David may build a Goliath

started life as a bank clerk, and was once an RAF pilot, is a moderate, but likely to be a more outspoken one than the retiring Lord Cooper. He could become the kind of television personality moderate unionism has so lacked since the death of Les Cannon. Mr Basnett, unlike Mr Gladwin, did not have a university education, but he has a faster mind than most employers.

For years, the GMWU has been a sleepy, slow-growing union. Mr Basnett, who previously handled mergers for the union, is likely to embark on an ambitious acquisition policy. He may, for example, try for a merger with Mr Frank Chapple's union. He is also likely to try to develop collective bargaining in other areas than pay. Unlike most British union leaders, he is sympathetic to workers' participation. As a keen European, he might persuade the rest of the TUC to support the recent plan for participation put forward by the European Commission.

The outgoing Lord Cooper, like Sir Sidney Greene, has been one of those powerful union moderates who seldom dared to oppose the militants publicly. His biggest contribution to the GMWU was a remarkably successful piece of property dealing, when he sold the old central London headquarters at such a high price that the union could buy a mansion near Esher, acquire some prime housing land, build a new headquarters and still have money to spare.

Industrial court

If Hughie still won't come . . .

Sir John Donaldson fined Mr Hugh Scanlon's engineering union £5,000 on Wednesday for contempt of court. The union had refused to obey a court

order to appear and explain why it refused to admit Mr James Goad of Suffolk to a branch meeting. If the fine has not been paid by November 21st sequestration writs will be issued and four sequestration commissioners appointed (nominated by Mr Goad).

Sir John, however, made it clear that the writ will not cover the entire assets of the union. The commissioners would be able to take possession only "of so much of the real and personal estate of the respondent union as is necessary to meet the said fine." So if it comes to the crunch the commissioners will presumably confiscate £5,000 worth of the union's property. The union itself seems pleased that the fine was so low. But it is an even bet whether Mr Scanlon will pay up or wait for the commissioners. The fine may seem small, but his union's finances are in a parlous state after the long dispute last summer. Its bank accounts are overdrawn.

The story may not end when the £5,000 reaches Bow Street court. On Friday next, the Sudbury branch of the union will meet again. If Mr Goad is excluded once more, he can return to the National Industrial Relations Court again. On past precedent, next time the fine might be a good deal higher.

Mr Jones's Transport and General Workers' Union will be in the dock again, this Friday, facing a charge of contempt from Howitts, the Liverpool lorry firm. The union does not support the blacking campaign against Howitts, but its own shop stewards are taking part. It could follow a similar pattern to the Heaton's saga. But, unlike Mr Scanlon, Mr Jones will be represented in court.

Textiles

Weave up

Courtaulds has told the 1,000 employees of its £7m weaving operation at Skelmersdale, Lancashire, that the plant will have to close because of "the cumulative effect of continual labour difficulties." In the language of the trade, it is to "weave up" immediately. Courtaulds is tight-lipped about the decision. The local union, the Amalgamated Weavers' Association, is hoping to reopen talks with the management and might take up the offer to send in its own cost accountants.

Courtaulds took a big risk when it built the huge and ultra-modern weaving shed in Skelmersdale. It was near the traditional Leigh weaving area but took its labour from among the Merseysiders who have been rehoused in

Skelmersdale. Weaving requires high skills, and a sense of the precariousness of profit margins and the necessity for the continuity of operations that long, insecure years in textiles have given weavers. An element among the Merseysiders tended to down tools, car-industry style, with disastrous results on productivity.

The commercial decision to build such a large plant was based on the hope that the high efficiencies and productivity of using the best and latest looms would enable the cloth to be produced at a price competitive with imports. This has clearly been thwarted by the labour problems. Unless the local workers learn the attitudes, as well as the skills, of their new industry, the factory will stay closed. The last Courtaulds accounts comment that the northern weaving losses were greater than in the previous year, when they were "substantial," but blamed imports and running-in expenses.

Steel

Melchett-bashing on the Clyde

A private group, which includes German money, is to put to the Government the biggest of the many proposals made so far for a major steel plant in Scotland. The Department of Trade and Industry is taking it very seriously. The group is hoping to cash in on the unease that Lord Melchett, chairman of the nationalised British Steel Corporation, caused the Scottish trade unions when he confirmed that he had no plans for a major greenfield development in Scotland. The most they could expect, once the immediate revamping of Ravenscraig had been completed, was a 500,000-tons-a-year minimill, costing £35m-£40m and providing 400-500 jobs, either at Hunterston beside the major ore terminal being built there, or at one of two possible sites in Lanarkshire.

The private group's proposed development would build up to a billet capacity of around 2m tons a year by 1978-80 and be based on four direct reduction units producing sponge iron pellets by the same process used by Korf at Hamburg. These plants could either use natural gas (as at Hamburg) or the tail gas from the refineries that have been suggested for the Hunterston site.

This project has an Achilles heel. It turns on being able to persuade the

Government to sell at least one and preferably two or three of BSC's present plants where BSC plans to shut down steelmaking but leave the rolling mills working. The Steel Corporation will resist this mightily. It is still refusing to sell off the Birchley mill in the Midlands, which is one of those that it is planning to close immediately. The private group's main weapon is the fear among Scots that eventually BSC will close down most of their mills, eliminating two or three times the 7,500 jobs that BSC admits will go by 1975. The private group is holding out the temptation of no shut-downs and no further jobs lost.

The next few weeks will see an increasingly vociferous Scottish lobby, led by the Scottish TUC, vying for a greater share of Britain's future steel developments. The Scots believe that the Government has to make its decision before European entry, because the responsibility for steel investment then passes to the commission. For different reasons, both the STUC and the new private group are hoping that the new Secretary for Trade and Industry, Mr Peter Walker, will follow his previous form and be a lot tougher with BSC than his predecessor, Mr John Davies.

Value-added tax

Retail relief

The Chancellor's change of mind on the treatment of retailers' stocks at April's changeover to value-added tax is good sense and good politics. Shops are simply going to be allowed to deduct the purchase tax element in stocks from their Vat bills for the first Vat period; just as if it were Vat on

purchases, which is deductible under the normal mechanism of the tax. Retailers will have to claim for such purchase tax rebates on a special form and produce some evidence they have really paid the tax. This is a huge advance on the mulish insistence by Customs and Excise that such an arrangement would be impossible to police. The details have still to be worked out, which suggests that the decision was taken in a hurry, quite properly in view of the little time left. Firm political control of the Vat changeover is not before time. The previous arrangement was going to be a purchase tax holiday for a short period before April, to allow retailers to clear out tax-paid-up stocks. A fine old chaos that would have caused.

Ports

Baby bogies

The many little ports outside the Dock Labour Scheme, which the dockers so vehemently attack for taking away their jobs, turn out to handle more of the nation's trade than expected, but they employ a much smaller proportion of the labour force than was thought. The preliminary report on the small ports issued by the National Ports Council on Tuesday concedes that they offer pay and conditions comparable with their competitors, their capital investment is much lower in relation to the trade they handle, and few of them could be called new—some date back to Roman days. None of this suggests they deserve to be clobbered, which will be a disappointment to the dockers, and even to some employers. On safety, one area where it was hoped there might be some skeletons in the cup-

board, they seem to be no worse than the big ports. A docker wearing a hard hat is unheard of almost anywhere.

The small ports' share of the market has risen from 15 per cent to 20 per cent since 1966, but since they only employ about 3,000 men they can hardly be held responsible for the 30,000 reduction in the rest of the dock labour force in the past few years. Much of the business they have gained seems to have come from special factors. Felixstowe is nearer certain continental ports than Tilbury, so a ship using Felixstowe can make more voyages in a year. Dover has a rush hour problem with its car traffic, so it has been able to expand into the roll-on, roll-off lorry market at abnormally low cost.

But on the whole it looks as if the big ports have commercial misjudgments to blame for their problems. They planned massive redundancies on the basis that the economy was expanding fast enough to absorb dockers as they were put out of work by containers, and so on. As it happened, the other jobs did not materialise, and this was especially expensive for the big ports, because they have progressively allowed the dockers to limit their flexibility about whom, and how many, they must employ.

Also, the big ports have failed to exploit opportunities for expansion. The NPC report shows how few of the little non-scheme ports have facilities for big ships, and so how few are able to compete in the deep sea trades that are the traditional markets of London and Liverpool. But it is the short sea trades that have been expanding fastest, and that is where the small ports have cashed in. It only shows that competition can be a healthy thing.

Key indicators: British economy

	Month	Index 1963=100	Percentage change on		
			previous month	three months	one year
Retail trade Clothing sales rebound in September, but food shops lost trade.					
Consumer credit Credit sales down in September except in department stores. But in the third quarter as a whole they were 11% higher in value than in the previous quarter.					
Banks Reserve ratios only slightly down in the four weeks to mid-October, from 14.9% to an average 14.6%. They may well have risen since, taking some of the edge off the Bank of England's call for special deposits.

Gillett Brothers Seminar 1972

**"Competition and Credit Control
—one year on"**

On 5th December 1972 Gillett Brothers Discount Company are sponsoring a one-day seminar at the London Hilton to review the first year's operation of the Bank of England's 1971 credit system proposals.

The seminar will particularly interest senior representatives of banks, commercial companies and other institutions in the City of London and the main European financial centres. Shipping, financial, commodity and money markets are expected to be well represented.

Wall Street puts its boots on

New York

For about an hour after the New York stock exchange opened for trading on Wednesday, following President Nixon's landslide, the market was euphoric. The Dow Jones industrial average rocketed by nine points in extremely heavy trading, to just 1.3 points shy of the record close of 995.15 in February, 1966. Then, just as abruptly, the rejoicing gave way to greed. In the next hour the rally was obliterated by profit-taking, and the session closed at 983.74, actually off 1.06 on Richard Nixon's glory day.

In a showier display of pre-election pyrotechnics, the Dow Jones the week before had netted a total increase of 38 points, on the expectation of both a Nixon victory and a growing conviction that a Vietnam ceasefire was coming closer. The rise delighted brokers because it was achieved in a remarkable string of five trading sessions in a row, with daily trading volume in excess of 20m shares, instead of the recent 15m-odd which they had begun to fear was all the market was

ever going to muster. After several months of low business and scarce commissions, this was balm in Gilead.

Many brokers said they saw in the resumption of heavy activity a return to the market of many individual investors who had been on the sidelines since last spring. The trouble is that institutional sellers were ready for them. Many institutional investors, notably bank trust departments, which this summer had bid up (and loaded up on) so-called glamour growth stocks, were lying in wait for the first concerted rally to unload blocks of overpriced shares. On Wednesday, therefore, the list of election day losers was led by these "busted" glamour issues, as Wall Street has come to call them. Burroughs dropped \$2½ on the day to close at \$208; Avon Products went down \$3½ to \$128½; Polaroid was clipped \$3½ to \$112½; Xerox by \$5 to \$150. While Richard Nixon in his greatest victory was no longer an object for newspapermen "to kick around," as he complained in his cele-

brated defeat speech after losing the California gubernatorial race in 1962, he seems nevertheless to have created a new booting opportunity for investment institutions.

As institutions have dropped the faded glimmers, they have been moving into issues on cheaper price/earnings ratios with favourable earnings growth rates. These include some motors, life insurance companies, utilities, oils and savings and loan associations. Soon, however, the market will have to absorb the traditional year-end tax selling. Brokers are therefore forecasting that the market may move further into a "consolidation phase" for the next several weeks. Most analysts see this as a base-building interlude, preliminary to a further advance in prices, at last carrying the Dow average well over the elusive 1,000 mark.

London market

The Queen of exchanges

With pomp but rather uninspiring circumstance, the Queen cut the ticker-tape of the London stock exchange's new building on Wednesday evening. The building is not yet finished, but

P&O/Bovis

No, no, P&O

Ford Geddes: charming

Next Friday, P&O is holding the delayed extraordinary general meeting at which shareholders will be asked to increase the authorised share capital of the company and thus allow the majority of their directors to proceed with their plans to buy Bovis. They should vote against.

Last week *The Economist* published a tentative, but detailed, profits forecast, arguing that an independent P&O might earn as much as £20m in the year to next September—and suggesting that the board of P&O should publish its own guesstimate. The board has stuck to its guns: it argues that the shipping business is less predictable than others, and that any forecast to which it could attach its name would need such wide contingency margins as to be useless. This is an honourable view to hold, but do the P&O directors realise that it is not shared by their fiancées at Bovis? After all, what could be more unpredictable than the construction industry, with its strikes and seasonal upsets, and yet Bovis has a forecast for next year and a projection for the year after. Forecasting, targets, budgetary controls—that is the stuff of management, and it is hard to believe that P&O sees itself as an unstuffed turkey running around blindly for a year. If the management is so bad that it needs to be taken over, is it good enough to decide by whom and for how much?

The majority of P&O directors recoil from the notion, shared by most of the press, that the Bovis deal is a reverse takeover to get the undoubtedly good Bovis management. Their rationale is that, over the long term, shipping will become increasingly competitive, and thus it will be harder to earn a decent return on heavy investment in ships.

Bovis, in the growth areas of housebuilding, construction, property and banking, is in on a steep profits incline from a tiny assets base. So, said Lazard Brothers (advisers to P&O, and ex-advisers to Bovis) marry the assets to the profits. In the sweep of this grand strategy, next year's profits may seem to pale into insignificance. But how secure are housebuilding and property profits over the next decade, which might see a Labour government with notions for nationalising property?

In spite of the £200,000 worth of advertisements in the press by Bovis and P&O, shareholders should vote against the board. The battle has been long (and clean, thanks to the charming and exemplary behaviour of P&O's chairman, Mr Ford Geddes). But it has not produced enough information to judge whether Bovis is the best buy. P&O can afford to stay independent a bit longer.

Shell

Snip if a snap

Shell's third quarter figures show why international oil companies are out of favour. With net income of £45m, compared with £53m in the previous quarter and £91m in the same quarter the year before, it is clear that some old chickens are still coming home to roost. The basic problem has been that while demand in Europe has been low for the past year—affecting all oil companies—the situation has been exacerbated for Shell by unfortunate timing. First, of its move into the tanker market: it took out three-year charters in 1970 when rates were at the dizzy height of worldscale 300 compared with 95 now. And then in its expansion on the chemical side.

Demand has been the key factor. The third quarter, for seasonal reasons, is usually one of especially low volume. This should be less of a worry for Shell, compared with British Petroleum, for example, because the company has a higher proportion of sales in the lighter end of the market, in fuel oil and gasoline. But this year gasoline prices have only just begun to move upwards; they usually begin to creep up in May as cars take to the roads. Another factor that has hurt margins this quarter, compared with the equivalent one last year, is that unit costs per barrel are up. In the second half of 1971 the company built up its inventories in expectation of the cold winter snap that never came, and has had higher carrying costs ever since.

Then there is the Catch-22 Venezuelan scheme: if a company's oil production falls below a certain limit it has to pay a penalty to the government; if it rises above a certain limit payments automatically increase. Shell has been hit by the low production penalty, and apparently is making no profits from its Venezuelan operation. However, the future looks less bleak.

Rotterdam spot oil prices have moved slightly upwards; on the law of averages, there should be a colder winter; and the tanker charters of 1970 will be coming to an end soon. More significantly, Shell could benefit from Arab participation. The company is bigger than most in European refining and marketing and could get some contracts from the Arabs to sell their oil. The American subsidiaries have already shown that things are picking up on their side of the Atlantic and this trend should continue. If the shares get down to their trading-range low of 300p in the short-term, they would be a snip for the cyclical upturn.

RECOMMENDED RETAIL PRICE

**Last year, United States Steel's
process produced 70%
of the world's tinplate.**

Wouldn't you expect us to have first-rate metallurgists?

United States Steel is the largest steel company in the western world.

So it's not surprising that tinplate lines owned or licensed by United States Steel account for almost three-quarters of the world's supply—or three-quarters of the world's tin cans!

We're United States Steel's worldwide sales organizations and distributors. And we can offer you more products and services than any other steel producer or distributor.

Take metallurgical assistance. When you need to talk to somebody with worldwide experience, our metallurgical engineer is never farther than a jet away.

He can help pinpoint specifications on products you haven't even made yet. Make on-the-spot suggestions on how you might cut production costs. Recommend changes in procedures that are causing you headaches. Determine which of United States Steel's products will best fit your application. Or even tailor-make a product to your specifications.

Besides every kind of steel you'd ever need...and every kind of know-how you'd ever need to use it...what else can we offer you?

Raw materials and chemicals. Products made from them. And products made from steel. What's more, we build bridges, oilfield equipment, office buildings and homes.

We perform complete shipping services everywhere we sell. And that's everywhere.

Our prices are competitive. So are our credit terms. And we've been successful in arranging financing for our customers.

Whether your needs are large or small, we're eager to talk business with you. Just say where and when.

Organization of AMF Incorporated.
White Plains, N.Y., U.S.A.

Right now your company is faced with a choice.

Either to wait for the new State Reserve Pension Scheme—which will mean only the basic minimum benefits for your employees.

Or to set up an acceptable alternative.

In which case you can't do better than to set up a plan with Commercial Union. A plan that's simple to run, easy to understand, and completely adaptable to your own particular requirements.

With Commercial Union every employee will get a realistic pension. One that is well protected against the ravages of inflation. One that will really take care of his wife and family.

And if your employees are happy, aren't you?

You'll find their commitment to the firm greater. Staff recruitment easier. Even trade union negotiations friendlier.

All very nice too, you may say, but what will it cost?

Remarkably little.

Because you'll have Commercial Union's investment expertise right behind you, making sure you get the highest guaranteed return on your money. And remember, every contribution your company makes to the plan can be set against tax.

The choice is clear: pay the State for the little it offers, or arrange a first rate alternative scheme which will be of greater value to you and your employees.

Before you decide, talk to your Insurance Broker about Commercial Union Pension Plans. Or send for the free brochures.

You'll find the choice a lot easier.

**Commercial Union
make pension plans simple.**

Energy for industry

Giant new power station feeding the UK grid.
Requirement from us: 4500 tons of fuel oil Per day.
We deliver Direct from refinery via undersea pipeline.

Factory machining metal components in Holland.
Requirement: cutting oils that could measurably improve
tool life, without fumes, without odour.
We deliver From our new Gulfcut range for Europe.

Energy for industry Every kind of industry.
Every type of energy Whichever way you look at it.
Gulf is energy.

Gulf Oil Corporation, Pittsburgh, Pa, USA, and throughout the world.

Investment trusts

Buy the tiddlers?

Investment trusts have been left a tiny corner of warmth in Mr Heath's freezer. Dividend limitation is not to apply to them, so their shareholders can benefit from any higher dividends that have already been received from British companies and any increases still to come from foreign holdings. The value of the concession is small. The institutions—which have, on the whole, been net buyers of investment trusts from the public for some time—may be more tempted to buy trusts for the franked income, and members of the public who have held their trust shares since the stone age will be a little happier. Since the yield on investment trusts is only 2.6%, few new seekers after income will be tempted into them.

But there are now other reasons for investors to buy British investment trusts. The discount of the average share price of investment trusts on their estimated underlying net assets is 20%—ie, the buyer of £80 of investment trusts is getting £100 of equities. Investment trusts always sell at a discount on net assets, but not usually such a big one. Thus there is a cushion

against any further fall in the market, since some of it might well be taken by the discount being reduced. Although investment trusts have fallen, they have fallen less than the market over the past three months. When the upturn in the market comes, the discounts almost certainly will narrow so that trusts should rise by more than the market does. The relative cheapness of British investment trusts is the more striking because 29% of their holdings, on average, are in American stocks. And few people have been forecasting that Wall Street will go down.

The effect of the widening discount can be seen in our usual "one-year" league tables opposite. Even the least successful fund, Globe, showed a growth in net assets which is higher than the price performance of the average investment trust.

Investment trusts sell at a discount because the whole is looked at as worth less than the sum of the parts; this is a tradition based on several factors. First, there is a potential liability to capital gains tax on the disposal of the shares; but in Britain this is now 15% instead of 30%, and this should have

caused a narrowing of the discount. Secondly, the supply of investment trusts is increasing to meet a demand which is not growing. The public at large prefers to put its eggs in unit trust baskets, while the institutions are choosy. In 1971 £116m was raised for new investment trusts, and in the first nine months of 1972 a mammoth £334m hit the market. Thirdly, the discount is usually large when general market sentiment is glum.

The size of the discount for each trust should reflect how well the management has done in the past, and what the market expects from it in the future. In exceptional circumstances, the discount is replaced by a premium. Thus Atlantic Assets, top again of the yearlings, is at a whacking premium of 60%. Management matters, and new management is sometimes more successful than old-established manage-

ment. One of the more delightfully cynical members of the investment trust club makes no secret of his view that, with a few exceptions, investment trusts are the worst-managed businesses in Britain.

Slater, Walker has become one of the whizz-kids of the business, after having had to fight its way into the club. Its SWIT, a year old, is second in the yearlings, but its Flag has dropped out of the top 20. However, Flag shareholders benefited from the Slater, Walker wheeler-dealing; three-quarters of it was sold to Mr James Goldsmith at peak net asset value.

The discounts are now showing a pattern which is not rational. We have analysed the statistics provided for us by Wood, Mackenzie, the brokers who specialise in investment trusts (all comment is ours), and suggest that in the short term there should be a distinct advantage in following smaller trusts. The accompanying table shows that in the past year they have significantly outperformed the bigger trusts, even though our figures exclude all trusts with under £10m of net assets. Unless

this table is a statistical freak, the smaller funds should now logically be at lower discounts. A lot of them stand cheaply at high discounts instead.

We have had a go at repeating this analysis for relative performance between small and large trusts over the past five years, but ran up against

Small = Good

Size of trust	No of trusts	Average % growth Nov. 1971 - Oct. 1972
£100m+	11	24.3
£50m-£100m	29	26.6
£25m-£50m	43	29.5
£10m-£25m	45	35.6
Wood Mackenzie index		16.1

a technical snag: we use the trusts' financial year-ends so as to get an accurate figure for net assets, and can therefore only compare them with the performance of the Wood, Mackenzie composite index (of British and American shares and bonds) over the relevant period. That aside, we got the rather curious result that in 1967-72 as a whole the very biggest funds have done

best, the smallest funds second best, then the £25m-£50m group, with funds between £50m and £100m doing worst.

Two funds which look attractive on both a discount-to-size and a discount-to-performance basis are General Funds and Investing in Success, both managed by Vickers da Costa (under their trade name of City Financial Administration). Vickers are experts in Japanese stocks and in small growth companies. Since both trusts are also in the top 20 in the five-year table, their results do not seem to be flashes in the pan.

If one believes that the reign of Nixon II will see a post-election boom, this might seem a good week to recommend investment trusts with a large American involvement. The trouble is that many of these seem to have followed the sheep into growth companies with high p/es. Among the better buys may be the large Foreign and Colonial which has been proving itself more than usually adept at international management. But is this the year that big will prove beautiful?

INTERNATIONAL INVESTMENT COUNSELLING Establishing a Policy

Your international investment portfolio *Policy* should include consideration of safety, income and growth.

At Lionel D. Edie International, we are prepared to assist you in balancing these factors to fit your requirements; advising whether or not you should have straight bonds, convertible bonds, or equities—and in which countries and in what ratio.

We are also prepared on the basis of a professional research to select the investment vehicles we consider right for you, maintain continuous supervision and recommend changes when, and if, it is decided that an investment no longer suits your requirements. Whether it be a change in safety—income—or growth potential.

Senior Counsellors have ample time to devote to establishing your *Policy*, and to maintain close and continual attention to your investment portfolio.

If you would like more information contact Edouard Iselin, our Executive Vice President in Geneva. He will be glad to discuss services, fees and answer any questions you may have.

ANNOUNCEMENT

SYRIAN GENERAL COMPANY OF PHOSPHATE & MINES S.A.R.

Announce the sale of a quantity of rock phosphate production extracted from khnefis mines in accordance with the following conditions:

- 1—Quantities:
The yearly quantities available to be sold of the rock phosphate produced from khnefis mines are 150-250 thousand metric tons.
- 2—Specifications:
- | | |
|----------------------------------|-----------------------|
| % P ₂ O ₅ | 30.7—32.5 (68—71 BPL) |
| % CaO | 45—51 |
| % SiO ₂ | 2.5—4 |
| % F | 2—4 |
| % CL | 0.15—0.25 |
| % Fe ₂ O ₃ | 0.2—0.5 |
| % Al ₂ O ₃ | 0.1—0.60 |
| % MgO | 0.2—0.5 |
| Losses of Ignition: | 7.5—11 |
| Humidity | 5—9 percentage max |

3. Delivery and Reception as from the signature date of the contract. Buyers should receive and sellers should deliver at Tartous port a monthly quantity of not more than 2,500 metric tons and not less than 8,000 metric tons plus or minus 10% according to the captain's option.

4. Loading Conditions: As from the signature date of the contract sellers accept to sell and to deliver, and Buyers accept to buy and receive the rock phosphate quantities sold under the contract on F.O.B. Tartous Basis, and at a daily loading rate of 2,000-2,500 metric tons, which will be loaded by the conveyor belt belonging to GECOPHLM on vessels whose capacity should not exceed 8,000 metric tons maximum within 1972-1973, but after this period the daily loading rate will be 1,000 metric tons per hour and the vessel's capacity will be up to 25,000 metric tons maximum. Demurrage and despatch money will be calculated on the daily loading rate basis, which will be agreed upon between both parties, but any other loading conditions will be discussed later between both parties, to be agreed upon according to Africanphos Charter parties' conditions. Draught at Tartous port is 10.5 metres and acceptable vessel length is 300 metres maximum.

5. Payment Conditions: Participants should be engaged by the following payment conditions:
A. The value of the contract should be paid by an L/C opened to G.P.H.O.M.I.CO. through the Commercial Bank of Syria; such L/C should be confirmed by C.B.S.
B. The A/M/L/C should be opened by the nomination total value of the contract, and should be, revolving, renewable automatically to cover the value of each shipment, divisible, and payable by U.S. against the presentation of documents required to the bank which the L/C opened through.
C. All expenses charged on the L/C should be paid by the Buyers.

6. Expenses and Dues. All expenses and dues charged on rock phosphate in S.A.R. will be paid by sellers who should deliver the merchandise free from any dues or expenses including the stowage and trimming fees, but not the maritime services and dues which should be paid by the owners represented by the captain, the maritime agent, or the buyers.

7. Contract Validity: The validity of the contracts, which will be arranged as a result of the offers presented, may well be a year, or more than a year, as the selling of a part of the quantities is acceptable by sellers.

8. Bank Letter of Guarantee: Buyers should present a bank letter of guarantee representing 10% of the contract value to guarantee the good execution of the contract. Such a letter of guarantee should be issued by the Commercial Bank of Syria, or by a bank accepted by C.B.S., providing that it should be confirmed by C.B.S.

9. Buyers' Representative. Buyers have the right to nominate representatives on their behalf to present the weight, loading, sampling operations, but sellers should arrange the whole necessary facilities to those representatives, which permit them to execute their obligations required.
- In case Buyers want to nominate an inspector company, so the expenses will be charged to the Buyers.

10. Disputes: Any dispute that may arise between both parties should be settled amicably, or by arbitration in accordance with the rules of the International Chamber of Commerce in Paris, or in any other locality that is agreed upon between both parties.

11. Closing Date for Presentation of Offers: Offers will be accepted at the latest on 20th November, 1972, taking into consideration that any suitable offer will be reconfirmed to the participant within ten days, as from the presentation date, otherwise the unacceptable offers will be kept up to the closing date, while being compared, and reconfirmation will go to those who submit the highest price and best conditions, especially to those who attach to their offer a preliminary deposit, representing 5% of the offer's total value.

12. Offer Validity: The validity of any offer submitted should not be less than ten days, but in case the offer is not suitable, so it will be kept up to the closing date, and we will ask the participant to extend the validity of his offer which should be valid for ten days after the closing date to obtain the General Company of Phosphate & Mines, to discuss, study and compare the offers and to notify the approval and the ratifications of Syrian authorities. Whatsoever, those who are interested to participate for purchasing any quantity of Syrian rock phosphate should present their offers to the following addresses referring on their envelope (Phosphate Calling Offer):—

- The mail address: Ministry of Petroleum Electricity and Mineral Resources (Commercial Directorate) Damascus Mutanabbi Street.

- The cable address: Petrol Ministry Gecopham Damascus
- The telex No. 20006 Petsyria.

Write to Keith Spence, Mitchell Beazley Ltd, Mill House, 87/89 Shaftesbury Avenue, London W1, or ring 01-437 6645

COMPANY STATEMENT

Shares doubled since formation

During the past financial year, which was marked by the most serious international monetary crisis since World War II, the value of a ROLINCO share has shown a satisfactory rise of about 12% to Fl. 199 as at 31st August 1972. Since ROLINCO started its activities, in less than seven years the value of a share, adjusted for all free scrip issues, has doubled. Since the end of the Company's first financial year – six years ago – assets have increased more than tenfold to Fl. 2,331 million.

Investment policy

Our investments in U.S. and Japanese growth stocks this year have shown a considerable increase. Our investments in Japan have been a striking feature of the year amounting to nearly 22% of our total assets or twice the percentage of previous years.

Our interests in America and in Europe, 35.78% and 33.99% respectively, are about the same. In the autumn of 1971 we made fairly large investments in America, and towards the end of the winter season we also resumed investing in continental Europe. The slight percentage decrease of our U.S. investments since the publication of our interim report does not mean that we have reduced our holdings in that country. On the contrary, these investments have shown an increase from nearly Fl. 780 million to Fl. 834 million as at 31st August.

Capital

In the past financial year the Company's ordinary share capital rose from Fl. 444,300,000 to Fl. 606,000,000. This was due to the issue of 3,234,000 new shares. Of these 892,171 shares were issued following the one for ten scrip issue and 2,341,829 to meet the enormous demand on the stock exchange. Thus a total amount of about Fl. 410 million worth of new funds became available to the Company.

Dividend

ROLINCO aims not at yield but at capital appreciation. In the financial year 1970/1971 we held at first a large amount of liquid assets in view of the short term expectations on the stock exchanges. The extremely high interest rates prevailing at the time thus resulted in unusually high interest income and in increased profits. As under fiscal law we are held to distribute all fiscal profits to our shareholders, this resulted, for the year 1970/1971, in a rise of our cash dividend from Fl. 2 to Fl. 3 per share.

However, at the beginning of the year under review our liquid assets had been reduced again to virtually nothing, and we continued to be fully invested in low yield stocks almost up to the end of the year, so that profits were at a normal level again.

Accordingly, we propose to reduce the cash dividend to its former level and to distribute an amount of Fl. 2 per share on the capital as increased by the 1 for 8 scrip issue.

Copies of the full Report and a descriptive booklet may be obtained from the Company:—

ROLINCO N.V., P.O. BOX 973, Rotterdam.

BORROWING AND BANKING

About £3,000

Applications are invited for a post within a Section of the Financial Department primarily concerned with the important activity of financing the electricity supply industry. The successful candidate will have an interesting range of duties which entail regular contact with Electricity Boards, banks and other outside bodies. The work is largely concerned with the forecasting of the industry's cash requirements and the raising of its funded and temporary borrowings which amount to about £450m. annually. It involves monitoring the industry's banking facilities, its internal pooled banking system and the calculation of interest and financing expenses for the purpose of forward estimates. Applicants should preferably be qualified in accountancy or banking, but candidates able to demonstrate the requisite experience would be considered. A keen interest in these fields is essential.

Write giving full personal and career details and quoting ref E/135/72 by 20th November, to:— Howard Bussey, Personnel Officer.

NATIONAL ECONOMIC DEVELOPMENT OFFICE

Applications are invited from suitably qualified men and women for the following appointments in the National Economic Development Office:

(a) One post and possibly others in the near future for the sections serving various Economic Development Committees (Little Needles). The work calls for (i) familiarity with statistical sources (ii) experience in collection and analysis of statistics and of their use in making projections (iii) general ability in investigating and reporting on industrial problems (iv) secretarial ability relating to committee administration.

(b) A macro-economist with knowledge of major post war developments both in the UK and abroad and ability to write concisely. Interest in public finance would be an advantage.

(c) An economist or econometrician with experience of applied econometrics and the use of advanced computing methods to develop economic models of UK industries; initially he will be responsible for the on-going development of models of the UK agricultural industry, covering food demand and agricultural output, manpower and investment; work is also in hand on an input-output model of the textile industry and on financial models of other industries to which he will contribute later.

(d) An economist who has some experience of transport problems; his field of activity will include a study of the competitiveness of handling air freight in the UK compared with the continent and a study of the impact of cash and carry wholesaling on the distributive trades.

Applicants should preferably possess a degree in economics although for posts at (a), a degree and/or a professional qualification in a subject of relevance to industrial questions would be an acceptable alternative. Salaries will be in the range £2500-£4500 depending on qualifications and experience.

Applications, stating which post is being applied for, and giving full details of age, qualifications and experience, including the names of two referees should be sent not later than 24th November to:

Mr P N Odell, National Economic Development Office, Millbank Tower, Millbank, London SW1P 4QX.

APPOINTMENTS

The Economist Intelligence Unit

TRANSPORT & ENERGY DIVISION

Transport Economists and OR Staff

This Division of the EIU wishes to make appointments in the following fields:

1. Port Economist. An economist experienced in the analysis of port investment projects, with knowledge of the economics of shipping.
2. Shipping Economist. An economist with detailed knowledge of shipping, preferably gained through work with a shipping line.
3. Operations Research Analyst. Applicants should be interested in developing computer models in the transport field, should have a degree in economics or statistics, and preferably have experience of transport operations. This post is intended to be at intermediate to senior level. At the same time a more junior post would be offered to the right candidate who has significant ability and interest in programming.

Applicants for the economists posts should have knowledge of statistical techniques. All applicants should be willing to travel: the EIU's work in this field has an emphasis on the study of transport projects and policies in developing countries.

The salaries for the above posts would be commensurate with experience and qualifications: they are likely to be in the range £3,000-£4,500 per annum.

DEVELOPMENT & PLANNING DIVISION

Economists

The Division requires economists to work in the following fields:

1. Macro-economics (both UK and overseas)
2. Property Economics.
3. Regional Economics and Economic Planning.
4. Industrial Project Appraisal (both UK and overseas)
5. Economic Appraisal of Financial Investments.

These vacancies are at both intermediate and senior levels and are likely to be of interest to economists aged between 25 and 35. Salaries from £2,500 to £4,000 or more, according to qualifications and experience.

Applicants with suitable qualifications and practical experience in the above fields should write with full details to either the Transport & Energy Division or the Development & Planning Division, as appropriate, at the following address:

The Economist Intelligence Unit Ltd.

Spencer House, 27 St James's Place, London SW1A 1NT.

LONDON BOROUGH OF GREENWICH

P.P.B.S.

Corporate Planning and Research

Two posts are vacant in the Council's multi-disciplinary team responsible to the Chief Executive for the development and operation of Corporate Planning.

Corporate Planning is a new and rapidly growing field. It involves:

- Specifying objectives
- Research and analysis into problems and needs
- Evaluation of alternative policies
- Setting of targets to be achieved
- Preparation of 4-year corporate plan and budget
- Monitoring progress against targets and objectives

Both posts offer practical experience in an advanced application of this system in a progressive authority. The system is already in operation, but much remains to be done to refine the planning processes and to research important issues.

RESEARCH OFFICER

(£2,670-£3,099)

An important function of this central team is research and analysis into planning issues spanning the Council's services. This involves surveys to assess needs and problems, the development of alternative plan policies, and the use of advanced techniques for analysis. Examples of research already under way include the needs of pre-school children and the elderly.

PROGRAMME PLANNER/RESEARCH OFFICER

(£2,670-£3,099)

This post will involve both research and implementation of the planning system as the occasion demands. It is an excellent opportunity to get wide experience of planning systems.

Applicants for both jobs should be numerate and have a good degree of relevant professional qualification. A background in economics or statistics would be useful, but not essential. Ages are likely to be mid to late twenties. Local government experience is not essential.

Over 5 weeks' leave; staff restaurant; removal expenses. Application forms from the Chief Executive, Town Hall, Woolwich, SE18 6PW. Closing date: 24th November.

APPOINTMENTS

THE COMMITTEE ON INVISIBLE EXPORTS

Applications are invited for the post of Assistant Director of the Committee on Invisible Exports. The Committee represents the principal contributors to Britain's invisible earnings and its terms of reference are to suggest, and where possible implement, measures for the encouragement of such earnings. Its work is wholly financed by contributions from firms and institutions in the private sector of the economy.

The Assistant Director is required to plan and supervise the preparation of statistical and other material for publication, and generally to assist in running the Committee's activities, including its research projects.

Applicants should have a good grounding in Economics (academic qualifications are preferred), with a specialised interest in finance and commerce, including the activities of the City of London. Experience of writing for publication is desirable. Age limits are 30 to 45; salary will be £4,500 a year.

Applicants should write to the Director, Committee on Invisible Exports, 18th Floor, 23, Fenchurch Street, London, EC3M 3DD, stating their qualifications and experience.

Cambridge University

FACULTY OF ECONOMICS AND POLITICS

Lectureship or Assistant Lectureships

Applications are invited for two Lectureships or Assistant Lectureships in Economics from people whose interests lie in any branch of Economics, including Economic Statistics.

The appointments will be for three years in the first instance, with the possibility of re-appointment. Candidates must be able to take up their appointment by 1 October, 1973. (An earlier start would be preferable.) The maximum tenure of a University Assistant Lectureship is five years.

The pensionable scale of stipends for a University Lecturer is £2,715 a year, rising by twelve annual increments to £4,614; the scale for a University Assistant Lecturer is £1,923 a year, rising by four annual increments to £2,656 a year. The starting point will depend on age and experience.

Further information may be obtained from the Secretary of the Appointments Committee, Faculty of Economics and Politics, Sidgwick Avenue, Cambridge CB2 9DD, to whom applications (nine copies), including a curriculum vitae and the names of not more than three referees, should be sent as soon as possible. The closing date is 29 November, 1972.

University of Nottingham

Readership in Agricultural Economics

Applications are invited for this recently established Readership in the Department of Economics. The appointment will be effective from a mutually convenient date and the salary will be within the range £4,143 to £5,247 per annum.

Further particulars and forms of application returnable not later than 4th December, 1972, from the Staff Appointments Officer, University of Nottingham, University Park, Nottingham, quoting ref. no. 224.

University of Oxford

University Lectureship in the Economics of the Firm

Applications are invited for the above post. Preference will be given to candidates with special interest in the internal management of firms. Stipend according to age on the scale £1,644-£4,616. Details may be obtained from the Secretary of Faculties, University Registry, Broad Street, Oxford, OX1 3BD, to whom completed applications (seven copies) should be sent by 1 December 1972. The successful candidate may be offered a Fellowship at Lincoln College; details of the fellowship may be obtained from the Principal.

Birkbeck College

(UNIVERSITY OF LONDON)

Department of Economics

Applications are invited for posts as LECTURER IN ECONOMICS in the recently established Department of Economics, which is intended to cater especially for part-time mature students attending in the evening. The Department will offer instruction to part-time and full-time students for the M.Sc. (Econ.) beginning in October 1973, and it is also accepting a limited number of research students. Of the prospective twelve members of the teaching staff, two Professors and five Lecturers have so far been appointed. While welcoming applicants from all branches of economics, the Department does particularly wish to attract candidates from the following specialist fields: Applied Macroeconomics, Economics of the Public Sector, Urban Economics, Industrial Economics, Labour Economics, Economic Development and International Trade. A research interest in one or more of these fields combined with a good quantitative background would be especially welcome. The successful applicants will be appointed at levels appropriate to their qualifications and experience on the scale £1,784 x £1,560-£4,289, plus London allowance of £182 p.a. Further particulars and forms of application should be obtained from the Secretary (E) Birkbeck College, Malet Street, London WC1E 7HX. Closing date 24 November, 1972.

APPOINTMENTS

Polytechnic of the South Bank

DEPARTMENT OF BUSINESS STUDIES

Lecturer in Economics (Ref. WB.16).

to specialise in Public Sector Economics for students on degree, H.N.D. and professional courses in the Faculty of Administrative, Liberal and Social Studies.

Appointment of Lecturer Grade I or II level according to qualifications and experience.

Salary up to £3,201 (for Grade II post).

Further particulars and application form from The Clerk to the Council, Room 299, Polytechnic of the South Bank, Borough Road, London SE1 0AA. Tel. 01-928 5989.

For further

announcements

see pages 5 and

120 to 129

The University of Manchester Institute of Science and Technology

Applications are invited for the following vacancies in the Department of European Studies and Modern Languages.

LECTURER IN EUROPEAN STUDIES (POLITICS) (Ref. ES/193/AD)

A preference will be given to applicants whose teaching and research interests lie in the field of French Politics and Institutions.

LECTURER IN EUROPEAN STUDIES (HISTORY, ECONOMICS OR ECONOMIC HISTORY) (Ref. ES/194/AD)

A preference will be given to candidates whose teaching and research interests lie in any of the following fields:—

- (1) Economic development of modern Europe;
- (2) Social history of modern Europe;
- (3) Economic policy in Europe.

Commencing salary, according to qualifications and experience within the scale £1,784 to £4,143 per annum (£4,289 in October 1973) with F.S.S.U.

Requests for application form and conditions of appointment quoting appropriate reference number should be made to the Registrar, U.M.I.S.T., Sackville Street, Manchester, M60 1QD, to whom the completed form should be returned by 30th November, 1972.

University of Malaya

Faculty of Economics and Administration

Applications are invited for the posts listed below which are now vacant and new posts expected to be available early in 1973. For all posts, subject to suitable professional/academic qualifications and experience, preference will be given to candidates who are competent in Bahasa Malaysia (Malay). Candidates should have high academic and/or professional qualifications and wide experience in teaching and research in their respective fields.

CHAIR IN LAW STUDIES (Industrial Law; Commercial Law; Income Tax Law and Constitutional Law in the relevant areas of Malaysian Laws)

CHAIR IN ACCOUNTING

CHAIR IN ANALYTICAL ECONOMICS (Micro Economics; Theoretical Economics)

CHAIR IN PUBLIC ADMINISTRATION

ASSOCIATE PROFESSORS (3 new posts) and LECTURERS/ASSISTANT LECTURERS (several posts) in any of the following fields: Accounting; Analytical Economics; Applied Economics; Business Administration; Public Administration; Rural Development.

For the Lectureships/Assistant Lectureships, candidates should have at least a good Honours degree with suitable teaching or research experience in addition to the special qualifications indicated in the further particulars. For appointment as Associate Professors, high academic and professional qualifications together with wide teaching and research experience are required.

Emoluments (approximate sterling equivalents per annum) are:

- (i) Salary Scales
Professor: There is a range of basic salaries, to a point on which a Professor is appointed, depending on his qualifications and experience. These are: £2,919, £3,032, £3,146, £3,259, £3,373, £3,486, £3,600, £3,713.

Associate Professor (Senior Lecturer): £2,278 x 89-2814/RP/2919.
Lecturers: £1,524 x 73-1962/2035 x 81-2441.
Assistant Lecturers: £1,130 x 65-1460.

- (ii) In addition, a Variable Allowance is at present payable at the following rates: 35% of basic salary subject to certain maxima depending on marital status: minimum £243 per annum, maximum £649 per annum.

- (iii) Supplementary Housing Allowance: £503 per annum.

Medical benefits are provided under the Medical Services Scheme of the University.

Further particulars, details of superannuation and application forms are obtainable from the Association of Commonwealth Universities (AppU), 36 Gordon Square, London WC1H 0PP. (Tel: 01-387 8572).

The closing date for the receipt of applications is 30 November 1972.

The Economist

European Sales Manager

This is a new appointment which offers a remarkable management opportunity to an exceptional man (aged 25-35) who will report to the Circulation Manager, and be responsible for increasing the sales of The Economist in Europe profitably. He will be expected to spend a minimum of 100 days a year in Europe and be capable of establishing and supervising a wide range of sales programmes to develop both subscription and bookstall sales.

A significant amount of his time will be spent selling The Economist directly to senior management in large organisations. It is essential that he can produce evidence of success in selling to businessmen. He should be fluent in French and German.

The sales targets are ambitious. Comprehensive promotional support will be available. He will be expected to contribute to marketing policy and be capable of creating and leading a team of part-time representatives in Europe.

The salary will be negotiable according to experience and qualifications. A car is provided. There is a contributory pension scheme.

This is an unusual career opportunity with excellent prospects for the man who meets the challenge.

Applicants should send a typewritten curriculum vitae with a handwritten letter of application, outlining their eligibility to:

Graham Billington,
Circulation Manager,
The Economist,
25 St James's Street,
London SW1A 1HG.

Applications should arrive by November 26th.

VACANCIES FOR ECONOMISTS OVERSEAS

Government of Malawi ECONOMIST

required to work in the Economic Planning Division of the Office of the President and Cabinet. Candidates, aged 25-35, must have a degree in Economics plus two years' post-graduate practical experience. Familiarity with modern techniques of project appraisal would be an advantage. Salary is on a scale approximating to £1,720-£2,825 per annum. A Gratuity of 25% of total salary drawn is payable on completion of a normal tour of 30-36 months' resident service (M3A/721038/EN).

Government of Fiji SENIOR PLANNING OFFICER

required by the Central Planning Office to research on various aspects of the Fiji economy and to help formulate Government policies on those areas; and to help in reviewing, implementing and drafting the nation's economic and

Social Development Plans. Candidates must have an Honours degree in economics and statistics, with at least three years' relevant experience which can have been in University, Government, private sector or research institutions.

Salary is in a range equating to £2,970-£3,580 incorporating tax-free Inducement Allowance in range £996-£1,176 per annum.

A Gratuity of 25% of total salary drawn is payable on completion of a tour of duty, which will be of 30-36 months' duration (M3A/721030/EN).

The posts described are partly financed by Britain's programme of aid to the developing countries administered by the Overseas Development Administration of the Foreign and Commonwealth Office.

Apply to: CROWN AGENTS

M. Division, 4 Millbank, London, SW1P 3JD, for application form and further particulars stating name, age, brief details of qualifications and experience and quoting the relevant reference number.

APPOINTMENTS

Transport Policy Research

Applications are invited from graduates in the social sciences, political science, economics or associated subjects, for a post as RESEARCH ASSOCIATE to work on a transport policy study forming part of a large-scale interdisciplinary transport programme sponsored by the S.R.C.

The appointment is for two or three years at a salary within the scale £1923-£2238.

Application forms and further particulars from Professor Norman Ashford, Department of Transport Technology.

Loughborough Leicestershire

University of Birmingham

CENTRE FOR RUSSIAN AND EAST EUROPEAN STUDIES RESEARCH, DEVELOPMENT AND INNOVATION IN THE U.S.S.R.

Applications are invited for research posts associated with this project, which is supported by the Social Research Science Council. An accurate reading knowledge of Russian and good background knowledge of the Soviet economy and/or Soviet science and technology are essential. One three-year appointment is to start as soon as possible, and two two-year posts from 1st October 1973. Applications for part-time appointment will also be considered.

Salary: Research Fellow, £1764-£2079 p.a.; Research Associate, £1419-£1626 p.a. plus F.S.S.U.

Further particulars from the Assistant Registrar (RS) University of Birmingham, P.O. Box 363, Birmingham B15 2TT, to whom applications (five copies) including names of three referees, should be sent by 27th November, 1972. Please quote reference RM4.

For further announcements see pages 5, 120 to 129

Strategic Planning

We have a vacancy for an ECONOMIST in our Central London Headquarters.

The work covers a wide range of economic and planning studies contributing to the preparation and integration of the Board's individual plans, including the writing of briefs on key issues facing the Board. The breadth and pace of the work are demanding; they call for a high degree of both creative and analytical ability, as well as the capacity to communicate clearly and effectively across disciplines and with Management.

Candidates should possess a degree, preferably in Economics or some related subject and have recent relevant industrial or postgraduate experience.

Salary range: £2430-£3312 p.a. incl., according to qualifications and experience.

Applications stating full relevant details and present salary to the Personnel Officer (Headquarters), Central Electricity Generating Board, Sudbury House, 15 Newgate Street, London EC1A 7AU., by 22 November 1972. Quote Ref. E/271.

Central Electricity Generating Board Headquarters

THE ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS (Chatham House)

DIRECTOR OF STUDIES

Applications are invited from candidates with high academic or other relevant qualifications for the post of Director of Studies. The appointment—to commence in 1973—will be for five years in the first instance and subject to renewal.

The duties include the planning and supervision of the Institute's research and publication programme, which is concerned with all aspects of international relations; the initiation of research projects; and the direction of a small research staff. The holder of the post is also expected to undertake some research on his own account for publication by the Institute. The post is regarded as the senior appointment on the Institute staff after that of the Director, for whom the Director of Studies would deputise as appropriate.

The salary will be in the range applicable to a University professor in London but is subject to negotiation in the light of special qualifications and experience. Further particulars may be obtained on application to the Administrative Director, 10 St James's Square, London, SW1Y 4LE. The closing date for applications is Monday 18 December 1972.

University of Liverpool

Chair of Accounting

Applications are invited for the newly established Chair of Accounting. Applicants should be highly qualified in accounting and should have teaching experience.

The salary will be within the range currently approved for full-time professional appointments and in any case not less than £5,667 per annum.

Applications (12 copies), together with the names of three referees, should be received not later than 15th December, 1972, by the undersigned, from whom further particulars may be obtained. (Candidates overseas may send one copy only, by airmail.) Quote ref. RV/E/14118.

The University, P.O. Box 147, Liverpool, L69 3BX.

H. M. Burchnell, Registrar.

University College, Cambridge

Gabriel Harrison Research Fellowship in Land Economy and Environmental Studies

Applications are invited for the above Research Fellowship tenable for three years at University College, Cambridge.

The Fellow will be expected to carry out research, as part of a project directed by the Scientific Committee of the College, into the effects of the urban environment as it bears on the individual. The Fellow will work in the Department of Land Economy. Preference will be given to applicants with interests in land economy with particular reference to the medical and psychosocial aspects of industrial and commercial development in urban areas. The Fellow will be expected to spend an initial period formulating a detailed plan of study.

An applicant for the Fellowship should have had at least three years research experience in a relevant field. The stipend will be either in the range £2,500-£2,750 (Senior Research Fellow) or in the range £1,800-£2,300 (Junior Research Fellow) according to age and status. Applications, which should be fully detailed and include the names of two persons to whom reference can be made, should be sent to the Bursar, University College, Cambridge CB3 9BB (from whom further particulars may be obtained) to arrive not later than Wednesday, 15 November. It is hoped that the successful candidate will be able to take up the Fellowship on 1 January, 1973.

SUGAR

Recommendations of:

- 1 Jan. 1971 — Sell on near term advance. Weakness will follow.
- 2 March-April 1971 — Broad downward trend. Buying opportunity around mid-year.
- 3 July 1971 — Expect selling on approach to 4.5¢.
- 4 Aug.-Sept. 1971 — Only moderate further weakness. Add to purchases on weakness. Long term trend up. Maintain long positions.
- 5 Oct.-Nov. 1971 — Long term trend up. Maintain long position.
- 6 Jan. 1972 — New Highs expected first quarter 1972 followed by downward trend in second quarter. (this advice was first given in Aug. 1971.)
- 7 Feb. 1972 — Significant price depression in March.

For over a quarter of a century, our basic research has enabled us to anticipate price in advance a major reversal in the price trend. It is indicative of the commodity work performed by us for many large corporations in industrial and agricultural commodities.

GOLD... for two years we have remained broadly bullish on gold!

BRITISH AND COMMONWEALTH NEWSPAPERS LTD
150-A, MOUNT ROAD, MARRAS-2.

November 18, 1972

A world for pirates

It is because modern society moves so many things so skilfully from place to place—people, mail, food, information, even household water and sewage—that it offers so many striking-points for the modern terrorist; and society will have to be as ingenious as the hijackers and letter-bombers and the other, coming interferers with traffic if it is to beat them, page 11. The sky-jack map for 1972, page 36. Britain tries to cope with bombs in the post, but Christmas is coming, page 22.

50 years on

The BBC deserves the tributes it has received on its golden anniversary. But its greatest days are already in the past, page 15. The restless life of old John Reith, page 63.

Living like pigs

House prices go in the same sort of cycle that pig prices used to do—which means that they are due for a fall very soon, page 72.

On the tiger's back

All the Nine have their troubles when riding the tiger of inflation, but some have it bumpier than others, page 76. The CBI thinks it's found a loophole in Britain's freeze—and the Treasury's looking for spending cuts soon, page 78.

Content with either

There's enough to be said for either Willy Brandt or Rainer Barzel, page 13. Inflation is a key issue, but it may be losing some of its terrors, page 75. Election eve in Germany, pages 29 to 33.

Nixon never!

The Nixon victory in the United States has not gone down well with fashionable politicians and commentators, especially in Britain, who had attached themselves more devotedly to the McGovern mini-bandwagon than even American liberals had. This display of nostalgia, prejudice and genuine concern says a lot about the British intelligentsia, page 17.

Back into the breach

Is this really the last Vietnam peace session?, page 34.

The freeze

SIR—Your table on "How to talk yourself into an incomes policy" (November 4th) was a stimulating exercise in the politics of incomes policy. I might add that as an Englishman engaged in research in the United States, it is not only interesting but disturbing to read your well-informed but comprehensive reports on developments in this field. The success of Richard "four-more-years" Nixon in winning the support of employers and unions in his incomes policy is largely due to the careful political manipulation of both parties and the appearance of the Administration in the eyes of the American public as a benevolent body, eager to protect the country from the ravages of inflation. Mr Heath's Government surely has the latter attribute. I would submit, however, that he has failed in not convincing either employers or unions that both of them will be penalised equally.

Apart from this, there are more rogue elephants in the unions and corporations than would be compatible with either a voluntary policy or a statutory policy, where the pressures of discipline or public opinion may well backfire. Hasn't the economic ineffectiveness of incomes policy been proven in Britain—let alone Europe (see Ulman and Flanagan, "Wage Restraint: A Study of Incomes Policies in Western Europe," University of California Press, 1971)?

It appears that union leaders are taking an overtly militant stand to avert their power being usurped from below. Employers appear to be resisting price controls and unions as a matter of principle only, and the Government lays the blame on both parties—but it can only buy a short period of rake's progress. Unfortunately, a statutory policy seems to be the only escape from such an impasse. My point is, what happens when the politics of incomes policy becomes firmly institutionalised? There appears to be little discussion about the conflict which is endemic to such a situation.—Yours faithfully, G. A. MAGNUS
University of Illinois

SIR—I am surprised it has not been pointed out that in the recent tripartite talks the TUC did not represent the registered trade unions which were recently expelled, or the majority of workers who are not members of trade unions. Had the latter been consulted it is more than probable that there would have been a large majority in favour of a voluntary prices and incomes policy.

Would it not be possible at future talks for the majority of workers to be repre-

sented? More sense would emerge more quickly.—Yours faithfully, E. MADDOX
Stansted, Essex

SIR—My admiration goes to Sir John Lomax, whose letter (November 11th) is the best commentary on current economic nonsense to appear in your pages.

The following jingle seems to arise more or less naturally from his remarks:

The lady with
The overdraft
Was thought by all
Completely daft.
She wrote a cheque
To pay it off:
But experts think
It's wrong to scoff
When Britain cuts
The selfsame caper;
Tries to live

On worthless paper.—Yours faithfully,
Northwich, Cheshire S. J. LARCOMBE

Heath and Nixon

SIR—After reading your article "The kidding had to stop" (November 4th) and then hearing the Government's proposals, announced the following Monday, to counter inflation by the use of statutory powers involving an immediate freeze etc, I was apt to spring to the conclusion that you were a clairvoyant, or else had enormous influence in Whitehall.

The fact is that Mr Heath has always been a great admirer of President Nixon, and was one of the few people to show the President any attention when his fortunes were at a distinctly lower level than they are now. That this attention was appreciated was shown when Mr Heath visited the United States after he became Prime Minister; his reception was presidential.

This mutual respect does not spring from any belief that it can reap any political dividends for either man, but from the genuine fact that both men have a similar outlook and view the direction in which the world should evolve in the same way. This can be shown and emphasised by the number of parallels in their policies, and not just domestic economic policy with "phase one" (sorry, "stage one") "stage two" etc, but with the whole panorama of their foreign policy, their view of the world in five major blocks, maintaining an equilibrium balance of power, their willingness to negotiate disagreements and use force only as a last resort—the list could go on, but it is merely to illustrate that we may look forward to a generation of peace, with statesmen at the helm, rather than vacillating and ineffectual "poll-watchers." For, as John F. Kennedy said:

United there is little we cannot do in a host of co-operative adventures, divided there is little we can do for we dare not meet a powerful challenge at odds and split asunder.

Yours faithfully, M. R. TULLOCH
Bristol

IBM

SIR—Your article "What shall we do with IBM?" (October 21st) surprised me by falling short in several ways of your usual high quality:

1. The implicit acceptance, as background to the piece itself, that commercial success leading to worldwide leadership in an industry characterised by ease of market entry and rapid technological innovation with low capital requirement is in itself reason for antitrust action.

2. You make much of "over-selling." I can assure you that over-buying is the real problem. While there are undoubtedly cases in which this has occurred, to my own observation, over-selling has far more frequently been by non-IBM manufacturers, and especially new entrants into this field eager to demonstrate a competitive price performance capability they later find it impossible to deliver.

3. You make much of the need for better education of computer users. No company has done more than IBM to educate its customers and industry at large. Typically the newcomers to the field have done the poorest job in this regard for the understandable reason that they have not maintained the gross profit margins necessary to provide the customer proper backup services. You criticise the company that has provided the overwhelming bulk of such support, for lack of such support, and talk blithely of cutting it up.

4. You make no mention in your piece of the competition IBM faced, when it was a far smaller company, from then established giants such as GE (US), RCA, Philips, et al. IBM was a tiny company when it faced this competition. It has become one of the world's greatest companies, not by cartel arrangements, price fixing or any of the other practices that antitrust laws were designed to fight, but rather by the most "straightlaced" Protestant ethic—hard, intelligent competition.

Who benefits from an IBM split-up? I find it hard to see who, other than competitors (and they only in the short run), would gain. In such a situation is not the public really better off to let market forces settle the issue, rather than bureaucrats in a necessarily highly political environment? Have the behemoths ever before predominated for any sustained period? Do trees grow to the sky—or do the forces in man and nature predominate?—Yours faithfully, JOHN DIEBOLD
New York

Rochdale by-election

SIR—In your report on the Rochdale by-election (November 4th) you refer to the size of the vote for Mr Merrick, the anti-immigration candidate, as "alarming" and states: "Some 4,000 voters must have strong feelings on the subject of immigration which they do not speak aloud but which the secrecy of the polling booth allows them to express."

Are you really so much out of touch with public feeling on the matter of

MANAGEMENT APPOINTMENTS

£7000 PA AND OVER

Assistant Vice-President

Mid-West

c.£20,000

A dynamic, well-managed international insurance complex is to appoint an Assistant Vice-President to understudy the Vice President of International Operations. In the absence of the Vice President he will direct the international activities of the group and will progressively assume profit responsibility for all operating units outside U.S.A.

A long-term background of progress in casualty insurance to the level of at least general manager of a modern multi-line company is essential. Responsibilities must have included underwriting, claims adjustment and general insurance administration. Experience of acquisitions, divestments and "trouble shooting" in divisions and subsidiaries is important.

A university degree together with fluency in European languages are both highly desirable.

The post may eventually be based outside America.

Age up to 42.

Write in confidence, quoting reference 301/E, to: R. G. Birch,

Peat, Marwick, Mitchell & Co.,
Management Consultants,
Suite 401, Salisbury House,
Finsbury Circus,
London, EC2M 5UR.

Project Managers

Major Building Contracts Middle East and Far East Cementation Overseas Construction Limited

Cementation require immediately two experienced Project Managers to take full charge of major building projects, one in the Middle East and one in the Far East. The appointments will be for initial 3 year contracts with very good possibility of permanency either at home or abroad.

Top class and proven teams of specialised UK supervisory staff have already been appointed. Technical attainments are therefore less important than administrative experience and the ability to cope effectively and diplomatically with difficult local conditions.

A successful record in similar circumstances overseas is essential.

The terms will be appropriate to these important appointments and are designed to give the successful applicants the opportunity to save in excess of £5,000 per annum over the term of the contract.

Applications stating age, experience and giving references should be addressed to The Personnel Manager, 25 Christopher Street, London EC2A 2BR.

Cementation

immigration that this vote comes as a surprise to you? There has been much indignation expressed regarding our entry into the common market without a public referendum being held, but who has ever suggested asking the indigenous people of Britain how they feel about immigration? Successive governments have completely ignored public opinion on this issue and have foisted on to us the Race Relations Act, an ever-expanding race relations industry, Ugandan Asians etc, etc, ably supported by the mass media (particularly the BBC and Penguin Books). Anyone who objects is usually ignored or is labelled a "racist" or "fascist" and made to feel that he is on a par with Hitler cremating the Jews.

It is, therefore, not "alarming" that 8.9 per cent of the electorate voted for Mr Merrick, but alarming that the polling booth is the only place where so many people feel free to express their opinions. —Yours faithfully, A. J. HEATH
Pinner, Middlesex

Ugandan Asians

SIR—I wish to second Mr Gillams's assertion (Letters, November 4th) that dispersal of the immigrant population in this country would lead to greater integration. However, I do not believe that it is the help of over-anxious volunteers and professionals or fear of a strange land which turn new immigrants toward the established immigrant communities. It is largely the need to have a roof to sleep under. Only in the immigrant areas can they find accommodation at a suitable price or friends to let them in.

Once in such areas an important barrier to eventual dispersal—even if personal economic circumstances improve—is the language problem. This problem is being tackled with as much effort and concern as limited funds and manpower can

muster—in the schools. But of what avail is hours of patient work by specially trained or understanding teachers if the children never hear a word of English in the home?

It is naive to divorce "origins" from "culture" as Mr Gillams does. Common history is an important determiner of culture and outlook. I have not been to East Africa as Mr Gillams has, but it certainly seems that the Asians there were a distinctive enough group to trouble General Amin's dreams.

Any idea of integration which involves forcing immigrants into a "British" mould is doomed, rightly, to failure. Britain benefits already from the distinctive contribution of sections of the community with different origins from the "Anglo-Saxon." While dispersal will aid integration, when it happens it will be more an index of integration occurring. To achieve this we need to put much more effort into teaching new immigrants (and older ones) of all ages English and be prepared to accept immigrants into our "white" communities just as unquestioningly as their fellow immigrants welcome them into theirs.—Yours faithfully, R. C. DUNCAN
Oxford

SIR—If Master Gillams of Whitgift School (Letters, November 4th) cannot put up with people who have other customs, dress and diets, then his education cannot have done him much good. I hope his housemaster gave him a good spanking when he saw the letter in print: if not, he should remedy the omission now.—Yours faithfully, RALPH LEAVIS
Oxford

Suicide

SIR—Your article "Gunning for the system" (November 4th) says that the overall suicide rate has remained remarkably steady. In fact, suicide in the United Kingdom declined by 34.4 per cent between 1963 and 1970—as pointed out by the Office of Health Economics in its widely publicised report (October, 1972). This report attributed the decline to better diagnosis of depression; better recognition of social conflict; the spread of non-toxic gas; and to the Samaritans. As Professor Erwin Stengel, president of the International Association for Suicide Prevention, has pointed out, availability of resources does not affect suicide rates, except sometimes temporarily; when gas became non-toxic in Basel, the rate fell for six months till people started drowning themselves instead.—Yours faithfully,

BASIL HIGGINSON
General secretary,
The Samaritans
Slough, Bucks

Hijacking

SIR—Your normally impartial magazine shows an unusually partisan approach in its condemnation of the German government's attitude to the Palestinian hijackers (November 4th).

I think you should be aware that, as a 150,000-mile per year traveller on many of the world's major airlines, I (and many others) are very appreciative of Lufthansa's primary consideration for passengers' safety in these difficult situations.

By contrast, I have no intention whatsoever of flying El Al, with its impossible approach to air piracy.

The world is becoming somewhat tired of the Jews' continued protest against supposed ills, when in fact it is they who at this time are clearly the aggressors in Egypt and Syria.—Yours faithfully,
New York M. TREVOR

Pornography

SIR—Your reviewer says of my book "The Pseudo-revolution" (October 28th) that it goes "on and on about 'Oh! Calcutta!'" and there is personal hatred of Mr Kenneth Tynan.

The book was written at a time when hardly a day went by without a news item, or item on television, about "Oh! Calcutta!". Memories are short; and now the British seem anxious to demonstrate that they never really acclaimed this stage revue at all—while they certainly don't like to be told how obscene and sadistic it is. How the British must hate sex, to allow such degradations of it to continue for three years in public!

My hatred is directed at anyone who humiliates woman as a symbol of our humanness—whether naked Jewesses on the tables at Treblinka, or on the stage in London nightly. I have no personal hatred for Mr Tynan: I have never met him; have never read anything by him except the scripts for "Oh! Calcutta!"; have never seen him on television, or indeed seen a photograph of him, or read an interview with him. When I use the name "Tynan" in my book I mean him and his collaborators—John Lennon, Samuel Beckett, Edna O'Brien, Robert Stigwood, Jules Feiffer and others—all of whom collaborated in this show. As Colin Wilson says in "Books and Bookmen," it is all "nasty, infantile and vicious"—the "contributors only seem to understand the most trivial kind of human nastiness." Yet this is advertised in the newspaper every day as "breath-takingly lovely"—surely an occasion for someone to try, as I have done, to break the spell?

Your reviewer would like to read George Steiner on pornography. There is a splendid essay by him in my symposium "The Case against Pornography," also published by Tom Stacey.—Yours faithfully,
Lustleigh, Devon DAVID HOLBROOK

Ireland

SIR—Mr Patrick Bury in his letter (November 4th) certainly has a point all right and perhaps he would like to say what would happen to Ireland if all those people in Britain did return home!—Yours faithfully,
Cobh, Co. Cork HUGH REYNOLDS

City to City-Door to Door

Get the best of both worlds with Inter-City and Godfrey Davis Rail Drive

On a long business trip you can't beat travelling in the comfort of an Inter-City express. But at the other end it's often essential to have the convenience of a car. By using Godfrey Davis Rail Drive you can have your cake—and eat it.

No fuss. No flaps. Just get your secretary to ring, or call in at the Rail Drive kiosk (now situated on 74 Inter-City stations). And when you step from your train you'll find a self-drive car waiting.

Even if you haven't pre-booked—no problems. Pop in the station kiosk when you arrive—say the word to the Godfrey Davis girl—or pick up the Freephone—and hey-

presto! You'll have a car within minutes.*

Rail Drive opens the door to travelling freedom. You can even pick up a car at one station—leave it at another—or take it to any one of the 200 Godfrey Davis offices throughout the country.

This is the businesslike way to go on business. Fast, comfortable, and time for a meal or drink—on Inter-City. Convenient, everything arranged, instant mobility—from Rail Drive.

Rail Drive takes you door to door in minimum time—and maximum comfort. Ask for details and the Rail Drive leaflet from British Rail Stations and Appointed Travel Agents.

Look for the Rail Drive kiosk

*During normal business hours

Inter-City is for you

Take it in comfort

**U.S. markets
are profitable
but the
competition
is tough.**

British companies are expanding into the USA.

Because the returns can be high. But selling into the mecca of marketing isn't for the faint-hearted; the competition is tough and they are fighting in their own backyard.

Irving can help.

Through our London Branch you get direct access to all the commercial banking facilities of our Wall Street headquarters. Complete financial services covering the whole of the USA. Data

on your particular US market; its history, present activity and forecast. Location and introduction to agents, distributors, lawyers and consultants. Credit information. Help with planning and execution of mergers or acquisitions. In fact, the whole range. We are big enough (\$1 billion in deposits in London) to give you full international services yet small enough to give you personal attention.

Let Irving be your *personal* guide to international banking.

Under skull and crossbones

Terrorism is developing into a form of total war, the kind of war in which there is no distinction between combatants and non-combatants, and passers-by find themselves thrust into the firing line. The causes that the hijackers and letter-bombers think they are pursuing—those of them who are not in it just for kicks or to appease some suicidal fantasy—matter very little to most people in most western societies. But far from that being a reason, as they suppose, why they should be left alone, they are assured by the fanatics that that is precisely why they ought to suffer for grievances real or supposed. The modern methods of terror affect many people's lives and gnaw at the system of communications that binds countries together. The letter-bombs that started arriving in Britain from India at the end of last week might have blown the heads off post office sorters and secretaries as well as the Jewish businessmen they were meant to kill if Scotland Yard had not moved so fast in getting warnings out and if the men behind the campaign had not lowered their chances of success by indulging a gaudy taste in stationery.

The India-based letter-bomb campaign seems to have petered out without killing anyone, but there are plenty of cities where postmen are overworked or inefficient and the volume of air mail passing through their hands is too vast to permit proper screening. There have been three serious letter-bomb campaigns since September: one aimed at Israeli diplomats, one at Palestinian guerrilla chiefs, and the latest at British businessmen named in the Zionist Yearbook. The prospect now is for another misguided group of Jewish extremists to strike back. The Palestinian terrorists might then use that as a pretext for a Christmas spree of terror, as the post office men, deluged with mail, are obliged to let through letters and parcels that may well contain bombs but will be all the harder to detect because many will be addressed to private individuals who cannot easily be spotted as potential targets (see page 21).

The police and the postmen can be organised to

screen the mail going to target addresses, such as foreign embassies, or posted from suspect areas, such as the Middle East or Yugoslavia (which has become a favourite post-box for terrorists). But how can they be expected to stop letters getting through to, say, a right-wing stockbroker in the City or a Jew who runs a stall down the Portobello Road? People had better learn, before the things blow up in their faces, of the dangers presented by the terrorists' attack on communications. Company executives had better learn to spend money on proper private screening devices or automatic letter-opening machines. And it may not remain just a problem of letter-bombs. The trouble is that a lot of the convenience of civilised modern life consists of having things provided over a distance instead of having to go out and get them yourself: not only communications with your friends, but food and goods and information of all kinds, even your daily milk and water. Every one of these acts of transmission is a chance for the terrorist to get his hand in. That is why modern society is wide open to the fanatics with bombs or poisons—maybe one day with germs and atomic devices.

The Cubans think again

The hijackers, even more obviously than the letter-bombers, are dealing in innocent lives. There has been an upturn in the number of successful hijack attempts, according to figures collated from British and American sources (see page 36), which show that in 32 out of 63 attempts so far this year hijackers have managed to gain control of planes. The corresponding figures for last year were 26 out of 61. In many of these hijackings the motives of the hijackers were clearly pathological rather than political, and that especially applies to the United States, where half of the hijack attempts took place. There was a dramatic example on November 10th, when three black Americans hijacked a Southern Airways plane and eventually landed up in Cuba with \$2m in their pockets after a 29-hour odyssey that had taken them as far north as

Toronto. It was a spectacularly successful operation—or it would have been but for the fact that Dr Castro, who regards himself as a genuine revolutionary, has little time for refugee rapists and escaped convicts. He seems to have clapped all three men into cells in a Havana jail, and the Cuban government now says it is ready to negotiate with the United States about piracy in the air. The Cubans, like the Algerians, are starting to get fed up with the riff-raff who have been turning up on commandeered planes and are pretty useless even when it comes to cutting sugar cane.

When the Cubans are actually prepared to repatriate an American hijacker, the world will have gone a long way towards achieving the most effective deterrent: the denial of a place to escape to. The fact that the Cubans have asked for details of the charges that are pending against another batch of Americans who took a plane to Cuba early last month leaves some room for hope. Some of the men in that group, led by a Mr Charles Tuller, had been involved in a murder during an armed bank hold-up and afterwards gunned down a ticket-clerk. It is desperate men like these, psychologically unbalanced and responsible to no disciplined political organisation, however extreme, who will continue to present the most serious menace to aviation until governments come together to cut off their escape-routes.

There are two different sorts

The Americans, who feel the problem most acutely, have been studying how to handle the sick skyjacker. One of the results is their "profile system," which is supposed to enable airport staff to recognise potential hijackers according to a sort of psychological identikit. A Texan psychiatrist, Mr David Hubbard, has argued that the typical American skyjacker is a suicidal schizophrenic, deeply frustrated in his private life, who is excited by violence and tends to regard the threat of death as a stimulus rather than a deterrent. Certainly some hijackers are plain nuts, like the man who tried to take over a Swissair plane over Rome in April, demanding to see the Pope, or the series of would-be skyjackers who have this year tried to copy the man who parachuted out of a United Airlines plane with his ransom money. According to the Hubbard school, once this kind of hijacker gets control of a plane he has to be treated with great care, and slowly talked into surrender by negotiators who know how to play upon his growing fatigue and overwhelm him with minor problems (hitches in refuelling, supply of food and so on) that will finally compel him to give up. The FBI men who shot at the tyres of the Southern Airways plane last week tried the opposite approach, with very nearly disastrous results. They failed to stop the plane taking off, but made the pilot's job much harder and, by panicking the hijackers, got the co-pilot shot.

It is essential to understand the confused mind of the enemy. Terror can be used as a political instrument by rational men with a clearly defined policy. But many of the hijackers do not come within that category. Once they have gained control of a plane, dealing with them is often rather like arguing with the man stand-

ing on a 14th floor window ledge, except that this time he is threatening to pull other people over the edge with him.

Hijacking and the other forms of international terrorism can be curbed, but not if public opinion, its nerves and imagination blunted by media that sandwich images of real violence between cowboy films and police thrillers, comes to regard them as routine hazards—or entertainments—of modern living. Until more effective measures are taken, everyone who boards an airliner should be mentally prepared to find himself flying under the sign of the skull and crossbones.

The problem has to be tackled by the authorities at three levels. It has to be made harder for hijackers to get their guns and bombs on board a plane, through body-searches and better screening of baggage. It has to be made harder for them to gain control of a plane if they do manage to slip through the net. This may involve a whole series of precautions, such as fitting a special screen between the flight deck and the passenger compartment, a ban on cabin luggage, and perhaps—although the airlines and many passengers will understandably hate the very idea—the placing of armed guards among the passengers, equipped with low-velocity weapons. It should also involve careful research into the chances of producing a non-lethal gas for use when the plane is on the ground, giving airport police the chance to enter the plane. If these precautions also fail, expert negotiators will be needed who understand the psychology of the people they are dealing with and have some chance of talking—or bluffing—them into surrender.

Get it defined

But the most effective measure of all is to seal off the hijackers' bolt-holes. Unfortunately, although President Boumedienne and Dr Castro are irritated by most of the men who have applied to them for asylum, there are still several countries that provide sanctuary. This year, for example, the Libyans have given refuge to a group of Yemeni hijackers and to the Black September squad that blackmailed the west German government into releasing the Munich killers by seizing a Lufthansa plane. And there are still occasions when even western governments have given refuge to hijackers. The west Germans gave asylum to some Czech hijackers last June. There is a genuine moral problem when people use hijacking because they have no legal way of getting out of their country.

Unfortunately, there is still little sign of the kind of international consensus that is needed to get the Montreal convention (which provides for collective sanctions against countries that harbour hijackers) into effective operation. Maybe the current session of the United Nations Assembly will help to provide some impetus. The Americans have again tabled their proposals for a draft treaty defining "international terrorism" as political violence conducted outside the territory of the parties involved in a conflict, or violence conducted against the citizens or property of a third party. This is the kind of violence that most governments should badly want to see stopped, but so far they have shirked the collective measures that are the real

response to an international problem.

It is no good mouthing all over again the old pretexts for prevarication, or even the arguments that the murder of innocents and the barter of human lives can easily be justified by a just cause. The means usually usurp the end, and the only end that glimmers in the minds of

Happy with either

Germany's friends can be content with whoever wins on Sunday. The real danger is still more stalemate

Brandt or Barzel? After an election campaign that has thrown up no really decisive issue between west Germany's parties, the answer to the simple question of personalities is most likely to determine the result of Sunday's election (see pages 29 to 33). And that is just the way Herr Willy Brandt and his Social Democrats have been hoping it would be. They have based their campaign on Herr Brandt's undoubted popularity both at home and abroad, and on the attention captured by the Ostpolitik that he has created.

The Christian Democrats, on the other hand, have not attempted to project their chief, Herr Rainer Barzel, as the more attractive leader. He is still a relatively unknown man, for he has never held a major ministry and this is the first election he has fought as party leader. Instead, the opposition has tried to concentrate the voters' minds on where they claim Herr Brandt has most visibly failed—his handling of the economy. The Christian Democrats believe that the fact that the cost-of-living index has risen 6.4 per cent since October last year is their strongest card, although they may be wrong (see page 75). Inflation at 6.4 per cent is quite a bit less than the rise in Britain and several other countries; but for older Germans the memories of what inflation meant in the pre-Hitler era are still sharp.

Herr Barzel is promising that he and his party will restore "stability," and in a last-minute move he has attempted to persuade Herr Karl Schiller to fall in beside him and lend a hand. In the 1969 campaign Herr Schiller was the Social Democrats' strongest electoral card, because of his successful heading of the economics ministry in the grand coalition government. It seems that the Christian Democrats have conveniently forgotten that, not so long ago, Herr Franz-Josef Strauss, who will take charge of the economy if they win this election, was calling Herr Schiller "the minister of inflation."

Herr Barzel has had little to say about Herr Brandt's latest act, the negotiation of a treaty with east Germany which recognises that east and west are separate states, that the border between them is "inviolable," and that it is time for them to establish almost-normal diplomatic relations with each other. The opposition leader has said that he needs time to study the treaty's implications, but should he form the next government it is unlikely that he will attempt any major renegotiation. Herr Barzel can claim that six months ago, when the Bundestag

most of the hijackers is to blow a ragged hole in the fabric of a society to which they have nothing to contribute. Liberal opinion, for admittedly lofty motives, has been too sympathetic to the argument that such violence is the response of desperate men to an impossible political or social situation. It is now clear where that logic leads.

debated the ratification of the 1970 Warsaw and Moscow treaties, it was his pressure that forced Herr Brandt to insist that Russia should accept a letter that set out the west German interpretation of the agreed text. He might usefully try to wring some further concessions from the east German government on the freer movement of east Germans to the west, and to gain some undertaking that any of them who try to cross the border without permission will not be simply shot down.

But although Herr Barzel did have some success in strengthening Herr Brandt's stand over the Moscow and Warsaw treaties in May, the same episode revealed a weakness in his capacity for leadership: his inability to stand up to Herr Strauss, the leader of the CDU's Bavarian sister party, the Christian Social Union (CSU). Herr Barzel wanted the CDU-CSU to vote for the treaties' ratification: Herr Strauss did not—and he won the day. Whether, once in office, Herr Barzel would be able to take a firmer line with him is a question the German voters may have much in mind.

Who will stand up to France?

The Christian Democrats emphasise the need to integrate the European community more closely, and Herr Strauss, in his election speeches, has made a particular charge that Herr Brandt has neglected western Europe; he says that his own goal is a European state capable of achieving the degree of unity needed to provide for its own defence. The charge is not entirely fair. The British Government owes much to the sympathy and support Herr Brandt has given it throughout its negotiations with the community. In the end, Britain got into Europe because Mr Heath persuaded President Pompidou to let it in. But there may soon be times when Britain needs German support against France. The Franco-German co-operation that had been forged by Adenauer and de Gaulle remained a cornerstone of west German policy when first Herr Erhard and then Herr Kiesinger became chancellor. Neither of these Christian Democrats was willing to endanger his close relationship with Paris. Whether Herr Barzel would feel able to stand up to President Pompidou is open to doubt, and it is a question of some concern to the British. And certainly the Labour party would find it easier to overcome its hesitations about a full British commitment to Europe if west Germany, the strongest economic partner in the community,

still had a Social Democratic government.

Another charge that has been levelled against Herr Brandt is that he has allowed his party to be infiltrated by marxists, and that the SPD, if it retains power, will inflict full-blown socialism upon the Germans. The Young Socialists undoubtedly have loud voices and have made their presence felt, but there is nothing in the SPD election manifesto that could frighten off the middle-of-the-road voter. Moreover, Herr Brandt's chances of forming the next government may well depend on whether his Free Democratic allies survive Sunday's voting. Under Herr Scheel's leadership the Free Democrats have committed themselves to maintain their alliance with the Social Democrats in a new coalition if the voting enables one to be formed. Nobody sees much chance of the SPD obtaining a clear working majority by itself; so Herr Brandt will again have to cut his coat to suit Herr Scheel's cloth. This alone should reassure the German voter that the Social Democrats will not spring any radical surprises on the country.

On the other side of the electoral divide, Herr Barzel,

since he took over the leadership of the CDU, has done much to reinvigorate his party, and he has brought new energy to its thinking. He has proved himself an able politician, an aggressive leader of the opposition and an efficient party boss. He has also voiced some doubts about the long-term consequences of Herr Brandt's Ostpolitik that could usefully be built into German policy, and into the wider debate on the subject. His misfortune is that he has had only one year in which to show his paces. If his party is defeated on Sunday he may have to face an attempt, led by Herr Strauss, to replace him as leader. It will be unfortunate if such a bid succeeds, for Herr Barzel has many of the qualities required in west Germany's present circumstances. If the voters do turn to him on Sunday, Germany's European partners will have a man they can live with as well as they can with Herr Brandt. Here are the two moderate alternatives, just right and left of centre, that not enough European countries have. The worst outcome for Europe, as for Germany, would be if neither Brandt nor Barzel were able to form a government that could survive.

Another step away from Europe?

Mr Wilson's friends on the left wing of the Labour party want him to forfeit more respect by boycotting the Strasbourg parliament

The Labour party is in danger of taking another unwise step away from Europe. There has been an increasing belief in the past weeks that the parliamentary Labour party would decide eventually in favour of its MPs and peers joining the all-party delegation to the European parliament at Strasbourg; but this has rested on the assumption that Mr Wilson would come down against Labour boycotting the parliament. Now there are serious doubts about that.

There are certainly two powerful reasons why Mr Wilson will pause before committing himself totally against Labour's participation. First, there is the attitude of the socialist parties in the community. Mr Wilson knows that Labour's relations with the socialist parties of Europe have never been worse than they are now. But if the parliamentary Labour party were not to join the all-party delegation—thus preventing the socialist group from becoming the largest in the European parliament—he knows that he risks a painful and humiliating breach of personal relations. Second, Mr Wilson is aware that even if the opinion polls still show that a majority of Labour voters are still nominally against British entry to the community (largely, though not exclusively, because of their general anti-Government views) an Opposition boycott of the European parliament would not be understood by many Labour supporters in the country. How would it be possible to complain about the bureaucracy of the commission in Brussels while refusing to send parliamentarians to the only democratic body capable of making them answerable for their decisions? And how would it be possible to present such a decision to the

moderate majority in this country, without whose support Labour cannot win a general election, as anything other than just another surrender to the prejudices of the left?

Yet Mr Wilson may be finding the counter-arguments more persuasive. There is, for instance, the party conference's decision. While prime minister, Mr Wilson showed a fine disregard for conference decisions; and he has probably not changed his basic views all that much. After all, the Blackpool conference also passed a neo-neutralist resolution on nuclear bases, and there is no indication that Mr Wilson has the slightest intention of adopting its sentiments. But the trouble is that not many people care very greatly about nuclear bases at the moment; Europe is an altogether different matter.

Conference didn't say no

The left maintains that the boilermakers' resolution adopted at Blackpool called on a future Labour government to do a great many things, including declining to participate in the European parliament until satisfactory new terms have been negotiated, so that it is mandatory on the Opposition to refuse to join the all-party delegation now. The truth is that the resolution made no such demand; and, even if it had, a Labour party conference has no power to instruct the parliamentary party on how to handle its day-to-day business. Mr Wedgwood Benn demonstrated the correctness of this view only a few months ago when he persuaded Mr Wilson and the parliamentary party to back his demand for a referendum on Europe despite the clear decision of the previous

party conference against any such thing.

Still, the view that the parliamentary party should heed rank-and-file views on Europe (which, freely translated, means the opinions of Mr Jones and Mr Scanlon) has some appeal, all the more so as it has been backed by the party's new general secretary, Mr Ron Hayward, in a speech of remarkable confusion. Mr Hayward angered many moderate MPs by intervening at all in the internal affairs of the parliamentary party, but he no doubt succeeded in pleasing the left (presumably the purpose of the exercise) and creating doubts in the minds of some of the flabbier MPs in the centre. It is a little hard to believe that Mr Hayward would have spoken in these terms if he believed that Mr Wilson had set his mind the other way; and even less likely that some of Mr Wilson's remaining personal allies, such as Mr Frank Judd and Mr George Thomas, would have committed themselves so firmly against Labour's participation without checking on their leader's views.

Tantrum on the left

There is also the wider question of the present mood of the left. Despite its victories at Blackpool, its control of the national executive and its success in ousting the miners' leader, Mr Joe Gormley, from the chairmanship of the party's international committee, the left is by no means happy. It fears that however much it may triumph outside the Palace of Westminster, inside it is still a minority. And its fears were justified when it got a bloody nose in the shadow cabinet elections. The left did not believe that Mr Harold Lever would be re-elected, nor that Mr Silkin would be defeated, nor that Mr Wedgwood Benn and Mr Shore would do so badly. The result has been quite a neurotic little tantrum. Mrs Castle has withdrawn to the backbenches, and both she and Mr Mikardo have complained bitterly that the party in the Commons is so much out of touch with rank-and-file opinion in the country. And in *The Times* on Wednesday Mr Richard Crossman proposed "one simple change" in the parliamentary party's rules: that Labour MPs should be deprived of the right to choose

the shadow cabinet. This, he said, should be entrusted to the party's officers and a small liaison committee who would then choose "a balanced shadow cabinet."

The sulking of the left has evoked more mirth than indignation in the parliamentary party. But even that may have a quite different effect on Mr Wilson. Whenever the left bleeds Mr Wilson suffers a haemorrhage. He is aware that the bulk of his personal support in Parliament comes from the left, and although there is no likelihood of anyone standing against him for the leadership this side of the next election, he does not like to become isolated from the left. If he really were to support sending Labour MPs to the European parliament when the shadow cabinet gets down to it he knows that he will have to rely more in the future on the marketeers and the centre; and this prospect fills him with gloom. Time and again Labour's marketeers have persuaded themselves that Mr Wilson is about to make a gesture their way; and they have consistently got it wrong. It is now more likely than not that he will try to devise the sort of compromise that will earn him the votes of colleagues such as Mr Crosland and Mr Merlyn Rees. This would give the left the substance of its demand—a boycott—while leaving alive the possibility that the party might reconsider its decision at some time in the future.

Stony solution

Mr Wilson will not be able to prevent the Tories and the Liberals from sending their men to the European parliament, though with each MP and peer facing a workload of up to 50 days in Europe each year, and no pairing possible, the Tories may have to send rather more peers than they would otherwise have done. That does not matter much. But it will matter a great deal if, once again, Mr Wilson feels that he has to stifle his instinct for statesmanship for the sake of a party unity that, on Europe, he believes can only be maintained by following the left-wing line. He has a dilemma, but it is a stony solution that denies him respect in Europe as well as in this country. His friends demand too much of him.

Auntie's birthday

The BBC has celebrated its 50th anniversary this week. It has done very well—but it should not go on doing it indefinitely

The tributes which are being paid to the BBC on its 50th anniversary have been well deserved. The BBC is almost certainly the finest broadcasting service in the world, although there are many, in this country and abroad, who would not regard that as an unequivocal encomium. To people who have grown up with it, the BBC's faults inevitably seem more manifest than its virtues, and perhaps one must live for some time at the mercies of broadcasting at either of the extremes of total commercialism or total state control fully to appreciate how really good the BBC still is. But if it would be

wrong not to congratulate the BBC on its very considerable achievements, or to be ungrateful for the very high standards it has usually set itself, it would be equally unrealistic not to wonder whether the BBC's greatest days already lie in the past.

It would be no great national tragedy if that were so. On the contrary, if the BBC ever celebrates another such significant anniversary in an equivalent position of eminence in British broadcasting it will be either because (a) television has proved such a socially harmful medium that rigid control is necessary (which seems unlikely) or

(b) because muddled, unthinking conservatism has held Britain back from the next important stage in the development of mass communications (which seems all too likely). On any sensible projection of the future, if the BBC is around in 50 years' time it should be as a very minor, British Council-type operation keeping expensively alive such minority arts as opera, ballet and petit point embroidery in a national multi-channel cable television system.

Unfortunately, only a very few people are looking that far ahead, and under the totally spurious slogan that public service broadcasting must survive the BBC's very highly-developed off-screen persuasive powers will be enlisted in aid of all those who will say cable television is either too expensive, or too dangerous, or both. Indeed, the boundaries for the debate on broadcasting over the next decade are already being drawn far too narrowly. The Mrs Whitehouses want to talk about broadcasting's prurience, the politicians about its power, while so-called informed opinion continues to be obsessed with its "role." The BBC will no doubt be happy to keep the debate at that level, and it has a heaven-sent red herring in the 405-line television channels which will become free in the early 1980s. Who, if anyone, should run that new service, and how, will no doubt keep most concerned people happily, if barrenly, talking for years while the United States goes even further ahead in the real development of communications.

Is power a myth?

Of course, those problems will not lose any of their present importance in the next few years, but that is very largely because the social and political effects of television in an advanced society are not yet demonstrable. What evidence there is, however, based on 50 years' experience of radio and the academic surveys which have been done, increasingly tends to suggest that the once-vaunted power of television is no less, and no more, a myth than the power of the printing press. Indeed, it may prove that while individual television services strive to capture such huge and diverse audiences their influence will be more limited than that of the printed word. Of course, no one would deny that television has, at times, an enormous impact; but whether it has all that greater an impact than the event it is portraying is another, and rather more fundamental, question. On the limited knowledge available it appears that television has no significant influence on the outcome of a British general election, and it is at least an open question whether the reactions, say, of the people of the United States to the war in Vietnam, or of the British to the conflict in Ulster, would have been very different if television had not even existed.

By the end of this decade it ought to be possible to say that if television has no demonstrably deleterious effects such effects can be presumed not to exist. Even the medium-term future, say from the mid-1980s, of the BBC will very largely depend upon whether that question is squarely faced and honestly answered. The main justification for allowing the BBC to grow into such a great public institution has always been the ready

acceptance by politicians and informed opinion that as first radio and then television were such powerful influences in the community they had to be controlled (when Independent television was set up to break the BBC's television monopoly in 1955, the theoretical controls enacted, and accepted, over it were even greater than those over the BBC). At the moment, of course, much of the conflict between the politicians and the BBC is because it seems the corporation has grown so big and powerful that it cannot be controlled; which, some would say, serves the politicians damn well right. But what if the whole assumption that television is such a powerful medium proves less than justified?

In one way it would greatly ease many of the immediate pressures which are on the BBC, and which are bound to increase if present assumptions are maintained. If it does not matter as greatly as we are accustomed to believe what the BBC (or ITV come to that) puts out, it would not greatly matter whether Mrs Whitehouse and her friends were shocked by rude words or a woman taking off her clothes in a BBC play; they seem incapable of distinguishing between what might personally offend and publicly corrupt anyway. And if it were accepted that television by itself was hardly able to influence a single vote, it would not really matter whether there were more reds than blues in the control rooms, or more anarchists than decent Labour or Tory men in front of the cameras. Of course, the imbalance or outright bias would continue to upset those broadcasting journalists who take a professional pride in putting out impartial or objective programmes, but it would not be something for successive prime ministers to get steamed up about.

The questions of control

But the BBC would only welcome a more level-headed approach to broadcasting up to a point. If it ever accepted that broadcasting was really no more important than the press, the cinema and the theatre combined it would forfeit any right to be subject to more public control than the other media of information and entertainment; and if broadcasting is not so powerful that it requires stringent public control, it is not so vital that it requires a huge and expensive public service.

Most of the BBC's present difficulties stem from the fact that it is signally more effective in persuading everyone that it is terribly powerful because it is so influential than in convincing many people in public life that it is exercising responsible control over all those who wield its power. This is most notable, because it is considered most dangerous, in its documentary and current affairs programmes (its news bulletins, about which other criticisms can be made, are generally, and rightly, excluded from that charge). Too much is made of this, even by those who swallow whole the current mythology about broadcasting; there is, nevertheless, some substance in the complaint.

Television (like radio, to a lesser extent, before it) has always attracted the politically-minded; either they see it as a congenial preparation for, and assistance towards, becoming an MP or as a vehicle of political

influence in itself. In the 1950s and the first half of the 1960s a number of such broadcasters went on to Parliament; some others failed and still remain highly regarded broadcasters. But whichever major party they belonged to, or ended up in, they were all essentially middle-of-the-road politicians (Mr Wedgwood Benn's left-wing metamorphosis occurred long after he ceased to be a professional broadcaster). The politically-minded producers and performers who have succeeded that wave have, however, been very largely of an entirely different breed. Younger, inevitably, more politically illiterate, unfortunately, they have been impatient with party policies—partly, perhaps, because they have deluded themselves that television is a more powerful instrument for social change than any single party. However left they may seem they are political spoilers rather than serious, even if extreme, politicians, and their only success has been to arouse the anger of all the parties.

Over the top

There might be a rather simple reason for that change. When the first, postwar generation of political commentators was effectively running current affairs television it was a medium which was expanding both physically and in concept. All that has now changed. The only areas for physical expansion are in a possible non-BBC fourth television channel and in commercial radio. But even so, in television and radio generally there is a growing and worrying awareness that the apex in technical

and professional performance has already been reached, or soon will be, and that from now on there is not much new to be done which is little better than gloss or gimmickry. Within a remarkably few years, television has reached the point where it seems everything has already been done, and as a result creativity has become equated with the capacity to shock by irresponsibility. It is probably no more than a passing phase, for if such irresponsibility really does matter it will be stopped, and if, as is far more likely, it is seen to be ineffectual, its practitioners will become disillusioned and pass on or grow up.

On its 50th birthday the BBC has tried hard not to seem dead, or even apparently dying. Yet the reality which the most dedicated BBC men and women know they must face is that their corporation has stopped growing. There may be some minor extensions in local radio yet to come, but that will be the limit of the BBC's expansion; indeed, it may not be able to use all the time it already has available.

So, for all the fanfare of this and previous weeks, the BBC is fighting a defensive battle for its existence from now on. Certainly, there will be times when it will deserve support in that battle against the crassest of its critics. But it does not follow, as the BBC and its friends will try to argue, that the proper development of public service communications can only be advanced by maintaining the BBC intact. On the contrary, whatever the present alarms, the BBC will eventually prove to be one of the most truly conservative of British institutions.

The view down one's nose

The way some people in Britain reacted to Mr Nixon's victory says a lot of unhappy things about Britain

President Nixon's revenge on the fashionable commentators in the United States and Europe who have reviled him and traduced him throughout his career (and often written him off besides) has naturally not gone down well with fashionable commentators anywhere. Some Anglo-Saxon pundits on the British side of what used to be the special relationship have even surpassed Senator McGovern (who said the Nixon Administration was the most corrupt in American history) in heaping acrimony on the President and warning of imminent disaster. When Mr Peter Jenkins, in the *Guardian*, declared that "only a stroke of divine providence can save the United States and the world from four more years of President Nixon" he met a tartar in *The Times*, Mr Bernard Levin, who is never at a loss in pouncing on the unwary. Mr Jenkins was rather pushed in his reply in Mr Levin's paper on Monday.

What has become the fashionable middle-class British view of American society is one matter: a number of British people with experience of the United States are rightly concerned by aspects of American life and values. Their feeling is encouraged by some of the better-known American liberal expatriates who have settled in Britain

and who enjoy what they see as great merits of British society: that there is less striving, or less effective striving, after material ends, that (perhaps partly because of this) there is less recourse to drugs and violence, and that educational and social welfare priorities (however imperfect to local egalitarians) are sometimes more consciously directed towards the underdog. It is not surprising that in a country which shares, besides many of the same principles, the same language as the United States, and whose dissatisfied youthful minority speaks the minority American language of dissent in evident imitation, there should be a predilection among the articulate communicators who want change to favour the candidate of change in an American election and to lament his defeat when that happens. This is not intellectual silliness or even bad manners. Americans need to know less and less about Britain; British people still need to know more and more about (and try, however vainly, to influence in some small way) America.

The real worry about the political and intellectual quality of some of the British comments about Mr Nixon's re-election is not that they were critical of America; no British paper ever goes as far, or as close to home, about

the troubles of America as the New York Times or the Washington Post. The worry is that the comments were not concerned about British interests. It is an easy mental transference for almost anyone in Britain who has ever read the New York Times or the Washington Post to imagine himself or herself a resident in the Commonwealth of Massachusetts or the 20th Congressional district of New York or the District of Columbia. The block seems to be when it comes to considering such matters as the future balance of power, the security of western Europe and the preservation of the international trading system. These are not, admittedly, easy subjects. It is much less demanding on one's own research energies, and one's conscience, to concentrate on racial prejudice or medical insurance or just the rape of the environment.

Of course, commentators take other commentators too seriously. The British eye, reading the French press, is chiefly impressed by the treatment of the struggle for the presidency less as a family feud than as the Americans' own business, however much the Americans have habitually tended in the past to mind other people's business. There was also Mlle Françoise Sagan, after a week in New York and one night in Washington (as she had the frankness to admit), sighing over the elegance of Mr Sargent Shriver and mourning the "mental sterility" and "boredom" of the next four years. Well, that is an openly subjective, sentimental response, and no one would deny the right of its author to translate it into words. No one has to like Mr Nixon.

These who had to dislike him

But it was left to some of the British (and, it is worth noting, to some of the Scandinavians) to suggest that it was actually an intellectual offence to think that Mr Nixon was better fitted to govern than his adversary, or even that his re-election might in many ways suit European interests better than the election of Senator McGovern. The west Germans saw clearly enough that what was at stake, so far as their national interest was concerned, was the determination of the American government to maintain its commitment to European security. No serious German commentator pretended that he had the right to tell the Americans whom to vote for. Yet among some commentators and politicians in Britain Mr Nixon cannot even be given credit for many of the things that traditional liberals as supposed to approve of: for improving relations with the communist powers, for example, or for coaxing concessions out of the North Vietnamese that have brought a genuine settlement of the Vietnam war within reach. The French, again, were quicker to give credit where it was due. M. Jean-François Revel, writing in *l'Express*, argued that Mr Nixon has to be regarded as "the president who put an end to the cold war." Maybe the French are better equipped to recognise a gaullist policy when they see one, although most of them chose the obvious Metternich analogy (for Mr Kissinger) instead.

It has become platitudinous to point out that it is much easier, politically, for a conservative party to prac-

tise a flexible, innovating foreign policy, since it is bound to carry many of its right-wing constituents with it as well as some liberals and many of the uncommitted. If not the whole, that was the main part of Mr Nixon's first term. What are we to expect from the next? Greater emphasis on relations with the European community, on sorting out the world's monetary system, and on the American economy, certainly. That implies an effort to get the Vietnam issue out of the way once and for all—although not at the price of a collapsible settlement that would lead to the disintegration of a non-communist regime half-way through Mr Nixon's second term. The most peculiar of all the apparent counts against Mr Nixon, permanently condemned as that realist of the gutter, is that his realism does not, it seems, extend to securing his own peace of mind, far less his place in history, in the four more years that liberalism has had to concede to him.

The left looks west for a hero

It is very likely that the majority of the British press and television pundits would have castigated Mr Nixon anyway, at any juncture; but what needs to be thought about a little is the conjuncture of his re-election with Britain's definitive anchoring beside the continent of Europe. Perhaps it is not just a coincidence that among those who most abhor Britain's entry into the European community there has been this curious, late obsession with America, as if there would come, if it were willed strongly enough, some sign that the world was not entirely made of Nixons and Pompidous and Heaths. Somewhere up near the Canadian border, in South Dakota, Minnesota or Maine, there must be someone to lead an American party in the way the British left wing likes. Certainly since 1940 it has mattered greatly to British people who has been in charge in the United States. The British, like the blacks and the Jews, are, in that sense, to be numbered among the last remnants of the Rooseveltian coalition. So, unable to bring itself to take an interest in the politics of a Europe it does not like joining, the British left-wing intelligentsia seems to have cast a last, despairing and imploring look towards the Americans; seems to have indulged, almost consciously, if belatedly, in the prerogative of being the concerned and critical cousins; seems even to have engaged itself more fiercely in the hopeless fortunes of Senator McGovern than the American intelligentsia ever brought itself to do.

It would be a sad day if the British were either so uninterested in America or so preoccupied with Europe that they did not try to advise on and indicate consent (or do the other thing) to the American presidency. But the world, and even more the Americans themselves, must increasingly recognise what is real and what is hallucination in this. It was Harold Macmillan who saw the British as Greeks in another Roman empire. There has been a little in that. But nowadays it is not respect, in Europe or America, that is engendered by the spectacle of the British pretending to be wise, if dilapidated, Greeks sitting like Diogenes in his barrel in the sun, concerned only to lecture the more affluent passers-by.

When you're always flying from one problem to another, you deserve a little understanding

Travelling for business is never easy.

You rush out of a tough meeting. Fight the traffic. Finally get to the airport just in time to catch your flight.

And what can you expect when you arrive? More of the same.

Obviously Air France can't change all that. But we understand how hectic and difficult your life can be. So we do everything we can to make the part of it you spend with us as relaxed and enjoyable as possible.

That means the attention

you deserve. Service and entertainment when you want it. Or the choice to work or rest undisturbed. Maybe it can be summed up best by the *savoir-vivre* that knows the value of a smile.

BRITAIN

Thalidomide children: it is not a party issue

National tragedies are not good subjects for party politics, and the Opposition ought not to have tabled an official motion on the thalidomide children. Mr Jack Ashley, a Labour backbencher, had already, through his persistence born of a genuine concern for the plight of these children, persuaded the Speaker to accept his own motion calling upon Distillers to "face up to their moral responsibilities," and this should have been debated as a non-party matter. It will not help the children for the Labour party to have taken over this motion and to try to appear as the party supporting them by contrast with a Government that is holding back. Mr Heath was quite right to tell Mrs Castle that the Government cannot interfere to bring pressure on one side or the other in legal proceedings.

Nevertheless, those proceedings should be speeded up. Protracted litigation has the worst possible psychological effect in all compensation cases. It has been shown time and time again that accident victims, for instance, cannot adjust themselves to their disabilities until their claims have been settled—whether for or against them. In the case of the thalidomide children 62 actions, which were brought within the three-year limitation period, were

settled early in 1968. Claims for negligence against Distillers were withdrawn, and the company agreed to pay 40 per cent of the damages that would have been paid had it been found totally liable.

In all, the company paid nearly £1m in respect of this settlement. It then announced that it would set up a charitable trust of £34m, to be used for the benefit of other thalidomide children—374 in all—on behalf of whom claims had not been made within the necessary three years. However, in 260 of these cases the time bar was surmounted for one reason or another, and in five of these the parents refused to accept the offer of a charitable trust, arguing in rejection of it that their children might fare better from a court action if it succeeded. Distillers, on the other hand, has taken the view that the offer is an all or nothing affair. By refusing to accept it, the company says, these parents are holding up a settlement for the remaining 369 children.

To add to the legal complexities, the Attorney-General has argued that some discussion of the issue has amounted to pressure on one side, and therefore, while legal proceedings are still going on, is contempt of court. Judgment is expected shortly on his application to restrain the Sunday Times from printing an article on Distillers and on the contempt case he brought against London Weekend Television.

In the meantime, Parliament should be concerned to treat the matter non-politically and to try to establish some facts. How many, for instance, of the 400-500 thalidomide children born in Britain—even their exact number is in doubt—are seriously handicapped? Not all of them are limbless—the disability with the biggest emotional

impact—and a report on the Scottish cases published two years ago found that on the whole they were no more likely to be maladjusted than ordinary children of the same age—though admittedly they were then all under 10. That survey found that deafness was an underrated handicap of thalidomide children. But there are many deaf children born each year, and also some with missing limbs, whose mothers did not take thalidomide in pregnancy. Or did they? Some doctors are concerned that there are still many medicine cabinets containing pills marked for sleeplessness or depression which are in fact thalidomide.

But by concentrating on thalidomide the Commons is in danger of overlooking the needs of those other congenitally handicapped children; for instance, the 1,500 spina bifida cases born each year of whom—as a result of modern surgery—600 are likely to survive, but often with fearful physical and emotional handicaps. Any foundation that the Government sets up, once the legal issue has been settled, should surely not be restricted to those disabled by thalidomide.

Census

Main crop

The advance analysis of the 1971 census,* published on Friday, contains only such basic information as it was possible for the enumerators to transfer, quickly, from the original forms on to machine-readable documents (and even then, it seems, the computer failed to read the birthplace of 200,000 people), and only covers Great Britain. But this wealth of information will be quite enough to satisfy most people's curiosity while the full reports—three per county—make their gradual way into the light from the Office of Population Censuses and Surveys. The tables in the advance analysis cover the major topics of age and sex distribution, birthplace, household size, economic activity and what is in statisticians' parlance called marital

*HMSO. £4.50.

Ashley: persistent concern

Britain by birthplace

condition.

The figures for age and sex distribution contain no great surprises, and were foreshadowed by the mid-year population estimates. Some 20 per cent of females, as against 10 per cent of all males, were of pensionable age (all figures are four months out, because the enumerators transferred the year of birth, rather than age on census night—which was in April). Even if one excludes the 60 to 64-year-old women, the percentage is 15 per cent. Since women live longer, they outnumber men. The overall ratio is 106:100, though men outnumber women in all age ranges up to 40.

Almost exactly a quarter—24 per cent—of the population was under 15, but the proportion varied markedly: 27.8 per cent of Clydesiders were under 15, but only 21.5 of Londoners. So too did the distribution of old people, with the highest proportion of them in the south east, outside London. The sex distribution followed the same pattern. Over a quarter of those over 65 in private households were living alone, but there was a considerable sex difference. Only 14 per cent of old men in private households were living alone as against 36 per cent of old women. The proportion of widowed and divorced people in the population continues to grow and, naturally, increases with age. One would expect the proportion of single people, similarly, to fall with age: but, curiously, it reaches a minimum—9 per cent—in the 50-55 age-group.

One of the most interesting tables shows the remarkable increase in female economic activity: over 53 per cent of all women in the 20 to 45 age-group were economically active (meaning in work, looking for work or not working through sickness). Even

among married women, nearly 44 per cent of those aged 25-40 were economically active. The chart above shows how greatly this figure has grown since 1961, and also how the proportion of students in the population has increased.

The "out of employment" figures, which include those looking for work but not registered, followed the pattern of the regular unemployment figures (high in the north, decreasing towards the south) but the advance analysis contained a particularly interesting breakdown of immigrant unemployment. The summary figures for the birthplace of Britain's population, illustrated above, suggest that the Home Office's estimate—650,000—of the number of New Commonwealth-born immigrants over the past decade (allowing for deaths and re-emigration) was remarkably good: the 1971 census results show an increase of 625,000 people. They also suggest, as expected, that the 1966 census was nearly 10 per cent too low in its enumeration of immigrants (for no more sinister reason than that multi-occupied dwellings were under-represented in the sample). But the Home Office's estimate—250,000—of net increase from the Republic of Ireland in the decade 1961-71 now looks about 150,000 too high.

The number of New Commonwealth-born people in Britain on census night was 1,160,000, or 2.15 per cent of the total. This includes an estimated 130,000 people of British ethnic origin, who will be distinguished in later census publications. These immigrants included a lower proportion of children than the population as a whole, a higher proportion in the 25-45 age group and a very much lower one of those over 45. There was a lower proportion of females, particularly among

The changing work force

1 Estimated; age-groups for the 1961 census were slightly different.
2 Age groups are slightly distorted because for advanced analysis year of birth was used rather than age at the time of the census.

those born in Pakistan, who included only 39 women for every 100 men.

By far the most disturbing figures displayed the marked difference between the proportion of overseas-born and British-born who were out of employment: this was particularly large for West Indians, but even larger, interestingly enough, for the Irish-born. Some 9 per cent of Irish-born men aged 20-45 were out of employment, as against 4.7 per cent of the British-born (and only 4.4 per cent of the Indian-born). But West Indian-born teenagers showed the highest out-of-employment rate of all: 16.2 per cent, as against a figure for the British-born, itself depressing enough, of 8.1 per cent. It will be interesting to learn from later census data whether this distinction is as great when British-born teenagers of West Indian ethnic origin are included in the calculation. For the moment, the best estimate of the number of British-born people of New Commonwealth ethnic origin is still 500,000. Meanwhile, a breakdown of births in 1971 shows that the number of babies born to New Commonwealth immigrants is actually falling slightly.

Letter-bombs

And Christmas is coming

When Mr Tom Jackson, general secretary of the post office workers, described a statement about letter-bombs put out by the Metropolitan Police this week as "alarmist in the extreme," he was probably trying to calm the understandable fears of his own members about handling letters or parcels from overseas which might be carrying plastic explosive. But the police attitude was that although

Leadership

British Aircraft Corporation designs and builds leaders in every field of Aerospace. **Concorde**—with Aérospatiale France—will halve the world in size with supersonic services from 1975; **One-Eleven 475** brings mainline jet services to the small fields; **QTOL**—with Saab of Sweden and MBB of Germany—will bring the boon of Quiet Take-Off and Landing to the world's airports; **Jaguar**—with Dassault/Breguet—is the most cost-effective tactical support aircraft in production today; **MRCA**—with MBB and Aeritalia—is Europe's most important military aircraft, while **Strikemaster** has already been chosen by nine nations for ground attack and training. **Rapier** has revolutionised the concept of missile defence against tree-top aircraft attacks, just as **Swingfire** has changed the balance of power in the ground fight against tanks. We can say little of the surface-to-air **Seawolf** and helicopter-borne air-to-surface **CLB34** weapon systems, save that each is a world leader in its class. BAC's **Space** programmes are, beyond challenge, the most successful in Europe and include BAC teamwork on **Intelsat IV** with Hughes Aircraft and on the remarkable **Space Shuttle** with North American Rockwell.

100 PALL MALL LONDON SW1

Hoechst keeps thinking ahead

Protecting your pets and farm animals

Animal health, particularly that of our pets, is constantly threatened by a series of dangerous infectious diseases. Because of his close relationship with animals, man is also at risk. Scientists at Behringwerke, a subsidiary of Hoechst, have developed Maxavac* a combined vaccine for dogs which protects simultaneously against four infectious diseases – distemper, hepatitis and two forms of leptospirosis. Maxavac was the first combined four-in-one vaccine and the first homologous tissue culture vaccine to offer effective protection to your dog.

Scientists working at Hoechst's Mill Hill laboratory in London have developed a comprehensive range of sheep vaccines, headed by the seven-in-one sheep vaccine Heptavac. Simultaneously, a sterile multi-dose plastic disposable syringe has been developed to enable the farmer to vaccinate his flocks with maximum speed and safety.

*Maxavac is also marketed in other parts of the world under the trade name Candur.

Ahead through systems thinking

Maxavac to protect dogs, Heptavac to protect sheep, vaccines for pigs and cattle – the result of Hoechst knowledge and experience in many fields. The development of sera against diphtheria and tetanus, co-operation between scientists in human and veterinary medicine, in bacteriology, virology, parasitology, zoology and toxicology to create new drugs and vaccines.

Systems thinking is the Hoechst strategy. Research, development and product experience in many areas are concentrated on the solution of specific problems. Interdisciplinary thinking, systems analysis and systems technique

to bring success. To keep thinking ahead – to solve the problems of today and tomorrow – Hoechst employs 10,300 people in research and development with a research investment this year of more than £60 million.

Hoechst in Britain

Hoechst UK Ltd is an independent company within the international Hoechst group. Its British staff know their country, its problems, its people; and they realise where Hoechst know-how can inject into Britain's economy the experience gained by the parent company during more than a century in chemistry.

In textiles, for example, where Trevira high tenacity fabrics have, at long last, rendered outdoor events independent of the weather; and where 'Jersey Man', evolved in collaboration with leading UK knitters and based on Trevira Jersey cloths, is introducing an entirely new concept into male fashion. In resins, where Mowilith, 'the raw materials with a thousand uses', is helping to preserve and restore works of art such as the priceless lace and gobelins in Karen Finch's Ealing workshop. Or in pharmaceuticals, where construction has recently begun at Milton Keynes of a new research centre for nuclear medicine to develop new diagnostic techniques and to speed the evaluation of new preparations.

Whether your problems are in plastics or paint raw materials, dyestuffs or pigments, fibres or pharmaceuticals, agrochemicals or films, graphite products or offset printing plates, Hoechst UK can help you promptly and efficiently.

Letter-bombs: outside and inside

only one of the 22 letter-bombs which arrived in Britain between Friday and Tuesday had caused injury—a London diamond merchant opened one which blew up in his face—any or all of them could have killed. They were therefore dealing with 22 cases of attempted murder.

That is why the matter became the business of the Criminal Investigation Department and why a special bomb squad was created under the leadership of Commander Ernest Bond (who had been known as Commander "X" during investigations of Angry Brigade activities last year). Under him was an ad hoc team recruited from the Special Branch and the CID, with a chief superintendent acting as an international liaison officer. As it was, Scotland Yard's resources were well stretched in destroying actual bombs sent through the post to Jewish companies and in following up what turned out to be false alarms but could not be ignored. The Yard has only four explosives experts capable of this kind of work, all of them former army officers, three ex-majors and one ex-captain. The army's own experts are kept busy in Ulster. The Home Office also has a small team which followed up calls from Glasgow.

To protect both the public and post office workers—for whose safety Mr Jackson was, of course, properly concerned—a security system was quickly set up. Extra supervisory staff were given the job of watching for all suspicious mail and the screening was especially intense at ports and airports and major centres of population. The Post Office was sensibly discreet about the methods being used but satisfied

it was doing all it could. Some embassies and firms invested a rapid £2,300 in a special detection machine, but experts reckon the really foolproof device for discovering which letters or packets are concealing plastic explosive has yet to come on the market.

For its part, the Metropolitan Police issued detailed guidance about the likely form a bomb sent through the post would take, how it could be recognised and what should be done about anything that looked like a bomb. Emphatic advice: don't put it in water and don't try opening it or tampering with it in any way—leave it to the experts. But the Yard statement left the impression that anyone who followed the instructions and behaved with care should be able both to spot a letter-bomb and not get hurt by it.

For all the precautions that have been taken and will be taken the Post Office is vulnerable and believes it must always be so. It is aware of the dangers and so are the police, and the focus of all their anxiety is the approaching Christmas rush. Normally 35m items of mail are handled each working day, but over the three weeks of Christmas collections and deliveries just under 1,000m items will be handled, with room a day at the peak.

Letter-bombs are not all that delicate, and any airmail letter that makes its way from India to Britain has to put up with some pretty rough handling. But what happens at Christmas is just that much more rough. The police would be less worried if they—or their opposite numbers in other countries—had any idea where in the world the bombs are being manufactured. But so far they haven't,

and they feel sure there are more to come. The question is—from where?

Ulster

Crossed fingers

There is a real possibility that the Roman Catholics of Belfast will fall into line behind the Catholic ex-Servicemen's Association (strong in the Ardoyne) and the association itself is quite likely to take on a paramilitary form. On the other side, the wild men of the Ulster Defence Association and the Ulster Volunteer Force could still decide to translate their rhetoric into street violence against either Roman Catholics or the army. Yet Mr Heath should be able to draw some comfort from his two-day visit to the province this week.

Just by being there he has shown yet once more that he has no intention of washing his hands of the whole business. The main aim of the IRA Provisionals' campaign of urban terrorism has been to make British public opinion fed up with Ulster's troubles to the point of forcing the Government to withdraw. But however much pub gossip in Britain may be for pulling the soldiers out, that populist mood has not so far won many supporters at Westminster. On the contrary, there is plenty of realism about Ulster on both sides of the House, even if Monday's Commons debate on the Government's green paper was an arid and predictable affair. Naturally enough, many Labour MPs are unhappy at the holding of the plebiscite on the bald question of whether Ulster's people wish to stay in the United Kingdom or join the Irish Republic. During the plebiscite bill's passage through the Commons, they will try to get the questions broadened, but Labour will not object to the measure in principle.

The Government's green paper has found some friends abroad. Senator Edward Kennedy, who last winter made several ill-informed attacks on Britain's Ulster policy, welcomed it in a BBC television interview on Friday, and Lord Windlesham, minister of state for Northern Ireland, has spent the week explaining it to the Americans. He told a Harvard audience that the aim of successive British governments since August 1969 has been the same. There were three objectives. First, to create a stable peace in the province "under conditions of equal opportunity for all its citizens." Second, to keep and strengthen cordial rela-

tions between Britain and the Irish Republic "which should exist between neighbouring states with so high a degree of mutual interest." Third, "to reassure the Protestant community that they will not be forced into a united Ireland against their will." In the words of Lord Windlesham, such a policy "simply stated is far from simple to achieve." That is the kind of caution every politician has learnt to show in talking about Ulster, even when there are small signs of hope.

Planning Pain-killer

The Land Compensation Bill, published at the end of last week, goes far to meet the material objections of people affected by such things as new motorways and airports. In line with the recent white paper (Cmd 5124) it offers for the first time compensation to people living nearby who can show, within certain time limits, that their property has been reduced in value by the building of new or enlarged public works. Formerly only those actually bought out from the site were compensated. At the same time, to give public authorities a chance to make a more tolerable job of fitting new roads and other works into their surroundings they are to have additional powers to acquire adjacent property. At an official guess, these and other aspects of the bill may cost central and local government up to £65m a year plus a short-term £25m for two years to deal with the backlog.

Another new feature is the right to personal compensation for people who lose homes or farms in the process of development; quite rightly, this section covers slum clearance too. Lump sums of up to £1,500 may be paid to anyone who has been in occupation more than seven years. Given a time limit, there is no justice in excluding furnished tenants from any home loss compensation, while the exclusion of statutory tenants (those benefiting from the security of the rent acts) looks merely spiteful. All in all, though, these innovations plus improvements to the existing law—such as terms for traders and a much firmer rehousing obligation on local authorities—should take quite a bit of pain and fear out of these major upheavals.

Perhaps the Government should now concentrate on improving what happens at the pre-building stage. There is much resentment, currently

being aired in The Times letter pages, about Whitehall secrecy over trunk road proposals (though local government can be just as clam-like about road plans at times). Waltham Holy Cross council is in hot water with the Department of the Environment for publishing off its own bat details of a controversial motorway through Epping Forest in order to get public views before the last minute. The difficulties faced by objectors at public inquiries seeking official information are well known. On the other hand some Buckinghamshire villagers who successfully fought off a bypass road were told by Mr Peter Walker, shortly before he left the environment department, that they could reclaim their legal costs from the county they had opposed.

Police

Not so softly, softly

Police and journalists are not natural mates and it is very much easier to say that relations between them ought to be better than to make it happen. But that is what Mr Robert Mark, the metropolitan police commissioner, wants and there is no doubt of his determination or that of his senior colleagues to achieve it.

Mr Mark is prepared to let policemen of all ranks, down to the man on the beat, speak to the press and be interviewed for television and radio. He is taking an acknowledged risk that some will put their big feet in it but is ready to forgive genuine mistakes so long as a man has stuck to what he is responsible for—eg, how an accident happened, how a hold-up was staged—and does not talk on matters of policy, such as wages or race relations. At least 200 members of the metropolitan force, starting at the top with the four assistant commissioners, are going to be trained in broadcasting techniques in the next year by the same firm that put the army in Ulster through its initial paces.

Eventually this sort of indoctrination into the hazards and opportunities offered by the media is intended to become part of a policeman's basic training. It is one thing, however, to teach a man to face a camera and to abandon the language of the notebook—"I was proceeding along the high street in a northerly direction..."—but quite another to change deeply ingrained attitudes of mind. The instinct of the policeman is to keep

Mark: talk up, coppers

what he knows to himself and to keep himself at a mental distance from the public he serves. If anyone is to talk to the press or appear on the box, he would say, let it be one of the top brass. He sees no reason for sticking his neck out and, considering what the attitude at the top has been in the past, no one should blame him. But Mr Mark is concerned with fostering more trust and confidence in the police, and he is right to think that a more open attitude towards the press could contribute to that objective.

The metropolitan force has held a series of meetings recently with media representatives. One outcome is to be the issuing of new press passes by the police, passes whose wording will stress the help the holder should be given wherever possible rather than, as at present, warning against misuse. In the past they were issued only after the journalist had been vetted by the Special Branch and the Criminal Records Office. In practice, the pass has conferred no great benefit or privilege in the capital itself, as some who have tried to get round parking restrictions and the like have soon found out. But it has been helpful in other cities and especially in Ulster where the knowledge that a reporter has been vetted and found clean is a starter in his favour at least. Now the vetting is to go; an editor's recommendation will be enough and it is the editors who will be told if a journalist's conduct is persistently unsatisfactory from the police point of view. That must ultimately lessen the value of the metropolitan police pass as a respectable visiting-card, but it does show again the wish of the commissioner to remove some of the more obvious barriers to media-police relations.

With every Ferranti computer control system comes a bonus

The Prevention Of Environmental Pollution has become a critical factor in industrial growth. Ferranti Argus computer control could well be the answer, because with every system comes a bonus—a built-in pollution control system. In computer control of industrial plants and processes, probably no-one on earth can match Ferranti skills and experience. Ferranti Argus computers control nuclear power stations and steel mills, oil refineries and chemical plants, Jodrell Bank's radio telescope and the national gas and electricity grids.

In most Argus installations, the computer monitors and controls the operation of the various component units and processes that make up the plant. Simultaneously the computer works offline calculating better ways of running the plant and its processes, so as to optimise efficiency and profits. Pollution can be one of the factors taken into consideration.

For the real problem in pollution control is not what to do with smoke or other noxious wastes after they have

been created, but how to minimise their creation, if possible to zero level. As combustion becomes more efficient, smoke is reduced.

Pollution is therefore one of the many variables involved in operating a plant, and it is amenable to computer control.

Preferably by a process control computer that already carries in its memory most of the needed operational data and process inter-relationships.

In a word, Argus. While it is on-line monitoring and controlling your plant, it can simultaneously off-line calculate and improve your process to minimise pollution.

In automation, electronics and electricity supply equipment, Ferranti is among world leaders.

German elections

A choice between two ideas of Germany

FROM OUR BONN CORRESPONDENT

In Sunday's computerised west German elections, the polls will close at six o'clock in the evening. Immediately, the teleprinters will start to bring the verdict of an electorate of 40.8m people to Bonn. Here, for a feverish hour, the vote (half by direct constituency election, half by proportional representation) will be counted by computer and analysed under television lights by party leaders. Soon after seven o'clock it should become clear, by normally accurate computer prediction, whether Herr Willy Brandt will remain chancellor or whether the Christian Democrat leader, Herr Rainer Barzel, will move into the Palais Schaumburg.

This week's run-up to the run-off has been lively enough. Both the Brandt and Scheel coalition team (Social Democrat-Free Democrat) and the opposition Barzel-Strauss combination (Christian Democrat-Christian Social Union) have been giving their images a final polish on the television screen and making daily whirlwind tours around the provinces. One thing that is required of any leading German politician, as much as of any American, is an iron constitution. Additionally, on this particular occasion, when the campaign was curtailed because the government had failed to complete its full four-year term, your politician has required a delicate sense of timing. Herr Brandt has shown that he possesses more of these attributes than Herr Barzel.

Last week's initialling of the newly negotiated treaty with east Germany got the opposition well and truly over a barrel. Herr Brandt somewhat disingenuously remarked that the treaty need not necessarily become a bone of contention in the campaign. For a few hilarious days it became an issue whether the treaty should be an issue

or not. The personable Herr Barzel, revealing an unsureness of touch, convoked a press conference and told it at some length that he had not had time to read the treaty properly and had no comment to make.

Herr Barzel has since been moved (prompted, perhaps, by his formidably forthright Bavarian partner, Herr Strauss) to accuse the government of having acted dishonestly in not providing full information about the background to the treaty, and to declare that it must not be signed until all shooting by east German border guards has stopped. The two shooting incidents on Tuesday, in one

of which a would-be escaper was wounded by an automatic firing device and in the other a girl was stopped from crossing the line by heavy fire from east German border guards, have given some useful last-minute support to Herr Barzel's argument. He has also been haranguing the ambassadors in Bonn of Russia, Britain, France and the United States, suggesting that it was unfriendly of them, in the circumstances, to "help" the government by signing the declaration on the four powers' continuing rights and responsibilities in Germany and thus making it possible for the treaty to emerge.

While all this was going on, Herr Barzel seems also to have been searching for a last-minute secret weapon with which to counter the government's treaty coup. He lighted, unfortunately as it turns out, on Professor Karl Schiller, who until his resignation in July was minister of finance

Would you guess that Barzel offered stability, and Brandt mobility?

and economics and a leading member of the Social Democratic party (SPD). After the professor had had two meetings with Herr Barzel, it was reported that he had agreed to help the CDU to fight inflation. The clear implication was that the professor, who had been the SPD's star performer in the 1969 election, would be wheeled out before the electorate during this last week to damn the government for its economic policies (for which he himself was until recently responsible). However, the secret weapon was insufficiently primed. The professor, who is given to delphic utterances, has denied that he was seeking any public office and has retired to keep his own political counsel once again—at least, presumably, until he knows the result of Sunday's election. Collapse of secret weapon.

Professor Schiller has, however, been featured in newspaper advertisements alongside the former Christian Democratic chancellor, Herr Ludwig Erhard, embracing the opposition's electoral slogan of economic stability. This was, is and will be the CDU catchword. The slogan appeals to an electorate which has seen the cost of living index rise by 6 per cent during the past year, a sight that revives tortured memories of galloping inflation under the Weimar republic. What the CDU would actually do to curb inflation is not spelled out in detail. For its part the government reiterates its argument that a 5 per cent increase in prices is better than 5 per cent unemployment. It also claims that inflation is due to international circumstances.

The government counts on its successes in its eastern policy to keep it in power. But the real deciding factors on Sunday will be attitudes of mind rather than straight issues. The conservative Christian Democrats consider themselves the true inheritors of traditional German values; Social Democrats claim that they are establishing a new social order internally, and that externally they have created a good-neighbour relationship with the communist east while retaining and even strengthening the alliance in the west.

One of the Social Democrats' main slogans, which is apt to have a nationalistic ring in the ears of the younger generation, is: "Germans, we can be proud of our country." This has been printed under pictures of Herr Brandt, who says he thought it up himself and that he was thinking chiefly of older people who could remember

Schiller: as delphic as ever

the years before 1945. In the eyes of right-wing-minded electors, who are accustomed to think of Herr Willy Brandt as an "outsider" because of his exile in Scandinavia during the years of Hitler, the slogan is a piece of outrageous cheek.

A sizeable part of Sunday's decision, however, does not lie with those who have memories of Hitler or of war. This is the first election in which 18-year-olds will have the vote, and altogether some 4.8m people will be voting for the first time. The majority of these, according to one poll, would prefer to see the present coalition remain in power.

Immediately after the last elections in 1969, the line-up in the Bundestag was: SPD 224, and their coalition partners the Free Democrats (FDP) 30, against the CDU/CSU's 242. The coalition thus had a majority of 12, which was subsequently whittled away, by defection to the opposition, until the two sides were equal and the Bundestag was deadlocked. At this turning point in European affairs, what many people most fear is that Sunday's voting may produce a situation uncomfortably similar to the one this election has been called to resolve.

Behind Scheel's smile

Bonn

"Blessed are the chancellor-makers, for they shall see Brandt"—thus spake one contemptuous CDU supporter on the eve of the election. The chancellor-makers are the Free Democrats (FDP), led by Herr Walter Scheel. In the 1969 elections they won 30 seats—none of them outright, but all on the propor-

tional representation system's "second list." They thus enabled Chancellor Brandt to come to power, and in the process they picked up the two plum jobs of foreign minister and interior minister. But they polled only 5.8 per cent of the total vote, which came too close for comfort to the 5 per cent threshold below which parties are debarred from being represented in the Bundestag.

The party says it is confident that in Sunday's election it can improve on its 1969 showing. But in fact it could be touch and go whether it can get the vital 5 per cent, since the German electorate is showing a tendency to polarise itself between the two big parties, the Social Democrats and the Christian Democrats. And if the FDP fails to cross the threshold, it seems to follow that Herr Brandt is not going to be returned to power. Nobody believes that his Social Democrats will get a clear majority of their own over the Christian Democrats. The Free Democrats are the gum in his strategy, and if they come unstuck, so does he.

It was the defection of several of their Bundestag members to the opposition this year that made it impossible for Herr Brandt to carry on. Now they are in much better shape, having purged themselves on both the right and the left. They have sought to ensure, by a vigorous screening process, that all their candidates know what the party is about. They are publicly pledged to a continuation of the present coalition.

During the election campaign they have had a difficult row to hoe. They have had to display themselves as an independent party, but at the same time to insist that their differences with the Social Democrats are not big enough to prevent a continuing and harmonious coalition. In this task they have been greatly helped by the performance of Herr Scheel, the smiling Rhinelander, who perhaps comes across on television better than any of the other prominent politicians.

They confidently expect themselves to emerge again as chancellor-makers on Sunday. But there is another possible perspective that has been discussed by some people in Bonn. Suppose the government wins the elections only by a narrow margin, and the Free Democrats only just get their 5 per cent of the total vote. The resulting situation might yet tempt some of the Free Democrat members of the Bundestag to cross the floor when suitable issues come up; and then history would begin to repeat itself.

Year after year Falconbridge delivers nickel.

Falconbridge began delivering nickel in 1930.

Highest purity electrolytic nickel. Then in 1969... NICKEL 98 granules as well... again, nickel in a very pure form.

In 1971, iron-nickel pellets... and in 1972, ferronickel for cost-conscious steelmakers.

Nickel in more forms, and increased production.

It means new nickel supplies are available now from Falconbridge—the only producer in the world that ships from three countries.

Steelmakers, electroplaters and other nickel users seeking a main or second source of nickel—an assured source—should be in touch with Falconbridge now for their near and long term needs.

Nickel... the improvement metal... from Falconbridge... the assured source.

A granule of NICKEL 98, an iron-nickel pellet, and a square of electrolytic nickel.

A ferronickel pig.

FALCONBRIDGE
Toronto Canada

And 60% more capacity is expected now.

The closing gap

This west German general election will be the seventh to be held in the Federal Republic. Two distinct trends have marked the elections between 1949 and 1969. The first has been the gradual elimination of most of the smaller parties. The electoral system was altered before the 1953 election to prevent the Bundestag and the Land (provincial) legislatures being overrun by small splinter parties. Two hurdles were erected, which any party must surmount before it can be represented in the parliaments. A party must either win seats outright in at least three constituencies, or it must receive at least 5 per cent of the total vote.

These hurdles prevented the extreme right-wing National Democratic party from getting any seats in the Bundestag in 1965, when it polled 2 per cent of the vote, and even in 1969, when it got 4.3 per cent. Its complete failure in subsequent provincial elections suggests that it will fare very badly on Sunday.

Since 1961 only three parties have been represented in the Bundestag and the strength of the smallest of these, the Free Democratic party, has steadily declined. The vital question to be answered on Sunday is whether this party, whose alliance with the Social Democrats has made Herr Brandt's coalition government possible,

will get more than 5 per cent of the total vote. In 1969 its percentage fell to only 5.8.

The second important trend which has shown itself since 1957 has been the narrowing gap between the two major parties, the Christian Democratic Union (here taken to include its Bavarian sister party, the Christian Social Union) and the Social Democratic party (SPD). In 1949 there was no more than a 1.8 per cent difference between their shares of the poll, but this widened to 16.4 per cent in 1951 and to 28.4 per cent in 1957, when the CDU-CSU won over 50 per cent of the total vote. But after the SPD party congress of 1959, when the party quietly dropped its more rigid socialist doctrines, its fortunes turned; in 1961 the gap narrowed to 9 per cent, and in 1965 to 8.8 per cent. In 1969 the SPD was only 3.4 per cent behind the conservatives.

The opinion polls have given no clear indication which party will emerge victorious. At the beginning of October the Allensbach poll showed the SPD well in the lead with 49 per cent of the votes, the CDU-CSU with 44 and the FDP with 5 per cent. The same organisation's latest poll, this week, indicated that the CDU was just ahead of the SPD, but that the SPD and the FDP together might get 52 per cent of the total vote. The FDP had the support of 6.1 per cent of the electorate.

Percentage of votes

Seats in the Bundestag

Postwar governments

	1949-57	1957-61	1961-65	1965-66	1966-69	1969-72
Governing parties	CDU/CSU + FDP + GB + DP	CDU/CSU + DP	CDU/CSU + FDP	CDU/CSU + FDP	CDU/CSU + SPD	SPD + FDP
Chancellor	Adenauer	Adenauer	Adenauer, then Erhard	Erhard	Kiesinger	Brandt

CDU—Christian Democratic Union. CSU—Christian Social Union. SPD—Social Democratic party. FDP—Free Democratic party. GB—All German Block. DP—German party.

The border view

Helmstedt

At first sight it looks temptingly easy. The old signboard still stands at the eastern exit from Helmstedt, two miles from what they still call the zonal border, proclaiming in black on yellow: Berlin 185kms, Danzig 653kms, Königsberg 784kms. No hint of the "inviolable" east German, Polish and Russian frontiers that you would in fact have to cross before you could reach east and west Berlin, Gdansk, and Kalininograd. But the eastward-bound through trains are still subject to an hour's close scrutiny when they reach Marienborn, the first stop in east Germany.

But soon things will be easier, according to most of the Social Democratic and Free Democratic candidates, for a lessening of the present border obstructions is expected as soon as the new Bundestag ratifies the basic general treaty between east and west Germany. Most directly affected, at first, will be the 6m west Germans who live near the border in a belt, from 25 to 40 miles wide, that includes several sizeable towns. Four new road crossing points are to be opened to supplement the four existing ones. And the west Germans of the border belt are to be permitted, "on application," to enter a corresponding belt of east German territory and to spend up to 30 days a year there, which they may divide into nine separate visits.

Christian Democratic speakers in the border region are echoing the doubts voiced by Herr Gerhard Schröder, the former foreign minister. In his speeches up and down the country, he is asking whether the promised "alliations" are guaranteed, whether east Germany might cancel them on some contrived pretext, whether four-power responsibility for Germany and Berlin has in any way been eroded, and why the unity of the German nation is not mentioned in the treaty.

At a subdued rally in a Helmstedt beer hall on Monday night the federal minister for transport and communications, Herr Laurenz Lauritzen, plunged straight into the subject. Sunday's election, he said, had largely assumed the character of a plebiscite on the treaty with east Germany. He was sure that the east German government meant business, and that the four powers would honour their responsibilities for Germany as a whole. At this juncture the west Germans could not afford to demand all or nothing.

THE WORLD

International Report

Once more into the breach,
dear enemies

FROM OUR SAIGON CORRESPONDENT

The Vietnam peace negotiators are assembling again in Paris, for what may or may not be the one last session Henry Kissinger was talking about three weeks ago ; but it is still impossible to tell whether the gap that remains to be bridged is a yard wide or a mile. Le Duc Tho, North Vietnam's chief negotiator, left Hanoi for Paris on Tuesday, with stop-offs in Peking and Moscow for consultations on the way. His equivalent from South Vietnam, Pham Dang Lam, was due in Paris on Thursday, without knowing whether he could join in the private Kissinger-Le Duc Tho talks. Mr Kissinger himself, who has to provide most of the ingenuity needed to span the gap, was expected to take off from Washington at any time.

From Saigon it now seems clear that Mr Kissinger was uncommonly lacking in prescience when he failed to foresee the South Vietnamese government's reactions to the draft peace agreement. General Haig's visit to Saigon at the weekend appears to have done little to soften President Thieu's objections to it. No reliable information has been released on the substance of the two men's talks, but the president's public relations machine continues to utter the same dire warnings as before.

On the face of it, Mr Thieu is still demanding what amounts to a fundamental revision of the agreement. The point he is concentrating on is that North and South Vietnam are two entirely separate countries, and that this should be reflected in the agreement. Of course, lawyers could spend a long time arguing whether this is what the 1954 Geneva agreements really intended, as Mr Thieu insists they did; but the Americans are not well placed to disagree with him, since they have long used similar arguments to justify their Vietnam policy. The

consequence, for Mr Thieu, is that there can therefore be no justification for northern troops to stay in the south. Mr Thieu wants North Vietnam's men either to leave directly after a ceasefire, or to regroup in areas where they can come under international supervision, and then pull back to the north later. North Vietnam is resisting this—indeed, any change in the draft text, Mr Xuan Thuy said on Thursday.

But Mr Thieu could be playing a very skilful hand of diplomatic poker. He has suggested as much by asserting that there are 300,000 North Vietnamese in South Vietnam, whereas the Americans—from whom the South Vietnamese get much of their information on such matters—say there are only half as many. It is the sort of

tactic you might use if you were planning to bargain about numbers. There may also be more bargaining room in the geographical aspects of the ceasefire agreement than most accounts of it suggest. To begin with, it would indeed be of the "leopard-spot" sort. But North Vietnam and the Vietcong seem to accept that a certain amount of regrouping must then take place. What they are shooting for is a viable piece of territory that the Provisional Revolutionary Government can call its own. This would have to lie mainly along the border areas, but it might also include some areas along the coast, either in the Mekong delta or along the coast of central Vietnam.

Is President Thieu trying to make sure the other side gets as little territory as possible, just as he is trying to get the Americans to ask North Vietnam to withdraw more troops than it already seems to have tacitly agreed to pull out? Maybe. The trouble is that if Mr Thieu does in the end agree to compromise he is going to look to the South Vietnamese as if he has given in to the Americans. And any-

It's one way of looking for North Vietnamese, but why should they have to?

THE ECONOMIST NOVEMBER 18, 1972

The image features a large, bold, black 'IMI' logo centered within a white circle. The background is a repeating pattern of the text 'Imperial Metal Industries' in a small, black, sans-serif font, arranged in a grid-like fashion. The logo itself is composed of thick, black, sans-serif letters. The 'I' and 'M' are connected, and the 'I' is slightly taller than the 'M'. The 'V' is also connected to the 'M' and is slightly taller than the 'I'. The entire logo is set against a white background within the circle.

means more than metal

IMI is a remarkable group of fast-growing companies.

Each company is free to decide how best to meet the needs of its customers.

Each is backed by IMI's strength in planning and financing.

The facts speak for themselves:

1966 turnover. £69 million (IMI's first year as a public company). **1971 turnover.** £180 million.

Refiners and Producers of copper, copper alloys and new metals such as titanium and niobium.

Fabricators of non-ferrous metal and plastic products and components – car radiators, coins, sporting cartridges, taps, carburettors, chemical plant, plumbing fittings, water heaters, beer coolers, zips, superconductors, and hundreds more.

IMPERIAL METAL INDUSTRIES LIMITED · KYNOCH WORKS · WITTON · BIRMINGHAM B6 7BA ☎ 021-356 4848

way the old question of how much pressure the United States can really apply to Mr Thieu has never been more vexed. In theory the Americans could cut him off without a penny tomorrow. In practice Mr Thieu seems to be a necessary part of Mr Nixon's peace-with-honour formula.

While the bargaining goes on the communists have cut back their military activities. The number of "enemy-initiated incidents" has been running at only 60 or 70 a day this week, most of them consisting of a few rockets or mortar bombs. That is half the number in the upsurge that started just before the middle of October. The South Vietnamese say the communists have now been driven out of all the villages they moved into at that time around Saigon. But guerrillas in small groups remain in this area, far more in evidence than they were before this year's offensive started.

North Vietnam

The others who deserve a break

FROM A SPECIAL CORRESPONDENT IN HANOI

Hanoi is preparing for peace in pretty good shape, despite the attention it has received from American bombers since April. The only bridge over the Red river has gone, severing the rail-

way to Haiphong to the east and the food surplus provinces to the south. But there are no apparent signs that this is hurting the city. Some people have been evacuated to safer zones, but the majority of the population still lives and works here, and it is eating and drinking as well as before. There has been no cut in rations and it is said that the prices in state shops are unchanged.

The new pipelines running across the border with China evidently keep North Vietnam adequately supplied with oil. There is plenty of long-distance truck traffic to be seen, which suggests that bomb damage to roads gets quickly repaired and that trans-shipment across rivers by ant-like labour brigades working through the night makes up for missing bridges. The six-month-old naval blockade has certainly hampered the flow of war materials to the south but there is no evidence of a creeping paralysis. The North Vietnamese claim that imports of both civil and military requirements are "adequate," and that shipments are still coming in by sea. But they do not deny that Haiphong is out of commission: nothing has moved in or out of that port since May.

It is difficult for a western observer to make any firm judgment about the state of morale. The North Vietnamese make no secret of their desire for an

early end to the war, but they add quickly that they have always wanted peace. It is admitted that the loss of manpower is holding back agricultural growth, but even so they claim that rice production has moved ahead thanks to higher yields from new paddy strains. They complain loudly that bomb damage to dikes will hamper the harnessing of water for irrigation in the current dry season. But whether the repair job has been unexpectedly quick, or there is a simpler explanation, the fact is that there is little dike damage to show to visiting correspondents or wide-eyed delegates from American anti-war organisations.

In contrast, a large part of North Vietnam's slender industrial base is visibly in ruins. Some machinery and equipment was perhaps dispersed to the countryside, but not much. A great deal will have to be rebuilt from scratch. This is where the American offer of aid will help to ease the burden. The unanswered question is whether North Vietnam is willing to make itself dependent upon American spares. Since it cannot, even if it tried, produce everything itself, it may well have to choose carefully what it agrees to receive by way of American "contributions" for reconstruction.

The hijack map: 1972

This map shows where most of this year's hijackings took place, which of them were successful, and where the hijackers who managed to divert their planes to a foreign country actually went. The American definition of a hijacking as an incident in which the hijackers manage to gain control of a plane is used here; so the figures for hijackings should not be taken to mean

that the hijackers actually made a clean getaway in every case. That happened in only six of the 16 hijackings in the United States this year; four planes were taken to Cuba and two to Algeria. Two other American hijackers parachuted out of their planes (one over British Honduras) but both of them were later arrested.

That is the chimney of your friendship.

You see, you have at your service our flotilla of ships* and twenty-eight scheduled sea routes.

That includes between the Far East and Oslo, Hamburg, Rotterdam and Copenhagen... via our Maersk-Kawasaki Line international friendship.

You also have roll-on/roll-off container service between Australia and Japan... through another international friendship, ESS Line.

And you have all-40-foot-container ships which ply the Pacific directly between the U.S.A. and Hongkong and

Korea bypassing Japan.

That saves you five valuable days or more. Plus it helps emerging nations emerge into the container age on their own.

International friendship is simple. Efficient shipping services... that serve all countries.

Quickly. Safely. Economically.

Ships and friends anyone?

*Including scheduled liners, tramps, tankers and specialized ships to carry your special cargo like iron ore or automobiles.

Int'l Friendship

 Office: 17 St. Helen's Place, London E.C. 3, England Telephone: 01-588-2251 Telex: 88507

If you're scattered all over the map, we'll help you pull yourself together.

Mountains, rivers and deserts don't mean a thing to us. Our GTE International subsidiary hops across them in microseconds with microwaves.

Which means we can bring together a whole nation or nations. Or help make a business out of a lot of branch operations.

In 1950, we established the first microwave television link in Europe.

Recently we linked Greece and Italy across the 53-mile Strait of Otranto, enabling Greece to receive international TV programs for the first time. Next, we'll bring Turkey and Bulgaria together.

In Iran we're one of a four-company consortium building the largest microwave network ever assembled under a single contract. This 8700-mile system will have 500 stations and cover some of the roughest desert and mountain terrain on earth.

In Venezuela we built a microwave system for television and long-distance telephone, crossing plains, tropical jungle and the Andes mountains. Several stations are over 14,000 feet above sea level.

In Indonesia we built the microwave system for their national television network. And in Mexico our system was used to transmit the 1968 Olympic games.

Much of our work is industrial.

We've installed telecommunication and control networks for power companies in Canada and Brazil. For oil companies in Nigeria, Venezuela and Colombia. For railroads in Canada and Mexico. We built one of the longest microwave systems in South America for an oil pipeline crossing Argentina.

In all, GTE International has supplied telecommunications systems in more than 60 countries throughout the world.

We're also strong in satellite communications. We've constructed earth stations in Alaska, Nigeria, Thailand, Chile, Venezuela and the Philippines and provided equipment to some 20 other nations.

Wherever we go we train local people to maintain and operate the networks after we're gone.

If you're in government communications, pipelines, power, oil, broadcasting, railroads or any other organization that's spread all over the map, we'll help you get it all together.

The first thing to do is get together with us.

to, via Copenhagen

- On the contrary — it's the shortest way.
- Yes, I thought so too. But then somebody made me look at a globe — that's the only true picture of the world, as you know. The straight line from here to your place happens to run smack through Copenhagen, and not the way the maps show it.
- You're right, it does sound crazy to set out north when I'm going southeast. But you can't quarrel with the globe. And I'll save over a thousand kilometers by going that way.

This long-distance call was from some place in Europe to somewhere in the East. Of places where "the straight line from here to your place happens to run smack through Copenhagen", there are several pairs to choose from. Such as:

Paris and Tokyo
Glasgow and Bangkok
London and Hong Kong

But regardless of where it came from, here is the essence of the talk: The shortest way between western and central Europe and Japan/Southeast Asia/Australia is via Copenhagen. (And to Australia, it is more than that: it's the only way with next-day arrival in Sydney.) Take our word for it, or look at a globe!

FAR EAST — FAR WEST
NOT SO FAR BY SAS

SAS
SCANDINAVIAN AIRLINES
General Agent for The International

Continued from page 36

Looking ahead to peace, officials talk of a big effort to improve the quality of life. "Our people deserve a break after what they have gone through." The growth of food production is to be accelerated by wider use of chemical fertilisers. New farming areas are to be opened up in mountainous regions, to which there are plans to shift people from the overcrowded Red river delta. As rice output picks up, more land will be put to growing fodder for the extra meat that is urgently needed.

The North Vietnamese add that they are going to give priority to expanding the production of minerals, particularly coal, to increase their exports. North Vietnam wants to be able to stand more nearly on its own two feet when those American "contributions" cease. There is no mistaking the importance it attaches to economic viability. It trusts no one—not even its socialist brothers.

Japan

Words eaten

FROM OUR TOKYO CORRESPONDENT

To no one's surprise, least of all his own, Japan's prime minister, Mr Tanaka, has called a general election for December 10th. The idea is to give the Liberal Democratic party a chance to cash in on Mr Tanaka's personal popularity, before it declines and before he is compelled to eat his words about not revealing the yen just as he has now eaten those about not calling an election.

Like his predecessors, Mr Tanaka won the prime ministership last summer in an intra-party fight for largely intra-party reasons. But he also came into office on the crest of an unusual boom of public support. Some of this so-called "Tanaka bumo" was simply the work of the press, which had been bitterly critical of the previous prime minister, Mr Sato. Some of it represented the genuine feelings of the man-in-the-sushi-bar, who liked Mr Tanaka's folksy, unpretentious manner, and his ability to get ahead in spite of an unorthodox background. Then came the trip to China in September, which neutralised the only big issue that the left-wing opposition parties might have latched on to as a way of cutting into the conservatives' 24-year dominance.

Newspaper enthusiasm for Mr Tanaka has decreased, naturally enough, since the leadership election,

and particularly as a result of his poor performance in the recent special Diet session. At times, he would answer opposition questions by reading straight from his briefing papers. Since these were prepared by civil servants, they did not sound at all like the prime minister's own views, and they were formalistic even by Japanese standards. And Mr Tanaka looked distinctly awkward when a Communist member of parliament chided him with the existence of a mistress who had had two children by him.

The whole question of the structure of the Japanese economy—potentially a far more important political issue than either China policy or Mr Tanaka's personality—has barely been touched on. The country's famous study teams are still groping for the right way to change it. Mr Tanaka, echoing the views of numerous economists, talks of a vast public works programme under a visionary title, "the remodelling of the Japanese archipelago." So far, however, the main impact of this idea has been to drive land prices even higher.

Mr Tanaka's party now holds 60 per cent of the seats in the lower house, and although it has been slipping in recent elections for prefectural governors it is expected to retain roughly this same percentage in the new Diet. The main question to be decided in the December election is the distribution of seats within the Liberal Democratic majority. Mr Takeo Fukuda, Mr Tanaka's chief rival, now leads the largest single faction in the party, and he and his supporters will be trying to increase their own factional strength, even at the expense of other conservatives. And the four opposition parties will be competing as much against each other as against the Liberal Democrats.

New Zealand

Looking-glass land

On the opposite side of the world from Europe, New Zealand may be forgiven for running election campaigns that sometimes look like reversed images of the ones being simultaneously staged in, for example, west Germany. The leader of the opposition in Wellington, Mr Norman Kirk, has denounced the government for its failure to curb inflation and to maintain law and order. But it so happens that Mr Kirk

Third time lucky for Kirk?

heads the Labour party, and it is the incumbent right-wing National party government that he has been reviling in the sort of language that is more easily associated with, say, the attacks made on Herr Willy Brandt by his Christian Democratic opponents in Bonn.

Mr Kirk is making his third attempt to lead Labour to electoral victory, and there are those who say that a third failure, on November 25th, would finish him. He is, however, only 49, as vigorous as he is large, and the time scale can be misleading: New Zealand holds general elections every three years, and Mr Kirk has been leader of his party only since 1965. He has certainly given his supporters no cause to complain that he is starting to slow down. His performance in recent weeks has been compared favourably with that of the prime minister, Mr Marshall. Having succeeded Sir Keith Holyoake as leader of the National party as recently as February, Mr Marshall had been looked to as the bright new-risen star in this campaign; but his uncertain manner of launching himself into it at the end of October disappointed many of his admirers.

In 1969 the opinion polls showed Labour slightly ahead of the National party only a few weeks before the election day, but in the event the ruling party won 44 seats in the House of Representatives, against Labour's 40. This year the polls have again indicated a small Labour lead, but the situation is complicated by the increase in the number of seats from 84 to 87, which is generally regarded as improving the chances of National candidates in several of the areas

affected by boundary changes.

Mr Marshall's line seems to consist of urging the electorate not to switch horses in midstream at a time when New Zealand must continue to grapple with the problems of inflation and of Britain's entry into the common market; recalling the manifold blessings that last June's generous budget bestowed on practically everybody; and hoping that, as in previous elections, some of the protest vote will go not to Labour but to minor parties that will win no seats. But he cannot count on Labour's chances being seriously spoiled by the man who, after changing his name to Mr Mickey Mouse, has entered the fray as leader of a Mad Hatter's Tea party.

Australia

Huddled together

FROM OUR CANBERRA CORRESPONDENT

On Monday and Tuesday nights this week Australians were given the chance to compare the policies of their government and opposition for the election on December 2nd. Although the two methods of presentation differed greatly—the prime minister, Mr McMahon, appeared alone in a television studio, whereas Mr Whitlam, the leader of the Labor party, was seen addressing an enthusiastic crowd in his own constituency—the interesting thing was the close resemblance between the two offerings. Both men were appealing to middle Australia.

On taxation, for instance, both men promised not to increase rates and to reform the system. On housing both recognised the need for young couples to be helped to buy their homes, although they differed on the details of how this should be done. In the controversial field of education—now regarded as the key issue by a bigger proportion of Australians than any other—they are both going to provide better pre-school care and assist schools generally, although the differences of approach are important. Both promised to provide automatic increases in pensions. Plainly they both see the middle ground very much as a matter of better education and social services.

All the same, there are differences. In education they centre on the treatment that Labor would give the fee-paying schools, all of which the government at present subsidises equally by means of per capita grants. Mr Whitlam and his party believe this system should be changed so as to provide bigger subsidies for those fee-paying schools—

largely Roman Catholic parochial schools—in which standards are low because parents cannot pay high fees. There is also a major difference over health services, which Labor wants to provide on something like the British basis, whereas the government intends to continue with the present insurance system. The doctors much prefer the Liberal party's way.

There are more emotional differences. Labor wants to spend more money and take more coercive action in favour of aborigines, disciplining the state governments if necessary. There is a clear split over industrial legislation, since Labor would abolish the penal provisions in the arbitration acts. It would also abolish national service and rely on a volunteer army. This is denounced by Mr McMahon as likely to bring the army dangerously below strength and make it difficult for Australia to fulfil its commitments. Mr Whitlam, while continuing the five-power arrangements in Malaysia and Singapore, points to the likelihood that south-east Asian countries will support the neutralisation of that region. Mr McMahon prefers to say nothing about neutralisation and continues to emphasise the traditional policy of forward defence where it is acceptable to Australia's allies.

The major issue is probably not what the two leaders say but how much confidence they aroused in the viewers. If the public opinion polls are to be believed, Mr Whitlam is regarded as competent by a larger proportion of the electors. But neither man is viewed with favour by a majority. Mr Whitlam's slogan is "It's time!" For Mr McMahon the election is a conflict of policies, philosophies and teams. His own team has been in for too long, and Mr Whitlam's has not been in at all. It is a choice for the electors between those whom they know all too well and those whom they find it hard to envisage as an effective government.

France and Libya

Super Id

The Libyan prime minister, Major Jalloud, returned to Tripoli last Sunday after spending eight days on a "private" visit to Paris. He had been in France for three days before the Libyans let out that he was there, and since then both the Libyan and French governments have been unusually discreet about what he was up to. But he was certainly doing more than buying presents for the Moslem feast of Id

that follows the fast of Ramadan. The red carpet was rolled out for him to the offices of the president of France, the prime minister, the minister of defence and many senior officials.

At the end of 1969, France contracted to sell Libya 110 Mirage jets and about half have already been delivered. But this year Libya agreed to form a union with Egypt by September, 1973. In 1969, France argued that the sale did not contradict its ban on arms sales to the belligerents in the Middle East conflict. It is certainly possible that President Pompidou wanted some assurance that if and when the union comes about the Mirages will be used only for the defence of Libya.

It is certain that Major Jalloud will have brought up the subject of the possibility of buying other French arms, including the AMX-30 medium tank. Britain has turned down a Libyan request to buy the Chieftain tank, arguing that there is no guarantee that the tanks will not find their way to the Egyptian front line. It will go down badly in Whitehall if the French think up a way of getting around their own arms ban.

Both the French and the Libyans seemed satisfied after Major Jalloud's visit. This suggests that there may have been some agreement to extend trade between the two countries (France is already Libya's most important trading partner), particularly through increased sales of Libyan crude oil. France would like to land the contract to supply the desalination plant the Libyans are thinking of buying and get the lion's share of contracts to help the Libyans establish some light industries.

Kenya

Oh, to be in England

Outside Uganda, the group most sensitive to the shockwaves created by General Amin is the Asian community in neighbouring Kenya. The Asians there know that they are no better liked than their counterparts in the rest of east Africa; and they have not been reassured, as Tanzanian and Zambian Asians have, by a condemnation of General Amin's behaviour from their own president. Inevitably they have been wondering whether they, too, may soon have to pack their bags.

Now some of them must think the time has come. It was reported on Thursday that the government has ordered all non-citizen Asians in Kenya's main towns to wind up their businesses and sell out to Africans within three months. Until now these traders have been exempted from the 1969 Trade Licensing Act which laid down that licences to trade would be issued only to Kenyan citizens.

Over the past five years the Kenyan government has repeatedly made it clear that it would eventually like all non-citizen Asians to leave Kenya. There were 182,000 Asians in Kenya in 1968, but the figure is probably in the region of only 120,000 now; of these some 50,000 are said by the Foreign and Commonwealth Office to hold British, and no other, passports; and there are probably also some with only Indian or Pakistani citizenship. Since 1968 Britain has been accepting a quota of east African Asians each year; vouchers were originally available for 1,500 heads of families annually, but the figure has since risen to 3,500. These vouchers have been issued to those who, faced with Africanisation measures that have been broadly similar throughout east Africa, have chosen to come to Britain.

The first Kenyanisation laws were put through in 1967, four years after independence, and they have since been tightened. But it is reckoned that about 80 per cent of Kenya's retail trade is still handled by Asians. Since trading was the sector at which most of the legislation has been aimed, it is clear that the policy was working only slowly. It was thought that ministers accepted this, knowing the important part that Asians play in the country's economy and the serious effects that

any Amin-style expulsion would have. But in Kenya, as in Uganda, there is political capital to be made from Asian-bashing, and some politicians there have openly applauded General Amin's actions.

Thursday's edict will have heightened the anxiety of those Asians with Kenyan citizenship. Officially their position remains secure but, like other ethnic groups, they will be expected to integrate with other Kenyans, "to be loyal to the government, join with Africans in development, and mix with blacks as one community."

South West Africa

Vorster's victory

FROM OUR SOUTH AFRICA CORRESPONDENT

While angry rumblings began issuing from the United Nations over the Escher report on South West Africa—due for release on Wednesday but delayed—it began to look in South Africa as though the negotiations between the UN secretary-general's personal representative, Mr Alfred Escher, and the South African government had presented the latter with a considerable diplomatic windfall.

According to leaks the report lists a number of points of agreement reached between Mr Escher and the South African prime minister, Mr Vorster, during the UN envoy's recent visit to South Africa and the disputed territory of South West Africa (called Namibia by the UN). The most important are:

1. That the principle of "one man, one vote" cannot be applied to determine the future of South West Africa.
2. That instead of the territory being led towards independence as a single

entity, as the UN has always insisted, a regional authority established for each ethnic group should be allowed to decide for itself what constitutional position it will adopt.

3. That the prime minister of South Africa take overall responsibility for the territory.

4. That an advisory board, comprising representatives from each of the regional authorities, be formed to meet the South Africans from time to time.

5. That investigations should begin immediately with a view to abolishing restrictive legislation on freedom of speech, labour and movement, as well as freedom of political expression.

6. That there should be no further confrontations between the two sides, but that the aim in future should be to further negotiations on the basis of the conditions already agreed upon.

From South Africa's point of view such an agreement, if approved by the Security Council, would amount to no less than United Nations endorsement of the policy of separate development. It would be a complete ratification of the status quo in South West Africa—a fact which indicates the near certainty that the report will not be approved by the Security Council.

Indeed, it seems likely that the secretary-general, Mr Kurt Waldheim, will not be given an extension of his mandate to negotiate with South Africa over the disputed territory. This mandate was granted at the Security Council meeting in Addis Ababa last February, when a resolution was passed calling on the secretary-general to "initiate contacts with all parties concerned" to establish conditions for Namibia's independence. Acting immediately on this Mr Waldheim visited

Now Escher (left) has given Vorster something to smile about

the territory the following month and met the South African government. His purpose ostensibly was to see whether there was any common ground between Pretoria's plans to balkanise South West Africa into 11 tribal bantustans and lead these towards separate independence, and the UN's own goal of unitary self-determination. This preliminary exploration was then followed by a more detailed study by Mr Escher.

But whether or not the report is rejected by the Security Council makes little difference to the South African government. It has an unexpected victory either way. Mr Vorster would almost certainly announce a unilateral acceptance of the agreement—declaring that South Africa had done everything that could possibly be expected of a reasonable nation, to the point of allowing the highest officials of the UN to come and see the facts of the situation for themselves and then accepting a compromise agreement with them. It could be the biggest diplomatic coup of Mr Vorster's career.

East-west talks

No story yet

Next week looks like being one of those times that find a lot of eager journalists speeding to and fro across the map of Europe in pursuit of a quick succession of stories that may turn out to be non-stories. On Tuesday, November 21st, in Geneva, the Americans and Russians are due to start the second series of their strategic arms limitation talks (Salt). Next day, November 22nd, in Helsinki, a rendezvous has been arranged for the preparatory talks intended to lead to a pan-European conference on "security and co-operation." All this will fall under the shadow of the west German elections, which will at least produce a real story.

If Salt Two is conducted on the same lines as Salt One, which ran from 1969 until the signing last May of the Russo-American missile limitation pacts, there will be no more news coming out of Geneva than there was in the days when Mr Gerard Smith and Mr Semvonov oscillated between Helsinki and Vienna. Such information as did emerge about the progress of their talks emerged in the two superpowers' capitals; and when their treaty on anti-ballistic missiles and their interim agreement on other nuclear weaponry were at last concluded, these texts were whisked off to

Moscow to serve as the showpiece of Mr Nixon's meeting there with Mr Brezhnev, the most interesting disclosures being provided by Mr Kissinger (of course) at such way-stations as Kiev. The one currently visible feature of the Salt scene is that the talks have been shifted away from Helsinki in time to avert any collision in the Finnish capital with diplomats converging there for the "European security" preliminaries.

Next week's stories out of Helsinki are likely to focus mainly on the question of who turns up there, and how promptly. The Finns, as eager hosts, and the Russians, as equally eager guests, and the other states of the Soviet sphere, as docile spear-carriers, may be confidently counted on—and this count surely includes the east Germans. It would seem doubtful whether the west Germans will have sorted themselves out after their elections in time to put in a punctual appearance; but somebody from Bonn will probably be available to keep a seat warm. These, after all, are low-level preparatory talks—although even among the western participants there are enthusiasts, notably the French, who may think it appropriate to field a star team.

The Americans, whose right to join in these meetings was established after much Soviet humming and hawing, and most of their Nato partners will come to Helsinki with one eye cocked at the prospect of the Russians making good their promise to join, early next year, in separate talks about mutual and balanced force reductions (MBFR) in Europe. On Thursday the western allies formally proposed a starting date of January 31st for the MBFR talks. Until those talks actually get going, it would be unwise to expect many signs of progress from Helsinki.

China

Read all about it

FROM OUR SPECIAL CORRESPONDENT

All over China millions of people are poring over the latest editorial in the People's Daily. They read it at home, on street billboards or in their offices; they discuss it in factory or commune study groups and at party meetings; and they follow its instructions. For an editorial in China's leading newspaper is no sometime thing. It may take weeks to compose and when it finally appears in print it carries the imprimatur of the politburo of the Chinese communist party.

Daily delivery for the people

Last month's national day editorial, for example, was a month in preparation, so Mr Chen Chun, one of the paper's seven "leading members," told a group of British journalists recently. The leader-writing process began when the central committee told the paper what subjects the editorial should cover. Then writers from the domestic and international departments of the People's Daily met representatives of China's other two major publications, Red Flag and the Liberation Army Daily (the most important editorials always run in triplicate), to produce a draft. The draft then went to the central committee for approval; there followed more discussions, more drafts and more revisions until the final version was ready to be displayed on the eve of October 1st.

Not every editorial requires consultation on this level. On domestic issues, the People's Daily sometimes goes it alone. But as the official organ of the communist party of China the paper "plays a guiding role in ideology and work." So it must maintain a direct pipeline to the politburo. None of the editors is himself a member of the politburo or the central committee (nor are the editors of other leading papers) but they are appointed by the central committee and sometimes participate in its deliberations. Because of its special relationship to the party half of the editorial staff are party members, compared with a national average of under 3 per cent. For the same reason, the People's Daily has no revolutionary committee and no representatives from the army.

There are 160 writers on the paper. Only a third of the editorial staff

is actually in the Peking office at any one time because of the shift system adopted after the cultural revolution. Another third is spending a year at the special May 7th school of the People's Daily where cadres study marxist texts while doing manual labour; the third third is down at the grass-roots level doing special investigations for the paper which result in full-page features. Apart from these reports, all the paper's domestic news comes from the New China News Agency. This agency also provides all foreign news except for coverage by the paper's sole foreign correspondent, who is based in Tokyo. He is soon to be joined by another correspondent posted in London in exchange for The Times's man in Peking.

The People's Daily publishes 3.4m copies a day, 1.5m in Peking and the rest in nine other cities. Six cities print from a matrix delivered by plane; three, Urumchi, Chengtu and Canton, operate under the more advanced method of facsimile transmission which will eventually be extended to the other six. Some 90 per cent of the circulation of the People's Daily is by subscription at a cost of £3.50 a year. This alone brings the paper a profit, although it also gets some advertisements. It also suffers from irregular schedules. "Sometimes the People's Daily is a morning paper," a Chinese official explained, "and sometimes it is an afternoon paper."

In spite of an editorial earlier this year advocating a national shift from Chinese characters to romanisation, the People's Daily itself has no plans to make such a change. Instead it will continue with its present laborious method of setting up to 6,000 different characters by hand; 140 printers are employed to set 2,000 characters apiece for each edition. The only technical change the paper is planning is an experimental use of colour. Managers eagerly questioned visiting journalists about the use of colour in British papers.

The People's Daily is far and away the most important newspaper in China, but it is not the biggest. There is another national newspaper, not available on any news stand, which beats the People's Daily hands down. This is the Tsan Kao Hsiao Hsi, or Reference News, which provides trusted cadres with news that is considered unfit for the public press. Six million copies of this four-page paper, which is run by the New China News Agency, go out to offices across the country every day of the year.

Taiwan

Lovers rebuffed

FROM OUR HONGKONG CORRESPONDENT

"Non-party lovers of democracy" in Taiwan have failed in a timid attempt to amend the regulations for next month's national, provincial and local elections on that confused and lonely island. Some 50 non-Kuomintang politicians who will contest the elections, which Taiwan's prime minister, Chiang Ching-kuo, claims will widen the representation of native Taiwanese, threatened a boycott if these amendments were not approved. In failure, they have now prudently forgotten the boycott threat.

The rebuff dashes shy hopes for a realistic new deal for the 12m native Taiwanese under Chiang Ching-kuo, Chiang Kai-shek's son. The two changes which the politicians sought from the Kuomintang, the Chiangs' Nationalist party, were hardly dramatic. One was the right to make campaign speeches without previous sanction from the governmental election commission on time and place; the other was the right to appoint poll-watchers at any election ward. The rejection by the interior and justice ministries was curt, and Chiang Ching-kuo declined to meet any non-party representatives.

It is 12 long years since Taiwanese and non-Kuomintang politicians tried to form a loyal opposition parliamentary group in Taipei. That movement, led by a "retired" Kuomintang official, Lei Chen, was ruthlessly suppressed, and allegations of communist sympathies landed Lei Chen in prison on a 10-year term. Survivors of that initial native opposition movement rallied around for this autumn's new and futile "discussion of election problems," but earnestly protested, with

Young Chiang says no thanks

nervous back glances, that this time no opposition party was contemplated.

The deplorable incident is a dismal approach to the December elections, which were proclaimed a healthy, sovereign and independent defiance of the treacherous United Nations by Chinese Nationalists and Taiwanese natives. President Chiang Kai-shek was probably not consulted. Still "recovering from a cold," he has not been sighted over the past four months.

Italy

Yes, we'll come back, maybe

FROM OUR ROME CORRESPONDENT

Although deeply divided, the Italian Socialist party has chosen to try to rejoin the coalition. At the end of the party congress on Tuesday 58 per cent of the delegates voted to rejoin the centre-left coalition "on certain conditions," thus theoretically resolving the dilemma facing the party: how, when and on what terms the Socialists should get back into government. But the two factions which voted in favour of an immediate return are not in a hard and fast alliance, and 58 per cent of the delegates are not enough to convince the other parties of the old coalition that the Socialists are safe partners in government.

Signor De Martino, who will probably be the new party secretary, controls 45 per cent of the party and stands somewhat to the left of Signor Nenni, whose faction—the Autonomisti, comprising some 13 per cent of the total party—forms the right wing. The outgoing secretary, Signor Mancini, is angry and hurt, and intends to carry on the fight to keep the Socialists out of government until a change of attitude in the other parties enables them to negotiate their return from a position of strength. He believes that any centre-left government that might now be formed would be the weakest ever. But Signor Nenni and Signor De Martino argue that in the present state of Italian politics, with the far right on the warpath, the Socialists should not "allow the reactionaries to consolidate their power."

After the congress the shape of future events depends very much on the personal ability of Signor De Martino. His first task will be to win the trust of the parliamentary party, both left and right, and then do the same at a regional level. It will not be easy.

How are we doing and what we are doing?

Lack of alertness in the chemical industry and failure to create new fields of activity may very well force an entrepreneur to give up sooner or later. DSM knows. That's why in the last few years we have enlarged and modernized our plants, built new plants, introduced new technologies. We tried to find (and found) good partners inside and outside Europe.

We strengthened our commercial efforts, especially on foreign markets. Thus we improved our international competitive position. But we do not leave it at that. We are constantly searching for new markets for our promising new products. We rely on the future.

DSM  **Holland**

DSM, Information Service, P.O. Box 65, Heerlen, Holland

Some examples of what we did:

We built a new plant for acrylonitrile and meanwhile doubled capacity. Acrylonitrile is a raw material for yarns and fibres and for several types of plastics and rubbers.

We started - together with Akzo - the construction of a methanol plant and plants for formaldehyde and formaldehyde-based resins. Raw materials for thermosetting plastics, applied, inter alia, in the wood-using industry.

We developed a new light-weight aggregate for structural concrete, called KORLIN. And built a big plant. KORLIN can be used to make a light constructional concrete of very high quality.

We increased the capacity of our pipeline for the transport of naphtha from the Botlek near Rotterdam to DSM and took a share in an international pipeline network for transporting ethylene, an important raw material for our plants.

We greatly extended the capacity of our units for the production of ammonia, ethylene and propylene, and improved the processes. Products leading ultimately to plastics, rubbers, yarns and fibres.

These Chemical Bank money managers have travelled 10,000 miles to do more for your money.

International money management.

These men are Chemical Bank's international money management group. A team of experts with responsibilities for finance wherever money circulates. On this occasion, they have come together from their own countries to meet in Zurich. The purpose? To discuss in detail many different aspects of international finance. Rates of interest, exchange rate tendencies, exchange control, capital movements, and financing, for instance. All factors which affect a customer's interests.

Thoroughness.

Meetings like this one in Zurich are typical of the thorough approach Chemical Bank takes to the handling of money. Today, when finance is in a state of perpetual change, these men all realise that even the smallest effect on money could have far-reaching, vital consequences for their customers.

Teamwork.

That's why Chemical Bank places such importance on teamwork. At these international money management meetings, New York, for example, can, and does, help Brussels solve problems and vice versa. In this way, profound knowledge of finance is backed by up-to-the-minute information. It makes a powerful combination. It is also one more way in which Chemical Bank does more for your money.

How to find us.

London Branches:
10 Moorgate - Phone: 606-8040
13 Davies Street - Phone: 493-2921

Main Office: New York. Branch Offices: Brussels, Frankfurt, London, Paris, Tokyo, Zurich and Nassau. Representative Offices: Beirut, Madrid, Bogota, Buenos Aires, Caracas, Rio de Janeiro, São Paulo, Mexico City, Hong Kong, Manila and Sydney. Correspondent Banks in over 185 nations.

CHEMICAL BANK

We do more for your money.

THE WORLD

American Survey

Second term abroad

Washington, DC

Four more years in charge of American foreign policy are, most probably, what President Nixon wanted a second term for. Home affairs have never fired his imagination and his recent utterances—most notably, the interview which he gave to the Washington Star-News just before the election, for publication just after it—suggest no change there. Now he will have no more worries about staying in office and he will have the pleasure of being more firmly seated than almost any of the foreign heads of government with whom he will be dealing.

He also has grounds for confidence that, for the first time, he will be free of the appalling burden, distraction and complication represented by the war in Indochina. The known terms do not exactly provide an assured future for America's ally, the South Vietnamese government, but the Administration does believe that they give it a fair chance. It will be reasonably safe from external military overthrow for some years to come.

That, so far as the Administration is concerned, constitutes peace with honour, or cease-fire with honour at any rate; having come so close to that long-sought outcome, Mr Nixon is not going to let it go. Not he, but the

North Vietnamese, disclosed the terms and demanded signature before the election. His advisers concede that the North Vietnamese may have genuinely feared that, once re-elected, he would lose interest or demand better terms. There was indeed a time when Dr Kissinger used to warn Le Duc Tho to make terms before the election or expect worse ones after it. But that was forgotten in recent weeks when the scale of Mr Nixon's impending electoral success became virtually certain in his mind. He can now get a little credit for magnanimity by honouring his, or Dr Kissinger's, prior word.

Free of that entanglement, as he should soon be, Mr Nixon can attend to more conventional aspects of foreign policy in more propitious circumstances than he has enjoyed yet. There is plenty of such business waiting. None of it offers much chance of such spectacular events as his trips to Peking and Moscow this year. "Nothing sudden is going to happen," as he told the Star-News. At that point he went out of his way to reject the possibility of any change in American policy towards Cuba—"unless and until—and I do not expect this will happen—Castro changes his policy." Given Mr Nixon's record of changing his mind

with deliberate suddenness, one would not take that as ruling out for ever a trip to Havana, but it does mean that nothing of that kind is in the wind.

No proposition is more regularly denied than that the first Nixon Administration, in its preoccupation with the Far East and with global strategy, has "neglected" western Europe. Not only are ordinary European relations, however, less pressing than the limitation of antiballistic missiles and less rich in sex appeal than a walk on the great wall of China, but they are also too multifarious to be easily managed from one office on Pennsylvania Avenue. Mr Nixon's recently retired Ambassador to the European Community, Mr Robert Schaezel, has just published in Fortune magazine a scathing attack on the manner in which American-European relations are allowed to be soured by protests, retaliations and counter-restrictions on matters like tomato puree and refrigerator parts, while nobody is seen to pursue any comprehensive political design. The impeachment is not so much denied as turned away with explanations of the complexity of it all and professions that a political design is indeed to be produced. More will be heard of this kind of talk as the Vietnam war recedes and the new phase of marathon conferences and negotiations breaks out.

Some of these exchanges are already in course. A fairly explicit American view about the reform of the international monetary system has already been expounded to the International Monetary Fund. American spokesmen have been urging the General Agreement on Tariffs and Trade in Geneva to set the machinery in motion to produce an almost world-wide free trade area in industrial goods. If this proposal gets little credence, it is partly because the American Administration manifestly does not possess the necessary powers to put it into effect. A group of the higher functionaries in foreign economic policy is at work drafting a new Trade Act to lay before the new Congress soon after it assembles. Another difficulty is the

Peace-making at breakfast-time: Rogers, Nixon, Kissinger, Haig

well-founded belief that Congress is not going to become suddenly immune to pressure from domestic interests to protect the American market from foreign shoes, textiles, chemicals, steel, and much else besides. Yet another doubt comes from the utterances of the Administration itself. Thus Mr Paul Volcker, the Under Secretary of the Treasury, in a speech in New York this week recommended the penalising of countries that persist in maintaining monetary surpluses by "applying a special surcharge on imports from the chronic surplus country."

General free trade can logically be reconciled with a system of restrictions, penalties and retaliations for agreed special purposes, as all can see. But there will be, and indeed are, two views of the advantages of constructing the trade and monetary arrangements of the next 10 years in this particular way. Teams of American negotiators are preparing to leave Washington to establish themselves in different European centres for negotiations that seem, for the most part, likely to be prolonged. But it is not only the heads of the teams and their policy directors in the capital who are uncertain whether their employment is, or is not, coming to an end. President Nixon marked his re-election by demanding formal letters of resignation from about 2,000 of his servants, including everybody who is in charge of anything.

The experts on strategic arms limitation will take up stations in Geneva by November 21st for the second round of the Salt talks with the Russians. Another team will be off to Helsinki to start up the preparatory talks for the conference on security and co-operation in Europe, a concession to the Russians to be paid for with Soviet participation in the talks on mutual balanced force reductions in Europe. Not always a cherished object of American policy, these are now seen as a most useful way of warding off congressional pressure for cuts in the number of American troops in Europe—cuts which President Nixon is still determined to resist unless as a part of some international deal.

The MBFR talks are to be held somewhere other than Helsinki and to start in, perhaps, late January. Before then there will be North Atlantic Treaty consultations in Brussels and in early December a meeting of the Organisation of European Co-operation and Development, a somewhat neglected body which has begun to acquire a new interest as a means

of involving Japan and Canada in the complex of economic decisions by, in the next phase, the non-communist developed world.

Still to be devised is the mechanism by which Mr Nixon's Administration will put together a homogenous Atlantic policy out of this hotch-potch. Some group under the umbrella of his personal authority will have to relate, more tightly than has been done before, the different strands of defence, central banking and trade interests, domestic economic needs and a general diplomatic view. What is wanted is an organised pursuit of an international political goal, which for simplicity can be called Atlantic partnership, paying due heed to the economic and strategic considerations involved. It will need President Nixon's approval and support at every stage, or else it will be a failure.

Almost certainly it can be organised only from the White House, that is, by the President's national security staff headed by Dr Kissinger, who nowadays is thoroughly awake to the implications of economic aspects for other aspects of foreign policy. Very likely Dr Kissinger (whose resignation, like everybody else's, is in the President's hands) will stay. But he will not decide to stay until he sees who is to be Secretary of State, Mr Rogers or another. That will not be decided till Mr Nixon has composed his entire new cabinet. It involves the question whether he wants to continue to keep the conduct of foreign policy on the subjects closest to him separate from the conduct of routine foreign relations—a feat obviously more difficult when the object is to build an Atlantic relationship than when it is to arrange a trip to Peking or even a ceasefire in Indochina. Settling it will probably involve Mr Nixon in deciding for himself to what extent he wants to be a nationalist President or an internationalist President. In different ways, he is both the one and the other.

... and at home

Preoccupied, as he has been, with Vietnam and the election campaign, Mr Nixon is only now planning his next four years at home. From his long and bracing interview with the Washington Star-News it appears that these plans are for cutting down activity in Washington rather than for stepping it up. In this, as in so much else, the President is in sympathy with the mood of America as shown in last week's election. Quite clearly the voters did not

Do-nothing President?

want change, at least not change imposed by Washington; quite clearly they did want federal officials to interfere in their affairs less in the future than they have done in the past.

Mr Nixon intends therefore—or so it is reported—to ask Congress once again for the second half of his revenue-sharing proposal; under this money from the federal government would go to state and local governments in block grants for such broad purposes as housing or education, leaving the recipients free to decide on the details of the outlays themselves. But the recipients may not be so happy if under the plan they get less money than in the past. This appears probable since the President is also determined to hold down government spending because he believes that "the total tax burden of the American people has reached breaking point"; yet, unless spending is cut, the country will have to choose between inflation and a tax increase. This view seems likely to be just as unacceptable to the new Congress as it was to the old one.

What Congress particularly fears is the President's intention of economising by "shucking off" and "trimming down" social programmes, although Mr Nixon is right in claiming that many of the Johnsonian anti-poverty projects have failed as remedies for the problems that they were attacking. Another of the President's economies will be to decentralise and slim the government in Washington; this will also have the effect of "nurturing" the "new spirit of independence, self-reliance" that he senses in the American people. They are, Mr Nixon feels, like children who must be given responsibility and not be pampered if they are to amount to anything. So

Citibank: New ideas are one of our biggest assets.

As the largest international bank, we at First National City Bank could be content to just rely on our assets (which exceed 29 billion dollars) and provide a good, steady service for our customers.

Instead, we use our vast organisation to plan and evolve new ways to improve the banking business and make borrowing easier.

During our 70 years in the City, our innovations have proved to be as big an asset as our money.

For example, in March 1969 we introduced the concept of sterling loans tied to our Base Rate.

The Base Rate concept has been a great success with our customers, and has been adopted by our major banking competitors.

Other Citibank innovations are appreciated by our customers. For example, we make loans against your cash flow. Leaving your assets untouched.

Another advantage big companies get at Citibank is our industry specialist teams. The men in these teams are all experts in banking. But they also specialise in different categories of industry.

Stan Howell's team covers Mining, Metals, Electronics and Manufacturing. John Montgomery's covers Oil and Chemicals. Geoff Liley's covers Consumer Products. And Sinbad Coleridge's covers Transportation.

They know the pitfalls and opportunities that exist in these various fields. And because they understand your business, they can give you some worthwhile advice along with your loan.

We've tried to break new ground in every aspect of the banking business. Come along to our new Corporate Headquarters at Aldwych and you'll see what we mean.

FIRST NATIONAL CITY BANK
Citibank House, 336 Strand, London WC2R 1HB
Telephone 01-240 1222.

Innovators in Corporate Banking.

Isn't it comforting in this day and age...

Comforting indeed to find a whisky which tells you at the first sip, that it is an undisputed leader in quality which rightly costs a little more. Famous Grouse whisky. We scarcely need to spell out the ancient pedigree of this mellow balanced blend - for here is bottled history. Enough to say that Famous Grouse whisky is the cumulative creation of one distinguished family who have been blending fine whiskies since 1800. So call it taste, discernment, what you will, this is the whisky for a man like you.

Matthew Gloag & Son Ltd., Perth, Scotland. Established 1800.
Sole distributors in England, Wales, I.O.M. Deinhard & Co. Ltd.,
29 Addington Street, London, SE1 7XT.

Someday you may be happy we ran this ad.

Someday you may want to know where to find a good banker in one of these cities. And then these little maps will come in very handy.
Right now we have two full-service

branches (London and Paris), three representative offices in Europe, and a merchant bank in London.
And we're growing and expanding every day.

they will have to turn to and solve their domestic problems themselves, without any fresh help from Washington. One wonders what will be thought of this priggish approach by the voters who found Mr McGovern too moralistic. And one wonders how it will in practice be possible for a President to keep his hands off America's social pressures for the next four years.

More Indian wars

Washington, DC

Only the sacking of Washington by the British in 1814 and the San Francisco earthquake of 1906 caused more damage to the federal government's property than did the group of Indians who seized and occupied the Bureau of Indian Affairs for the first week in November. The demonstration, called the Trail of Broken Treaties, organised by the radical American Indian Movement (AIM), started peacefully enough. But then there were complaints about lodgings in Washington, the Indians were refused permission to hold a memorial service in Arlington national cemetery for two of their war heroes and, almost before anyone knew what had hit, the Indians had installed themselves in the Bureau of Indian Affairs which they renamed the Native American Embassy.

Most of the \$1.9m worth of damage to the BIA occurred on November 6th when a court order for the eviction of the Indians had been granted, and officials of the Interior Department were strongly demanding police action. But members of the White House staff overruled them—in order not to give the Indians any martyrs—agreed to

Makeshift weapons guard BIA

set up a group to study the Indian demands, promised that there would be no prosecution for the seizure and occupation of the bureau and gave the Indians \$66,000 to return home. But the Indians also took with them what they call "highly incriminating" documents, which implicate past and present members of Congress in the exploitation of Indians. These documents are apparently being studied by the Indians who will then auction them off to the news media. Because the White House claims that its promises did not include an amnesty for theft or damage, there will probably be prosecutions. Already two Indians have been arrested for theft.

Aim presented a long series of demands for the consideration of the Administration. Some of these reflect the fact that Aim is largely composed of urban Indians (according to the 1970 census 45 per cent of all Indians now live outside the reservations). An example is the demand for the extension to Indians living in towns of the special subsidies which are allowed for Indians who remain in the reservations. But most of the demands concerned all Indians, ranging from the reburial of Indian bones and remains now in museums to a guaranteed total of 110m acres of land for their use, the restoration of various reservations closed down in the 1950s and 1960s, the establishment of a federal grand jury made up of Indians to deal with cases involving Indians across the country, the immediate firing of certain officials of the BIA and of the Interior Department, the abolition of the BIA by 1976 and the grouping together of all programmes concerning Indians in a new department.

The Indian establishment goes along with most of these aims, but is bitterly opposed to the tactics. Indeed representatives of the National Tribal Chairmen's Association, who arrived in Washington in their shiny business suits to survey the wreckage at the BIA, demanded the dismissal of any Administration officials who did not take action against Aim members. They are afraid that not only may the cost of repairs be taken out of the total Indian budget but also that any implicit official recognition of Aim might weaken their own standing. They also point out that the destruction of records may actually make revision of "unfair" treaties more difficult. Aim has certainly overplayed its hand. But even so the study group is going to have to come up with something constructive.

Daley's defeats

FROM A CORRESPONDENT IN ILLINOIS

For the Mayor of Chicago, Mr Richard Daley, the two most important political posts in the state of Illinois (apart from his own) are the governor's chair in Springfield, the state capital, and the office of state's attorney in Cook County (this is where Chicago's crime is investigated). Mayor Daley has now lost both and, if reports of his demise are grossly exaggerated, there is much planning and rethinking under way in the high political councils of the city, the county and the state.

The post of governor was won by Mr Daniel Walker, a Democratic lawyer and businessman, who got the nomination over Mr Daley's opposition. Mr Walker campaigned against the incumbent Republican governor with scattershot charges of waste and inefficiency and with a general anti-establishment tinge to his speeches—in opposition not only to the Republicans who control the state outside Cook county, but to the Democratic machine within the county and city itself; this stand garnered him strong support in the rest of the state. Mr Walker's victory pushed him into the forefront of giant-killers, not only in Illinois, but nationally as well. He is suddenly talked of as a member of that select grove of politicians called "presidential timber." For the mayor, the idea of a maverick Democrat sitting in Springfield, the state capital, dispensing jobs independently of Democratic headquarters in Chicago is an unheard-of development.

Even more serious, however, was the loss to a Republican, Mr Bernard Carey, of the sensitive job of state's attorney. In a city where official corruption often appears in headlines but seldom in the dock, Mr Daley has taken great care in the past to see that the state's attorney is a loyal Democrat. Now, however, Mr Carey, once an agent of the Federal Bureau of Investigation, who can work closely with the Nixon-appointed federal prosecutor's office, is in a position to give the Mayor and the Democrats sleepless nights with grand-jury investigations.

The startling aspect of Mr Carey's victory, however, was the sudden awakening of voters in Chicago's 15 black wards to a new political identity. Mr Hanrahan, the Democratic incumbent, who was acquitted (by order of the judge) just before election day of criminal charges arising out of the deaths of two Black Panther leaders in a police raid in 1969, was a focal

point of fear and hatred among black voters. He was regarded as a "hit-'em-on-the-head" law-enforcement official whose special targets were ghetto residents.

Mr Carey carried 11 of the 15 black wards in the city, mainly because voters split their tickets—choosing Senator George McGovern for President (he beat Mr Nixon in Chicago) and Mr Walker for Governor on the Democratic line and then jumping to the Republican line to vote for Mr Carey. This demonstrated a degree of political sophistication which had not been seen before in Chicago's Negro wards; this seems to indicate that from now on Mr Daley must eschew "plantation politics" and begin to pay attention to black demands. If he does not, he can rest assured that the Republicans—and Mr Walker—are going to do so; in that case the 70-year-old Mayor may find his solid mass of Democratic support seriously and permanently eroded in the future.

Ethnics for Nixon

Washington, DC

In last week's election ethnic voters defected from the Democratic party in greater numbers than at any time since Franklin D. Roosevelt built a new coalition to give the Democrats a majority in 1932. These so-called ethnics are Roman Catholic voters of eastern European, Italian and Irish extraction with considerably lower incomes than Protestants and Jews.

At Republican national headquarters in Washington, there is much self-congratulation that a generation of wooing "heritage groups"—the latest euphemism for ethnics—has finally borne fruit. In truth, the switch of the ethnics had nothing to do with the efforts that Republicans have aimed at formal cultural associations and foreign language newspapers. The young ethnic American has no such ties. Even if the contemporary Polish-American has not married out of his group, the chances are that he does not live in an identifiably Polish neighbourhood, does not associate with fraternal societies and does not even speak Polish.

Nevertheless, the ethnic vote maintains its own characteristics and as such turned away from the Democrats in this presidential contest more sharply than did any other voting group. The basic reason was Mr McGovern himself. His problem with these voters was ideological. To them his positions on the Vietnam war, amnesty for draft

Shriver trips the tarantella for an ethnic vote

dodgers, defence policy, welfare benefits, race relations, street crime and other abrasive issues were so different from their own that they were willing to swallow their working-class misgivings about Mr Nixon's cronyism with big business and vote Republican, many for the first time.

Buttressing their ideological difficulties were questions of style. Mr Michael Novak, a distinguished lay Catholic theologian who has turned to ethnic politics, enlisted in the McGovern campaign and attempted to convince Mr McGovern that his Methodist moralising, which may have pricked the conscience of upper class Protestants and Jews, offended Catholics. Mr Frederick Dutton, the theorist of the new politics, made much the same recommendations. As is his nature, Mr McGovern politely acknowledged such advice and went right on moralising.

Through the spring and summer, the condescending attitude within Mr McGovern's inner circle was that the ethnics, after some threats of rebelling, would come naturally back into the Democratic fold (as, indeed, they did in Massachusetts, the only state that Mr McGovern carried). Any ethnic defections, it was believed, could be compensated for by getting more blacks and young people registered to vote. However, signs of panic became evident in early September when Mr McGovern abruptly changed course by endorsing a form of federal financial aid for Catholic parochial schools. That change, far from winning back the ethnics, only reinforced their suspicion of Mr McGovern's sincerity and consistency.

Nor did the tactic of using Mr Sargent Shriver, the vice-presidential can-

didate, to lead the ethnics back home work. Mr Shriver, a Catholic with a non-moralising vivacity congenial to the ethnics, hit the circuit of fraternal association banquets and picnics. But vice-presidential candidates are largely ignored by the news media and only a tiny percentage of ethnic voters were exposed to Mr Shriver's charms.

Almost any other Democrat would have run better among the ethnics than Mr McGovern, but no other Democrat—not even Senator Muskie, himself a Polish-American—could have escaped losing some votes to Mr Nixon. Over the last generation, the blue-collar ethnic voter has become alienated from what he regards as corrosive changes in American life and has come increasingly to associate the Democratic party with those changes. His hostility toward big government, high taxes and special governmental aid for the black man has been transferred to national Democratic leaders who share those positions. Mr McGovern exaggerated and accelerated a postwar historical trend which was only interrupted by the nomination of President Kennedy, a Catholic, by the Democrats in 1960.

Mutinous navy

The navy had a better chance than the army of avoiding low morale, disruptions and mutinies. It considered itself to be an elite service; nearly all its men were enlisted rather than conscripted; it was much better to be a sailor than a soldier. But now the navy is trying to be less disciplinarian and more open to the world outside, and at the same time it is also taking over much heavier responsibilities for

Tipping in Canarsie

New York

An uneasy truce has been reached in yet another school district in New York city, this time in the Canarsie section of Brooklyn following a boycott by white parents who succeeded in shutting down schools for over a fortnight. The boycott began after the local school board, which is entirely white, objected to an order from the city's school chancellor, Mr Harvey Scribner, that 32 black and Puerto Rican children should be bused from an adjoining district into a junior high school (for the 12 to 15 age bracket) in Canarsie that is 70 per cent white. Mr Scribner's decision, which was designed to bring about better racial integration in Canarsie, where another high school is 97 per cent white, resulted in a strike by parents that affected all schools in the district. The situation was not helped when Mr Scribner rescinded his order, claiming that his target was the other junior high school. He was over-ruled by the central board of education, which insisted on going ahead with the busing. The boycott ended when the local and central boards agreed to work out a compromise. But if open battle has been avoided, the situation has aroused fresh tensions among blacks, whites, Mr Scribner and the central board of education.

The Canarsie boycott is the latest incident in a running conflict between local community boards—there are 31 in the city—and the central board of education concerning responsibility for setting policy. Ever since 1968, when local districts were given more authority, black-dominated community boards have fought to improve educational facilities in their areas. Now, a local white board is resisting the central board's decision to change the makeup of its schools. In acting more like southerners than New Yorkers, Canarsie's board has mustered surprisingly solid support for its stand against integration as conceived by the city's centralised authority.

In many respects Canarsie is alien to the city. Located on a peninsula of Brooklyn that has been a butt of jokes to New Yorkers because it used to be a refuse dump that emitted foul smells, Canarsie has become a predominantly white middle-class community. Despite the fact that a junkyard in Canarsie was the site this autumn of

Constellation's ratings berate the sea

the war in south-east Asia as the army withdraws from Vietnam. As a result it is facing difficulties—anti-war demonstrations, sabotage, drugs, racial discrimination, conflicts between officers and men—that look very much like those already faced by the army.

There have been mutinies on three ships in the Pacific fleet in the past month. Conflicts between blacks and whites have been the most obvious explanation and the one universally given for the riots. But it is not only the blacks who have mutinied nor is it only whites who have stayed at their posts. There have been serious and dangerous incidents of sabotage and arson in both the Atlantic and the Pacific fleets; in one case it is a white who is facing court martial. There is also evidence now of a serious split in the upper ranks of the naval command. So bad have things become that the chief of naval operations, Admiral Zumwalt, thought it necessary this week to summon 90 admirals to Washington. He told them openly and frankly that the top ranks had failed in their leadership, that they had not implemented his directives on race relations and that, if they continued in this way, they could not expect any leniency from him. He has also told young ratings, in no uncertain terms, lest they should think otherwise, that strict discipline will not be sacrificed for the sake of reform.

The present troubles first came to a head in October when there was a riot between blacks and whites aboard the aircraft carrier *Kitty Hawk*, which was sailing off Vietnam. In the bloody clash 40 whites were injured and six blacks. Since then 25 men have been arrested, all of them Negroes. This was followed four days

later by a fight on the oiler *Hassayampa* at port in the Philippines. On that occasion four were injured and 11 arrested—all of whom were black. The latest incident was on the aircraft carrier *Constellation* which has been plagued with difficulties for months. Protests by blacks forced the ship back to San Diego where 123 sailors, most of them blacks, were put ashore and then staged a strike when ordered back on board. They have now been assigned to shore duties. Just what will happen to them and their fellow mutineers on other ships is not yet certain. So far the first concession has been to delay the trials of those on *Kitty Hawk* until she docks in San Diego.

There is discrimination against blacks on board ship, according to many reports. They are assigned to the most menial jobs, they have less chance of promotion and when things go wrong they are punished more severely than whites. Part of the trouble is that until the arrival of Admiral Zumwalt two years ago it was made difficult for blacks to join the navy. Now things are better and roughly 12 per cent of the new recruits are Negroes. But there are still few blacks in positions of responsibility.

But if there is a lack of understanding between blacks and whites, there is also a big gulf between the white officers and the white ratings. On the large ships where 5,000 men are sometimes crowded on top of each other the captain often lives in lonely isolation. And there are many crusty old admirals who like it that way and who fear that the fresh air that Admiral Zumwalt is trying to breathe into the navy will sink the whole structure.

what has been described as the largest anti-Mafia raid in police history, the district is not a high crime—or drug—area. Its black population is only 4,000 and is confined to two low-cost housing projects. The whites, mostly of Jewish and Italian extraction, have come from other sections of Brooklyn taken over by blacks. They are understandably concerned about maintaining good schools and preserving property values.

There are definite links between the value of property and the racial composition of schools. When integration has been carried out in other districts of the city, the inflow of black pupils has led to an exodus of whites. The shift in the race of the majority, which is called tipping, has been accompanied by a similar change in the residential composition of a neighbourhood. As a result, entire sections have tipped from white to black as white families beat a path to the suburbs and the blacks rush in to fill the vacuum. In Canarsie, where most white residents are young, a strong community spirit has developed against outsiders, white and black. Determined to remain dominant in their district, they won notable concessions from Mr Scribner and the board before accepting a truce.

A new pupil arrives at Canarsie's junior high

Under its terms the central board agreed to the community board's demand that no Canarsie pupils would be bused out of the district. In return, the local board has until mid-January to come up with its own plan for achieving greater integration by accepting more blacks into its schools. Whatever the outcome, Mr Scribner

has been badly embarrassed and the central board has lost some of its power to effect reform. Unless it can reassert its authority and make much more careful plans to achieve greater integration, the prospect is that other local boards will resort to similar action when they feel threatened by tipping.

Fed's two birds

Washington, DC

After being delayed for some six weeks as a result of litigation brought by a group of smaller banks, the Federal Reserve Board has managed to put into effect two significant changes in the rules governing America's banking system. Nearly everyone involved thinks that they are for the better.

The first ends the rule of almost 60 years' standing under which banks belonging to the Federal Reserve System had their reserve requirements based in good part on their geographical location rather than their size (member banks must keep idle reserves equal to a fixed percentage of their customers' deposits). While this anachronism did not seriously hamper the conduct of the central bank's monetary policy, it created inequities among individual banks that are members of the system. In brief, the higher the reserves that a bank is required to keep, the more costly this requirement is. While there is reason to have higher requirements for the larger banks, on grounds of both monetary policy and safety, there is no longer any reason to distinguish between the old categories of "country" and

"reserve city" banks, based only on location. Now all \$500m banks will be treated alike, as will all \$10m banks and all \$10 billion banks.

The second change requires all banks, in practice, to make payments on cheques on the day that they are presented. This is already the case with about 80 per cent of the dollar volume of daily cheque collections and more than 50 per cent of the actual number of cheques. But many smaller banks had made a good profit out of the long-standing custom of paying only on the day after presentation, which created a large and uncertain "float" of uncollected cheques as well as slowing the general system of cash transfers. It was two groups of these banks that sought unsuccessfully in court to halt the Federal Reserve Board's new rules.

It is rare that anybody, even a central bank, can find an opportunity like this to kill two birds with one stone. Here two ancient ills have been abolished at once and neither could have been easily abolished alone. The reason is that the ending of the cheque "float" would have extinguished too much money, while a painless equalisation of bank reserve requirements would have created too much. By combining the two changes in a period

of about a month, the Fed has avoided any serious disruption to monetary policy, though the figures for the money supply and other monetary statistics may be slightly distorted for a few weeks. The Fed has also made special provision for the smaller banks that might find themselves short of funds as a result of being required to pay cheques on the same day; this includes an offer of borrowing facilities at the central bank even for banks that are not members of the system. Judging from the early results, it seems that the two birds have died painlessly.

America's commercial banks

June, 1972

The Edwardian Christmas Dinner.

A gourmet's guide.

To begin. A dish of finest caviar. The addition of chopped onion and lemon juice is to be discouraged. Serve simply with thin slices of buttered rye bread and a glass of well-chilled champagne.

After the caviar a tureen of game soup. To complement the flavour of partridge or hen pheasant a glass or two of Madeira.

Onwards. To poached fillets of Brill, coated in a delicate shrimp sauce garnished with shrimp tails and sent to the table with melted butter. With this—a deliciously crisp Chassagne Montrachet.

Oysters. Served in the English manner with the juice of fresh lemons and, perhaps, a dash of cayenne pepper. After this a dish of mutton cutlets grilled and placed on a dish around a mound of mashed potatoes and garnished with parsley.

Having thoroughly whetted the appetite we come to the zenith of the festive feast. A roast turkey. Garnished with bacon and sausages and served with bread sauce, or chestnut sauce or a good rich gravy. To drink? Claret.

To accompany the beautiful bird—a tureen of plain, boiled potatoes and a pyramid of buttered Brussels sprouts. Then to liven the senses what better than a dish of Russian salad? Not of the tinned and turgid variety

so popular today. A genuine Salade Russe. Complete with truffles and mushrooms, french beans, beetroot, lobster, tongue and ham, mayonnaise et al.

A short respite and on to holly-decked plum pudding, with brandy sauce or brandy butter whichever you prefer. For those with lesser appetites an alternative of maraschino jelly. For all, the luscious and incomparable Chateau Yquem.

To end. No bits of this and that. No meagre pots of cheese. An English Stilton. Ripe and round. With bread or biscuits. And celery—taken with a little salt.

The napkins lie crumpled. The cigars are lit. The Port is passed from

right to left. Croft Port from the house founded in 1678. Today, two Ports represent the great Croft tradition.

Distinction. Very rare, very old, aged in the wood for ten years, sleek and tawny as a lion in sunshine.

Commemoration. A fine vintage character, rich and full-bodied. As full of promise as the bride of Solomon.

CROFT

Purveyors of Port since the reign of Charles II

There are ample baggage lockers, strong enough to hold 18 kg. The 8 ft. headroom adds again to the general spaciousness. You don't have to bend when you want to stand up and walk around. All this space and comfort demanded lively colours. So we saw to that. The Royal Class is in KLM blue, the Economy Class has a yellow and orange colour scheme broken by occasional green seats in the front section and red ones in the rear.

"Wall-to-wall" comfort in the air.

"Wall-to-wall" comfort means that in our DC-10 there is so much space that we can comfortably seat nine passengers across. The middle seat can be put down and used as a table. The whole interior has been designed to emphasize the spaciousness of this aircraft.

KLM introduces the DC-10 to Europe

More daylight, wider views. The DC-10 has bigger windows than any other aircraft - you get the maximum light inside and more to see of the outside world. Each cabin has a separate ventilation system, which is draught-free and changes the cabin air every three minutes, so your ears won't tell you when you're landing or taking off.

Each one of our DC-10's features a personalized music programme. The selector dial and volume control are located in the armrest as are other personal controls like reading light and call button.

Our DC-10 makes its first flight from Amsterdam to New York in December. From then on, four times a week. And from the 26th of February 1973, daily non-stop to Chicago. If you want to fly our new DC-10's, you can. Book now at your travel agent or KLM office. Or call us for information on how to charter our DC-10's.

The passenger doors are so wide that two persons can pass through at the same time. Again comfort by space. The modular baggage containers see to the safe transportation of your luggage.

When an airline buys a DC-10 it has a choice of engines. With the environment in mind, we chose an engine that makes less noise and leaves no visible exhaust; the General Electric CF 6-50. This engine has such enormous power that the aircraft could fly or land on any of its three engines.

Seventeen years after you buy it, this watch could get you arrested.

On November 11th, 1970, Mr. Robert L. Fancher Snr., of Nashua, New Hampshire, USA, was clearing Customs at Logan International Airport, Boston.

In his own words, this is what happened.

"After I paid the cashier, the young man standing next to me took out a badge and said, 'I'm with the US Customs' and asked me if I would step into one of the small Customs offices with him, which I did. Now, bear in mind that my party and myself had cleared Customs and the porter had all of my luggage ready to roll out to the taxi area.

"The Customs gentleman then asked me what the total of my declaration was and I told him that it was \$240. He immediately pointed to my wrist and said, 'Well, I feel that you have failed to declare that watch you have.' I said that I had had this watch for seventeen years and therefore I saw no need to declare it and in addition to this it was purchased in the US.

"Well, he told me that the watch looked new and asked me to take it off my wrist, which I did. He proceeded to examine the watch carefully and I explained to him that one way he could tell that this watch had some wear was because there is a certain amount of separation that occurs on the gold links of the bracelet over the years, and if you look at a new bracelet, each section is close together. Well, after a great deal of arguing with him, he told me that one way or another I should have identified the watch prior to my departure so that I could return to the US without going through this sort of thing, and I said that I would."

The watch Mr. Fancher was wearing was a Rolex Oyster Datejust, serial number 6305/49812.

He purchased it seventeen years ago from Jaccard's in St. Louis.

If you wear a Rolex you may care to remember what happened to Mr. Fancher. It might just happen to you. Because when our craftsmen build a Rolex, they build it to last.

Each watch takes them a year to complete. They start with a single, solid chunk of surgical stainless steel, or 18ct. gold, turning this block of metal into a seamless Rolex Oyster case with a series of 162 separate operations. Then, into the case, they carefully fit one of their patented inventions, called the Rolex Twinlock Winding Crown.

The Twinlock works rather like a submarine hatch, actually screwing down onto the case, forming a solid core which can't be penetrated by dust, dirt or water. (You may like to compare this to the winders you'll find on some other watches, which are often their weakest point.)

Resting securely inside the case is a rotor self-winding Perpetual movement. But before this is fitted, we pay for it to undergo fifteen days and nights of testing at one of the Swiss Institutes for Official Chronometer Tests. If the movement meets with the exacting standards of accuracy demanded by the Institutes, we're allowed to call the watch a "Chronometer." The Rolex Red Seal (which you can see in the picture) is your proof of this fact.

Our craftsmen have made it possible for us to win nearly half the Chronometer certificates ever awarded, even though we're responsible for a mere fraction of the annual production of Swiss watches because it takes so long to make each Rolex.

Given this skill and expertise, it's not really surprising that Mr. Fancher's watch was mistaken for new when it was seventeen years old.

Or that men like World Champion racing driver Jackie Stewart, and explorer Haroun Tazief wear Rolex watches.

Like Rolex owners everywhere, they get a great deal of satisfaction out of wearing what they consider to be the best watch in the world.

Almost as much as our craftsmen get out of making one.

Owning one is almost as satisfying as making one.

Pictured: the Rolex Datejust. Available in 18ct. gold or stainless steel, with matching bracelet.

Books

The wind cannot read

ONLY THE WIND WILL LISTEN

By Andrew Boyle.

Hutchinson. 368 pages. £4.50.

Men like John Reith should die on retirement; old age becomes them ill and affords them less pleasure. He did not altogether lack the approachability, the kindness towards the young that, born of loneliness, often mellow the elderly great; Mr Boyle bears generous, but never effusive, testimony to the "exhilaration of his company." But in this altogether admirable biography he shows how, characteristically, in John Reith these currents turned awry. His fondness for young women was more ludicrous than endearing. His taste for honours was scarcely less so—though perhaps only biographers and prime ministers know how common a failing this is. In the 1960s, Lord Reith lobbied the Labour government for an advancement in the peerage, seemingly unaware that it was only creating life barons, anyway; as Lord High Commissioner in Scotland he publicly rebuked his wife for entering a car in front of him. He displayed a rigidity towards broadcasting developments (Mr Boyle's own "World at One" was anathema). His detestation of Churchill was untempered by perspective: as Churchill lay dead, Reith told Mr Boyle that "It will be 100 years at least before Britain gets over the malign influence of that unscrupulous man."

John Reith was old for too long. He was removed from the director-generalship of the BBC in 1938; he did not die until last year. He was only 49 when he left the BBC, and the jobs that he got, in quick succession—the first, to shake up Imperial Airways and create out of it and British Airways the British Overseas Airways Corporation, was followed by wartime government posts as minister of information, of transport and finally of works—would have seemed arduous enough to lesser or less ambitious men, but Reith found himself "never fully stretched." In a way, Mr Boyle suggests, he was happiest after Churchill had dispensed with him in 1942, administering in the Admiralty in the rank of lieutenant-

Reith: unhappy titan

commander. But he never got the "one big task" that Attlee, for one, thought in the postwar years that Reith still had in him.

And yet, what would have "stretched" this difficult, forceful man? His earliest days at the British Broadcasting Company, with a staff that could be reckoned in dozens, battling for his vulnerable charge with newspaper proprietors and unsympathetic postmasters-general, persuading politicians to speak on radio at election time, fighting for a place in the establishment for broadcasting—these were fully employed, of course. The circumstances of his appointment seem bizarrely casual. Mr Boyle points out that Reith never acknowledged the help he received from Sir William Bull, to whom he had been acting as political secretary, while Professor Asa Briggs, in his history of broadcasting, has pointed out that "there is not even a short list of the six people seriously considered for what was to be a strategic post in twentieth-century history." Whatever the causes, the choice was admirable: Reith became at once pioneer, champion and godfather.

It is a hard moment for David when he sees Goliath in the mirror: the watershed in the BBC's life, and Reith's, is conventionally symbolised by the move from Savoy Hill to the new Broadcasting House in 1932. Bureaucracy could not be cut down to size, like the offending genitals of the statue of Ariel that adorned the entrance hall. New vigour could not be injected into the now-stultifying Reithian structure, any more than the bogus books lining the talks room could

be read. Mr Boyle is too percipient to accept this simple division of career into good and bad. He is more critical, for example, than Professor Briggs of the BBC's performance at the time of the general strike. And he has sympathy for the Reith of the 1930s. But both director-general and corporation grew more and more unhappy.

What could then have been found for Reith? Undoubtedly, his talents were underused, but jobs at the level to which he had risen did not often come in the granite blocks he liked, on which he could expend his force and drive out the *accidie* in his soul. He was always less good with the plasticine of political diplomacy. Would he have found greater satisfaction in America, where he was undoubtedly happy, after he had had the side of his face torn apart in the first world war, supervising arms manufacture? It seems unlikely, when so much of his unhappiness came from within, from inheritance or childhood. Curiously, Mr Boyle's biography improves as Reith ages and becomes more certain, quite without reference to external evidence, of personal failure. Never less than excellent, except perhaps at the very beginning of Reith's life, where there is a lapse into historical novelesque ("After the slow agony of delivery came the first feeble cries of the new baby, echoing in his mother's ears like an uncertain hymn of praise") it rises to a level of perception and understanding at the end that is beyond mere judgment or appraisal. In Mr Boyle's book, Reith reveals himself, a self-blinded Milton who found his talents death to hide. But the winds to which John Reith listened for the voice of God never, like Milton's patience, taught him acceptance of over 30 years of waiting. Did they listen? Reith never lost his deep Christianity. But the wind cannot read, and Reith's soul was a book he kept too tightly closed. Mr Boyle has managed, remarkably, to prise it open.

King of the gossips

THE CECIL KING DIARY, 1965-70

Cape. 353 pages. £3.

This book will have an assured, if select, readership. Everyone—politicians, ambassadors, Bank of England officials, businessmen and even fellow newspaper proprietors—who ever lunched, dined or talked with Mr Cecil King between 1965 and 1970 will at least have to look up the index. If they are mentioned they will then have

to look up the references to see who they should avoid, or be especially nice to, for the next few months. For Mr King has well and truly carted practically everyone of any note who was, in retrospect, so ill-advised as to give him, or accept from him, hospitality over those years. His book is a nauseating end to many a meal.

Of course, those who find it the best giggle for years will say that Mr King's hosts and guests have only themselves to blame. Certainly the former chairman of the International Publishing Corporation has breached every explicit or implied confidence given him, and that may not be very nice manners. But if Mr Wilson had not been so contemptuous of many of his colleagues to Mr King, and they had not returned the compliment about him, none of them would be squirming now, would they? The Tories come out of it rather better, for they were never so bitchy about their colleagues as the Labour chaps: perhaps they did not trust Mr King quite so much. Some of them had reason not to.

For what is clear from his diary is that Mr King was not only a vain and arrogant man but he was also rather a silly one. Take his relations with Mr Heath. Mr King trots round and tells

Mr Heath what secret (his own word) information he had been given by the Bank of England in his capacity as a director. Does he then really expect Mr Heath, or anyone else on whom he has performed the same egotistical exercise, to give him any worthwhile confidences in return? Mr King still does not seem to realise just how often he was having the mickey taken out of him.

For those not mentioned in its pages but who still want to buy the book, there are two warnings worth passing on. First, do not believe quite everything that is in it. Sir Christopher Soames, for example, may well have said that he would not go mouse hunting under a sofa with Mr Roy Jenkins (although that is an unlikely activity, in itself, for either man); but it is extremely doubtful that the merchant banker, Mr Louis Franck, ever told Mr King that the amount which went out of London on the Thursday and Friday before devaluation was "not less than \$1,300,000 million." Secondly, do not try to read it in one sitting. What starts out as a giggle ("Sunday, August 15th, 1965 . . . have been thinking of Wilson, whose days look to be numbered") becomes rather pathetic well before the end.

THE SOUTH AFRICAN CONNECTION

RUTH FIRST

JONATHAN STEELE

CHRISTABEL GURNEY

What is the real effect of investment in South Africa? Does it raise the living standards of the Africans and help to liberalise the regime, or does it have just the opposite effect? This book presents a large body of hard facts and a clearly argued case. It investigates the problem industry by industry and looks in detail at the activities of a number of individual companies and groups.

Economist: 'Those who rely on an economic resolution of the South African problem should certainly read this book.'

The Times: 'A mine of information and a minefield of controversy.'

Guardian: 'A scrupulous investigation of the facts.'

Sunday Times: 'Devastating compilation of evidence.'

New Statesman: 'Invaluable material . . . the information is thoroughly documented; the appendices are instant reference aids; the indexing excellent.'

37 GREAT RUSSELL ST LONDON WC1

The echoes of war

THE WORLD AND NIGERIA

By Suzanne Cronjé.
Sidgwick and Jackson. 421 pages.
£5.95.

THE MAN DIED

By Wole Soyinka.
Rex Collings. 315 pages. £3.50.

Sooner or later those who followed the Nigerian civil war from the safety of Britain became aware of the remarkable Mrs Suzanne Cronjé. It was said that her wireless set effortlessly picked up "Radio Enugu"—even after the Biafran capital had fallen and broadcasts were coming from makeshift transmitters in Owerri or Umuahia. True or not, there was no doubt that the Biafran bush telegraph had no trouble in reaching her flat in north London, where she amassed an enormous quantity of information about the war to add to her already considerable experience of its antecedents.

Now Mrs Cronjé has managed to digest her data, or at least some of it, and produced not a history of the war but an account of its ramifications abroad. Inevitably, this largely concerns Britain, the country that became most embroiled in the affair. The British government was in a cleft stick from the moment that a rift first appeared in Nigeria's fragile unity. Genuine neutrality—implying a ban on arms sales to both sides—was bound to be interpreted as withdrawing assistance from federal Nigeria in its hour of need; but support for the federal forces was a cause that many felt to be unjust—or at any rate no business of the British.

Government aid for Biafra was never likely, and Britain, while proclaiming neutrality, weighed in with arms shipments and diplomatic support for the federal side. The full measure of the British government's duplicity and double-talk is well brought out. The arguments put forward by Mr Wilson's ministers—that Britain was the traditional supplier of arms to Nigeria and that anyway it only sent 15 per cent of Nigeria's arms imports—are shown up.

Mrs Cronjé is probably correct in her analysis of the reasons for British support: a sentimental attachment of policymakers in the foreign and commonwealth offices to the federation (and particularly to northern Nigeria), coupled with anxiety about Britain's commercial interests (particularly the British stake in Nigeria's oil fields). But Britain's arms shipments were justified

not on these real, hard grounds but on lamentably feeble ones: that if Britain did not sell arms someone else would, and that there was a need to maintain a "moderating influence" in Lagos.

All this Mrs Cronjé deals with well, though it is hardly original matter. Other aspects—such as the Russian position—are less well known, and equally well handled. Perhaps Mrs Cronjé does not delve deeply enough; she has used the published sources well, but these have their limitations. Much information has not yet been released; it may, indeed, never be put on paper. The only way of getting round this difficulty is to draw more heavily than Mrs Cronjé has on the experiences of the people involved. For all that, her book is a serious one and well worth reading.

So too is "The Man Died," Mr Wole Soyinka's account of his imprisonment in the civil war. A Yoruba from western Nigeria, he had no tribal affiliations with the Biafrans of the east. But he was appalled by the brutality and injustice that he saw in federal Nigeria and became an outspoken critic of the military government. He was therefore locked up, though never brought to trial.

"The Man Died" is an extraordinary and moving book. It provides a rare opportunity for others to understand what the war meant to a Nigerian who was not a member of the political and military establishment. Mr Soyinka is obviously not typical—his talents and courage would mark him out in any society—but experiences like his were perhaps not uncommon.

Magnificent obsession

A PIECE OF TRUTH

By Amalia Fleming.
Cape. 257 pages. £2.95.

The outline of Lady Fleming's story is already well known. In August, 1971, she was arrested by the Greek military police and tried for complicity in a plot to effect the escape of Alexander Panagoulis, who was serving a life sentence for attempting to assassinate the Greek prime minister, Mr Papadopoulos. She was sentenced to 16 months' imprisonment and then released on medical grounds. Three weeks later she was forcibly removed from her Athens apartment, driven to the airport and put on a plane to London. The only compensation for her expulsion from her native land is her present freedom to tell without

fear the truth of her case.

Amalia Fleming is a woman of remarkable courage. She is, moreover, warm-hearted, impulsive, compassionate and consumed with hatred for all forms of oppression. She could no more have refused to hide escaping allied soldiers during the German occupation of Greece than she could have shut her eyes and ears to what was happening in Greece after the military coup of 1967. Although not connected with any underground resistance group, she actively tried to help the families of men imprisoned for their political beliefs, and when she was begged to assist in getting Panagoulis out of prison, where she knew he was being tortured, she could not refuse.

Her account of her own interrogation by Major Theophyloannakos, head of the military police's interrogation centre, and her treatment in detention is a chilling indictment of a regime. The letters from other prisoners, smuggled out of jail, which recount their tortures and the names of their torturers, show how fortunate Lady Fleming was to have international reknown; otherwise, her treatment would have been immeasurably worse.

On her own admission Lady Fleming is a political innocent, and thus she is on shakier ground when she digresses from her own story, as she often does, and offers her judgments on the course of Greek history over the past 25 years. For her there are only goodies (the late George Papandreu, his son Andreas, the left wing of the Centre Union party and the intellectuals who have shown resistance to the regime) and baddies (the king, the right-wing politicians, the generals and, of course, the governments of the United States and other Nato powers). But the blatant over-simplification of political issues, the many sweeping judgments based on unproven facts and the exaggerated language do not in the end undermine this book's veracity.

Lady Fleming: free to tell

ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

THE EXPERIENCE AND KNOWLEDGE of 23 countries brought to bear on some of today's TOP PRIORITY PROBLEMS

OECD publications:

POLICY PERSPECTIVES FOR INTERNATIONAL TRADE AND ECONOMIC RELATIONS. Report by the High Level Group on Trade and Related Problems to the Secretary General of OECD.

The report of the High Level Group, under the Chairmanship of Jean Rey, brings out the great changes which have occurred in international trade and the main problems now being experienced and examines the opportunities for further progress towards the general objective of a greater liberalisation of international trade.

ECONOMIC GROWTH IN HISTORY

By J. D. Gould.

Methuen. 480 pages. £4.50 cloth, £2.25 paperbound.

This is an ambitious as well as a long book. While Professor Gould eschews any very grand claims for his analysis or conclusions, he has in fact attempted to write a textbook on the historical characteristics of economic growth which is designed for both historians and economists. Unfortunately, the result is far from satisfactory—although it is only fair to emphasise that there have been few satisfactory and no really successful books on this sort of subject.

Admittedly, Professor Gould has done his homework well: his study is based on extensive reading in modern economic history and in those quasi-theoretical quantitative surveys which empirically minded economists have recently produced in such abundance. The result is an enlightened and suitably sceptical discussion of specific contributions to growth theory. Yet, in spite of the variety and wealth of its material, it is an excessively lengthy and somewhat rambling study, lacking in firm organisation or stylistic vigour. The first chapter, on "Growth and Development in History," has little definition or economy of purpose. It is too preoccupied with conceptual problems and fails to establish a framework within which the rest of the book can be logically accommodated. It is followed by four chapters on agriculture, capital, foreign trade and productivity—although there is little explicit justification for selecting these topics as the central themes of development. The final chapter discusses "Some Theories of Growth and Development," examining the work of such economist-historians as Chenery, Gerschenkron, Hoffmann and Rostow.

At bottom, both the strength and the weakness of the book—on the one hand its detailed scholarship, on the other its disjointed and rather aimless character—are attributable to the fact that its themes, whether historical or theoretical, were apparently determined by the kaleidoscope of available literature. The result is a lack of central purpose and even (given the book's breadth) of depth, which is bound to be disappointing. One is driven to the conclusion that detailed history and sophisticated theory are not yet ready to be married at the altar of economic growth.

1665: plague city

Years of destruction

THE DIARY OF SAMUEL PEPYS, VOLUME VI: 1665; VOLUME VII, 1666

Edited by Robert Latham and William Matthews.
G. Bell. 381 and 464 pages. £9 a set.

To the inveterate Pepysian, or to the serious student of restoration social history, every new volume of the diary that appears in this admirable definitive edition is equally welcome. On library shelves the handsome tomes accumulate, and there are now only two more instalments of the diary to look forward to, though the editors plan a tenth volume of commentary, a companion to the whole series—and an eleventh, comprising the index.

The two volumes that have just been published contain the passages that everyone who reads Pepys at all associates with his name—the eye-witness accounts of the plague in 1665 and the Great Fire of London in the following year. These are the most spectacular interludes in the narrative that opens with the expectation of Charles II's return to England, and centres—as regards public events—on the Dutch wars. Pepys at the Navy Office was of course in a particularly strong position to comment on the battle at sea, and his diary during these two years vividly communicates his incessant busyness. His uncommon ability as a civil servant had gained him recognition and he was received everywhere, to his considerable gratification. He had easy access to the Duke of York and to the King himself. When the fire was ravaging the City, he went to Whitehall, to the King's

closet in the Chapel:

... where people came about me and I did give them an account dismayed them all; and word was carried in to the King, so I was called for and did tell the King and Duke of York what I saw, and that unless his Majesty did command houses to be pulled down, nothing could stop the fire. They seemed much troubled, and the King commanded me to go to my Lord Mayor from him, and command him to spare no house but to pull down before the fire every way...

He is also authorised to offer the lord mayor the help of soldiers, so back he goes to the City:

At last met my Lord Mayor in Canning Street, like a man spent, with a handkercher about his neck. To the King's message, he cried like a fainting woman, "Lord, what can I do? I am spent. People will not obey me. I have been pulling down houses. But the fire overtakes us faster than we can do it." That he needed no more soldiers; and that for himself, he must go and refresh himself, having been up all night...

In contrast to the dramatic account of the fire, a panic-provoking event that called for swift action, Pepys's day-to-day comments on the plague through the summer months of 1665 convey the sense of a menace growing implacably. The figures published in the weekly hills of mortality, news of acquaintances stricken and dying, the sight of the dead-carts, the streets denuded of people, plans to move the Navy Office to Deptford—such items as these work up to a crescendo of alarm. But it is a danger against which there seems to be no defence, so Pepys works harder than ever and enjoys whatever there is to be enjoyed. He misses no chance of illicit kisses and dalliance, and so far as his social life is concerned the phrases "mighty merry," "full of content," "with great pleasure," recur just as frequently as in more auspicious times. It is his unending relish for life that makes his diary so perennially fascinating.

Unconscious modesty

SOCIAL SECURITY: ANOTHER BRITISH FAILURE?

By John Walley.

Charles Knight. 300 pages. £4.50.

The timing of the publication of Sir John Walley's book on social security could hardly have been better. It appears almost simultaneously with the publication of Sir Keith Joseph's massive bill to remodel the financial basis of national insurance, and only a little after the Chancellor of the Exchequer's green paper outlining a negative income tax scheme. The whole system of social security in Britain is going through one

of its regular periods of overhaul and reappraisal and no one, as Mr Dale's admirable foreword points out, has greater knowledge to contribute to this process than Sir John.

His subtitle, "Another British Failure?" has an element of unconscious modesty. For in his long career as a civil servant in departments concerned with social security, Sir John Walley has had a bigger share in its development in Britain than almost anyone except Lord Beveridge. Sometimes, perhaps more often than not, he did not very much like what his political masters made him do. He does not succeed in concealing his dislike of the 1959 National Insurance Act, which introduced, on a modest scale, wage-related contributions and pensions, and to which his skill and knowledge made a notable contribution.

Part I provides a concise history of social security in Britain since the Elizabethan poor-law, which he stoutly defends. Nor does he share the conventional wisdom which disapproves of Speenhamland. He quotes Pitt's powerful rebuttal of the concept of a minimum wage, on grounds whose validity continues today: it wholly ignores the factor of family size. Sir John has always been a firm supporter of family allowances and his historical review provides much support for their use. In this part of the book, incidentally, he argues that good social reformers make the best war lords—citing Pitt, Lloyd George, Churchill, Bismarck and Roosevelt as formidable evidence for his theme.

In Part II, which is the larger part of the book, he deploys his own ideas. Few would agree with them all; no-one will question that there is much to be said—and he says it well—for most of them. Some may wonder, though, whether his antipathy to means tests is not a little out of date. Many economists will doubt whether "dynamising" all provision for old age as a protection against inflation may not, particularly in view of Sir John's ideas as to the scale of such provision, provide at the same time both a guarantee of continuing inflation and a deterrent to other forms of saving. He also seems to treat very lightly the political and economic consequences of swingeing increases in national insurance contributions. Some people with experience of social security administration may think that he is a little hopeful here.

The book is completely up-to-date, and includes not only a commentary on Sir Keith Joseph's "Strategy for Pensions" but even a reference to the

change in the rates of family income supplements announced in April, 1972. It is the ripe fruit of a life given to social security administration and should be on the desk of all who seek to plan or administer social services.

Terrible twins

THE PROFESSION OF VIOLENCE

By John Pearson.

Weidenfeld and Nicolson. 233 pages. £3.

With the exception of the Richardson brothers, the Kray twins were the most dangerous criminals produced in Britain since the second world war. For years they terrorised the criminal classes, and a great many others besides, in the east end of London, and it seemed that there was remarkably little chance of securing their arrest and conviction—all the more so because they were specialists in tampering with juries.

Mr Pearson, who was asked by the Krays at one time to write their official biography (so that their retirement could be marked appropriately), has written a rather impressive little book on the Krays' rise to fame and on their destruction. Ronnie comes through as the more interesting, if chilling, personality: the graduate of Colchester and Shepton Mallet military prisons who liked being called "the colonel," the cold-eyed homosexual psychopath who attempted to ape Al Capone. The only slight disappointment about this book is that Mr Pearson does not appear to realise that it was the Krays, and the Richardsons, whose activities persuaded the Home Office of the need to introduce majority verdicts in criminal trials in England and Wales.

The Krays: trial by biography

Take 7

Race Relations at Work

Published for the benefit of all concerned with the employment of immigrants, this report on a survey into immigrant labour relations at seven English firms is a factual record of interviews with people of different races in the firms concerned and with managers, supervisors, trade union officials and community relations officers. The study shows the advantage of a clearly defined and carefully monitored race relations policy communicated to staff at all levels.

75p (by post 82½p)

The Story of the Earth

Presents, with the aid of 75 full-colour diagrams and plates, a complete and totally up-to-date view of Earth Science from the cosmic origin of the elements to the geological activity of the Earth at the present day. Geological jargon is avoided, though technical terms which the authors wish to establish are fully defined. The title has been published in conjunction with the big new exhibition now open at the Geological Museum.

NOTE: For the convenience of our foreign stockholders the amounts included in the financial statements have been converted from Italian lire to U.S. dollars at the exchange rate of lire 580.75 to the dollar in effect at June 30, 1972.

Pursuant to Article 29 of the By-Laws, the Stockholders have resolved to appropriate the net income of as follows: U.S.\$ 11,276,021

—to the Legal Reserve to increase it to 20% of capital stock	688,764
	<u>10,587,257</u>
—to the Board of Directors, 1% of the remainder	105,873
	<u>10,481,384</u>
—to the preferred stockholders as a preferred dividend on 18 million shares, 5% par value	1,549,720
	<u>2,410,676</u>
—to the Extraordinary Reserve	5,045,200
—to the Dividend Equalisation Reserve	1,475,788
	<u>372,997</u>
—unallocated earnings carried over from prior years	1,848,785
	<u>4,959,105</u>
—to the preferred and common stockholders, as a dividend on 18 million shares of each class	
—to the 2 million common shares, issued on January 1, 1972, in connection with the conversion of 5.50% debenture loan	137,753
	<u>5,096,858</u>
Less interim dividend paid on April 5, 1972, out of Dividend Equalisation Reserve	3,323,289
	<u>1,773,569</u>
	<u>75,216</u>
To be carried forward as unallocated earnings	

Therefore, the dividend per each class of shares is as follows (in Italian lire):

	Total dividend	Interim dividend	Balance payable
Common Shares	80	40	40
Common shares outstanding since January 1, 1972	40	20	20
Preferred shares	130	65	65

The balance, net of withholding tax, will be payable on, or after, October 31, 1972, upon presentation of the share certificates (coupon No. 8) through the following banks:

In Italy: Banca Commerciale Italiana—Banca d'America e d'Italia—Banca del Monte di Credito di Pavia—Banca Lombarda di Depositi e Conti Correnti—Banca Mobiliare Piemontese—Banca Nazionale dell'Agricoltura—Banca Nazionale del Lavoro—Banca Popolare di Novara—Banca Subalpina—Banca Ambrosiana—Banca di Napoli—Banca di Roma—Banca di Sicilia—Cassa di Risparmio di Torino—Cassa di Risparmio delle Provincie Lombarde—Credito Commerciale—Credito Italiano—Istituto Bancario Italiano—Istituto Bancario San Paolo di Torino—Monte dei Paschi di Siena.

In France: Lazard Frères & Cie, Paris

In Germany: Commerzbank A.G., Düsseldorf, Frankfurt a. M.

In England: Lazard Brothers & Co. Ltd., London

S. G. Warburg & Co. Ltd., London

In Holland: Amsterdam Rotterdam Bank N.V., Amsterdam

In Switzerland: Crédit Suisse, Zürich

In addition, the Stockholders have approved the Board of Directors' resolution of March 14, 1972, whereby Mr. GIANLUIGI GABETTI was appointed director and have reconfirmed as members of the Board of Statutory Auditors for the three year period 1972/73–1974/75 its present members:

—ALDO CIOLETTI, Chairman
—FERRUCCIO BURATTI, Auditor
—ALFONSO FERRERO, Auditor
—LIONELLO JONA CELESIA, Substitute auditor
—MARCO WEIGMANN, Substitute auditor

Immediately following the stockholders' meeting, the Board of Directors has reappointed GIANLUIGI GABETTI Managing Director.

Therefore, the officers-directors are:

—GIOVANNI AGNELLI, Chairman of the Board and Managing Director
—GIOVANNI NASI, Vice Chairman
—GIANLUIGI GABETTI, Managing Director and General Manager

Business Brief

Hogs, cobwebs and homes

Housebuyers can take no comfort from the freeze: mortgages are not covered by it. This means the $\frac{1}{2}\%$ rise in the interest rate for nearly 4m building society borrowers on January 1st will go ahead—the result, with the usual time lag, of the building societies' decision in September to raise their interest rate to investors, which was beginning to look uncompetitive. The higher rate seems to have boosted the societies' cash position: in October, the first month after the interest rate rise, the net inflow of funds was not far off the all-time high recorded in July. The question now is whether this will give house prices another push after the comparative slowdown of the past few months—which may have owed a lot to the squeeze on building societies.

The massive rise in house and land prices over the past two years was not simply the result of recent Government policy, no matter what the unions and the Labour party may say. It is a modern variant of a classic phenomenon known to economists for the past hundred years as the hog cycle and, as its name suggests, it has applied mostly to farm products. In principle it can crop up wherever supply can only be increased or reduced over a fairly long time—a year or more. Houses fit the theory admirably.

In the hog cycle the price in one year determines the supply in the following year. If pigs fetch high prices this

year, farmers are encouraged to breed and fatten more pigs for sale next year. But in year two the increased supply drives the price down, leading to a shortage in year three, and so back to high prices. There is no reason why this price cycle, one year up and the next year down, should ever stop unless farmers get the message and stop over-adjusting. If they do not, the fluctuations can sometimes become increasingly severe, and the cycle explodes. This is how cobwebs are formed.

The cobweb chart shows demand and supply curves for pigs, with each point on a curve showing how much, measured along the horizontal scale, would be demanded by buyers or offered by sellers at the price shown along the vertical scale. But for the supply of pigs the relevant price scale is the left-hand one, last year's actual price; while for demand it is the right-hand scale, this year's price. Starting at A, the supply determined by last year's price of X, the next step is to B for the price this year, C for the supply next year and D for the price next year, and so on, exploding into ever larger price fluctuations, as the spider spins.

House inflation

House prices at first sight do not follow this pattern; they do not go up—down—up, but up—up—up, at least in the modern inflationary world (it was not always thus). But the rate of increase has been going through a marked cycle, and one which

recently has become much more violent.

The chart on the opposite page analyses what has happened. At the root of the problem is the rigid way building societies operate and their near monopoly in the supply of funds for house buying in Britain. Building societies are loath to vary mortgage interest rates. One traditional reason for this is the administrative cost and inconvenience involved—although with computers now in widespread use this is becoming less important. The demand for mortgage advances is insensitive to changes in the mortgage interest rate—which is not surprising given the level of rents, the shortage of houses to rent and the tax mollycoddling of the owner-occupier. But building societies are also very conservative bodies with a feeling of moral obligation to look after their existing borrowers and not squeeze them too hard.

However, if the building societies are unwilling to change their lending rates often or by large amounts, they are also unable to change the rates they pay to their depositors. Yet their inflow of funds is very sensitive

to the interest rates offered, and how they compare with the interest on rival assets such as bank deposit accounts or national savings.

Since other interest rates are more flexible, building society rates become uncompetitive whenever the tide of general interest rates rises, as in 1967 to 1968. Then, as the tide recedes, the societies' rates are left to look increasingly tempting. Thus, the societies suffer successive famines and gluts of funds. From 1970 to mid-1972 their interest rates were very competitive. Because of this, and because of the state of the financial markets and the inflationary situation, funds flowed into the building societies on a massive scale. The net inflow of deposits trebled in two years.

As the societies do not ration advances by price they have to ration them by making borrowing conditions more onerous, or easier. New advances follow the flow of net deposits into the societies very closely. But with the supply of houses fixed in the short run, every additional £100 made available for buying houses adds roughly £100 to

house prices. The building societies supply 80% of the finance for house purchase, so house prices are largely determined by the availability of mortgage finance.

The societies argue the other way round, maintaining that advances have to go up to keep pace with house prices. But building costs have risen at a much more moderate pace than house prices. A rise in house prices does, of course, influence the supply. As prices rise, new house building starts to go up too. But completions follow only after a lag of a year to 18 months, by which time mortgage finance may have become scarce again. The chart shows how the drop in housing starts during the mortgage glut in the early 1970s, pushing prices up. But the sharp rise in house and land prices also made property an excellent inflation hedge or speculative asset. Speculators were attracted into the housing market, drawing in funds which would otherwise not have been available for buying houses, and reducing the supply for genuine owner-occupiers.

Slump coming?

It now looks as though the peak of the cycle has passed. Interest rates have been rising, and though the building societies have increased both their mortgage and deposit rates, they are still being left behind. Meanwhile, the supply of completed new houses is rising. The speculators are retreating, and "gazumping" seems to have died down. House prices have stopped their mad upward rush; where prices had reached fantasy levels, some have even dropped.

But nothing has yet been done to ensure that the same excesses will not be repeated the next time round. The risk of increasingly violent fluctuations has been accentuated by the new system of credit control, with interest rates generally much more flexible. If interest rates are allowed to rise sufficiently to arrest the runaway growth in the money supply, there is now a real risk of the first postwar slump in house prices.

The building societies bear the lion's share of the blame for this game of yo-yo. They have made no attempt at stabilisation, but have allowed the market in housing, and thereby

the construction industry, to bear the full brunt of monetary policy. This has done great damage to the industry. Every upswing produces shortages of building materials, but there is no incentive to invest in more brickworks because everyone knows the shortages will prove temporary. The building industry is both smaller and more fragmented than it needs to be, and consequently less efficient than it might be.

What is the solution? The building societies will have to find ways of varying the level of interest charges on mortgage advances more easily, and on a larger scale. One way of doing this would be to make the term of advances variable, and issue tables showing the effect of different interest rates on the time it would take to repay a loan at a given monthly repayment rate. At the end of each year the societies could send borrowers individual statements of where they stand. If rates were raised, this would not immediately produce an increased inflow of funds for the societies; there is no way of doing that without borrowers paying more. But the extra funds would build up gradually.

A first mortgage runs on average for fewer than four years; the average for all mortgages is below 10 years. All new borrowers would have to pay the going rate. The extra funds would come from the turnover of existing mortgages and from new borrowers. One snag is the danger that existing repayments would not even cover interest payments if interest rates went very high, so the debt would actually go up. But this is no great problem. The societies could accept that during the first few years of a mortgage its amount could be increased. For mortgages which have already run for a number of years, increasing the size of monthly payments should be no hardship for the borrower: inflation will have helped him.

The building societies should also consider more direct lending to the construction industry, perhaps in the form of "back-to-back" loans. Above all, they must accept responsibility for ensuring a steady growth in the supply of credit, and smoothing out the wild fluctuations of recent years. This will do far more to help the owner-occupier and the young married couple than a narrow preoccupation with mortgage interest rates.

Building societies call the tune

Building societies don't like changing mortgage rates

Therefore they can't change deposit rates

Other interest rates change more often

So building society deposit rates are sometimes too high & sometimes too low

So net deposits & new advances fluctuate

Advances influence the rate of increase in house prices

Which affect housing starts

Which, with a lag, affect completions

You'd never think this lot had so much in common

This announcement appears as a matter of record only

Stability über alles?

Or so it used to be. Inflation is still a key issue in Sunday's German elections, but neither party has a ready answer to it

"Better 5 per cent inflation than 5 per cent unemployment." This is the pat reply of Herr Helmut Schmidt, Germany's economics and finance minister since Herr Karl Schiller resigned last summer, to all embarrassing questions about the government's cost-of-living record. Although the opinion polls report that four-fifths of the electorate still put price stability right at the top of their list of economic priorities, it has also dawned on many Germans in the past year that even if they exceed their postwar average inflation rate of 2-3 per cent annually, they will not immediately be struck down by lightning. Inflation as the supreme German bogymen—a relic of the devastating experience of the inter-war years—may be losing some of its terrors.

Herr Brandt's government seems to believe so. One election poster shows the Chancellor beaming with the message: "Germans, we can be proud of our country." He means that they have never had it so good; and how they know it. Instead of the recession predicted little more than a year ago, the Germans have the beginnings of a moderate boom. Consumer spending is humming, investment is showing signs of picking up, unemployment is down to about 1 per cent (with vacancies about three times as numerous), and short-time working, widespread last year, has been largely ended. At the same time the number of immigrant workers has climbed beyond 2.3m, with a brisk demand for more.

So when Herr Schmidt speaks of 5 per cent unemployment, he is talking figuratively. He knows that the Germans did get quite a fright when, during the 1966-67 "recession," unemployment at the winter peak temporarily climbed to 600,000. But he knows equally well that there is no prospect at all of unemployment reaching anything like that level now. According to one school of thought, his inflation-unemployment equation is nothing but a veiled message to the unions that wage claims will be treated sympathetically and there will be no radical, Heath-like attempts at squeezing them to get on top of inflation. But the unions would be unlikely to put up with too much squeezing anyway.

On the eve of the annual autumn wage round the civil servants—whose claims are important because they tend to set the pace for other settlements—have already tabled preliminary demands amounting to a 10 per cent rise in their wage bill, protesting all the while that they

are holding back in the interest of stability. The first regional claims in the metal industry, which employs more than 4m people, are around 11 per cent. Settlements in Germany are usually a bit lower than first demands, but the unions have not got much room for manoeuvre if they want to come away with some real increases for their members. With inflation running at 6 per cent plus, and tax taking perhaps a further 2 per cent, even a 10 per cent rise would only leave 2 per cent extra in real disposable income.

The prospect of fairly high and fairly determined wage demands, a really tight labour market and a growth forecast of at least 5 per cent for next year do not augur at all well for the chances of keeping prices under control: they promise to add demand pressures to existing cost-push. It is probably no accident that the annual report on the economy by the "wise men" (the government's economic experts), originally due on Wednesday, just four days before the election, has been held up. But a fair amount of economic navel contemplating has been going on anyway. The five big economic research institutes published their joint analysis of the economy only last month, and were uniformly horrified at the outlook for inflation. Three of them went so far as to advocate another DM float.

The Germans insist that theirs is not an undervalued currency now. Although there is still a trade surplus, the current balance has slid into deficit to the tune of over £200m in the first three-quarters of this year, helped along by the German taste for foreign holidays and by all those foreign workers sending money back home. German wage costs per unit of output in dollar terms will have gone up by nearly half between 1968 and this year—against a rise of one-third for the EEC countries as a whole, a good quarter in Britain and only 6 per cent in the United States. This suggests that another runaway German export boom is less than likely. With import prices rising more slowly than export prices, and the inflow of foreign funds effectively stopped, talk of imported inflation has become a nonsense. Germany's present inflation is well and truly homemade.

This does not make controlling it any easier. Neither Herr Brandt's coalition nor the Christian Democrats have any snappy solutions at the ready. The Christian Democrats have made price stability one of their main election

platforms, but their action programme talks fairly hazily about stricter budgetary policies, more credit control, an incomes policy of some sort, and more competition. On the government side, Herr Schmidt is planning to raise taxes next year, but on the whole admits there are no patent solutions to be had.

Either party would have trouble cutting down much on the rise in public spending, particularly if public sector wage claims succeeded. On the other hand, monetary policy will probably get tighter whichever side wins. Germany agreed to the EEC council of ministers' resolution in Luxemburg in October to try eventually to cut down the rise in the money supply to the same rate

as nominal gnp. The Bundesbank has already raised the discount rate twice in the past few weeks. It may not be possible to push rates much higher for fear of once again attracting a flood of foreign funds. Strong hints are now being dropped about a possible credit ceiling.

The one recipe the Germans do not yet seem prepared to try is a serious price and wage freeze. A recent document on such freezes in other countries, put out by the economics ministry, caused a huge flap because it was thought to be a government kite for similar measures at home. Industry and unions are equally convinced that it could never work. But they are keeping a sharp eye on the British experiment just the same.

And the rest of us

The common cause of price inflation in Europe may be the different ways everyone shares the national cake

All the members of the enlarged European community are in inflation up to their necks, just like most other industrial countries. The table shows that the surprising thing is the similarity between the rates of inflation in most community countries. Prices have risen between 5½ per cent and 6½ per cent almost everywhere. But if we are in step now, it was not always so. In the past the different countries have had quite different long-run rates of price inflation, from Germany's leisurely 3 per cent a year over 1963 to 1971 to France's 4 per cent, Britain's 5 per cent and Denmark's hectic 6 per cent. This means that those countries which did best in the past have had the biggest jump in prices, while those who did worst have had the smallest. So two things have to be explained, not one:

- (1) Why did all countries suffer the price explosion?
- (2) Why did the past best performers suffer most?

Up with the nine:
consumer prices, % growth a year

	1963-71	Last 12 months*	Present rate as % of long-run average
Germany	3.0	5.7	190
Luxembourg	3.2	5.7	178
Italy	3.7	6.0	162
Belgium	3.7	5.4	146
France	4.2	6.1	145
United Kingdom	5.0	6.6	132
Netherlands	5.4	7.2	133
Ireland	5.9	8.9	151
Denmark	6.1	6.5	106

*Source OECD, % change to August, 1972.

The temptation is to blame international trade and capital flows for carrying the infection of inflation from one country to the next. Rising import prices can have a direct effect on a country's own price stability. But this has hardly applied of late; import prices in dollar terms have risen less than domestic prices in Europe, while adjusting for exchange rate changes means, for countries like Germany, that import prices have been a stabilising force.

Capital flows are a different kettle of fish. They can make life difficult for those on the receiving end, particularly where, again in Germany, domestic control over

the money supply is a little rocky. But then no one suggests that money supply effects are quick-acting. Anyway, money supply changes, or for that matter surpluses on trade which would accrue to the least inflationary country, would pull them into line by pushing on the pressure of demand and level of activity. The interesting thing about the present community is that, as the chart shows, none of the nine community members is at present over-worried by excess demand. On the contrary, four countries have the highest unemployment for more than a decade, while the rest have a good way to go before they hit previous lows. So we must look on the cost side rather than the demand side for an explanation.

The Organisation for Economic Co-operation and Development has pointed to one vital clue. In a study of expenditure trends in OECD member countries it has observed a widespread fall in what it calls "pure" private consumption. This is the amount the consumer spends out of his own earnings. Such spending is, in effect, matched by the consumer's own contribution to output, whereas spending out of money given to him and others as transfer payments, such as pensions, family allowances etc, is matched by someone else's output. The state has to grab from those who produce and earn in order to give away these transfer payments—even though some part of them may go back to the same people. This grab results in higher taxes which then tend to put up costs and prices. The OECD notes that the fall in "pure" consumption is the result not so much of a fall in wages as a share of total incomes but of a larger part of incomes being taken away in taxes. In the past we have argued a similar case for explaining British inflation. This explanation apparently applies to continental countries as well.

Income and resource distribution is more like a balancing act in which it is possible to fall either way. Countries which give too small a share of the cake to wage-earners run the risk of unions becoming increasingly militant and demanding more. This can cause wage-cost inflation. But at least if the cake is increasing in size sufficiently rapidly, wage earners may be content

with their low share. Moreover, fast growth is a better bet if the wage share is low. There is more room for such worthies as exports and investment. So it is possible for a country with a low share for labour to keep out of trouble by riding the growth tiger. But it is also a game which requires both skill and daring.

At the opposite extreme a country devoting too large a share to the wage-earner and private consumption has its difficulties. All too often this means low investment, a bad balance of payments, poor growth and public squalor. Yet to take away from the wage-earner can be as inflationary as to refuse to give to him. Declining shares are always difficult to achieve when living standards are anyway fairly stagnant. The saving grace, however, of the slow-growth high-share economy is that it can always try to mount the growth tiger and potentially stands a better chance of success. The fast-growth low-share economy which falls off is in a sadder plight.

This table gives a rough indication of ratings:

Sharing inflation

Prices		Consumption: share of gnp		
Up most 1971-72	Up most 1963-71	Biggest in 1963	Biggest loss to 1970	Slowest growth 1963-70
Ireland	Denmark	Ireland	Ireland	Ireland
UK	Ireland	UK	Denmark	UK
Neth	Neth	Belgium	Belgium	Luxem
Denmark	UK	Denmark	UK	Denmark
France	France	France	France	Belgium
Italy	Italy	Italy	Neth	Germany
Luxem	Belgium	Luxem	Luxem	Neth
Germany	Luxem	Germany	Germany	Italy
Belgium	Germany	Neth	Italy	France

Ireland fares badly all round. It is the exception to the rule that the best have done worst and the worst have done best. The reason is probably that Ireland is so far below the other countries' living standards that problems of resource distribution are endemic.

Britain, Denmark and the Netherlands generally compete for the remaining places at the top of the table. Denmark, like Britain, has suffered from an over-rapid growth in public expenditure over the past decade. In terms of direct claims on goods and services Danish public

spending rose from 16 per cent in 1955-57 to 23 per cent in 1967-69, and this swing was accompanied by a sharp rise in taxation. But in contrast to Britain, Denmark has rather less slack in the economy to give it a leg up on to the growth tiger. By 1973, demand-pull inflation could be reinforcing cost-push.

The Netherlands, however, has been in the social contract game for some time and has paid attention to what is happening to shares in the national cake. Unfortunately, perhaps because it comes into the low-share, fast-growth category, it has of late not had a very comfortable ride. Although over the past decade wages have been pushed up, the share of consumption has remained low. Its inflation has been aggravated by the way value-added tax was bungled. It was introduced in conditions of excess demand during 1969. The Dutch have also had a wage explosion which, as in Britain, seems to have resulted in some labour shake-out and unusually high productivity gains during a slow-growth period. But from early 1970 onwards, at just the wrong time, the index-linking system has run riot—virtually all wages, social security premiums, pensions, sickness benefits and national assistance payments were being brought into the net just as inflation was getting into its stride.

France and Italy fall in the middle of the table; France as the most successful exponent of tiger riding and Italy as the country which has just fallen off the brute. The French had their fright in 1968 after growth had slowed down. They are not risking that again and indeed seem all set to notch up another 5½ per cent rise in output this year. But France's success has been bought at the expense of riding dangerously fast and has had to be paid for in inflation. As inflation looks like accelerating further, France may have to introduce a more formal prices and incomes policy on the American and British lines before too long rather than risk having to cut back on growth. Italy had already come a cropper when the growth god failed. Whether the original cause was political and industrial strife matters little. Without growth the resource allocation problem has become almost unmanageable. No one in Europe looks very comfortable, and perhaps Britain can take a wry comfort from this.

The long and the short of it

BUSINESS

Britain

Tony's sharpening that knife of his again

The knives are out in Whitehall for the annual public expenditure cuts. This is the season when the Government reviews and rolls forward its public spending programmes for the next five years: it is now looking forward to 1976-77. The results will be revealed in the next public expenditure white paper, probably early in the new year. For ministers it is a more important exercise than the budget. They all have a vested interest in spending more money but, unlike tax changes which the Chancellor presents for rubber stamping, they also have a say in who gets what. Mr Anthony Barber lays down what will be available and each minister bids for his share. The bids in total are always too large, so the annual ritual of horse-trading follows.

This year the business is for real and some people are going to get hurt. When the Conservatives came to power in 1970, the Government was committed to spending cuts. In October, 1970, it cut the growth programmes inherited from Labour down from 3-3½ per cent a year at constant prices to around 2½ per cent. Since then it has all been the other way. Public expenditure has been pushed up sharply to counter stagnation and rising unemployment. Indeed, a year ago when unemployment was rising towards the million mark the Treasury was almost begging departments to find ways to spend more, provided it could be done quickly and not last very long.

Since last November the new industrial and regional development policies, the decision to up-rate social security benefits annually, and assistance to nationalised industries to pay for price restraint have restored all the original spending cuts and added at least as much again. Then there is the £1 billion for negative income tax to be found at the end of the period. All

in all it now looks as if public spending on present policies could have climbed back to the 4-4½ per cent a year of the National Plan era of the mid-1960s.

This does not mean there must be an emergency package of cuts for the next year or so. Counter-cyclical spending is still needed to get the economy up to 5 per cent growth. It does mean that some pretty large cuts will have to be found for later years if taxation is not to start rising once more, not a pleasant prospect on the run up to a general election.

Optimists will argue that the underlying growth of the economy has already accelerated from the modest 3 per cent a year basis the Chancellor likes to use when he sets his spending targets. They may well be right. But everyone should have learned the lesson of not spending resources before they actually show up. To do that again would be to run a quite unnecessary risk of pre-empting resources from exports and investment vital for growth. A sharp change of course on private spending is just as damaging to industry as crisis cuts in public spending.

The freeze

Looking for leaks

The first major attempt to break the freeze failed on Wednesday night. Labour moved a series of amendments to the freeze bill in the Commons, the first of which tried to exempt all wages. This was easily defeated, but one to exempt the farmworkers came closer to success; a dozen Tory MPs abstained, and the Government carried the day only narrowly.

Mr Barber argued that if he gave the farmworkers their money, another 500,000 low-paid workers in wage

council industries would have an equally good case to claim theirs. The new Minister of Agriculture, Mr Joseph Godber, claimed (with little evidence) that increases in farmworkers' wages had been regularly used as a stepping stone for larger increases in pay for industrial workers. He also claimed (with more evidence) that the industrial trade unions had always kept the agricultural workers at the bottom of the queue. But some Tory MPs from rural areas did not agree. Mrs Kellett-Bowman, explaining how she had mucked out pigs and cows in her time, said farmworkers were entitled to a rise. The Chancellor remained unimpressed.

So the Government held that bit of the dyke, only for the Confederation of British Industry to discover a serious loophole which might allow Mr Clive Jenkins to succeed where the farmworkers failed. The CBI wants some kind of legal fall-back if that happens. It says that the proviso making it possible for civil servants to receive their fixed annual salary increments will also provide a way for employers to give rises to the 30-40 per cent of white collar workers who are on vaguely defined pay scales. It only takes a few loopholes like this to thaw out any freeze. The simplest way round the problem would be to eliminate the rises for civil servants altogether, since in themselves they will create much divisiveness, as they did in the 1966 pay pause. The secretary of the National and Local Government Officers' Association, Mr Walter Anderson, has naturally taken a very poor view of this suggestion.

Another plea came from the gasworkers, who demanded on Wednesday that they should get the same wage rise as the power workers got. However, the gasworkers are not a militant lot, so a strike is most unlikely. Most of them belong either to the engineers' union or the general and municipal workers, soon to be headed by the moderate Mr David Basnett.

On the prices side, the delay in introducing the freeze has had serious

The cold truth about Canon calculators.

At Canon's test lab we put our calculators in a 30°C (22°F) below zero chamber for up to 70 hours, with nothing between them and the deep-freeze. When at last they come in from the cold, they only pass if they work perfectly.

Now, let's face it. You may never use a Canon calculator where it's likely to get frostbitten. But wherever you do use one, Canon's quality control assures perfect performance. For

three weeks we put our calculators through a real hall of horrors. 95% humidity. 60°C (140°F) heat. Shock tests. Vibration tests. Endurance tests. Even sound tests in a non-echoic chamber like the ones used by sound equipment makers. We make sure they do their quick work quietly.

We're just as particular about everything else. We begin by using only the finest materials. We design and redesign each model to be as

easy as possible to use, as pleasing as possible to look at. We check and recheck them each step of the way, through final assembly. Then we test them. Unless they reach our exceptionally high standards, they don't reach you.

We've been making calculators this way a long time. Which is to say we've been making them unbeatable. If that's the kind you want, you want a Canola. And that's the cold truth.

**The Twin Otter. It's not a pretty plane.
But its rugged, simple design and world-wide
support keep flying-time up and down-time down.
And that's beautiful.**

We could have made the Twin Otter pretty. Instead we made it reliable, versatile, economical—and easy to service, anywhere in the world.

We gave the Series 300 Twin Otter highly advanced STOL capabilities. A payload capacity of up to 4430 lbs. A spacious, modern cabin that helps you cope quickly with any kind of passenger-cargo configuration. And we coupled all this with a simple, rugged airframe and powerful PT6A-27 twin turbines with reversible, full-feathering props.

To keep you airborne longer in all kinds of weather, all kinds of places. Places like the Caribbean, where Air Indies uses five Twin Otters to provide a regular service between San Juan, Ponce and Mayagüez, St. Thomas and St. Croix.

They run 116 daily flights, with average stage lengths of 73 miles, from 6 a.m. to midnight. Then tomorrow's maintenance begins.

"We are scheduling 3600 hours annual utilization per plane," says president Harold Olsen. "And the reliability that permits 6200 hour engine TBO approvals explains how we're able to confine all our maintenance to the off-hours.

"We're looking for our sixth Twin Otter."

As we said, the Twin Otter keeps flying-time up and down-time down.

That's the beauty of it.

We go all the way.

Most international airlines think they've done a good job if they deliver your imports to London. After all, that's the end of the road for them. But BOAC don't think that's good enough. We know you want your imports much closer to home than that. So we make sure it gets closer. In fact BOAC is the only international airline operating a cargo road service regularly between 11 major U.K. centres and 5 U.K. airports. So no matter where you are, we'll deliver

your imports right to your doorstep.

Which saves you time and miles. And there's no extra charge, since in most cases the service is part and parcel of our freight rate.

So isn't it better to use an airline that delivers to your door, instead of leaving your imports in London.

the best way here

You are short of finance
 You are going public
 You plan to expand
 You're merging or taking over
 You're starting a business
 You're wondering about the EEC
 You're setting up abroad
 You have foreign currency problems
 You need instalment credit
 You're uncertain about insurance
 You need leasing facilities
 You require factoring or invoice discounting

The turning points.

Only the Midland has a Finance Management Team to see you through.

There are occasions in the life of every business, *large or small*, when financial arrangements must move in a new direction.

This is when the best financial advice, assistance and management are essential. And it is for these occasions that the Midland Bank, alone amongst the major clearing banks, operates its Finance Management Service.

Details of the facilities of the Midland Bank Group can be discussed with a member of the Team, all of whom are highly trained, experienced men who have already held management appointments in the Midland Bank. Each is available to companies to provide a complete finance management service, and can

be contacted through the appropriate Regional Director, your Midland Manager, or through the Team's leader, Michael Clipsham—who is based in the Bank's Head Office, Poultry, London.

As a clearing bank service, it is unique. To many businesses it has already proved itself. It will be of great significance to many more in the future.

Mr. Michael Clipsham,
 TD, FCIS, FIB, MBIM, M.Inst.A.M.,
 leader of the Finance
 Management Team

Continued from page 78
 effects. Wholesale prices of many products, which went up 4½ per cent during the CBI's first year of restraint, took off during the following three months' extension at 9 per cent. The October retail price index published on Friday will show how far these wholesale prices have reached the shops. Insofar as they have not, there is clearly trouble to come.

The first really significant indication that Britain's food manufacturers and retailers are going to co-operate with the freeze came, oddly enough, in the form of notifications of price increases. If they had been so inclined, companies could have steam-rolled through the proposals with a whole host of increases, making it extremely difficult for the Government to investigate and pronounce on every one when it eventually gets its law. Even with the guillotine, this is going to take a month.

Companies will still be able to put up prices after that, and then wait for them to be rolled back officially. But so far, of more than 50 food price increases that have been reported to the Department of Trade and

Industry's special prices unit, not one has been actually put into force.

Many of the early applications were expected. The Government secured pledges of co-operation on the Monday after the freeze was announced. But, from Wednesday morning to Friday evening of last week, it had a constant stream of industrialists, including representatives of the Food Manufacturers' Federation, trooping in to iron out details of how it would work. It was then that the Government was warned that some prices (lard, for example) would go up shortly.

Of course, there was more activity than showed on the surface. The hard-pressed machine tool maker, Alfred Herbert, is hoping to be allowed to increase prices. Almost alone in the industry, it did not push them up in the past few months. The British insurance industry is now having unofficial talks with the Department of Trade and Industry to get special treatment under the prices freeze. The DTI has agreed that insurance companies may continue to raise motor premiums when the increases were announced before the freeze took effect for policies up for renewal afterwards.

Tax harmonisation

Vat can stand a big round

Full tax harmonisation with Europe would mean £1.30 off a bottle of scotch or gin (halving the price), 25p off a bottle of wine, nearly 4p off a pint of beer and 13p off a packet of 20 cigarettes if Britain adopts the average rates for those excise duties now in force on the continent. Except that if the Government wants the revenue back it will put 1p on a gallon of petrol (one tax that is higher on the continent) and 8½ per cent on the rate of value-added tax. There is, of course, always the option of harmonising to the extent of subjecting food to Vat, as in Europe, so that the increase in the Vat rate could be less—or so the Confederation of British Industry has worked out in the study of excise duties in Britain and the common market, published on Friday.

But the study, having raised tribulous hopes, shows that the commitments to harmonise taxes are satisfactorily vague from the Government's point of view. In the course of 1973 there is supposed to be a quantitative study of the budgetary, economic and social consequences which will follow a harmonisation of rates of excise duties, and after that some actual proposals for harmonisation.

One social consequence of coming totally into line with Europe would be a shift in the average household of about £1.50 from the wife to the husband, assuming that he buys the excised goods and she the ones liable to Vat. But what the CBI's study does show

*CBI. £5.

Export trade, retail trade: in volume terms (value at constant prices).
 Unemployment: wholly unemployed excluding school-leavers; latest rate 3.4 per cent. *Seasonally adjusted. ‡Provisional

is that if the Government puts Vat at a 7½ per cent rate to prevent it actually being inflationary, it should concentrate any disinflationary tax reductions on the excises: halving beer duty would cost £250m, take ½ per cent off the cost of living and 2p off a pint of beer, and concentrate the benefit among poorer people.

Wool prices

Over the eyes

The price of raw wool may have doubled at the auctions but that is no justification for the large immediate increases in retail prices confidently being forecast by some manufacturers and retailers. In the two-month period ending in late October, buy-at-any-price purchasing by the Japanese created the most rapid rise at Australian and New Zealand auctions since the Korean war. But it is physically impossible for the wool bought in October to find its way into the shops now in suits, sweaters, carpets or even as straight lengths of cloth or knitting wool. It will spend anything up to 18 months in the pipeline.

The mills are trying to add the cost on now to compensate for what they will have to pay for raw materials in the future. A month ago one was quoting even its biggest customer three prices for an 18-month contract; one price if he ordered today, one for tomorrow, and another for any time after that. Each varied by 4p a yard. They also have their eye on next week's big Frankfurt cloth fair, and the hardest bargaining that will have to be done for years.

No one knows how the future price will average out. In the past three weeks, auction prices have dipped even though the Australian Wool Commission stepped in to buy. Last week's slight rise again was probably because British and continental buyers were bidding, reckoning that the Japanese whirlwind had spent itself.

No matter what the auction price ends up at, it will not be enough to warrant the sort of manufacturers' increases being mooted, with reports of cloth going from about £1.50 to £2.30 a yard. At the top end of the market, there is talk of a jump of from £4-£5 to £7-£8 a yard in two years. This would add more than £10 to the 3½ yards needed for a suit. But the International Wool Secretariat argues that raw wool represents only

Harold wields his slide-rule

What lies heaviest on Mr Harold Wilson's conscience? None other than that, 30 years ago, he introduced for the first time (subject to challenge) the word "productivity" in an official document. This came out in a lively presidential address to the Royal Statistical Society on Wednesday. It is a nice question whether his apologies are owed chiefly to the statisticians to whom he gave a diabolic job of measurement, or to the trade unions for a stick put into the employers' hands, or to the Labour party for giving the Heath Government an indicator on which its track record is remarkably good.

Mr Wilson was running the wartime Mines Department's statistics when he got hooked on the new concept of output per manshift. He had the qualifications all right, having worked for Beveridge before the war, "when I had to do two hours of forced statistical labour before breakfast, estimating seasonal variations in the monthly unemployment figures by industries (1927-37)." And the young Harold Wilson was evidently not lacking in the upmanship he was to display later, for he relates that perhaps he was the only statistician instructed to report direct to the minister: "It helped—I commend this to Her Majesty's Statistical Service—that I shared an air-raid shelter with the then Principal Private Secretary, most recently a Permanent Secretary to the Department of Trade and Industry."

Those were heady days for the statisticians, hewing out the first-ever official balance of payments figures, the first-ever official national income estimates, with no computers to spoil the fun. "The Mines Department's prime weapon," Mr Wilson recalled, "was a cylindrical wooden slide-rule, too heavy to hold in the hand, mounted at an angle on a spiky base, like a Crimean war mortar, and equivalent to a flat slide-rule 83 feet 4 inches long." He still uses a cylindrical rule equivalent to 66 inches and claims that in an arithmetical race with a "distinguished colleague" (disguised as Mr Wedgwood Benn), who had "invested in one of those pocket electric calculators," "the slide-rule won hands down."

Mr Wilson has stuck to his slide-rule but kept up with the statistical times. Or so he believes:

Every prime minister has his individual style of government—and his own personal approach to the use of statistics. Mine was inevitably voracious. Contrary to a carefully fostered legend, I spent more time with statisticians and statistics than with journalists and the public opinion polls.

He certainly did much in office to

elevate Whitehall's statistical service. There are 382 employed in it today, more than double the number in April, 1967; and its head, Professor Claus Moser, is now a Permanent Secretary. (Although this only occurred on May 1, 1971, the impetus came in Mr Wilson's day). He encouraged Mr Moser to draw up proposals for radical changes in early 1967: "future economic historians and historically-minded statisticians will see this as the Great Charter of statistical reform." A new cabinet committee was set up to keep statistics under review: characteristically, he adds, "I took the precaution of chairing the first meeting."

The trouble is that however big some of the leaps forward in enumeration have been, particularly in social statistics, the major issue in decision-making which must dominate all our discussions, as Mr Wilson admitted, relates to macro-economic statistical information. And here the record is less than comforting. He himself ran away from the issue by letting the politician take over the tail-end of his address. This consisted of an onslaught against the 1970 pre-election trade figures ("Those goddamned jumbo aircraft—£16m of a £31m deficit—were as electorally damaging some felt as the World Cup defeat the previous day") and the bankers' ramps which upset honest-to-God calculations about sterling: "You are dealing with the irrational, the imponderable, the immeasurable." But Mr Wilson was merely blaming the world for being a real place and not fitting into a rigid statistical framework.

Anyone who assumes that Mr Wilson's acceptance of this presidency means he has discounted a snap election in the coming year could be wrong. One famous predecessor, Mr Gladstone, found time to become prime minister in the middle of a term of duty as president of the very same learned society in 1867-69.

'Marked improvement in our financial results'

Points from the Chairman's Review 1972

'I am glad to report a marked improvement in our financial results. This is due above all to a most encouraging turn-round by Capitol; a further successful year for our records business worldwide; and increased profits from our entertainment, television and property activities.'

'Although we continue to face difficulties, we also face great opportunities in the UK and overseas. Much has been achieved during the past year, especially in North America.'

'Subject to the general course of the economy, we believe that, overall, the Group should show improved performance – in terms of both turnover and profitability – this current year.'

Sir Joseph Lockwood

Copies of the 1971/72 Report and Accounts may be obtained from Group Public Relations, EMI Limited, 20 Manchester Square, London, W1A 1ES. Telephone 01-486 4488.

The international electronics, records and entertainment group.

Financial Highlights	1971/72 £ 000	1970/71 £ 000	
Sales	251,052	230,569	+ 9%
Profit before interest and taxation	22,788	13,978	+ 63%
Profit before taxation	18,336	8,968	+ 104%
Profit attributable to ordinary stockholders	7,297	4,562	+ 60%
Earnings per ordinary stock unit	10.2p	6.4p	+ 59%
Dividend for year per ordinary stock unit (50p)	7.5p	6.25p	+ 20%
Net gain in liquidity	12,641	2,482	

4 per cent of the end price (and retailing 50 per cent).

In Britain, seven multiples account for between 55 and 60 per cent of the 8.5m suits sold each year, and use between 40 and 70 per cent of wool in them. As total sales have stagnated in the past 10 years, they watch each other like hawks. It was always assumed that one dare not make a significant price change without putting its precious market share in jeopardy; however, one recently did, adding £5 to a popular suit, and those particular sales continued to climb.

The carpet market is even more critical for wool. Britain accounts for almost half of the 200m lb used in woven carpets in Europe. But it is to tufted carpets that the IWS has been looking for future growth: in 1971 50m lb were used, compared with 17m lb the year before. Now the rapid rise may make manufacturers stick with the synthetic fibres.

Computers

Sell ICL?

If the Government is not already worried about the ability of Britain's International Computers Limited to

continue in its present form then it should be. The size of the problem is this: according to an EDP Europa Report, about 25 per cent of ICL's main range of computers, the 1900 series, was installed either before or during 1967, and a further 39 per cent was installed in the following two years. Over the next two to three years about 1,600 out of a total of 2,500 machines will need either modernising or replacing. Some of ICL's internal sales estimates suggest that if more than 800 of these are held it will be a major achievement.

Like all computer manufacturers, ICL maintains a substantial dossier on each of its competitors, and the thickest in the ICL library now is on the Burroughs Corporation. It became obvious that Burroughs would pose a major threat when it introduced its B1700 machine in June. This was probably the reason why ICL approached Burroughs soon afterwards in an attempt to arrange some sort of merger. The Government forced ICL to break off the negotiations because Burroughs would talk only on the basis of a majority shareholding, and the Government feared it would be accused of a sell-out. It was a decision which both it and ICL could regret.

Burroughs was prepared to bid for ICL to get its customers, not its facilities. Now Burroughs is making a good stab at winning those customers in the market place. The usual difficulty about inducing any customer to switch from one computer manufacturer to another is that not only does the old computer installation have to be scrapped but all its programmes too, and the whole lot has to be worked out afresh, which is a daunting prospect. Promises made about compatibility rarely work out without unacceptably big losses in efficiency. But Burroughs is now in the last stages of polishing a computer programme that can slot neatly into the ICL system, so that a marrying of ICL and Burroughs equipment can be carried through without disruption. Claims like this have been made before, but the Burroughs computer has features which make many people think that this time it could work.

The Government could now do worse than reconsider its attitude to an ICL-Burroughs merger. Burroughs can no more afford to offend the Government than can any other computer company. It therefore cannot expect to call all the tune. There are also powerful voices on the ICL board who favour selling out.

Please get together, chaps

It hardly needed a £100,000 investigation by a former Lord of Appeal, Lord Devlin, to identify the main trouble with trade and employers' associations and their ilk: there are too many of them. As his report, published on Thursday, says, the vast majority of the 2,000 or so that exist are far too small to represent the interests of their members effectively. More than 250 have a piffling income of less than £500 a year.

It has been very foolish of industry to spread so thinly the £20m or so it contributes each year to its trade bodies. But entry into the EEC makes it absolutely necessary to change the system. European trade associations are more logically organised, larger and therefore richer. Consequently they have better staff and more authority. If the British associations do not merge to match them, the EEC industrial policy which is still being settled will not be formulated in the way that British industry wants. There have already been some nominal association mergers to suit EEC negotiating bodies, which only allow one or two representatives from each country. Examples include food manufacturing and banking. But these are small beer compared with the fundamental shakeup that is

needed.

What Lord Devlin has suggested, in most diplomatic terms, is that there should be a merger at the top between the Confederation of British Industry and the chambers of commerce (which would, incidentally, reinforce the CBI's regional set-up) under the name of the Confederation of British Business. He also suggests that the closer links between the CBI and retail bodies like the Retailers' Consortium that came to the talks on prices and incomes should be made more formal (some retailers will fight this hard on the point that the consortium is totally unrepresentative of the more modern shops). So that this new CBB should not get too remote from industry, the top 500 companies in Britain should be admitted to membership, provided they are also members of a trade association.

None of this is very surprising and all is unexceptional. Lord Devlin has even appeased the small companies lobby by saying they should continue to have their own council and a seat at the CBB. Unfortunately, his report does not suggest how to get from the present proliferation of associations to his ideal. He even admits that it will probably be necessary to have another

commission to settle the details of a merger between the CBI and the chambers of commerce if the idea is agreed in principle. (There is some doubt whether this will be possible, since the chambers have a yen to achieve public law status—ie, compulsory membership—as their opposite numbers have in Europe.)

Status is one of the key problems. There is considerable local importance in being president for a year of, say, the left-handed bracket makers' society and being photographed in the chains of office. As the report says, this may well give more satisfaction than actual work. The present set-up is also a good way to avoid the restrictive trade practices legislation, the *raison d'être* of a great many small price-fixing trade associations. The answer lies in industry's own hands.

How small are they: % of all associations

Income £2m	%	Staff	%
	0.1	More than one	28.7
£500,000+	0.3	One only	11.6
£100,000+	7.3	Part-time	35.9
£50,000+	6.2	No staff*	25.8
£10,000+	20.2		
£5,000+	12.6		
£2,000+	13.2		
£500+	17.4		
under £500	22.7

BUSINESS

International

We just want freer trade

The next round of world trade talks should get under way by next autumn, after the ground has been prepared by an advance party meeting in committee, it was decided at the annual meeting of the General Agreement on Tariffs and Trade on Tuesday. The Americans have been floating the idea of phasing out the tariffs on industrial goods, with Japanese and Canadian support. But this unofficial initiative has been rather coldly received by the Europeans, who have thus been made to appear on the defensive.

Part of the problem is that the European commission so far has no mandate from the Nine and cannot therefore take any initiative. It is also an open secret that the Nine are not entirely of one mind on whether industrial free trade ought to be a declared objective of the talks. The Germans are keenest on the idea. Britain probably reckons that its industry will have quite enough to cope with in adjusting to competition from the present Six as tariff barriers fall. Elsewhere in the community there are lingering fears that virtual disappearance of the common external tariff would destroy one of

the two most powerful bonds that tie the community together, while the other, the common agricultural policy, will be under attack also.

What the community wants is a general levelling down of industrial tariffs, and especially of the very high ones that America now puts on many categories of goods—with total abolition to follow only in some future round of trade talks. Above all, community feeling is that President Nixon does not have a hope of getting Congress to approve a trade expansion mandate that aims to scrap industrial tariffs, no matter how long the timetable or how numerous the exceptions.

The sparring at Geneva is bound to have an impact on feeling in the new Congress. The shape of President Nixon's mandate, far more than any other single factor, will determine whether the talks get off on the right foot next year. His special trade negotiator, Mr William Eberle, therefore has a double job to do: to get across to Congress the idea that America has something positive to hope for from the Gatt talks; and to convince the Europeans that the President will get the sort of powers he wants. That is why the Americans are pushing the apparently over-ambitious objective of industrial free trade.

Unfortunately, the prospects for keeping Congress sweet on trade do not look good. Apart from the running row over the EEC's Mediterranean policy, the Americans are pressing for compensation for the enlargement of the community. Here the talks are bogged down on whether the EEC's variable levy on agricultural imports which is now to be extended to Britain, to the detriment of outsiders, is a tariff (as the Americans insist), or merely a device for supporting farm incomes (and so not to be taken into

account, as the Europeans maintain). America also wants compensation for the EEC-Efta treaties, although the EEC will probably refuse to offer anything. And the community has yet to extend the Yaoundé arrangement, for the former French colonies, to the former British African colonies and the Caribbean, as well as give something to the Asian Commonwealth countries—all of which will raise the congressional temperature.

Behind all this lies the persistently disruptive influence of Japan. Japan has now cut its tariffs by 20 per cent and has loosened its quotas so as to slice an estimated \$400m-\$500m a year off its payments surplus, supplemented by other measures that might bring the total up to \$1 billion. But in the first 10 months of the year the Japanese payments surplus was \$7 billion.

The poor watch

The Nixon Administration now plans to tack on to its trade expansion bill legislation to give generalised tariff preferences to exports from the developing world. America is the only industrial country not to have started the GSP (generalised system of preferences) scheme, devised and successfully promoted by the United Nations Conference on Trade and Development. This will not make it any easier to get the bill through Congress, and the prospect was nearly damaged beyond repair by the intrigues of Chile at Geneva this week, supported by Argentina, Cuba and Peru, which prolonged the talks by half a day.

The Latin Americans tried to write into the agreement what some delegates described as a lot of Unctad stuff, including better access for products from poorer countries into the markets of the rich, and higher prices for their commodity products. The less-developed countries have been fulminating at Geneva for some time that the Gatt talks look like being a carve-up between the rich, and that their only impact on the poor would be to narrow the tariff

Industrial uranium: what's it got to do with longer drives? Nothing-yet.

Industrial uranium (or depleted uranium) is one of the densest natural materials there is. So, for the same weight, you can have much smaller components than with lead, steel, tungsten, etc.

Smaller machines for industrial or medical radiography, for instance; smaller balance weights in aircraft. Or, if some enterprising manufacturer were to put a slug of uranium in a golf club, maybe another 30 yards on your drive.

Now, here's where you come in. If you have a potential use for a material that's small in volume but very dense and that can be cast, machined or formed as easily as steel, get in touch.

We won't try to sell you industrial uranium. What we will do is to evaluate it in the light of what you have in mind and tell you whether it makes sense as a proposition.

We're open to ideas—wild or sober. Are you open to suggestions and advice?

preferences they now enjoy in rich markets under the GSP scheme. In the event, the Unctad stuff was kept out of the agreement, largely for fear of driving Congress into straight protectionism at the very start.

Chile was ill-advised anyway. Everybody has an interest in getting a decent trade expansion bill through Congress, and the developing countries in particular will benefit directly and immediately from the GSP that will be tacked on to it.

The developing world other than the fairly rich Latin Americans may benefit from future moves by the European community. Because of the obligations to the Caribbean sugar producers that the community "took to its heart" in the treaty of accession with Britain, some sort of regional sugar agreement will have to be devised when the Commonwealth Sugar Agreement comes up for renewal. This, coming after the new cocoa agreement, could set off a wave of commodity pacts between the community and the developing world. Nothing would aggravate the United States more than this policy which is now being strongly pushed by France—although in practice it could be the best way to compensate some of the African and Asian countries for the British entry into the EEC.

Oil

Talking tough

In the Middle East what a government appears to be doing, particularly to the oil companies, is often more important than what it is doing. Such is the situation at the moment in Kuwait, where the participation agreement between the companies and the oil-producing countries has stalled.

On the surface there are narrow differences on technical matters and on the buy-back price the companies will pay Kuwait for the oil it receives under the agreement. But these differences are not really causing the delay. Partly there is a need to explain the situation to many people not directly in the oil industry, including Kuwait's national assembly and free press. There is also a need to display a certain toughness to the oil companies and mollify oil-company critics inside and outside the country.

The companies remain confident that the show of toughness will fade and the Kuwaitis will sign. If this happens, the stage might finally be set for the start of something like meaningful

negotiations between the oil companies and the Iraqi government over the seized Kirkuk fields.

Most western businessmen and government officials think the Iraqis in the end will have little choice but to reach a deal with the companies. It is in the Iraqis' interest to do so since they badly need to get the full Kirkuk revenues flowing again. However, the Iraqis are capable of acting directly against their own immediate interests. So the oilmen worry. The longer the estrangement lasts the greater is the chance that somehow Iraq will make a deal with the Russians or east Europeans, despite the communists' lack of hard cash to pay for large amounts of oil.

Australia

Soap box stuff

Sydney

The Australian election campaign, which opened officially this week, will be dominated by domestic issues. On Monday Mr Gough Whitlam's Australian Labor party offered the voters a wide-ranging but by no means radical programme that concentrated on social welfare, housing, education and city redevelopment. Next day the prime minister, Mr McMahon, put up his counter-bid: it also promises more social spending—but not much. Mr McMahon is standing pat on the record of the Liberal-Country party coalition, more particularly its record since he took over the top job in March, 1971.

A few months ago the state of the economy could have been decisive in putting Labor in for the first time since 1949. But now, although there are no signs of an impending boom, there is little doubt in the public mind that things are getting better. The unemployment figures are evidently on the turn and they are scrutinised with

obsessive interest every month in a country where to be unemployed, if not quite a crime, is still a major personal disaster. The October figures released this week show fewer jobless and more vacancies, even though unemployment is still close to 2 per cent, which is historically high. The weak area of consumer spending is also showing improvement and inflation is slowing down.

Unexciting though they may be, these indications can only blunt the force of Labor's slogan "It's time" (for a change). In a way reminiscent of Mr Harold Wilson in 1964, Mr Whitlam claims that his expanded welfare programmes and other hand-outs can be had without increased taxation and will be paid for by faster economic growth. This is optimistic. The two proposals that have attracted most attention are concessions on home loan interest payments, one of the few obvious tax deductions not currently available in Australia, and pre-schools for all children at a cost of £120m over six years.

Mr McMahon has made the obvious rejoinder to these promises that they are vote-catching giveaways that will mean steeper taxation and worse inflation, but he has not been above offering a giveaway or two of his own; one is to link pensions automatically to the cost of living.

Cheap flying

We've won—almost

It took two days, deadlocked almost every inch of the way, before the immovable object gave way to the irresistible force and the airlines ended the latest of their interminable series of meetings with grudging agreement that air fares must come down. Nothing in this industry is ever simple, so next summer passengers who book about

Key indicators: world commodity prices

On the wane

The gold price has been shrinking almost daily for two weeks. At \$60.80 an ounce it is \$9.27 down from its high. Heavier Russian and South African selling caused some of the weakness. But speculators are taking profits and moving over to booming Wall Street. Silver prices, dictated largely in New York, are weak for the same reason.

three months in advance will be able to fly the North Atlantic almost as cheaply as if they were flying charter, while the less far-sighted will have to pay through the nose much as before and could even find fares have gone up. But the International Air Trans-

port Association has at last got its members to agree that the whole fare structure on the Atlantic will have to be revised, not just tinkered with. The process will not be quick, and the revised tariff will not be ready to take effect for another year.

1m ton tessies

Almost unnoticed, oil tankers are getting bigger again, with 1m ton ships likely by the end of the decade. Mr Andrew Spiros, technical director to Mr Aristotle Onassis, has revealed a proposal for a 1m ton mother ship that would berth somewhere off Scotland (the Channel being too shallow) and there give birth to four "baby" ships of 200,000 tons each which could make for separate European ports. The mother ship would have a deck area equivalent to four soccer fields, and could carry enough water to keep a city of 400,000 people for 15 days in midsummer.

It was only in 1969 that Shell suggested

the pure economic advantage of, say, the 400,000, 500,000 tonner or larger ships as against a 200,000 tonner is fairly marginal and could be offset by their greater inflexibility in operation, the considerable additional investment required to upgrade shore facilities and the limited number of ports capable of accepting them.

Most people in the industry would still agree with this, but Shell now has on order two 530,000 tonners, and Globtik is expected to announce a 650,000 tonner within a month.

Doomwatchers suggest that a 500,000 ton tanker, if it had an accident in the Arctic, might cause the ice cap to thaw and lead to the submerging of much of the world's coastline. This is far-fetched. Many of the pollution objections to mammoth tankers are met by international regulations which severely restrict the size of any single tank inside a ship's hold. Lloyd's, which

stands to lose as much as anyone, has just fixed a premium for a 460,000 tonner. At \$2m a year for a \$65m ship, it is in line with the premiums for two ships half that size, although the extra draught means route diversions. Lloyd's, it is true, is facing tough competition from New York, and has some incentive to be first in this business. But shipowners point out, fairly, that one big ship is less likely to have an accident than four smaller ones.

The navigational problems of big ships are overstated, and the twin screws that ships of 500,000 tons and upwards are going to have will improve their manoeuvrability compared with the present one-screw versions. (This could avoid the sort of collision that killed 45 Greek sailors on Wednesday.) Since insurance amounts to half the operating costs on ships of 200,000 tons and upwards these considerations are vital. But some naval architects doubt whether the strength of 1m tonners can be calculated with any certainty until one is built; and no convincing economic argument for taking this risk has yet been put—at least in public.

At present there are no ports where even a 500,000 ton ship can discharge. But ports of sufficient depth are now being planned at Fos and Le Havre in France, Genoa and Naples in Italy, Ria de Arosa in Spain, Finnart and Maplin Sands in Britain and Cuxhaven in Germany, as well as in Japan, South Korea and Canada. Most of these ports will be developed by 1976, although there will only be a handful of 500,000 ton ships by then.

Arsenal, Chelsea, Spurs and West Ham could all play on board

This is progress indeed, and for once it has been led by Britain. Credit should be given where it is due. Persistent pressure from the British Overseas Airways Corporation has gradually forced acceptance of the principle of a discount of around two-thirds for advanced booking, although other airlines and aviation authorities other than the British have complained periodically and plaintively that a rule like that was unenforceable at a discount as big as that. BOAC knew this. One of the attractions of the scheme to the more cynical of BOAC's management was precisely that the low fare would, in a relatively short period, become the standard fare and bring about cuts that Iata would never otherwise accept unless tricked into it.

Opponents of the scheme are still fighting; this latest meeting has proposed a number of restrictions that should be killed at the next one (yes, yet another), provided BOAC still plays its cards right. There is no reason to think that it will not; both British corporations have exploited for the past two years the fact that if no agreement is reached on new fares at an Iata meeting, then all fares lapse automatically at their due expiry date, and airlines are then free to strike their own bargains. BOAC has only to go on demanding its own way to get what it wants, with or without the agreement of the meeting. The trouble, however, will start when the airlines get round to discussing fares for North Atlantic journeys that go beyond London and well into Europe and Africa. Fares to Paris, Frankfurt and the major west European cities cannot be badly out of line with those from New York to London, but the national airlines of countries immediately beyond these Atlantic gateways will cut up rough.

Norway

Were we wrong?

Brussels

The opening of negotiations between Norway and the EEC for a free trade agreement has been a rather melancholy occasion. There were new faces among the leaders of the Norwegian delegation, but most of the officials were the same men who had earlier negotiated the treaty of accession and then seen the Norwegian voters throw it out. They have few illusions about obtaining significantly better terms for Norway than those already negotiated by Sweden and Finland; and the chances

The remarkable record of Merrill Lynch in trading large blocks of securities.

During 1971 the Merrill Lynch Special Handling Unit—only two years old at that point—executed 2,245 blocks of 10,000 shares or more. Total value \$2.2 billion. We broke up some of the blocks but more than half appeared on the tape as 10 thousand plus share units. And these figures don't include block business in the Over-the-Counter market, exchange distributions, or unregistered secondary issues.

We can't expect you to be impressed just by the figures so we will let you in on the reasons that account for Merrill Lynch's performance.

1. Direct Approach

Merrill Lynch's capital can be promptly committed in substantial amounts whenever necessary, for large or small blocks.

2. Experience

Merrill Lynch's block traders in New York have extensive experience

and are backed by a highly specialized staff, plus special institutional liaison teams in 12 other major cities.

3. Feel of the Market

Direct contact with financial institutions is maintained through Merrill Lynch's network of 199 offices in U.S. cities and 33 offices outside the United States. In fact, literally thousands of financial firms throughout the world.

4. Communications

Minute-by-minute coverage gives Merrill Lynch traders a fast line on the size of the market, timing and price. Merrill Lynch's private wire network throughout the world tells Institutional Account Executives what securities Merrill Lynch has either to buy or to sell.

The institutional departments in 54 of the largest offices in the U.S. are also connected with each other and New York via an open line voice communications system.

5. Floor Coverage

Merrill Lynch's 22 floorbrokers handle one out of every six trades on New York Stock Exchange. Merrill Lynch has 10 floorbrokers on the American Exchange. And direct lines to the four major U.S. regional Exchanges.

6. International

There is a growing need to buy and sell large blocks of non-North American securities quickly, efficiently and economically. Merrill Lynch International offers marked advantages for the international institutional investors. It can find blocks, locate potential buyers and sellers, match trades among professionals, or distribute blocks of European, Japanese, Australian and other securities among Merrill Lynch customers.

If you would like more information about Merrill Lynch's block handling services, whether in U.S. or European securities, just contact your nearest Merrill Lynch office.

New York and certain of its affiliates, and are available outside the United States through Merrill Lynch, Pierce, Fenner & Smith International Ltd. and its Subsidiaries and Associated Companies.

COURTAULDS

Interim Profit and Dividend

The Board announce an unchanged interim dividend of 2.083p per 25p Ordinary Share to be paid on 2nd April 1973 to the Ordinary Shareholders registered in the books of the Company as at the close of business on 15th January 1973.

The dividend will be paid three months later than last year for taxation reasons. The Government's measures to counter inflation have prevented an intended increase in the amount.

Results for April/September (which are unaudited) and the corresponding half year in 1971 are:

April/Sept. 1971 £ millions		April/Sept. 1972 £ millions
323.4	World Sales to External Customers	355.4
194.1	Sales to U.K. Customers	199.8
58.4	Exports from United Kingdom	64.4
16.2	Profit before Taxation	21.3
1971 £m. 1972 £m.		
39.9	Trading Surplus	45.6
17.1	Depreciation	17.9
22.8		27.7
2.1	Investment Income	2.2
24.9		29.9
9.6	Interest Payable	9.5
15.3		20.4
0.9	Share of Profits from Associated Companies	0.9
16.2		21.3
2.6	Less: Taxation—including £3.9m abroad (1971 £2.6m)	4.7
13.6		16.6
1.4	Less: Minority Shareholders' Interest	1.4
12.2	Courtaulds Shareholders' Interest	15.2
0.1	Less: Preference Dividends	0.1
12.1	Courtaulds Ordinary Shareholders' Interest	15.1
5.6	Cost of Interim Dividend of 2.083p (1971—2.083p) per 25p Share	5.6

The 1971 taxation figure has been amended so as to be consistent with the basis used in the Accounts for the full year 1971/72.

Profits benefited as a result of increased contributions from exports and from overseas operations. Productivity again improved, with one or two exceptions.

L. R. CROYDON, Secretary
15th November 1972
COURTAULDS LTD.,
18 HANOVER SQUARE, LONDON W1A 2BB

are that they may be significantly worse.

The new Norwegian government—a coalition of the anti-marketiers supported by pro-market Conservatives—finds itself in office largely because the former Social Democrat government wanted to get out of the thankless job of handling the talks. The old government knew well that the argument that largely swung the referendum—that Norway could get all the benefits of co-operation with the EEC without accepting the obligations of membership—was going to be a non-starter. Opinion polls in Norway show that the public is already regretting its decision. The new government is coming under pressure to show that it can defend Norway's trading interests at least as well when outside the EEC as in, including markets for oil and fish. But Brussels is not exactly in a forgiving mood.

The EEC is likely to offer a simple trade agreement on the Swedish model, involving the progressive removal of tariffs on industrial goods at the same pace as between the Six and the three new members. For sensitive products like paper, aluminium and other non-ferrous metals, which together account for 40 per cent of Norway's industrial exports to the community, the tariffs will not be wholly eliminated for 11 years. The Norwegians have known all along that a Swedish-type agreement would hit their exports harder than Sweden's, but this is the price to be paid.

The main battle is over fish, which the Norwegians want included in the agreement as it is in Iceland's. The EEC is not impressed with that precedent. For Iceland, 80 per cent of whose exports consist of fish and fish products, an agreement that excluded fish would have been meaningless. This is not true of Norway, whose fish exports account for only 14 per cent of total sales to the EEC, and things like herring, sprats, tunnyfish, salted and dried cod already enter duty-free. The fishermen of the Norwegian north were the most effective of the anti-market lobbies and the anti-marketiers made great play with the argument that Norway could get free trade in fish without having to open up its coastal waters. But the EEC feels it made the maximum concessions to the Norwegian fishing industry during the membership negotiations. In the background, though, there is the current campaign within Norway to persuade the government to follow Iceland's example and extend its fishing limits to 50 miles.

India

In trouble again

New Delhi

Mrs Indira Gandhi has told her parliamentary party that "extremely difficult" days lie ahead for India, in the form, once again, of widespread food shortages and crippling inflation. In the past year food prices have risen by 16 per cent, pushing up the general price index by 10 per cent. There have been severe monsoons in two successive years and now drought this summer has reduced the cereal harvest by 6 per cent. There is some hope of larger winter crops, but the government's food stocks, built up to a record level of 9m tons, are already being drawn upon at a rate that will exhaust them by March. The call has gone out for 4m tons of rice from stocks held by some states to replenish them. Even so, the government will still need to import both wheat and rice, and pay in hard cash at the current high world prices.

Mercifully, industry shows some signs of renewed growth after a year of stagnation. Output is running 7 per cent higher than last year. Share markets are cheerful because most companies have either maintained or increased dividends. Twice as much capital has been raised in the first nine months of 1972 than in the whole of 1971. New Delhi has already made some policy changes to help the growth of private industry and more concessions seem to be in the offing. Where the government can expect trouble is from the unions. Organised labour now tends to react to any threat to real incomes by rioting, and has begun sporadically to do so.

You need to be nimble in politics

Think zinc

Zinc

Zooming

Zinc, usually the duller of metals, has become the star performer of the world's metal markets. At £165 a ton its price has improved by 7 per cent in a month and a massive 65 per cent since the beginning of 1971. And there is no stopping it. The world's producers are already considering raising their posted prices from £160 a ton to something nearer £180 in the next few weeks. This will squeeze the margins of the major zinc consumers, the galvanising and die-casting industries.

But the producers feel they need the break. Over the past three years zinc smelter plants have been closing down at a rapid rate. Since 1969 the zinc output of the United States has been cut back by 45 per cent. Slack industrial demand made many of the old plants, working under capacity, quite unprofitable; and the anti-pollution lobby in the United States has inhibited the more efficient producers from expanding, and added to their running costs. It is the growing industrial demand from America, which consumes 28 per cent of the free world's output, that is now driving prices up and giving those producers who have held on through the thin times a better and more profitable share of the cake.

It is not difficult to see which countries and companies will benefit. Australia and Canada account for 10 per cent of the world's output, but because of heavy transport costs Canada is in the best position to exploit the situation. This means overwhelmingly Cominco, the world's largest producer, and those plants using electrolytic smelters which, though more expensive to run, are pollution-free. But their zinc is not cheap.

BUSINESS

Investment

The millennium has arrived:
so what else is new?

New York

One landslide deserves another. Exactly one week after President Nixon was returned to the White House with a near-record 60.7% of the popular vote, the Dow Jones industrial average for the first time in its 88-year history closed above the 1,000 mark. The significance of both achievements has been chiefly psychological. In reality Mr Nixon was again denied a Republican Congress despite his stunning personal victory. And Wall Street, while happily acclaiming the breakthrough in the Dow average, readily conceded that the yardstick of 30 blue chips was widely thought to be more representative of the market than it actually is.

Whether or not that is so, Tuesday's 1003.16 came about not through a quantum leap but as the result of investors gravitating toward cyclical groups linked to the strengthening economy. Motors, international oils, utilities, retailers, paper companies and even the long-depressed steels have come into the limelight. On the day of the millennium, the Dow stocks posting the sharpest gains were Chrysler, Du Pont, General Motors and General Electric.

Ford and Chrysler actually have the lowest p/es, 9 and 11 respectively, of the motors and are generally regarded as having the greatest upside potential. But even though sales should continue strong in 1973, the year will scarcely be clear sailing for the group, what with the problems of pricing and emission control, as well as a new labour contract to negotiate in the autumn. For the moment, however, the road is reasonably unobstructed.

The international oils are another group in which the more immediate prospects of growth in earnings outweigh future problems, not the least of which is the possible nationalisation of their Middle Eastern sources of supply. The three Dow oils, Exxon, Standard of California and Texaco, came through the 1,000-mark breakthrough with good net gains, though they are all still below their highs attained in the 1960s. The utilities, paper and retail stocks also seem cheap against the prospects of a buoyant economy in 1973. The great range of profits in the first quarter of 1972 brought the average market p/e down with a bump: the third quarter figures should

Hello, 1,000

repeat the same bullish medicine.

The thing lacking from the market is euphoria. As soon as the Dow record was breached, profit-taking the very next day brought the index back to 998.4. There is too much caution around still for the opening of the American bull market to be proclaimed. But it must happen.

Needham's visits

New York

What was the chairman of the New York Stock Exchange, Mr James Needham, doing in Moscow? While he was there, the news came that the Chase Manhattan Bank had been granted permission to open a representative banking office in Moscow, which will be the first such American representation since the 1920s. That, however, could hardly have had anything to do with Mr Needham, who had "very friendly" talks with Soviet bankers, but wouldn't say about what.

Perhaps the visit means the Moscow Narodny Bank wants to float a trade loan on the American market (the Eurobond market would be a better place). Or perhaps communism just

Fly by 'Homa' from Europe to Iran, the Persian Gulf, Afghanistan, Pakistan and India.

Welcome aboard.

Iran's 2,500th Anniversary Celebrations.

The Persian Gulf.

Traditional Afghan Costume.

Lahore, Pakistan.

Snake charming, India.

The 'Homa', legendary bird of Ancient Persia (now Iran), is said to bring good fortune to all who catch sight of it.

You will find its majestic profile on the tailplanes of every Boeing in Iran Air's all-jet fleet: 707s and 727s for our international flights; 737s for servicing our 17 destination network in Iran itself.

'Homa' flights are conveniently timed from major European cities to Istanbul, Tehran, the Persian Gulf - then on to Kabul, Karachi and Bombay. And next year our services will extend to China and Japan.

There are many attractive rewards for flying by 'Homa'. The food is always deliciously fresh (never frozen). The hostesses are charming and

attentive. The pilots are specialists in European, Middle East and Far Eastern routes. But, best of all there's the welcome from the whole Iran Air family who keep up the national tradition for hospitality which goes back thousands of years.

For more about the fabulous 'Homa' and all the rewards that come with it, see your Travel Agent.

needs capitalism to work anyway. Whatever the reason for the visit, it has happened and has got Mr Needham, and the NYSE, very much in the news.

The NYSE is fighting to stay in the limelight. With the insight of his years at the Securities and Exchange Commission, Mr Needham realises that the trading market of the future is going to be the nationwide central trading market. If the NYSE is to retain its position as the king-pin of American securities trading, then it will have to open out or get shut out. The National Association of Securities Dealers already operates a highly automated alternative market (Nasdaq), embodying a different method of trading from that espoused by the exchanges, with their clubby atmosphere and cavernous trading floors. Mr Needham wants the NYSE to allow institutional membership (on restrictive terms), is keen on greater competition, wants more disclosure by member firms, and is eager for the exchange to establish its dominance in the eyes of the rest of the world. Hence these travels.

On his trip to London Mr Needham suggested that the trading hours of the New York market should be radically extended to make it easier for investors in different time zones to trade in New York. He also announced the formation of an advisory committee on international capital markets to stimulate the free flow of investment capital across international boundaries; by this he meant a committee of officers from major New York member firms. Both ideas were less ostensibly aimed at making sure that these movements were into the United States and through the NYSE.

Needham: travelling man

Eurobound into America?

The resurgence of Wall Street and the firmness of the dollar in the foreign exchange markets are tempting international investors into dollar securities. This is already apparent in the Euro-bond market, where prices of Euro-dollar bonds convertible into the equity of the issuing American company have touched new highs in recent sessions. Investors' appetite for them is at present unsatisfied, and so the market is looking for a steady flow of new offerings, preferably by top quality names.

With a neat sense of timing, Morgan and Cie International and White Weld have brought Gillette to the market with a \$50m convertible. The indicated coupon of 4½% and conversion premium of 10-15% look relatively generous in today's market and the issue is assured of a strong response.

Interestingly enough, Gillette issued a

\$50m convertible, also on a coupon of 4½% in December, 1967. The price of that bond is now back to the \$100 at which it was issued, after having been down in the dumps in the interim. The convertibles to look for are those issued by the best companies, which have the lowest conversion premium into the underlying equity, and the highest running yield. On that basis the most attractive bets would include Ford, with a premium of only 2% and a yield of 5%; JP Morgan with a 9% premium and 3½% yield; ITT with 4% and 4½%, and American Express with 7% and 4½%. The benchmark comparison for the yields is the average of around 7% on non-convertible dollar bonds; the gap between that and the yield on the convertible, plus the conversion premium, adds up to the rise in the underlying equity that is being discounted in the convertible's price.

Courtaulds

Skelduggery

The Skelmersdale crisis, which dominated home industrial news for a couple of days, is over. The 1,000 workers at Courtaulds's most modern weaving mill were sufficiently chastened by the announcement of imminent closure to agree to co-operate with the management. Lord Kearton, Courtaulds's chairman, unexpectedly dashed up to the scene of the potential crime and, after 6½ hours of negotiations, helped to sort things out. Some quite progressive industrial machinery has been agreed to avoid future disputes.

There might have been an element of bluff in all this but the premise of the Skelmersdale settlement was high productivity. To prove the point that he has not made any strategic error in his policy for Lancashire textiles, Lord Kearton announced, the day after Skelmersdale was reprieved, plans for spending more money in weaving in that beloved county—£4m-£5m for weaving work-wear material and heavy corduroys.

The general success of the Kearton strategy shows up in the results: while all the fibre companies are looking feverish and feverish, his fibre-plus-textile giant produces results £5m to the good at the half-time, at £21.3m pre-tax. The expected dividend increase has been frozen, but the share price moved favourably to 178p on a p/e of 13, on the assumption that earnings growth for the year will be just about

10%. The splendid first-half results owe much to the special conditions in the United States, where King Cotton enjoyed a boom that has since somewhat evaporated.

Excess Holdings

Reassurance needed

Excess Holdings is a small, composite insurance company with close links with Lloyd's broker firms, whose share price has plummeted from 302p in May, 1971, to 109p now. In March it announced a loss for 1971 of nearly £1m, and retrospectively it adjusted its 1970 profits down by £2m (to £200,000), the claims provisions for previous years having turned out to be too small. In August it stopped writing British motor insurance altogether. In September it passed the interim dividend because of the unknown costs of closing down its British motor underwriting and for claims under provisions on its North American casualty business.

Closing down its British motor insurance will bring Excess's non-life premium income down from £29m in 1971 to about £22m. The stock market values the company at about £5.5m. Leading composite companies are usually capitalised at about the level of non-life premium income. On its reduced business, Excess ought to be earning investment income of about £1¼m, a generous quarter of its market capitalisation. Thus the shares could look a good buy—if the company

at least breaks even on its underwriting and if it dispels lingering fears about how much underprovision of claims remains to be unearthed, particularly of British motor claims.

On its 1971 premium income the company needed to maintain a minimum solvency margin of £3m of free assets (after £1.5m loan stock) to comply with the rules. Last December the accounts showed net assets of £7.1m, after a contingent liability for capital gains tax on its investments and properties (shown in the balance sheet at market values), and less any further underprovision for claims that may yet be discovered. Will there be any? Here the new detailed returns insurance companies must make to the Department of Trade and Industry throw some light. At the end of 1970 Excess reckoned its 1970 motor claims at £3.1m. But in the 1971 return this figure for 1970 had been adjusted to £4.1m, and the slice of it representing outstanding claims had in fact been upped by 100% to £100 per claim. By contrast both the Legal & General and the Pearl had to make adjustments of only 21%, and the Royal came out about right.

At the end of 1971, however, the Excess had provided only £64 per claim for its 1971 claims outstanding (compared with the adjusted £100 for the prior year). If these claims turn out to cost £110 each (the 1970 average outturn plus 10% for inflation), its provision for 1971 claims, at the end of 1971, will have been £1.2m short.

On top of this there will be the overall loss that it almost certainly incurred on its 1972 motor underwriting, plus whatever the underprovision on its North American casualty business was at end-1971. There remains, therefore, a grey area of uncertainty which the directors ought to dispel as quickly as possible.

Earnings

Analysts' trilemma

The problem of settling on a generally accepted measure of earnings under the new imputation system of corporation tax that is to start next April 6th has been complicated by the recommendation of the Society of Investment Analysts, which differs from that of the Institute of Chartered Accountants' discussion paper (and *The Economist*, June 10th).

Under the present system the calculation of earnings, p/e ratios and dividend yields is simple: profit less tax equals the earnings that can be distributed as dividends or retained. But the dividends are, in turn, taxable, and imputation eliminates this double taxation of profits. The corporation tax rate will be increased (from 40% probably to 50%), but dividends will be distributed tax-free, an appropriate part of the corporation tax counting as a prepayment of income tax; with the 30% basic rate of income tax expected next year this appropriate part will be 30% of the gross dividend. By simple arithmetic this advance corporation tax (Act) will be three-sevenths of the net dividend.

There are three possible ways of defining earnings in the new system: (a) the maximum coverable dividend; (b) the sum of net dividends actually paid out plus retentions—the "net" earnings; and (c) the amount that would be left to the company if no dividend were paid—the "nil" earnings. These are different because, despite its name, the Act paid on dividends distributed out of foreign profit does not, in fact, count as an advance payment of corporation tax. There is a bias against foreign

income when it is used for the payment of dividends.

Altogether 30% of the income of British companies comes from abroad. Any of it used for dividends is worth less than good old British profit. Thus (a), the maximum coverable dividend, depends on the split of profit between British and nasty foreign profit. It will not be possible from normal accounts to work out what the maximum coverable dividend would be. This definition also understates the actual money available to the company and its shareholders as a result of the retention of some of the profit.

Neither (b) nor (c) gives dividend cover, but the society favours (c), the nil method, for three reasons. It does not vary with the level of payout, thus eliminating the distortion that would occur in comparing high dividend payers with low ones; the excess Act caused by distribution should be considered a cost of the dividend, which could be reduced by cutting it; and the net figure (being lower) could understate the value of the company in a takeover situation.

A difference between net and nil would only arise for 20 out of the 136 biggest British companies—those that have to use foreign profit for their dividend. But these include British Petroleum, Shell Transport and Trading and British-American Tobacco. Our preference for (b), the net definition, rests mainly on the fact that it is a real figure that will automatically appear in the accounts; and it reflects the actual amount of money available to the shareholders and the company in the period. The nil definition gives a hypothetical figure, but so does (a), which the society rejected for this reason. Clearly (b) changes according to the level of dividends but then the whole idea of

Key indicators: world bourses

This was the week Wall Street made it at last. The 1,000 on the Dow helped London too. Tokyo doesn't need anyone else's steam: it just goes on hitting new records—trading this week was so heavy that it had to be partly suspended to clear the backlog.	Stock price indices			Percentage change on

Stock prices and yields are on pages 117 and 118

the new corporation tax is to unify companies and shareholders. It is silly to object to the net method on the ground that the excess Act is an avoidable cost and nothing to do with the companies' earnings: cutting dividends is not that easy.

No definition is going to do all the things that earnings do for analysts now. Each will have its devotees, and, more important, its uses; the society quite rightly presses for disclosure of all three by companies.

Société Bic

Bullpoint pens

Paris

Baron Michel Bich seems to be in two minds about the launch of his hugely successful Société Bic (of ballpoint fame) on to the market. The Paris bourse's largest new issue was offered, in the tender French way, at a minimum price of Fr650, but such was the weight of eager buyers that the shares had to be suspended on Thursday, after the price had gone up to Fr880, raising £22m for the baron.

The eagerness was despite the dearth of a profits forecast for the financial year ending in seven weeks. Although a forecast had been prepared, and had been printed in both French and English, Baron Bich ordered its withdrawal at the last moment. When asked at the press conference to launch the issue why profits had dipped in one year, he replied that he did not know: neither did he have any idea what the sales prospects for his new disposable lighters were.

Would-be investors were not deterred. The unofficial profit forecast for the coming years shows an annual growth of over 15%, which justifies the initial p/e of 30 on the 1971 earnings of Fr28 per share. Bic did not invent the ballpoint pen, but Baron Bich was quick to see the possibilities in a low-cost, throwaway product (the first ballpoints, made by Reynolds in the United States, cost \$12 each). The company was started in a shed in Clichy in 1945 and now produces one-third of the world production of ballpoint pens, turning out some 7m each day. In 1953 Bic organised itself to go after foreign markets; in 1957 it bought Biro Swan (England) and in 1958 Watermans (United States), which eventually became Bic Pen Corporation. Purchasers of shares of the French parent company are undoubtedly looking for a performance similar to that of Bic Pen, which

was introduced on the American stock exchange in 1971 at the equivalent of \$8 and is now worth \$28.

Last year's turnover for the group was £38m and the company's plans are ambitious. However, the market for ballpoint pens has reached a point of near-saturation and is in danger from felt pens. Last year Bic pushed into this market, and it is now making 700,000 felt pens a day. The next move to widen the company's activities will be the introduction of a throwaway cigarette lighter, produced by Flamir-aire, bought last year for £1.3m. The new lighter will be similar in concept to those already produced by Cricket and Feudor. The company is also studying the possibility of introducing an inexpensive fountain pen. But the shares are neither giveaway nor throw-away.

Special situation

Hopes from Esperanza

Esperanza Trade and Transport besides its attractive name, which derives from a copper mine it had in Spain. The mine ran out in the 1930s and the company acquired the concession to mine the Limni concession in Cyprus. Even at 96p, up a quarter from the low point this year, Esperanza is largely seen by the market as one of those little copper companies whose mine has another seven or so years of life, needing no higher a p/e than 12.

In fact copper and other mining earnings only contributed 65% of the operating profits of £1m notched up in the year to March (one of the best years for Esperanza despite the indifferent behaviour of the copper price), and next year the proportion could well fall to half. Total earnings

may not improve much, but the quality of them will, since Esperanza is doing a fascinating and intelligent piece of diversification. It is buying firms that perform specialist services, like loss adjusting for insurance companies, cargo superintending, laboratory analysis and inspection of this and that: the kind of businesses that sound dull but are able to earn good profits whatever the state of world trade, or the copper price. The companies can be developed and expanded on an international scale with just a small amount of capital spent on them. That is what Esperanza is doing and could well be earning £3m out of them in the next year, according to the brokers to the company, de Zoete and Bevan.

Another of the attractions is the heavyweight board and shareholding. Mr Harry Kissin, chairman of the well-run and successful commodity company, Lewis and Peat, is to become chairman of Esperanza, and Lewis and Peat owns 20% of Esperanza. Mr Jacob Rothschild is another director, and N. M. Rothschild and Sons has a 15% stake. The drawback is that the equity capitalisation is smallish, some £7m, and the market in the shares is tight. Fairly small orders tend to shove the price around quite a bit, so investors will have to buy quietly and carefully, but buy they should.

C. T. Bowring

Prospectus in five languages

After a mind-boggling exercise in diplomacy, patience (but no games here) and public relations, C. T. Bowring is to introduce a proportion of its shares—which will be provided by existing shareholders—simultaneously on to the main continental bourses on November 28th. Apart from a desire to blaze a financial trail into Europe, the main object of the move, says the company, is to widen the share ownership and provide a base from which to expand its European business.

Only a small proportion of the shares is to be released for continental consumption, perhaps less than 10%. But the closer ties with foreign institutions, like the Deutsche Bank, the Algemene, and the Banque de Bruxelles are significant. Sensibly, Bowring wants to feel its way with some care through the maze of continental financial practices and thinks it needs—perhaps on the grounds of politeness—the guiding hand of the domestic experts.

NOTICE

STATE OF ABU DHABI

The Government of Abu Dhabi invites hereby internationally reputed oil companies having marketing facilities and willing to participate in exploration for and development and exploitation of oil and other hydrocarbons in areas in Abu Dhabi (off shore) totalling 2,800 sq. km., to apply to the Ministry of Petroleum & Industry (P.O. Box 9, Abu Dhabi, Arabian Gulf), for information regarding the areas in question, the terms and conditions to which applicants should conform and any other information. Documents and information will be supplied only to oil companies or to a duly authorised representative of such companies.

Bids should be submitted in a sealed envelope marked "Confidential—Bids for Oil Rights in Abu Dhabi" to the Minister of Petroleum & Industry, not later than February 1, 1973.

Mana Saeed Al-Otaiba,
Minister of Petroleum and Industry,
and

Chairman of the Abu Dhabi National Oil Company

APPOINTMENTS

Research
Assistant

Applications are invited for the post of Research Assistant to be appointed in the Department of European Studies. The successful applicant will work under the direction of Professor David Coombes on a project, financed by the Social Science Research Council, to study the effect of EEC membership on national parliaments.

Applicants should be recent graduates with good honours degrees in political science or a related discipline, and should be interested in the politics of Western European integration. Ability to read and write German and French is essential. Salary within scale £1296-£1764. Please write to Professor Coombes for application forms and further particulars.

Loughborough Leicestershire

London School of
Economics

UNIVERSITY OF LONDON

Applications are invited for appointment from as early a date as possible to a Senior Research Officership or Research Officership in the Centre for Urban Economics, to a project on housing economics. The project will be under the supervision of C. D. Foster and C. M. E. Whitehead, and will be of special interest to those with some knowledge of urban economics, econometrics, or with an interest in economic policy issues. The project is to monitor change in public and private rental housing in London. The appointment will be for three years and will be at a starting salary of £2,397 a year with annual increments of £159, plus £162 a year London Allowance and superannuation benefits.

Applications should be received not later than November 30, 1972 by the Administrative Officer (Room H.610), London School of Economics and Political Science, Houghton Street, London WC2A 2AE, from whom application forms should be obtained.

BUSINESS NOTICE

INTERNATIONAL
INVESTMENT COUNSELLING
Formulating a Strategy

Your international investment *Strategy* concerns the degree to which you are invested; the degree of investment in each country; and the degree of risk or protection in each investment.

At Lionel D. Edie International, we have the tools to assist you in these decisions. Our Economic and Security Research is excellent — *AND* we will assign a Senior Counsellor with ample time to interpret and apply this information to your portfolio.

Your tax *Strategy* is important too. Do you, for example, hold United States equities subject to withholding when you could own Euro-dollar convertible bonds at little or no conversion premium — get 2 to 3 times the income and — no withholding?

We would like to help you establish your investment *Policy*, formulate your *Strategy*, and apply them toward the successful management of your international investments.

If you would like more information contact Edouard Iselin, our Executive Vice President in Geneva. He will be glad to discuss services, fees and answer any questions you may have.

University of Capetown

Senior Lecturer and Lecturer in Business Finance

DEPARTMENT OF BUSINESS SCIENCE

Applications are invited for appointments as Senior Lecturer and Lecturer in the Department of Business Science. It is hoped to fill the vacant positions as soon as possible after 1 March, 1973.

Applicants should have good academic qualifications and relevant business, teaching or research experience in Business Finance. A strong background in Economics is essential and ability to participate in the teaching of other areas of Business Administration, such as Business Policy, Organisation Theory, Economic Statistics, Marketing, Operational Research, etc., would be an advantage.

The Department of Business Science conducts general courses for the degrees of Bachelor of Commerce (3 years of study), and Bachelor of Business Science (4 years). Specialised courses at the honours level are provided for B Bus Sc. students in the final year. These presently include Business Finance, Economic Statistics, Personnel, Marketing and Statistics and Operational Research. The persons appointed will be expected to participate in the general courses and in special field courses in Business Finance, and will be required to supervise postgraduate students undertaking research for the degrees of Master of Business Science and Doctor of Philosophy.

The salary scale applicable to the post of Senior Lecturer is R5300 x 300-R8100 per annum, and that to the post of Lecturer is R4000 x 300-R6900 per annum. The commencing salary will be determined in accordance with the qualifications and experience of the person appointed.

Applicants should state their age, nationality, marital status, academic qualifications and relevant business or teaching experience, present salary, publications and research interests, and should give the names and addresses of at least two referees (preferably persons with knowledge of the applicant's academic qualifications and experience) whom the University may consult.

Two copies of the application should reach the Secretary-General, Association of Commonwealth Universities (Appis), 36 Gordon Square, London WC1H 0PF from whom memoranda giving the conditions of service, including transport expenses on appointment, and information on the work of the Department may be obtained) not later than 15 January, 1973. A third copy of the application with a medical certificate should be sent direct by airmail to the Registrar, University of Cape Town, Private Bag, Rondebosch, Cape Town, South Africa, by the same date.

The University reserves the right to appoint a person other than one of the applicants or to make no appointment.

COMPANY STATEMENT

BARLOW RAND LIMITED

(Incorporated in the Republic of South Africa)

GROUP PROFIT AND ORDINARY DIVIDEND

The audited group results for the year ended 30th September, 1972, are set out below

	1972	1971	
		Excluding results of Rand Mines Limited	Including results of Rand Mines Ltd from 1st June, 1971
Group Turnover	R416,022,000	R331,671,000	R335,407,000
Group profit after taxation and outside shareholders' interest	R22,389,000	R14,509,000	R16,470,000*
Number of ordinary shares on which earnings per share are based	87,593,000	63,639,000	84,039,000*
Earnings per ordinary share based on Group profit	25.5 cents	22.7 cents	19.5 cents*
Dividend per ordinary share	11.5 cents	10.5 cents	10.5 cents**

* 20,400,000 shares were allotted for the acquisition of Rand Mines Limited. The profit of Rand Mines Limited was consolidated for four months only in 1971 and the results and earnings per ordinary share of 19.5 cents as shown in the third column above were thus not representative of a year's trading.

** 4.0 cents on 63,600,000 shares, 6.5 cents on 84,039,000 shares.

A Final dividend of 7.5 cents per share has been declared. This dividend with the interim dividend of 4.0 cents per share, makes a total distribution of 11.5 cents for the year, an increase of 9.5% over the dividend for 1971. The final dividend is payable to shareholders registered on 27th November, 1972.

C. S. BARLOW,
CHAIRMAN.

APPOINTMENTS

STATISTICS with a social emphasis

Statisticians in government today work closely with administrators and economists in a congenial, professional atmosphere. They are encouraged to develop their own ideas and methods and they have access to unrivalled statistical data and sources.

Office of Population Censuses and Surveys

There are vacancies in three divisions of this important Office.

Population Statistics Division. This appointment is concerned primarily with demographic analysis and interpretation of population statistics for England and Wales. It also involves population projections and model building.

Social Survey Division. Involves reviewing the design of the Family Expenditure Survey. Experience in the use of computers in survey analysis would be particularly appropriate.

Census Division. Mainly experimental and pre-test work for the next census, and control of statistical work on topics such as education and fertility.

Home Office

The Home Office Statistical Division is based at Tolworth, near Surbiton, Surrey, and provides information on, and interpretation of, a variety of subjects - fire, crime, immigration and other important social subjects. The work involves interpretation of complex data, which could have a direct bearing on the formulation of social policy.

There are posts at Statistician and Senior Assistant Statis-

tician levels. Appointment may be for a fixed period or on a permanent basis.

Qualifications

Applicants should normally have a degree with honours in statistics (or in another subject involving formal training in statistics) or another appropriate qualification, eg AIS.

For posts at Statistician level - £3653 to £4883 (slightly less in Surbiton) - candidates should have several years' relevant experience and should normally be at least 27. For Senior Assistant Statistician posts - £2476 to £2984 - they must have some relevant post graduate experience and be at least 24. Starting salary may be above minimum of either scale.

Prospects

Senior Assistant Statisticians can expect promotion to Statistician within two to three years and there are real prospects of further promotion to Chief Statistician - £5525 to £7451.

There are also vacancies for Statisticians and Senior Assistant Statisticians in other government departments.

For full details of acceptable qualifications, information on all current vacancies in the Government Statistical Service, and for an application form (to be returned by 15 December), write to the Civil Service Commission, Alencon Link, Basingstoke, Hants RG21 1JB; or telephone Basingstoke 29222 ext. 500 or London 01-839 1992 (24 hour 'Ansafone' service), quoting reference A/619/14.

GOVERNMENT OF ABU DHABI

MINISTRY OF WATER & ELECTRICITY

I Applications are invited for the post of Technical Director General/Chief Engineer in the Ministry of Water & Electricity, Government of Abu Dhabi.

The selected candidate will be responsible for:

- Technical & Administrative supervision of Diesel and Turbine Power generating & Sea water desalination plants.
- Supervision of water & power distribution systems and the management of the relevant operation and maintenance organisations.
- Reviewing the development of water & electricity requirements and evaluation of proposed schemes and the determination of consumption needs in the Emirate

II Applicants should have the following qualifications:

- University Degree in Electrical/Mechanical Engineering or Electrical Engineering (Generation branch).
- Not less than twenty years' experience (after graduation) in the fields of planning, design, erection and operation of large power generating and desalination plants.

III

- The salary of the post will be determined according to qualifications and experience.
- Employment will be on foreign contract basis for two years on first appointment (renewable yearly afterwards) during which the employee will be provided with a suitable free housing accommodation including water, electricity and an attractive furniture allowance.
- The employee will be entitled to first class air tickets for himself and family on taking up appointment, on termination and on annual leave provided that the number of such tickets does not exceed five full tickets each time.
- The employee will be provided with free government transport or with a car loan to buy a car and will be paid a car allowance at the rate of not less than 35 BD per mensem.

IV Applicants are requested to observe the following when submitting their applications:

- State Nationality.
- Salary expected (besides the fringe benefits referred to above).
- State the names and addresses of three references to whom one can refer for further information.

Applications—corroborated by the necessary documentary evidence of qualifications and experience should be addressed not later than 31/12/1972 to:

Director, Civil Service Commission,
PO Box 371,
Abu Dhabi, UAE

APPOINTMENTS

ECONOMISTS for Management Consultancy

We offer excellent opportunities for young economists to obtain practical experience over a wide field, on assignments covering investment appraisal, financial and economic planning, industry studies and market surveys.

Our clients are in industry, commerce and government, and opportunities arise to work in Continental Europe and Africa, as well as in the UK.

Aged up to 30, applicants must have a

good degree, and preferably also a post-graduate qualification.

Starting salaries will be highly competitive for appropriate ability and experience, and subsequent promotion will depend entirely on merit. Future prospects are excellent within the firm or, alternatively, attractive openings arise with clients.

Apply in confidence, giving brief details and quoting reference 355/S, to:

D The Recruitment Manager,
Deloitte, Robson, Morrow & Co.,
17th Floor, St. Alphage House,
2 Fore Street, London EC2Y 5DT.

FELLOWSHIP

University of
London

Vicente Cañada Blanch
Fellowships

Applications are invited for Vicente Cañada Blanch Fellowships (one senior and one junior) tenable from October 1973. The Fellowships have the object of promoting the study of the civilization and culture of Spain, and are open to graduates of any university for research in Spain in any recognized subject of academic study of Spain.

The Senior Fellowship is of the value of not less than £1,600 and the Junior Fellowship not less than £800 a year, and will normally be tenable for one year but may be renewed.

For Senior Fellowships preference will be given to postdoctoral candidates. For Junior Fellowships candidates must be engaged in or prepared to undertake a postgraduate course of study approved by the Committee of Award.

Applications for Fellowships tenable from 1 October 1973 must be received on or before 1 February 1973 by the Academic Registrar, (E) University of London, Senate House, WC1E 7HU, from whom further information may be obtained.

University of Bath

APPLICATIONS ARE INVITED
FOR THE POST OF

Lecturer in Economics

The successful applicant will be expected, in the first instance, to teach across the whole range of economic theory. The appointment is available from February 1, 1973.

The appointment will be made within the lower range of the Lecturers scale. Application forms and further particulars obtainable from Registrar (S), The University, Bath, quoting reference 72/69.

EDITOR—PPE graduate (or similar degree) with knowledge of economics and social sciences wanted for international publishing project. The work entails the ability to translate abstract concepts into visualised form. Salary negotiable, above £2,000 p.a.

Write to Keith Spence, Mitchell Beazley Ltd, Mill House, 87/89 Shaftesbury Avenue, London W1, or ring 01-437 6645.

Australian National University

Scholarships for Ph.D Degree Courses

Applications are invited from persons of high scholastic calibre with the capacity for research, who hold, or expect to hold, a good honours degree, or its equivalent, from a recognised University, for a limited number of Ph.D Research Scholarships. These are tenable in the Institute of Advanced Studies or in the School of General Studies in the fields of research listed below.

TENURE: Subject to satisfactory progress, a Research Scholarship is tenable for the whole period of a course of study and research for the degree of Doctor of Philosophy. This is usually three years.

SCHOLARSHIP BENEFITS: The basic living allowance is \$A2915 per annum tax free, but for scholars with appropriate medical qualifications it is \$A4200 per annum. In addition dependants' allowances may be paid to eligible scholars. Living and dependants' allowances are currently under review. Assistance with accommodation in Canberra is available for most married scholars. Reasonable travel and removal grants are paid.

APPLICATIONS: Applications should preferably be made by the end of January, April or September, but those received at other times will be considered. A Research Scholarship may normally be taken up at any time, subject to agreement with the department concerned.

The fields of research in which scholarships are offered are:

Accounting and Public Finance	History of Ideas
American Literature	Human Geography
Anthropology	Indonesian and Malaysian Languages and Literatures
Asian Civilisations	International Relations
Australian History	Japanese Language and Literature
Australian Literature	Law
Biochemistry	Linguistics
Chinese Language and Literature	Medieval Literature
Classics	Modern British History
Demography	Pacific History
Econometrics	Philosophy
Economics	Political Science
Economic History	Prehistory
Economic Statistics	Psychology
Education	Russian
English Literature	Sanskrit and Buddhist Studies
Far Eastern History	Sociology
Geography	South Asian History
Geomorphology	South-East Asian History
Hindi Language and Literature	Urban Research
History	

Application forms and further particulars are available from the Academic Registrar, Australian National University, Box 4 P.O. Canberra, A.C.T. 2600, Australia, or from the Secretary-General, Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF.

Completed applications from overseas should be sent direct to the University and not to the nearest Australian Embassy, High Commission or Consulate. Successful applicants will be notified of any requirements which they will have to satisfy for entry into Australia as private students.

The Scottish Council
(Development and Industry)

DIRECTOR OF SCOTTISH POLICY INSTITUTE

An executive is sought to direct the newly formed Scottish Policy Institute. The Institute will incorporate the Council's existing Research Group, and will undertake a new function of policy making. This function will relate both to regional policy issues, for discussion with Ministers or Departments, and to the evolution of industrial policies for the guidance of the Council itself and of outside interests. The Institute will also be involved in commercial consulting work.

The post of the Director is a senior one, reporting directly to the Board of the Institute. The successful applicant would probably have a degree in economics or related subject and experience of economic planning or research is desired; experience in consulting work would be a particular advantage. Age 30-40.

Applications should be made to:

The Secretary,
The Scottish Council (Development and Industry),
1 Castle Street,
Edinburgh, EH2 3AJ.

CAREER OPPORTUNITIES in Economic Development

The World Bank, based in Washington, D.C., is an international organization with worldwide operations in the field of economic development. The World Bank seeks qualified candidates for the following positions:

Country Economist

Requirements: A graduate degree in economics, the equivalent of a Master's degree, with training in fields such as economic growth, international economics, money and banking, and public financial and fiscal policy. Several years experience in economic analysis and the application of economic principles. This experience should include work on economic development problems, or national economic problems using national income and balance of payment analysis. A knowledge of underdeveloped countries and the various factors, including non-economic factors, conditioning their development.

Transportation Economist

Requirements: University degree in economics combined with experience as a transport economist concerned with roads, railways, airlines, or ports. Relevant work with a planning commission or in a government department, public authority, banks making loans for transport enterprises or with consulting firms preparing economic analysis of transport projects, would be suitable.

The World Bank offers interesting and challenging work, with frequent opportunity for international travel. It requires a good command of written and oral English; knowledge of other languages, particularly French or Spanish, is desirable.

The starting salary is fully competitive and benefits include health and life insurance; five weeks annual leave with transportation to home country every two years; pension plan and relocation expenses on appointment.

U.K. Nationals can obtain further particulars and forms of application from:

Foreign and Commonwealth Office, Overseas Development Administration, International Recruitment Unit, Room E304 Eland House, Stag Place, London, S.W.1

Nationals of all other countries should submit a detailed resume to:

The Personnel Department, International Bank for Reconstruction & Development, 1818 H Street, N.W. Washington DC 20433 U.S.A.

I know where I'm going

Export the wrong one to Japan and you're dead. Which one?

In Japanese, the word for 'four' is the same as the word meaning 'to die'. And nobody would buy death for themselves, let alone make a gift of it to a friend. On the other hand, the number 'eight' means 'splendour' and is thought to be lucky.

This is the sort of information that the locals know and insiders, like Standard and Chartered, who are also there, have learnt through their daily life in the business community. These are the small things which might

never come out in your research but which could lead to expensive mistakes.

These are the kind of details which Standard and Chartered make sure you get, along with the hard facts in your report.

Standard and Chartered are in a unique position to help you expand or break into markets in Africa and all over the East.

As a leading British bank, with over 1500 offices in 55 countries, we can report daily on personalities,

opportunities and situations, in a doubly well-informed way. We know the answers to your questions and we know why you've asked them.

And you don't have to be a customer to use our marketing services, just contact:

Standard and Chartered
Banking Group Limited,
Head Office: 10 Clements Lane,

I know where I'm going

Jack Lynch is having a fight to get his new anti-IRA measure through the Dáil, but as usual he's arranged things so that the country is behind him. He seems to have made his choice at last, page 11. But the television sackings have left a very sour taste, page 33. The IRA in the north has acquired Russian missiles, page 24.

By-election blues

Next week's by-elections in Uxbridge and Sutton and Cheam will be the first test of Mr Heath's prices and incomes freeze. If it's not bad news for Mr Heath it will be for Mr Wilson, page 14. The extraordinary Uxbridge election, page 27.

Pompidou's France

A special survey on the economic situation of our near, and rich, neighbour, after page 60.

Vat to buy for Christmas

Santa Claus needs to calculate just what the real effect of value-added tax will be on prices. There are bargains now, but other buys are better postponed until after Vat comes in, page 75.

Last trip

The last rocket sets off for the moon on Wednesday and man is not likely to set foot there again for 20 years. There are other things to be done in space but why has the major programme fizzled out?, page 73.

Upside down under

If Australia follows New Zealand into the Labor camp it won't prove much more than that the voters got bored with the old lot, page 13. The Kirk session promises to last for six moderate years, page 46.

Sinking Egypt

The word in Cairo is "decomposition," and even the would-be coup-makers seem too eaten away by inertia, page 34.

American foreign policy

SIR—Your inference in "Second term abroad" (November 18th) that President Nixon will try to put together a more homogeneous Atlantic policy is well taken. But I believe that a caveat is appropriate with respect to the likelihood of the emergence of a coherent programme on either side of the ocean.

There persist divergent forces in the United States which will make it a labour of considerable magnitude to create a harmonious policy mosaic of the many bits and pieces which Washington's economic, monetary, diplomatic and military power centres produce. Nor does Dr Kissinger's awakening to the political implications of foreign economic policy assure an organised American approach to Europe.

Perhaps even more doubtful is the prospect that our European "partners" will soon find it possible to speak with the single voice which their current foreign policy consultations attempt to foster. The European community, as it adjusts to quantitative enlargement and to the qualitative changes implicit in such projects as economic and monetary union, is unlikely to transcend quickly the national rivalries which were politely papered over at the recent Paris summit meeting of the Nine.

One may hope that both American and European policy makers will be patient and flexible as increased attention is paid to the complex problems of Atlantic relationships. But to expect either side to articulate a homogeneous policy in the next four years is more sanguine than the evidence of the last four would warrant.—Yours faithfully, ROBERT MCGEEHAN
New York

The freeze

SIR—I fear the prospects of continuing growth through Government spending during the wage and price freeze will prove disappointing ("And the rest of us," November 18th). Too great a proportion of that spending is now earmarked for purposes unlikely to produce new wealth: everything from propping up failing industries to propping up failing individuals, with such things as the bottomless well of Concorde in between.

The belief that encouraging spendthrift habits on a national scale by means of make-believe money will result in good husbandry has never been transparently logical. The connection between too much easy money and too little productive work is rather more obvious, and makes the connection between inflation and a low rate of growth readily understandable.

There is a visible fallacy in the use of the word expansion as a euphemism for dilution. Diluting the money supply, like watering the milk, simply means that the public must have more of it just to get the same nourishment.

The Great Depression of 1929-31 has been held to be due to buying power lagging behind improved production. The present Great Inflation is due to buying power running ahead of production. Printing soup tickets faster than soup is made destroys confidence in the tickets. Restoration of confidence, removing the motives for unwholesome speculation, requires a return to money that is a reliable alternative to owning something real.

Money supply must not lag behind, but neither must it run ahead. By hook or by crook it must be kept in step with material growth. Whatever the practical difficulties, a government declaration of intent in those terms would be more widely understood than the pundits appear to suppose, and would have an immediate steadying effect.—Yours faithfully, STUART J. LARCOMBE
Northwich, Cheshire

SIR—Steps 4 and 5 of your algebra (October 21st) are not consistent: in step 5, the solution depends on statutory enforcement of wage controls; step 4 admits that statutory enforcement is insufficient if the trade union movement resists.

An alternative is as follows:

1. The problem: to ensure that $W=S$ = maximum

W =wage/price policy
 S =success of policy (but when $S=0$, S =failure)

2. The elements: as in your algebra, viz:

V =voluntary wage/price control
 C =compulsory wage/price control
 T =official trades union support
 P =public opinion
 M =militants

3. $W=V+P+T-M$

4. But W is only positive if $V+P+T > M$

5. The problem is to maximise ($V+P+T$) and/or minimise M .

6. V is constant, but may be slightly increased by substituting C . But this may increase M . An increase in M causes an increase in P .

7. The only independent element is T .

8. The solution: $C+P+T-M=W$ will only be greater than zero if T is high.

∴ To ensure $W=S$ =maximum depends mainly on ensuring trades union support.—Yours faithfully, B. DOMMEN
Suva, Fiji

State pensions plan

SIR—After reflecting on your article (November 11th) on the new pension scheme arrangements and in the light of my own experience in changing employers it occurs to me that what you describe as occupational schemes are nothing of the kind. Company pension schemes are bosses' schemes in the traditional sense of the word and to suggest that employees can influence decisions is illusory.

An occupational scheme would require, for example, the Institute of Cost and Management Accountants to manage a scheme for its members. Employers and employees would make their monthly contributions and there the employers' function, influence and responsibility would end. The entire management of the scheme would be vested in the council of the institute elected by the members. The problem of transferability on changing employers would no longer apply but transfer of actuarial valuation to another scheme could be provided for.

The same principle could apply to craft guilds and unions with competing fall-back schemes for the non-unionised. The bookkeeping for such schemes could easily be computerised and company management would be spared involvement in a problem which, judging by the way we are going, can only become more intractable and is not their business anyhow.—Yours faithfully, D. B. L. GIBBONS
Addis Ababa

Housing

SIR—We were pleased to see how closely your views on the housing market ("Hogs, cobwebs and homes," November 18th) agree with our own. We presented a not dissimilar analysis at the recent Shelter conference on house purchase finance (see "Regulating House Price Increases" by Alex Henney).

We share your view that "the building societies bear the lion's share of the blame" for short-term fluctuations in housing prices and new private sector building. You rightly mentioned their unnecessarily infrequent changes in interest rates as one cause of the fluctuations in the housing market. Their policy has accentuated the magnitude of the cycle.

Another cause of their propensity to flood the housing market when money is readily available, is their wish to grow. Asset growth, rather than economic or social responsibility, serves as a proxy for profits in measuring their success in their own eyes. We hope that the building societies will respond to current criticisms in a constructive way. In particular we hope they will try and smooth the flow of money into the housing market by adopting a more flexible interest rate policy, and if necessary by the Government introducing a scheme of special deposits. We also hope that they will undertake some serious research into their effect on the housing market, and into the demand for mortgages.

The excessive advantages available to half the country as existing mortgagors with "trade-up" profits have reached levels which are injurious to all tenants.

It is a sorry reflection on the building societies' lack of serious research that we probably know less about the demand for their £3,000m worth product than we do about the demand for baked beans.—Yours faithfully, JOHN T. WILLIS
ALEX HENNEY

MANAGEMENT APPOINTMENTS

£7000 PA AND OVER

SCHLESINGERS

"Schlesingers" is the short name for Schlesinger Insurance & Institutional Holdings Limited, a large South African organisation with international connections.

It controls important banking, property, investment and insurance interests, principally the giant African Eagle Life Assurance Society Limited.

These interests are growing rapidly in the United Kingdom with a view to expansion into Europe. Schlesingers control the Southampton Insurance Company Limited and have recently acquired the Trident Insurance Company Limited, both United Kingdom organisations

It is desired to make two key appointments to assist in developing the insurance activities of the Group.

An Actuary, to be responsible for the management of the Life Assurance business, and to assist in the profitable development of the General business. He should also be able to participate knowledgeably in the investment and property work of the Group.

An Administration Manager with practical experience of setting up and controlling the work of a comprehensive Life Department organised on a computer basis.

Candidates for these appointments should be youngish men with lively minds. Salary on appointment should be around £7,500 p.a. in both cases with benefits to match. Career involvement is more important to Schlesingers than money.

Please apply, in confidence, stating details of experience and personal aptitudes, to:

A. F. Noyes Esq.,
Schlesingers,
Number One, Kingsway, London WC2B 6XG.
Telephone: 01-836 6772

SCHLESINGERS

Eurobond Manager

We are the recently-established and rapidly-expanding U.K. merchant banking subsidiary of Wells Fargo Bank, N.A.. We seek a highly-qualified individual who will occupy a senior position and be directly responsible to the Managing Director for:

- Establishment of a Eurobond underwriting department and capability within our merchant bank.
- Rendering advice to international companies on corporate finance.
- Providing support to our Eurocurrency loan syndication effort.

The candidate should be well-versed in all phases of the Eurobond field, including origination, syndication, and trading, and have extensive contacts in this area. Salary will be generous and will reflect the individual's qualifications and experience. Please reply in confidence, enclosing a resume of career activities to:

C. R. Sanders,
Managing Director
WELLS FARGO LIMITED
80 London Wall
London, EC2M 5ND

Immigration

SIR—*The Economist* is certainly to be congratulated on its prescience: earlier this year you repeatedly warned that a single European currency meant reducing peripheral areas like Britain to the level of Ulster or West Virginia. Now that a single currency system has been agreed for 1980, Sir Alec Douglas-Home himself, in the immigration debate, has confirmed your worst fears by his contemptuous comment that the likely effect of free movement of labour in the market was a flood of Britons seeking work in Europe.

As usual with dear Sir Alec, he didn't tell quite the whole story, which is that even while a country is being run down, there is still strong pressure to immigrate to it from still poorer areas. For example, in the past decade while Britain has been falling behind in the prosperity stakes, over a million people from very poor countries have immigrated while a roughly equivalent number of our better workers have emigrated to the richest areas of the world. Thus, in the market, it is likely that our best workers will largely go to the Ruhr to get top wages, but it is also true that huge numbers, perhaps millions, of Asians from Turkey will flood in to do menial jobs rejected by the British.—Yours faithfully, G. J. A. STERN
London, N6

Terrorism

SIR—Your correspondent Mr C. J. Hughes's suggestion (Letters, November 25th) that Zionist organisations send letter bombs to Jews ought not to be ignored.

The idea, of course, would not be new. I have suspected for some time that Coventry was rubbed out in 1940 by the RAF at Churchill's instigation to promote anti-German fervour in Britain; the Americans probably scuttled their fleet at Pearl Harbor to justify a war against Japan; and it appears equally likely that British soldiers in Northern Ireland are being shot by our own secret service on Mr Heath's orders to win support for fierce repressive measures against Catholics there.—Yours faithfully, H. CONNOR
Radlett, Herts.

SIR—Your correspondent Mr C. J. Hughes (Letters, November 25th) implies that there is no specific evidence linking the letter-bomb campaign with the Arabs and suggests that Zionists and Israelis could be sending them!

I would suggest that this thesis is completely ridiculous. It would seem most unlikely that a government would send letter-bombs to its own diplomatic corps, one of whom was actually killed.

However, there is proof positive that not only the Arabs, but Arab governments are also involved in the letter-bomb campaign. This became apparent when an Algerian diplomat was apprehended at Amsterdam airport, on his way to South America, with a suitcase of letter-bombs. There seems little doubt that if it had not been for the action of the Dutch

police, there would have been a wave of letter-bombs coming, not only from India, but from South America as well.—Yours faithfully, DAVID M. JACOBS
London, SW7

Air accidents

SIR—You say ("A heartbeat away . . .", November 25th) only 36 seconds was available for reacting to an emergency. Actually much more than reaction would have had to be fitted into the 36 seconds:

1. Perception of fault.
2. Identification of fault.
3. Assessment of fault as real, not a false alarm.
4. Decision on action.
5. Action.
6. Time for action to take effect.

The last item would probably take more time than all the rest. Retraction of droop at low altitude and speed is almost certain to be catastrophic. And the speed was low because of noise abatement procedures.

As for the pilots cancelling the actions of the automatic stick pusher, is there any evidence that the automatic stick pusher would have prevented disaster? Had the warning been a false alarm, use of the pilots' veto would have been the right action.—Yours faithfully, J. D. PROCTOR
Reigate, Surrey

Sisal

SIR—While appreciating that only brief comment is possible within the scope of your feature "Key indicators," I feel that on the subject of sisal (November 11th) your readers deserve a few more facts.

It is true that considerable changes and rationalisations on the production and consuming sides of the industry have taken place in recent years, and these will obviously continue. However, the fact remains, as FAO figures indicate, that sisal production and consumption continues at about 600,000 tons per annum—only a small reduction in recent years. What is lost in traditional markets has largely been made up in new areas.

Synthetic agricultural twine has now been on the market for many years and has had only minimal success in replacing sisal. Estimates are that it accounted for only 4.5 per cent of the total North American twine market last season, and considerably less than this in Europe.

The situation regarding ropes and packing twines is, of course, rather different with synthetics dominant, but, as you state, the main outlet for sisal is in agricultural twine. (Incidentally in most countries binder twine is being largely replaced by baler twine.)

In Tanzania—I read your article on a return flight from east Africa—considerable development and judicious replanting is taking place and the trend is towards a smaller number of larger and more efficient plantations. On one large group of estates, and as a result of tremendously increased yields, costs per ton are currently lower than 20 years ago despite,

of course, monumental wage increases. In Brazil and Mexico production costs are in any case very low.

Finally, regarding the price of sisal today (now £117 per ton cif for No. 1) it should be remembered that the recent increase to which you refer is only partially compensating growers for the fall in the value of sterling over the past months.

It should also be remembered that it was the combination of the drought in east Africa together with the third consecutive season of high demand which caused prices to rise to the present level.

The industry is fully aware that today's price is high, reviving talk of synthetics, but polymer producers should not be misled into being too confident about the future as far as the agricultural twine business is concerned. The sisal-producing countries and their distributors still have a lot of fight in them!—Yours faithfully, V. J. LONDON
London, EC3

Iceland

SIR—In your article, "Norway: Were we wrong?" (November 18th), you say that "For Iceland, 80 per cent of whose exports consist of fish and fish products. . . . This is incorrect. Iceland, in its attempt unilaterally to extend its fishing limits to 50 miles, has consistently claimed that 85 per cent of its exports are accounted by fish and marine products.

The facts are that, taking into account invisible exports and other income, fish and marine products account for 49.5 per cent.

I am afraid that Iceland has shown a reckless disregard for the truth in presenting its case. This is one example.—Yours faithfully, H. WM. BERNHARDT
Geneva Markpress

English language

SIR—Simplified spelling of the sort advocated by Mr Edward Smith (Letters, November 25th) would be costly to introduce and would tend to widen further the gulf between English and other languages—such objections have surely been sufficiently rehearsed in debate. What has not been advocated in print is the case for pronouncing English as it is spelt. English is the only language using the Latin alphabet in which—sometimes but not always—of the vowels the first is pronounced as though it were the second—"a" as in "nation"—the second as though it were the third—"e" as in "serious"—and the third as the diphthong forming the personal pronoun of the first person singular. To reverse the great English vowel shift would be a huge contribution to the internationalisation of English—even to make sure that every English-speaking person is aware of the phenomenon would be a valuable step. Then, instead of advocating such freakishness as neishun-nashunal, we might learn to accept the desirability of pronouncing

PROPERTY

prestige building in Paris

Unusual opportunity to acquire twin block prestige building in Paris

Britannic Building, 72 Boulevard de Verdun and 5 rue Dubonnet, 92 Courbevoie
800 yards from the center of La Défense.

An impressive building providing 25,000 sq. metres (with car parks for 702 cars).
Due for completion early 1975.

This superb complex of luxury office space is situated in the rapidly expanding area 2 miles northwest of Place de l'Etoile. It is equipped with high speed lifts serving nine floors of 1300 sq. metres. There is complete air conditioning and carpet throughout.

The tastefully designed interior includes a spacious reception area.

Britannic Building is being offered as a whole for sale or rented at well below current market prices. Illustrated brochure rent and conditions of sale through OCEFI, developer and sole agent.

nation as we do the first two syllables of national.

Discussion would surely bring to light further areas in which it would be seen that what is needed is reform of pronunciation rather than of spelling. Will you help to initiate it?—Yours faithfully, London, N1 G. HENRY TALLACK

Malaysia

SIR—I feel that a misleading passage in your article on Malaysia (October 28th) needs to be clarified.

The passage in question has given your readers the entirely false impression that Tun Tan Siew Sin, president of the Malaysian Chinese Association, and minister of finance, is condoning and protecting the vested interests of the party within the government. At the same time it implied that Tun Tan and myself are at loggerheads with each other. I wish to point out that Tun Tan has no part in the "vested interests" if any, in the party. He has always been the chief advocate of honesty and integrity in the party as well as the need for a mental revolution among the Chinese in the country to identify themselves with the nation. Tun Tan Siew Sin and I are working in very close co-operation within the MCA and I wish to state categorically that I am fully behind him and his policies.

I am not aware of the "Malay suspicion" of my activities that your correspondent mentions.—Yours faithfully,

LIM KENG YAIK

Minister with special functions
Kuala Lumpur

Ireland

SIR—Commenting on Ulster from across the Atlantic may be presumptuous, but as one who is old enough to have observed with interest and concern the evolution

(disintegration?) of the British Empire and Commonwealth over a period of 50 years, I must confess to a sinking feeling of déjà vu when I read the news from Ulster.

If there is one rule of political behaviour that has been verified by experience, it is that when you try to replace majority rule, whatever imperfections it may be deemed to have, by something else, you inevitably get something worse. The only alternative to majority rule is minority rule, which means dictatorship. To invite the majority to participate in an alternative government always fails because it is the implication in such circumstances that the majority are going to be denied the democratic right of a majority—the right to govern.

If British public opinion felt that the Ulster majority in the Northern Ireland parliament were behaving towards the minority in an unfair manner that was incompatible with being a part of the United Kingdom, the British Government should have given the Ulster government a choice between two alternatives: either the Northern Ireland government would correct its policy towards the minority, or the British Government would enact legislation conferring complete independence on Ulster. This would have put the onus of decision where it belonged: on a parliament representing a majority of the people of Ulster.

Instead the British Government has intervened in a manner to alienate the majority and in effect has painted itself into a corner from which it is proving more and more difficult to extricate itself.

Recently I had occasion to reread the American Declaration of Independence and realised why the Ulster situation gave me a sense of déjà vu. I almost got the impression that Mr Heath and Mr Whitelaw had diligently studied this historic document and were for some perverse reason faithfully re-enacting the events of 1774-76. The American colonies at the beginning of the crisis had a status similar to Ulster's under its own parliament. They were accustomed to being governed by their own legislatures with little interference from London. The attempt of the British government and Parliament to revive dormant powers and impose what is today called "direct rule" precipitated the crisis.

Among the charges brought against King George III were the following:

He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without and convulsions within. He has erected a multitude of new offices, and sent hither swarms of officers to harass our people and eat out their

substance.

He has combined with others to subject us to a jurisdiction foreign to our Constitution, and unacknowledged by our laws; giving his assent to their acts of pretended legislation . . . for taking away our charters, abolishing our most valuable laws, and altering fundamentally the forms of our governments; for suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever; and so on and on.

It all sounds dismally familiar.

When the first rebel Congress assembled in 1774 there was no immediate intention of declaring independence; that did not come till 22 months later. As a young officer in the British service, George Washington had professed fervent loyalty to the Crown. An alienated loyalist often becomes the most intractable enemy.

Is the Ulster tragedy destined to play itself out to the same sad denouement as took place in America two centuries ago?—Yours faithfully, G. E. W. JOHNSON
Sudbury, Ontario

Senator Scott

SIR—Your otherwise reasonably accurate article on the American elections (October 28th) had one glaring lack of homework, or bias. Your description of Virginia's former Representative (now Senator) Scott was deplorably ignorant. Mr Scott, far from being a "negative-minded nonentity" is constantly hard at work for sensible progress, and certainly well known by the people he represents. His hard work and fame appear to have spread to the rest of the state, since he did defeat Mr Spong, who has held his seat in the past primarily only because he was a Democrat.—Yours faithfully, RONALD SARSON
New York

Ugandan Asians

SIR—Mr Thomas (Letters, November 11th) chides *The Economist* for the "left-wing policy" it follows. By the same criteria I suppose Mr Thomas may regard President Nixon and perhaps the Pope as dangerous fellow travellers.

Are they both on his list of those with whom the "British people will settle accounts" or is this privilege reserved, on racial grounds perhaps, to British nationals?—Yours faithfully, P. CRONEY
Felixstowe, Suffolk

SIR—Mr Gillams of Whitgift is of course quite right in what he says about Ugandan Asians and Master Leavis of Oxford (Letters, November 18th) quite wrong. In any case if Mr Leavis thinks that spanking by a housemaster is the proper way to deal with 17-year-olds who express unacceptable views then one must ask what good his own education did or is doing for him.—Yours faithfully, W. F. WARREN
Putney, Surrey

PROPERTY

CORPORATION OF DUBLIN MOORE STREET/PARNELL STREET REDEVELOPMENT PHASE 1

A redevelopment scheme has been prepared by the Corporation for a site of approximately 8 acres bounded by Moore Street/Parnell Street/Chapel Lane. This site is in the heart of the retail shopping district in central Dublin adjoining O'Connell Street, Henry Street, Mary Street. It is proposed that the redevelopment will be carried out on a phased basis.

Offers are invited for participation with the Dublin Corporation in the Redevelopment of Phase 1, which has an area of approximately 6.25 acres (2.52 hectares). This redevelopment envisages the provision of:

- 400,000 sq ft of retail shopping
- 50,000 sq ft of other commercial uses
- 150,000 sq ft of offices
- and parking for 940 cars

A brief containing further particulars together with a site map and photographs of the Advisory Scheme showing the form of development required may be obtained at the Development Department, Exchange Buildings, Lord Edward Street, Dublin 2, on payment of a non-refundable fee of £25. Additional copies of the brief may be obtained on payment of a non-refundable fee of £9.

Offers should be submitted on the forms provided and addressed in sealed envelopes marked "Tender for the Redevelopment of the Moore Street/Chapel Lane Area, Phase 1," to the City Manager, City Hall, Dublin 2, so as to reach him not later than noon on Friday, 27th April, 1973.

The lowest or any offer will not necessarily be accepted.

GEORGIAN COUNTRY HOUSE HOTEL

FOR SALE

Situated in 21 acres of delightful grounds 12 miles from Aberdeen. This "listed" building is in superb condition, and has a recent extension which blends extremely well.

32 bedrooms (30 private bathrooms), heated and covered swimming pool, sportshall, billiards room, stables. A magnificent boardroom is the centrepiece of self-contained business wing.

This property would be an ideal residential business centre perfectly located for the development now taking place in the north east of Scotland.

The Economist

December 2, 1972

I know where I'm going

Despite all the apocalyptic nonsense that has been talked about Ireland sliding into civil war, the prime minister, Mr Lynch, will be strengthened by the stand he has now taken against the Irish Republican Army. Of course, it is still possible that Mr Lynch's new bill to tame the IRA—the Offences Against the State (Amendment) Bill—will be defeated when the Dáil brings it to a vote. The opposition has many doubts about it. If Mr Cosgrave, the leader of the main opposition party, Fine Gael, does clap on the whips and the doubters in the party obey him, and if the half-dozen independents in the Dáil decide to vote the same way (one of them has said he will) Mr Lynch will have to keep every one of his people loyal to get even a tied vote. The tie would then have to be resolved by the Speaker's casting vote—which Mr Lynch has indicated he would interpret as a defeat. He would then hold a general election. His plan of campaign seems clear and resolute. Mr Cosgrave is, of course, even less of a friend to the IRA than Mr Lynch. But the lawyers in his party have been arguing that the new bill's rules on evidence are unconstitutional, and Mr Cosgrave's public line is that what was needed was not so much new laws as a new political will. A general election might confirm that with a vengeance. But nothing is likely to change the new direction of Irish policy.

There are liberals on both sides of the Irish Sea who are alarmed by some of the clauses in the new bill (although liberals sometimes forget that you cannot deal with terrorists in the way that you tackle car-thieves). There is better reason to have doubts about the sacking of the entire board of the television authority, RTE (see page 33). This was interpreted by many observers as an attack on the freedom of the individual and the media, and there were half-audible mutterings about what the European Commission on Human Rights might have to say about it all. But the dramatics of the IRA's Mr Sean MacStiofain, on hunger strike since his arrest last week, have won him precious little sympathy.

From the day that Mr MacStiofain started his hunger strike there has been a danger that through blind obstinacy, the fear of being called a coward by his followers, or a simple miscalculation of how much his constitution could take, he would carry it through to the end. That may still happen. A sip of tea and a sip of water on Tuesday night helped to keep him going at a stage when one of the priests who visited him in the Curragh barracks announced he was about to die. He now appears to be taking liquid but is still refusing food. But if Mr MacStiofain does mean to take his own life he will not be greatly mourned even within the Republic of Ireland. The crowds that turned out to protest against the arrest of this Englishman-turned-terrorist-chief numbered only a few thousand. The IRA would be thankful for a martyrdom, however spurious; but the Ireland of ordinary men and women, the real Ireland, has had enough of cardboard saints.

What Lynch has done

It seems pretty clear now that Mr Lynch has got the majority on his side in his own country. Most Irishmen are troubled by the methods that the IRA has been using in the north; however much some of the Irish press might interpret what has been happening in Northern Ireland through nationalist eyes, outrages like Bloody Friday were too dramatic and too tragic not to be understood for what they were. There has been a growing fear that the bloodshed in Ulster might spread to the other side of the border. It is increased by such incidents as the cinema bombing in Dublin, which many Dubliners are inclined to attribute to the Provisionals, or to some uncontrollable fringe group of them, rather than to any Protestants. Mr Whitelaw's attempts at conciliation in Ulster have strengthened moderate Irishmen who argue that a solution should come through negotiation, not violence. The political courage of individuals such as Mr Conor Cruise O'Brien in this educational process has been beyond praise. The IRA's decision to

ask for a ceasefire while Mr Heath was in Ulster a fortnight ago, and to modify its previous conditions for calling the gunmen off, is one measure of the growing opposition it knows it is running into. The IRA still wants British troops off the streets and an amnesty for its men in return for a ceasefire, but it knows it will not get either of those demands. It has felt the change in the wind.

But it is Mr Lynch himself who has done most to isolate the IRA from the southern community as a whole. One portion of his own party, Fianna Fáil, served as a gleeful midwife at the birth of the Provisional IRA in the autumn of 1969. Some of Mr Lynch's ministers were said to have connived at gun-running to the IRA, and until fairly recently the government gave the impression that it was unwilling to do anything to curb the terrorists' activities in the south. Persistent pressure from the British Government seemed to go unheeded.

What he wants

But the need to act was recognised at last. The new bill, and the arrest of Mr MacStiofain, do not represent an entirely novel departure. They are the culmination of a gradual process that was set in motion some 18 months ago when the government imposed tighter controls on the possession of explosives and called in firearms, apart from shotguns. Before Mr MacStiofain's arrest 138 people had been brought to trial in the special courts set up in May, and 103 were convicted—mainly on firearms offences. Then Mr O'Malley's justice department went a stage further in the summer by looking into the whole problem of how to make it still easier to put gunmen behind bars. Mr Lynch's attacks on internment in the north ruled out that particular device. The answer was found in the new bill, which alters the rules of evidence in the special courts. If a senior officer of the Irish police states that a prisoner is a member of an illegal organisation, according to clause 3, "the statement shall be evidence that he was then such a member." It is up to the prisoner to prove otherwise. This clause obviously gives very wide-ranging powers to policemen who are directly employed by the government. The supreme court still has to rule on whether the bill is constitutional.

What are Mr Lynch's motives for taking measures at this stage that have been welcomed even by Unionist party hawks like Mr Bill Craig? There are two possibilities. The first is that Mr Lynch has become seriously concerned about the danger the IRA presents to political institutions south of the border, and by the deterioration of relations with Britain that were a consequence of his government's past weakness in the face of the gunmen. Second, he may now calculate that, by playing the English card, he can outmanoeuvre the ultra-nationalists who still flourish on the fringe of his party. There have always been two ways, and probably only two ways, in which Mr Lynch could hope to get a chapter to himself in the Irish history books, and perhaps the presidency of his country before the history books are written. One was to use the instrument provided by the IRA's base in the south to prise an Ulster settlement out of Britain that would make him the hero of the eventual

reunification; but letting the IRA run on, until Britain would agree to that sort of settlement, had come to look increasingly chancy, and increasingly dangerous to the republic itself. The other was to make sure of Britain as Ireland's ally in pursuit of more realistic Irish ambitions and those policies (especially in Brussels) that lie outside Ireland itself. That is the English card, and the self-preservatory one, and it seems to be the one Mr Lynch has chosen.

It is possible that he either thinks he has got a private agreement with Mr Heath, or thinks he is about to get one, which will bring new British concessions on Northern Ireland. But it is not easy to see what precise form these could take. Mr Lynch might want them to include an agreement to hold only one referendum on the border, rather than repeating the exercise every time the extremists on the Protestant side need calming down. Mr Lynch does not like the referendum, but then it is not aimed at moderate men like himself, on either side; it is intended to remind the IRA of the size of the majority in the north against unity in present conditions, and to discourage the growth of the Protestant lunatic fringe by demonstrating that one of the old verities, at any rate, still holds good. To abandon any idea of another referendum would be to throw that potentially useful calming device away. But perhaps Mr Lynch is looking for something other than this: it may turn out to be agreement to set up in the near future an Irish Council (such as he has long talked about), especially on economic issues, with representatives from both north and south. That would be a modest British payment in return for what he seems to have begun to do to the IRA. There are serious issues, especially as the European community's regional policy develops, on which the two parts of Ireland have a common interest. Now that Stormont has gone, at least in its old guise, there may be a better response from the north than there would have been from the Stormont of the Mr Craigs and Captain Brookes that was all the south thought it could see after Lord O'Neill departed.

The way could be open at last

By moving against the gunmen, Mr Lynch has made it easier to see the shape of a workable solution in Northern Ireland. It is not until the IRA has been broken as a military force in the north, which means until its terrorism has been reduced to a level that the society of Ulster can endure, that a stable settlement can emerge. Only those who take a stand against violence can claim the right to take part in reaching such a settlement, and it is an encouraging straw in the wind that, for their part, the leaders of the Social Democratic and Labour party decided last weekend to drop their refusal to talk to Mr Whitelaw. But the important thing is that there at last appears to be the rudimentary understanding between Mr Heath and Mr Lynch that has been so badly needed since the shooting in Ulster began. The army has already cut deep into the IRA chain of command since Operation Motorman in July denied the gunmen their sanctuaries in the north. Now the south, too, is being closed to them.

Let's try the other lot

Something as simple as that got Norman Kirk into power in New Zealand, and will probably give Australia to Gough Whitlam

The real issue in this weekend's election in Australia, as in last weekend's election in New Zealand, is not inflation, permissiveness, union left-wingery, or being nice to China. It is change. Voters start to yawn cavernously when a government has been in power for 12 years, as the National party had been in New Zealand until Mr Kirk's Labor party rolled down its unexpected landslide (see page 46). And when a single group has ruled the roost for 23 years, as the Liberal-Country party coalition has done in Australia, it is right for people to start asking themselves whether it has held on to its original drive and purpose. If power doesn't always corrupt, doesn't prolonged enjoyment of power at least breed weary complacency?

That seems to have been the judgment of the New Zealand voters, who responded to the Labor party's slogan that it was time for a change even though the relatively fresh-faced government of Mr Jack Marshall could lean on the laurels he won in his shrewd bargaining with Britain and the EEC, and had been imaginative enough to rope in some younger, trendier politicians interested in topics like pollution. It is even more likely to be the judgment of the Australians when they go to the polls on Saturday. Recent public opinion polls give Mr Whitlam's Labor party a lead of 5 to 7 points over the governing coalition, although Australia's curious system of preference voting means that the result could still hinge on how the supporters of smaller parties such as the Democratic Labor party choose to distribute their second votes. That is why Mr Whitlam is thinking of getting rid of the present electoral system if he wins and doing it the British way: first past the post.

If the Liberals do lose this weekend, they will have defeated themselves. The party has failed to unite around a real leader since Sir Robert Menzies retired from politics in the mid-1960s. It had a chance to do so when John Gorton came to the top. Mr Gorton was the nearest to a radical Tory the party had produced for a long time, a man who recognised that most Australians wanted a more decisive central government, a politician with a mind and a style of his own. But the style frightened the conservatives of the party, and in 1971 they replaced him with Mr McMahon. By comparison with Mr McMahon, the Labor party's Mr Whitlam has looked a model of cool, closely reasoned rationality. He has learned the lesson of other recent social democratic triumphs—the victories of Herr Brandt and Mr Kirk—that, to win power these days, a left-wing party must spread itself over the middle ground, forget about the socialisation of the means of production, distribution and exchange, and above all steer clear of the casual flirtation with way-out minority groups that did so much damage to Senator McGovern's campaign in America. In Australia, where the whole political spectrum is

centred much farther to the right than in Britain (many Australian Liberals are astonished by Conservatives who advocate a negative income tax) this means steering a very sober course indeed.

Mr Kirk and Mr Whitlam are very similar in the things they stand for. They are almost completely in tune on foreign policy. They want to leave the South-East Asia Treaty Organisation, which is indeed little more than a skeleton now. They say, but they may not mean it, that they will gradually dissociate their countries from the present five-power arrangements for the defence of Malaysia and Singapore. Both Labor leaders have promised speedy recognition of mainland China and the ending of conscription. At the same time, they are not averse to throwing their weight around on two rather different issues—French nuclear tests in the Pacific and the British Government's proposals for new immigration rules. This week Mr Kirk was threatening to engage in a bit of new-style gunboat diplomacy by sending a New Zealand frigate, with one of his cabinet on board, in the direction of the Mururoa atoll in order to stop the French setting off any more bombs. And he wants the British to agree to treat the citizens of white Commonwealth countries in the same way that these countries treat British visitors. Now Mr Whitlam has taken up the call for reciprocity, which is going to make it pretty hard for Mr Heath to ignore the Tory rebels at Westminster who want the new immigration rules to provide for just that.

The right reaches for morality

These new ideas about the world abroad could cause problems, especially for Singapore and Malaysia; but Mr Kirk and Mr Whitlam may think twice about dropping the five-power defence system. And anyway foreign policy has played only a marginal part in the electoral debate in Australia. Towards the end of the campaign the Democratic Labor party, a sternly anti-communist Labor breakaway group that draws most of its votes from Catholic European migrants, played down its conventional attack on Labor's "isolationist" foreign policy and lashed out at Mr Whitlam as the champion of the permissive society. The legalisation of abortion, homosexuality and pornography has been built up into a major election issue. Mr Whitlam says that he believes that these are all areas where freedom of conscience should apply; which was promptly interpreted by the DLP and some Liberals as proof that new laws would be tabled by a Labor government. In a country as suburban and tidy-minded as Australia that could still hurt Mr Whitlam on Saturday.

But the choice that is open to the Australian electors—and was open to New Zealanders last weekend—is

not really a choice between two different kinds of society. The Liberals and the Labor party in Australia have vied with each other in offering the voters expensive new lists of such social benefits as free dental health and subsidised interest rates for young home-buyers. Both parties are content to work within the framework of the welfare state, although that framework has not been built as wide and solid as in Britain. The Labor party has attacked rising inflation and record unemployment; but with wool and beef prices soaring and a comfortable trade surplus, the Australian economy is riding high. For all their occasional bluster, the Labor leaders are unlikely to move very far beyond the restrictions already announced by Mr McMahon in their attempt to contain the effects of foreign investment, or

what Mr Whitlam calls "the great takeover."

All this goes to say that Australia and New Zealand, like Britain and—today in a more wobbly way—the United States, are countries of consensus politics, where most voters will still side with the centre party. This makes their politics very different from those of most European countries, especially the Latin ones, where there is no similar tradition of competition for the centre ground. Some of the Australian students and union left-wingers trooping to the polls on Saturday may bewail the lack of a more radical, more ideological, choice. Most of the world will envy Australia because it does not want a choice of opposites—and because, after all, the economy is still so prosperous that it would take a very bad botch indeed to mess it up.

All to play for

For Mr Heath the loss of the Sutton by-election would be appalling; for Mr Wilson a failure to win Uxbridge would be disastrous. It's electoral roulette

Both Mr Heath and Mr Wilson have good reason to be nervous about the by-elections that take place next Thursday. If the Tories were to lose Sutton and Cheam to the Liberals—or even come close to doing so—or Labour failed to win Uxbridge from the Conservatives, the political consequences would be serious. The Tory revolt in the Commons last week demonstrated the anger and frustration among a sizeable section of Government back-benchers, and the Opposition is, as usual, in even worse shape. Neither major party can afford another shock to its morale; so the stakes on Thursday are pretty high. The gamble is all the greater because no party manager is at all confident of how the electorate really feels after Mr Heath's wages and prices freeze.

Mr Heath knows as well as anyone what will happen to the nerve of many of his supporters if the Tories do lose both Sutton and Uxbridge. That double disaster is, however, improbable. A private poll commissioned from National Opinion Polls by Lord Beaumont of Whitley, editor of the Liberal magazine *New Outlook*, shows the Liberals running a good second (they came a poor third at the general election) with Labour well behind; but it is hard to believe that they can win a seat which the Tories held by nearly 13,000 votes in 1970. There is little comparison between Sutton and Cheam and the scenes of past Liberal triumphs such as Orpington and Rochdale. In both of those seats, the Liberals had significant representation on the local authorities and strong organisations; in Sutton the Liberals are still relatively weak. However, they do have some advantages. There is the fact that the public opinion polls are now showing a sharp upward movement of Liberal strength in the country. This, combined with Mr Cyril Smith's victory at Rochdale and the increasing likelihood that Labour will come bottom of the poll, may encourage a substantial number of Labour voters to cross over to back

the Liberal candidate, Mr Graham Tope, in order to defeat the Tory.

Even a Liberal near-miss in Sutton could cause much grief for Conservative Central Office, for scores of Tory MPs hold seats similar in social composition to Sutton. But were the Tories to scrape back at Uxbridge it would induce a manic elation among Tory MPs that would put Mr Heath equal in the party pantheon with Disraeli. For a near-miss at Uxbridge would be quite unacceptable for Mr Wilson. This is just the sort of seat Labour has to capture if it is to win the next general election. If Uxbridge were not to fall now, when the Government is in serious political trouble, it is hard to believe that it can be done at an election which will take place at a time of Mr Heath's choosing.

The immigration issue

There is no doubt that the Labour candidate, Miss Manuela Sykes, is the favourite to win (see page 27). But Labour is worried at the prospect of losing a significant share of its vote to the left-wing Liberal, Mr Ian Stuart, who is chairman of the shop stewards' consultative committee at London airport. There are around 6,000 airport workers living in the division, and the bulk of these voted Labour at the last election. If many of them drift over to Mr Stuart, Miss Sykes could be in trouble. There is also the problem of immigration. Although only about 3 per cent of the population of Uxbridge is coloured, there are substantial immigrant communities in nearby Slough and Southall, and the Tory candidate, Mr Michael Shersby, claims that this is the major issue he is being confronted with on the doorsteps. Despite this, Mr Shersby says he supports Mr Carr, not Mr Powell, on the Ugandan Asians issue. There are no fewer than three anti-immigration candidates in Uxbridge, and although this will probably ensure that none obtains a really substantial

vote, their total—if it reaches the 9 per cent that the anti-immigration man got at Rochdale—could make all the difference for the two major parties.

The Tories have not quite conceded defeat at Uxbridge, even though a swing of only 3.8 per cent would put Miss Manuela Sykes (once Liberal, now Labour) in. They derive hope from the better showing they are making in the polls nationally. A Labour failure would certainly add to the present belief of a substantial section of the parliamentary Labour party that Mr Heath is likely to win the next election. It is remarkable how many Labour MPs hold this view; it encompasses left and right of the party, and pro- and anti-marketisers. Many Labour MPs seem to believe, fatalistically, that the Government's standing in the country will improve over the next year, partly because of public support for the wages and prices freeze and economic expansion.

On to Lincoln

But Uxbridge is important to Mr Wilson in another way. He knows that even if Miss Sykes wins this could be the last good news that Labour's supporters will hear for some time. For in two of the other three outstanding by-elections Labour seems likely to lose one and may come dangerously close to losing the second. Few people in the Labour hierarchy at present believe that they will retain Lincoln, where the former Labour member, Mr Dick Taverne, is fighting the seat as a Democratic Labour

Doing the splits

Should father or mother receive the child credits proposed in the Government's negative income tax scheme? A political issue is being wrung out of this innocent question, so here's a proposal

In his very first speech of this parliamentary session, Mr Harold Wilson (who has not lost his eye for a good issue) loosed off an attack on the Government's "quite wrong" proposal to withdraw family allowances from the mother. That has proved the first of a scattering of political squibs that Mr Tony Barber and Sir Keith Joseph have been kept busy trying to stamp out. What Mr Wilson said was actually quite inaccurate—a misrepresentation of the Government's green paper proposing a tax credit scheme. But Mr Barber soon found it necessary to reassure the House of Commons that the apparently simple issue of whether the new child credits will be paid to the mother or the father was one of the main points on which he would welcome the views of the select committee that is to be formed to review all the tax-credit proposals. Meanwhile, the Opposition had got round to demanding a general debate on the issue even before the select committee was set up. Not, of course, that that would produce any solutions; it was merely a display sign that child credits had arrived as one of the few satisfactorily contentious issues that could be wrung out of the Government's generally welcomed plans for a negative income tax in Britain.

At present, the bulk of state benefits to families with

children goes to the father, in the shape of tax allowances. The poorest families naturally benefit least from these: family income supplement now does something to redress the balance. But flat-rate family allowances, handed out for second and subsequent children only, are paid to the mother. That was finally decided on a free vote of the Commons back in 1945. Family allowances have been somewhat less than popular with the Labour party (and, for that matter, with the Tories). The introduction of "clawback" made them even less loved, since a man who was paying tax on his wife's family allowance might find that more was being taken out of his pay packet than out of the next unmarried man's. That could not happen under the tax-credit scheme, even if all the child credits, which will replace tax allowances, supplements and family allowances, were paid to the mother. At a conference on family incomes last Thursday organised by the National Council for the Unmarried Mother and Her Child, it was argued that not only should all child credits be paid to the mother, but that half of the married man's credit (on the Treasury's illustrative figures, £6 a week) should, too. Married women would be cushioned against the financial disasters of desertion or separation.

But this would reintroduce clawback with a vengeance. It is still possible that under Mr Wilson's nursing Labour will rediscover its sense of purpose before the next general election. But at present the party looks remarkably similar to its state in the middle of 1954 when, after two years of exhausting interminable conflict, Labour MPs had ceased to believe in the prospect of electoral victory and had begun to prepare themselves for a change in the leadership. No one doubted then that Mr Attlee would retire if he failed to win the next election just as few Labour MPs now believe that Mr Wilson will stay if he does not win next time. A good result for Mr Wilson in Uxbridge would blow away the nightmare for a time. But Miss Sykes's victory will not dismay the Tories as much as the loss of Sutton would. They will tell themselves that the crisis within the Labour party will simply be suspended until after it loses the next election.

The family man would always have a smaller pay-packet than the unmarried man. Even payment of all child credits to the mother would be a transfer of benefits from husband to wife which would make most family men markedly worse off than they are now. Paying all the credits—the “illustrative” figures in the green paper suggest £2 a week for each child—to the father would be an even more unpopular (not to say a retrograde) step. So the two simplest alternatives are ruled out, though the green paper toyed with both. It is perfectly obvious that the child credits will be split.

Something for everyone

The first idea for a split put forward in the green paper is an easy but totally illogical one: to pay the credit for the first child, or even for the first two, to the father, and to give the remaining ones to the mother. That would be as near as possible to the present scheme. But no one (with the possible exception of Lord Beveridge) has ever tried to pretend that there was any logic in giving family allowances only for second and subsequent children; merely, no government has yet found the money to include the huge group of families with only one child. Since this Government now intends to do so, it would be foolish to perpetuate the deficiencies of the older and cheaper set-up. It would also lose the Government the support of all those pressure groups who, quite ready to decry the tax-credit scheme, found themselves forced into approval by its resemblance to their pet proposal: for a tax-free, far more substantial, family allowance scheme.

The green paper does not even mention the simplest split: £1 each. It would obviously be more expensive to administer a scheme under which all mothers became eligible for payments. Both divisions suffer anyway from one more important defect: though the amount the husband receives varies inversely with his income, the amount the wife receives remains fixed. For example, on the figures used for illustration in the green paper (and neglecting for the moment national insurance payments), the married man with four children earning £15 a week would be entitled to a total of £14 in credits and would owe £4.50 in tax. If he and his wife received half the

child credits each, she would receive £4 and he would receive £5.50. If his income was only £10 (the bottom limit of the scheme is £8) he would receive £7 and she would still receive £4. (If the husband received the first, or first two, credits, the position of the wife in the one- or two- or three-child family would be much worse.) If, on the other hand, he was earning just under £47 a week, he would actually have to pay £4 to the Government so that his wife could draw it out again as her child credit. If all the credits were allotted to him, instead, his tax liability and credits would exactly balance at that point. All husbands earning above this break-even point—£27 for the one-child family, £33 for the two-child, and £40 for the three-child—would be paying £1, £2 and £3 extra so that the wife could claim it back.

The best solution would be to split the surplus of credit over tax. In other words, in the examples above the father and mother would each get £4.75 and £5.50. This would take out of the expensive payments system all mothers whose husbands were earning above break-even point, since there would be no surplus. That ought to make up for the administrative complexities of varying the weekly payments to the mothers (of which one interesting by-product would be that they would learn what their husbands were earning). It would offend the universalists, who seem to be able to swallow variations in payments to the father if the amount the mother receives is the same for all families. But it really would be an expensive nonsense if what was basically a simple transfer of money from husband to wife always had to be processed through employer, inland revenue and back to the post office. The very least that the select committee should recommend is that in all families above break-even point the wife should be able to waive her right to a child credit in favour of her husband. That should provide the committee with a warm enough glow of virtue, provided by a proposal which actually reduced administrative costs, for it to insist that all mothers below break-even point are entitled to a credit irrespective of the size of their families. If the tax-credit scheme has got to look like the old family allowance system, it might as well work like a better version of it.

The tamed tigers of reform

Hungary's Janos Kadar, like the other would-be makers of change in eastern Europe, is starting to realise how little change is in prospect

In Hungary this week Mr Brezhnev has worn the look of a man who thinks things are going his way. So they are, for the moment. Earlier this year the more nervous conservatives among Mr Brezhnev's colleagues seemed to be worrying that Hungary was sliding into heresy. But Hungary has managed to sort itself out: the inflation brought about by its five-year-old economic reform has been checked, and the argument about how far the reform should go has been settled in a compromise (see

page 46) that means it will not go much further for the time being, and the Soviet Union's backwoodsmen can stop worrying. All that was left for Mr Brezhnev to do was to pin the Order of Lenin on the deserving chest of the Hungarian party leader, Mr Kadar, before going off for a Pannonian shooting holiday.

Elsewhere in eastern Europe Mr Brezhnev has just as much reason to feel pleased. It is true all Czechoslovakia's obstinate petit-bourgeois spirit still needs to be

The more Taylor Woodrow you use, the less it costs.

The new pharmaceutical plant for Beecham Pharmaceuticals (Pte.) Ltd. in Singapore.

The new semi-synthetic penicillin plant for the Beecham Group in Singapore is a prime example of the big advantage of using Taylor Woodrow's integrated design and construction service.

The £4½m project was completed within 18 months of receiving the Client's design brief and despite continually rising prices and increasingly stringent local building regulations, within budget too.

The reason for this remarkable achievement is simply that using Taylor Woodrow for the whole operation allows significant savings in time and money to be made. Close co-operation with the Client from the outset on process plant design, co-ordination in the worldwide purchase of specialist plant and its subsequent shipment, local sub-contracting, and speed of commencement of the operation through to mechanical commissioning—all are important factors made possible by the use of one designer/contractor team.

Consider Taylor Woodrow teamwork for your next project; you will find that the more of our resources you use, the less it ultimately costs in time and money.

TAYLOR WOODROW

The world-wide team of engineers and constructors

If you would like to know more about us, please contact Robert G. Smith, Taylor Woodrow Construction Limited, 345 Ruistip Road, Southall, Middlesex (Tel: 01-578 2366. Telex: 244281); or for overseas, Emil R. S. Coppock, Taylor Woodrow International Limited, Western House, Western Avenue, Ealing W5 1EU (Tel: 997 6641. Telex: 235031).

exorcised daily. But farther north the German Democratic Republic is safe, and respectable at last, and Poland seems to have found in Mr Gierek a leader who manages to be both popular and orthodox. Rumania is still throwing its independence about, but its shaky finances may yet put a limit on that. The control of Mr Brezhnev and his colleagues over the estates they inherited from Stalin seems as firm as ever.

Quite so, say many east Europeans. The trouble is that the period of negotiations that Europe embarked on two years ago, which has been greeted by so many people as the end of the postwar order of things, has left the east Europeans little better off than before. It has certainly not provided them with more national independence. What they have now is the same Soviet hegemony buttressed, not tempered, by western recognition. Nor is there any real evidence that the European security conference which is now being prepared in Helsinki will change this, despite Rumania's display of individualism there this past week. The time to sit up and take notice will come if and when Poland or Czechoslovakia, for example, starts following Rumania's example. For the moment, at least, discipline in the Soviet Union's world is getting tighter as east and west sit down together at more and more negotiating tables. It is not only the east German government that is arming itself with new rules and regulations for the challenge of increasing contacts with west Germany. Even relatively relaxed Hungary is refurbishing its ideological weapons in preparation for the battle against anti-marxist influences from the west.

The loss of heart

It is true that periods of tightening-up in eastern Europe have often in the past been followed by times of relaxation and even of liberalisation. There is no reason why this should not happen again. But if the next push towards reform, wherever it may happen, looks rather half-hearted, it will not necessarily be because someone is actually stopping it. The new thing in eastern Europe is that the reformers themselves are losing enthusiasm as they realise the limits of what reform can bring them.

These are not just the political limits set by the Soviet Union. The would-be reformers of eastern Europe have come to recognise that, however much Russia wants to see their economies getting more efficient, it is not prepared to see the party's monopoly of power diminished in the process. This has been a hard blow for the men who saw economic reform as a back-door to political reform, as Ota Sik did in Czechoslovakia in the early 1960s. But they learned that lesson in 1968.

A more important reason is the realisation that the result of economic reform, where it has actually been put into operation, has often been the curate's-egg sort. The reforms have certainly been welcomed by the middle class of these societies—the managers, the higher-grade engineers, the professional people—because they have gained by them. Mr Sik recognised that they would when he had the honesty to say, as early as 1964, that one of the aims of the reform was the "de-equalisation"

of incomes. But a lot of industrial workers, especially those in industries for which demand has been artificially kept far too high for far too long, have gained very little, and some are relatively probably worse off. These people have felt cheated of their share of the new deal; and the idealistic young have been put off by the growing gap between rich and poor. In Yugoslavia, which has carried the reforms furthest of all, there has been widespread unemployment caused by the shutting down of bankrupt factories. The accusation is that the reform has benefited only the new middle class, with its flash cars, its weekend houses, and its shopping sprees in the west.

The return of the dogmatists

In the non-communist world the faltering of the political and economic system is liable to produce a demand for an honest colonel to take charge and clear up the mess. In eastern Europe it has had the effect of giving a new credibility to the old dogmatists. And the dogmatists are not always the older men: there are plenty of younger party officials, anxious to preserve their power, who are prepared to manipulate workers' discontents in order to curb the influence of the troublesome intellectuals who are the main threat to that power. It is such men who in Hungary have managed to postpone the end of subsidies to inefficient firms. In Poland the new caution has taken the form of reluctance to embark on more than pilot projects of reform, which can be called off at a moment's notice if they look like becoming controversial. Nowhere is there the old enthusiasm of the mid-1960s, when it seemed that the mould of over-centralisation, of planned stagnation, was about to be broken, and socialism given a new direction.

The taming of the reforming tigers in eastern Europe, is welcome enough to Mr Brezhnev if it makes the area easier to control. But he still wants the east European economies to become more efficient within the limits he has set them. And they need it too. The Soviet Union's new economic relationship with the west will allow it to become more choosy in what it buys from its east European suppliers; but they often have no other outlets than the Soviet market for things like capital goods. The danger is that they will find themselves stuck with technologically backward products unsellable anywhere but in a Russia which does not want them any more.

Of course, the prospect of some stiff competition would not hurt east European industries if they were free to reorganise themselves as they liked to meet the new challenges. But they are not: the limits are set by Russia and Russia can enforce its will because it is eastern Europe's biggest supplier of raw materials and fuels. There are the makings of a vicious circle here. The smaller countries need reform to make themselves competitive, and they need to make themselves competitive to satisfy their people's demands for at any rate a materially fuller life. But the limits within which their reforms have to be confined may make it impossible to achieve this, and the failure to achieve it could generate pressures for change of a more fundamental sort. This is not exactly the relaxation that was said to be coming.

Grand Marnier for Socialites

Take a generous shot of Grand Marnier in a tall glass, swoosh in a bottle of tonic water, chunk in a couple of ice cubes, add a twist of lemon, et voila—the new mix that's sweeping South America (no, seriously).

Marnier and tonic.

Those who haven't tried it, laugh.

Those who have, smile.

Knowingly.

-and for Conservatives

There is no cause for alarm. That seemingly sacrilegious offering over on the Left is merely a novel serving suggestion.

Grand Marnier is still the superlative liqueur it always was, the same subtle blend of wild oranges and the finest old Cognac.

Something to sip reflectively after a good dinner.

And conserve for your special friends.

The big brown paper bag that could have been a negligee.

A large amount of the sulphite and sulphate pulp which we produce at Uddeholm goes as raw material to various industries around the world. There it is used to make paper, rayon silk, cellophane, gunpowder, as well as a lot of other things. So many, in fact, that we can't claim we know them all. Perhaps some of our customers make delicate negligees to drape beautiful women in. It's a pleasant thought.

We ourselves have specialized in making heavy duty paper for large bags.

It sounds perhaps mundane when there are so many glamorous possibilities. But the fact is that specialization makes big demands on both equipment, technical knowledge and inventiveness.

CMC powder, which is sensitive to damp, is transported by sea to Australia in bags made from our paper; delicate fish protein, used for enriching bread, goes to the USA; ammonium nitrate, used in explosives, is freighted to numerous mines, et cetera, et cetera.

Paper, all things considered, is an ideal packaging material in many fields. It's easy to live with. And not only because it's a natural substance, without any built-in environmental problems.

Nature has been good to us.

In an area almost twice the size of Luxembourg grow Uddeholm's own forests. They provide us with excellent long-fibred wood as raw material. Rivers provide all the electricity we need for our forest, chemical and steel industries. The pure iron ore which was the basis for today's highly specialized steel industry is also obtained here in Swedish Värmland.

And we, in turn, are doing our best to be good to nature.

For example, our sulphite pulp mill runs on sodium base. This means that it has been possible to integrate it in an ingenious way with our sulphate pulp mills. The result being a closed system that doesn't harm the countryside. Nor the atmosphere. Nor the great lake Vänern, on whose shores the mills are situated. In fact we're almost in the heart of Europe, as Vänern is directly linked with the North Sea.

In other words, we can transport our products by sea routes out into the world faster and with less bother than most others. Delivering to places where bag and rayon manufacturers, and fashion creators, are to be found.

Right now we are having a brochure printed entitled "Some stories about what can be put into a paper bag". If you drop us a line we'll send it to you as soon as it's ready.

UDDEHOLM

Uddeholm, Forest Industries Division, S-663 00 Skoghall, Sweden.

BRITAIN

The Commons will be watching very carefully what goes on

Although the Labour party pressed its motion to a division—and lost—the half-day debate on thalidomide children in the Commons on Wednesday did not turn out to be the party dogfight over those tragic children that had seemed possible. It was saved from that by two things: the quality and sincerity of almost all the speeches and by Sir Keith Joseph's announcement, at the outset, of an immediate £3m trust fund to help all very severely, congenitally-disabled children. It was unfortunate that the debate ended in division, for the differences between the Government and Opposition were narrow: the gaping difference was between the House of Commons and the Distillers company, the producers of thalidomide in this country.

Hansard will make as much uncomfortable reading for the directors of Distillers and/or their insurers as the Sunday Times article which the high court banned from publication, although that paper and its editor were rightly praised by many speakers in the debate for their campaign on behalf of the thalidomide children. For if Distillers (Biochemicals) Limited had any friends in the Commons they did not speak up, and although the company had upped its offer to the remaining thalidomide children to £5m the day before, a figure of £20m was being widely accepted on both sides of the House as a minimum well before the closing speeches.

The argument between Mr Jack Ashley, who moved the Labour motion, and Sir Keith Joseph, the Secretary of State for Social Services, was whether a trust fund for thalidomide children only should be set up now, as Labour wanted, or left to be considered when the cases were no

longer sub judice.

Mr Ashley commands wide admiration and respect for the way he continues a public career despite the handicap of being totally deaf. But his efforts in getting the debate mounted and his speech would have been praised without that; perhaps the only advantage his handicap gave him was that when he talked of children being "deprived of the magic of childhood" by a man-made disaster it sounded merely factual rather than mawkish. Certainly, his insistence that Distillers, with its assets of over £400m and profits of over £60m, would not be destroyed by what he called facing up to its "moral responsibilities," found support on the Conservative benches also.

Mr Wilson supported Mr Ashley's demand that a trust fund should be set up to help the parents and the thalidomide children even though litigation and negotiations between them and the company are still continuing. Sir Keith's argument against this underwent an interesting change during the course of the debate. In his speech after Mr Ashley's he said he was not making the imputation, but some others might, that such a trust would lift the pressure on the company to settle. In his winding up speech he was saying that "many of us believe" that pressure to reach a satisfactory agreement would collapse if such a trust were set up.

It will not go unnoticed by Distillers that as a result of the Government's amendment the motion finally passed by the House began: "That this House, disturbed about the plight of thalidomide children, and the delay in reaching a settlement between Distillers (Biochemicals) Limited. . . ." In his winding-up speech Sir Keith said he could not give a date for the second

tranche of £3m for the handicapped trust because that would depend on an assessment of whether the trust was working well, which could only be made when the cases were no longer sub judice. Mr Ashley said that would deliver them to the mercies of the company, who could spin out negotiations for many more years. Not so, said Sir Keith, for "this House will be watching very carefully what goes on."

The first £3m trust has obviously been an emotional rather than a carefully considered response by the Government to the concern felt for thalidomide children. Sir Keith was anxious to bring in all children severely disabled at birth, but about the only details he could give of the fund is that it would not, unfortunately, cover children born blind or discovered shortly after birth to be deaf. Yet it is obviously the beginning of a very considerable national effort to do far more for handicapped children and their families.

In a debate which, with the odd exception, saw the Commons at its very best, the outstanding speech was made by a doctor who had himself pressed patients to take thalidomide because he had been convinced that it was an absolutely safe drug. Dr Gerard Vaughan entered the Commons in 1970, and Opposition MPs who followed him had to look up their reference books to see that he had won Reading for the Conservatives. They will not need to do that again.

Dr Vaughan, who had examined the

Vaughan: outstanding speech

Our welcome is both warm and cool
-depending on your taste.

On board our jets, you'll be offered a warm cup of *sake* by a hostess in kimono. She'll serve it with careful ceremony to complement its ceremonious taste.

Or if you'd prefer something cooler, you'll find she's just as much at home serving champagne - chilled the way you like it.*

And it's this combination of pleasures that makes our service so delightfully different.

As different as a menu that can include Tournedos Rossini and Lobster Thermidor as well as *sushi* and chicken *teriyaki*.

As different as placing a hostess, who

personifies a thousand years of tradition, in planes that are as modern as tomorrow.

As different as taking endless time to make you happy, yet not wasting a moment to make sure you arrive on time.

These are the things that create the big difference between JAL and other airlines.

These are aspects of the two different worlds which only Japan Air Lines combines so skilfully. And which will make your flight a memorable experience.

JAPAN AIR LINES

We bring you
the best of two worlds

* Alcoholic beverage complimentary in 1st Class only.

60 children whose claim had already come before the courts, made the most convincing plea yet for considering thalidomide children and their parents as cases apart. Basically, his argument was that as the parents very often had asked to have thalidomide they felt doubly guilty, and that, unlike most other severely handicapped children, the thalidomide children now approaching puberty are highly intelligent. Without seeking effect, Dr Vaughan made all those who heard him share his distressing experience of hearing such children discuss their future. Dr Vaughan wanted far more to be done in developing artificial limbs—"we are in the middle ages in our provisions for handicapped children"—and for the court cases to be speedily concluded. Between them, Dr Vaughan and Mr Ashley may have achieved in half a day more than many MPs achieve in a lifetime.

Ulster

Russian rockets

The war in Ulster took an unexpected turn this week with rocket attacks by IRA Provisionals using Soviet-made launchers. Their targets were army installations and police stations, mainly along the Irish border; they killed one policeman and one soldier. The army captured one of the rocket launchers and hopes the Provisionals have not got their hands on too many of them, for it turned out to be a brand-new RPG 7, which is current issue to the Soviet and other Warsaw pact armies.

In the past, the Provisionals have used the 3.5 American bazooka, a cumbersome and sensitive launcher, and they have not had much success with it. The RPG 7 is a sophisticated weapon but it can be used without a lot of training. It weighs about 10 lb and one man can handle it easily. Firing from the shoulder at about 200 yards, the Provisionals seem to have scored seven good hits out of the 11 attacks they made on Tuesday and Wednesday. Attempts had been made to scratch out the manufacturing source on the rocket launcher the army were lucky enough to capture, but Russian lettering on the safety catch and the label tag on the nose cone gave away its origin.

The army does not know just how the rocket launchers reached Ulster. Communist activities on both sides of the Irish border have become more

RPG 7: where did the IRA get it?

conspicuous over the past six months, but there is no evidence that arms and ammunition are coming direct from any source in the Soviet alliance. It is more likely that the Provisionals either bought the weapons on the international arms market in western Europe, or that they got them from a Middle East source like Syria, which has been supplied with the RPG 7 in recent months by the Russians. The Provisionals have built a large number of contacts with Arab guerrilla organisations.

The crackdown in the south has made the republic a more difficult place for the IRA to get arms or ammunition. One of the best things that could come out of closer Anglo-Irish co-operation would be an effective ending to the present traffic in weapons. The Provisionals have never been able to equip themselves with a standardised weaponry; they have had to take what they could get from wherever they could get it. What annoys the security forces particularly is that liberal Sweden has done least to check sales by private arms manufacturers and that country is a major supplier of ammunition to the Provisionals.

Social trends

State of the nation

The 1972 volume of Social Trends* is something of a milestone for the Government Statistical Service. It is a remarkable advance on the previous two towards the goal expressed in its title: to be as good a sourcebook on society as Economic Trends is on the economy. The advance is marked

*HMSO. £2.90.

by the compilation of a "social commentary" on the past decade by the Central Statistical Office. This paints a familiar picture of a nation marrying younger, rearing smaller families, containing more students, working women, old people, divorcees and widows, and committing more violent crime and contracting fewer infectious diseases. Statistics on incomes and expenditure shed a certain amount of light on the effectiveness of different government social policies, but only indirectly: the tone of the commentary is purposely as flat as the civil service could make it.

Equally deadpan is an important article on sources and methods of collecting statistics on immigrants, which contains new, and rather higher, estimates of immigrant fertility rates, but is careful to point out how these are confused by the atypical age structure of the immigrant population and by the imbalance of the sexes: the large surplus of males over females among immigrants means that a far higher proportion of immigrant women are married. Immigrant fertility rates were thought, in the mid-1960s, to be about one-third above the average for the British-born: it now seems that the difference is more like 50 per cent. But it is just worth remembering that the top projection of the coloured population made by the Institute of Race Relations in 1969, which was for about 2.7m such people in 1986—a long way short of Mr Powell's projections—assumed that the immigrant fertility rate was exactly twice as high as that of the British born.

Reliable projections of the size of the coloured population in Britain must in any case wait on later results of the 1971 census, such as data on family size. But for the population as a whole, there is an important new source of information on family structure which could provide the backbone for more frequent publications of Social Trends. This periodical has been labouring under the disadvantage that most social statistics are collected by individual government departments, which naturally publish them first, though in Social Trends they may actually be drawn together for the constituent parts of the United Kingdom. But it now appears that this is to be the medium for the publication of many of the results of the brand-new General Household Survey, a continuous sample survey covering 15,000 households which was begun in 1971 to provide a wider range of social statistics than the older Family Expenditure Survey. The household survey

We say Yes!

We rent more cars than anyone in the world. We say Yes!

covers some topics hitherto tackled only by the census—mobility, family size, household amenities—and some, such as family "intentions," meaning the number of children couples intend to have, which could not be coped with even there.

The government now carries out four continuous sample surveys—the International Passenger Survey, the National Food Survey, and the expenditure and household surveys. Excluding the huge IPS, which is rather a special show and involves about 250,000 travellers each year, but including the one-off special surveys of the Social Survey Division, one's chances of being approached by a government interviewer in any one year are now just about one in 180. But in 1972 they were very much greater: the government has just carried out (provoking remarkably little objection or resistance) a post-census survey of incomes which included 400,000 people—roughly 1 per cent of all those over 15. The results were nowhere near ready for inclusion in this issue of *Social Trends*: they should make some interesting reading in the next. Next year, too, the government will be participating in a vast manpower survey to be carried out by the Nine; and it should be clear whether or not it will be going ahead with present plans for a regular large-scale population survey between censuses, comparable with the micro-censuses carried out regularly in west Germany, the United States and Canada.

By-election

Little to laugh about

Uxbridge has seven candidates, including an ex-Liberal as its Labour candidate, and a transport workers' union shop steward as its Liberal. It sounds like a bundle of fun by-election but it isn't. Uxbridge is a rather depressing place, part dormitory suburb, part home of a large number of workers from London airport, the largest employer in the constituency. Politically it is depressing because three of the candidates are standing on an anti-immigration platform.

There is nothing particularly amusing, for instance, about Mr Dan Harmston, of the Union Movement, a veteran of the Smithfield meat porters' anti-immigrant demonstrations. Then there is Mr John Clifton, of the National Front, who is another way-out

Sykes: new darling of the left?

right winger, and Miss Clare Macdonald, of the National Independence party, who lives at home with mother and has not been seen a great deal. Mr Reg Simmerson is an ex-member of the Tory party who is standing as an opponent of the common market, but he is not likely to do much better than he did at Greenwich and Macclesfield, where he lost his deposit. However, Mr Simmerson might, in an already desperately confused situation, do some damage to the young and forceful Tory candidate, Mr Michael Shersby, who is director of the British Sugar Bureau.

Miss Manuela Sykes, the Labour candidate, is a tough political campaigner, formerly a Liberal candidate in several elections (though this is not disclosed in her election address) and a member of the Westminster City Council. Miss Sykes sees herself as a potential member of the Tribune group and it will no doubt welcome her with appropriate enthusiasm if she is elected; she has all the acceptable views about the common market (which she is against) and she takes the cautious line on immigration which is nowadays pretty fashionable in Labour left-wing circles.

Neither of the two major parties believes that the Liberals are a serious challenge: they have lost their deposit five times in six general elections. But Labour is concerned that Mr Ian Stuart, the Liberal who is shop stewards' chairman at London airport, may draw off enough votes from the workers there to lessen their chances of winning. Mr Stuart is a friendly chap, bright and brisk, looking and sounding like a rather good quality Labour councillor. He thinks shop stewards get

a bad press, that disputes at the airport are exaggerated—he has been involved in half a dozen strikes in the past 11 years or so—and he generally has a number of views which would give pleasure to his union leader, Mr Jack Jones. If he had been in the House of Commons he would have voted against the wages and prices freeze (his party did the opposite) and he does not much like the Industrial Relations Act.

If Mr Stuart had a powerful machine behind him he might do considerable damage to Labour. As it is he might just lose his deposit; though, as with the other candidates, where he gets his votes from will have a decisive effect on the result. On the whole it looks as though Miss Sykes will win, but no one in the Labour camp is making exaggerated claims about the likely margin of her victory.

Prizes

Winner takes nothing?

Generous prizewinners are a bit of a mixed blessing. It was less than civil of Mr John Berger to insult the system that presented him with Britain's most famous literary award, the £5,000 Booker prize for fiction, as he took the cheque. (On the same day, the Booker prize lost its sole claim to being the richest literary prize: the presentation of the first £5,000 Wolfson literary award for history to Mr Michael Howard attracted almost no attention.)

Mr Berger intends to present half his money to the Black Panthers. That is a generous gesture, and one can sympathise wholeheartedly with his criticisms of the maze of literary prizes; but some other novelists may feel that they could have done with the money. Mr Heinrich Böll, the winner of the 1972 Nobel prize for literature, was even more generous and perhaps more logical in his decision to spend part of his money (nearly £42,000) helping imprisoned writers and their families. Lastly, the generosity of Sir John Hicks, who announced on Tuesday that he will give almost all the money he receives as joint winner of the Nobel prize for economics (rather over £21,000) to help the London School of Economics in its fund-raising for a new building to house what he rightly describes as "probably the best economics library in the world," is beyond praise. And Sir John is an Oxford man.

Juggernauts

Who is out of hand?

Brussels will probably be persuaded to delay a decision on heavy lorries until after January 1st, thanks to the revolt against them in the House of Commons on Wednesday. Even if the heavier lorries were allowed into Britain, they would not get far. A private member's bill was laid before the House on Wednesday, too, to restrict the routes on which heavy lorries can travel, a move the Government was expected to make anyway.

The whole argument on lorries is in danger of getting out of hand. What the Six are trying to do is create a common market in lorries by standardising their dimensions. Less than 10 per cent of Britain's lorries are over eight tons (the size of a small bus): that covers all the lorries between eight tons and the current maximum of 32 tons. An increase in maximum size to 40 tons, as the Six are proposing, could be achieved without increasing the overall length of the lorry by more than nine inches. As long as such vehicles were restricted to suitable routes, and had to comply with strict noise and other controls, there could be little objection to them. The economic saving would be only about £5m, small beer compared with the 5 per cent of its turnover that industry spends on transport. But if Parliament restricts the size of lorries, there will simply have to be more of them. In Britain the number is likely to increase to 1m by the end of the century. So we had better start now building the roads for them, and seeing that they are as quiet as a modern car and otherwise less tiresome than the

current generation of lorries.

Of course, the fashionable argument against this is that freight should be carried by rail; that is pure illusion. British Rail's biggest potential in winning freight from road is its Freightliners container service. But Freightliners itself owns 850 of the 24-ton and 32-ton lorry juggernauts the public is complaining about, to distribute containers from the rail terminals to their destinations inside cities. The environmental advantage of rail is on the inter-city part of the journey alone. Admittedly, at present many villages with trunk roads inherited from the middle ages could be spared the horrors of heavy lorries, but another decade of motorway building will largely eliminate that problem. The average freight haul is 25 miles in Britain, and neither begins nor ends near a rail terminal. British Rail will never have any hope of capturing that business.

Furthermore, British Rail's freight hopes are to some extent incompatible with its aspirations to introduce 155 mph passenger trains. The average company freight train runs at about 60 mph, and many wagons are restricted to 45 mph maximum. One or other will have to get off the track, a problem that can only partly be solved by running freight trains at night.

The other debate going on about lorries is over the parking of lorries overnight. This issue has also got out of hand. A survey carried out a year ago throughout England, but excluding London, showed that on a typical weekday only 27,000 out of Britain's 600,000 lorries were parked overnight in the street. Understandably, the problem is especially sensitive in some residential areas. The response of the Government is to build 50 hideous lorry parks, with equally hideous hotels for lorry drivers, backed by

£10m of taxpayers' money. This is hard luck on the landladies who have lived off providing beds to lorry drivers for years. It would have been far better to follow the Birmingham experiment of allowing lorries to park in certain streets only.

Race relations

Not before time

The Community Relations Commission may not discover any unexpected causes in its investigation of unemployment and homelessness among young blacks, but it could make some useful recommendations. The survey, to be conducted in four urban areas by Opinion Research Ltd, will try to assess the relative importance of family, school, employment opportunities and discrimination in causing joblessness among black teenagers, who were recently shown by the 1971 census to have an unemployment rate of 16.2 per cent, twice that for their age group.

It is a pity that the survey, due to be finished by next summer at a cost of £25,000, will not stretch to comparisons with unemployed white youths, or employed black ones. But at best it will come up with some concrete needs, like crash literacy programmes or hostel accommodation. Because the Home Secretary has called for the investigation, the money to meet them may then be forthcoming. If it can be channelled through black organisations, so much the better. But there is always the risk to be faced of causing resentment among West Indian immigrants, especially where the family is blamed and if unflattering comparisons are made with Asian performance.

Although teachers and community workers have long seen the dangers of these young blacks without homes or jobs, it is only recently that it has been more generally recognised. Official appreciation of it has been impeded in the past, first by a rather complacent report in 1969 from the Select Committee on Race Relations and Immigration, and then by Department of Employment statistics now acknowledged to be misleading. The problem is not yet large numerically—about 1,600 boys and 1,300 girls are affected, mainly of West Indian origin—but it will obviously increase, and the proportion of youths involved in the current increase in robbery with violence (now given American overtones by being called mugging) has at least provoked a sense of urgency.

Right lorries, wrong roads

After the Freeze - What next?

by the Rt. Hon. Reginald Maudling

In two months, the first 90-day stage of the Freeze ends.

What happens then?

In tomorrow's Sunday Express Mr. Reginald Maudling, former Chancellor of the Exchequer, outlines what he would now be plainly telling Mr. Heath if he were still in the Cabinet. His views will be of immense interest to business men, economists, and politicians of all parties.

Reginald Maudling - this weekend.

of the new Stock Exchange by H.M. The Queen.
The goblets, designed by Colin Hillier, are 5½" high and
are supplied in impressive presentation cases singly, in pairs
or in sixes.

Each goblet is individually numbered and carries a signed
certificate of authenticity.

The sterling silver goblets cost £75 each but if you think
gold is more fitting for the occasion, 50 18ct. gold goblets
are available.

These bear white gold motifs and cost £585 each.

THE WORLD

International Report

The other side of Jack Lynch

FROM OUR DUBLIN CORRESPONDENT

The Irish prime minister, Mr Jack Lynch, is now showing some of the toughness that close acquaintances have always known to exist behind the apparently mild exterior. He has cracked down on the IRA, sacked the governing board of the RTE, the national broadcasting service, and given clear warning that he is going to take no nonsense about things in the future. On Wednesday 66 people, who were demonstrating outside the homes of ministers, were arrested.

At first it seemed that Mr Lynch might have bitten off more than he could chew. The extent of the outcry created by the dismissal of the RTE authority was probably not foreseen. The sentencing on November 25th of Sean MacStiofain, allegedly the chief of staff of the Provisional IRA, was followed by demonstrations, a bomb explosion outside a Dublin cinema which injured five people seriously, and an armed attempt to free Mr MacStiofain from the Mater hospital.

But Mr Lynch can digest his mouthful. He is letting it be known that he will use whatever force is necessary to meet the IRA threat and that he will bring the RTE into line with government requirements however vocal the opposition. And, as the days go by, the country as a whole seems to be accepting his new tough line as a necessary, although unpalatable, alternative to anarchy. The prime minister has chosen to move now as much to anticipate future trouble when the major decisions on Northern Ireland have to be made as to meet the pressures of the moment, which include Mr Heath's continued strictures.

The prime minister's main weapon against the IRA will be the powers given by a new bill—the Offences against the State (Amendment) Bill,

1972—which the Dáil began debating on Wednesday. If and when it is enacted it will be far easier to secure convictions against IRA members, who until now have been protected by the difficulty of producing acceptable evidence and by the intimidation of juries. The bill is one of the toughest measures ever introduced in a democratic system. It is being bitterly opposed by left-wing and liberal organisations and has come under strong criticism even from moderate opinion.

But Mr Lynch is determined to get it through, even if he has to go to the country first. And, in the present climate, the opposition fears he would sweep the country on the straight issue of democratic government versus the IRA. The opposition is not united in its dislike of the measure. Some members are for outright opposition; others would settle for certain amendments and a time limit on its operation.

The bill would allow a senior police officer's word that he believed the

accused to be a member of an illegal organisation to be sufficient to secure a conviction. And if an accused person has failed to deny a published report that he is a member he could find himself convicted. Furthermore, picketing of courts would be prohibited, and taking part in public meetings about civil or criminal proceedings could carry a penalty of up to five years' imprisonment.

The IRA expects that when the bill is enacted its leaders will be picked up one after the other, but it does not foresee mass arrests of its members—at least not at the start. The government appears ready to accept the consequences if convicted IRA men follow the example of Sean MacStiofain and go on hunger and thirst strikes. Despite the public demonstrations of sympathy with Mr MacStiofain, there are no signs of the massive reaction expected by the IRA and Sinn Féin organisations. The 5,000 people who demonstrated outside the Mater hospital in Dublin last Sunday were all the republican movement could muster on such an emotional occasion and many in the crowd were sensation seekers rather than sympathisers. Since Mr MacStiofain's removal to the Curragh military hospital on Monday night and the news on Tuesday that he had modified his thirst strike the tension

MacStiofain sympathisers outside the Mater

has decreased. Though his death would undoubtedly revive it, the strength of the anti-IRA feeling is such that public opinion would withstand even this.

In the long run the RTE affair is likely to cause the government more trouble than its moves against the IRA. The sacking of the broadcasting service's authority shocked liberal opinion and brought forth a spate of protests, although the man in the street is prepared to support the government in anything it does to keep the IRA in check. The sacked authority hit back by blaming the government for being too vague in its original directive of October 1, 1971, which prohibited the RTE from broadcasting any matter calculated to promote organisations using violence.

In practice the RTE interpreted this to mean preventing suspected members of the IRA from broadcasting directly. But on several occasions IRA spokesmen have been interviewed and their views reported indirectly. This is what happened in the radio programme of November 19th when the views of Sean MacStiofain, who had previously been interviewed by an RTE reporter, Mr Kevin O'Kelly, were broadcast.

After several skirmishes over the past 18 months the government was waiting for its chance to crack down. It came with this broadcast. The authority was sacked, and the tape recording of the original interview was used to bring Mr MacStiofain before the special criminal court. There Mr O'Kelly refused to identify the accused as the man he interviewed and for this was sentenced to three months' imprisonment for contempt of court. This brought the RTE's television and radio services to a halt for two and a half days and stopped all newspapers for a day. Mr O'Kelly was subsequently released on bail pending an appeal.

The problem now is that the staff of the RTE will try to make the new authority adopt the same liberal policy as its predecessor. If it succeeds there will be further trouble, for the government is determined to prevent the IRA from getting any publicity. And if the opposition parties continue to try to make political capital out of the affair, the RTE will become a political shuttlecock. But, however bitter the feeling within the RTE or in the country as a whole, Mr Lynch's new toughness looks like ensuring that the government will win through.

Egypt and Jordan

A coup behind every pyramid

FROM OUR SPECIAL CORRESPONDENT

Two days of sudden and abnormal rain last week brought communications in Cairo to a virtual stop. The oily, undrained lakes called streets did nasty things to the few cars pretending to be amphibious; the telephone system, always erratic, collapsed under a thousand curses as people tried to pound their half-dead receivers into life. The morning newspaper, al Ahram, prepared a cartoon of waterlogged frustrations captioned "Our country sunk." Overnight somebody (the censor?) killed the point by substituting "city" for "country." But Egyptians do not require al Ahram's discreet needling to feel small and bemoan the decomposition around them.

"Decomposition" is a favourite word. Some critics, sniffing carrion, say the regime cannot last: others, that much more critical, say that the crumbling disintegration of authority and willpower has eroded even the initiative that might fire conspirators into successful action. This is probably too academic an assessment of the resentful lethargy enshrouding a nation for which nothing in the past few years has gone right. Undoubtedly President Sadat no less than King Hussein, the other Arab ruler under obvious threat, has been taking his precautions; the president's men are

THE ECONOMIST DECEMBER 2, 1972

said to be placed strategically. But in Cairo, unlike Amman, the precautions are not visible in the shape of machine gun posts, security checkpoints and the rest of the paraphernalia of an authoritarian regime with many enemies.

On the surface Cairo is as relaxed and welcoming as ever, feeding the correspondent's nightmare that a coup might happen without his noticing it. Some sort of middle road has to be found between the exaggerated reports of attempted coups emanating from Beirut and elsewhere (the BBC is currently considered top culprit in rumour-mongering) and the limp denials and talk of apolitical "disciplinary action" which is the way chosen by the ministry of information, and the military censors, to reveal the truth to the world.

A few stories stand up better than others: there would seem to have been a couple of half-baked attempts by a handful of individualist junior officers in Cairo to intercept President Sadat, plus a more serious incident at an air force camp involving 24 officers (the official version is that 12 air force officers are being interrogated for spreading false rumours). A number of senior military men have been dismissed, some of them arrested; they include, although this has been denied, the chief of military intelligence.

In Jordan, too, official reticence tends to give credence to blown-up stories from abroad. But in a smaller community it is slightly easier to distinguish fact from fiction. A conspiracy to assassinate King Hussein and his very energetic young brother,

The censors sank Cairo, but Egypt is drowning in lethargy

DIEHL alphatronic

powerful new computing system

The keyboard of DIEHL alphatronic is very compact, but we had to turn it round to fit it on this page.

DIEHL alphatronic is a very compact, enormously versatile and powerful computing system. It successfully combines the simplicity of a calculator with the capabilities of a mini-computer. No special language is required and programming is greatly simplified by features such as indirect addressing, labelling, sub-routine capability, looping and branching.

DIEHL alphatronic is designed to be modular. For example, internal register capacity can be increased; plug-in ROMs give powerful functions relevant to your applications; a visual display can be specified (16 digit printer is already installed); a built-in universal interface connects DIEHL peripherals such as magnetic tape cassette unit, magnetic card reader, typewriter and plotter.

With DIEHL alphatronic you can now arrange your computing capability to suit your figurework. For anyone who copes with complex figurework this combination of power and convenience is a sure way to reduce work load and increase performance.

At Computer '72, 4th - 8th December, Stand Nr. 39 we shall be glad to show and tell you more about this powerful new DIEHL computing system.

Crown Prince Hassan, was apparently unearthed early in November; only seven officers were believed involved but the position of their alleged leader in the royal guard shows up the weakness of any security apparatus, however tight. The embroidery on the story is that an actual attempt was made on the king's life and that as a direct result he retired to hospital for a couple of days last week. He went to hospital all right, but not because of this. With all due scepticism to palace gossip, the more relevant factor contributing to his official "exhaustion" was his renunciation, a few days before, of any intention to divorce Princess Muna and marry a Jordanian girl, Miss Alia Touqan. His senior military commanders, it is said, "persuaded" him that this would not be seemly for the ruler of a country partly under enemy occupation.

In Amman, frustrated love: in Cairo, just plain frustration. Many Egyptians who condemn President Sadat for his lack of a consistent, or intelligent, foreign policy dread the prospect of his overthrow. They would welcome a ruler strong enough to decide a policy and to stick to it—even if the policy was to do nothing about Israeli occupation. But the divisions in the country are reflected in the army and many people fear that the alternative to Mr Sadat would not be a stronger man but a bunch of contending officers. The dread is that Egypt should drift into a decade of aimless palace revolutions. "We could become," they say, "like Syria in the 1950s."

Eyes are turned inward: since Egyptians believe that internal dissension is the prime determinant of what happens next, there is relatively little interest either in the possibility of a new round of peace talks or in the fighting on the Syrian-Israeli frontier, seen glumly as a repeat performance of the events that drew Egypt into the 1967 war. The most forceful pressure could be from the religious right. The recent anti-Copt demonstrations (themselves complex) are one major manifestation of this. Another smaller signal was the move within the People's Assembly to follow Libya's lead in adopting Koranic law, and punishment, for certain offences. The move was quickly and skilfully squashed but Libya's return to Islam has a certain appeal not only to the rich peasants (kulaks, says the Egyptian left dismissively) in the assembly but to their sons, now officers

in the army.

The left straggles along, much weakened. Socialists and communists draw together under the banner of nasserism, not because they like Nasser more but because they like his successor less. Students are divided, some say very deliberately, into right and left groups. So far their energies have been concentrated against each other but if one faction or the other does get out into the street it could work as a catalyst for workers—and eventually the army. The puffs of revolutionary steam, released by Mr Sadat's loosening of Egypt's disciplinary lid, blow all ways.

One danger is a domestic explosion; the other, closely related, is the length to which President Sadat may go in a bid to unite and galvanise his country. A widely shared view is that he believes that the only way open to him is to fight Israel. The editors who are now thought to reflect his attitude write of fighting, simply and without qualification. They do not write of winning. The president may yet be checked by his military advisers. When General Sadek was war minister, he refused to consider renewed war without adequate air defence—and the only air defence he considered adequate was a weapon that could threaten Tel Aviv. But General Sadek has been sacked, and his chief of staff, General Shazli, equally realistic about Egypt's military chances, has been passed over. Possibly the talk is still bluster; certainly to an outsider it sounds all too familiar. But the threatened belligerency this time last year fell into the pattern of Mr Sadat's pressure on the major powers for a peace settlement; now it could be primarily to save the regime's skin. And which motive, do you think, is the more powerful?

Israel

The bubbling in Golda's kitchen

FROM OUR JERUSALEM CORRESPONDENT

The Labour party's merry-go-round for the post of Israel's next prime minister after the election due in a year's time is in full swing, and not just at home but in Washington too. The minister of defence, Mr Moshe Dayan, has been in America; the deputy prime minister, Mr Yigal Allon, and the foreign minister, Mr Abba Eban, are expected in the next few weeks: and the prime

Sapir: powerful but unpopular

minister, Mrs Meir, may follow them.

All this looks very much like electioneering. Yet, oddly enough, all the main candidates are taking pains to declare earnestly that they are not in the running. The minister of finance, Mr Pinhas Sapir, has said that even if the party presses him he will say no; Mr Dayan says the party will not choose him anyway; Mr Allon and Mr Eban say evasively: we have a prime minister, Mrs Meir. As for Mr Israel Galili, the minister without portfolio, nobody seems to have asked him, although his chances are as good as anyone else's.

Mrs Meir has declared that she will retire as planned at the end of the current Knesset term next year, although first she would like to see peace signed with at least one Arab country. But at the moment it looks as though it will not be the question of the peace negotiations but that of the occupied territories that will decide the succession.

The contestants hold differing views on this; nobody has any solutions and nobody, particularly after the Munich outrage, will risk suggesting the return of territory without an overall peace. But there is still room for much heated polemic on the course to be taken in the seemingly infinite interim. The Labour party's hope is to find a course which will allow a consensus election platform without losing any of the crew.

Mr Sapir advocates the slowing down of integration between the economies of Israel and the occupied territories and a reduction of the territories' growing dependence on Israel. He would like to return most of the territory in exchange for a settlement with the Arabs, but he knows that it would

be hard to get a cabinet together to support this line. Hence his hesitations.

At the opposite extreme, Mr Dayan wants to press forward with his policy of intensifying economic integration: this would include larger Israeli investments in the development of the territories; more Israeli settlements, including a port at Rafah in Sinai; and the phased abolition of the military government and its replacement with civilian bodies. Taking this further, Mr Dayan has urged that the Knesset fill the parliamentary and legislative vacuum in the territories—and he has backtracked on one of his statements denying the vote to the inhabitants. But no Palestinian representatives are thought by the Israelis to be either competent or willing to enter into discussions over their future.

Mr Dayan's trip to Washington, although ostensibly labelled as shopping for arms, was in fact aimed more at diplomacy—hence his talks with Mr William Rogers and Mr Henry Kissinger. At home his trip has already had the effect of inducing leading critics of his integrationist policy in the occupied territories, such as Mr Sapir and Mr Allon, to state that no land should be returned except in exchange for peace. Mr Dayan has an important advantage over his rivals: the Americans consider him a more flexible leader than any of the other contestants.

Mr Abba Eban is thought to think on much the same lines as Mr Sapir, but both he and Mr Allon are keeping fairly quiet at this stage—although Mr Allon still stands behind the programme bearing his name. Mr Galili, in his sporadic public statements, supports Mrs Meir's view that Israel should remain a state with a Jewish majority assured for the generations to come, but neither of them specifies how this can be done without returning most of the territory taken in the 1967 war.

Although Mr Sapir is undoubtedly the most powerful man in the party and the country, he is also one of the most unpopular. Mr Allon has a tight clique of supporters, but by pitting himself head on against Mr Dayan he has forfeited much national popularity. Mr Eban's backing depends largely on Mr Sapir, although he enjoys a fair amount of respect in his own right. Mr Galili has little organised support, but he also has no real opposition. He is one of the four people (the others being Mr Sapir, Mr Shapiro and Mrs Meir herself) who as "Golda's kitchen cabinet" will finally decide who the next prime minister will be.

Germany

Strauss waltzes

FROM OUR BONN CORRESPONDENT

The west German elections have duly taken their physical and political toll. After his victory the chancellor, Herr Willy Brandt, took to a hospital bed with vocal chords strained by weeks of energetic electioneering. After his defeat the Christian Democrat (CDU) leader, Herr Rainer Barzel, cut short a Roman holiday to deal with party ructions at home only to be taken ill with a severe bout of flu.

Down in his Bavarian redoubt, however, the indestructible Herr Franz-Josef Strauss remains sound in throat and lung. His party, the Bavarian Christian Social Union (CSU), the parliamentary ally of the Christian Democrats, actually increased its percentage of the vote at the elections. The only state besides Bavaria in which the Christian Democrats increased their proportion of the vote was Hesse, where the local leader, Herr Dregger, holds right-wing views similar to those of Herr Strauss.

The noise in Germany this week has been that of Herr Strauss throwing his not inconsiderable weight about. The question that has been openly posed in Munich is whether the CSU should end its alliance with the CDU. The argument is that the opposition lost the election by pussyfooting tactics and that what was required then and is required now is more militancy—of the kind dished out by Herr Strauss. Nobody is taking the threat of a split very seriously. Logically, it would mean the Christian Democrats campaigning in Bavaria against the CSU and the CSU against the Christian Democrats in the rest of west Germany.

What Herr Strauss is up to is clear enough. In these dog days of defeat, he wants the opposition to have a clearer line, especially on questions

Strauss the indestructible

of Ostpolitik. If, incidentally, this results in shortening Herr Barzel's career as opposition leader, then so be it. The chosen ground of such militants as Herr Strauss and Herr Dregger is the coming battle over the ratification of the treaty with east Germany. They would reject the treaty. The farthest Herr Barzel went in the election campaign was to say that he would get better terms. The conclusion must be that Herr Barzel will have to be in very good physical and political shape if he is to emerge from the welter of recrimination and remain a credible opposition leader.

Holland

Work this out

Holland is little closer to having a government that can stay in office after Wednesday's general election than before. The same multiplicity of parties emerged with a slightly different distribution of votes; but it was different enough, in the confused context of the Dutch proportional representation system, to be just possibly a move towards polarisation of left and right.

The main losers were the religious parties which formed the basis of the outgoing conservative government: the Catholic People's party went down from 35 to 27 seats and the Protestant Christian Historical Union lost a quarter of its support. The prime minister's party, the Protestant Anti-Revolutionaries, managed to buck the trend by gaining one seat and the fourth member of the coalition, the secular Liberal party, made the biggest gain of six seats, bringing its total up to 22. The fifth member of the coalition, the Democratic Socialist party, which provoked the election by walking out last summer, lost two of its eight seats. If the coalition were to re-form it would still have a bare majority of 76 seats in the 150-seat house. But the willingness of the Democratic Socialists to join in is uncertain and the losses of the Catholics and Christian Historicals have left them looking pretty dubious partners too.

The left-wing opposition improved its position. Labour remains the largest party with 43 seats, four more than before, and the tiny Radical group gained five. But this gain was cancelled out by the five seats lost by the third ally, Democrats 66. So the opposition group, with a total of 56 seats, remains considerably smaller than the former ruling coalition.

Hoechst keeps thinking ahead

solve the problems of today and tomorrow - Hoechst employs 10,300 people in research and development with a research investment this year of more than £60 million.

Hoechst in Britain

Hoechst UK Ltd is an independent company within the international Hoechst group. Its British staff know their country, its problems, its people; and they realise where Hoechst know-how can inject into Britain's economy the experience gained by the parent company during more than a century in chemistry.

In textiles, for example, where ©Trevira high tenacity fabrics have, at long last, rendered outdoor events independent of the weather; and where 'Jersey Man', evolved in collaboration with leading UK knitters and based on Trevira Jersey cloths, is introducing an entirely new concept into male fashion. Or in resins, where Mowilith, 'the raw materials with a thousand uses', is helping to preserve and restore works of art such as the priceless lace and gobelins in Karen Finch's Ealing workshop. In plastic films, where products have been developed to convert brackish sea water into drinking water through a process of reverse osmosis.

Whether your problems are in plastics or paint raw materials, dyestuffs or pigments, fibres or pharmaceuticals, agrochemicals or films, graphite products or offset printing plates, Hoechst UK can help you promptly and efficiently.

Hoechst research fights civilization diseases

Cancer, heart disease and stress conditions are the main health hazards of our civilization. Their control remains the major preoccupation of medical research. To find effective remedies requires advanced drugs and materials for early diagnosis as well as sophisticated techniques for speedier testing and evaluation of new preparations. Nuclear techniques involving the use of minute quantities of radioactive compounds as tracer elements are vital to this work.

Hoechst is therefore in the initial stages of constructing an advanced medical research centre at Milton Keynes, Buckinghamshire which will utilize these techniques to investigate new diagnostic and therapeutic procedures and evaluate new pharmaceutical compounds. The research centre will serve the worldwide activities of Hoechst in the international pharmaceutical field.

A century in pharmaceuticals
Hoechst has pioneered pharmaceuticals for almost a hundred years. The first product in 1883 was Antipyrin, one of the classic

analgesics. Another milestone was reached in 1910 with the introduction of Salvarsan, developed in co-operation with Paul Ehrlich, the Nobel Prize winner, which effectively combated the dreaded syphilis and other venereal diseases.

Two other Nobel Prize winners were associated with Hoechst - Emil von Behring and Robert Koch who carried out the fundamental work that led to Hoechst's modern range of sera and vaccines against whooping cough, polio, influenza and many other infectious diseases. Rastinon, the first oral antidiabetic, was developed jointly with Boehringer, Mannheim, early in the 1950's and has since helped to relieve diabetics suffering throughout the world.

A similar success was achieved in 1964 with the introduction of Lasix, an improved diuretic that has the widest safety margin and overcomes other disadvantages of standard oral diuretics. To keep thinking ahead - to

A distribution centre on this site will put you miles ahead of the competition

This is the site we call Grange. An easy-going name for what is potentially the most dynamic manufacturing or distribution point in Europe. Less than an hour from 15 million consumers, hungry for your products, packed into the biggest and richest industrial conurbations outside America. At the junction of the mile-eating motorways, M6 and the new M62 (completion 1973), Grange is 276 acres of profit-filled land within minutes of Manchester and Liverpool and only a little more than an hour from Birmingham and the Midlands and Leeds and Yorkshire. Even Scotland becomes a realistic distribution region.

Close by, there are hundreds of companies ready to support your venture and the growing population of Warrington New Town is on your doorstep. **This is the Crossover!** The nation-shrinking site that gives you the edge on your competitors.

20% saving on building could help you with the plant or equipment.

The site is in a Government 'Intermediate' development area so you can reclaim 20% of the cost of building which could buy you that new articulated lorry.

You'll probably need one to meet the demands of your expanding business!

A ready-made factory!

We're building superb modern factories which you can lease for 35 years.

They're as big as your needs. From 10,000 square feet all the way up to 50,000 square feet.

Companies on the move! Already ambitious companies have realised the competitive advantages of this supersite. 48 acres are currently being negotiated and over 100 enquiries have been received. Now is the time for you to make your move. **Crossover.**

The other end of the 'phone
The team who want to sell you the best distribution centre in Britain is on your side. If your business isn't right for the cross-over site we'll tell you.

We'll probably be able to offer you something within our area which has the kind of qualities you need.

We've got financial experts who talk money simply and helpfully.

We've got economists and statisticians, planners, surveyors and architects, bricks and mortar men and businessmen like yourselves.

We talk your language.
We invite you to take the first cautious step in the direction of **Crossover**. Ring Brian Standivan, Chief Estates Officer, 0925 36551

November 28, 1972.

LNGC tomorrow. The way it's going to be.

The boom is on, and the boom is going to continue.

The world LNG tanker fleet of 1980 is estimated at 22 times the size of today. The global carrying capacity will be in the neighbourhood of 6.5 million cubic meters. An average tanker will carry about 120,000 cubic meters.

The reason for this fantastic expansion is easy to see. The demand for energy — especially nonpolluting energy — is growing faster than ever. At the same time the conventional sources of energy are becoming more difficult to find and more expensive to develop.

Of course, liquefied natural gas won't pump itself into a storage tank for nothing. More millions than you can count are going to be invested in systems for moving the gas from places where it exists but isn't needed to places where it's needed but doesn't exist.

The system will include computers, and every variety of analyst, and whatnot, but its core will be a basic means of transportation: ships. Since two-thirds of the total outlay for transportation is related to capital investment, construction costs have to be kept as low as possible. Reliability must be built-in and guaranteed; if the ships stop, everything stops.

So who's going to build these ships? There isn't a qualified shipyard in the world that wouldn't jump at the chance, but some of them have a better chance than others. The ones with experience. Like us.

We've already built the two biggest LNG carriers in existence, the LNGC Polar Alaska and the Arctic Tokyo.

And we've improved since we built them. Kockums is always improving.

Mind you, we're still using the Gaz Transport membrane technique; for the moment nothing can touch it in terms of cost-efficiency. Self-supporting tanks, for instance, would cost at least 20% more. We've also learned how to use a thinner, Invar steel. Cost is down, capacity is up.

We even invented an improved technique for the trickiest part of the job, 80,000 meters of seam-welds.

Most important of all, for the last two years we've been able to follow the day-to-day performance of our two LNG tankers.

Nobody knows the ins and outs of big LNG's the way we do, because we've built the biggest.

We're not saying we're going to build the world's LNG tanker fleet all by ourselves. But we won't need much help.

We make our own future—and yours.

You'd be surprised what we get up to.

From exporting our products and services around the world to building the runways and airport terminals to fly them from.

And at roof level we really spread ourselves. Not only in Britain where we put the roof on just about every type of building, but overseas too - we export a wide range of roofing materials. And asphalt from our mines in France and Switzerland ends up on European roofs.

We're on top of the job everywhere. And just to show we can land the big ones we've recently completed a jumbo-jet apron at Bahrain Airport.

France

The power to start and end a life

FROM OUR PARIS CORRESPONDENT

You can theoretically get up to 10 years in prison for performing an abortion in France. Last week the heaviest sentence handed down on several women involved in an abortion cause célèbre in the Paris suburb of Bobigny was a suspended prison sentence of one year. The mother of the girl concerned was fined £40. The girl herself, aged only 17, had already been acquitted.

You can get the death penalty for murder in France. This week, for the first time since M. Pompidou became president, it was carried out. The two men guillotined were in prison—one of them for an earlier murder—at Clairvaux when, last October, they seized two hostages and demanded to be set free and given arms. The demand was refused, the police attacked the building and the two men slaughtered their hostages, a nurse and a warder. The two were condemned to death in June. M. Pompidou refused the reprieve, which is his privilege, and the sentences were carried out on Tuesday morning.

The two cases have aroused passionate debate in France. In both, it seems, the law acted as public opinion would have had it act. France's anti-abortion law, dating from 1920, permits abortion only in the case of serious risk to the health of the mother. But it has long been questioned, recently very vigorously by the women's lib movement, which has published advertisements of the "I have had an abortion" variety. Simone de Beauvoir was one of the witnesses called by the defence in the Bobigny trial. And the challenge does not come only from embattled feminists claiming the right to abortion without restriction of any sort. A public opinion poll last year showed more than four-fifths of respondents agreeing that abortion was a matter to be decided by the couple concerned.

The health minister has already declared his opposition to unrestricted abortion. But the prime minister said at the weekend that the next parliament would have the chance to discuss a law originally conceived with the aim of rebuilding France's decimated population after the first world war.

The Bobigny trial seems certain to lead to a relaxation soon, if not at once. It has already moved the government to promise extra steps to spread knowledge of contraception.

The death penalty is another story. Here a recent opinion poll showed some two-thirds of respondents in favour of its maintenance, a view certainly aided by the nastiness of the Clairvaux case and, perhaps, by an even nastier case recently in the south of France when two petty criminals, having demanded money from a housewife, butchered a young child and stabbed the pregnant woman to the point of death in the hope merely of getting away undetected.

The triple murderer of Clairvaux actually demanded death at his trial. His long record of violence against women strongly suggested a man whom nothing would or could have deterred, but the prison warders' union, unsurprisingly, recently backed the death penalty for him. The public, it seems, agrees. Still less is it likely to back abolition of what it sees as a deterrent to the criminal who is perfectly sane.

Almost like Britain

In at least one respect it promises to be a hot winter for the French. The unions are smouldering; prices are warming up; and inflation threatens to take fire. France is not being toasted as much as Italy—where the cost of living went up by 1.3 per cent in October—nor does it yet approach the British figure for October of 1.4 per cent. But with retail price rises of 0.9 per cent in October, 0.6 per cent in September and 0.5 per cent in August, the French can no longer look upon inflation as the *vice anglais*.

To deal with this situation M. Pompidou has called on the services of M. Antoine Pinay, a former prime minister who acquired the reputation of being an economic troubleshooter during the 1950s. At 81, he may be pushed to repeat his performances of earlier years—particularly since M. Giscard d'Estaing, the finance minister, has ruled out restraints on prices and incomes. M. Giscard will announce a programme to tackle inflation next Wednesday. It will be based on the principles adopted by the common market finance ministers in Luxembourg last month and will try to remove the expectation that prices are bound to go on rising.

This will not be easy as long as

Put your trust in Pinay again

major wage claims are pressed. In addition to stoppages by dockers in some French ports, there have been strikes by postal workers and bank employees this week. On top of this workers in the power industry and on the railways are renegotiating their contracts. And although M. Ségué, the leader of the main trade union, the Confédération Générale du Travail, has promised no major confrontation with the government before the spring, he has declared that "the pressure of the workers" will be increased before then.

With an election expected in February or March both government and unions have an eye on the electorate. M. Pompidou dare not risk antagonising his supporters by introducing a wage freeze; M. Ségué dare not risk antagonising the supporters of his communist-led union by fuelling the inflationary fires too obviously. This may be the president's one consolation in the coming months. But, with another poll in *Le Figaro* this week suggesting that the opposition alliance is gaining more ground at the gaullists' expense, he cannot be sanguine about the present inflationary trend.

Iceland

No go

The breakdown of this week's British-Icelandic talks on the extension of Iceland's fishing limits from 12 to 50 miles will bring no comfort to British trawlers in northern waters. Lady Tweedsmuir, the Minister of State at the Foreign and Commonwealth Office, flew back on Tuesday from Reykjavik with the news that the talks were deadlocked. Iceland had not modified its claim to sovereignty over a 50-mile zone; and Britain had

rejected an elaborate proposal that would have divided the zone into a number of different areas to be fished at different times by vessels of a certain size. Britain is prepared to reduce its catch by 25 per cent of its 1971 level, and is also ready to allow the Icelanders priority in their own waters. But Lady Tweedsmuir argues that the Icelandic proposals would diminish the annual British catch not, as the Icelanders claim, by 35 per cent but by more than 70 per cent. This the British find unacceptable.

British trawlermen will undoubtedly continue to fish Icelandic waters up to the 12-mile limit in defiance of the Icelandic government. But, as winter wears on, they will find conditions growing more hazardous. Although the clashes that took place at sea last week were not typical of the relatively peaceful previous few weeks, they served as a reminder of the more serious October incidents.

With no prospect for a renewal of talks, the threat of harassment of British vessels will intensify the pressure on the British Government to increase its naval protection of trawlers. That may check the harassing of fishermen, but it may not make the Icelanders more willing to compromise: they seem to want to treat the sea off their shores like the continental shelf, saying that it is hypocritical for the British to lay claim to oilfields far beyond 50 miles from their coast yet deny Icelanders a similar right to their greatest natural resource, fish. But the real problem about the conservation of white fish stocks concerns not just the Icelandic, British and west German fleets but the depredations outside Icelandic waters of the Norwegians and the east Europeans. And there is no prospect of their activities being curtailed until the next United Nations general conference on the sea meets in a year's time.

Hungary

To Budapest, with tact

FROM OUR EAST EUROPE CORRESPONDENT

Mr Leonid Brezhnev, the Soviet party leader, waited tactfully until the Hungarians had straightened out their own domestic problems before descending on the Hungarian capital with a high-powered delegation this week. The straightening out took place just over two weeks ago at a meeting of Hungary's central committee which took a

Kadar gets an extension of Brezhnev's okay

hard look at the future of the country's new economic system, now almost five years old. The committee decided, after studying the findings of four commissions, to continue the curbs on prices and investment which were first imposed a year ago to correct "distortions" in the system without slowing down economic expansion. A state planning commission directly under the cabinet is to be set up to strengthen the powers of Hungary's central planners.

For years the Hungarians have been extremely wary in their efforts to reform their economy because the Russians were looking over their shoulders. But now they are feeling encouraged because of another display of Soviet tact at a recent meeting of Russian and Hungarian economists in Budapest. There the Russians conceded that Hungary, with its shortage of raw materials and a production capacity far exceeding its domestic needs, must make expansion of its foreign trade, particularly with non-communist countries, a top priority. The economists also agreed that the use of economic regulators and greater independence for industrial firms are the only methods for solving economic problems in communist states.

Hungarians are convinced that the Soviet economists would not have been so accommodating if there had been any danger of serious disapproval from the Russian leaders. Nor would Mr Brezhnev have pinned the Order of Lenin on Mr Kadar had he been assailed by doubts about the road Hungary is following under his leadership. The Hungarians seem to be right for the time being at least.

New Zealand

Kirk session

FROM OUR NEW ZEALAND CORRESPONDENT

The Labor party's landslide victory in the New Zealand elections last weekend was not predicted, but seen in retrospect it was not all that surprising. The National party had ruled for 12 years and Labor's campaign slogan, "Time for a Change" had great appeal, despite the fact that the country is more prosperous than ever and the outgoing prime minister, Mr John Marshall, was acknowledged to have done well in securing future access for New Zealand products to the British market.

But the Nationals looked somewhat lacklustre after four consecutive terms in office and were accused of being out of touch with public opinion, especially on social and environmental issues. Under Mr Norman Kirk's leadership, on the other hand, the Labor party had built up its image as a moderate, responsible party that would not turn the country upside down. In heavy polling, Labor secured 55 of the 87 seats in the house of representatives although its share of the vote was only 48 per cent against the Nationals' 41 per cent. The remaining votes went to splinter parties which failed to gain representation.

Mr Kirk is a shrewd, rough-hewn politician who has led his party since 1965 but has never held cabinet office. He left school at 12 and worked as a railwayman before he was elected to parliament in 1957. He is firmly in control of his party and, with a parlia-

Only one nickel producer in the world ships from three countries.

Control room, nickel-iron refinery, Canada

Nickel-copper-cobalt refinery, Norway

Ferronickel metallurgical complex, Dominican Republic

From Canada... Norway... the Dominican Republic... Falconbridge ships electrolytic nickel, NICKEL 98, ferronickel and iron-nickel pellets to nickel users around the globe.

And 60% more Falconbridge production capacity is upcoming now.

Diversity plus productivity. It adds up to assured nickel supplies today. Tomorrow. And tomorrow.

Falconbridge is ready now with new nickel supplies for steelmakers, electroplaters and other users of nickel, the improvement metal.

Your enquiry will receive immediate attention.

mentary majority of more than 20, he can probably count on enjoying at least six years as prime minister. This would let him push ahead with his programmes for regional development, housing, industrial relations and better recreation facilities.

For the first time in many years, foreign affairs and defence were not major election issues. Mr Kirk will recognise communist China and pull the tiny 50-man New Zealand army training group out of South Vietnam. But he is probably in no great hurry to withdraw New Zealand troops from the five-power force in Malaysia and Singapore. The Labor party is committed to pulling out of Seato on the ground that this is an outdated regional defence organisation. Mr Kirk will probably be his own foreign minister and is likely to handle these questions with discretion. He says he will step up aid to south-east Asia. His concern for the Pacific region and for the environment underpin his threat to send a naval frigate crewed by volunteers into the French nuclear test area around Mururoa atoll.

Britain's entry into the common market, in Mr Kirk's view, must make New Zealand look increasingly to Brussels rather than London as the focus of Europe. This belief has been reinforced by the immigration rules that the British Government is labouring to introduce. Mr Kirk and many New Zealanders feel strongly on this score, and the new government will insist that New Zealanders in Britain should have the same rights as Britons in New Zealand.

Cambodia

The new force

FROM OUR INDOCHINA CORRESPONDENT

Whatever the North Vietnamese have done, or failed to do, in South Vietnam this year, they have certainly managed to organise a genuine local insurgency in Cambodia. A year ago the Cambodian government could argue with some justification that Cambodia's troubles would fade away when the Vietnamese communists withdrew from the country. It is now accepted, however, that most of the fighting on the roads leading into Phnom Penh since the late summer has been the work of communist-led Cambodian guerrillas.

The North Vietnamese seem to have decided to build up the Khmer Rouge forces, and help them to acquire more territory, during the rainy season in

the summer and autumn of 1971. This may have been connected with the offensive they were planning in Vietnam for 1972, which was going to use most of their own troops in Cambodia. Anyway, by late this summer intelligence reports put the Khmer Rouge's strength at 40,000 men—not all front-line soldiers, but including 40 to 60 battalions of 200 or more men each, with Cambodian commanders.

The big question is whether these amount to an organised movement. Certainly the rebels in the maquis got there by very different routes. The majority are probably peasants impressed by the North Vietnamese as coolies. Others are remnants of the old anti-Sihanouk Khmer Rouges. There are villagers who took to arms after suffering at the hands of the South Vietnamese army, and some common or garden bandits. But the available intelligence points to North Vietnamese-trained communists as the chief force among the guerrillas.

Since Prince Sihanouk's overthrow in 1970 some 2,000-3,000 of these men have come back from North Vietnam, where they went in 1954 or soon afterwards. They and like-minded later converts, including some intellectuals who rebelled against Prince Sihanouk, together with the North Vietnamese, have organised the aggressive Khmer Rouge units that went into action this summer.

It is hard to get a clear idea of how much of the country they control. Much of Cambodia is no man's land, and has been for two years. But there is evidence from some areas of well organised villages with their own home guard. The relationship between the Cambodian guerrillas and the North Vietnamese will be very important if there is a ceasefire in Vietnam. Will North Vietnam want the guerrillas to stop fighting and try for a compromise political solution, with or without Sihanouk? They are a new factor in the situation, which the Cambodian government cannot ignore.

Chile

Leaving the army in charge

Chile's marxist president, Sr Salvador Allende, left Santiago for Mexico City this week on the first leg of a 14-day trip that will also take him to New York, Moscow and Havana. He plans to address the United Nations General

Assembly on December 4th.

General Carlos Prats, the army commander-in-chief who was made minister of the interior last month, will act in Sr Allende's place during the president's absence. But it may well be during the next few days that the loyalties of the armed forces will be most severely tested, either because right-wing extremists will seize on Sr Allende's absence as the opportunity to stage a rising, or because the generals themselves may get ideas, or because the military men in the present cabinet will be asked to participate in measures that would fully commit them to the programme of the Popular Unity coalition.

It is easy to see how that could happen. One possibility involves "the decree of insistence," one of the key legal measures used by the Allende government to override the appeal courts and extend state control over the private sector. It is a decree signed by every member of the cabinet that overrules the decisions of the highest appeal tribunal, the Contraloría. According to the Controller-General, Sr Hector Humenes, it has been used 28 times since Sr Allende took office.

Now the protracted conflict over a company called Fensa, which produces domestic appliances, seems to have reached a head, and it is likely that the government will call on the military men in the cabinet to join in signing a new decree of insistence to sanction its takeover. Whether or not they sign will show to what extent they are ready to underwrite the economic programme of the communist party.

China

Happiness is a bicycle

FROM OUR SPECIAL CORRESPONDENT

Mao Tse-tung's government has strung a safety net under the Chinese people. This is what strikes a visitor on the briefest tour and this is what makes China different from many poor and populous countries. The net is not without holes: some people do live in conditions which would be called slums anywhere else, and some people do face the familiar double disaster of unexpected illness followed by an unpayable medical bill. Not even the Chinese themselves claim that their social services or their welfare system have reached the level of relatively rich countries like Britain. But they have succeeded in mitigating both the rate and scale of human disaster. And they have set a standard of subsistence living that allows not only food, clothing and shelter but also, so far as one can tell, a new measure of self-respect.

The levelling process undoubtedly takes colour out of the social landscape. China looks, as every visitor has remarked, like a nation fitted out by army-navy surplus. The shops are in fact well stocked these days with brightly patterned fabrics—not beautiful but bright—and six months ago people were urged to break out of the standard blue boiler suit. But levelling brings with it a drive for conformity and the Chinese, schooled in caution, are evidently not ready to risk standing out in a crowd.

China is the farthest thing from a consumer society. Yet the shops in Peking and Shanghai are crowded at all times—partly because factories stagger their days off, partly because window-shopping is a cheap form of recreation, and partly because there is more money than things to buy. The luxuries available to a Chinese can be counted on one hand: a bicycle which costs up to three months' earnings; a sewing machine at about the same price; a short-wave radio; a mirror-inlaid bed. Yet even these major items seem to be within reach of a lot of working men; there are half a million bicycles in Canton, for example, where the population is 3m.

Clothing is relatively expensive: ordinary wool garments like cardigans

and trousers can cost more than in Britain and cotton is still rationed (the common solution is to buy a mixture of cotton and synthetic fibre). But apart from clothes and a selection of cheap household goods, there is nothing to buy. "What are you saving for?" this correspondent asked one party man who had £400 in the bank. "Nothing," he shrugged.

One option that is not open to people with savings is moving to a bigger home. Housing is usually assigned in connection with a job and tends to be extremely cramped by western standards. But there are great variations both within a city—between decaying old-style houses and modern housing estates—and between a city flat for six people, consisting of one and a half rooms plus communal flush toilet, running water and gas burner, and a suburban flat for the same size of family, with five rooms minus mod cons.

In the cities, all new housing is built and managed by factories or the municipal authority. Some pre-revolutionary houses are still owner-occupied and a handful of these small homeowners still rent out rooms. But most of the old housing is now rented out by the lowest level of local government, the street committee. In the countryside it is still possible for people to build their own homes, subject to approval by their production team and the commune which must allot them the land. In one commune near Shanghai 90 per cent of the peasants own their own homes. The usual pattern is that when a first son marries he continues to live with his parents, but when a second son gets engaged he either expands the old house or builds a new one, usually by demolishing an old one and recycling the materials.

All Chinese housing is very cheap by western standards: a relatively expensive Shanghai flat costs under £2 a month or less than 10 per cent of a couple's income. City rents, even in workers' estates, may be 10 times as high as the purely nominal fees on a commune. But an urban worker earns at least twice as much in cash terms as

THE ECONOMIST DECEMBER 2, 1972

Mod flat, 1½ rms, shared k & b, £2 monthly

a peasant. And if he is employed in a state factory he will have the benefit of free health insurance which continues after retirement and half-rate medical care for his dependants.

Since the cultural revolution, the national health scheme for state employees has been supplemented by a co-operative medical service open to commune members and workers in local enterprises. This gives them free medical care for less than 50p per person per year. But the co-operative insurance is not available in all areas and, even where it is, people can opt out. If they are then faced with a medical emergency, they must either pay up—an operation for a broken hip in a Shanghai hospital costs £7—or they can appeal for aid. For old people who are not covered by the state system, the first court of appeal is their son and their son's employer. People with no family to fall back on must seek help either from their local public service bureau in a city or their commune authority.

Medical care, like housing, still varies greatly from area to area, although the Chinese have made great efforts, particularly in the past few years, to shift medical resources from the cities to the countryside. Their best known innovation is the barefoot doctor—a worker who after a few months' training does simple diagnosis and treatment in local clinics. Fully trained physicians also leave their city hospitals to spend

THE ECONOMIST DECEMBER 2, 1972

part of the year making rounds of factories and communes. As a result of the government's public health and medical programmes, most of the scourges that used to wipe out millions of Chinese every year have been eliminated. Today China's main unsolved medical problems are the same as those of the rest of the world—cancer and heart disease.

Spare rib, sweet and sour

The spark of women's lib has started no prairie fires in China. But not because there is no more liberating to be done. Chinese women have come a long way since Mao Tse-tung wrote his first feminist tract 53 years ago. Today Chinese women are certainly more equal in law and probably more equal in fact than the women of Britain. But they are still barely represented in the councils of power. And they still have to cope with sick children, dirty dishes and discrimination by feudal-minded men.

The Chinese have a clear theoretical appreciation of the woman problem: "The emancipation of women is a measure of the liberation of a society," a Shanghai ideologist declared. And to back up his argument he explained that China is aiming to fill one-third of all party positions with women. Why only one-third? Because women constitute one-third of the Shanghai work force and because women are still catching up after millennia of backwardness. "But one-third is only our first target," a woman comrade interrupted with a zeal worthy of Germaine Greer. "We will carry on the struggle until we reach complete equality."

Apart from this flash of feminism—the only real debate among Chinese which your correspondent witnessed in China—there is no sign of a concerted effort to raise the status of Chinese women. The mass organisation for women perished along with all other such groups during the cultural revolution and there are no plans yet to revive it. There are no identifiable women's leaders (Mrs Mao has never involved herself in the problems of her sex) and even the annual policy statement on women—the People's Daily editorial on international women's day—has lapsed. "What new is there to say?" asked a weary male editor.

The one-third figure comes back again and again in response to questions about the representation of women (targets everywhere have a

way of transmuting into facts)—34 per cent in the Shanghai revolutionary committee, for example. But in the Shanghai party committee, where the power is, it is 17 per cent; in the group running the New China News Agency it is 7 per cent; and among the top editors of the People's Daily it is zero.

Progress at the top has undoubtedly been slow (the female contingent on the politburo was cut in half a year ago with the disappearance of Mrs Lin Piao) but the cultural revolution seems to have made a difference at lower levels. More girls are being educated now because of the expansion of primary schools in rural areas (where there was a shortage of school places before, the girls tended to stay home); more women are going to work because of the development of local workshops; and more working women are receiving equal pay.

Equal pay has been on the statute books in China since the mid-1950s but has always proved difficult to implement. All state enterprises are said to pay women equally now, but officials admit that in the countryside a "protracted struggle" will be required to overcome resistance to equal pay. This is partly because of the different methods of calculating pay: in urban factories and offices workers generally get a fixed wage whereas in rural communes work points are awarded by the peasants themselves on various grounds, including political attitude and physical strength. This is one of the loopholes women fall through.

Another is the familiar phenomenon of women's work. Apart from the much heralded labour heroines like the handful of women pilots, many ordinary women can be seen doing "men's work" like operating lathes, welding metal and driving tractors. But most

women seem still to be segregated into jobs that are considered most appropriate for women (and are usually lower-paid).

The local workshops that have been set up to woo the last housewives out of their homes tend to be an extension of home handicrafts, like sewing and basketweaving, or light industry, for which nimble female fingers are said to be especially suitable. Women earn less in these co-operative workshops than they would in a state-run factory and have fewer social benefits. But they have the advantage of being near to home and they can take an unpaid day off to tend a sick child.

Children are, of course, the main barrier between women and work and for years a shortage of public child-care facilities kept many Chinese women at home. But now the Chinese claim that in the cities, at least, every able-bodied woman under 45 has a job. Grannies are still preferred as babysitters but they have been supplemented by a network of nurseries run by factories (usually for under-tens) or by local committees. A typical nursery is open 10 or 12 hours a day six days a week and costs less than a pound a month. Nurseries will also take in boarders if the mother is away, at a cadre school for example, at a charge of about £3.50 a month—one-third of the mother's salary.

Another aid for working women is factory and neighbourhood canteens which provide cheap hot meals. Most people, however, prefer to eat at least one meal a day at home; here granny often comes in handy again as the weekday cook. Chinese husbands claim to help with the housework, but when a female cadre was asked why there were not more like her down at the commune, she replied in one eloquent word. "Housework."

Finding profits in the U.S.A.

Our Total Systems Approach can help you choose the right course.

Penetrating the U.S. market can offer rich rewards. But success is invariably reserved for those who have a thorough insight into the U.S. business scene.

How do you obtain that insight? Trust Northern. The Northern Trust Bank's Total Systems Approach to venture planning can help you maximize your opportunities and minimize your risk. We take an in-depth look at your strategy, then we help you seek out the opportunities that fit your plan—exploring with you the potential return.

If a merger, acquisition, or joint venture is called for, we can help locate and evaluate the candidates. If you need licensees to manufacture and

distribute your product in the United States, we can help get you together with the right contacts. If building a plant is the answer, we can guide you in getting the project underway.

Financial planning specialists, using sophisticated computer technology, will show you the most economical method of financing your ventures. Then we can arrange your U.S. dollar financing.

The Northern Trust is ready to work for you in penetrating the U.S. marketplace—profitably. Ask your own bank about The Northern Trust. Or contact Kenneth P. Kinney, Vice President, in Chicago, or W. James Armstrong, Vice President and Manager of our London branch.

American Survey

Housing: all falling down?

FROM OUR SPECIAL CORRESPONDENT

Four years ago the United States seemed at last set to fulfil a promise made in the 1940s: that every American family should have "a decent home in a decent environment." A 10-year goal of 6m new and rehabilitated homes for the needy was announced and big new subsidies, for both rented housing and for house-purchase, were piled on top of the subsidies and other aids already in existence. In terms of production of houses, the new approach has been a roaring success; beginning in 1969, more subsidised homes have been built than in the previous 31 years of government programmes. Yet federal housing policy has made so many enemies that it seems to be back in the melting-pot.

An early sign was the failure of the House of Representatives to pass this year's big and innovative housing bill, which for the first time would have given local authorities block grants in place of some of the many categorical grants—money limited to specific purposes—that exist today. The bill was immensely long and, because of feuds inside the committee sponsoring the legislation, reached the floor very late in the session. But in addition the coalition—of city mayors, builders, mortgage bankers, speculators and estate agents—which had kept the federal government in the housing business appeared to be falling apart. In the end Congress decided only to extend existing legislation until next July, leaving to its successor the job of reshaping the part which the federal government should play in the housing field. A fresh start will also have to be made at the Department of Housing and Urban Development (Hud). This week President Nixon received the long-expected resignation of its head, Mr George Romney.

In recent weeks Mr Romney has been campaigning actively for the virtual gutting of his department; he would limit the federal government's function to the establishment of housing goals and the stimulation of state, local and private efforts to meet them. Congress is also in on the action. Hearings start next week before its Joint Economic Committee, based on a series of special studies which the committee's chairman, Senator Proxmire, recently called a "damning indictment" of the government's performance on housing.

What has attracted most attention is a series of local scandals which have been coming to light. Most of these have concerned pre-1968 programmes, but they have tarnished the whole lot. In many big cities dishonest federal employees have connived with dishonest estate agents and mortgage bankers to inflate the appraised value of houses being sold to unsophisticated buyers in the deteriorating areas in the city centres. Hud has been left holding the not-inconsiderable financial bag, while many poor people whom Congress meant to help have lost both their savings and their homes. Congress deliberately authorised Hud to take greater risks when, a few years ago, it instructed housing officials to insure mortgages in the ghettos and other low-income areas. But the administration of the programmes has left much to be desired.

A much more intractable problem affecting the new homes being built under the 1968 subsidy programmes is the determination of towns and suburbs to keep out housing for the poor—and especially poor blacks. Mr Romney's efforts to persuade them to accept a fair share of such housing has never had the real support of the Administration, which sensed long ago how strong

Dynamite for a better environment

the resistance would be. Today that resistance seems stronger than ever. Americans, one observer notes wryly, want to be fair to the poor—but not just yet. Battles on this issue are going on all over the country.

Even so experienced, determined and wily a man as Mr Edward Logue, the head of New York State's powerful Urban Development Corporation, has failed to persuade towns in Westchester County that each should accept 100 units of housing for families with low incomes, although this was not for New York City's blacks, but for the towns' own poor. One aspect of this year's housing bill which disenchanted builders was the move to give local elected officials the power to veto all but the tiniest subsidised projects. Indeed, there is resistance not just to housing for the poor, but to new building development of all kinds, a product, very largely, of the new sensitivity to the environment.

A number of experts are also convinced that the design of the federal government's policies is basically faulty. Subsidies are available not only to the poor, but also as incentives to rich investors (through tax shelter arrangements), to bankers and to developers. Some critics charge that as much as

half of the government's expenditure on housing ends up in the hands of middlemen. This makes homes more expensive than they might be with a direct-loan programme, while many of the buildings put up are unaesthetic, badly constructed and designed with little thought for the families which will have to live in them. Some people argue that far fewer costly new homes would be needed if more of the existing stock were saved.

Finally, the housing commitments of the federal government are already large and are rising more rapidly than those in any other area of federal spending. In 1969 federal expenditure on housing was well under \$1 billion a year. Now it is nearly \$4 billion and in four years it is expected to be nearly double that, with a liability to go on providing the subsidies for 40 years. A small price, some might say, for a rich country to pay to assure a decent home to every family. But it does not look small to a President who faces big budget deficits. It is not only subsidised units which constitute a financial headache. Public housing (equivalent to British council housing) has long been out of favour and practically none has been built in recent years. But the great dreary blocks which went up after the war still house 1m of the very poorest families and the local authorities which operate them with federal help face yawning deficits.

Yet Mr Nixon has promised that many social programmes will be pruned and housing is a prime candidate for the knife. It is not only costly; it is a breeding-ground of many troubles. One long-time government expert in this field says that the Administration will move heaven and earth to get rid of the new housing programmes and public housing too. One way would be to extend block grants to housing (this year's lost bill confined it to programmes such as urban renewal) and give the money—or more likely just part of it—to the states and let them get on with the job.

The advanced states would probably do it well, if they get enough money. Massachusetts and New York, to mention two, have made a good start in packaging well planned schemes for developers and supervising them to make sure that the building is done right and that there is good management afterward. These schemes get away from the disastrous concentration of the poor in high blocks, which has led to so much crime—as in St Louis's notorious Pruitt-Igoe estate—by requiring each development to set aside 20

per cent or more of the flats for the under-privileged. More backward—and corrupt—states could be another matter. What many experts stress is that, with the present high prices of land and labour, it is impossible for private enterprise to build for the middle-class, let alone the poor, without the current level of financial aid from the government. But whether a strongly Democratic Congress, which is jealous of its control over spending of the federal tax dollar, will let the states distribute this money is open to doubt.

Another solution for housing woes which Congress will be discussing is the housing allowance, which would give poor people the money to find their own shelter in the private market; this allowance might be linked with block grants. If the laws against racial discrimination in housing were enforced vigorously—and here the Nixon Administration has a good record—the poor could live where they like, while the federal government's role would be reduced to what it does best: handing out cash.

But even here there are pitfalls. Mr Logue, looking out over a magnificent panorama of New York City, notes that its vacancy rate is a bare 1 per cent; here housing allowances would simply push prices and rents up. Even when the rate is higher, the houses and flats may be far from jobs. Where there are many vacant houses, this may be because of doubts about the area's economic and racial future; no builder is going to risk capital in a place where people will not live. An argument along the same lines comes from Mr Anthony Downs, a housing expert who is highly regarded. His study, which has just appeared, was financed by the big builders and mortgage lenders and it is being interpreted as a sign that they will be ready to do battle for the existing subsidy programmes when Congress reassembles. These interested parties have developed a cosy relationship with many powerful members which in the past has usually brought them what they want.

New players

Mr Nixon is a sports fan and so it came naturally to him, when he was discussing the need to keep up the "excitement and vitality" of his Administration during the next four years, to speak of changes in some of the players and some of the plays. But for the Department of Defence, Mr Nixon has chosen not a new face, but the

"Pretty Sure Of Yourself, Aren't You?"

familiar and highly respected one of Mr Elliot Richardson, the competent and hard-working Bostonian who has been running the vast Department of Health, Education and Welfare. Mr Richardson is a progressive Republican, but little progress was possible at HEW with Mr Nixon backing away from reform of the ill-designed system of public assistance, from racial integration and from social programmes generally. The Defence Department should be less frustrating, although what Mr Richardson achieves will depend, presumably, on what Mr Nixon wants.

Stepping into Mr Richardson's shoes at HEW will be Mr Caspar Weinberger, another familiar player as director of the Office of Management and Budget. The fact that Mr Nixon is sending his chief budget-cutter to HEW is no coincidence; many people expect a fierce onslaught on the "great society" programmes inherited from the Johnson Administration. But Mr Weinberger is no random slasher and he also possesses considerable organising ability.

Mr Weinberger's successor at OMB is to be Mr Roy Ash, the man who is dreamed up this agency when he was chairman of the President's advisory council on executive reorganisation. So far OMB has been more budget than management but with Mr Ash in charge this may change. There have been suggestions that, if Congress continues to resist the consolidation and streamlining of government departments which Mr Nixon has been seeking, he will go ahead anyway, as far as he can without congressional authority. Presumably this job will fall

Financial times

Very late.

Eleven thirty, and the financial director's still at the office trying to work out how the company lost £5,000 this morning. It happens to the best financial directors. They get stuck in the wrong currency at the wrong time.

Why does it happen? Because the world's money markets have never been as confused as they are today. It's a natural business hazard—and there's nothing you can do about it. Or is there?

At financial times like these, you could call Chase Manhattan. One of the first banks to set up a Cash Management service.

A service that can make a substantial difference to your company's financial situation.

Chase Cash Management can make sure you're never at a loss. They'll raise money in the right market, put it out in the moneymaking ones. Transfer your company funds into the company coffers—fast.

And Cash Management is only one of the many facets of Chase Manhattan's multinational expertise at your service to make sure your money works as hard as you do.

Maybe even harder.

Talk to Chase Manhattan about Cash Management. You'll wonder how you ever managed without us.

Chase Manhattan acts, while other banks talk

to Mr Ash, a noted business manager (he heads Litton Industries, Inc). His new post does not need Senate confirmation.

All three of these men are known as team-players, who can be counted on to carry out the President's orders. Two much stronger and self-willed possibilities for the cabinet, Mr John Connally and Governor Nelson Rockefeller, both potential Secretaries of State, will not be joining the government, Mr Nixon has announced. The subsequent news that Mr Rogers is to stay on at State thus caused no surprise. It seems that there is to be no change, just yet, in the management of foreign policy.

A real change, however, is going to take place at the Department of Labour, with the appointment of Mr Peter Brennan, head of the Building and Construction Trades Council in New York. No doubt this is thought of as recognition for the millions of trade unionists who, like Mr Brennan, deserted the Democrats and voted for Mr Nixon. But not all of them may appreciate it, although Mr George Meany, head of the big trade union federation and a defender of the Vietnam war, has welcomed the appointment. Mr Brennan first came to the President's attention when he organised a march of "hard-hat" construction workers in 1970 to support the foray in Cambodia. In the course of it there were attacks on student protesters. Mr Brennan was subsequently invited to the White House and this year he worked hard in New York for the re-election of the President.

Dissenters' day

Five leaders of the demonstrations against the 1968 Democratic presidential convention in Chicago have now had their revenge against the judge who presided over their trials. Last week the court of appeals which reversed their convictions for incitement to riot rebuked Judge Hoffman and the chief federal prosecutor severely for their antagonistic attitude toward the defendants and defence counsel, concluding that "the demeanour of the judge and prosecutor would require reversal if other errors did not." These other errors included a refusal to permit certain witnesses for the defence to testify. The defence acted disruptively, the decision said, but that did not excuse the judge's sarcasm.

The defendants—Messrs Abbie Hoffman, Rennie Davis, David Dellin-

Chicago's seven have something to smile about

ger, Tom Hayden and Jerry Rubin—are not quite out of the woods, like the two who were acquitted originally or Mr Bobby Seale (the case against him has since been dropped). The appeals court held that the five could be tried again. But, if they are, the government will have to disclose to defence lawyers all the information that it secured through electronic surveillance. The Justice Department had obtained no court authority for this wire-tapping, on the grounds that the case involved "national security," but this argument has since been restricted severely by the Supreme Court. If there is to be a new Attorney General, the decision on a new trial may be left to him, but in any case it might be the course of wisdom to let the matter drop.

Judge Hoffman also gave all eight defendants and two of their lawyers harsh sentences for contempt of court. These are to be reviewed by another judge but already the government has moved that the maximum penalty should be 177 days in prison (Judge Hoffman went as high as four years) and that the contempt charges against Mr Seale should be withdrawn (he was bound and gagged before his case was severed from those of the other defendants). The one real disappointment to liberals is that the appeals court, by 2 to 1, found constitutional the controversial anti-riot law under which the accused were tried. Therefore it still hangs over the head of other protesters, such as the Vietnam Veterans against the War, who were indicted last summer for conspiring to attack the Republican convention at

Miami Beach.

When you have a trial of intentions, trying what is in people's heads, then it is impossible to get a fair trial according to one of the defence lawyers in the Chicago case.

But almost all the other protesters who were arrested at Miami Beach have now been released without even having been brought to trial.

Ahoy there, reds!

As far as the White House is concerned ships and aircraft flying the American flag may now visit China for the first time in almost 23 years. Applications for docking and landing rights for American carriers have still to be approved by Peking; this may take time to arrange but no real difficulty is expected. The relaxation does not mean, however, that scheduled American air and shipping services to China are imminent; these are dependent on the negotiation of treaties which are not being considered at present. The flights now in prospect are *ad hoc* charter affairs and the ships will probably only be the odd cargo vessel delivering grain and any other bulky products which the Chinese may buy from the United States. But they are being careful in their purchases, all of which are on a cash basis, and they will probably prefer cheaper foreign ships, when these are available, to American ones.

Since trade with China is still so small the maritime trade unions have not stipulated as yet that a share of the goods must be carried in American

bottoms, as they have done with the huge Russian purchases of wheat. So far, however, only 3m of the 17m tons of this wheat have been loaded, all of it in ships belonging to third countries. When Soviet and American negotiators tried to work out details of the agreement on the price that the Russians are to pay to American shipowners (who are supposed to get a third of the grain cargoes), a deadlock arose over the key figure, the world market rate; on this was to be based the final price, high enough to remove from the American taxpayer some of the burden of subsidising American vessels to make up for their extremely high running costs. Last week a complicated formula was worked out at last and American ships are already loading the grain.

In spite of these delays there has been little sign of grain piling up at storage points or at the ports, or of the shortages of freight cars and the congestion on the railways that had been expected as a result of this year's huge increase in exports of wheat. Partly this is thanks to wet weather which delayed the harvest, partly to the special task force set up to handle the situation. But with storms and snow due at any time and the ports on the Great Lakes about to be frozen up, it will take even greater efforts to get all Russia's purchases delivered before next summer.

Miners' democracy

Even now the reformers in the United Mine Workers' union are having to fight hard to oust the present head of the trade union, Mr Tony Boyle. The Boyle administration has been associated with corruption, misuse of the union's funds, a fraudulent election, with violence and with murder. Mr Boyle himself has been found guilty of using UMW funds illegally in the national presidential election in 1968 and is faced with five years in prison if his appeals fail. Two senior members of the union have been charged with complicity in the murders of Mr Jock Yablonski, his wife and daughter three weeks after Mr Yablonski lost the election for the union presidency in 1969 to Mr Boyle. That election was overturned by a federal court this year on the grounds that it was fraudulent; a new one is now being held after a long battle by the remaining members of the Yablonski family.

On paper Mr Arnold Miller, the man who hopes to lead to victory the

Democrat Miller, autocrat Boyle

Miners for Democracy (the reform faction within the union) now has all the advantages. The new election is to be held under the terms of the Landrum-Griffin Act, designed to guard members of a union against corruption. There will be over 1,000 officials from the Department of Labour to ensure that there is no repetition of the vote stealing, the fraud and the intimidation which occurred in 1969. Unlike three years ago all the 200,000 members of the union have been notified of the election and have been told the times and places of polling by the Department of Labour. The ballots will not be counted by local officials this year; instead they will be taken under guard to a centre in Maryland. The whole election will cost the federal government some \$4m.

Mr Boyle's freedom has been curtailed in other ways. Neither he nor other officials have been allowed to campaign during the time which they should dedicate to union affairs. They have had to make the most of weekends. Mr Miller and the two other men on the MFD ticket, Mr Mike Trbovich and Mr Harry Patrick, have been free to campaign when they want; none of them is a union official. This year the Labour Department is making sure that Mr Boyle and his team cannot use one cent of union money in their campaign. Nor has Mr Boyle been able to monopolise the union's magazine, the bible for large numbers of miners, as he has done in the past. A court insisted that equal space must be given to all candidates.

But for many miners particularly the 80,000 pensioners, Mr Boyle is the trade union and the union has been the focal point of their existence since the revered Mr John Lewis led the UMW to greatness early in the century. The men who lead the MFD, which has its greatest following among younger members, are miners like themselves and they have little experience of union affairs or of dealing with

the owners of coal companies. Until they started to campaign this summer they were virtually unknown and miners, particularly those in the more isolated parts of Appalachia, do not take kindly to new faces or new ideas.

How did they do?

1. Women gained

FROM A SPECIAL CORRESPONDENT

The bare statistics from the recent election show that a year and a half of effort on the part of women's organisations did not achieve the hoped-for large increase in the number of women holding public office. In Congress, the total of women will remain unchanged at 14, out of the total of 535 Senators and Representatives. In all of the 50 state legislatures combined, the increase in the number of women members may be scarcely more than 70, which is a rise of only 1 per cent. In addition, an important symbol was lost with the defeat, at the age of 74, of the Republican Senator, Mrs Margaret Chase Smith, of Maine. Her absence from the new Congress will leave the Senate an all-male institution for the first time since her arrival there in 1949.

But plain statistics may be obscuring some trends. In the first place, two of the women members of the old Congress were widows who served out their husband's unexpired terms and did not try for re-election. Thus the number of what might be termed serious women politicians in Congress will be up from 12 to 14, out of the total of 32 women who ran as candidates for major parties. What is more, the five new women members of Congress have the look of the "new women" in politics. All are professionally trained as lawyers. Four of the five are under 40 years of age. The available information indicates that younger, better-trained women who intend to make a career of politics also predominate among those elected to state legislatures and city councils.

Two of the five new women in Congress are black and this high proportion also appears to reflect a trend. The three black women who will serve in the House of Representatives will constitute 20 per cent of all women in Congress (blacks constitute 11 per cent of the population) and nearly 20 per cent of the total number of blacks, whereas white women constitute only 2 per cent of all the white members of Congress. Among feminists, the

Holtzman: One of Congress's new breed

explanation given for this phenomenon is that black women, having always been forced to work, find it easier than white women to get themselves taken seriously when they try for positions of leadership.

Those who take an optimistic view of how well women did in the election make a number of other points. The National Women's Political Caucus, which was formed 18 months ago for the primary purpose of putting more women in public office, points to states where it was particularly well organised—such as Texas—as those in which women made the greatest gains. In some states where the number of women legislators declined (Vermont is an example) feminists none the less took comfort from the fact that the winners were—and the losers were not—women who were prominently identified with the new feminist issues, such as repeal of laws restricting abortion, easier divorce and expansion of facilities for day care of children.

There were also other victories for women at the polls. Four states passed constitutional amendments barring sex discrimination—Hawaii, Maryland, New Mexico and Texas. But there were losses for feminists, too. In both Michigan and North Dakota, the only states where the issue was on the ballot, proposals to liberalise abortion laws lost.

2. . . . and so did blacks

Washington, DC

Black voters seem to have followed the national pattern last month in turning out in smaller numbers than in previous years. In Washington, DC, which is over 70 per cent black, only 31 per cent of those of voting age bothered to go to the polls.

The last two Democratic presidential

candidates got a vast proportion of the black vote. Mr McGovern's share seems to have been somewhat less, if Mr Louis Harris's estimate of 79 per cent is anything to go by. What does seem certain is that a substantial number of middle-class blacks switched to Mr Nixon. According to the Joint Centre for Political Studies, a Washington body which monitors black voting trends, Negroes living in the suburbs voted much more heavily for Mr Nixon—up to 30 per cent in Philadelphia and Louisville—than the poorer Negroes living in the city centres who generally stuck to the Democrats.

In the House of Representatives three more blacks, two of them women, were elected to make a total of 15 and, in the Senate the one black Republican, Mr Edward Brooke, comfortably retained his seat in Massachusetts. Interestingly, the three newcomers—Mrs Barbara Jordan from Houston, Texas, Mr Andrew Young from Atlanta, Georgia, and Mrs Yvonne Brathwaite Burke from Los Angeles, California—are all from districts with a slight white majority. This had happened before in the case of Senator Brooke and Mr Ronald Dellums from the Oakland-Berkeley area of California, but never in the South. All this does not add up to much in terms of power for the blacks. In the new Congress Mr Charles Diggs, a Democrat from Detroit, will move up to be chairman of the District of Columbia Committee. But, while this may benefit the blacks of Washington, it has no great national significance.

In the state legislatures the blacks have made the same steady, spectacular gains. There are now 227 black state legislators in 38 states as opposed to 206 in 37 states just before the elections. Blacks lost their seats in the Iowa and Alaska assemblies. But, apparently for the first time, there are blacks in the Arkansas, Minnesota and Oregon legislatures; in Tennessee, the seven blacks in the lower house now hold the balance of power.

Environment wins

FROM A CORRESPONDENT IN CALIFORNIA

One indication that American voters are not as opposed to change as they seemed to be from their votes in the presidential and congressional elections is supposedly the sturdiness of their support for strong, even costly measures to protect the environment (although why a vote for conservation should be seen as a vote for change is

not altogether clear). Be that as it may, a \$1.15 billion issue of environmental bonds was approved by a vote of two to one in New York State. The largest share is to be spent on sewage systems and rubbish disposal; the remaining funds will buy open spaces and improvements in the quality of the air. New Jersey defeated a \$750m issue of bonds for transportation, primarily because conservationists objected that the provision for commuter facilities, as an alternative to motorways, was inadequate.

In Colorado voters overwhelmingly rejected plans to stage the 1976 Olympics in their Rocky Mountains. They feared that the games would spur the building of hotels, resorts and roads to the detriment of the rugged beauty of the area. Washington State chose a weaker, rather than a stronger, measure to protect the coastline, but it is still a comprehensive plan.

In California, a proposal was passed for strict regulation of any future building along the 1,000-mile coastline. Construction along the coast must now be approved by a system of new regional and stateside agencies. These will have final say over industrial and home building, developments for recreation, offshore oil drilling and the hotly debated siting of nuclear power plants along the coast. What is significant is that support for control over so great a natural asset came in spite of powerful opposition from oil companies, builders, property developers, banks, trade unions and utility companies.

Environmental interest has been whetted lately in California—and builders shaken—by a ruling from the state's Supreme Court that private construction, as well as public, must be accompanied by an "environmental impact" analysis, as ordered by a 1970 law. In an opinion halting the development of a holiday resort in the heart of a national forest, the court said that environmental effects must always be analysed before building permits are issued. Subsequently, the court modified its interpretation to apply to projects of "significant" impact, presumably omitting private houses which account for 90 per cent or so of all construction.

Numerous local propositions to preserve open space by buying it for parks were also approved by voters in many Californian communities. For example, San Diego and Santa Barbara voted overwhelmingly to set limits of 30 to 40 feet on the height of new buildings.

Enter France~ in Old Broad Street, London EC2~

through the doors of **Société Générale**.

Our clients use our office at 105-108 Old Broad Street as a direct link with our branches strategically spread through all corners of France. We specialise in international trade and foreign exchange, advising large companies in Britain on forging European links, are most active in the field of eurocurrencies, and—with one hundred years of experience behind us—we feel confident that we can help with any aspect of buying, selling or investing in France.

A few facts:—We are one of the big three clearing Banks in France. We have over 2,000 branches spread throughout France, and the rest of the world.

Our customers in Great Britain enjoy a range of services similar to those offered by a British bank, with an office in Manchester for direct contact with the North.

HAVE WE INTERESTED YOU? Telephone, or call in at one of our branches, we are sure we can help...

A change in style

The France of the General has become that of the banker. In the three years since General de Gaulle handed in his baton and M. Pompidou took charge of the balance sheets, France has been a good recovery stock. The recovery, of course, dates from the Anno Domini of postwar France, 1968 and *les événements*, when the French economy almost stopped working for six weeks. Once that political mardi gras was in the past, things have gone well—almost too well, senior officials will say, looking metaphorically over their shoulder. Initially there was trouble with the franc, especially from Frenchmen, who have more confidence in themselves than in their own country. But the masterly devaluation of the franc in August, 1969, sorted that one out, and nudged the economy even faster towards an export and investment boom. And now, if there are clouds on the horizon, they can hardly be found in the statistics or in the forecasts. They lie in the expectation that

sooner or later something unpredictable will happen once again.

Indeed, while the economic outlook is better than that of France's neighbours, it has not produced a sense of euphoria. France, like most other countries, is in a pre-electoral period. And this in itself, particularly when well-seasoned with a few scandals, is enough to make the surface of events a little obscure. The governmental UDR party has been going through a period of disarray reflecting the fact that a centre-right coalition, such as the UDR is, needs a vision to provide itself with a sense of identity. And visions have been in notably short supply since the General went. The substitution of the only man who attempted to produce one, M. Chaban-Delmas, by a man whose main claim to fame is that he is decent and honest, M. Messmer, can hardly do the trick, although after the Aranda affair, gaullism needs every decent man it can get so as to reassure the faithful, and rally the doubters.

The position is made more difficult, paradoxically, by the fact that M. Pompidou, while he may not have communicated a sense of national destiny, does have policies which might be considered by a hard-core UDR man as a retreat into realism. The framework is what a medium-sized power can and cannot do, the need to avoid expensive prestige projects, to collaborate increasingly on a European basis, to encourage French investment abroad and to allow foreign investment in France.

In the past, French politicians promised to transform their country from a semi-agrarian, cartel-ridden, highly protected society into a modern, competitive nation which could stand up to any of the major economic powers. The promises have nearly become a reality. It is hard to be in France for a few days without being conscious that it is going through a period of extraordinary change and upheaval. For a European country, it has an unusually large proportion of young people. The

shift from the countryside to the towns is perhaps less dramatic than that taking place in Italy, but it is nevertheless having profound consequences.

Rapid economic growth in itself produces a strain on a nation's social cohesion. Growth with the structural shifts which have taken place in France and the rapid modernisation of what was until recently a relatively sluggish industrial sector have added to the strains. And in a country where there is more or less permanently a political majority of the centre and right the sense which large sections of the population may have of living in what M. Chaban-Delmas described as "la société bloquée" is increased. France is a country of great inequalities. There is a huge distance between the highest and the lowest, between rich and poor, between the sophisticated technology which has produced Mirages fighters, Concorde planes and colour television, and life in the bidonvilles of Paris or in the mountain farms. The Pompidou policy of accelerated industrial advance, if unchecked, could easily exacerbate these inequalities. Any rational policy, even on the political right, must include an attempt to improve the social cohesion of what has always been a rigidly hierarchic, centralised and sectional society.

Thus the twin aims of the sixth plan were industrialisation on one hand and the improvement of the lot of the poorest on the other. The difference between the highest and lowest paid in France is something like 60 to 1 and the gap is not much reduced by what is, in effect, Europe's lowest incidence of direct taxation. In the past few years the Chaban-Delmas government succeeded in making the real incomes of the old and the lowest paid move up faster than the average. It also succeeded in establishing a continuous dialogue between unions and employers which has already led to such advances as making blue-collar workers salaried employees, improving the pension rights of the under-65s and bringing in a programme of permanent vocational training. What M. Chaban-Delmas and now M. Messmer, on one side, and the finance minister, M. Giscard d'Estaing, on the other, have not succeeded in doing is to reconcile high investment by industry with a low rate of inflation and with the unsatisfied demand for more social investment. If there is choice to be made between lower taxation or higher social investment, the instinct of the government is to choose lower taxation. The French are, for example, among the worst-housed

nations in Europe. This is in part the result of an institutional failure to provide the right kind of loan finance. But it is also the consequence of a long-standing political choice. For M. Giscard d'Estaing housing is still the most inflationary form of social spending.

In their way, therefore, the French are suffering from the Japanese problem, though, admittedly, in a less extreme form. They have deliberately gone for fast growth, at the cost, primarily, of a high rate of inflation (although this has been less true relative to other countries over the past four years) and also of the perpetuation of wide inequalities in living conditions. The decision of the Pompidou regime to put the needs of rapid industrialisation above every other social priority was quite deliberate. As M. Chaban-Delmas said when presenting the sixth plan early in 1971: "The options before us are limited." In terms of immediate need they are. And there may have been sufficient growth in the incomes of the middle ranks of French society for

the failure to provide some of the basic social infrastructure not to have serious political repercussions—at least not as yet.

But the French are at a stage in their national journey when risks have to be taken. The problems are growing. But so are the means for solving them. Among the planners already gathering data for the seventh plan, which will cover 1976-80, an exercise is being done to shift the balance of priorities from economic to social ones. In the following pages it will be shown that France has been, and is being, extraordinarily successful in solving its economic problems, partly through good management and partly through access to the right kind of resources. France is also the largest and least densely populated, the most beautiful and most varied country in Europe. By the mid-1970s it will have the economic potential to reshape its social framework. It will again have the chance of showing the rest of the world how to live. This will be the political challenge to gaullism.

The industrial imperative

The extraordinary investment boom that France has experienced since 1968 gives rise to the hope that one day, perhaps even by the end of this decade, France will be an industrial power commensurate with its resources. This is certainly the central objective of M. Pompidou's government. And the sixth plan is subordinated largely to the goal of "industrialisation." It may seem strange to talk about a highly developed nation like France in these terms. But the French have been obsessed by their industrial inferiority complex since the Franco-Prussian war of 1870 when Lorraine, where so much of France's first industrial revolution was taking place, was snatched from them.

The men of the Fourth Republic who originally put France into the EEC hoped to see its membership as a catalyst which would prevail on the timid, protectionist-minded, cartel-ridden French industrialists and force them to modernise and grow, or perish. French businessmen, by contrast, were terrified of les Boches on the other side of the Rhine, massed in Düsseldorf and Frankfurt with their samples at the ready for a commercial invasion. In the event, partly because it was still possible to throw up some temporary shelter when the going got really rough and partly because French business was not all that bad, France benefited more

than it suffered.

France's leading utility car, the Renault R-4, achieved a wide popularity in the birthplace of the Volkswagen. Poclair became the fastest growing producer of earth-moving equipment in the EEC. Moulinex discovered that by taking all Europe as its home market, it could produce its kitchen appliances at prices far below its French or German rivals. At the other end of the scale, M. Dassault, the idiosyncratic genius of aircraft design, and the French government between them managed to make France the

Growth plus inflation

By providing financial assistance to one out of every four medium sized business concerns outside the Paris area

The SDR contributed within a dozen years to the creation of 200,000 posts of employment

In the space of a dozen years, regional development companies (SDR) have raised on capital markets 3,500 million francs for the benefit of over 3,000 medium sized undertakings throughout France, excluding the Paris area. The SDR have thus participated in investments which have helped to create 200,000 occupations. It is estimated that, outside the capital and its suburbs, one medium sized industry out of every four (building and public works excluded) has been able to obtain funds from a SDR.

Despite their prominent role in regional development, the SDR are still far from being as well known as they should be. Fifteen of them, however, were formed between 1956 and 1960 and they cover the whole of France with the exception of the Paris area. By providing medium sized undertakings with the capital resources they require, the SDR are contributing to the policy of regional expansion.

In effect, the role of the SDR has today superseded in some respects that played previously by the private provincial banks. Incorporated as limited liability companies with an exclusively private capital, the SDR are decentralised credit institutions with powers to take decisions at the regional level. Their resources are in the main derived from issues on the French market of grouped loans guaranteed by the State and carrying interest right up to their redemption date. By reason, however, of inadequate resources on the domestic capital market during the last two years, the SDR have had to raise supplementary funds on the international markets where, last year, they had become one of the major French borrowers.

The SDR operate in a variety of ways. To begin with, these regional development companies can subscribe to shares in the capital of the undertakings involved or to debentures which are convertible into shares. It is noteworthy that since they were launched, the SDN acquired some 2,000 equity interests.

A rapidly expanding activity

As can be realised, the services rendered by the SDR are both considerable and widespread. Last year, their financial operations amounted to 700 million francs of which about 15 per cent represented property leasing facilities. A further expansion of their activities will be seen again this year.

They can now finance, by means of French loans, the subsidiaries of foreign concerns thanks to the extension of new issue possibilities on a national scale. They can also grant long term loans to the service

industries (road transport of goods, services connected with port activities and trade in industrial products), to regional tourist industries and to enterprises for easing congestion in built-up areas by transferring to industrial zones industries situated in town centres.

From long term loans to property leasing

Long term loans (15 years) are granted to industrial undertakings by the SDR, who as from the last few years offer also through four specialised subsidiaries advantageous property leasing facilities (low interest rates and non indexed rents). Since 1st January last, they have been authorised to deal in medium term credits, a sector which, until then, had been virtually outside their range.

Consequently, enterprises operating in the regional field can henceforth obtain from the SDR a comprehensive variety of financial services adapted, on the one hand, to their property or capital equipment requirements and, on the other, for the purpose of increasing their working capital.

Another notable activity of the SDR are the advisory services offered to the various concerns. Separately or in partnership, the SDR have set up subsidiaries for giving advice and conducting enquiries in connection with fund raising and joint ventures, for example, the "Centre Inter Régional de Négociations 'Cinég'" which was formed by ten companies. Six of them have, moreover, taken part in the creation of "France-Cadres" whose object is to specialise in appointing management staff in regional undertakings.

The fifteen companies of regional development are spread out over the whole territory and their activities, with the exception of the Paris area, are nation-wide. The above diagram shows the effective national coverage of the SDR.

Incontestable Prosperity

The shares of practically all the SDR companies are quoted on the regional stock markets and are held mainly by private investors who account for between 50 and 75 per cent of the equity holding in the capital of the respective companies.

Their shares, as yet relatively unknown and cheap, yield high returns and it is interesting to compare the consolidated growth, over the last five years, of their profits, dividends, capital and market capitalisation (in million francs).

	1967	1968	1969	1970	1971
Net Profit	12.2	13.5	19.0	19.8	20.3
Net dividend	7.5	8.2	8.4	9.3	10.3
Gross dividend (tax credit included)	8.1	9.1	9.8	11.2	13.3
Capital	140.5	145.5	145.5	147.6	151.7
Market capitalisation	124.0	119.0	116.5	121.5	132.2
Average gross yield	6.2%	6.8%	7.8%	8%	8.5%

Finally, it will be noted that, on a comparable net profit basis, the market capitalisation of the SDR combined is very much lower than that of market ratings of similar institutions. It is very likely that, sooner or later, the Stock Market will rectify this disparity.

Pretabail

INVESTMENT IN FRANCE?

Invest for growth with Groupe Pretabail

Choose one of three Sicomi for inflation-proof growth

One of three Sicomi?

A Sicomi is a limited company operating as a medium- and long-term credit bank or finance house. It builds or purchases commercial and industrial premises on behalf of selected companies to which it hires or leases them on the basis of an indexed quarterly rent.

The investment attraction?

Investing in a Sicomi means sharing directly in the development of selected companies in fast-expanding sectors. A Sicomi short-circuits the savings/industry gap, because the savers are the collective owners of the buildings they help to finance.

Indexed rents

The rents paid by tenants of Sicomi buildings are indexed—so Sicomi investors earn indexed dividends.

Three Sicomi

Groupe Pretabail operates three Sicomi. The first, Pretabail-Sicomi is quoted on the Paris Bourse. Two others, Cofipa-Sicomi and Batibail-Sicomi are "variable capital" companies enabling savers to take up additional shares, or to cash them, at any time.

Substantial and diversified assets

Since 1968, 184 industrial and commercial properties representing a total investment of 491.707.000 French francs.

Industrial development in France is taking off—now is the time to move in. Telephone Mr. Tulasne at 010.331.747.95.40, or drop him a line (a card with your name and address would do) to: Pretabail, 91 Avenue Charles de Gaulle—92—Neuilly (France) or fill in this coupon.

NAME

ADDRESS

.....
would like to receive more information on the French Sicomi of the Groupe Pretabail.

Europe is sprayed with Renaults

leading exporter of aircraft equipment after the United States.

Even so France still lacked by the late 1960s basic capacity in such humdrum fields as chemical, electrical and mechanical engineering. Its exports were still heavily biased towards agricultural products which were predictably benefiting from the EEC's common agricultural policy. Germany remained impregnable strong in the heavy industries and at the other pole the Italians were flourishing in the larger EEC market with the export of not only cars but textiles and leather goods, domestic appliances and a whole raft of products which required either style or relatively cheap labour. France remained uneasily in the middle.

During the period of critical analysis which followed 1968, the conclusion was drawn that the cold shower provided by the opening of France's trade borders was not in itself sufficient. By the late 1960s, for example, critics pointed out that while France accounted for 19 per cent of the community's exports it provided nearly 42 per cent of shipments of raw materials but only 17 per cent of manufactured products and less than 15 per cent of electrical and mechanical machinery. By 1968 it was in large and growing deficit with all its community partners (which amounted to more than \$1 billion in the case of west Germany). One of the indices of national inferiority was that while the gross national product of Germany was only 20 per cent larger than that of France by the end of the 1960s, its output of mechanical and electrical materials was nearly three times larger and its exports of these things was almost four times as big.

So the sixth plan for 1971-75 was dominated by the theme of "industrialisation." The argument is simple. France needs a rapid rate of economic growth (around 6 per cent) both to absorb the growing labour force and to provide a surplus for badly needed social investment. This rate of growth requires an increase of between 10 and 12 per cent in exports, which may not be sustainable unless France engineers a structural shift in what it sells abroad, away from the relatively slow growing food goods to faster growing industrial products. To do this meant changing the shape of certain industrial sectors, shifting the emphasis of governmental support away from prestige projects to areas where the pay-off might be faster, and encouraging a new international approach, including joint projects and investment abroad.

Catching up

Fortunately, by the time the clichés came to be written in the sixth plan, they had mostly been taken to heart by industry at large. What has struck most foreign observers over the past six years has been the change in the organisation and dynamism of the average French industrial company. The picture of the grande famille controlling the upper reaches of industry, with hundreds of thousands of small family-owned firms, little more than the milch cows of tax-evading patrons, is today only partly relevant. The change has been caused, almost everyone would agree, by the psychological impact of the common market on the one hand and by the enthusiasm for modern management ideas and new

technologies which make the pace of change generally faster on the other.

The French have a formidable capacity for catching up very quickly. There is an extraordinary passion for computers, perhaps because they have a natural appeal to the Cartesian mind. While the French have a peculiar capacity to retain their national identity, this feeling of change is more striking in France than anywhere else in the continent.

The Pompidou regime has adopted a three-pronged strategy to help shape this industrial ferment. The first prong is to encourage a rapid growth in basic capacity. One of M. Pompidou's famous dicta is that France must double its industrial capacity in 10 years. At the current rate it will do that in less than eight, thanks to the phenomenal growth in investment since 1968. But the groundwork for this was done some years earlier. During the mid 1960s there was one of those small but decisive shifts in economic ratios that can make all the difference between fortune and stagnation. Essentially, capital became relatively cheaper and labour more expensive.

There were a variety of causes. In the mid 1950s, the tax system was changed so that capital goods were not liable to turnover tax. Amortisation rates became more liberal in the early 1960s and at the same time the government developed a penchant for providing temporary investment allowances. The EEC was another factor in lowering the cost of inputs as French capital equipment producers became exposed to greater foreign competition. So the huge growth in wages after 1968 simply provided added momentum to a shift in relative prices that was already taking place. Even now, when the rate of increase in capital investment has temporarily slowed down to less than 10 per cent, more efficient use of capital is insuring that the amount of capital available per man is still increasing rapidly.

The second prong of the government's industrial policy has been to hasten the shift in the composition of exports. For most manufacturers, exporting outside the captive franc zone was until recently a marginal activity. This is changing, partly through the delayed impact of the EEC. The past two years have shown a marked shift in the trade balance on industrial products. Even more important, one suspects, was the alteration in exchange parities which gave French manufacturers a 20 per cent price bonus vis-à-vis west Germany and a significant

What France sells abroad

advantage in terms of other currencies as a whole. As a result of these two factors, the EEC and devaluation, French exports have been reoriented to faster growing markets, mainly in the EEC. A decade ago, a third of them went to the franc zone compared with only 10 per cent today. And there has been a marked shift in the type of manufacture exported, away from semi-manufactures and processed goods towards machinery, chemicals and transport equipment.

But if French companies now export more, few yet have taken the next step of investing abroad. French policy makers are only too aware of the multinational corporation. They have noted, though few other people have, that IBM France is the country's second largest exporter. They are aware too that perhaps as much as 20 per cent of total international trade in manufactures is accounted for by the shipment of goods from one part of a multinational empire to another. So M. Pompidou and his cabinet and advisors recognise that it is essential for France to have a strong international presence. This is the third prong of their economic strategy.

Diplomatic offensive

Compared with the United States, Britain and Holland, France has few companies with international claims. In the past, with the aid of lycées and French institutes, French culture has managed to hold its place in a hostile, Anglo-Saxon dominated world. Now there is a new diplomatic offensive. M. Pompidou put it this way in his last press conference: "Our ambassadors have renounced the daily round of tea and cakes and have begun to recognise that credits, commercial treaties and loans are problems which are worthy of attention."

The corollary of French investment abroad is well understood by the French government, namely that, as a quid pro quo, other nations must be allowed to invest in France. French officials are touchy on this subject. They feel they have been much maligned. They argue that France, unlike a lot of other European countries, at least has a clear-cut policy which is no more nationalistic than that of other, less articulate, nations. If foreign investment adds to new capacity, brings new technology with it or money for research, then in almost all cases it is welcome. What France is definitely against is purely financial investment, but even here there is a loophole. There is a strong chance of getting approval for investment in France provided it has some impact on regional development—and it helps if the applicant goes to the regional development agency Datar to act as its advocate.

Out of the thousand or so requests put before the foreign investment committee since 1967, there are few which have been actually turned down, although many take some time to process. Of course the French bureaucracy can be obstinate, difficult and many-headed. But French industries find this too. The real points are twofold. First, the kind of takeover to which the British are accustomed—a public offer for the shares followed by a quick plunder of the merged company's assets—is still anathema in France. Second, while foreign investment is still a low proportion of the total, France, like other countries, feels sensitive about certain areas and tends to look for a French solution first. The French argue that the foreign acquisition of one firm in a problem industry may prevent a rational solution for the industry as a whole. The classic case was the veto on the attempt by the American elec-

trical company, Westinghouse, to take over Jeumont-Schneider, which was part of the fragmented and weak French presence in the generator and turbine business.

In the mid 1960s there was the traumatic occasion when Chrysler bought Simca, the motor company, and the first General de Gaulle knew about it was what he read in the morning newspapers. French sensibilities were heightened by the take over of Machine Bull (the French computer firm) by the American company General Electric. As a result there was a period of some years when the government was extremely reluctant in principle, if not in fact, to allow foreign takeovers of French companies. *Le Défi Américain*, as it was rather over-dramatically described by the book of M. Jean Jacques Servan-Schreiber, became a catchword. Even so the number of foreign investment proposals which were turned down was small.

Change in attitude

The attitude of the French government began to change after the decisions by American Motor companies to put up several factories on the Belgian side of the northern French border rather than in France itself. Senior French ministers realised that a blanket mistrust of *le Défi Américain* carried a high price tag.

It was from the period of M. Debré, as finance minister after 1966, that the trend towards liberalisation began. A few years later the French government went out of its way to help Ford put up a plant for making automatic transmissions in the south west near Bordeaux. The need for new industry outside the boom areas of Paris and Lyons has also meant that local chambers of commerce are only too delighted to catch a foreign investor.

Many sizeable towns have industrial zones where land is either free or extremely cheap, and they offer various other kinds of assistance. So it has become considerably harder for those still in the Gaullist party who are antipathetic to the contamination of French soil by outside influences to resist the promise of more jobs.

Nevertheless, foreign investment in France will remain a controversial area of policy for some time to come. Its house is not yet in order; there are plenty of domestic firms vulnerable to takeover bids; and there are plenty of British companies, eager for a beach-head in the EEC, which are well prepared to put in their bids.

Are the French really fast?

Modestly, we must answer 'Yes'.

Quite apart from Motorail speeding to the sun. We have over 250 French Railways' inter-city expresses averaging over 75 mph every day.

Not to mention the T.E.E. 'Aquitaine' that does the 360 miles between Paris and Bordeaux in a world-record four hours flat.

As to the future, we're already perfecting a gas turbine train that can touch 190 mph.

But don't think our main concern is to rush you about.

Your comfort comes first.

That's why our latest trains have spacious open seat layouts, self-operating safety doors, seats adjustable to a semi-reclining position, sound insulation and air conditioning.

We're even working on a system of pendular suspension that will keep you on an even keel, come what may.

Nor do we rely on the beautiful countryside to keep you entranced. There's the best "gastronomie française" to add to your pleasure. And on trains like 'Le Mistral' there are bars, bookstalls, business bureaux and barbers' shops.

Come to France soon. Just for the ride.

Playing the European game

While the framework in which industry operates is changing, the government has been acting directly on the structure of those sectors where it feels France is weak. The philosophy is simple. In the not too distant future European industry in the main bread and butter sectors is going to be run by a few multinational firms, or by the joint subsidiaries of national giants. But while west Germany and Britain have got most of their basic building blocks for this European game into shape, France is behind in all but a few industries, the notable exceptions being Pechiney in non-ferrous metals, Michelin in tyres and BSN and St Gobain in glass. French companies in the subsistence fields of chemicals, electrical and mechanical engineering, machine tools, automotive products and so on have, in general, been short on weight, and, therefore, in poor shape for the bargaining that is to come.

So, where possible, the government has put together two groups, bringing in European participation when needed. Two examples are Rhône-Poulenc and Erap-CFP in chemicals and, Compagnie Générale Electrique and Thompson in electricals, with their various satellites in ancillary sectors. And in the field of electrical generating equipment the idea is to amalgamate two groups, one round Compagnie Electrique Mécanique, closely linked with the Swiss multinational Brown-Boveri, and the other round Alstom-CGE. It was to protect this tidy solution that the government prevented the American group Westinghouse from taking over Jeumont-Schneider (despite the fact that J-S was controlled by a Belgian, Baron Empain).

In the area of even more advanced technology, the French are notably less ready to squander resources on prestige projects than they used to be under the General. Once again they have realised that the concept of independence is an illusion. Instead France has gone for the best international deal it can get. And its presence inside the EEC has given it several extra cards to play, particularly against Britain which has had similar pretensions.

In nuclear energy France gave up its attempt to run its own programme, at least in the medium-term future, and has brought in American technology. In computers the CII is firmly

wedded to an alliance with Siemens and Philips, while in aircraft France is inevitably committed to European projects such as the airbus. And it is difficult to see today's government voting funds to start a new Concorde. As in Britain, the policy on research and development has been to trim as far as possible and look generally for quicker returns. In the budget, spending on direct aids to industry is now climbing quicker than research expenditure. Only the military budget, where all manner of nonsense still goes on (like the vast sums spent on nuclear

Finely timed

If you tackle a Frenchman about France's extraordinary economic success, he will usually reply: "What success?" After all in the 20 years until 1968, France was indeed achieving a reasonable growth rate of 5 per cent or so, but Germany next door, from a much larger industrial base was doing rather better. The curious fact is that, despite the enormous shock which *les événements* of May, 1968, gave to the French social and economic system, France has subsequently experienced its most successful period of sustained growth since the war. This has been all the more remarkable because the rest of the industrialised world has been suffering, with the inevitable exception of Japan, from the well-known disease of stagflation. Even Germany has seen its growth rate drop almost to zero while France managed to obtain a consistent increase of more than 5 per cent each year in gnp.

But the global figure is not the most significant one. The really important trend of the last four years, as we have seen, has been the expansion of industrial investment in France. Between 1969 and 1971 it rose by 20 per cent or more a year. As a result, French industry is now investing at a rate which is nearly two-thirds greater than it was before 1968. It has outpaced the most optimistic predictions. The French industrial machine of today is something quite new and the investment boom has transformed its prospects. The oddity is that the economic environment of the time was hardly encouraging.

Starting with 1968 itself, the strikes effectively brought France to a halt for six weeks during the summer. A large

weapons) remains relatively sacrosanct from the treasury's knife. France, then, is as ready to be co-operative in developing a European industrial policy as any other country in the EEC. At present, admittedly, this does not mean very much. But French technocrats are fond of pointing out that when the European commission brought out its voluminous report on industrial policy two years ago, France was the only country which bothered to produce a coherent set of counter-proposals. The fact that French economic diplomats like to have some strong cards in their hand when they play the European game does not mean that they are not eager to play it.

number of French companies could only catch up on the output that was lost through a very generous extension of bank credit. And this did not last long. By the winter of 1968, the government was forced to impose tight credit controls. After an agreement was hammered out between the government, trade unions and employers, which enabled work to be resumed, wages rose by something over 15 per cent and the minimum wage rose by as much as 30 per cent. So the industrialist was, on the one hand, short of cash and, on the other, having to pay enormously increased bills.

By the end of the year, however, the wage rises had triggered off a consumer boom and it was to cope with this that industry started retooling and expanding its capacity. But France still faced severe difficulties. Confidence in the French franc remained shaken, particularly among Frenchmen themselves. Many of them took off for the border with their Citroëns and Renaults heavily laden with French banknotes. The task of restoring confidence, by keeping a close control over credit and minimising increases in government spending, ran counter to the need for expansion. And on top of the short term movements, there was a worrying deterioration in the basic balance of payments.

Altogether, between the end of 1967 and August, 1969, France's exchange reserves, so painfully built up in the previous eight years, fell from over \$7 billion to less than \$2 billion if

This survey was written by

Giscard d'Estaing: finely tuned

borrowings from central banks and the IMF are excluded. The sickness of the French franc was only part of a wider currency crisis which involved the D-mark and sterling as well. It took the defeat of General de Gaulle in the referendum of April, 1969, and his abrupt retirement for France to come round to devaluation. By the time M. Pompidou and his cabinet did it, in August 1969, the economy was operating at full steam again—hardly, it would seem, the best conditions in which to make a devaluation succeed.

The timing was, in fact, brilliant. France devalued in the middle of August, 1969, when most of the country was on holiday and such a drastic move was least expected. Even the key ministers were out of Paris, the decision having been taken a month before. M. Giscard d'Estaing, then finance minister, was reputed to be somewhere in Africa, big-game hunting. But once again, the authorities had to walk a tightrope between maintaining full employment and letting the inflationary forces which are always endemic in any devaluation, get out of hand. M. Giscard d'Estaing announced that he had three objectives: to get the budget balanced; the current account on the balance of payments balanced; and short-term debts repaid to France's creditors. France was somehow able to do all of these things, amazingly on target, by the middle of 1970.

The first problem was to hold off the trade unions. They wanted protection for their members against the extra dose of inflation that devaluation was likely to bring. At the same time, the union leaders had a continuing fear

that they were being outflanked by left-wing extremist groups and that they had got out of touch with their members' needs. French unions are traditionally strongest in the public sector industries such as transport, electricity, and, to a lesser extent, in nationalised concerns like Renault. Any really serious strike action would have ruined the government's economic policy. In practice, the government emerged an easy victor. There was only one important strike during the winter and that occurred in the electricity industry. Thanks to a harsh winter, public opinion was strongly against the strikers and the government triumphed.

By 1971, France enjoyed a strong balance of payments and the lowest rate of inflation and the fastest growing national income in the EEC. How did M. Giscard d'Estaing do it? One answer is sheer luck. Once French industry started to invest, it did not stop. It was either boom or bust. And demand kept growing, first from home consumers and then from foreign markets. Exports reacted very quickly to the devaluation of the franc, partly because the D-mark was revalued soon afterwards, giving French exporters a

20 per cent bonus in the German markets.

The ingredients for what one might call the second French miracle were—luck apart—threefold. First, the trade unions, after the unnerving strikes of 1968 (which worried the trade union leadership as much as they did the government) have been careful to avoid an open confrontation. Second, M. Giscard d'Estaing, did some remarkable bits of fine tuning, largely by letting private investment boom at the expense of public investment. Third, France devalued at a time when the franc, if overvalued in terms of confidence, was not seriously overvalued in terms of trade. France thus emerged once again with an undervalued currency, an old recipe for success.

Inevitably, some of the indicators are not looking so miraculous this year. Investment could not go on growing by one fifth a year and there has been some faltering. Prices are rising faster than the government forecast, or likes to see. But the prospects for next year suggest that investment will go up again, and a rate of inflation of 5 to 6 per cent is something the French have learned to live with.

The unions contract in

Each spring and autumn the government has been haunted by the question of what the unions will do. And despite four years of almost unparalleled growth, there are few people in the corridors of power who are not nervous that underneath it all, some day, the prosperity which they have helped to engineer may be thrown away through an accident of fate. There is a nightmare scenario, starting, perhaps, with a minor confrontation in a provincial factory leading to a rapid shutdown of France's productive forces and from there to some kind of revolution. The fact is that 1968 made people in the government feel that they did not know, in the last resort, what feelings and what ambitions were lurking in the heart of the average Frenchman. And if the neo-gaullist machine is arrogant in some ways, particularly in its treatment of the Assembly, it has not recovered the self-confidence and the sense of mission which existed in the early years of General de Gaulle.

But who is there, in fact, to carry out a revolution? In 1968 it was the combination of students, providing the ideological gloss, and workers, providing the muscle, that unnerved the govern-

ment. The students are, if anything, more politically aware than ever before. But the revolutionary fervour is not there. One does not hear of professional pickets in France. And if they existed, the strong arm of the state would soon descend. If the labour situation has been relatively peaceful, however, much of the credit lies with the man who was in charge of social strategy in M. Chaban Delmas's cabinet, M. Jacques Delors. An ex-trade unionist himself, who had risen by way of the *Commisariat au Plan*, it was M. Delors who gave life to the policy of constant dialogue, rather than confrontation, with the unions, that M. Pompidou had begun during his stint as Prime Minister.

Essentially the government's strategy has been twofold: first to ensure sufficient economic growth to prevent unemployment from rising and to allow a 10 per cent or so annual increase in money wages; and second to replace the old policy of confrontation with a new one based on long term agreements on a wide range of key issues, from wages to professional education. The result has been a marked absence of serious strikes. And those that have

The Renault 16 computerised automatic: we gave it a little more thought.

A little more, that is, than goes into the average automatic.

The result of that thinking is the computer controlled automatic transmission we designed and made for the Renault 16.

It's a quite unique electronic decision maker, able to compute the various factors that affect which gear is required.

(In other words, it reacts to driving conditions faster than you, and without hesitation).

We also thought to add a manual override to the system and an accelerator kick-down, which gives immediate and exceptional acceleration.

(A thought that gets a lot of drivers out of a lot of tricky situations, fast).

So much for the automatic transmission, what of the car itself?

To start with, there's a 1565cc all-aluminium engine pushing out the power for a top speed of up to 100*, and easy cruising speeds in the eighties.

While petrol consumption, helped by the thinking transmission, stays at a low of 28 mpg (the touring average).

There's servo-assisted braking (disc and drum, with a hydraulic pressure limiter operating on the rear wheels).

There's independent torsion bar suspension on all four wheels (with anti-roll bars front and rear).

And there's a thermostatically controlled sealed cooling system that includes antifreeze and a rust inhibitor.

Having given so much thought to the mechanics of the car, we turned then to the inside comforts.

We thought you'd appreciate superbly comfortable seats for five (the two front seats are individual, fully-reclining ones).

Five doors (the fifth's a counter-balanced tailgate).

12½ cu. ft. for luggage (26 cu. ft. when the back seat's folded away).

And fresh air ventilation with adjustable face level vents.

To take all this in (and there's more) look in at any Renault showroom, or send for our brochure.

We think this version of the Renault 16 will be the first automatic to make you think seriously about buying an automatic for a change.

Collective demonstration: but what follows?

taken place have largely failed.

During the three years of M. Chaban Delmas's rule as prime minister, from mid-1969 to mid-1972, there were some 7.8m days lost as the result of strikes, which makes France about average for Europe, and a long way behind Italy and Britain. When one looks at the major areas of confrontation they, too, show that in almost every case the government has won at the expense of the trade unions. The first big trial of strength was in November and December of 1969 when workers at the Electricité de France went on strike for higher wages and shorter hours. In a cold winter all they succeeded in doing was to lose public support. The power workers went back to work without gaining any of their demands and without getting any improvement on the original offer by the administration.

The next major trial of strength was in June, 1971, when the higher-paid train drivers of the SNCF went on strike to maintain their differentials and to get a radical improvement in working conditions. Once again they succeeded in gaining almost nothing, largely because the strike was not well supported by the rank and file. The other main trial of strength in the public sector, in October of last year, had much the same outcome when the conductors on the RATP (the Paris metro) came out on strike. The only substantial dispute over the past four years which has had any real effect was that in the Renault car component plant near Le Mans last year, but this

was largely concerned with the parity of wages between the provinces and the Paris region.

There has been no counterpart in France to the increasing power and authority of the trade movement in Italy, where the different confederations have been effectively banding together to achieve a sophisticated series of demands. France's rival confederations, often present in the same industries, have been slow to agree on either common objectives or a joint plan of campaign. Inter-union rivalry has inevitably strengthened the hand of employers and of the government. This weakness of the French trade union movement has been a decisive factor in favour of government economic policy of the past few years. The appalling constraints which strangle economic policymaking in Britain have hardly appeared across the Channel. Not only have the trade unions been weak, but French industry has not been plagued by the wildcat strikes which have made the going so difficult for some British companies over the past few years. One cannot put this down to skilful labour relations for, despite the changes at the top, the average French patron is still conservative.

One factor is the lack of a trade union tradition. Even if one takes the membership figures claimed by the trade unions themselves they do not add up to more than 14 or 15 per cent of the total work force. And the areas where the workforce is increasing fastest, the new industries and more particularly the service trades, are on

the whole less unionised. The unions have tended to be strongest in those traditional industrial sectors like mining, the railways, and to a lesser extent steel and textiles which are all now shedding labour. In contrast to Britain, where white collar unions are strong and growing, the union movement in France still wears a blue collar.

The political division of the unions does not encourage a strong, cohesive outlook of "us and them." The largest grouping is the Confédération Générale du Travail (CGT) which accounts for about 50 per cent of unionised labour. The CGT is traditionally dominated by the French Communist party and, indeed, its current secretary general, M. Séguy, is on the party's central committee. Even though the CGT claims to be more independent of the Communist party than it used to be—and its behaviour and the tactics of its leaders suggest that this is at least partially true—it is still regarded with some suspicion by other trade unionists. The second largest union, the Confédération Française du Travail (CFDT), which developed out of the old Christian Democrat inspired CFTC, is about half the size of the CGT. It is strong in some sectors such as the coal mines in the north. Just like its counterpart in Italy, it is this union, and not the CGT, which is making some of the more original demands, putting less accent on wage rates and trying to develop a new philosophy of work in a modern environment. The third main blue collar union is the Force Ouvrière, much weaker than the other two, but with some strength in the south-west and in the public agencies.

All the unions, it may be remembered, were much taken aback by the events of May, 1968, and only climbed on the bandwagon relatively late in the day to negotiate with the government the wage agreements of the Rue de Grenelle. Like all bureaucracies, they are essentially conservative in their approach. But a powerful reason for their weakness lies in the lack of a common ethic. Although the CGT and the CFTC have been talking for some years about launching a joint programme, only too often they are at loggerheads when it comes to any particular industrial action, with one advocating a strike while the other avoids committing itself—or, indeed, in order to do the first union down, making a separate agreement with the management. But, while it is recognised that industrial unions on the German model would solve this problem, it is hard to see any of the French confederations making

the first move.

Another pressure against militancy is that over the past few years negotiations either with the government or the Patronat have actually achieved a good deal. Until 1968, negotiations at the top were a comparatively rare phenomenon. The three sides of the triangle were more like two parallel lines. The need to negotiate in 1968 hastened a change which had just begun, largely as a result of a new generation of leaders.

In the Patronat there was M. Seyrac, who advocated and practised the idea of discussion rather than antagonism. He is now the choice of Patronat itself for its new president. On the union side there was M. Seguy of the CGT, who has shown more flexibility than any of his predecessors in his tactics if not his objectives and who has shown himself to be a good performer on television, and M. Eugene Descamps of the CFDT (now succeeded by M. Edmond Maire). Until 1968, relations between employers and employees had been dominated by legislation imposed by the state. Naturally, a good deal of this lawmaking remained ineffective. The employers got into the habit of ignoring it, and trade unionists of saying that the employers could never be trusted.

But in February, 1968, largely at the instigation of M. Pompidou, the trade unions and the Patronat started talking. They agreed, in effect, to cushion the impact of short time and partial unemployment on the workers. Since then, visits by the trade union leaders to the headquarters of the Patronat have become an almost weekly event. Trade unionists were also helped, in principle at least, by government legislation in May, 1968, which forced employers to recognise them and to grant them certain rights and privileges—such as the ability to do some of their union work during normal working hours. As a

The open persuaders: Delors (left) and Seyrac (right)

result of all the talking it has become increasingly difficult for the trade unions to spring a major attack on the employers unawares or for employers to ignore the law.

Of the two key measures passed in the past two years, one relates to what the French call *Mensualisation*, which effectively gives the blue collar worker the same kinds of rights that the white collar employees have always enjoyed in terms of fringe benefits, like sickness payments and pensions. The second is an agreement on the *formation permanente*, which may prove the most important social act of the Gaullist regime. Essentially it forces employers to pay for the continuing education of their workers. The law, passed in 1970, decrees that companies should pay 0.8 per cent of their payroll costs into a fund for the education and training of personnel, rising to 2 per cent in the next few years. No one knows yet whether a French system of permanent training will run into major snags, as the British system of industrial training

boards did. But the concept is a powerful one, not only in terms of industrial rejuvenation but also as a lever for social change.

While negotiation has been the order of the day at the national level, workers generally have been benefiting from the rapid rate of growth. And wage packets have grown by around 9 per cent a year in money terms, producing an improvement in real terms of at least 4 per cent a year. And this, of course, is on top of the big leap taken in 1968 itself. In terms of wages the government's principal aim has been to encourage a contractual system of increases called *contrats de progres*. Applied almost exclusively in the public sector so far, these are meant to act as a model for the whole of the economy. The idea is that the union, in return for a guaranteed increase over a period of up to two years, promises not to strike—at least over the terms of the contract. In return workers have the right to automatic increases if prices rise above a certain threshold level.

It is difficult as yet to assess the long term impact of this new brand of government thinking. For one thing its principal architects, M. Delors and M. Chaban-Delmas, are now out of office. And the style may change. It may be, for example, that the key to industrial peace is not here at all, but lies in the fact that much of the labour in the country's largest factories is immigrant. And an immigrant who can have his licence to work revoked at any time is not in the mood to be militant. There is little doubt, however, that the beginnings of a new mood are abroad in

Where the labour has come from

YOUR FINANCIAL PLANNER IN EUROPE

As more and more companies have reached out for a share in Europe's great profit potential, the need for reliable insight into individual European companies, industries, economies and countries has grown apace. Equally important, the need for a Europe-based, Europe-oriented, Europe-experienced partner in planning has become increasingly clear.

Eurofinance was formed in 1961 to answer those needs. Simply put, Eurofinance provides clients with a total, unique service in one or all of the following areas:

- economic forecast & industrial analysis
- investment research in depth
- investment management & advice for pension funds & other institutions
- corporate financial advice
- mergers & acquisitions, acquisition searches

In doing so, it provides the vital link between the hopes and success of a company's European operations.

EUROFINANCE

Backed by 14 leading European American & Japanese banks. With a multinational experienced staff of 140, & a research budget of \$US 1.5 million.

France. Whether it persists depends in a large part on whether M. Pom-

pidou wishes to maintain the momentum in favour of the "new society."

Who runs what

It has often been thought that a French government has a major advantage, thanks to its étatist, centralised tradition, in translating policy into action. Certainly there is some truth in that view. "The Ministère des Finances has means to control the French economy which are totally lacking to the British Treasury," was the way one British civil servant enviously put it. There are, for example, some specific instruments, like price controls, which have existed for some time on the other side of the Channel. But it is less a question of specific instruments than a whole cultural climate.

Most companies of any size in France will have a director whose main function is to know his way around the ministries. It will help, as will be seen later, if he has been to the right graduate schools and preferably been a civil servant himself. His task, despite the overblown revelations of the Aranda affair, is not so much that of obtaining government contracts, as understanding the government's thinking in what is still a highly regulated economy and finding the magic formulae to open the necessary doors. There are so many rules that it would be impossible to operate in almost any direction unless they had some inbuilt elastic. In general while British laws work on the negative list system (you can do something unless it is specifically mentioned that you cannot) France works on the positive list system (you cannot do anything unless it is specifically written down that you can).

The need to deal with the government under one guise or another remains as great as it has ever been. The difference is that as France develops into a modern pluralist and open economy, the government is being forced first into adapting a more subtle, less direct method of control, and second into recognising the limits of its power. It can order less and has to negotiate more. Either way, the problem of making government policy work is simplified by the continuation of an unusually strong and coherent elite. "In France a thousand or so people run the country," said one civil servant. A recent article in the business monthly, L'Expansion, described the 100 who,

it claimed, were behind most economic decisions in France.

There are, of course, several overlapping groups. To have been in the resistance or on General de Gaulle's staff during the war has proved very useful to those who are now at the top of the political ladder. But what is claimed to set France apart from other countries and give a coherence to the execution of policy which sometimes looks so impressive from outside, is the set of close professional links existing between people who have been to the two key graduate schools, the Ecole Polytechnique and the Ecole Nationale d'Administration (ENA).

The network

The Polytechnique, founded by Napoleon to provide France with a superior group of militarily biased engineers, has long been the basis of a network with powerful links in the higher reaches of the civil services and France's leading industrial groups. Enarchism, if one can so describe the phenomenon of ENA, is a more recent manifestation, the paradoxical result of an attempt after the war to make the civil service more democratic by forcing new administrative entrants to go through the same trial by examination. Within the ranks of Enarchs—as the graduates from ENA are called—there is an inner, even more elitist group consisting of the top 20 or so in each year's crop who are able to choose the four plum postings as inspecteurs des finances, at the Conseil d'Etat, the Cours des Comptes or the Quai d'Orsay.

These people rapidly find their way into the higher reaches of the civil service, often through the cabinet of an important minister, or into politics. They are highly sought after by industry both in terms of their civil service connections and because of their sheer ability, and because the government owns large sectors of the economy (like the banks, Renault and aerospace). They find themselves in key positions almost wherever power lies.

Of the 100 quoted by L'Expansion, 40 worked in the public sector, which gives it about the right weight, 47 had been to the Ecole des Sciences Politiques or the Polytechnique (followed usually by ENA) and 20 were inspecteurs des finances. M. Giscard d'Estaing is Polytechnique, ENA, inspecteur des finances. M. Pompidou is a graduate of the Ecole Normale (a graduate school for teachers that provides much of the cultural élite). The head of France's largest company, Pechiney Ugine Kuhlman, M. Pierre Jouven, is Polytechnique. The head of Rhône-Poulenc, the largest chemical company, M. Baumgartner, ex-president of the Banque de France, is Sciences Politiques and inspecteur des finances. Director-general of the Credit Lyonnais, M. Jean Saint-Geours, is inspecteur des finances.

And so it goes on. The effect of this network is to provide an informal communications system (as well as to foster extreme ambition and rivalry). This helps to short circuit what would otherwise be a highly rigid system of government. There is far less distrust and suspicion, at least where it really matters, between government and industry than exists, say, in Britain. Going to the same school does nothing, of course, to prevent conflicts of interest, but it does help people to think alike. And old school rivalries are also a powerful career incentive.

Part of the academic network: Dreyfus of Renault (left), Chirac, Minister of Agriculture

Translating Keynes

Out of the paradoxical reasons why French economic policy has been successful is that the men running it have not, on the whole, been all that sophisticated in applying modern tools of economic analysis. In an interview last year, M. Giscard d'Estaing argued that his predilection for balanced budgets, in any case more formal than real, could not be described as pre-Keynesian because until he went to Oxford for a short period after the war he knew nothing about economics. But it was not until the mid-1950s that the finance ministry started to use the budget as a Keynesian regulator. In place of fiscal fine-tuning the weak regimes of the Fourth Republic were usually forced into an expansionary posture through the need to finance the wars in Indochina and Algeria. When the inflationary pressures became too severe, they would devalue and rely on a fierce restriction of credit to pull the economy back into the paths of righteousness. The gaullist regime carried on this tradition with the famous stabilisation plan of 1963 of M. Giscard d'Estaing, which some critics would claim was responsible through its deflationary impact on the economy for *les événements* of 1968.

What used to distinguish a French devaluation and subsequent credit squeeze from the British variety was the sheer effectiveness of the French model. In the first place, French business has been traditionally financed short-term by bills of exchange which are ultimately re-discountable at the Banque de France. By limiting the amount of paper which could be re-discounted by the banks or by altering the re-discount rate, the Banque was able to control credit in a way which would be impossible in more sophisticated monetary systems where companies could draw on a number of sources of credit. A second factor was the shortage of medium and long term loan finance. The main source has been a number of specialist credit institutions which are closely regulated by the Banque de France. As a result it has been possible in France to apply

a selective squeeze which would benefit, say, exports or the agricultural equipment market at the expense of other sectors.

Thirdly, when all else failed, France in the past applied a detailed system of physical ceilings known as the *encadrements de crédit*. Not only does each bank have a total ceiling on the amount of credit it can provide, but a close check is also kept on the positions of major customers. The Banque de France with the help of its network of provincial offices—recently reduced to some 140—goes in for a detailed supervision of credit ceilings that would make British bankers turn white with horror. The close control of the banking and financial sectors had another result. By preventing the development of a wide range of financial institutions, at least until the mid-1960s, companies and individuals had fewer sources of credit to which to turn. Hire purchase was not nearly as widespread as it was in Britain.

But until recently, while France had a highly effective credit policy, it had no concept of controlling the money supply. It was fortunate that the two would naturally tend to work in the same direction. But as the economy became more open during the 1960s to the impact of balance of payments flows, and as the banks became more adroit at offsetting the credit restrictions imposed by the government, it became obvious that new mechanisms would have to be found. For one thing the use of the re-discount rate was becoming too rigid, and as France became more exposed to international money flows, too dangerous. For another, the government realised that as French industry developed it would need a more sophisticated and dynamic financial machine to provide it with funds.

With new financial instruments developing, the old methods of controlling the credit mechanism became less effective. And the desire for banks to compete more actively came into open conflict with the most powerful means of restricting credit, the *encadrement*

The French rope trick

de crédit. This was last used in November, 1968. But as soon as it was lifted, in October, 1970, the banks started a frenetic campaign to lend as much as they possibly could. The fear of the next squeeze is leading them to achieve as large a credit base as possible while the going is good. In this way credit controls are actually proving counter-productive over the medium term.

The need to develop new techniques during the mid-1960s led to a high powered committee, composed of MM. Marjolin, Wormser and Sadrin, being appointed. Their main recommendation was that the Banque de France should switch to open market operations as the main day-to-day technique for controlling credit. The second reform, begun early in 1967, was to use obligatory reserves with the central bank relating to a bank's level of deposits as a check on liquidity. By increasing these, the Banque de France can raise the cost of credit. The effects of reserve requirements could not be fully seen until this year, owing to the *encadrements de crédit* from November, 1968, to October, 1970. Even so, the Banque has already developed the system in a unique way. Quite apart from bringing a wider range of financial institutions into the net, the Banque de France has extended the application of reserve requirements from the deposit side to the lending side. The rationale is that while for the banking system as a whole deposits and advances must move in parallel there is no clear relationship between the two for any particular bank.

To speed up the impact of a change in reserve requirements on the lending policy of banks and hence on the creation of new money the Banque has, since April, 1971, applied them to the lending side as well. But the new

L'UNION DES ASSURANCES DE PARIS:

We are the leading French Insurance company.

ASSETS: f 1,300 millions

80% of which are held in stocks and bonds; L'U.A.P.'s portfolio is the largest in France (second only to "la Caisse des Depots et Consignation's").

PREMIUM INCOME: f 475 millions

With this global premium income in 1971, l'U.A.P. holds the fifth position in the enlarged European Community.

Its insurance activities, dating back to 1828, cover to-day

fifty countries, and are carried out through branches and/or subsidiaries; it has worldwide reinsurance activities.

In 1972, l'U.A.P. concluded reciprocal agreements with two of the largest English and German insurance companies, in order to exchange technical information on industrial risks.

PRESIDENT : Dominique LEMA
DIRECTEURS GÉNÉRAUX : Pierre BERTHA, Jacques-Michel COCHET

(By the way, if you need a good bank, see facing page.)

SOCIETE SEQUANAISE DE BANQUE

**The way we are growing in France
we could be the bank you are looking for in Europe**

Founded in 1918, the S.S.B. became in 1968 the "banque d'affaires" of the french leading insurance group: l'U.A.P. still owns 55% of its equity capital.

Since 1968, a considerable development of its assets and merchant banking services took place. As its dynamic growth is reflected in its net profits, S.S.B. has become one of the glamour stocks at the Paris Bourse. (Its market capitalization has been multiplied by more

than 20 over the last three years).

Based in Paris, with branch offices in Lyons and Lille, the S.S.B. offers you all the personal and commercial services of a "banque d'affaires". S.S.B. may help you in block-trading obtaining a quotation and for mergers, and acquisitions, venture capital, takeover bids, etc.

PRESIDENT : Dominique LEMA
DIRECTEUR GÉNÉRAL : François MATHIAS

(Besides, we know an insurance company that can be a great partner. See facing page.)

THE RHÔNE-POULENC GROUP

A company with an international role. Rhône-Poulenc is one of the largest industrial companies in France and was among the first to be known internationally. In the last thirty years it has come to rank among the largest chemical companies in the world, with 120,000 employees and annual sales of over 12 thousand million francs (around \$2.4 billions).

Development of the Group

Rhône-Poulenc has achieved its present importance by launching new activities in France and other countries, and by combining these activities with parallel or complementary activities of certain other firms.

In this continuing process, three events have been particularly significant:

In 1928: the formation of the Société des Usines Chimiques Rhône-Poulenc

In 1961: the incorporation of 80% of Celtes assets (man-made fibres and cellulose films) which resulted in the formation of Rhône-Poulenc S.A.

And in 1969: the addition of Progil and Pêchiney Saint Gobain companies become Rhône-Progil in 1972.

The holding company and the Rhône-Poulenc Group

Rhône-Poulenc S.A. is a holding company whose stock is traded on the Paris Stock Exchange. Among its industrial holdings are important producing companies which are wholly owned or majority-owned, as well as minority interests in several other companies.

Rhône-Poulenc in 1971 (consolidated data in millions of French Francs)

Turnover	Fr. 12,030m
Cash flow (including minority interests)	Fr. 1,301m
Total consolidated net profit	Fr. 284m
Capital Expenditure	Fr. 2,331m
Research and Development Expenditure	Fr. 523m

Activity of the different sectors of the Group in 1971

One characteristic of the Rhône-Poulenc Group is the variety of its products: its diverse activities may be grouped in four main sectors: chemicals, pharmaceuticals, textiles (cellulosic and synthetic fibres), sheeting and plastic films.

As before, chemicals predominate in the breakdown of turnover. Geographically, turnover breaks down into four quarters, three quarters being manufactured in France, two of which are sold locally and one exported, and one quarter being manufactured outside France.

Activities of the principal companies of the Group in 1971

Chemicals

Société des Usines Chimiques RHÔNE-POULENC (organic fine chemicals, pharmaceuticals, pesticides, plastics): The turnover increased by 6.1%. Export sales forged ahead in Europe still further, especially within the Common Market.

RHÔNE-PROGIL (organic and inorganic chemicals, plastics, fertilizers): The amalgamation of Pêchiney Saint Gobain and Progil to form the RHÔNE-PROGIL company took place on 30 December last, and was retroactive to 1 January 1971. Since the two companies operated independently throughout the year, their activities are dealt with separately in this review.

PÊCHINEY-SAINT-GOBAIN: The turnover increased by 11.2%. Export sales represented 18.5% of the total.

PROGIL: The turnover increased by 13.8%. Exports represented 25.4% of the total product sales.

Main subsidiaries: NAPHTACHIMIE, MELLE BEZONS, THANN et MULHOUSE, PLASTIMER, PEPRO.

Pharmaceuticals

In this sector of the Group are companies which produce pharmaceutical specialities or more generally speaking "drugs".

SPECIA: turnover up by 7.55% **THERAPLIX:** turnover up by 14.3% **ROGER**

Foreign subsidiaries The Group's assets in foreign countries represent 25% of capital expenditure.

Europe

Chemicals and pharmaceuticals

MAY & BAKER (Great Britain)

Total turnover of the company and its subsidiaries rose by 9.2% in 1971, activity on foreign markets being the main contributor of the increase. The breakdown of MAY & BAKER Group turnover by markets (national, export, and sales by foreign subsidiaries) was as follows:

United Kingdom	42%
Exports from U.K.	12%
Sales by foreign subsidiaries	46%

Sales within the United Kingdom held up in spite of fierce competition, particularly in the field of pharmaceutical specialities.

Textiles

Société de la Viscose Suisse (Switzerland): turnover increased by 10.3% **Deutsche Rhodioceta** (Germany): Turnover increased by 7%.

S.A.F.A. (Sociedad Anonima de Fibras Artificiales)—(Spain): turnover increased by 3.44%

BELLON: turnover up by 13.7% **INSTITUT MERIEUX:** turnover up by 13% **A.E.C.** (human and animal food): Turnover up by 7.10%

Textiles (cellulosic and synthetic fibres)

Textile production of the Group merged under **RHÔNE-POULENC-TEXTILE**. Textile transformation: eight companies grouped together in **CHAVANOS S.A.**

Sheeting and plastic films

Principal company in the sector, **LA CELLOPHANE**: turnover up by 7.3%

North America

Rhodia Inc. (U.S.A.) **Poulenc Limitée** (Canada) **Rhodia Mexicana** (Mexico)

South America

In this area the subsidiaries established in Brazil have a pre-eminent position. They employ 12,500 people and their total turnover represents approximately 180 million dollars.

system has so far lacked bite because the total indebtedness of the banking system with the Banque de France, of which the need to finance the obligatory reserves forms a part, has fallen as a proportion of overall bank resources to rather less than it was during the last period of easy money, in 1967. So a considerable extension of obligatory reserves will be needed to have any impact. With this in mind, the Banque was recently given the power to raise the ratios vis-à-vis deposits and credits from 15 per cent to 50 per cent, which should provide it with all the scope necessary for imposing a squeeze when it is needed, which everyone judges will be after the election.

So it is not yet clear whether the Banque de France has found the means, in the France of the 1970s, to control the growth of money supply without imposing such a Draconian credit squeeze that the government's key objectives of full employment and a high level of investment would be imperilled. At the time of the 1963 stabilisation plan, the Banque de France and the Trésor were responsible directly for more than a third of the new money

supply. Now the equivalent figure is only a little more than a quarter. During the 1960s there was a very close relationship between the growth of money gap and the increase in money supply, broadly defined. But, over the past two years the money supply has been growing 50 per cent faster.

To sum up, the development of new forms of saving and borrowing, which has been proceeding all the faster during the current bank war, means that the Banque de France has to find new instruments of control. At the same time, it is becoming increasingly hard to isolate, except in periods of acute crisis, the French money market from the international one. Thus, if a French company finds it hard to borrow domestically, there are a variety of ways in which it can take in money from abroad. In France, as in Germany, the huge Eurodollar system complicates the shaping of internal monetary policy. If credit control was the chief means of regulating the economy without threatening its underlying dynamism in the 1950s and 1960s, it is not clear whether or how it will play the same role in the 1970s.

Waking up

The more liberal policy that M. Debré brought to foreign investment was only part of a much wider-ranging attempt to find ways of fulfilling the investment requirements of the fifth plan, both public and private. The problem was twofold, to improve the means by which companies could obtain money and to raise the level of long term savings available to industry. This may seem odd, given that the savings rate in France has for some years been one of the highest in Europe. But the problem which needed to be solved was that too much of these savings was kept highly liquid or channelled into unproductive uses.

The historic attitude of the French peasant was either to keep his money under the mattress or, even better, turn it into gold. France has more gold in private hands than any other country; the rough estimate being \$5 billion (at \$35 an ounce). The Debré formula was to increase competition for savings by revising the banking laws. In part this meant allowing banks to compete for any kind of savings, by abolishing the hard and fast distinction between banques de dépôts and banques d'affaires. The first are branch banks, dominated by the nationalised banks

(now three after the merger which led to the Banque Nationale de Paris, the other two being Crédit Lyonnais and Société Générale). They were not previously allowed to lend over two years. The second are the banks, similar to British merchant banks and predominantly concerned with financing industry, which were previously restricted on the number of branches they could have. M. Debré, as well as abolishing the distinctions between the two types, also raised the restrictions on the number of branches which banks could open.

The result was a fierce new era of competition. Against 138 new branches opened on an annual average between 1959 and 1966, the annual figures rose rapidly to 744 last year. To pull in the customers banks had to think of new sales techniques and to develop a new breed of marketing men. The frenzy has been heightened by the severe credit restrictions which were imposed between 1969 and 1971. Banks, fearful of another squeeze after the next general election, are now going all out to raise their credit base so that they enter the new period of restrictions—which have in the past taken the form of physical ceilings—with as much

room to manoeuvre as possible.

The banques de dépôts have developed a variety of new instruments, such as housing finance, long-term savings accounts and mutual funds which have helped to raise the level of savings. But their old enemies, the savings banks (caisses d'épargne) and the Crédit Agricole have done even better. These have been the traditional savings media for the provincial Frenchman, and they operate from a far wider base, with a network of branches unrivalled by the banques de dépôts. And, since 1966, they have succeeded, by a similar kind of aggressive marketing, in increasing deposits by 13 to 14 per cent a year.

Reviving the bourse

While the banking revolution has caused a lot of sound and fury—and produced a few disasters on the way, like the Carte Bleue, a credit card launched inexpertly by the major banks—a quieter but also significant attempt at resuscitation has taken place on the stock exchange. For a long time this was a disaster area which the development of SICAVS (as mutual funds are called in France) largely by the banks did little to rescue. Between 1962 and 1967 the market underwent a dramatic slide, with the index dropping by 40 per cent. Private investors deserted equities in droves, switching their portfolios abroad or into bonds.

To broaden the base for companies which wished to obtain new money a number of reforms have been initiated, starting with the formation of the Commission des Opérations de Bourse (Cob). This is a tentative move towards a Securities and Exchange Commission on the American model, without the SEC's policing powers. The Cob can only propose not dispose, in bringing the authorities' attention to such practices as insider trading, one of the old traditions of the French bourse which has aroused the distrust of the investing public.

The basic problem of the bourse is that it has long been too narrow, dominated by a dozen or so banking institutions. Company information has been inadequate and stockbrokers highly conservative, hampered by a commission system which does not encourage the development of small trading or, indeed, any form of marketing at all.

Parallel with the establishment of Cob, a commission was appointed under M. Baumgartner (ex-head of the Banque de France) to suggest a comprehensive series of reforms. The aim was first to attract more French savings.

Fouchier, Paribas

Only one person out of 33 is a shareholder, and limitations on institutions such as pension and life insurance funds buying equities mean that not many are even indirectly connected with the bourse. As a result only 4 per cent of French savings goes into stocks. Second, the Baumgartner report was asked to suggest ways of improving the international appeal of the French bourse. The government has been very conscious of the attractions of London, with a market capitalisation over three times larger and a vastly greater turnover. And the growing need for a European capital market meant that Paris unreformed might be in danger of sinking to the level of a provincial bourse.

The reforms put together by Cob and the Baumgartner commission include the publishing of better company information, such as consolidated accounts for companies wanting to raise new money, quarterly turnover figures and the publication of company reports before, rather than after, their annual general meetings. Consolidated accounts, which more and more large companies are now producing, provide analysts at last with some solid base for such indicators as price/earnings ratios. Other important reforms for foreign investors were the abolition of a 25 per cent withholding tax and the removal of exchange credit restrictions.

Since the beginning of 1972, foreign interest in the bourse, spearheaded by British institutional investors, has been largely responsible for a 30 per cent rise in the share index and a rapid increase in turnover. French stockbrokers, delighted by this trend, have set up offices in London or spent their time trotting round the financial capi-

tals of Europe. While average p/e ratios are now close to those of London, there are a number of high fliers, such as Legrand, Moulineux and Carrefour, which are still far cheaper than their equivalents in Britain or the United States.

The French investor, however, is still suspicious of the bourse and is still attracted by bonds which carry tax advantages and are actively sold through bank branches. The banks have been no help at all in developing the equity market, discouraging brokers from opening new offices and pressing bonds, which are far more profitable to them, on their customers. SICAVS have to invest at least 30 per cent of their portfolios in bonds (the actual ratio invested is currently over 50 per cent) and stockbrokers, hampered by their low commissions are, with a few notable exceptions such as Meeschaert (set up only a few years ago and already the largest broker by far), short on ideas.

In any case, in an era when stock markets are dominated by institutional buying and selling, private interest is less important than the encouragement of more institutions. One significant new development is the law on share participation by workers, which provides them with a share of profits on condition their money remains invested for five years. Already some of this money, which totals Fr5 billion, is finding its way into equities. Another is the activity of the new merchant adventurers such as Jimmy Goldsmith of Générale Occidentale, who are beginning to use the stock market if not yet for disputed takeovers at least as a way of gaining leverage on the companies which they wish to absorb.

Muscling in

The banque d'affaires, like the traditional deposit banks, have been allowed by the banking reforms to develop a new financial power and dynamism. Essentially they can now become deposit banks too, or develop deposit bank offshoots and thus broaden their financial base. The deposit banks, likewise, have been developing their own banques d'affaires. BNP, for example, has Banexi, and Société Générale, Valorinde.

The merchant bank sector of the market is dominated, however, by two Compagnies Financières—de Paris et des Pays-Bas (Paribas) and de Suez et de l'Union Parisienne. By a series of brilliant coups Suez gained control in 1971 of France's largest privately-controlled deposit bank, Crédit Indus-

Schlogel, Crédit Lyonnais

riel et Commercial, and more recently, the Banque de l'Indochine as well as another merchant bank, Union Financière et Minière. Paribas, which as its name suggests, is almost as active in Belgium and the Netherlands as France itself, has acquired a controlling share in two smaller deposit banks, Crédit du Nord and Banque de l'Union Parisienne. A third name which is beginning to make itself felt is Générale Occidentale, best known for the activities of Mr James Goldsmith, its Anglo-French chairman, which is associated with Cavenham, Occidentale's British food offshoot, and with Anglo-Continental Investment and Finance, a banking plus insurance group that has grown eighteen-fold in the past eight months.

The basic method of these financial groups is to feed the cash they obtain from their banking activities into their industrial holdings. Over time the huge financial muscle of the state-owned banks will be used in the same direction, if less adventurously. The urge to put together new and more profitable groupings should, in principle, help towards fulfilling two of the government's objectives, by widening the pool of funds available to industry and at the same time making it more dynamic. Earlier this year, Mr Goldsmith put forward a bold defence of the British tradition, whereby groups are free to bid for what they want on the stock market and let the best man win.

But it is not at all clear if the growing French financial groups—whether one describes them as banques d'affaires or not does not much matter—will take this path or be allowed to do so. The past weakness of the bourse has made French companies potentially too vulnerable to takeover bids by outside groups, which until recently has usually

New installations, decentralisation . . . great numbers have chosen the Seine valley

It is a priority development centre which, by the year 2000, should reach the proportions of an international industrial and port complex. The whole of the Seine valley—Rouen, Port-Jérôme, wharves on the estuary—holds advantages unique in France.

Rouen, diversified industrial port

All activities are represented: petroleum, petrochemicals, mineral chemicals, electronics, metallurgy, machine engineering, paper, textiles, cereals, coal, building materials, the food industry—all woven into a veritable fabric of industry along the Seine.

Numerous decentralised industries have already become installed in Haute-Normandie where the labourer force is young and qualified.

Rouen, a busy metropolis, has many technical colleges and a university. The present population is developing much more quickly there than in the rest of France (8% as against 6.2% in the rest of France).

A complete communications network

The Seine will accommodate vessels of 40 to 60,000 tdw in 1975.

The port of Rouen, situated 75 miles inland, allows enterprises which feel transport costs to benefit from cheaper transport by ships and a shorter journey on land. Rouen can take vessels of 25,000 tdw fully laden and 35,000 tdw unladen. By 1975 fully-laden vessels of 35,000 tdw will be sailing up the Seine. The forecasts are even more favourable for Honfleur and Port-Jérôme, which will be receiving vessels of 60,000 tdw in 3 years' time.

- a complete network of regular lines permitting the export of finished products,
- facilities for penetration inland,
- waterway with an international loading gauge (5,000 tdw as far as Paris),
- electrified railway (1 hr 5 mins to Paris),
- motorway (to Paris in 1 hr 30 mins),
- air links with the interior: to Deauville, Tours, Lille,
- land reserves among the most important in Europe.

In the confused French office space market,

you need a tool.

The future of your company is linked to the headquarter premises you select. The matter needs careful thought: where, how big, partitioned or open-office scheme, what price can we go to, when to move, who can help us? The office accommodation market is so bewildering. But we are in a position to look at your particular case in a rational way.

To give you a brief idea of our business, our methods, services and project schedules we have compiled a handy file which we see as a basic working tool. May we suggest you obtain a copy and contact us after perusal? In any case, it will be useful addition to your other data. SACI, a building development company, was formed by the Banque de Paris et des Pays-Bas, Crédit Foncier de France and some leading insurance companies to study, work-out and offer solutions to accommodation problems.

To: SACI, Offices Department, 2, 4, 6, rue Jules-César, 75012 Paris - Tel.: 346.12.10. Please send me, without commitment, your "SACI Information File".

La Boursidière Paris

At Petit Clamart, ideally situated close to Paris and Orly, La Boursidière offers 50,000 m² (545,000 sq ft) of superbly designed, air-conditioned offices. The complex consists of sixteen interlocking 5-storey buildings surrounded by woodland.

With Petit Clamart only 8 km south west of Paris and even closer to Orly International Airport, the area is already established as a major commercial and business area.

Tenants have access to the shops and restaurants within La Boursidière, which in turn is close to the massive Vélizy 2 Shopping Centre.

Office units, all with modern, prestige finishes and services, are available from 500 m² in the second phase of 15,000 m² which is now close to completion. Phase 1 is already fully let to international companies and the entire development will be completed in mid 1973.

meant foreign companies. To overcome this French industry has evolved a complicated series of cross-holdings whereby major concerns take defensive stakes in one another's shares.

As a result, no major disputed takeover bid has succeeded. A classic example of the defensive power of the establishment was the defeat, three years ago, of the bid by Boussois-Souchon-Neuvesel for the sluggish glass giant St Gobain. BSN clearly did not have the friendship of the right people. Later St Gobain was virtually forced into the arms of the building group Pont-à-Mousson—and Suez played an important part in engineering this.

The likelihood, therefore, is that the French stock market will not be helped much by the banking revolution since, on the whole, industrial groups prefer to act through secret share swaps rather than by buying or bidding for shares outright in the open market. In any case, until brokers become large enough and astute enough to take sizeable positions in shares (which they are only now being allowed to do) the open market method is virtually closed to them. The net result is that it is going to be extremely difficult for a French Jim Slater (who in a decade has built up Britain's largest merchant bank) to develop, unless, like Jimmy Goldsmith, he has toned up his financial muscle abroad.

The question is whether this matters. Despite the bad record of the bourse in terms of turnover and market capitalisation, far more new capital through new issues is raised on it than on the British market. Once the patronage of

one or two of the major financial institutions is obtained, a growing company can get the cash it needs, and if it cannot there are bodies like the Institut de Développement Industriel set up by the government to promote the growth of medium-sized companies.

The French bourse, once the fashion for it abroad passes, could therefore remain the sickly prisoner of the banks, through their own holdings and the medium of the mutual and other funds they control. There is just a chance, however, that the authorities will try to encourage the Jimmy Goldsmith version. First, the government, having opted for competitive, open-frontier capitalism as its industrial model, needs to give maximum scope to its go-go entrepreneurs. Hence the freer and more accessible the stock market, the better.

Second, the government is less and less able, as the economy grows larger, more complex and increasingly enmeshed with those of its European neighbours, to wield direct control over it. Power is seeping away from the government both to different levels of decision, international and regional, and towards pressure groups, which are becoming better and better organised.

At the financial level the future predicted by the banking reforms is a France controlled by banks in the same way that west Germany is. The only way to mitigate this is through a more active stock market. Some of the government's planners recognise this. The question is whether a France led by a banker will do anything about it.

The cost of pegging prices

The last time the French government actually froze prices was for a month after the devaluation of the franc in August, 1969. But the direct general control of prices, in one form or another, is a long and continuing tradition in France which brings the rue de Rivoli face to face with companies and businessmen in a way that is virtually unique for a non-communist finance ministry. Along with credit controls, the normal budgetary machinery and the plan, price controls form the fourth instrument with which the state manipulates the economy. And, like credit controls, limits on price increases can be used as a highly selective method of favouring one section of the

economy at the expense of another.

The French government has had the power to control prices ever since the war. Indeed, M. Giscard d'Estaing earned his reputation as an iron chancellor by his freeze on industrial prices in the stabilisation programme of 1963. But the squeeze did not work vigorously for long. The trouble is that over time price controls can only distort the economy. In this case, the profitability of companies making basic industrial inputs was so badly hit that in some ways they have only recently recovered. In particular, the problems of the steel industry, which has been late to modernise and switch from the traditional areas of production in the east

Shopping for the lowest price

of France, based on local coal, to new sites based on imported coal, such as Dunkirk, were made considerably more severe by the price controls of the 1960s.

The French government has hung on to price controls, but the system of policing them has become more flexible. Indeed, both sides of industry would grudgingly concede that price controls have done their bit to curb inflation. The system involves a series of agreements between the government and the main industrial groups (*contrats de programme*), which effectively allow them to raise prices by a certain amount provided that they keep them at that level for a given period. Over time, the *contrats* have been extended to cover service industries and, in the distribution field, gross margins. If a company refuses to accept a *contrat de programme*, it risks being unable to raise its prices at all. The *contrats* now extend widely throughout the economy. They now cover, for example, about half the country's 550,000 retail outlets. To run the system and maintain a detailed check on prices, the finance ministry has at least 2,000 inspectors, as well as a large section within the ministry itself.

For a company making a variety of products, the system offers a certain flexibility, since it only has to make a commitment on the average level of price increases and not on every product individually. Even so, in areas where there are frequent developments in new product lines or changes in specification, the system involves a good deal of haggling and tiresome delay. It may also, although the evidence here is conflicting, have had some impact on the ability of firms to finance new investment out of profits. Certainly, self-financing is less important in France than it is in the United States.

On the other hand, from the point of view of a company desperately wanting to raise the level of its industrial exports, price controls appear to have had the effect, on some industries at least, of making foreign markets look relatively attractive. The motor industry is a case in point. The European Commission has recently brought a case against the French car companies for allowing exclusive geographical franchises and preventing French dealers from exploiting the substantially higher prices prevailing in other EEC markets. This spotlights the fact that one of the main reasons why the French industry exports over 50 per cent of its output is that the controlled prices on the home market make it the only way to live.

Even so, the general effect of the price control system is inevitably partial. While *contrats de programme* have, in principle, kept price increases down to 3½ per cent this year, the actual rise in the cost of living from year end to year end, has been more than 6 per cent. But the administration would strongly claim that controls are essential to prevent inflation from running amok. If price increases are cut

from 5 to 4 per cent during one period, this limits the rate of wage increases during the next, which in turn has a beneficial effect on prices later on. Certainly during 1970 and 1971 France enjoyed one of the slowest rates of inflation in western Europe, though this year has been worse.

For the Patronat, of course, the price control system is one of the main bones of contention with a government whose economic performance in other directions they thoroughly applaud. But while investment was expanding at a rate of 20 per cent a year, their arguments about the impact on profitability had little cutting edge. It would be true to say, however, that the change in the competitive environment should normally make government intervention in prices less necessary.

When French companies operated in an atmosphere of cartels, low turnovers and high margins, government intervention was some substitute for market forces. But during the decade since the barriers between common market countries effectively came down, the scale and the pressure of competition have changed.

The best laid plans . . .

In addition to credit and fiscal policy, the French policy makers possess means of shaping the economy which are peculiarly French. The most all-pervasive is le plan. There was a time, perhaps a decade ago, when foreign academics suddenly discovered French planning. It became particularly fashionable among British economists as they searched for means of improving what appeared to be an endemically slow growth rate at home. An attempt was made to imitate the French planning process, first with the establishment of the National Economic Development Office and then with the ill-fated national plan of 1965. French planning started after the war, under the guidance of Jean Monnet, as a means of channelling what resources were available towards reconstruction. Since then there has been a steady progression from one plan to another (the seventh plan is currently being prepared). But by the time the French concept of planning became fashionable abroad, it was being questioned in France itself.

Nevertheless the apparatus of planning not only continues to exist, but has

steadily been expanded and refined. There is the Commissariat au Plan, a group of around 80 civil servants drawn from various departments, which is the effective secretariat for the planning network. There are committees covering every aspect of French economic life, staffed by several thousand civil servants, politicians, businessmen and trade unionists. And there is the plan document itself, an elaborate confection of political objectives, sector by sector, targets and forecasts, and a mass of statistical analysis.

France is now halfway through its sixth plan. And, even if few Frenchmen know the name of the commissaire général du plan, M. René Montjoie, they can hardly fail to find some mention of the plan whenever they pick up a newspaper.

The annual budget, presented to the assembly in October, is always placed within the framework of the plan. Spending decisions in the public sector generally are constantly related to what the plan has to say. Recently there was a long, three-part critique in *Le Monde*, France's leading daily newspaper, on the government's economic policy. It

began by quoting, ironically, from a recent pamphlet from the Commissariat au Plan which said that the success of the sixth plan depended on the will of Frenchmen to act responsibly. In which case, *Le Monde* commented, the citizens of France are clearly irresponsible since on most important counts the plan is not being fulfilled.

But does the fact that the plan discusses in great detail the future of the French economy actually make any

High investment, low government spending

difference to that future (as the commissariat implies)? Or does it merely observe what is happening and predict with greater or lesser accuracy what will happen? The most recent authoritative account of the growth of the French economy since the war spends a chapter discussing the impact of the plan. One of the authors, M. Edmund Malinvaud, is at present in charge of forecasting at the ministry of finance. Another, M. Paul Dubois, is in charge of the macro-economic studies used in the plan itself. Yet in their book they are curiously reluctant to come to any definite conclusions. Plan targets have generally been fulfilled, taking the economy as a whole. Even the original predictions of the fourth plan were very close to what was actually achieved over the five-year period as a whole (1961-66) despite M. Giscard d'Estaing's stabilisation programme. But when it comes to individual sectors, as one might suspect, the accuracy of the assessments has varied widely.

It is extraordinarily hard to show that France would have grown any slower if the planning apparatus had not existed. For example, might it not have done just as well by relying on a reasonably sophisticated economic policy framework for the annual budgets, coupled with some forward assessment of where public expenditure was going to go over a five-year period?

It is true that the plan has helped to articulate and co-ordinate spending budgets by the public sector, even if too often these have been the victims of short-term economic changes. It is also true that the individual sector committees have done a lot of useful work in building up a programme of reforms and educating the businessmen and trade unionists who sit on them. But the actual business of providing a detailed and coherent set of forecasts

for the economy is more suspect. What is the use of an industry forecast, for instance, if half the firms in the industry do not think more than one year ahead? And there is always the danger that industries will deliberately be over-optimistic.

Prediction or target?

One of the main problems of the plan was a confusion between what is being forecast as an objective prediction of what will happen to a sector of the economy and what has been presented as a target which that sector must try to achieve. Even the assessment of how fast the economy as a whole grows could be described either as a target or as a prediction. If France has by and large achieved the gnp laid down for it in the plan, this could be largely because it was chosen, on the basis of past performance, as being reasonably credible and likely in the first place. In general the plan now makes a clear distinction between targets and forecasts, and is less ambitious on the number of targets it chooses.

When it comes to the conduct of short-term economic policy, the ministry of finance, just as in other countries, is extremely jealous of its prerogatives and would no more keep firmly to what was laid down in the plan than hand over control of the economy to the International Monetary Fund. The annual budget, although it is presented in terms of the planning framework, is after all mainly concerned with the immediate outlook for the balance of payments, prices and employment.

Moreover, if one examines the three vital areas—the rate of inflation, the rate of growth in productivity and the behaviour of the balance of payments

—the plan's forecasting record is distinctly shaky.

Nevertheless when all these doubts have been aired, the fact remains that the plan is still important in French life. In the first place it provides a useful forum for presenting, in a coherent way, the impact of political choices on the economy. The rate of growth chosen as the target (if that is the right word) carries in itself strong implications about the trade-off between inflation and employment or growth and the increase in foreign exchange reserves considered suitable by the government. The plan, in other words, imposes a certain consistency. And even the minister of finance has to explain deviations in policy and performance from the plan, even if he does not hesitate to bring them about.

In the run up to the sixth plan three alternative targets were presented. Even if the way that they were presented made the final answer self-selecting, the posing of alternatives did expose the options in front of the government. There was the high growth rate much advocated by the Patronat, the employers' federation, of some 7 per cent. This was described in a rather hyperbolic way as growth *au Japonais*. The theory behind it was that France had the productive potential to grow faster, that it was lagging behind Germany and that there might be problems with the level of employment if it grew by very much less. On the other hand it carried serious short-term implications for the balance of payments and for the level of inflation. The second option was a low growth rate of 3-4 per cent which was found to carry not only serious implications for employment but also in the medium-term for the balance of payments (as

Monnet: the father of the plan

it would impede the structural shift in exports so badly needed). Lastly, the middle range target of 5.9 per cent was chosen. This was rather faster than the postwar average of around 5 per cent, but corresponded closely to what had happened between 1965 and 1970. And in principle it neither seriously endangered the level of prices nor the balance of payments. At least this is how it was presented by M. Pompidou.

Implicit in the whole concept of the plan and of the choice between political objectives is the idea that only through this conscious articulation of goals can France maintain a certain autonomy. At its highest—and this was true for the first plan and possibly also for the fourth plan at the start of the Fifth Republic—the plan expresses a certain national vision.

Thus the first plan was aimed at the rapid rebuilding and development of the commanding heights of the economy, such as electricity, the railways and steel. It was concerned with channelling national resources to priority areas and, as such, was far closer to the normative planning of communist systems than anything which happens today. The main preoccupation of the second and third plans was to foster the dynamic developed in the reconstruction period. France had fallen subject to a Malthusian pessimism over several decades of stagnation. It had missed out on the revival of economic activity which took place in the fascist countries during the 1930s and in Britain and, more particularly, the United States during the war. Therefore the fundamental need was to overcome the fatalism of the French people, and to show that the rapid growth rate achieved during the immediate postwar years of reconstruction could be sustained and was not doomed to peter

out once the economy was back to normal peacetime conditions.

With the return of General de Gaulle, planning received a new twist, as a medium for expressing political priorities and for obtaining a commitment to them, through the consultative committees, by the main pressure groups in the economy—employers, trade unions, professional organisations and, of course, the civil service itself. Apart from the maintenance of a high rate of growth (5.5 per cent), the overriding priority was seen as a rapid increase in public investment of 10 per cent in real terms. Education in particular received a massive boost to cope with the baby boom of the early postwar years. Accent on one type of public spending, then another, has remained one of the key notes of planning. After education, priority has been given to communications, roads and the chronically bad telephone system (where heavy spending was essential to provide a framework for France's industrialisation).

Beyond the stressing of certain objectives such as a high growth rate, however, planning in France has shown certain inescapable weaknesses. A good five-year indicative plan cannot prevent violent disequilibria appearing in the short term. This was shown in

1963 when prices and the balance of payments began to get out of hand. One answer was a lower rate of wage increases—through a system of contracts. In other words, wages had to be planned, too. The other was to use the traditional strategy of lowering the rate of expansion and increasing the margin of unemployment. A lower growth rate was accepted in the fifth plan and unemployment went up from around 150,000 to 500,000. If the objective of planning is to ensure that resources are fully exploited this is a defeat which allows the job of running the economy to remain squarely with its traditional mentor, the finance ministry. Obsession with inflation will remain, one suspects, the major obstacle to planning.

Second, by concentrating on economic growth, the planning mechanism put social priorities on the back seat. The sixth plan tried to correct this by affirming support for the lowest-paid workers and the dispossessed. And the commissariat itself is now feeding into the preparation of the seventh plan a lot more social indicators. But until they are firmly established, and a new hierarchy of pressure groups has been built, the bidonvilles and the clochards will continue to be a familiar part of the landscape.

More unequal than others

When M. Pierre Messmer, whom M. Pompidou appointed as successor to the unfortunate M. Chaban-Delmas in the summer, made his first prime ministerial speech to the Assembly, he described his goal as the need to make society more just, more responsible and more humane. Three years ago, M. Chaban-Delmas talked of the "New Society," in which divisions would be healed by the removal of the inequalities that have long been more prominent in France than in almost any other advanced country. Such proclamations are the regular clichés of political rhetoric. So how far in reality along this road has the Gaullist regime gone?

All the indicators suggest that the question of equality ranks low in the priorities of gaullism or even pompidolisme. De Gaulle had a few unorthodox views on such questions as worker participation, but these were never comfortably received by the bulk of his followers. There are a number of signs one can look at: the trend in wages and salaries between the highest

and lowest paid; the impact of taxation; social security payments and transfers; and the amount and incidence of social spending.

Over the past two decades French society has had a bias towards saving and investment rather than consumption, although a 5 per cent plus annual rate of growth allows for plenty of improvement in all sectors. While household consumption has gone up 2½ times, private investment (other than housebuilding) has risen nearly 6½ times. The total share of investment in gnp rose during the past decade alone from 20 to 25.5 per cent. Capital, in fact, has been accumulating faster than wages have been rising despite the anxieties of the economic policymakers—the result, one suspects, of a combination of inflation and weak trade unions.

If one looks at the difference between salaries paid to *les cadres*, as the French call anyone who is, however remotely, concerned with management from foremen upwards, their numbers

The old way of low taxes—and incomes

have both increased rapidly and their salaries have risen in relation to that of the average worker, from 3.5 to 4.2 times. The wage agreements of 1968 did, however, narrow the gap somewhat and there is no evidence that it has widened significantly since then. A further indicator is the discrepancy between the average and the minimum wage. Familiarly called SMIC, the minimum wage is fixed by the government so as to act as a protection for those in traditionally low paying industries such as distribution and textiles.

Over the past 10 years the minimum wage has risen mildly faster than the average hourly wage (by 56 per cent, against 52 per cent). Even so, the gap between the highest salaries and the lowest is still in the order of 60 to 1. But, as elsewhere, the poorest groups in France tend to be the old and those on the land. Although the grain farmers of the centre and north have done very nicely out of the common agricultural policy, the average agricultural wage and the income of the small farmer has lagged badly behind industrial wages. In the past four years, for instance, farm incomes rose by 7 per cent in real terms while average industrial wages rose by a hefty 23 per cent. But what France has succeeded in doing has been to shift several million people out of agriculture altogether. Only 12 per cent of the active population are now on the land, compared with nearly 30 per cent two decades ago.

As for the old, who form a growing part of the total population, the basic

pension has increased by a whopping 225 per cent over the past 10 years. But that was from a particularly low base, less than 3 francs a day. No west European country, however, has done all that much over the past 10 years to redress social inequalities. So France suffers more from a historic inegalitarianism than from present performance. Indeed, the government has declared that its intention is to make the minimum wage rise faster than wages as a whole, and it is discussing the possibility of putting it on a monthly, salary basis which would add some important fringe benefits.

Poor record

The next question is whether the impact of the tax system has become more or less equal. Here the record is poor. Although M. Giscard d'Estaing did undertake a massive study of the system which he presented to the Assembly in 1971, nothing has been done to upset the position of the privileged and those who do not pay their taxes. One of the most telling accusations which led to the replacement of M. Chaban-Delmas was that, during one year, he was discovered to have paid no taxes. This was perfectly legal. During the 1960s, to stimulate investors' interest in the bourse, M. Giscard d'Estaing modified the company taxation system so that tax credits could be offset against investment income, based on the profits tax the company had already paid. This may have been good for efficiency, but it did nothing for equity.

M. Giscard d'Estaing's study showed

what everyone already knew—that the whole system is long overdue for reform. In terms of direct taxation those on salaries have at least to pay, although rates are about the most regressive in Europe. But, the self-employed or people in well-favoured groups like farmers, pay very little. As a whole the system is biased towards indirect taxation and social security contributions which are both heavy and regressive.

The last measure of equality is the way that government funds are spent. How much cash goes into public spending which benefits the less well-off? Over the past decade as a whole, the increase in public investment compares favourably with that of other European countries. But since 1968, the need to avoid inflationary budgets has exacted its toll. M. Giscard d'Estaing is carrying on an old tradition when he cuts social spending rather than increase taxes. Thus programmes for building hospitals or roads which figured in the fourth plan have still not been translated into action. M. Giscard d'Estaing has, in fact, acquired the habit of putting a chunk of social spending projects into a fund (the FAC) which is then only unfrozen if the economy looks in need of stimulation. As a result, between 1970 and 1972, public investment has risen by less than half the plan targets of 7.6 per cent.

In order to get round the constraints of a balanced budget, M. Giscard d'Estaing has been persuading more and more money in the private sector to take the place of public finance. This may work for areas such as roads and telecommunications, but not in those where profit margins are low. Nor has the government done much to reform the shambles of the housing market. Since the war, France has built half the number of dwellings that west Germany has, and the number of new housing starts, while now rising by a reasonable 4 per cent a year, is not being swollen by publicly financed houses. The housing boom has been confined to flats and houses for the middle-income groups. The poor and even the not so poor have as much difficulty in finding somewhere to live as ever.

But, if France is a society where a high level of inequality still flourishes, it is because when a government is determined to put economic growth first, and when it is hamstrung by an incompetent and regressive taxation system, something has to give.

Paris is a desert

Paris, except on Sunday mornings and in the middle of August, is a pretty horrible place. It is just possible that its sheer unpleasantness may, by the mid-1980s, make it culturally démodé. And that would be the most important change in French life since the 1789 revolution. Why Paris became so grossly overweight in relation to the rest of France, why all roads and railways lead to it, is buried in the depths of French history and psychology. Whatever the reasons, the facts are outrageous. It was not long ago that a provincial prefect had to refer to Paris for anything involving the smallest expense such as hiring a new secretary or installing another filing cabinet.

The predominance of Paris since the days of Richelieu and Colbert led to what was described in a famous book published after the last war as *Le Desert Francais*. In the stagnant economy of the period between the wars the centripetal pull of the metropolis was less apparent than it became in the years of reconstruction. The concept of the *Desert Francais* was that, apart from a few areas like the Mediterranean coastline east of Marseilles and the industrialised corridor running to Lyons and St Etienne, the lifeblood of the provinces was being sucked out of them and pumped into the evermore bloated Parisian spider. To this disparity between Paris and the provinces was added two further problems: the structural decline in the old industrial areas to the north towards the Pas de Calais and in the east in Lorraine and the flight from the land, inevitable in a country which still had over a quarter of its population dependent on agriculture 25 years ago.

Despite the lip service paid to regional development from the early years of the EEC onwards, Paris continued to have remarkable powers of attraction, both in terms of people and resources, during the period of the fourth and fifth plans. For example, between 1962 and 1970, investment per head in urban equipment like transport and sewage systems was two to three times higher in the Paris region than it was in provincial towns. Incomes per head are twice as high in Paris as they are in the poorer regions. In terms of population and economic power, Paris grew even more preponderant. Whereas in 1800, less than 2 per cent of the population lived in the Paris region, by 1970

it contained over 9m people, or nearly 20 per cent of the French nation. It is thus nine times larger than the other main urban centres of Lyons, Marseilles and Lille. The Parisian hegemony is even more apparent in the most highly trained, most talented sectors of the population. In the early 1960s, when some efforts to redress the balance had already been taken, over 40 per cent of those with higher degrees lived in Paris, while two-thirds of those involved in scientific research worked in the area.

Since then, some attempts have been made to develop a regional policy. But while it was perfectly possible to devise noble plans for the more backward areas and to administer a system of regional incentives, the problem was and still is that all roads lead back to Paris. Regional investment incentives tend to be rather low (around 10 to 15 per cent). This is not so much because they are considered ineffective, but because in budgetary terms regional development still does not rate very high. It is hard for leading politicians and civil servants to overcome their blinkered Parisian outlook. It is true that the French system of administration, with the provincial and regional prefectures, means that the central government controls the running of provincial France in a way that does not happen in other European countries. But controlling local government is one thing. Changing the economic map is another.

After Haussmann

The first step was to get away from the Napoleonic structure of 90 departments towards a more rational economic grouping. The *raison d'être* of the department was that it made the whole of France amenable to being overseen by a central authority. Its size was such that a policeman on horse could reach any part of it from the town hall in a day. In 1955 a new structure was superimposed on the old, introducing 21 regions. But it was not until 1964 that the regional concept was given some political clothes, with the creation of the regional prefect and the Commission de Développement Economique et Régional (or Coder). The main task of the regional prefect and the Coder is to establish a programme for economic development and public investment in their region. After that principle had been established it was only a matter of time before the annual budget was put into a regional framework.

The Coder is an embryonic political body composed in part of local bigwigs in industry and commerce, in part of the elected representatives of local towns and in part of nominees of the prime minister. They and the bright young men in the regional prefectures have developed as an important new series of pressure groups. But there are still serious defects. In theory the local planners should be able to organise the funds allocated to the region in what seems to them the most fruitful way—for instance by putting more money into telephones and less into new houses. In practice, not only do these regional bodies remain largely

Modern living outside Paris, but still close

consultative but there is still considerable opposition to any dilution of the central authority within the ministries in Paris.

At the end of 1970, a minor financial gesture was made to regional prefects. They were allowed to decide themselves for the first time how certain small investments should be made. But power remains firmly in the hands of Paris. Of much greater significance has been the recent tendency for young civil servants fresh out of ENA to eschew the traditional ladders to the top. Instead of becoming *inspecteurs des finances*, they are trekking out to the regional prefectures, where at least they can have the illusion of getting something done. While the government retains a natural distrust of any dilution in its powers, it has gone some way towards distributing public investment more equally around France. And as counterweight to the ministries, the prime minister has under him an energetic agency, the *Délégation de l'Amenagement du Territoire et de l'Action Régionale* (Datar).

The main nuclei for large state projects are the *Metropoles d'équilibre*, such as Lyons, St Etienne, Bordeaux and Metz/Nancy. The planners have gone boldly for the idea of growth points, on the argument that if the economic influence of Paris is to be diminished rival poles of attraction must be established. Around these growth points some grandiose and imaginative schemes have been designed.

France is a country of engineers, if the term is taken in its French rather than Anglo-Saxon sense, meaning someone who not only knows

how to build a bridge but has a vision of what it is the bridge is joining. The conversion of Languedoc-Roussillon from a malarial swamp into a huge tourist complex cum market garden is one of them. Fos, the new industrial zone west of Marseilles, is another, and there are high ambitions for Le Havre and Dunkirk as well. Perhaps the most extraordinary achievement has been the taming of the Rhone. By the 1980s, it should not only be navigable along most of its length but connected to the central European waterways via the Rhine.

Large projects may be essential but they do not generally mean many jobs. The prosaic task of persuading medium-sized companies to move from Paris elsewhere or to get an American multinational company to invest in Lorraine rather than Westphalia has fallen to the group of organisations based on Datar. This small band of irregulars, with direct access to the prime minister but with no budgetary powers, tries to short-circuit the long-winded administrative

machine and act as advocate both for the regions and for those who want to invest in them. With the blessing of the highest authority, M. Pompidou himself, Datar has flourished.

If Paris is still growing at a rate which will take it to 16m people by 1980, the net migration from other areas is declining. And there are actually fewer industrial jobs in the Paris region than there were five years ago. Net migration out of the west, which used to be particularly severe in Brittany, has now been halted. And while two-thirds of the employees of the automobile industry in 1960 were in Paris, by 1975 the proportion will be less than 40 per cent. Datar is even beginning to make some impression on the crucial service sector, which provides three out of every four new jobs in France.

One of its main preoccupations has been to improve communications. Until the mid-1960s these were woefully neglected in the national budget. By the late 1970s there should be a complete motorway network reflecting the real need of the regions rather than just their satellite status to Paris. Telecommunications, not before time, have become the fastest growing sector of public investment. And a key plan of Datar is to reorganise the internal airways system so that it is possible to go from one part of France to another without changing planes in Paris.

Despite all these efforts, however, it is going to be hard, if not impossible, to spread economic growth and prosperity right across France. At the most, regional policy may have won for France two new poles of development: one running down the Rhone spreading east and west at the mouth to Nice and Montpellier; the other, just possibly, joining the main towns on the Atlantic. As for the rolling hectares in between, is it a bad fate for them to remain as they are, evidence that France is the most beautiful country in Europe?

The president dons a regional cap

Heading south

Marseilles, as Frenchmen are fond of saying, is hardly a French city, but part Mediterranean, part African and highly independent. Even government officials tend to say that it is hard for Paris to understand the problems of Marseilles. And these are great. Marseilles, like Vienna after the 1914-18 war, is a metropolis without an empire. In place of its past role as focal point for the commercial network which bound France and its North African colonies together, Marseilles has been in search of a new one. And the urgency of this task was increased by the closing of the Suez canal which cut off a lot of its natural traffic. Faced with the uncomfortable combination of a growing population, swollen by Algerian settlers, and a stagnant local economy, Marseilles and the national government in Paris have been looking for a dramatic solution.

Thirty miles to the north-west, there is a desolate region surrounding the Etang de Berre, a large inland salt lake. Once this used to be the grazing land of several hundred thousand fine merino sheep. Now, if the visions of the planners turn into reality, it will be one of the great new industrial areas of Europe, providing the means of livelihood for 500,000 people and acting as the hub of a great new area of industrial development.

The first part of the master plan was based on oil. Marseilles is strategically placed to receive shipments from the other side of the Mediterranean. Through pipelines it could serve not only southern France itself but also the central area of the common market, notably southern Germany. And the port of Fos, south of the Etang de Berre, was capable of receiving tankers of 500,000 tons or more. With Shell, BP, and the Compagnie Française des Pétroles setting up refineries, over 400 tons of refined products are coming out of the area. The oil and natural gas—for Fos is one of the key terminals for Algerian natural gas—should attract chemical plants. There ICI has built a 60,000 ton polyethylene factory, which went on stream this year.

But to obtain broadly balanced industrial growth, Fos needs something more. The success of the whole plan depends on what is Europe's largest steel project, Solmer. The aim is to produce 3.5m tons by 1975, expanding to 7m tons by the end of the decade. The sheet steel and rolled

products coming out of Solmer will, in theory, act as a magnet for a wide range of engineering plants, thus providing the balanced industrial growth the region so badly needs. While the plans look good—and will provide France with some bargaining power when the European Community gets round to controlling steel investment—the problem is money. Hopefully, the scheme will cost some £550m, but this will almost certainly escalate to nearer £1 billion. Wendel-Sideler, entrusted with building the steel plant, has, after more than a year of trying, only just succeeded in persuading Usinor, the other major French steel producer, to join forces, with some lubricating government money. And it is still not clear whether stage two will take place without other participants. The German firm, August Thissen Hutte, is

usually mentioned in this connection, but it is still being coy.

Until steel is actually being produced, the Fos grand industrial design will not get very far. Which is just as well. It is one thing to attract industry to the area, it is another to provide the essential services like roads, railway links and houses. The narrow, dusty lanes which at present give access to the Fos area could not stand much more traffic. Motorways are planned but it will be something like two years before they are actually built and connected to the national network. The housing situation is, if anything, worse. The main problem has been an appalling lack of co-ordination between the ministries, coupled with suspicion and distrust for the whole idea from the local communes and even Marseilles itself. Now a whole raft of committees and consultative bodies have been set up. But the sorting out will take time.

To the north of Fos, the Rhone is being turned into a navigable link be-

Helping the west

EMPAIN-SCHNEIDER: AN INDUSTRIAL STRATEGY

At the end of the nineteenth century, Baron Edouard Empain, a pioneer in the fields of production, distribution, electrical engineering and urban transport, formed a powerful and diversified group whose interests and industrial undertakings both in Belgium and in France were very substantial.

The Schneider undertaking, which was founded at Le Creusot in 1837, received during the first half of the twentieth century, under the management of Eugène Schneider, an impetus which placed it in the forefront of the French industry.

In 1949, Schneider became a holding company and its object was to acquire interests in other fields including:

- electronics,
- nuclear industries, enterprises in general...
- automation and computerisation,

and it gave to its financial activities a considerable expansion.

In 1963, the Empain Group acquired a large shareholding in Schneider and thus became the firm's principal shareholder.

In 1966, the limited partnership was converted into a public limited company with the Barons Empain joining the first Board of Directors.

In 1967, Baron Edouard-Jean Empain was appointed Chairman of Electrorail and Vice-Chairman of Schneider S.A.; he thereby assumed responsibility for the general management of the Empain-Schneider Group and in June 1972 this office was legally confirmed by his appointment as Chairman of Schneider S.A.

The assets of the Empain-Schneider Group were integrated within two holding companies, one subject to French law: Schneider S.A., the other subject to Belgian law: Electrorail S.A.

Both companies operate in the fields of finance, industry and services.

In each one of these sectors, Empain-Schneider's constant endeavour is to devise and pursue a strategy of expansion designed:

- to maximise its existing industrial holdings and give these a more even spread by acquiring interests in light industries in which there is more scope for control and usually a higher profitability.
- to reinforce its financial activities by extending the operational sphere of the Group's financial and banking subsidiaries.

RAW MATERIALS AND ENERGY

Heavy iron and steel industry

In the heavy iron and steel sector, the aim of Schneider S.A. is to focus its attention on those companies in which it has a controlling interest or over which it can exert a decisive management influence.

After the renovation of the plant and machinery, destroyed during the war, of Société Métallurgique de Normandie (S.M.N.), this company has made good progress. Its steel production has increased from 671,000 tons in 1968 to 865,000 tons in 1971. The turnover advanced to 554 million francs with exports accounting for 31%. Investments in 1971 amounted to 53 million francs. The installation of an additional steel processing plant with a 450,000 tons per year capacity will be completed in the course of Plan VI.

In Luxembourg and in Germany, Arbed, which is managed jointly with Société Générale de Belgique, produced in 1971, with the steel-works of Roehling, in whose capital it has a 50% interest, and other companies in which it owns a major equity holding: 10,139,000 tons of steel.

In 1971, Arbed created, on an equal share basis with the American company National Standart, a new concern named Fan-International which produces tyre reinforcing wires.

Electricity-gas

Thanks to its equity holdings in the major Belgian companies engaged in the production and distribution of electricity and gas, Electrorail has a prominent place on the energy market in Belgium through the medium of three companies: Intercom (sales 1971: about 2,623 GWh of electricity and 614 million cub. m. of gas), Interbrabant (sales 1971: 2,905 GWh) and Electrobél, whose speciality is that of engineer consultants and technical research not only in the electricity and gas sector but also in the fields of civil engineering and industrial equipment.

Petroleum and by-products

In Canada, Electrorail holds a controlling interest in "Canadian Hydrocarbons Ltd." which is a rapidly expanding company with assets worth some \$130 million. This leading propane gas distributor in Canada is also engaged in the distribution of natural gas and petrol both in Canada and in the north-west of the United States. Electrorail also controls an oil producing and mining company (Canadian Homesteads Oils) and has recently launched into uranium mining in Colorado.

MANUFACTURING INDUSTRIES

Metallurgy-engineering

In 1970 a new company, Creusot-Loire, was formed as a result of a long-prepared merger between S.F.A.C. (Société des Forges et Ateliers du Creusot) and C.A.F.L. (Compagnie des Ateliers et Forges de la Loire). The special steels market conditions, which were very buoyant in 1970, contributed to this amalgamation. A combined strategy has already been carried into effect to enhance the profitability of an industrial instrument of exceptional importance.

Creusot-Loire achieved an after-tax turnover of 2,683 million francs which represents a consolidated turnover amounting to over 3,000 million francs. Its capital investments in 1971 reached a figure of 163 million francs of which the major part is being devoted to the construction of nuclear tanks at Le Creusot and of steam generators at Chalon. The five-year Plan of Creusot-Loire, financed largely from internal resources, represents one of the greatest ventures of

modernisation and equipment ever to be undertaken in France by a company in the private sector.

Mechanical construction

H. Ernault Somua was able to record further growth in its production of machine-tools for the French and export markets, the German market in particular. The turnover, excluding taxes, increased from 223 to 246 million francs, of which 30% represented export sales.

In addition to its activities in metallic and mechanical fabrications, the A.B.R. Company (Ateliers Belges Réunis) continued in 1971 to expand in the field of engineering. The gross turnover amounted to 1,544 million Belgian francs against 1,465 million in 1970.

Electromechanics

In the electromechanics sector, the problem facing Jeumont-Schneider is shortly to be settled. Having ascertained that a merger of this company with a competitor would lead to a disruption of the Group, a solution was advanced by the parties involved whereby this sector could be reinforced by a link-up between Jeumont-Schneider and Merlin-Gérin, both concerns being complementary to each other. This new partnership will be operational in June 1973.

In 1971, the after-tax turnover of Jeumont-Schneider reached 924 million and the net profit 9 million francs (3.6 in 1969) after capital expenditure amounting to 48 million.

France-Dunkerque

The buoyant conditions prevailing in the ship-building industry during 1969 and 1970 have ensured for the ship-yards of the France-Dunkerque Company a full workload until 1975 consisting mainly of methane and propane tankers.

In 1971, this company received an order for two roll-on/roll-off vessels from Société Française des Messageries Maritimes.

Public Works

In this sector, Citra, a subsidiary of Schneider, merged with Spie-Batignolles of the Empain Group, thus forming the largest public utility company in France with a turnover of 2,000 million francs.

The primary purpose was to constitute a coherent and efficient alliance aiming at higher profitability by a more systematic selection of markets.

In Belgium, the Group has a controlling interest in two utility companies, "E.T.S." (Electrification and Travaux Spéciaux), and Immeubles et Constructions, which are respectively specialised in electrical, piping and allied installations, and in public and private utility works.

Packing industries

Empain-Schneider operates in this sector in Belgium. For the glass container branch, 1971 was a year of expansion and significant market adjustment, this being reflected in improved turnovers (7.9% for Verlica Momignies, 5.8% for Boutelleries Belges Réunies, in whose capital Verlica-Momignies has a 30% holding) and also in the realisation of important capital investment programmes.

In 1970, the Group acquired a substantial interest in the capital of Papeteries Catala, thereby extending, with the addition of cardboard wrappers, its share of the whole packing materials market.

FINANCIAL AND BANKING ACTIVITIES

Empain-Schneider is in a position to exert a powerful financial leverage through the medium of Union Européenne and its shareholding in Banque Belge pour l'Industrie.

The objectives are: to reinforce its position in the sector of financial activities, to ensure the financing of its existing subsidiaries, and to take effective action in certain sectors with a view to securing an appropriate spread of capital investments leading to quicker and higher profits.

Union Européenne

Union Européenne is a joint undertaking comprising two companies:

—Compagnie Financière de l'Union Européenne, which consolidates and supplements the industrial and financial interests of Empain-Schneider, makes surveys and investments in new sectors. In 1970, investments were effected in the food, property, tourist equipment and toy industries. Recently and through Sofisport, a newly created holding company, an interest was acquired in Dynamic skis and in Fusalp.

The net profit for 1970/mid-1971 amounted to 13.8 million francs (+20% compared with the previous year).

—Banque de l'Union Européenne, which is controlled by Compagnie Financière, has increased the number of its establishments and extended its branch network in France and other European countries. It participated in numerous operations in connection with market transactions, introductions to the stock market, investment management, and reorganisation of industrial company structures. In 1971, its balance sheet total stood at over 4,000 million francs (a 22% increase over 1969) and its net profit advanced from 7.1 million Frs. in 1969 to 19.5 million in 1971.

Banque Belge pour l'Industrie

This is the Group's banking institution in Belgium which has been affiliated since 1968 to the international network of the Royal Bank of Canada and which acquired therein a 25% interest. This medium-sized institution is very dynamic and within a year doubled both its turnover and resources (balance sheet total: 5,000 million Belgian francs).

Across the Atlantic

The Group is also engaged in financial activities in North America, particularly in Canada, where it has ample scope for manoeuvre with the large amount of funds placed on deposit or invested in readily marketable securities.

tween the Mediterranean and the area around Lyons, which, with the cheap electricity being generated close by, should develop into a new industrial corridor. This is the planners' dream and there is a good deal going for it. The more ambitious visionaries would go further. They see the three southern regions of France — Languedoc-Roussillon to the south-west, Provence-Cote d'Azur to the south-east and above it the Lyons region—forming a linked and coherent whole.

Without the smog

Already the south of France is one of the most interesting areas of change in Europe. Its population is increasing almost as fast as that of Paris, as more Frenchmen seek the sun and the good life. To the east of Marseilles, along and behind the Cote d'Azur, the hope is to develop away from the present dependence on tourism and property speculation and become a new California—without the smog. The first seeds are already planted. There is the IBM research centre just above Nice and Texas Instruments has a factory in the area too. Near Antibes a high technology industrial park is being set up, together with research centres and graduate schools.

The problems of the south-west area, Languedoc-Roussillon, are different and far more severe. Between the mouth of the Rhone and the Spanish border, there is over 100 miles of flat, marshy, once mosquito-ridden, coastline with very little on it except for a few smelly little fishing villages and the odd dusty resort. At least this was the position ten years ago when the government got to work. There were two essential problems: one was to attract tourists to a fairly inhospitable and not particularly exciting area with in fact only one natural advantage, miles and miles of sandy beach; and the second was the comparative poverty of the traditional Languedoc kingdom where there was little except vineyards, deserted villages and the relics of a once great culture.

Over the past decade the French government has been working in two different ways. It has been pumping billions of francs into a new irrigation system to allow economic farming in the south-west. The effect has been a huge increase in France's output of such things as peaches, tomatoes, apricots and all the other Mediterranean produce already grown in super-abundance from the south of

Spain to Sicily. The second part of the plan was to drain and develop the whole of the Languedoc-Roussillon coastline. The idea was to foster six new holiday resorts. Now, nine years after the scheme began, futuristic developments dot the coastline. But the response in terms of tourism has been

disappointing. The area is too expensive for the poor to invest in, the scenery too dull for the rich.

But these, like the problems at Fos, are teething troubles. Along the south coast, France is planning for the next century. The cynics should suspend judgment at least for another decade.

Marseilles has an old port.

a new port

and a competitor close by at Fos

Another beginning

"Chère vieille France! La bonne cuisine! Les Folies-Bergère! Le gai Paris! La haute couture et de bonnes exportations, du cognac, du champagne, des Bordeaux ou du Bourgogne! C'est terminé." In these words, the President of the French Republic, during one of those pieces of political theatre, a presidential press conference, closed a chapter in French history. M. Pompidou had spoken. In the place of the old France, a new one, engaged in a second industrial revolution, is emerging. The main thesis of this survey has been that the rhetoric of the Fifth Republic in its second phase, after General de Gaulle's retirement and death, has by and large been translated into reality. The transformation is not complete, for if France is a country where change, once underway, can be extraordinarily rapid, it is also a country where the past to an unusual degree continues to live in the present. The rhetoric of ambition has always to be qualified by the reality of achievement.

The first qualification is that agriculture will continue to be more important to France than to any other advanced European nation. Farming remains one of France's major resources. Although the proportion of the labour force employed on the land is declining by around one per cent a year, the current ratio is still that which existed in Britain a century ago. France has a larger area of cultivable land than any other European country. The proportion of its exports which arise from farm products has actually increased

over the past decade. General de Gaulle described France as the country of 200 cheeses, and despite M. Pompidou's picturesque turn of phrase, farming and the sale of all that the rich soil offers, whether it is Camembert, Chateau Mouton-Rothschild or the most advanced form of convenience food, will continue to bulk large in the French economy.

The second qualification is that sectional interests—such as the farmers, blocking the road with sugar beet or grapes—will have enough power to slow things up. It is now the shopkeepers, café-owners or artisans, who give France so much of its individuality. France is a country where sectional privileges remain commonplace—where farmers, for instance, pay no income tax. Recently it has been the turn of the shopkeepers and café-owners, led by their young hero, M. Nicoud, to protest, by strikes and the burning of tax records in provincial government offices, against the march of progress. Shopkeepers, for instance, are menaced by the vast out of town hypermarkets developed so rapidly by groups like Carrefour and Casino over the past decade. It is no coincidence in a pre-electoral year that M. Nicoud and his friends have been granted an amnesty for their part in civil disturbances and that Carrefour has been given permission to build only two hypermarkets. Progress even in a hard, unsentimental country like France is kept within bounds. A political party to the right of centre, even when it proclaims economic progress as its main raison d'être, can never forget its constituents.

The third qualification relates back to M. Pompidou's press conference and his famous sketch of the old France and the new. He was in fact replying to a question about France's well known diplomatic activities in favour of foreign sales of its colour TV system, Secam, and of Mirage military aircraft. These—and such matters as French participation in Concorde—are to a large extent the products of old gaullist policies in favour of national self-sufficiency and high technology programmes, rated in prestige rather than cost terms. These are now largely discarded. French sales of military equipment abroad have accounted for a large slice of its increase in manufactured exports. But this is a game which will have declining returns in the new

One of the 200 cheeses

France. There is a new maturity at work. Prestige now takes second place behind pay-off. This means that France is no longer prepared to bear the costs of high technology itself. Just as the French have learned the lessons of modern management, which implies teamwork, so they have caught on to the rewards to be won through international consortia.

The consequences of France's industrial revolution point in the same direction. Given the French traditions of self-sufficiency and autarchy the common market was bound to have a greater impact on France than on the other northern European nations. Initially, the French conceived the impact as meaning a greater vulnerability to risk and damage, which, they hoped, would be counterbalanced by higher agricultural exports. Now it is seen in France as meaning something else. France is becoming as dependent on international trade and as closely enmeshed in international business as its partners. And this will lead, indeed is already leading, to a profound change in mentality. The curious paradox is that General de Gaulle had to revive a sense of national confidence before the French could persuade themselves to think internationally. Like all the major changes in the history of France, the switch from being France in Europe to being European France will not be accepted by a section of its population for a long time to come. But it is happening nonetheless. What Algeria was for General de Gaulle, Europe is for M. Pompidou.

investment in office buildings near Paris

Creteil is a new town, 6 km. from Paris by underground "metro". Under the direction of the "Société d'Aménagement du Nouveau Creteil", 100 architects are building all the various important buildings required for this new town — Headquarters for the Prefecture, University, Town Hall, General Post Office, Borough Financial Headquarters, Law Courts, Cultural Centre, Police Headquarters, Shopping Centre, etc. together with new factory and office buildings.

The group responsible for New Creteil (SEMAEC, Avenue François Mauriac, 94301 Creteil. Tel : 207.65.00) have taken advantage of the following facts — extension of the Paris metro; French Governmental decision to encourage office building on the east side of the Paris region; and finally, the availability of land for immediate building, and have obtained the agreement of seven of the biggest investors and promoters in Paris for the immediate construction (1972-1975) of 150,000 sq. metres of office buildings.

The selling price for this space which investors in the Creteil region can demand is about 2,500 fr. per square metre. This price is the lowest in the whole of the Paris region, and will ensure the success of this project — office buildings of this quality are usually priced two or three times higher.

In view of the initial success of this project, the SEMAEC has decided to increase the scope of its development, and is offering new sites, either immediately available for building, or available in one or two years' time. Prospective investors are asked to get in touch at the address given above.

Books

The view from Harvard

THE FALL OF THE AMERICAN UNIVERSITY

By Adam Ulam.
Alcove Press. 226 pages. £2.75.

REBELLION IN THE UNIVERSITY

By Seymour Martin Lipset.
Routledge and Kegan Paul. 336 pages. £2.75.

When President Nixon ordered the renewal of the bombing over North Vietnam last May there was every expectation that there would be a repeat of the violence and the troubles that exploded in the American universities in the wake of the Cambodian invasion in 1970. But the spring of 1972 was not the season for demonstrations. Students merely worked harder to secure the Democratic presidential nomination for Senator George McGovern. The enthusiasm for the Democratic candidate did not last into the autumn term; but there was, curiously, still no sign that this disenchantment was a prelude to more direct action. Instead, there were reports that more students were turning up to their lectures and classes, that the libraries were fuller than for many years past and even that attendances at football games, a pastime scorned in the late 1960s, were up again. The calm may be short-lived; there is plenty of tinder in American

society to fire the indignation of a new generation of students. The deaths of two black students at Southern university in Louisiana last month perforated, if it did not tear, the fragile peace. But there has been time for analysis and for soul searching, not so much among the students, who moved on and out of the universities, but among the professors and academics who remained behind.

Professor Adam Ulam, a professor of government at Harvard university, presents a personal theory of what went wrong in American universities during the last decade. As he makes plain even in his title, he believes that the events and their consequences were a disaster for academic life and for higher education. He lays the blame for the upheavals squarely on the shoulders of his own profession.

Professor Ulam's great lament is that the university became a centre of public attention and politics in the 1960s. Just as business was thought to hold the answer to the nation's problems in the 1920s, so, he argues, too much hope was invested in the genius of the universities, and of education in general, in the 1960s. Professor Ulam singles out the presidency of John Kennedy as the turning point for intellectuals. This was the period when professors (particularly those from Harvard) were given positions of considerable power in Washington, and

when it was thought that the academic approach would uncover the perfect solution to America's domestic and foreign ills. But then came the troubles with Cuba, and with south-east Asia. After the fiasco of the Bay of Pigs invasion, intellectuals searched for scapegoats; the military and the intelligence services were the closest at hand. The mistakes by which the academics in government failed to profit in the early 1960s were repeated later, in south-east Asia. And by then, Professor Ulam claims, there remained too few detached scholars in America.

What the professors began, with their move to Washington, the students completed. Beginning with the civil rights movement in the early 1960s, direct action, to help the blacks, the poor whites or to halt the war in Vietnam, became the order of the day. With direct action came the call for a revolution in academic teaching; the reaction against Greek philosophy, French literature or English history as irrelevant to the riots in the black ghettos, the starvation in Appalachia and the slaughter in south-east Asia. Having involved themselves so closely in the government and the problems of the day the universities were in no position to resist the demands of their students. Now, according to Professor Ulam, unless the universities are able to rebuild their walls, to revalue learning and research for their own sakes and also to acknowledge their limitations, there will be more trouble.

But this type of breast-beating can be too self-destructive. It has become painfully clear that able and valuable academics who were involved with the government's policies in Vietnam are being blamed for the war and ostracised by the academic community. The universities may react to their failures in the outside world by barricading their doors and breeding a new type of isolated academic. Fortunately, the conclusions of Professor Seymour Lipset, also a professor at Harvard, are less gloomy and more objective. He places the student revolt in its historical and international setting. It is comforting to be reminded that protests among American students about methods of teaching and the inaccessibility of professors are not unique to the 1960s, and that in the nineteenth and early twentieth centuries the activities of Russian, French, German and Italian students had far more political impact on their governments. Professor Lipset gives a detailed sociological analysis of student activists in America: their home background, the

Harvard in mourning for the war—and for academia?

socio-economic group of their parents—like their British counterparts but unlike other European students they tend to come from more affluent homes—their religion, their political views and their academic ability. He includes the results of polls that have provided hard evidence of students' reactions, political identification, attitudes to American institutions and involvement in demonstrations. Right from the start, the percentage of people opposed to the war was higher among the older age-groups than in the 21-29 age group.

But Professor Lipset is also uneasy about the present role of the universities. He is against the idea that universities should simply be teaching establishments, an advanced form of high school. Like Professor Ulam he values academic research. But he is wary of the idea that the universities should shut themselves away and that involvement in matters of policy and public concern corrupts scholarship and intellectual freedom. Professor Ulam decries activism, and Professor Lipset does not support it; but he points out that, historically, a politically inactive student body has been a much more curious phenomenon than an active one.

Passing of the liner

THE NORTH ATLANTIC RUN

By John Maxtone-Graham.
Cassell. 448 pages. £3.75.

The Atlantic liner was probably the most glamorous form of bulk passenger transport ever created. But the legend is becoming a little hard to explain. The sea voyage was, of course, born of necessity. Now that ships cannot compete, either for speed or even for price, with the jets overhead, their share of the market has almost vanished. But for all the extravagance of the decor—a trend started by the Germans—and other efforts to insulate the liner passengers from the awful knowledge that they were at sea, it was not until the 1940s that naval architects paid serious attention to the problems of seasickness. Many passengers spent the voyage in acute discomfort, and others in boredom. Yet perhaps it was their shared knowledge that they were prisoners for the duration, that this was the only way to get to the other side, that made them determined to turn the crossing into a ball. Curiously, a modern cruise—in calm waters, and with the daily thrill of arriving at a new port—has not got the same charisma.

Mr Maxtone-Graham's history of the Atlantic run avoids the superlatives that can ruin a book of this sort. His narrative is a sensible compromise between those sea-going anecdotes that are almost too good to be true, and matters of historical significance that are never too solid to be interesting. Jingoism played a big part in the development of these floating palaces. Shortly before the German Emperor left for trials in 1913 an enormous, pugnacious bronze eagle arrived, to be fitted to the prow. It added 10 feet to the ship's length, deprived the British *Aquitania* of the prize for the longest ship—and considerably reduced visibility from the bridge. German liners built at that time were fitted with gun-mountings; in the event, several of them spent the first world war impounded in New York harbour.

In one respect, however, the Germans were content to give first place to the British. The German designers realised that speed could only be bought at the expense of comfort, and, since they did not share Cunard's preoccupation with the running of a competitive mail service, they could concentrate on building some of the most sumptuous liners ever afloat. Decorators included Charles Mewès, designer of the Ritz hotels; galleys were given over to mushroom cultivation; and the cuisine was outstanding, for those who had worked up an appetite carrying out the German dictum that plenty of on-board exercise was the only way to avoid seasickness.

A crammed jumbo is neither as exciting nor as uncomfortable as an Atlantic liner could be. And on the modern liner, the blue rinses who have

The Emperor's eagle

replaced the film stars do not make good copy. Even the stowaways are duller. Gone are those of the stamp of "Prince Mike Romanoff," the debonair but bogus Russian aristocrat, who, questioned as to his cabin number by a suspicious purser, declared that "the entire ship is my cabin," and waltzed down to dinner.

Diary of a not-quite-nobody

THE FORGING OF A REBEL

By Arturo Barea.
Davis-Poynter. 751 pages. £5.

Very few of the lasting books about the Spanish civil war have been written by Spaniards. It is probably too early, even now, to ask for impartiality from a Spaniard writing about a war that tore a whole society apart and set Moroccan soldiers at the throats of peasants and peasants at the throats of priests. What one must look for instead, above all from Spanish novelists and memoirists, is the immediacy of perception and the depth of understanding of Spanish society that are denied to most foreign historians.

Arturo Barea's autobiography, the work of the man who served as foreign press censor for the Republican government in Madrid, would have proved ephemeral had it come from the hand of a lesser, or less human, writer. He is openly partisan; he regarded General Franco as a fascist in league with Hitler to overthrow democratic society. But he does not attempt to turn his opponents into pasteboard caricatures, nor to impose his developed political consciousness on the story of his childhood or his conscript service in the Riff wars in Spanish Morocco. It is this detachment from party politics, and a meticulous respect for the facts as he saw them—remarkable qualities in a civil war refugee—that make Sr Barea's autobiography a tremendously valuable social document 30 years after it was first published in three volumes.

Written in a spare, sinewy prose that is beautifully translated by his Austrian socialist wife, Sr Barea's book is set out in three parts. "The Forge" is the story of his early life, a tug-of-war in which the boy Arturo was pulled back and forth between his washerwoman mother and his middling-prosperous, voraciously possessive aunt, to emerge in stiff-collared penury as a clerk at the *Crédit Etranger*. This part of the memoirs beautifully evokes the world of the strong, silent men of Castile,

like Uncle Luis, the blacksmith at Mérida who rose at dawn to swill home-brewed brandy and gobble up a brace of pigeons.

The second volume, "The Track," probably has the greatest historical value. Sr Barea pops up as a sergeant with the engineers in Morocco, caught up in an army web of profiteering, whoring and corruption. This is a world where soldiers die horribly in the heat and flies while their sergeants make a few hundred pesetas a month by skimping on provisions; where Colonel Millán Astray of the Legion sends his lost soldiers into battle screaming "Long live death" and Major Francisco Franco is beginning to make his mark through his personal valour and his obsession for discipline.

Finally, "The Clash" brings Sr Barea back to Madrid in 1935. He suffers the siege of Madrid, an amateur entrusted with the job of looking after foreign pressmen and removing "unfavourable" news from their copy. He is finally the "rebel" of the title, but not a prominent nor a very ideological one. Lacking powerful friends in the government, he falls victim to the petty intrigues of the Republican bureaucracy even as Franco's troops tighten the ring around the capital, and leaves for France, in 1938, a defeated man.

The reader should not expect completeness from Sr Barea's book, nor more than a passing glimpse of the great men who brushed past—General Primo de Rivera, General Miaga (the beery Republican commander in Madrid) or Franco himself. There are some convincing vignettes of middle-rank party chiefs or Russian commissars, who, then as now, are more concerned with the views of the conservative press abroad than with the opinions of communist papers. But Sr Barea's book is so immediate precisely because it is the work of a not-quite-nobody, a little man with a keen eye caught up like a surfer in a great historical crisis, buffeted by it and never quite grasping its course, but able to chronicle the shocks along the way.

God in America

A RELIGIOUS HISTORY OF THE AMERICAN PEOPLE

By Sydney E. Ahlstrom.
Yale University Press. 1,174 pages.
£7.95.

By any standards it is a story of remarkable range and depth. It encompasses at one end the simple piety of William Bradford's Plymouth Pil-

Mennonites: primitivism is godly

grims: "Our fathers were Englishmen which came over this great ocean and were ready to perish in this wilderness, but they cried unto the Lord, and He heard their voice;" and at the other the promotional advertising of RIAL (Religion in American Life) with its "attend the church of your choice" posters in bus and subway. It ranges from the primitivism of the Mennonite sect to the exuberances of the Shakers and the show business of the Jesus People. It includes the theological rigour of Jonathan Edwards and the "power of Positive Thinking" of President Nixon's favourite pastor, the Rev. Norman Vincent Peale.

There is no lack of multi-volumed treatises to encompass this diversity, from "The American Church History Series" to Smith and Leland's "Religion in American Life." Mr Ahlstrom's study, though contained between two covers, can fairly be said to rival, if not exceed, these in comprehensiveness, because he seeks both to set his religious theme in a specifically social context (as his title implies) and to reassess the whole of American religious experience from the viewpoint of one living, as he puts it, in the post-historic culture of the contemporary United States.

Of these two objectives the first is considerably the easier to achieve. Mr Ahlstrom has here developed and extended, with more thoroughness and self-consciousness, a well-established genre of American religious history. It is the extent, rather than the novelty, of this reassessment that will most strike the reader. But when he goes on to revise the concept of what is relevant for religious history from the standpoint of what he calls "the turbulent sixties" (his penultimate footnote alludes to the Bobby Seale trial and riots in New Haven in 1970), Mr

The Atlantic Papers

A series of quarterly publications on current political and economic issues sponsored by the Atlantic Institute for International Affairs, Paris. Read by high level policy makers throughout the world, each paper presents an authoritative treatment of a single topic by an internationally known expert.

Trends in British Society since 1900

A Guide to the Changing Social Structure of Britain

Edited by A. H. Halsey

"This book sets out to be a convenient compilation of British social facts. It succeeds well in its purpose. . . . The coverage is comprehensive from population and family, the economy and the labour force, through the social services to penal measures and religion."—Maurice Kogan, *Times Higher Educational Supplement*.

"Future policy-makers will or should welcome the easy access to data which this volume affords. . . ."—Asa Briggs, *New Statesman*.

" . . . this is a useful book with which noisily to correct the errors of others, and quietly to correct one's own."—Colin Welch, *Daily Telegraph*.

£4.95

Macmillan

Ahlstrom may be thought to risk weaknesses as well as gains. What he gains is breadth of sympathy, a non-dogmatic sensitivity to the variety of the American religious experience. What he lacks is any clear perspective beyond that of a vague liberalism and, as it were, intellectual egalitarianism. Little wonder therefore if the story frequently lacks edge and drive: the shadow of the card catalogue often falls across the page. Where, however, the "enemy" to be exposed is the arch-opponent of liberalism and the claims of diversity and toleration, even this weakness of Mr Ahlstrom's pays off, in a renewed insight and vitality. Some of the best pages in his book are those devoted to that religion of American nationalism which many have thought to be the most pervasive of American faiths but which the historians of creeds and sects have seldom been willing to recognise. Mr Ahlstrom's Part VIII on "The Age of the Faltering Crusades" is a frank and shrewd incorporation of this theme into the more conventional story of faith and church.

One complaint is, quite simply, a request for more. Fleeting lunacies apart, the United States has invented two distinctive and outstandingly successful religions of its own—Mormonism and Christian Science. So remarkable an achievement seems inadequately explained or recorded in Mr Ahlstrom's synoptic survey. Mormonism rates some eight or nine pages; Christian Science some five or six. Joseph Smith and Mary Baker Eddy might have valid grounds for protest. More important, perhaps, the enquiring layman will find most of his questions about these movements, so striking for their creeds and their social achievements, largely unanswered here.

All contributions welcome

PROJECT EVALUATION: COLLECTED PAPERS

By Arnold C. Harberger.
Macmillan. 342 pages. £9.50.

The problem of evaluating investment projects in developing countries, where relative prices may fail to reflect resource scarcities, has drawn a lot of attention in recent years and it is good to have Professor Harberger's contributions assembled in one volume. Although there is some overlap between them, the papers fit together much better than is usual when authors reprint their selected works.

Professor Harberger is firmly convinced that in countries without developed capital markets the right discount rate to apply in project evaluation is the social marginal productivity of capital in the private sector. He argues that this can be approximated by measuring the private rate of return on existing private capital and then by making corrections to allow for the effects of taxes and for any excess of wages over the shadow price of labour. Calculations of this sort are presented for India and Colombia, both of them good examples of his penchant for rough and ready measurement in a field where many other writers are content with precise but unusable theorising.

A second and related aspect of his approach is his view that the marginal productivity of labour in agriculture is not nearly zero and in any case is not as high as the shadow price of labour to industry. He produces an ingenious model to show that the existence of an urban pool of unemployment can be an equilibrium phenomenon, not demanding any downward adjustment of observed unprotected-sector wages to obtain the shadow price of labour.

This, like his views on the discount rate, is controversial and it is a pity that Professor Harberger says so little about other people's ideas. But much of the discussion, such as the notion that the discount rate depends on the choice of numeraire, has appeared since he wrote these papers. A final up-to-date essay which commented on some of these issues would have made a good book better. As it is, he concludes with a case study of a proposed dam in Argentina and a general essay on how the United States could make aid more effective.

Judgment for Effie

THE RUSKINS AND THE GRAYS

By Mary Lutyens.

John Murray. 298 pages. £4.

A blink of the eye turns this title into "The Ruskins versus The Grays"; another reduces it to the cold courtroom singular, "Ruskin v Gray." And that, in a way, summarises the popular idea of the marriage between Ruskin and Effie Gray, the one with all the heavyweight wealth of Denmark Hill, the other a pre-raphaelite wraith.

Thanks not least to the scholarly work of Miss Mary Lutyens, this picture has lately begun to shed some of its more romantic over-simplifica-

tions and to take on a harder, more realistic, line. The name of her book, to begin with, states at least that Effie had a family like normal girls. Not that hers was an altogether normal family; there were tendrons of speculation and bankruptcy clinging to the family tree, which actually had branches entwined with the outwardly more prosperous growth from the Ruskin trunk.

Yet even here there was blight in the form of an old suicide, and Ruskin's father himself does not stand up too well to cross-examination. Jane Austen would greatly have appreciated him for so beautifully representing in his own far from simple personality that horror of commerce by which his own kind had made its way. To be "in trade" was to be without the law, and part of the strain between Ruskin and Effie sprang from old Ruskin's unwillingness to find George, her brother, a "position" in London.

Here, indeed, are matters far removed from all that fuss about Effie offending Ruskin by being as other women in body. That is, of course, mentioned by Miss Lutyens, but the emphasis is, rather, on the social comedy implicit in the narrative, on the lack of balance in the financial scales as weighed between the families.

Miss Lutyens has uncovered some fascinating material in the letters that whizzed about between the families and the principals themselves. There are enough of Effie's to show her as an attractive and spirited girl, although not strong in health (hypochondria was raging round like a bush fire) and it is easy to believe in the fascination she had for the eminent and the elderly. Ruskin, on the other hand, seems to dwindle in the face of the limelight turned on him. In his correspondence with, for instance, Anna Blunden, he showed the more attractive side of his nature; here, as a young man, he is hard to take and to like.

His hatred of babies (masking a hatred of responsibility?) which more than anything else seems to have condemned the girl to years of unconsummated marriage, his supine acquiescence in the doting spoiling lavished on him by his parents, his self-expressed indifference to the problems and sufferings of others, all add up to give at least a measure of justification to the thunderous condemnation by Millais that was to come. But it would perhaps be best to enjoy the book as a delightful social document, to be read side by side with, say, "Mansfield Park."

Short list

US Investment in Scotland by David J. C. Forsyth (Pall Mall, £7.75). Americans love Scotland's whisky and golf courses. They also, it seems, love to invest there. American firms have invested an average of \$143 per Scot, more than in any other foreign country except Canada, and nearly twice as much as in the rest of Britain. This excellent study shows that this has been the result of regional incentives. It also analyses the effect on Scotland's economy of this influx of capital, which has been generally very beneficial. In the 1960s, for example, one new job in three was created by American firms. The only bad effect of American investment is that it may have helped accelerate wage inflation, since companies like Chrysler seem to have given in to trade union demands rather too easily.

The Economics of Public Policy by E. Victor Morgan and Ann D. Morgan (Edinburgh University Press, £4). The temptation to write books aimed both at ordinary citizens and at students of economics is a strong one. This latest manifestation of it is in four parts. First comes a theoretical introduction to welfare economics, then a less theoretical introduction to macroeconomics culminating in a chapter on incomes policy and followed by seven chapters on transport, housing and other such topics in applied welfare economics. Lastly, there are two chapters on international trade and payments. It is, as one would expect, an extremely competent textbook. Being concisely written, it covers a great deal of ground.

The Economics of Medical Care edited by M. M. Hauser (Allen and Unwin, £5.50). The bill to reorganise the health service has appeared, the first intimation of the brave new world of management in the provision of medical care, and the members of the proposed new area health authorities would be well advised to read this book. The outcome of a conference at the University of York, it includes the papers and comment on such topics as efficiency and equality in medical care, a cost-benefit approach, decision-making in hospitals and operational research, and it has contributions from Sweden, France and the United States. There is a really excellent summary by the editor which is stimulating but also cautionary, since it shows the difficulties of an economic approach to the subject.

Delmas-Harrap French and English Business Dictionary compiled by George Anderla and Georgette Schmidt-Anderla (Harrap, £12). If you are in business, the law, the social sciences or even computers, this is the dictionary to turn to if Harrap's New Standard French and English Dictionary fails you. The compilers have spent 10 years gleaning business terms, both in Britain and America, and claim that this is the first bilingual dictionary of its kind and size. The size may not be an unmixed blessing: at over 5lb, the book is less than portable.

The New Militants: crisis in the trade unions, by Paul Ferris (Penguin, 25p). This little book is a highly readable and up-to-date description of militant trade unionists in 1972. Sadly, there is little original research and even less analysis. Mr Ferris is an accomplished journalist, but does one really want to know that:

On the dot of 12.30, he [Laurence Daly] appeared from the Euston Road and said he had driven with colleagues straight down the motorway after celebrating a union official's retirement; a short man with shiny face and strong eyebrows, porkpie hat jammed on his head, carrying a bag.

If one does, this book has plenty more to offer.

4 days, 40 hours, edited by Riva Poor (Pan, .75p). Earlier this year, the Trades Union Congress passed a motion which among a dozen other things called for a four-day working week. The TUC sees the four-day week as a device for reducing working hours, but, as this book's title suggests, the two are not necessarily linked. The book mainly consists of a series of case histories of American experience, where a sprinkling of smaller companies have introduced a working week of four 10-hour days. Most have found it has worked well, although the unions have been apathetic. One chapter is devoted to British experience with the four-day week, but since only two tiny firms have adopted it so far, there is not much to say. It may never catch on seriously, but then that is what was once said about the five-day week.

British Trade Unionism: select documents by N. Robertson and K. I. Sams (Basil Blackwell, £9.50). This two-volume work is a handy digest of the multitude of documents about unions published between 1914 and 1969; handy, that is, if your interest extends to such literary gems as the rulebook of the National Union of Boot and Shoe Operatives.

LAW AND POLICY IN INTERNATIONAL BUSINESS

1972-1973 Volume

1000 pp.

£4 (U.S. \$12) per volume—3 issues.

CONTENTS

Trade with the People's Republic of China: The Canadian Experience. Henry S. Albinski.
Transnational Securities Trading and Its Regulation. Manuel F. Cohen.

The Antidumping Laws of the United States: A Legal and Economic Analysis. Bart S. Fisher.

Middle East Oil and the U.S. Energy Crisis: Prospects for New Ventures in a Changed Market. Geoffrey D. C. Best.

The Legal Structure of the Par Value System. Joseph Gold.

And many other articles, comments, and reviews by distinguished authorities in the field of international commercial policy.

"In this era of greatly expanded international relations—economic, legal, political, and social—Law and Policy's analyses of problems and developments in the legal-economic sphere should be of very valuable assistance to those who work in both the public and private sectors." Wilbur D. Mills, Chairman, House Ways and Means Committee, U.S. Congress.

The Changing Balance of Power in the Persian Gulf

by ELIZABETH MONROE

The coming world energy crisis and its economic and political consequences in the Middle East was examined by 22 international experts, oil executives, bankers and diplomats at the American Universities Field Staff's Rome Center for Mediterranean Studies last July, meeting under the chairmanship of Sir Denis Wright, former Ambassador to Iran. Their sobering findings are ably, concisely reported by the Oxford historian, Miss Monroe.

\$4.95 (£2. plus postage) through your bookseller or directly: Book Department, American Universities Field Staff, P.O. Box 150, Hanover, New Hampshire, 03755, U.S.A.

Europe's banks come in all shapes and sizes. So why talk to Toronto Dominion?

In Europe, banks are already pretty thick on the ground, so what special advantages can we offer?

Look behind some of today's important projects in Europe, and you'll see Toronto Dominion have quietly established themselves as a major force on the international banking scene.

Bringing finance and expertise to projects as varied as mining in Australia, harbours in Greece, roadbuilding in Spain and steel plants in the U.K.

If you need this kind of financial service, the man from Toronto Dominion can show you the full extent of our international banking activities.

He'll bring you the experience not just of a great Canadian bank, but of a truly great international bank as well.

TORONTO DOMINION BANK

where people make the difference.

Who cares about family planning?

please do something about it.

Give us your time. Contact your local Oxfam organiser via the phone book or by writing to the address below.

Send as much money as you can. We need it urgently to continue the projects we have started and also to tell others in this country about some of the problems which poor countries face.

In return, we will send you a copy of *A Kind of Caring* — a report of five journalists on Oxfam's work in the field.

We believe this is the kind of project you approve of.

It's up to you to prove us right.

We do.

By the time you finish reading this, another 90 babies will have been born into the world.

Many will be welcomed, loved and provided for.

Many won't.

Every single baby will need food, clothes and shelter. And space.

Oxfam believes that no matter where a child is born, he or she should be positively wanted.

For this reason we're currently financing family planning projects in 16 countries.

If you agree that family planning is one of the most important contributions towards a better world,

National and Commercial Banking Group Limited

GROWTH with wider services

**Leasing·Factoring·Export Finance·Access·Insurance
Corporate Advice·Saving Schemes·Share Registration
Trusteeship·Personal Loan Schemes**

Statement to the Shareholders by the Chairman, Mr. J. O. Blair-Cunynghame

The Annual General Meeting of Shareholders of National and Commercial Banking Group Limited will be held in the North British Hotel, Edinburgh, on Thursday, 28th December 1972 at 12 noon. The following is from the Statement by Mr. J. O. Blair-Cunynghame, O.B.E., LL.D., D.Sc., Chairman of the Board, which has been circulated with the Directors' Report and Accounts to 30th September 1972.

Results

The Group profit before taxation increased from £24,158,000 to £29,870,000 or by 24 per cent. The rise in profit after taxation is from £14,382,000 to £17,816,000 which also represents a 24 per cent. increase.

This year's total includes second half earnings not only better than for the six months to 31st March 1972 but also greater than for the corresponding period of the previous year. This satisfactory result is due to a number of factors which include the higher sterling and currency resources available for deployment, the satisfactory margins maintained on wholesale money activities, at any rate in the earlier part of the year until interest rates generally started to turn up again, the greater commission and fee income and a large rise of some £1.6 million after tax in the share of associated companies' earnings, particularly in the Royal Bank of Scotland.

These contributions to greater income were more than sufficient to offset the rise in costs which were reasonably well contained and also the reduction from an average Bank Rate of 6½ per cent. in 1970/71 to an average Base Rate of about 5½ per cent. this year.

Current and deposit accounts rose by £360,210,000 to £1,533,015,000 whilst advances increased from £788,808,000 to £1,082,964,000. At 30th September 1972 capital and reserves stood at £129,255,000 compared with £119,231,000 at the end of the preceding year.

Dividend

Since the standstill outlined by the Government in the White Paper issued on 6th November includes dividends, we are thereby limited in our recommendation for a final dividend

to the same as last year. The cover, on the basis of accounting which includes the share of associated companies' profits, is 3.1 times compared with 2.7 times last year and would certainly have justified a higher distribution had there been no restraint.

The Group

The commercial policies of both banks in the Group have reflected the changed trading conditions resulting from the new arrangements introduced last year to encourage greater competition in the banking industry. These have been directed to expanding revenue by offering customers new and better services at realistic prices and, at the same time, collating and analysing fuller information regarding market potentialities and comparative contributions to profitability.

Common to both banks has been the Group decision to join the Access credit card scheme and thus make this additional service available to all customers. A share option scheme for senior executives was to have been proposed to shareholders for approval but was withdrawn, temporarily, in view of current circumstances.

The Royal Bank of Scotland Limited

The Royal Bank of Scotland has continued to develop a wide range of services for all its customers, small and large, private and corporate, representative of every facet of the Scottish economy. The bank has played a leading part in the lending by British and American banks to the North Sea Oil industry and, with the help of its New York Office, maintained continuous contacts with the important foreign and domestic service industries growing up in this field.

In a more general way, by the setting up of insurance, leasing and financial advisory departments, the Royal Bank of Scotland is catering for the needs of the complete spectrum of the Scottish business community. There has also been further developed machinery for the provision of risk capital for new and growing ventures which need this kind of help.

The growth in the Royal Bank of Scotland's earnings continues to come from a useful increase in resources—both sterling and

foreign currency—from a growth of commission income and from the continued process of branch rationalisation. That part of the Royal Bank of Scotland's total of £16.3 million pre-tax profit which now comes from their share of Lloyds and Scottish Limited and of Associated Securities Limited has now reached over 30 per cent.—i.e. £5.5 million. This is a useful counterbalance to the continued sluggishness of the Scottish economy. The bank is a market leader with about half of the deposit banking business in Scotland.

Williams & Glyn's Bank Limited

In contrast to the Royal Bank of Scotland, on the domestic side Williams & Glyn's represents only a small share of the English deposit banking effort and, accordingly, makes the best use of the opportunity this provides to present the greatest possible flexibility of marketing approach to customer service, based on the mixed bank concept and on initiatives best suited to individual business sectors. Examples of this policy in retailing are the Nest Egg plan and the Masterguard policy. On the merchant banking side Williams, Glyn & Co. and Williams & Glyn's Leasing Company have both had an active year. An important development was the setting up of BankAmerica-WilliamsGlyn Factors Limited in which Williams & Glyn's has 39 per cent.

On the international banking side, where Williams & Glyn's has been increasingly active, a significant feature was the successful Eurobond issue of \$25 million with an 8½ per cent. coupon. During the year the formation of the Inter-Alpha Group of six European banks, of which Williams & Glyn's is a member, was announced. Williams & Glyn's intends to form a subsidiary company in Piraeus before the end of 1972 to serve its extensive shipping business.

The greatly increased profits of Williams & Glyn's compared with the previous year are attributable to a number of factors. These include, firstly, greater resources, both sterling and currency, in which the latter has played an increasingly important part, secondly, rising commission and fee income and, thirdly, a most satisfactory containment of costs based on a sound system of management accounting and information.

Banking and the Economy

General

Three features of the general economic background were prominent during the year in their influence upon banking operations. Firstly, the new arrangements introduced in September last year designed to encourage competition in the industry and for the control of credit, have worked well against a background of fiscal and other measures by the authorities to encourage growth and industrial investment and achieve some reduction in the unacceptably high level of unemployment. Within this setting the new freedom for borrowers and the competitive lending efforts of the banks have brought an exceptional rise in deposits and the money supply. Although the pace of expansion slowed in the latter part of the year and a call for special deposits a week ago was evidence of the authorities' concern in this respect, it is still not wholly clear how well the new arrangements will operate in a period of severe restraint. It would, however, be a seriously retrograde step if the authorities, in reducing the rate of expansion, were to consider revoking the underlying principle.

The second most significant feature of the banking scene is in the field of international banking operations which are playing an increasingly important part in the work, plans and revenue of all banks in this country and throughout the world. The United Kingdom's decision to join the E.E.C. will, I believe, be judged ultimately—perhaps fifty years from now—on grounds far wider and more deeply rooted than economic gain. These will include political, social and cultural considerations of great importance to mankind, including the contribution it may make to peace in Europe. So far as banking is concerned and apart from early developments such as the setting up of a European Monetary Union which may itself raise some problems in reconciling differing financial systems, it is well to remember that there has been a large measure of mutual

penetration and understanding between the banks in the United Kingdom and in all other European countries for many years. The formal entry into Europe will serve to underline the importance of further progress in this direction.

Finally, there is the present problem of domestic inflation in the United Kingdom. The Government has just announced the first stage of its programme for controlling inflation. The threefold objective remains to contain the rate of income and price increases and to allow the growth of the economy to provide the necessary stimulus to existing plant and thus absorb some of the present high unemployment. It is clear that there can be no long-term benefits for anyone from rapidly rising prices and incomes or from repetitive devaluations of the currency to meet balance of payments difficulties.

Scotland

In the Scottish economy during 1971/72 two contrasting features predominated. Firstly, there was a depressing reflection of the United Kingdom economy as a whole where the recovery of activity was much slower than expected. Against this background the Scottish banks have done well to maintain their position by participating in the rapid upturn in United Kingdom deposits and advances over 1971/72.

The second feature, however, is a really significant improvement in the prospects for the future, not only because of similar hopes for the United Kingdom economy but due, firstly, to the current and potential impact of North Sea Oil and, secondly, to the much better regional incentives introduced in the budget, which may get further force from the regional policy of the E.E.C.

Future Prospects

Given these three general conditions, therefore, that the year-old arrangements to encourage competition and control credit are maintained, that international banking continues to develop on the basis of the new constructive thinking and hard bargaining regarding currency exchange rates of which clear signs appeared at the International Monetary Fund and, finally, that domestic inflationary rates are abated without, however, too severely restricting the money supply and so as to stimulate industrial investment, then the growth potential for banking profitability is there.

To secure and increase our share of these benefits, the major efforts of the two operating banks in the Group will continue to be directed to giving the best possible service to customers, anticipating their needs if possible and, at the same time, giving effect, quickly and decisively, to changes of commercial policy based on timely management information about how our business runs. All this underlines the tremendous importance of the excellent communications between all levels of management and staff, which, in the context of their individual management styles, is one of the most marked characteristics of the Royal Bank of Scotland and Williams & Glyn's.

Business Brief

How savers beat inflation

When you newly fashion an old-fashioned word like bonds, you can be in business. The three fastest-growing new investment media in Britain today are managed (or flexible, or balanced) bonds, growth bonds and income bonds. Run through any week's newspapers and you will find one or other, or all three, on offer. Managed funds are now attracting £250m a year, according to a recent estimate by the investment magazine, *Planned Savings*. And insurance brokers say that growth and income bonds have together already taken £260m this year. As a yardstick, the net inflow into unit trusts was only £191m (to October). Building societies, however, are still in a different league; they got £1,782m (to October).

Managed funds appeal to people who shy away from the risks of investing in equities, yet are too worried about inflation to stay in building societies. Growth and income bonds offer no inflation hedge, but the attraction of a guaranteed high post-tax return. How do they all work?

Managed funds

It all started off with the equity-linked life policy. That is a special life policy, all the premiums of which (less a disclosed charge) are invested in a unit trust, which might be set up specially for the purpose. When the policy matures, or when you withdraw, you get the value of the units bought with your premiums, plus the reinvested net income they have produced. This idea was soon adapted, substituting property for equities. While unit trusts are not legally permitted to invest in property, it is quite legal for a life assurance company to run a fund entirely invested in property, consisting of the premiums from property bond life policies. So the property bond—a form of life policy—came into being, enabling the ordinary investor to invest in commercial property.

The managed fund grew out

of this: it is invested in a mixture of equities, property and fixed-interest, in proportions which can change as the fund managers see fit or good opportunities for buying commercial property arise. When the policy matures, or is cashed, the investor gets his slice of the capital, plus reinvested income.

Where the managed fund falls short of the conventional with-profits life policy (except for the new Lloyd's Life one) is that it does not offer the chance to share in the life office's other profits (made from without-profits life policies), or in the income from the office's accumulated reserves. But managed funds offer one decisive advantage. They are suitable for lump-sum investment, unlike conventional with-profits policies which are only good for regular premium investment, with high or low life cover tacked on.

Managed funds, too, can be used to provide pension policies for people in jobs without a pension scheme. But most of the money comes in lump sums. Hambro Life—the new company which Mr Mark Weinberg has built up from scratch to funds of £100m in 18 months—sold policies in October that will generate annual premiums of £500,000 a year, but lump-sum, single-premium policies of £103m.

These lump-sum investors were clearly not interested in life cover. They would not get any life assurance tax relief and were not trying to avoid surtax. There was a time when single-premium policies were a fine old way to escape surtax since the income accumulated after tax at just 37½% (the flat rate a life office pays). When the surtax payer needed money, he cashed his bond (no surtax, but possibly some capital gains tax) and started again.

Top-slicing

Mr Roy Jenkins put a stop to these high jinks in his 1968 budget. A single-premium policy (or bond, as it is now called) became a "non-qualifying" life

policy (to "qualify," premiums must now be paid for 10 years or more). When it is cashed, the entire gain (ie, the reinvested net income) is then charged to surtax on the holder. For this there is a special formula, known as top-slicing. You divide the gain by the number of years the bond has been held, and add the result on to your income in the year you cash it. The whole gain is then taxed at whatever rate of surtax applies at that time. If you can manage to wait for a year when you are below the surtax limit—say after you have retired, or a sabbatical year, or when you get the sack and take time to find another job—then fine: no surtax. But you may need to cash out before that. You need strong nerves for this game.

However, the bulk of the money now flowing into managed bonds is not running away from surtax. The typical investor is a chap in his 50s, who up to now has relied on building societies (deposits £14.6 billion), or banks (personal deposits £9.5 billion), but who has become really rattled about inflation and is looking for a better return to make up for it. Confusingly, the bonds are called by a number of different names such as Schroder's flexible bonds, Lloyd's Life's multiple growth bonds, Abbey's selective bonds, Tyndall's three-way fund, Save and Prosper's balanced investment bonds, and the most popular one, Hambro's managed bonds. As a refinement, under many of the schemes you may now cash in, say, 6% of your original investment every year, giving you an income free of income tax, but subject to top-slice surtax.

Growth bonds

Growth and income bonds are both aiming for the same market. The growth bond was first on the scene. Although sold only by life offices, it is not a life policy, but a so-called deferred annuity. You pay a lump sum now; at some agreed point in the future the life office starts paying you an annuity of so much a year for life. Obviously, growth bonds are intended for people saving for retirement; but they also invariably give an option to cash out at the point when the annuity would become payable, or even (subject to a penalty) any time before that.

This means that if you had invested, say, £1,000 in a recent

Winning Weinberg

offer of Trident Topgrowth Bonds, you could choose a maturity date for the bond between 5 and 15 years ahead. If you had chosen 10 years, you would have had the option of either cashing out for £2,220, or taking an annuity then, the amount of which would depend on your age, but would be laid down at the outset. The investor who takes the cash will have a net tax-free build-up between 8% and 8.3% a year over the 10 years.

How can a life office give such a generous rate when the money goes straight into fixed-interest stocks, yielding 8-9% gross? Only because its annuity fund is taxed in a special way. Its income is investment income, its outgoings are the annuities it is paying. The Inland Revenue considers part of these to be capital and part income; only the income part is taxed, in the hands of the person who gets the annuity. Normally, the life office itself is not taxed on its investment income, except when this is greater than the annuities it is paying out. So whenever the office's income falls below its annuity outgo, it can issue a batch of growth bonds (and might sell £2m worth in 48 hours) to bring its investment income nearer to its annuity outgo, knowing that it will get the extra investment income tax-free.

Income bonds

The income bond developed from the growth bond. If you had invested £1,000 in a 10-year Star High Income bond, recently offered by Eagle Star, you would have been promised two things: a tax-free income for

10 years of between 7.5% and 8.3% depending on your age, plus, at the end of the 10 years, either £1,000 back or an annuity for life. The Eagle Star would have split your money into two parts. About £450 of it would be used to buy, in effect, a growth bond, which would accumulate to £1,000 over the 10 years, at the end of which you could either cash it or take the annuity. The other £550 would be used to buy you a 10-year immediate annuity. A large slice of the annual income payments is simply your £550 being returned to you, which makes it not taxable. Only the small remaining slice counts as income on which you are taxed. The returns quoted are net of this tax, assuming you pay at standard rate (or 30%, as it will become next April onwards). With complete security of capital and reasonable provisions for pulling out, the standard-rate taxpayer gets a guaranteed net return of over 7½%, against 5½% in a building society.

Surtax problems

The bulk of the money both types of bond are attracting would otherwise have gone into building societies. But brokers suspect that the massive advertising for these bonds has also lured in a good deal of mis-directed surtax money. For surtax payers income and growth bonds are a much more mixed proposition since they are "non-qualifying." If the holder pays surtax (or the higher rates of unitax, after next April), he is taxed on the gain in the year the bond matures, by the top-slicing method. So our investor in Trident Topgrowth bonds would be charged tax on the gain of £1,220. If he chose to take the annuity instead of the £2,220 cash, he would still be caught. Only a small part of the annuity payments would count as capital—a part corresponding to the £1,000 invested 10 years earlier, not the £2,220 lump sum cash he could take as an alternative at that point. If he is aged 65 when the bond matures, the spot cash option of £2,220 will leave him with £1,220 surtaxable by top-slicing; the annuity option of £226 will allow him £68 to be counted as capital, but £158 as income liable to income tax and surtax (or their new equivalents).

A surtax payer is no better off with income bonds. The £1,000 he gets back at the end

includes a gain of about £550 (£1,000 less £450), on which he gets top-slice surtaxed. If he chooses the annuity, about two-thirds of it (if he is aged 65) is taxed as income. But of the income he gets during the life of the bond, only a small part counts as income for tax purposes. Most of it is considered as return of capital, that is, the £550 used to buy the immediate annuity to provide the income during the term of the bond.

Both life offices and some of the faster-moving brokers are guilty of not spelling out clearly enough just how unsuitable these bonds can be for surtax payers. For people just in the surtax bracket when the bond matures, the drawback is not serious. The top surtax rate man, however, might buy an income bond thinking his capital was guaranteed on maturity, only to find himself clobbered for top-slice surtax on the presumed gain. On a £1,000 bond for 10 years, this could cost him £275, or even more for a longer term.

He might, of course, have retired by then and fallen out of the surtax bracket. But unlike the holder of a single-premium managed bond (as already explained), he cannot escape top-slice surtax by waiting for a year when his income is low and cashing in his bond then. He must decide the term at the outset. And his tax rate at maturity may be higher than he expected.

Avoiding income tax

Optimists reckon that the Inland Revenue is unlikely to prod the Government into legislating against growth and income bonds, but they could be wrong. Although these bonds are pretty useless for avoiding surtax, they do happen to be a fairly effective way of avoiding income tax. As long as only growth bonds were being issued, the revenue might not have worried. Life offices could only issue enough of these to boost their own annuity fund investment income up to the level of

the outgo, which put a strict limit on numbers. But an income bond produces income and outgo in roughly comparable amounts, both largely free of income tax; so there is no limit on the quantities the life offices can issue.

Yet the Government will be wise to think twice about getting rid of an attractive new savings device used mainly by non-surtax payers. The returns are still barely enough to keep pace with inflation. The penalties for cashing in the bonds before maturity should keep dissaving down. And the intense promotion behind the bonds may actually encourage people to tie up loose savings they might otherwise have spent.

It is the building societies and local authorities who are losing money to the bonds who should worry, rather than the Inland Revenue. This money is being diverted to equities, commercial property, gilts, and fixed-interest stocks. The long-term implications could be intriguing.

Five ways to invest your money

CONVENTIONAL WITH-PROFITS POLICY

Invest £x a year
(less life assurance tax relief, worth 16% of premiums)

Equities, property, fixed interest.
Plus surpluses from life office's non-profit policies and income from reserves

Sum assured payable on maturity or death, guaranteed at outset.
Plus reversionary bonuses added on every year (according to profits)
Plus terminal bonuses added on at the end (according to life office's unrealised capital gains then)

EQUITY-LINKED POLICY

Invest £x a year
(less life assurance tax relief, worth 16% of premiums)
Or invest a lump sum

Equities*
(less a small deduction to cover charges and cost of life cover)

On maturity or earlier death
Value of equities bought with premiums and reinvested income. Guarantee of a minimum value on maturity or death. Much higher life cover can be added on (small charge) if wanted

*Property bonds and property-linked policies, same; property in place of equities

MANAGED FUNDS

Invest a lump sum or £x a year
(less life assurance tax relief, worth 16% of premiums)

Equities, property, fixed interest.
(less a small deduction to cover charges and cost of life cover)

On maturity or earlier death
Value of share of fund appropriate to invested premiums and reinvested income. Similarly on death. Guarantees etc as for equity-linked policy

Option to cash in 6% (or so) of policy annually

GROWTH BOND

Invest £1000

accumulates over 10 years to
£2220 cash or Annuity of £226 (if then aged 65)

INCOME BOND

Invest £1000

about £450 into a growth bond — accumulates over 10 years to — £1000 cash or Annuity of £90 (if then aged 60) £122 (if aged 70)
about £550 buys an immediate annuity — income of £75 p.a. (free of standard rate tax) for 10 years

The new IBM Copier II. Can your copier catch it for speed, and match it for quality?

Meet the new IBM Copier II.
We believe that there's no copier capable of catching it for speed and matching it for quality.
In today's business, most copying jobs are impulse or convenience copying which means probably 3 or less copies per original. So IBM has designed the Copier II just for you.
Now, with consistently high quality, you can make those two or three copies from several originals really fast.
In just 6 seconds* you get your first copy.

Repeat copies, or copies of further originals, are produced every 2.4 seconds*.
And here's how it's done.
Using a unique document feed system, the originals are fed in, copied, ejected and stacked without re-starting the copy cycle for each original. No bothersome lid-lifting and aligning process, and all the copies are of the very highest quality.

Even at this speed, every single copy is sharp and clear with a consistently high quality. Whether it's of a halftone, a solid or colour. Whether it's taken from a large book, a section of a technical drawing, a map or a plan. All can be copied on to plain bond, without any folding or creasing of the original.
You can change the copy size merely by touching a button - there's no need to change the paper. And because the paper is roll-fed there are fewer jams.
In fact, because the machine does more - you do less.

Measuring only 41" long by 28" wide, you can site it where the work is. And that's exactly where it should be. Simple to use, it requires a minimum of operator intervention. And it's predictable in cost because of the easy-to-understand price structure.

But you should take a close look at Copier II for yourself.

Compare it with your own copier.
We think you'll find that no other copier is going to catch Copier II for speed and match it for quality.

BUSINESS

The last men on the moon

The last American astronauts set off for the moon on Wednesday night, and no man is likely to set foot there again for another 20 years. It leaves the space programme in something close to ruins

The Americans have not really begun to ask themselves why Apollo 17 has turned out to be the end of a programme that once looked as if it would run up to Apollo 22 and beyond. The first men landed on the moon only three years ago. This will be the seventh team to set out and, with luck, the sixth to land. The moon is not a small place—its area is equal to the whole of the land mass of the earth—and a dozen astronauts spending a few hours on a few square miles of its surface cannot be said even to have begun to explore it.

As good a face as can be is being put on this last flight. Everything possible is being crammed into the mission, knowing that its results must last for at least 20 years, that at least two of the previous landings have been chiefly a waste of time, and that there was the terrifying near-failure of Apollo 13 which all but broke up before it had even reached the moon. Three men and five mice (for cosmic ray research) are attempting the trip, and for the first time on any moon flight one crew member is not a professional pilot but a geologist. Captain Eugene Cernan, the mission commander, and Commander Ronald Evans, the command module pilot, are typical professional astronauts, but Dr Harrison Schmitt, the lunar module pilot and a teaching fellow of Harvard,

will be the first and last scientist to set foot on the moon in this generation.

Astronauts have refused to fly with scientists before because they said the risks were too great to carry civilian passengers who were at best only amateur pilots. If anything went wrong on board the spacecraft, they said, the presence of men who were scientists first and astronauts second would be a positive liability. Apollo 13's epic struggle home as good as proved them right; three experienced test pilots just got away with their lives. But that attitude has cost them dear in the goodwill of the scientific community. Not that the scientists actively resented their exclusion from the moon flights, although many of the young scientists recruited as astronauts left the National Aeronautics and Space Administration as they saw their chances of landing on the moon receding to nothingness. But the absence of scientists on the moon has reduced the scientific value of the moon landings, and diminished scientific interest in them.

The astronauts did what they could to offset this: they studied geology, learning to recognise and describe rock and soil samples in an adequately intelligent way to scientists following their moon walks on the television monitors. They picked up what they were told to collect and each crew snuffled like a pair of docile bird dogs. They were as effective as well-trained retrievers—but nothing more. If he is lucky Dr Schmitt is going to be the first man who will stand on the moon and really know what he is looking at.

The caution and stubbornness of Nasa are also responsible for the fact that at least two landings were made in places that were profoundly uninteresting; Nasa had been warned in advance that they would be. This was especially true of the Apollo 16 mission, which duplicated that of Apollo 14 in many respects. And that was not a particularly outstanding success either. This time the scientists have got their way, as they have over Dr Schmitt, and Apollo 17 is going to the narrow valley where the Littrow crater lies among the Taurus mountains, a site that Nasa objected to on safety grounds but where the scientific urgency of making this last flight a success has overruled all other misgivings.

The area is not easy to get to. The launch has to

take place at night during the period while the moon is in the right position—and that is another thing that Nasa would have preferred to avoid. Some advisers doubt whether the technique of landing lunar modules is up to the task of steering them down into so small a valley at a sharper angle than any used before, but those misgivings have been overridden too. Had there been the prospect of another moon flight, scientists might not have been so insistent, but ever since Apollo 15's command module flew over the spot in the middle of last year, they have wanted to get into that crater more than they wanted to go anywhere else on the moon.

Their reason was that photographs taken of it by Major Al Worden, which are so clear and sharp that they show objects as small as 3ft across, picked out sharp-rimmed craters that look like relatively new volcanoes—if you regard a few hundred thousand years as young. This could be one of the most recently formed parts of the moon, and scientists want samples from it; they are no longer interested in oldish sites. At the same time, it is surrounded by mountains as old as the moon itself, from which massive landslides have sent rocks from the peaks down into the valley for which the astronauts are aiming. Astronauts have regularly claimed to have brought back specimens of original moon bedrock, but this will be the first time that they can be sure of collecting samples that came without question from the mountains themselves. There is enough doubt about how the moon was formed, when and by what process, and how often it has melted, for scientists to feel the need for unambiguous evidence. The belief that the moon has a liquid core is gaining respectability since two meteorites hit it this year—the last on its backside only three weeks ago—and sent reverberations ringing through the instruments implanted on its surface.

Without the support and enthusiasm of the scientists, Nasa's hopes of keeping its space programme lay in getting the public's support, and that it failed to do. Without a flow of scientific information to give some purpose to the landings, Americans simply did not see

what the astronauts were doing, and their diversification into the souvenir business has not helped their image. If the astronauts were not bringing back results there seemed no object in continuing to finance them. This, of course, is a travesty of what was actually happening, but because Nasa had from the outset refused to release any scientific news from the moon landings until it had been worked over, agreed with and deodorised by the scientific establishment, and all traces erased of the violent controversy it was causing the landings appeared both unproductive and boring. Since the astronauts were not putting the moon to any other obvious use, like establishing temporary bases, people were left wondering what the project was really for.

President Nixon has not made it any easier for them to find out. His space policy has been to cut spending to below an effective threshold level, while maintaining the outward appearances of a thriving programme. He has allowed the remaining Apollo rockets to be diverted to such public spectacles as a joint link-up with the Russians which will do nothing more useful than foster a sense of togetherness that could come unstuck if anything goes wrong. He has set in motion a programme for space shuttles that will in their turn make it necessary to develop space platforms and deep space ferries, and eventually allow the Americans to return to the moon—perhaps 20 years from now. But the money is plainly inadequate for anything so ambitious, and in their efforts to keep costs down Nasa's engineers have chosen shuttle systems that they will almost certainly have to drop at some later date. Some future President may decide it is worth breathing life into the programme again. But Mr Nixon does not look like being that man, and Europe is understandably cautious about accepting his invitation to join in work on a space shuttle about which the Americans themselves are so noticeably unenthusiastic. The picture of the last man leaving the moon will induce nostalgia. The Skylab will be promoted on the world's television screens, and the Mars probes will keep the enthusiasts happy for a while. But it will take a long time to get the Nasa machine into gear again.

Key indicators: British economy

Bank advances

Large rise in November. Both personal and industrial loans were up.

Employment

Lower in the production industries in September after four months of hardly any change. With output up about 4 per cent and employment down about 3½ per cent, there was a third quarter increase in output per man of 7½ per cent on a year ago.

	Month	Index 1963=100	Percentage change on

How to have a Vat-happy Christmas

The Commons got worked up again on Tuesday about the effect of value-added tax on retail prices. We calculate what the difference could be, and what you should (and should not) think of buying for Christmas

When value-added tax comes in next April, purchase tax and the remains of selective employment tax go out and it is the balancing of gains and losses from the new arrangement that causes the argument. Those businesses that now pay Set but will not pay Vat are in for a bonus: that means food shops and builders. Experience suggests that only 40 per cent of any Set reduction is passed on to customers; even so, we would expect food prices to come down by between ½ per cent and 1 per cent. Some eatables that are not strictly food, like sweets, soft drinks and potato crisps, will pay Vat, but probably not as much as the purchase tax they pay now. And since Set accounts for £60 of the price of a new house, house prices ought to fall marginally too. That deals with two things over which MPs are most liable to work themselves into an emotional lather.

The losers are the service industries. The abolition of Set will not compensate them for having to pay Vat, and, with the single exception of public transport, everything from car repairs to restaurant meals and new telephone installations is likely to go up. Ironically, it was complaints from the service industries about the crippling effects of Set that made the Tories put Vat into

their election programme. At worst, we would expect prices in service industries to go up by rather less than 4 per cent, and at best (ie, if the Government decides on a 7½ per cent rather than a 10 per cent rate for Vat) at rather less than 3 per cent.

In between falls the whole range of consumer goods that now pay purchase tax, with only one or two exceptions. As a rule of thumb, anything paying above the 11½ per cent rate would be cheaper as an Easter present (Easter is late next year), and that includes nearly all consumer durables and most luxuries. The exceptions form an odd bunch: yachts, caravans, pianos and cookers do not incur purchase tax and all will be hit painfully by Vat. The ending of Set can have little material effect on their prices, but it may play a bigger part in moderating what would otherwise be a sharpish rise in the price of children's clothes. At least that is how ministers have been trying to reassure MPs; but it would be as well to be prepared for a rise of around 2½ per cent.

There are fringe trades like pet dealers who will pay Vat unless their turnover is small enough to allow them to opt out, and secondhand car dealers who will gain if Vat is assessed on their mark-up only and be clob-

Daddy'd better buy me a bow-wow now

Christmas presents

Children's clothes
Cookers
Havana cigars
Health farms
Holidays in Britain
Liqueurs, brandy, malt whisky
Meals out
New telephone
New works of art
Pet dogs and cats*
Pianos and organs
Redecorating the house
Theatres
Yachts

Easter presents

Boxes of chocolates
Cameras
Furs, leather
Hair dryers, brushes
Jewellery, cuff links
Motor cycles
Musical instruments (except pianos)
Radios, television sets
Record players, tape recorders
Sewing machines
Tapes and records
Toasters and mixers
Washing machines, refrigerators
Watches

Vat-minded Santas want to avoid buying Christmas presents that attract heavy purchase tax. They should concentrate on anything now free of purchase tax, and not heavily affected by Set, but likely to go up after Vat. Consumer durables and fancy goods generally would make better Easter presents. One exception is good quality drink and cigars. When part of the present excise duty is replaced by ad valorem Vat, the price of cheap tobacco and alcohol will go down slightly, but the good stuff will go up quite a lot.

*Racehorses may avoid Vat by qualifying as potential horse meat

For stockings: some modern art, some good drink,

something useful,

something cuddly

Vat's bonus

	Consumer spending 1971	Effect on prices of Vat* at		Effect of 7½% Vat on spending†

*Assuming that 40% of Set cuts are passed on in prices.

†For each spending group this is calculated by multiplying the relative price change by the price elasticity of demand (see unpublished paper by J. Dorrington and G. A. Renton prepared for a London Business School conference in July). The net of £210m implies a real income increase.

‡This assumes the worst: tax on the full value of secondhand car sales. This is unlikely, but separate figures for secondhand dealers' mark-ups are not available. Tax on the mark-up only would show a price fall for cars as a group.

bered badly if it is based on anything wider. But the National Institute of Economic and Social Research's original estimate of the cumulative effects of Vat, based on 1970 data, of an extra 1.1 per cent on consumer prices generally still looks much closer to the mark than the scare reports that have been going round. It is, if anything, over-pessimistic. Using 1971 prices and 1971 levels of consumer spending, we would expect a 10 per cent rate of Vat to add 1 per cent to prices. But hardly anyone now expects the Government to go for a 10 per cent rate. The general expectation is that Vat will come in at 7½ per cent; if it does it should have no effect on the general level of prices at all.

But Vat is bound, just the same, to change the pattern of spending. For three decades, consumer demand in this country has been distorted by the incidence of purchase tax on some forms of spending and not on others. The relative rates at which purchase tax was levied on

different goods were decided by wartime priorities and continued unchallenged and unamended throughout 25 years of peace. Vat, levied at the same flat rate on all spending other than food, fuel, public transport and housing, could set in train a change in buying habits that would on certain assumptions leave consumers more than £200m in pocket. The table shows how such a figure can be arrived at.

The gain is equal to 0.6 per cent of consumer spending at, admittedly, fixed prices. One of the quarrels that Mr Roy Jenkins has had with the Government is over the notional ending of the price freeze in February, which he argues will give industry several weeks in which to raise prices before Vat comes in. But it is more likely that the freeze will still be in force when Vat is introduced; it is certainly in the Government's interest to see that it is. The first quarter after Vat is introduced will see a jump in industry's cash flow, so that requests to raise prices are going to look a bit thin.

The easiest contributor to identify is Set, which all employers pay as part of the national insurance stamp and which manufacturers then reclaim and have refunded some months later. These refunds will continue to come through for at least three months after Set ends in April, probably up to a total of £155m. The other, much less obvious, source of cash is Vat itself; everyone paying it will also be collecting it at the same time from customers but only handing it over to the Government once every quarter, and it could represent quite a tidy sum in hand.

To some extent, industry gains in the same way now from purchase tax; manufacturers or wholesalers collect it from retailers when they deliver goods (except from the toughies who insist on sale-or-return so that no one pays over tax in advance), but pay it only quarterly to the Government. But their gain has been the retailer's loss; with Vat all have a cash flow gain at the expense of the Government which ought to be equal to the average Vat outstanding in any given quarter. This could be of the order of £310m, making a probable total cash injection of £465m in the second quarter of next year, a sum equal to nearly 3½ per cent of the quarterly gross national product. Even as a rough guide these figures show that Vat is going to give the Government a strong argument for insisting that industry should keep prices down for some considerable time after the freeze.

Better save the scent for Eeeter, along with the mink, the dish-washer and the record player

TECHNOLOGY & TECHNICIANS

In other words, men and ideas. At SNAM PROGETTI the two have combined to give new thrust to the modern science of large-scale projects - projects of fundamental importance that have made their mark all over the world. Original research and far-sighted planning have blazed the trail for the technicians of the future. For the achievements of SNAM PROGETTI, spread over five continents, are there for all to see: thousands of miles of oil and gas pipelines and sea lines, as well as hundreds of oil refineries and petrochemical plants.

SNAM PROGETTI: a wealth of men and ideas serving the world community, today and tomorrow.

We've made millions of black and white tv sets

Over 25 million of them. That's our record since 1946. It makes us the world's largest manufacturer of monochrome TV's.

Colour sets are a lot more complicated, of course. If only because they have about three times more parts. But here, too, Philips lead the field - the result of our hard-won experience and 30 years of comprehensive CTV research.

Knowledge that's also built into all our colour TV cameras, monitors and transmitters in use throughout the world.

To bring you a better colour picture

PHILIPS

the innovators

Is this any way to enter Europe?

There seems to be an attitude abroad in the nation that if one ignores the Common Market for long enough it'll go away.

How wrong can you be?

For better or worse (according to your views) we will become part and parcel of the European Community on January 1st 1973.

Bar Britain sinking beneath the waves before then, or some cosmic disaster, we're going to need to know just what we're letting ourselves in for. And how we can best shape our future.

The European Movement was founded for this very purpose.

Some of you may shy away,

suspicious that we're some kind of lay arm of the government.

Your suspicions are totally unfounded.

We're an independent movement with just the one ambition, namely that of making sure that the entire European venture is a success.

If you decide to join us you will automatically get a free subscription to 'New Europe', the monthly magazine written by leading authorities on European affairs both in this country and across the Channel.

You'll also receive all the publications, pamphlets and leaflets issued by our various affiliated groups and committees.

There are lectures and seminars for you to attend all over Britain and on the continent.

The seminars will give you the opportunity for informed discussion. You'll find it a refreshing change from the prejudice and jingoism so common on the European issue.

If you have the time and inclination, we'll also help you set up a local branch of the Movement.

For more detailed information drop us a line at the address below.

Nothing ventured, nothing gained as they say.

BUSINESS

International

Playing it the Morse way

Washington, DC

From all accounts the first working meeting of the deputies of the Committee of Twenty was orderly, unruffled, polite and gentle, which is a way of saying that no attempt was made to reach agreement on new rules to run the world's monetary system. Indeed, the three-day meeting started off with a series of such general statements of governments' views that all topics seem to have got a mention from somebody. Then they proceeded to get down to the one substantial item on the agenda, the adjustment process. But they did not manage to finish even with that; according to their chairman, Mr Jeremy Morse, they will complete this part of the debate when they next meet, in Paris from January 23rd to 25th. However, that does not necessarily mean that at that stage they will have reached agreement on the adjustment process; that will not be attempted until all the topics have been debated.

Mr Morse told a press conference on Wednesday evening that he did not think the timetable had slipped this week and he still thinks two years a reasonable time in which to finish, adding: "If we got some kind of outline agreement in Nairobi [where the International Monetary Fund meets next September] there would then be more work to do."

The impression left at the end of

the Washington meeting was that the Americans are still out ahead of the field with their adjustment proposals, though they have redefined them somewhat in a paper circulated on Monday night. They claim to have been misunderstood and not to have advocated automaticity: but they are still fairly alone in their concentration on reserve movements as the indicator for exchange adjustments. (There is, of course, to begin with, a problem of definition: our table, put together in London, shows that Japan's reserves at the end of October were officially reported at \$17.8 billion, but the true figure must have been over \$23 billion.)

The majority feeling was that in determining the need for adjustment attention must be paid to other aspects of a country's situation besides its reserve movements, and that other remedies besides exchange rate adjustment should be considered. As Mr Morse outlined it, if the indicators light up for a country there should first be consultation. Then there might be "positive guidance." If that did not work, should there be sanctions? The Americans are not alone on that, but a rather more extended and flexible series of processes is favoured before sanctions than the Americans are believed to want.

The next group of subjects for debate, to be taken up in Paris, will

be reserve assets, convertibility and intervention mechanism. The link between SDRs and development aid is to be left to the third meeting, which will probably be in March. Mr Morse is certainly not using an express timetable. But will he be overtaken by events?

TUC into EEC

Backing in

The British Trades Union Congress seems a trifle keener to participate in the EEC than the Labour party. The fact that Labour's shadow cabinet decided against sending anyone to the European parliament has not stopped some unions from ensuring that they are represented in Brussels. Already, the miners have decided to sit on the advisory committee of the coal and steel community.

The TUC has not formally taken any decision about the two main institutions in the EEC where unions are directly represented: the unimportant Economic and Social Committee ("a bladder of lard" to some trade unionists) and the up-and-coming Standing Committee on Employment. The employment committee was set up last year and is one of the few institutions at which unions, employers and government ministers can meet face to face. Already both the commission and the council of ministers are treating it very seriously.

Mr Feather hinted in Brussels at the weekend that the TUC might wait for up to a year before joining either committee, although he himself would like the TUC to participate as soon as possible. In the meantime, the TUC will probably send observers and rely on a new Euro-TUC to speak on its behalf. This double-speak should keep anti-marketeers happy.

The decision to set up a Euro-TUC was taken in principle last summer at a meeting of EEC and EFTA unions in Geneva. However, the British TUC insisted that the new organisation should not be confined to the EEC unions but should include the Swedes, Austrians and others. Many of the

German TUC's Vetter

individually powerful German unions, like the metalworkers, thought this stupid: they could not see the point of diluting an organisation whose main aim was to influence EEC policies. The DGB, the German equivalent of the TUC, eventually persuaded them to accede to the whims of the British. But this has delayed the founding of a Euro-TUC until next February at the earliest. The other suggestion the British made was that a Euro-TUC should not be confined to Social Democrat unions, but should include the Christian unions as well. This was a much more sensible idea.

The Dutch Christian unions may well affiliate to a Euro-TUC, and could be followed by the Belgian Christians. The French Christians will probably not join because they are still at political loggerheads with the French socialists. There is not much chance of communist unions joining, although if the Italian unions merge the Italian communists could do so under the guise of a new Italian union structure.

At the end of this week, union leaders will meet in Brussels to decide the details of the finance, staffing and constitution of the Euro-TUC. But the British TUC now fears that reports that it does not want to participate in the EEC could so anger the Germans and others that the whole scheme could fall through. Mr Feather will have to explain once more that the TUC often speaks with two voices.

Car plants

You have Dagenham, señor

Chrysler stopped exports of the British-built Cricket to America this week. Sales of the Cricket, the American version of the Avenger, have been sagging, partly because of the import surcharge and the devaluation of the

dollar, which helped the American-built small cars made by General Motors and Ford. The more recent fall in the value of the pound has not helped Chrysler to shift the heavy stocks American dealers are now carrying. An even more dangerous long-term threat to the British motor industry is posed by Ford's rumoured plan to set up in Spain.

Our Spain correspondent writes that the latest joke in Madrid is about how Sir Alec Douglas-Home went to clinch a deal under which Britain keeps Gibraltar but gives Dagenham to Spain. It is widely believed that if Spain shuts up about Gibraltar Britain has agreed to help Spain to get into the EEC, and this in turn will enhance Spain's attractions for the motor industry. Mr Henry Ford was in Spain recently. His views about the Dagenham way of life are well known. And last weekend Madrid announced new and easier rules for foreign car firms: only 50 per cent of the components need now be Spanish-made in place of the old 70 per cent minimum.

Ford has recently been diverting some component orders to Spain that used to be placed in Britain. Chrysler, Fiat and even British Leyland have been buying more Spanish components. But Spanish planners want to see vehicle exports stepped up. Only 2 per cent of the 313,000 Spanish-made cars were exported in 1968. Of this year's output of 600,000, 16 per cent will be exported. Seat (owned mainly by Fiat and the Spanish government) has had great success in exporting a Fiat model, no longer made in Turin, which sells well in more distant countries. Renault is expected to continue making its R4 and R8 there, after they have been phased out in France. Citroen makes its GS in Spain for export to non-European markets. This avoids competing too inconveniently with the home factories.

Seat (55 per cent of the market) plans to raise production to 500,000

cars a year by 1976. Renault (24 per cent) reckons on 200,000 within three years. Chrysler (7 per cent) aims for 300,000. Exports, for all of them, will provide the bulk of the growth. British Leyland (7 per cent) is vaguer. Its Minis and 1100s missed the boom because of uneconomic production methods and inadequate promotion. With the camping and caravanning boom, the Maxi ought to do brilliantly, if British Leyland could market it. Meanwhile, Spanish planners want fewer, bigger units. They have tried to merge Citroen and Seat; Renault-British Leyland has also been mooted. But if Ford arrives with plans for making 250,000 cars a year, three-quarters of them for export, the smaller producers will either coalesce or collapse.

Coffee

Soluble problem

The 22 developing countries which grow the \$3 billion of coffee traded in the world each year will be trying to suspend the international coffee agreement at a meeting with consumers in London next week. The growers are determined to keep the world supply of coffee restricted and to boost prices which are already at a record high (60 per cent higher than when the agreement was started in 1962).

The plan for a unilateral producers' pact has been spearheaded by the four biggest growers, Brazil, Colombia, Portugal (Angola) and the Ivory Coast, which account for 60 per cent of the world's output. In the short term a breakdown in the agreement would keep prices high. World stocks, particularly of the high grade arabica coffees, are short—so short that Brazil has begun importing coffee. But coffee bushes are easy to grow. Unless the producers can stick together in divid-

*provisional

Zinc
European zinc producers have raised prices £13 to £173 a ton. This is not quite as bad as expected; a figure of £20 had been batted around because demand from industry is rising while stocks, at least in Europe, are dwindling with the decline in world smelting capacity. The free market cash price of £161 a ton looks as if it will go on going up.

**You need it.
We buy it.
You lease it.**

Brandts pioneered the development of sophisticated leasing techniques. Today, Brandts Leasing provides world-wide facilities for companies whose requirements involve funds of £100,000 and upwards.

Brandts Leasing covers, for instance, high-cost equipment such as the Redifon flight simulator shown above to be leased to Court Line Limited for training pilots to fly their new fleet of Lockheed L-1011 TriStars. Included in the financial package is a simulator for the BAC 111 aircraft which has just been accepted from Redifon. The contract is a good example of how leasing can be used to meet the costs of non-recurring, high-technology investments.

Brandts Leasing can also give manufacturers a powerful sales weapon by providing special facilities which they can offer to their customers.

For further information, please call Bill Colegrave, Director, Wm. Brandts (Leasing) Limited, 36 Fenchurch Street, London, EC3P 3AS. Telephone: 01-626 5900.

Brandts Leasing
A Division of Brandts the Merchant Bankers.

ing the world market between themselves—without help from the consumers—there could be a rash of independent planting and a world glut within five years, with prices perhaps falling to those existing before the agreement.

Under the agreement each country is rigorously restricted to an export quota, though this has not prevented the African countries chipping away at Brazil's market dominance by growing the cheap robusta used for instant coffee. The surge in potential African production over the past 10 years is a far greater threat to the major producers than the consumers' desire to keep prices steady.

The growers' plan to keep world supplies at only 50m bags next year would certainly bring on the high prices that would tempt smaller producers to boost production and so undermine the cartel that the big growers are devising. The consumers, led by the United States, which takes 40 per cent of the world's coffee, would rather see the pact collapse—even if marketing chaos results—than agree to a quota restricted to 50m bags.

The international coffee agreement, however, has been on the verge of breaking down many times before, only to be kept going. Its collapse now would threaten the policy that is increasingly favoured inside the common market of encouraging commodity pacts as a useful way of funneling aid to developing countries. The recent cocoa pact, largely useless because it does not include America, is one such effort. The renewed enthusiasm for commodity pacts spread largely from the United Nations Conference on Trade and Development in Santiago this year. But the same countries that pressed for commodity deals then are now happy to scrap the coffee agreement, by far the largest and most important commodity pact. This plays right into the hands of those who believe in a free market.

Iran

Redistribute, please

Teheran

Under the Shah's orders, Iran's new five-year plan is being rejigged to encourage greater income redistribution. The minimum earnings of civil servants are to be raised and a £55m fund is to be created to pay off peasants' debts to rural moneylenders.

Iran is by no means the first to discover that fast economic growth exacerbates income inequalities, but it needs to act decisively just because its pace is so spectacular. Real growth has averaged 11.5 per cent over the past four years but could be as much as 16 per cent this year, spurred on by rising oil revenues and large public outlays. Yet inflation, until this year, has been held to 4 per cent or less.

The Shah met his ministers a month ago under the great tent at Persepolis, where the world's heads of state were wined and dined last year, to prepare the launching of the new plan. The planners, whose chief is Mr Khodadad Farmanfarmaian, a former governor of the central bank, wrote into the draft supervisory powers for themselves that were resented by the ministries of economy and finance. More seriously, the Shah ordered the planners to re-work some of their figures with income redistribution in mind. The plan itself is still unpublished. But the prime minister, Mr Amir Abbas Hoveyda, has said it will provide for real growth of 11 per cent a year up to the end of 1977, a rise in income per head from £200 to £340, and 1.4m new jobs.

The plan will entail investment of £12.75 billion over the five years, including an allowance for inflation at 6 per cent. Of this, £8.5 billion will come from the government (including £6.4 billion from oil revenues) and the

rest from the private sector. Agriculture will absorb a greater proportion than before: £1.7 billion is being allowed for concealed subsidies to peasants as well as new projects. Social welfare spending will also go up proportionately, but from a very low level.

The big digesters of funds, however, will be the programmes the government is already committed to: dams, electric power, gas distribution, the Isfahan steel mill and the huge Sar Cheshmeh copper mine. The private sector will provide a greater proportion of total new investment than in the last plan. Once the massive military budget and the government's current spending have been allowed for, however, the planners have less room for manoeuvre than the growing volume of oil revenues (likely to top £3 billion a year by 1977) might suggest. The existing law—that 80 per cent of oil revenues must go to the plan—is being quietly ignored.

European glass

To be looked into

Having been rebuffed in the Court of Justice in Luxemburg over Continental Can, the European commission's competition department has held off similar inquiries into the merger

between the French and Belgian glass giants, Boussois-Souchon-Neuvesel and Glaverbel. Instead, it came in this week with a hefty anti-trust fine of £45,000 against Pittsburgh Corning Europe, a subsidiary of two American glassmakers. Naming the company's Belgian and Dutch distributors, the department alleges the existence of restrictive agreements. The distributors are said to have been told not to export, and, as a result, prices in west Germany for cellular glass insulating material were up to 40 per cent above what they should have been.

Inquiries into BSN and Glaverbel will not be completed until well into next year, but the department wants to use article 86 of the Treaty of Rome to control mergers likely to affect trade between members. First, however, it wants to examine what effect the entry of Britain, and Pilkington Bros in particular, will have on the European glass market. At the moment, BSN has only one other competitor in its league, France's Saint-Gobain. Pilkington's entry will make little difference: a large amount of its glass is safely exported these days (even to Australia) but transport and insurance costs are probably too high for further bulk supplies to Europe.

In the past 12 years Pilkington has been raking in handsome royalties (now about £10m a year) through licensing its float glass process, which is what it would use in any plant set up on the continent. But the company that has acquired numerous rights to the float glass process is Saint-Gobain itself. In effect, Pilkington, which invented float, has sold the dominant position in continental Europe; in six plants, Saint-Gobain has invested £31m and commands more than a third of float glass productive capacity.

With a strong Saint-Gobain around, why should the commission be worrying about BSN? Both make massive quantities of flat glass. But they are not strictly competitive across the board. Their processes, and therefore their end uses, differ. BSN and Glaverbel have limited float production, but they and their subsidiaries (eg, in Germany) rely mainly on the old process of making flat glass for windows. But the other big customer for glass, the car industry, is going towards float, and so are other customers wanting better quality.

BSN first merged all its glass interests in France with the Belgian producer Mecaniver, so ending with 92 per cent of the shares of the

resulting Belgian-based manufacturing company. Then the ailing but bigger Belgian producer, Glaverbel, in which BSN owned 25 per cent already, took over the enlarged Mecaniver. Both deals were done purely by swapping shares and were completed on November 15th. BSN ended with 58 per cent of Glaverbel-Mecaniver—and over half the European sheet glass market. Hence the commission's curiosity in what is going on.

Japanese exports

Chimerical controls

The more that is known about Japan's new export controls, the more chimerical they look. Not only are there blatant omissions, such as computers and desk calculators, but the export quotas so far spelled out by the Ministry of International Trade and Industry are hardly repressive. Manufacturers of motor cars, whose foreign sales have been expanding at an annual rate of 33 per cent, are being asked only to knock back that pace to 25 per cent. And the growth targets for exporters of seamless steel tubes and of clocks and watches are as much as 18½ per cent and 27.3 per cent respectively for the year ending next August.

Then there is the problem of policing. Most of the curbs will be administered by export cartels formed by the industries concerned—although the cartmakers, unable to agree among themselves, have plumped for statutory controls. At the start of the scheme, manufacturers can plausibly argue that any bulge in shipments merely reflects prior commitments. One rumour is that Miti will not even attempt to assess the statistics for three months—that is, before March—which is about the latest most commentators believe a yen upvaluation can be delayed.

And that raises a third point. If the yen defence programme fails to avert another upvaluation, the export controls are expected to become a dead letter overnight. And since almost everyone outside the ministries assumes that the programme will fail, there is every temptation to push sales hard while the going is good. The value of export credit in October turned out to be 28 per cent higher than a year earlier.

Small wonder, then, that the controls look a write-off even as a public

relations exercise. They never promised to be much else. In defending their policies before the Organisation for Economic Co-operation and Development in Paris recently, the Japanese suggested that the entire package of measures to prevent a yen upvaluation might trim \$1½ billion to \$2 billion in a year from their current account surplus (which promises to be nearer to \$7 billion this year than the \$6 billion officially forecast). The smaller figure assumes virtually nothing from export controls, the larger one no more than about \$½ billion. There is not much for Japan's competitors to be grateful for there.

North Sea oil

Making it all leak-proof

What will happen if an oil pipeline breaks in the North Sea? Very little. British Petroleum and Phillips Petroleum have devised pipeline systems that should keep the loss from the worst possible leak to a few hundred barrels of oil, roughly the same amount the seas must absorb every time a tanker flushes its tanks and a mere nothing compared with the potential loss from a conventional pipeline which might run as high as 100,000 barrels. Yet the new systems devised by BP and Phillips, which will probably be the first companies to lay North Sea oil pipelines, hardly involve any new technology. Instead, they will minimise leaks by making use of the pressure from the hundreds of feet of water lying above the pipelines. To do so, pressure inside the pipeline must be kept relatively low.

When a leak of any size appears, the pressure inside the pipe will drop. This will then automatically shut down the pumps within seconds. Without the pumps, the pressure inside the pipeline will then be lower than the pressure exerted on the pipe by the seawater outside. The slight compressibility of oil probably makes a small loss unavoidable, but the weight of the water should quickly stop the leak.

The new system will require sophisticated separation equipment on the production platforms themselves instead of on shore as with conventional pipelines. Putting it on the platforms costs marginally more. For instance, Phillips estimates that the new system will cost an extra £4m-£6½m. The total cost of its Ekofisk project, excluding drilling expenses, will run to £235m.

Key indicators : world economies

America is now achieving Japanese-style industrial growth and both countries are managing to contain inflation to a rate about half that of the main European countries. Both, too, are putting up good export performances, although American figures are distorted by dock strikes.

	Industrial production			Exports			Retail prices		
	1963=100	% change 3 mths	% change 1 year	1963=100	% change 3 mths	% change 1 year	1963=100	% change 3 mths	% change 1 year

BUSINESS

Britain

Putting the squeeze on BSC

The Government is now convinced that British Steel has set some of its prices at unfairly low levels and will shortly force the corporation to raise those of three important products: reinforcing bar; low-carbon, soft-wire rods; and hot-rolled, mild steel sections. The decision, which will be put into effect as soon as the freeze allows, results from an inquiry led by Lord Hirschfield which upheld allegations that the nationalised industry had been manipulating prices in a way that squeezed the private sector's profit margins and meant BSC was making an actual loss. It is expected that the three prices will be increased by about 4 per cent over and above any general increase that might be allowed at the end of the freeze. Such increases would add at least £10m to British industry's steel bill. This is not the only time that the corporation has been caught abusing its monopoly.

The Hirschfield report will be only the first knock in what promises to be an uncomfortable period for BSC. Ministers are attempting to clear a backlog of steel decisions before entry into Europe, when responsibility for steel formally passes to Brussels. British Steel had, for example, hoped to gain commercial freedom after January 1st

within the community rules. This would have included a general price increase and changing to a new pricing system in which transport costs are charged separately. But the Government has made it clear that there will be no price movements until the freeze ends, however much catcalling there is from continental steelmakers. (The commission is saying nothing: it already has enough inflation worries without importing more and it has always accepted that January 1st was a purely nominal date.) Britain's private steelmakers are prepared to go along with the delay so long as the Government makes it clear to BSC that it must behave in the future.

The Government is being much tougher with BSC since the new Secretary of State for Trade and Industry, Mr Peter Walker, arrived on the scene. It has twice sent back the corporation's new price list drafted to EEC standards, the first time because of some crafty "structural" changes which involved hidden price rises for certain customers, and the second time because charging for transport inevitably means that steel-users living a long way from a rolling mill will have to pay more for their steel, which would be incompatible with the freeze.

Boardman, cool

Hirschfield, critical

Melchett, on the defensive

Mr Tom Boardman, the Minister for Industry, was to make a statement about basing points on Friday.

BSC would like to go ahead with its so-called brown field development at Redcar, which would cost at least £700m, but the prospects of getting that approved in time are becoming increasingly gloomy. It is much more likely that BSC will be told to start on the less ambitious programme of extending existing works, like Port Talbot in South Wales.

A new factor is the prospect of an increased share of production being taken by the private sector. The Hirschfield report raises the question of BSC's involvement in some of the smaller tonnage markets and suggests there is room for greater rationalisation. There is a plethora of private sector plans to set up mini-mills, but more fundamental changes are in the wind. This week GKN entered into new talks with BSC; GKN would like to buy back its old steelmaking plant at Brymbo which was taken over on nationalisation. But it wants it at a realistic price. It is holding out as a carrot the idea that GKN and BSC might then invest jointly in the new rod mill that it said on Monday it would like to build some day.

Employment

We lost 130,000

Employment in British industry is still falling. Figures released on Thursday, but not published yet because of a hitch in printing the Department of Employment Gazette, show there were 10,051,800 people employed in production industries in September, 22,200 fewer than in August. This brings the fall in jobs in six months, on a seasonally adjusted basis, to 63,000. Yet in March unemployment nationally reached its peak and by September the number of people looking for jobs had fallen by 67,000. How could 130,000 workers get lost?

Industry is not the only employer of labour, but there is a long delay before any employment figures emerge for the

The British Steel Corporation belongs to you.

Here are some important facts about its future.

Exporter to 147 countries

In 1971, the British Steel Corporation exported over 4 million tonnes of steel to 147 different countries.

Add to the raw steel, the quantities of steel in items like cars, refrigerators and other consumer durables, and British Steel helped to bring in more than 50% of Britain's export income!

Plan of Anchor buildings superimposed on a map of central London to show their vast scale.

The Anchor Project

To meet the demands of the 70s and 80s, BSC will have to produce low cost steel of high quality. This will require a mixed investment in large bulk steelmaking plants and smaller 'mini-mills' to serve specialist consumers. The first of the larger plants is due to begin operations in 1973 at Scunthorpe.

The "Anchor" scheme is the biggest single investment ever undertaken by British industry (£200 million). Additions to the existing works complex, plus a new ore terminal at nearby Immingham, will enable raw materials to be brought in in giant carriers; steelmaking capacity will be increased by two-thirds; new rolling mills will turn out top quality products.

BSC leads in investment

For many years, the British steel industry, starved of capital, was unfitted to meet the challenge of the international future.

In the last decade, the position has changed: particularly since 1969. In the two years to the end of March 1972, British Steel's rate of capital investment increased by more than 200%. Not only that: in terms of £'s per tonne of annual crude steel production, BSC's capital investment was greater than that of either Japan, the USA or ECSC.

British Steel and better transport

As major consumers of steel, the transport industries have priority calls on BSC's technical resources.

It is a general rule that as machines develop and become more sophisticated, greater and greater demands are made on the steel used in their construction. The car of the future, for instance, will need to embody specialist steels to enable it to meet the rigid noise, pollution and safety requirements that will be placed upon it. Higher

exhaust temperatures will bring about the widespread use of stainless and other high alloy steels in silencers and other important parts of the exhaust system. Long-life silencer systems incorporating some of these steels are already on the market.

BSC is also developing a unique sound deadened steel which will make future motor travel quieter and more comfortable. And to combat the increasing problem of corrosion in the underbody of a car, British Steel has developed a new sheet steel with an iron-zinc coating, which has all the corrosion-resistant qualities of zinc-coated steel plus easier weldability and paintability.

New steels for the new supertrains

When the Advanced Passenger Train commences regular services at speeds of up to 150 m.p.h., much of the track it runs on will be of a high grade steel developed over the years by BSC to meet the strains of high speed traffic. BSC is continually developing specialist steels for the aircraft industry, bridge building and marine applications.

As the opportunities in transport engineering increase, so does BSC's market for these steels. At home and abroad.

BARCLAYS

Banking means Barclays

Up the next step

service sector of the economy. It is a fair bet that when they do a good number of the missing 130,000 will eventually turn up. It is also probable that the Department of Employment will run true to form and in due course revise its industrial employment figures upwards. Even so, it does look as if the labour shake-out in British industry has continued.

The result has been an impressive rise in productivity. But productivity always does well in the early stages of each upswing in the economy. When demand picks up most companies are able to take up some slack before they go in search of extra workers.

The chart shows industrial production over the past 20 years. While it is difficult to identify the precise timing of each turning point, there seem to have been four previous periods in which the economy has moved into the upswing phase of the cycle. The results for the 18 months straddling such turning points are, in terms of per cent changes, as follows:

	Output	Employment	Output per head
Jan/March, '52- July/Sept, '53	+0.0	+0.4	+ 5.6
Jan/March, '58- July/Sept, '59	+4.2	-0.7	+ 4.9
Jan/March, '62- July/Sept, '63	+6.6	-1.8	+ 8.5
July/Sept, '66- Jan/March, '68	+3.4	-4.0	+ 7.7
Jan/March, '71- July/Sept, '72	+4.8	-5.8	+11.3

Each time round, productivity grows that bit faster than output. It is also probable, from the accepted fact that the underlying growth of productivity in the economy has shown some acceleration during the past two decades, that such gains on the early stage of each upswing are not completely lost later on when employment does begin to recover. The recent fall in unemployment does not, therefore, mean that the hypothesis of a faster underlying growth in productivity has been upset.

Women are odd

Women account for little more than one-third of the working population: that is, those at work or available for work. What happens to them is normally hidden by what happens to the more numerous males. But it is dangerous to ignore them. Last Friday the Department of Employment released some rather dated figures which showed that the labour force increased by 204,000 in the year to March, 1972, and that women accounted for all but 1,000 of this increase. Many more married women are apparently staying at work, going back to it, or wanting to do so. This trend has almost certainly continued since.

They have not been having too much luck lately. Out of the past month's fall in wholly unemployed of 18,200 only 900 were from the ranks of unemployed women. Yet most of the new jobs appear to have been in distribution and services; employment in industry is still falling. This should have helped the girls. They account for only a quarter of employment in production industries and a much higher proportion in service industries.

One answer is that women finding jobs have come from the ranks of the 300,000 who the Department of Employment estimate are available for work but are not registered as unemployed. The sharp rise in unemployment over 1970-71 was almost entirely accounted for by men.

If this is what has been happening it means that the actual fall in unemployment has been larger than the figures for registered unemployed suggest. It also means that the rise in employment in the service sector may have been larger than implied by the analysis of the missing 130,000. Not only are there a lot of men finding jobs when the number at work in industry continues to fall; there may also be a lot of women not finding jobs when the number of them at work rises. The mystery deepens, but one thing is sure: women will need watching more carefully in future.

Transport

An eye on profit

The port of Felixstowe—a private enterprise thorn in the side of the militant docker—completed on Tuesday the first phase of an £8m expansion that will double its capacity. The

new berths are fully booked already, and the port could double in size again, which would give it 20 per cent of Britain's trade and make it a serious rival to London.

Felixstowe has to pay higher interest charges than public sector ports. How does it survive? It is the nearest British port to Rotterdam, and that helps. But the main reason is that its service is dependable. Felixstowe was the last port to down tools during the national dock strike, and the first to start work again. Mr Gordon Parker, the 80-year-old chairman, was on the quay in his bedroom slippers before breakfast helping his customers. This means a lot to many of them, such as the suppliers of newsprint, who can lose a contract by missing one day's supplies.

The dockers do not have the bitter history of other ports to sour them, nor does management give any excuse to get like that. Felixstowe was giving all its dockers permanent employment long before Lord Devlin persuaded the rest of the industry to do the same.

Felixstowe opened a new Freightliner terminal on Tuesday. So far Freightliners, which runs British Rail's container trains, has made a loss on Felixstowe business, and it did not pay a penny towards the new terminal, a marked change from its early over-expansion. Freightliners used to be the jewel in BR's crown, but when he was minister of transport the present BR chairman, Mr Richard Marsh, made BR sell 51 per cent of Freightliners to the commercially successful but road-oriented National Freight Corporation.

Freightliners could at last be on the verge of making profits, though. With only 30 per cent of costs accounted for by labour (compared with two-thirds for BR generally), Freightliners is a capital-intensive business that should have a good gearing factor when capacity utilisation improves. At the beginning of 1972 utilisation was only 60 per cent, but now it has been brought up to 70 per cent. Another 5 per cent, and it will be earning a decent return on capital, and next year's trade upturn could well be the cue. The company is winning an increasing number of customers among the road haulage firms themselves, who are learning to use rail for the trunk haul of a long journey. British Road Services has now stopped sending lorries from London to Scotland.

Bank lending

Going strong

There is no mistaking the revival in industrial loan demand. The London clearing banks' ordinary loans and overdrafts went up by something like £250m-£300m in the four weeks to mid-November, after allowing for seasonal factors, compared with about £200m in the previous month. More to the point, the rise was spread right across customer lists.

The banks could not meet all the extra demands painlessly. Their ordinary retail deposits did not keep pace, a tribute, perhaps, to the Government's continued success in selling gilts to the public. All but a fifth of the £353m rise in the banks' total net deposits last month are thought to have been bid in, increasingly expensively, from the wholesale markets. Issues of certificates of deposit by the big banks were heavier than for some

time, even though secondary market dealers were reluctant to take large lines. Despite some further off-loading of gilts, the clearers' average reserve ratio fell slightly, from 14.6 to 14.2 per cent; Williams and Glyn's ratio was down to 12.6 per cent, just a whisker over the minimum.

But the banks will not have had any difficulty meeting the Bank of England's modest call for special deposits, the first tranche of which fell due on Thursday. The Government's own financing requirements, even allowing for substantial sales of gilts to the public, and the fact that the banks' large holdings of 5½ per cent Treasury stock will soon rank as reserve assets, will have seen to that. But a rise in the banks' base rate, now 7 per cent, may well be in the offing. The authorities have already signalled by their tactics in the money markets that, at the very least, they do not want to see short-term interest rates come down. The Bank of England's call for special

deposits may hardly amount to a squeeze within the freeze, but it requires little more than another touch to force bank lending rates up. On Thursday, the finance houses announced that their rate would go up next day by half a point to 8 per cent.

Monopolies

Which witch?

The Government's long-awaited legislation on monopolies and mergers is expected at any moment. Companion legislation to protect shoppers was announced on Thursday. The drowsy Monopolies Commission will be given additional powers, probably to edge it further towards being able (and keen) to initiate monopoly and/or merger studies off its own bat. The Minister for Trade and Consumer Affairs, Sir Geoffrey Howe, has hinted that "monopoly conditions" in an industry may be redefined. A monopoly is presumed to exist now when one firm

The other men on Papa India

The Trident court of inquiry was scheduled to visit Farnborough on Friday to inspect what remained of Papa India but it spent the earlier part of the week taking evidence not about the aircraft but the state of its crew. The emphasis has shifted from Captain Stanley Key and his health at the time of the crash last June. It is now on discovering why, if he did have a heart attack just after take-off, the fail-safe precautions against precisely this eventuality failed to work. Pilots have collapsed at the controls of aircraft before, and there is a clearly laid out chain of command under which the rest of the crew know what they have to do when it happens. On Papa India this failed.

The court has so far uncovered facts about the training and discipline of British European Airways crews that raise questions ranging well beyond the Papa India disaster. Pilots are assumed

by the public to be highly trained, disciplined and responsible. In the course of the inquiry some of them have been presented as childish, petulant and slow to react. The most shaming piece of evidence so far is the scribbled-upon table from the flight deck with graffiti so immature that passengers might prefer not to trust their lives to the men who wrote on it. Handwriting experts cannot conclusively pin the scrawls on the Papa India crew; if they were not responsible, the men who were cannot sleep at all easily at nights. They could at least come forward and tell the court—if only to clear the names of dead men.

Papa India was not the only BEA aircraft to be so defaced. Granted that BEA crews were in the middle of a wage dispute with the management, and that pilots have become more militant and strike-prone in recent years than they ever were in the early days

of flying, that still does not excuse behaviour that they would not tolerate in their own children. But the fact that there was such an apparent lack of responsibility also reflects on BEA's crew selection and training. The court heard a good deal this week about protests that senior captains had made over the relative inexperience of the crews with which they were asked to fly, and it heard in particular about the slow reactions of Mr Jeremy Keighley, the co-pilot on Papa India who should have assumed command when Captain Key became ill. On Mr Keighley's last training flight the month before the crash, it was reported of him that he "needs prompting, but not as much as before."

Both BEA and BOAC have a pilot age problem, with an excess of senior men near retirement, junior men just out of training and a dearth of crews in between. BEA has to answer the growing impression that it has not coped with this as well as it might.

Things better left unsaid

BBA scores all over the world

The BBA Group is in the first division of the world league. We have seven teams on four continents and ten in the UK. And they're all scoring production and sales goals.

There's Scandura Inc in the USA, a great side for producing conveyor and transmission belts. And Textar in West Germany, real winners in the manufacture of

brake liners and disc brake pads. Vivian-Regina of South Africa and Bendix Mintex of Australia are also top teams.

The Group's products also include low-friction reinforced plastic bearings and bushes, mechanical handling equipment and glass fibre and asbestos products. Last year, total BBA sales reached nearly £40m.

BUSINESS

Investment

The thoughts of the tanks

The think tank is thinking about the City. About a year ago, Lord Rothschild and his merry band decided that the City was moving fast into Europe and all over the place, but without any clear sense of direction. The City presents the perfect project for the Central Policy Review Staff: it is important, but not examined comprehensively by any single policy-making department.

To help the think tank decide whether any policies were necessary, the Inter-Bank Research Organisation—a kind of clearing-bank tank—was asked, in June, to report on the present shape and future form of the City. That report has now arrived at the Cabinet Office, and will be one of the bases for inter-departmental discussion of the useful sort that the tank can initiate. The trouble is that, to avoid upsetting anyone, it is not being published yet.

The report is far from dogmatic. It errs on the side of the "there are umpteen options and umpteen alternatives" approach, and at the end of the day no clear conclusions emerge.

The central theme is that there is

an interconnection between financial services, a common thread between banks which lend money, stockbrokers who lend to clients, and insurance companies that lend to policyholders. The regulations that have been tailored over the years to clothe the separate bodies that carried out each of these different activities no longer fit. The bodies are changing shape. Insurance companies go into banking and vice versa. Clearing banks poach on merchant banking territory: even Lloyds has now joined in initially by grouping all its existing corporate services, and adding new ones, in one distinct division.

The Bank of England regulates banks and the Department of Trade and Industry regulates (or fails to) insurance. Thus, at a time when the City is girding its loins for Europe, and the harmonisation thereby entailed, the Government should think of making a new loincloth; it should look at things comprehensively.

But who is to take this comprehensive look? A committee (of whom?) in the first place, and a more permanent body later on? The report wants a task force to do it, and is keen on avoiding the introduction of Whitehall bureaucrats into the City. A kind of bigger and better combined think tank (one breeds another) and expanded takeover panel would be one solution. The greater codification of practice and ethics in company law, and more specific laws for various other activities, would be a necessary adjunct of greater self-control. There is a delicate balance between the laws of the land, the light touch of the Bank of England, and the ways of the City which the City sums up in the word "flexibility." Clearly, like motherhood, flexibility is a good thing—but the recent voices

of Lord Shawcross and Mr Jim Slater have been added to those who think that the City is far from perfect.

Supplements to the main report contain a great deal of useful material: on the physical environment and how rents and the cost of living affect the City, and the competitive advantages of London and its various markets (money, capital, commodities) compared with Europe. European developments are looked at, too, and there is a useful summary of all the ways that the Government affects all the activities of the City. The report should be published before the dust gathers. The most important need for the City is not a body of recommendations, but an informed debate by all concerned about what those recommendations should be.

BP and Burmah

Troubled waters

British Petroleum is still in a bit of bother, even though its third quarter figures were better than expected and the market moved its share price up 21p to 533p. Net income was £14m, against a paltry £6m in the second quarter and £36m last year, but the effective devaluation of sterling contributed windfall profits of about £7m. The remaining £7m was none the less better than the pundits were expecting. Crude oil sales were up by 15% and

the common pasar

Europe has a Common Market known principally for its economic bonds. South East Asia has a common "pasar," the Indonesian - Malay word for market place. Called the Association of South East Asian Nations - and comprising of Indonesia, Malaysia, the Philippines, Singapore and Thailand - the common pasar is a composite of modern and historic Asia. Come to Bangkok, Djakarta, Kuala Lumpur, Manila or Singapore, and wander through the un-commonest group of countries anywhere, any time. From the hustle and bustle of Manila and Singapore to the idyllic villages on Java and the East Coast of Malaysia. From the sun-splashed resorts of Bali and Thailand's Pattaya Beach to the cool, quiet mountain lodges in the Malaysian Highlands and the Philippines' famed Baguio area. Here, some of Asia's oldest civilizations - influenced by Buddhism, Christianity, Hindu and Islam - live side by side to offer the traveler, seasoned or novice, a true package holiday.

product sales by 20% on the equivalent period last year.

The weak prices and high costs that drove Shell's third quarter profits down to £45m have also been responsible for BP's worries. But BP's trouble has been exaggerated by high gearing—both financially and operationally. Unlike Shell, BP is a net seller of crude and margins are smaller. A drop in volume, therefore, leads to a more-than-proportional drop in net income. Low demand caused by the unusual mildness of last winter sent product prices sliding toward the end of 1971. But BP's profits remained steady for a while, as its crude prices were protected by long-term contracts. Also, as Libyan production slowed down, BP controlled enough of the marginal crude market to keep prices firm. Then the borrowed time ran out.

But the high gearing that made BP's downswing the worse should help it in the upswing. The summer months are never the best and already there are signs that fuel prices are picking up—Rotterdam spot prices in particular. German inland product prices, which tend to be a more accurate indicator of demand, have been less buoyant but are also on the turn. On conventional share evaluation terms, BP's price of 533p is too high; the prospective p/e is an astronomic 50-ish. But the shares are towards the lower end of their trading range and the gearing is such that at the first sight of gravy investors immediately jump aboard. On that basis, if the worst really is past, the shares could be up to 600p again in no time.

An investor, however, has to look at the longer-term problems. BP holds more reserves in the politically unstable Middle East than any other oil company. Nobody really knows what 51% participation is going to mean. And the financial position is tight at a time when the company is entering a very expensive phase. It is unlikely to be able to achieve off-balance sheet funding Forties-style until the Forties are producing the goods (and cash). The consolidation of Sohio will also add to the gearing. These problems—particularly the expected cut in the BP dividend—are all bad news for Burmah Oil, which collected about £4m from BP last year. This can only be grist for the mill of Mr Dennis Blake, the ex-director of Quinton Hazell who opposed its takeover by Burmah. He and Dr Bill Dawkins, previously a senior Burmah

executive who resigned because he reckoned the company was badly managed, complain that the company's investments in BP, Shell and Woodside-Burmah account for the equivalent of the present market capitalisation and thus the trading interests are in the share price for nothing. These include Castrol, Rawlplug, Halfords and, most recently, Quinton Hazell, all profitable businesses. They want to split the Burmah shares into two, one representing the BP holding and the other the trading interests. They also want to improve the management, and have sent out letters asking shareholders to convene an extraordinary general meeting. They claim to have over 25% in favour as a result of a previous circular, but, without representation on the Burmah board, the going will be hard.

IOS

Sincerely yours,
Robert L. Vesco

In SEC's bad books

The Securities and Exchange Commission has filed a suit against Mr Robert Vesco, and 40 associates, accusing them of taking \$224m out of four IOS offshore funds and of diverting the proceeds "to their own personal pursuits and interests." The American portfolios were in good quality companies, and their removal must have left the funds in a more illiquid and barren state than before. Since the IOS funds are still unaudited, the true value to the remaining investors is still uncertain. The latest news will no doubt start another round of redemptions.

Mr Vesco, and his International Controls Corporation, arrived on the IOS scene in August, 1970, with the offer of a loan of \$5m to bail the group out. But the SEC had effectively banned all companies from having dealings with IOS, and so Mr Vesco was obliged to resign his IOS

posts and give up control of the group. At least he appeared to do so. Another part of the suit alleges that he did not in fact do so and that a series of shell companies obscured the true situation, which was that Mr Vesco remained very much in command. The original purchase of control, from Mr Bernie Cornfeld, was hidden from shareholders for several months. But Mr Cornfeld was most unhappy at what was going on and encouraged dissident directors to wrest control back. He and the others lost, and Mr Vesco simply made sure, according to the SEC, that the funds sold their marketable securities—and the cash was collared by banks he controlled.

It was the fact that the transactions took place in the United States and that ICC is an American company that renders them subject to the rule of the SEC. For many years the SEC has been following IOS through all its from-bad-to-worse changes and has been examining the Vesco file for nearly two years. Its single-mindedness in the face of such determinedly offshore activities is worth commending.

Hongkong Land

The battle is over

Hongkong

After all the paraphernalia of full-page newspaper advertisements, unexpected forecasts, revised asset valuations and not a few muffled grunts behind the scenes Hongkong Land, the largest company in the colony in terms of market capitalisation (£520m), has emerged victorious in its battle to take over Dairy Farm Ice and Cold Storage, with 80% acceptances. Not only was it the largest bid ever made in Hongkong, putting a value of over £100m on Dairy Farm, it was the first full-scale paper bid and it was contested. N. M. Rothschild and Sons of London was called in for the defence.

The takeover battle was an unusual sight in Hongkong, where business grows by interlocking holdings, joint ventures and directors with fingers in many pies. But Hongkong Land decided to go all out, and had the market rating to do so. When the offer of two Hongkong Land shares for every one Dairy Farm was first made, Hongkong Land at \$HK94 was standing on a p/e of nearly 80. Dairy Farm was at \$HK145, but the shares quickly took off to over \$HK230. In a

week of frenzied market activity the shares of Hongkong Land went up to \$HK130 while Dairy Farm touched \$HK270, compared with its net asset value of around \$HK50. But with a market which has doubled in a year, logic is scarce.

The merger, however, does have some industrial sense. Dairy Farm is the largest processor and packager of food, and this would fit in nicely with Land's hotel side. But the lure for Hongkong Land was Dairy Farm's undeveloped properties. Not so much the acres at Pokfulam, on the west side of the island, where its cows graze—it is doubtful if the government would allow these to be developed—but the warehouse and a choice site on the island's waterfront. Property values have risen in Hongkong by 25% in the past six months and Dairy Farm did not convince shareholders that it could unlock the assets itself.

What undoubtedly helped to swing shareholders was the profit record turned in by Hongkong Land especially since Mr Henry Keswick, a 34-year-old Etonian, was appointed managing director (he also became managing director of Jardine Matheson this year). Profits are expected to be £6m this year (up 25%) and nearly £8m next year. It was hard to resist.

Italian bourse

Is now the time?

Rome

The Milan bourse is taking off. In a month which has seen token strikes by engineers, farmworkers, school-teachers, building workers, postmen, bank clerks and even the bourse personnel themselves, the Il Sole share index has climbed by 13%, relieved that things have not been worse.

It was the last round of major wage talks that brought the economy to a three-year standstill and the threat of further wage inflation still has many industrialists worried. But Italy is recovering. Its balance of payments is running an annual surplus of £1.3 billion and, according to this week's annual scrutiny by the Organisation for Economic Co-operation and Development, Italy could be back on a 5% growth rate by 1973, compared with only 1.4% in 1971. So the lira should be protected from its long-threatened devaluation and foreign investors may, therefore, be encouraged back to the bourse. What is required now is for Italy's record and

spiralling foreign trade earnings to create an export-led boom that will lift the domestic economy and tighten the inordinate slack in industrial capacity.

It has already lifted share prices. In the past eight months the index has grown by 30%, making the 180 companies of the Italian bourse among Europe's most bullish performers. The boost in equity prices has come largely from domestic funds anxious to find investments that might be proof against Italy's 6% inflation. Though most Italian companies have reported net losses for the past two years (making p/e ratios a useless guide), the bourse is attractive because its downward potential is so slight. Even with the present upturn the average share is still standing at less than half the levels of 1961. Foreign funds are likely to be encouraged further by the announcement this week by Signor Malagodi, the Liberal leader, that bearer shares may shortly be allowed on the exchange.

But at present the Italian bourse remains highly volatile and unorthodox. This week Montedison, one of

Italy's largest industrial companies, decided to halve its capital of £550m to set £275m against its debts and continuing losses. So stick with the financial and property sector. Società Generale Immobiliare, Italy's largest property company, has soared 300% this year, and has doubled in the past six weeks. SGI used to be controlled by the Vatican, but now has Signor Michele Sindona and Gulf+Western as its chief shareholders. SGI has a string of high-class developments to its credit, including the famous Watergate building in Washington. At L880 the capitalisation is £150m, compared with the 1971 book asset value of £130m. But no one really knows how much SGI is worth.

SECTOR ANALYSIS

American movie company Oscars

Movie companies and associated conglomerates are among the least-favoured sectors on Wall Street, but as bargain-hunting in the bull market gets under way some could be in for a substantial re-rating. The arguments for the movie industry start from recreation and entertainment expenditure in the United States, now running at close to \$1 billion a month and 13% higher than last year. Although the share from cinema box offices continues to decline, the film companies are increasingly taking advantage of the leisure dollar. After the bloodbath of 1969-71, when something like \$300m (pre-tax) was written off the value of films in the balance sheets, the distributors reduced

APPOINTMENTS

CJ RECRUITMENT ADVERTISING LIMITED
25 NEW BROAD STREET, LONDON, E.C.2 TEL 01 588 2588

CJRA **ECONOMIST STATISTICIAN**

CITY £2,000 — £3,000

Our clients are a well-known international Group of non-ferrous metal brokers and merchants based in the City of London, and having subsidiaries throughout the world. They are looking for an Economist Statistician to assist the Management by providing an economic advisory service in support of the Group's trading activities. Applicants, male or female, should be 22/28 years old, have a good economics degree and have had experience working in the commodities or industrial fields. The job could involve some overseas travel and has excellent prospects.

Applications, under reference ES7219, will be forwarded unopened to our clients, unless you list companies to which they should not be forwarded in a covering letter, marked for the attention of the Security Manager:

CAMPBELL-JOHNSTON RECRUITMENT ADVERTISING LTD.,
35 NEW BROAD STREET, LONDON EC2M 1NH.

CRU Project Director

Commodities Research Unit is a young, fast growing firm of economic consultants which has pioneered the application of advanced techniques to commodity problems. Rapid expansion has created the need for an outstanding man to join the staff of its London headquarters. He must be capable of handling every facet of a client assignment: the initial briefing, proposal preparation, internal organisation of the project, writing up the final report, and presentation to the client.

Candidates without a high degree of technical proficiency—a second degree in economics, statistics or econometrics would be desirable—are likely to feel out of their depth. Yet, in the final analysis, we are looking for someone who can marry creativity to industry and who is capable of expressing himself—and the work of others—in a clear, easily readable, fashion, free from unnecessary jargon. Familiarity with commodity problems, especially in the field of metals, would be a decided advantage, as would previous research or relevant industry experience.

Age 25 to 35 years. Salary will depend largely on the abilities and background of the successful applicant: it will not be an obstacle for the man we seek.

Please submit curriculum vitae with a covering letter to: The Managing Director, Commodities Research Unit Ltd., 8 Princes Street, London, W.1.

GOVERNMENT OF ABU DHABI

MINISTRY OF WATER & ELECTRICITY

I Applications are invited for the post of Technical Director General/Chief Engineer in the Ministry of Water & Electricity, Government of Abu Dhabi.

The selected candidate will be responsible for:

- Technical & Administrative supervision of Diesel and Turbine Power generating & Sea water desalination plants.
- Supervision of water & power distribution systems and the management of the relevant operation and maintenance organisations.
- Reviewing the development of water & electricity requirements and evaluation of proposed schemes and the determination of consumption needs in the Emirate.

II Applicants should have the following qualifications:

- University Degree in Electrical/Mechanical Engineering or Electrical Engineering (Generation branch).
- Not less than twenty years' experience (after graduation) in the fields of planning, design, erection and operation of large power generating and desalination plants.

III

- The salary of the post will be determined according to qualifications and experience.
- Employment will be on foreign contract basis for two years on first appointment (renewable yearly afterwards) during which the employee will be provided with a suitable free housing accommodation including water, electricity and an attractive furniture allowance.
- The employee will be entitled to first class air tickets for himself and family on taking up appointment, on termination and on annual leave provided that the number of such tickets does not exceed five full tickets each time.
- The employee will be provided with free government transport or with a car loan to buy a car and will be paid a car allowance at the rate of not less than 35 BD per mensem.

IV Applicants are requested to observe the following when submitting their applications:

- State Nationality.
- Salary expected (besides the fringe benefits referred to above).
- State the names and addresses of three references to whom one can refer for further information.

Applications—corroborated by the necessary documentary evidence of qualifications and experience should be addressed not later than 31/12/1972 to:

Director, Civil Service Commission,
PO Box 371,
Abu Dhabi, UAE

APPOINTMENTS

Market Planning Statistician

Age 24-30

We are a prominent member of the Mars Incorporated International Group of Companies, market leaders in the U.K. £120m prepared pet food market. The increasing complexity of this market demands much more sophisticated planning techniques on a continuing basis. Hence, this additional appointment to our market planning staff of a statistical officer responsible primarily for sales forecasting and developing improved forecasting systems.

This is an exciting opportunity for a young, highly numerate graduate to broaden his experience with a company which has an enviable reputation for success in fast moving, fast changing consumer markets. Whilst our present need is for a specialist to do a specific job, it is company policy to develop managers through an enlightened management development programme and promote

**Pedigree
Petfoods
Limited**

Around £3,500

able people from within. Whether you remain a specialist will largely depend on you. For the man who can show flexibility of thought and apply himself to new disciplines there will be opportunity to branch out into other areas of the Company's operation.

The ideal candidate will have a good honours degree in econometrics, mathematics or statistics with a minimum of two to three years post-graduate experience in industry or commerce, which will include proven expertise in model building and/or computer applications to forecasting.

The Company offers a generous non-contributory social security scheme covering sickness, life assurance, pension and four weeks' holiday. Relocation expenses will be paid if appropriate. Housing is moderately priced in a wide variety of locations from village to university city.

For further written information and an application form, please telephone or write to

Ian Davies, Pedigree Petfoods Limited, Melton Mowbray, Leicestershire. Tel: Melton Mowbray 4141.

Controller

Major Manufacturing Unit
c. £5,000

- Our client is a multi-national, multi-product manufacturing and marketing corporation whose U.K. operations are making record profits.
- Planned expansion will double the capacity of this manufacturing unit, located in Western Scotland. Elsewhere in the company, both in the U.K. and in Europe, similar growth is taking place.
- The man we want, is a Controller. At present a member of a successful management team producing results. He will be using modern financial management techniques, including EDP. A background in factory costing and an accountancy qualification will have been the prelude to his career as a Manager. He will now want to take advantage of an opportunity which will provide plenty of scope for personal development.
- The company offers a starting salary in the region of £5,000 together with a comprehensive fringe benefit package.
- Write in confidence for full information on the company and this key management post to: C. Buckeridge.

Leslie Coulthard Management

Brettenham House, 14 Lancaster Place, London WC2

Australian National University

RESEARCH SCHOOL OF
SOCIAL SCIENCES

Urban Research Unit—
Research Fellowship

Applications are invited for the above position. The Unit is a multi-disciplinary group within the Research School of Social Sciences. At present its major work relates to economic, physical and administrative aspects of urban development.

Applicants are expected to have a Ph.D. or equivalent experience preferably in one of the social sciences related to urban studies. Applications would be especially welcome from those whose work has been in applied economics, engineering, economics and public administration. However an appointment will not necessarily be made in these areas. Applicants from other areas in the social sciences with an interest in urban studies will be given full consideration.

The salary of a Research Fellow is determined within the range \$A6804-\$A9324 per annum. Appointment is for three years, extendable to a maximum of five years. Superannuation is on the FSSU pattern with supplementary benefits. Reasonable travel expenses are paid and assistance with housing is provided for an appointee from outside Canberra.

Those interested in a possible application should apply to the Secretary-General, Association of Commonwealth Universities (Appsu), 36 Gordon Square, London WC1H 0PP (Tel: 01-387 8570) for further particulars about the Unit and the position.

Applications close on January 15, 1973

APPOINTMENTS

SOCIAL SCIENCE GRADUATES

Applications are invited for a post with the

SOCIAL SCIENCE RESEARCH COUNCIL

to assist the Secretary of the Economic & Social History and Statistics Committees in dealing with research grant applications and other more general aspects of Council business. Applicants should normally be under 29, have a relevant honours degree, and be interested in research and research administration. Salary scale £1,206-£2,043 plus £175 London Weighting allowance. Starting salary may be above the minimum. FSSU is payable; 41 hours/5 day week; 20 days holiday; staff restaurant.

Applications in writing stating age, qualifications and experience and giving the names of two referees to SSRC (SO/E/2) Room 1135, State House, High Holborn, London WC1 by December 8, 1972.

Young Actuaries

*with horizons wider
than the life business*

for a major insurance composite with extensive overseas operations which is a pace-setter in the industry. It is convinced that actuarial skills and know-how can fruitfully be extended into many new areas to provide a numerate base for the management and development of its total business. In addition to UK opportunities there are openings in life departments in Australia and South Africa. Candidates, honours graduates and qualified actuaries, should have up to 5 years' post qualification experience and performance records which show they have real potential. Managers are developed internationally and career progression might include secondment overseas. Salaries are negotiable and will not be a limiting factor, there are comprehensive benefits. Please write or telephone 01-629 1844 (at any time)—in confidence—for further information. R. Llewellyn reference S.3707.

Management Consultants

17 Stratton Street, London, W1X 6DB.

□ BIRMINGHAM □ GLASGOW □ MANCHESTER

The Economist Intelligence Unit

TRANSPORT & ENERGY DIVISION

Transport Economist

With special experience in Road Feasibility Studies

A Transport Economist is required to take part in road feasibility studies overseas, mainly in Africa and South East Asia.

Normally the person appointed could expect to be working in a team comprising economists and consulting engineers.

Applicants should preferably have had some previous practical experience of work of this kind, be familiar with techniques of project appraisal, and be willing to travel and work overseas.

The salary for the above post would be commensurate with experience and qualifications but is likely to be in the range £3,000-£4,500 a year. Overseas allowances would be paid in addition.

Applicants should write with full details of qualifications and experience, including details of present position and salary to:

The Director (E), Transport & Energy Division,

The Economist Intelligence Unit Ltd,
27 St. James's Place,
London SW1A 1NT.

SHARE YOUR TALENT AS A COMPUTER TIME-SHARING SALES CONSULTANT

- The outstanding success of the TIME-SHARING DIVISION of our Client Company now makes it necessary for them to recruit a number of additional SALES CONSULTANTS to share in their future plans.
- Candidates for the position of TIME-SHARING SALES CONSULTANTS are required to have professional qualifications, together with experience and knowledge of Computer applications to Problem Solving, Production Control, Banking, Accountancy, Retail Distribution, Data Communication Terminals.
- We would appreciate hearing from you, regardless of your present location, if you have already achieved a good sales track record in the time-sharing field, or would be desirous of entering this field.
- Every application sent outlining in what way you meet our requirements will be treated with the utmost confidence.
- Good Salaries are negotiable and in addition there are personal and team incentives.
- Company Benefits include: Four weeks holiday and free life insurance.

Please write to:

A. G. Blake, Director,
PREMMIT PERSONNEL,
79 Buckingham Palace Road,
London, S.W.1.

APPOINTMENTS

INTER-BANK RESEARCH ORGANISATION

The Inter-Bank Research Organisation is looking for an able graduate in his early twenties, with some knowledge of banking and finance, and an appreciation of the way data-processing is affecting banking services.

The post will be with the new Inter-Bank Standards Unit. The Unit's task is to facilitate inter-bank operations nationally and internationally by the introduction of standard formats, codes and procedures. This role will be particularly important in the context of European monetary and financial integration. Some international travel will be required.

Three year appointment. Competitive salary. Five weeks' annual holiday.

For further details please apply to:

J. H. Robertson, Director,
INTER-BANK RESEARCH ORGANISATION,
Moor House,
London Wall,
London, EC2Y 5ET
or telephone 01-628 3070.
Please quote Reference No 33.

CORPORATE PLANNING

Additional posts have been created in the inter-disciplinary team responsible to the Chief Executive for Corporate Planning throughout the whole range of the Borough's services. They offer the opportunity of involvement from the early stages in a project which has the full support of the Council which aims to see continued advancement in the fields of:

Objective setting.
Analysis of problems and alternative methods of approach.
Establishing a systematic approach to policy making and monitoring.
Formulation of a multi-year corporate plan and programme budget.

SENIOR CORPORATE PLANNING OFFICER (Ref. CE74(1)).

£2,670-£3,429

To participate in the provision of a corporate planning service and particularly to assist in the depth analysis of specific policies.

CORPORATE PLANNING ASSISTANTS (Ref. CE74(2)).

£2,493-£2,766

Generally to assist with the collection and utilisation of information and the analysis of particular problems, projects and plans.

Both posts will involve close liaison with departments and inter-departmental working parties and the ability to provide concise information and reports is essential. Applicants should be numerate and have a good degree or relevant professional qualification. A background in economics or statistics would be an advantage. A variety of backgrounds would be relevant including economics, statistics, accounting, sociology; but experience in housing or social services could also be valuable. Local Government experience is not essential. Removal expenses paid in approved cases.

Application forms, returnable by 23.12.72, and full details from 01-690 7666 (24 hour Ansafone service), quoting appropriate reference and job title, or write (or call at) Personnel Division, London Borough of Lewisham, Town Hall, Catford, London SE6 4RU.

Applications (6 copies) giving full personal particulars (including full names, place and date of birth, etc.), qualifications, experience and publications, and naming three referees, should be submitted by 13 January 1973 to the Registrar, University of Rhodesia, P.O. Box MP 167, Mount Pleasant, Salisbury, Rhodesia. A further copy should be sent to the Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PP from whom further particulars of terms and conditions of service may be obtained.

ECONOMIST

British Petroleum Pension Trust

The British Petroleum Pension Trust is seeking a young economist to work with the Investment Research Manager, himself a trained economist. This is a new position in a new, analytical team at present being built up, and offers considerable scope for innovation to a person with a creative approach.

The economist will be responsible for the macro-economic analysis of the UK and other countries with developed capital markets; he will be expected to provide the information and forecasts on the basis of which decisions on the allocation of the Trust's funds will be made. He will work closely with a group of investment analysts engaged on monitoring the sectors of the various economies.

The ideal candidate will have a degree in monetary economics, or a related subject, and at least two years' experience of economic forecasting.

A fully competitive salary will be negotiated.

Please write, giving age and brief details of qualifications, experience and current salary, quoting reference S.448, to: The Manager, Central Recruitment, The British Petroleum Company Limited, Britannic House, Moor Lane, London EC2Y 9BU.

APPOINTMENTS

University of
BradfordPROJECT PLANNING
CENTRE

For those who care about their appointments

THE DESK DIARY makes keeping appointments a pleasure. This truly handsome, craftsman-made volume has long been the highly treasured possession of connoisseurs all over the world.

It is the incomparable desk-top work of reference for people of affairs. It contains 100 pages of valuable facts and figures specially distilled from international research surveys and official statistical analyses covering public affairs, commerce, industry and the professions. Special sections on U.K., U.S.A., E.E.C., World. New in the 1973 edition, a totally revised 60-page, fully indexed world map section, including special highly informative statistical maps and charts and 16 street plans of important world city centres. A loose, durable, six-year calendar. Two blue heavy silk markers to find those reference sections you use most and 117 superbly designed diary pages. Beautifully bound in rich red leather with its title, and your initials, in real gold.

The Economist Diary has been designed to be used as a permanent personal or business record and makes the ideal gift for even the most difficult to please.

THE POCKET DIARY

This slim pocket diary, delightfully practical to use, has been designed to keep its immaculate appearance the whole year.

Luxuriously bound in red leather. Specially stressed covers finished with gilt metal corners. Pages edged with gold and a blue silk marker to add an extra note of distinction. The same sensible day-to-day layout as the Desk Diary, a three-year calendar, world times and public holidays—to meet all essential needs. Tear-out slips of blank paper for notes and messages. Gold embossed blue Duplex end papers. The pocket Diary is a justifiable extravagance for those who care about quality. Order one for yourself and give others to your nearest and dearest. Let us add your initials—or name—in gold leaf.

We will be happy to despatch The Economist Diaries in attractive gift sleeves, with your card enclosed, to anywhere in the world.

Obtainable only from The Economist

Price including inland and surface postage. Desk £5.00 (£12.50). Pocket £1.75 (£4.40). Gold-blocking: initials 40p (\$1) names 75p (\$1.90) extra per diary.

MAJOR TIMING RECOMMENDATIONS

COCOA — Oct. '71: major buying opportunity expected during this quarter; Jan. '72: prices to average higher in second than first quarter, still higher in third.

SOYBEANS — Apr. '71: B U Y; Oct. '71: complete '71/72 crop year coverage on current weakness.

SOYBEAN MEAL — Nov. '71: BUY AGGRESSIVELY.

SOYBEAN OIL — Jan. '72: New lows fourth quarter.

WHEAT — BUY on dips towards 1.45 Chicago; June '72: Much further price strength into fourth quarter if significant sales made to U.S.S.R.

CORN — June '72: BUY on weakness.

SUGAR — Jan. '72: SELL ON STRENGTH; June '72: Aggressive buying; Mar. '73 New York Future 5.50-6.00 cent range.

HIDES — (HEAVY NATIVE) Jan. '71: B U Y; March '71: B U Y; July '71: B U Y; Oct. '71: B U Y; Jan. '72: B U Y; Apr. '72: B U Y.

PORK BELLIES — Aug. '71: B U Y on weakness; Feb. '72 B U Y.

HOGS — Feb. '72: B U Y

WOOL — Mar. '72: Continue view major trend up.

COTTON — Mar. '72: New York futures approaching top levels thereafter major trend down.

SILVER — Oct. '71: B U Y — cover previously recommended short position; Jan. '72: Prices in second half higher than first half.

COPPER — Aug. '72: SELL Dec. '72 COMEX in 52-54 cent range.

GOLD — We have been bullish for two years; Jun. '72: expect third quarter high around \$70-75 London.

PLATINUM — May '72: B U Y.

For over a quarter of a century, our basic research has enabled us to anticipate well in advance a major reversal in the price trend. It is indicative of the commodity work performed by us for many large corporations in industrial and agricultural commodities.

The eyes on Henry

There are three main tests of whether Henry Kissinger has got the last loose ends of the Vietnam settlement tied up right—and whether he can therefore go into the coming years of bargaining, with Russia and western Europe and in the Middle East, as a man who has stood out for his principles, or let them go at the last moment, page 13. The first shots in 1973's negotiations between America and the European community, page 34.

Alms for Allende

Chile's President Allende has gone to tell the Russians that he is losing support so fast he needs \$500m from them to keep himself in power, page 18.

What's yours?

Tea, coffee, port-and-lemon? The Erroll committee thinks you should be able to buy what you like in a pub, when you like, page 66.

Phase two

The best recipe for phase two of Mr Heath's incomes policy in 1973 will be to allow wages to rise by 1 per cent for each 1 per cent rise in prices, and to take all rises in real incomes solely through higher social security benefits and lower taxes, page 15. If Thursday's by-elections were the first political test of how phase one of the freeze has been greeted, the result was a draw, page 23.

Japan steps out

A special survey from Tokyo suggests that booming, changing, but cautious, Japan probably will upvalue the yen, pages 73 to 83, after Sunday's hugely expensive election, page 41.

Talking oil

Iraq has started negotiating with the oil companies again and the logjam's breaking up, page 69.

Terrorism

SIR—One of the main points made in your otherwise excellent article, "Under skull and crossbones" (November 18th), has, I am afraid, little foundation in fact and I trust that you will permit me to put the record straight.

In the paragraph headed "The Cubans think again" the article states that the Cuban government now says it is ready to negotiate with the United States about piracy in the air. This is not a correct assessment of the position at all since Cuba has on several occasions offered to enter into bilateral extradition treaties dealing with sea and air piracy "on the basis of strict equality and reciprocity" with all nations.

In August, 1961, following the very first hijacking of a United States airliner to Havana, a Cuban proposal that the United States and Cuba enter into a bilateral agreement for the return of both aircraft and hijacker evoked no response from the United States government. In September, 1969, Cuba's foreign minister declared his country's readiness to "discuss bilateral agreements for the solution of hijacking with those countries which will undertake to implement fully identical measures in regard to the seizure of aircraft and ships." This offer has been reiterated several times by the Cuban representative in the United Nations but has been met with silence on the part of the United States.

The position is, therefore, that the United States has at last accepted Cuba's offer made eleven years ago to enter into negotiations with a view to signing a bilateral extradition agreement.—Yours faithfully,
DANIEL GARDNER
University of McGill, Montreal

SIR—May I be permitted to reply to Messrs Connor and Jacobs (Letters, December 2nd) on the subject of the recent letter-bombs?

As is inevitable with this cowardly form of attack, conclusive evidence is very hard to come by, but surely there is all the difference in the world between an open attack that is freely admitted by the attacker and an anonymous action by an undercover organisation. No reasonable person would doubt the origin of the air-raids on Coventry or of the bombing of Palestinian settlements, but in the case of the letter-bombs the acceptance of responsibility is not so clear cut. To the best of my knowledge, the Palestinian Liberation Organisation has denied any Palestinian involvement, although they appear to have had little opportunity to publicise their denial.

That Zionist organisations are willing to use letter-bombs is clearly established by the freely acknowledged use of such weapons against German scientists working in Egypt in 1963. It is, of course, completely misleading to suggest that Jewish extremists would not risk harming their own people. Jews as well as Britons and Arabs were killed in the bomb attack on the King David Hotel in 1946. There was certainly less danger of people being killed by the letter-bombs sent from India since the envelopes could scarcely have been more conspicuous if they had "bomb" written all over them.

Which leaves us with the evidence of the letter-bombs and arms found in the luggage of an Algerian diplomat in transit at Amsterdam airport. Searching a transit passenger's luggage is such a rare event that the police were almost certainly warned beforehand, so there is at least the possibility that the letter-bombs were "planted." Even if they were not, what does this prove? Only that some Arab organisations are willing to use letter-bombs as terror or counter-terror weapons in imitation of a well-known Zionist technique. It certainly does not prove that the letter-bombs sent from India to British Jews (as distinct from Israelis) originated with the Black September organisation.

When the Palestinian Ghassan Kanafani was killed by a bomb earlier this year, it was widely reported that rival Palestinian groups were responsible. Is it so unrealistic to consider the possibility that some of the recent letter-bombs were sent by other than Arab organisations? Terrorism, like war, is essentially the use of force for political ends. I suggest that the political objectives of terrorism should be considered, as well as the apparent evidence, before reaching firm conclusions.—Yours faithfully,
G. J. HUGHES
Felixstowe, Suffolk

Public expenditure

SIR—I must compliment your newspaper on its highly-informed article on future public expenditure plans ("Tony's sharpening that knife of his again," November 18th). However, might I suggest that, rather than limiting public expenditure throughout the country, there should be a redirection of public expenditure towards improving the "social infrastructure" in the development areas especially. Whilst I accept that public services throughout Britain require overall improvement, I believe that a construction programme, involving renewal of schools and hospitals in the development areas, would both provide employment but, more important, serve to convince management and employees from the south-east, who may be attracted to these areas, that civilisation does not end north of the Trent.

Secondly, I believe increased public spending on labour-intensive environmental projects, using mainly youth labour, could be justified at this time to remove the danger of widespread teenage unemployment giving rise to anti-social behaviour.

I do not know whether these ideas would appeal to the Treasury as medium/long-term policies rather than short-term palliatives, to be altered with each change of government. I feel, however, that although they can have little influence on expenditure planning for the period to 1977, there can be little harm in their being suggested.—Yours faithfully,
Catshill, Worcs.
KEITH BLACKBURN

ICL

SIR—The impression created by the note on computers in your edition of November 18th is that a high proportion of ICL's 1900 computers have been installed for more than five years and are due for replacement. This is totally erroneous and misleading.

The facts are that by a continuous policy of product improvement ICL customers have replaced the bulk of their early 1900 machines by a second and third generation of 1900 computers known as the "A" series and "S" series. Over 60 per cent of the presently installed 1900 machines have been delivered in the past three years. Only 7 per cent of 1900 installations were delivered before 1968 and of these a significant number are due to be replaced by ICL equipment already on order.

In total over the past five years, 98 per cent of ICL customers have replaced their computer systems with new ICL systems. The company believes that our approach to customer service will be rewarded by continued customer loyalty in the years ahead. ICL is working as hard as possible towards this end.

The other comments in your article are therefore based on incorrect assumptions or are purely speculative and must therefore be disregarded.—Yours faithfully,

G. R. CROSS
Managing Director,
International Computers Ltd
London, SW15

Housing

SIR—Your excellent article "Hogs, cobwebs and homes" (November 18th) barely mentioned two important and preventable causes of the hog cycle, i.e. the shortage of houses to rent in the private sector and the financial cossetting of owner-occupiers.

A determined effort to revive the private rented sector would be immensely beneficial on several counts. Obviously more houses would get built but also at a more even rate, for in times of financial stringency builders would let houses and in easier times sell them; either way they would get a return on their money and houses would get built continuously. Also there would be a proliferation of option schemes for renting with an option to purchase at a fixed price within a given time. The simplest way of achieving this state of affairs would be for the Government to implement the recommendation of the Francis committee that the rents of newly-built houses should be decontrolled and also to provide realistic depreciation

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

Chief Executive

for a new division of a large British public company with a household name and a reputation second to none in its field. The new business is in the exclusive distribution and sale of books from selected publishers.

- RESPONSIBILITY is to a main board director for achieving profitable sales of about £10 million in five years time from a base which already exceeds £1 million after the first year's operation.

- THE requirement is for a record of success in consumer products marketing, a firm grasp of financial control and information, with the ability to negotiate contractual and related aspects of business enterprise.

- PREFERRED age: 35-45. Base salary negotiable above £7,000, depending upon the man and what he can justify.

Write in complete confidence
to A. Longland
as adviser to the company.

JOHN TYZACK & PARTNERS
LIMITED

10 HALLAM STREET • LONDON W1N 6DJ

Finance HONG KONG

- A major financial institution in the City is to appoint a senior executive to its subsidiary in Hong Kong.

- DEPTH experience of foreign exchange operations and knowledge of the money markets are essential. A "good nose" for credit situations would be an added advantage.

- REMUNERATION can be well into five figures with attractive fringe benefits. Preference is for a married man aged about 30.

Write in complete confidence
to A. Barker
as adviser to the institution.

JOHN TYZACK & PARTNERS
LIMITED

10 HALLAM STREET • LONDON W1N 6DJ

allowances against tax, as is done with industrial plant and buildings. So far they have made no move in this direction.

At first sight it would be absurd to think that a Conservative government would reduce benefits to owner-occupiers but there is one way in which it would make sense. Tax relief on mortgage interest costs £300m a year and a property tax analogous to the old Schedule A would bring in perhaps another £300m net. If all this were then used to finance a massive cut in income tax then this would be a package deal that made sense, for it would make for economic logic and, on balance, electoral appeal. It is doubtful whether the present Government would have the flair to implement such a package. It is quite certain that the Labour party, whose thinking on housing, as on most issues at the moment, is intensely reactionary, would not look at it but it could well be considered by a future Labour government.—Yours faithfully, JOHN LEWIS Porth, Glam.

Air accidents

SIR—I wish to comment on the strange conclusions drawn from the stated facts by you in "A heartbeat away . . ." (November 25th).

Your main argument in favour of machine over man seems to be in the statement "had they (the machines) been left to get on with the job, and not for some inexplicable reason been overruled by human hands, those robots might very well have pulled Papa India and the 118 people on board out of danger." I suggest you answered this inexplicable reason when you state: "There had been four such false alarms on Papa India in the previous month." Why wasn't this aircraft grounded until such a serious fault was corrected? I do not condone the action of this crew if they ignored the warning siren, even if at first they assumed it to be

erroneous, but let me paint the following picture. The warning was not ignored but cancelled because of the great distraction such horns are (and indeed designed to be) before making the correction. The pilot, in the middle of the correction, suffers his heart attack, slumps over the controls and leaves the startled and inexperienced co-pilot to regain control of a stalling aircraft, with a 200lb dead weight lying over the controls, with the two other pilots strapped shoulders and waists into their seats, out of reach. All of this as the aircraft is dropping from a mere 1,000 ft.

You make much of the fact that there were four pilots on the flight deck. You state: "Captain Key's heart attack must have affected his performance, although it should not have led to disaster with three other pilots present." Unless seats are swapped, only two pilots have access to the controls and I respectfully point out that in the take-off and landing regimes only one pilot, the one actually flying the aircraft, has any effective control. There is just too little time for the other pilot to take over.

This might suggest automatic take-offs and landings would be more responsive. Unfortunately not. In aircraft automation great reliance is placed on accurate and precise measurement of radio signals, which in turn actuate torque motors, which actuate hydraulic valves, which finally move controls. All of this takes even more time and tends to lead to over-corrections. But worse still, what does the fully automatic aeroplane do, 200 ft off the ground, coming in for a landing and, for some reason, losing its radio signals? In aviation, "Murphy's Law" states: "If something can go wrong, it will."—Yours faithfully, ROBERT FRENCH Marlboro, N.J.

Newspapers

SIR—Your article "Sun at night?" (November 25th) is speculative nonsense. Mr Petrie and Mr Pilton are joining the Sun. No more, no less.

This was made absolutely clear to *The Economist* reporter who twice telephoned this office seeking confirmation of his "story."

It ill becomes *The Economist*—never slow to lecture the rest of us on journalistic ethics—to publish stories which it knows to be untrue.—Yours faithfully,

LARRY LAMB
Editorial Director,
London, EC4 News International Ltd

Development areas

SIR—I was originally attracted to establishing my business in a development area—Cornwall: I now experience three aspects of this error of judgment.

- (1) My company is failing to meet export orders.
- (2) (1) is due to inability to house enough chemists in this area.
- (3) (2) is due to the refusal of the Cornwall County Council to allow our

company to use its own land to enable potential workers to erect dwellings—despite (or perhaps because of) the fact that we offered plots at one-seventh the local immoral market price.

The Cornwall County Council justifies this by saying that within this area there are over 700 outline building permits (present prices vary between £3,000 to £6,000 per plot). The result of this selective rationing is:

(1) Virtually no building is occurring—owners of "outline plots" are "hanging on" as a "hedge against inflation"—thus there is a housing shortage.

(2) Economically more important from a capitalist point of view is the fact that people owning a plot with outline permission can borrow against this equity two-thirds from any bank. Thus, within this area some £2m-£4m of assets capital is poured away without the necessity of creating any employment in the area or wealth for the country—is this sense or is it stupidity? Is it capitalism in practice or is it communist subversion? My company has created export wealth (over 90 per cent of our products exported) and jobs (without Government assistance)—with local government obstruction. It would appear that unless we get classified as a Rolls-Royce or Upper Clyde Shipbuilders, or perhaps get nationalised, we have no hope of accelerated expansion.

The real point, however, is the way in which "phony assets" can be capitalised without reference to the usefulness to the society—surely this is the basic responsibility of government.—Yours faithfully,

R. J. BRIDGWATER
Maybridge Chemical Company Ltd.
Tintagel, Cornwall

English language

SIR—Changing the pronunciation of English to fit the spelling, advocated by Mr G. H. Tallack (Letters, December 2nd), is already common for individual words but has rightly been likened to cutting off one's toes to make do with ill-fitting shoes. Spelling pronunciations destroy the rimes, metre, alliteration and puns of English literature. In Shakespeare, "Davenry" (spelt "Daintry" in early editions) scans as two syllables. By departing from the traditional pronunciation and popularising a spelling pronunciation the BBC has diminished the ability of people to appreciate England's greatest writer. The rime "clothes: rose," common in English poetry from the sixteenth century to the present, is imperfect for those speakers who have adopted a spelling pronunciation of "clothes."

One or two spelling pronunciations would be little cause for concern, but unfortunately a hundred examples could be easily found. If we treasure our literary heritage then we must not let bad orthography erode the oral tradition. A language spoken by hundreds of millions around the world requires a simple orthography that would be a conservative influence on pronunciation.—Yours faithfully, EDWARD SMITH Beckenham, Kent

MANAGEMENT APPOINTMENTS

£7000 PA AND OVER

The Electricity Council and the EEC Overseas Relations Executive

This new appointment recognises the Council's growing overseas involvement and interests—particularly in the context of Europe, where the UK electricity supply industry will both influence and be affected by EEC policies. He will maintain contact with the European Economic Commission and with other countries of the Community; keep under review the industry's interests and representation at meetings of European, international and British organisations and institutions; and generally act as a point of reference and communication. His resources will include an Overseas Activities section providing information, translation and related services. Candidates must have demonstrated skills in communication, co-ordination and administration at senior level; and, desirably, should have experience of the working of international organisations and some knowledge of electricity supply. Facility in French or German will be of advantage. Salary within a range rising to £8,000; pension. Location London. Please write—in confidence—stating how requirements are met to P. Saunders reference S.37223.

up to £8000

**We can keep you
in touch out here.**

Time and space are the great gulfs that keep people apart. We bridge them for you with the here and now of telecommunication. Out there.

These days telecommunication is more than sending a telex or a telegram or dialling a phone call. The companies who are making the going multi-nationally use integrated, purpose-built telecommunications systems.

These companies have outgrown standard facilities. They've dis-

covered that the effective management of their affairs around the world requires specially designed telecommunications links. They get immediate access, anywhere. In total security. And it usually costs them less money than existing piecemeal communications.

We design and maintain telecommunications systems, but we don't build equipment. So there is no constraint to use anything less than the optimum for the job in hand. If it doesn't exist, we have someone

build it for you.

Ask your director in charge of telecommunications about us. If you don't have one, perhaps you should. Give us the job.

The Cable and Wireless Group of Companies and Associates, with offices around the world.

PROPERTY

GEORGIAN COUNTRY HOUSE HOTEL

FOR SALE

Situated in 21 acres of delightful grounds 12 miles from Aberdeen. This "listed" building is in superb condition, and has a recent extension which blends extremely well.

32 bedrooms (30 private bathrooms), heated and covered swimming pool, sportshall, billiards room, stables. A magnificent boardroom is the centrepiece of self-contained business wing.

This property would be an ideal residential business centre perfectly located for the development now taking place in the north east of Scotland.

Box 2550.

EXTRAORDINARY BAHAMAS DEVELOPMENT OPPORTUNITY

583 lots already sold. 1103 acres with clear title, available for immediate sale as package. Includes 735 lots platted and approved and 146-acre 18-hole championship golf course and clubhouse, and 30-acre lagoon. Shopping centre nearby. 3.77 miles completed canals and waterways; over 7 miles completed roads. Also 705 additional adjacent acres available on option.

Located at Coral Harbour, 25 min. from downtown Nassau and Paradise Island, 10 min. from airport, by excellent highways.

Also available, separately or with above, adjacent 16 acres including 299-room ocean-front luxury hotel complex (60% completed), plus 85-slip operative marina.

A \$19 million investment offered at sacrifice prices to qualified developers. Further details on application. Terms available.

December 9, 1972

We're all watching

It is only half of the story to say that Henry Kissinger needed to get Vietnam out of the way before he could make 1973 the year he sorts out the tangle in Europe, or takes a hard look at the one in the Middle East. Even this remarkable manipulator knows that he cannot manipulate himself out of the iron realities of how countries judge each other: which means that he needs to deal with the last loose ends in Vietnam in a way that does not actually make it harder for him next year to deal with governments, in Bonn or London or Jerusalem, which in the last resort have to rely on what America will do for them if things get rough.

There have been a lot of eyes watching Mr Kissinger this week. It has seemed increasingly likely that the present meetings with Le Duc Tho in Paris really are the last round: that a ceasefire agreement is about to be signed, and that soon the planes will be on their way to bring back the first American prisoners from North Vietnam, and the first international supervisors will be assembling, with varying degrees of cynicism, to watch over the ceasefire. The Vietnam war has always been both a war about self-determination for South Vietnam and a war about America's relationship with the rest of the non-communist world. It is not only in Saigon that every word of the settlement Mr Kissinger finally accepts will be examined with a microscope.

Between them, President Nixon and Mr Kissinger have brought off a small miracle in the past four years. They realised, when they came to office in 1969, that the United States needed a few years of peace and quiet in the world, and that one necessary step towards achieving this was to detach the Soviet Union and China from North Vietnam's war aims. They saw the opportunity provided by the enmity between China and Russia, and by the fact that both of them needed economic help from somewhere. The result has been, step by step, and each step just about exactly on schedule, the new American relationship with the two great communist powers. It has been a model of pre-planned foreign policy. But Mr Kissinger knows that so far he has achieved no more than

a suspension of hostilities: a truce, which may last no longer than the heartbeat of Leonid Brezhnev and Chou En-lai, in which the real problems of our half-century's war of ideas have still to be settled. There is still no clear understanding about the Soviet Union's future relationship with either half of Europe, or China's with the small countries to its south; or about the American relationship with western Europe; or about the ultimate disposition of that small corner of the world that happens to lie around Armageddon. These things are the agenda for Mr Kissinger's next four years, if he chooses to stay the course. It is his bad luck that they are coming on to the agenda just when his winding-up of the Vietnam war is being put to the test of public inspection; but that is how the timetable has gone, and he has to live with it.

The three things to look for

There are three main tests that are going to be applied to the Vietnam settlement, to see whether it fits Mr Nixon's definition of peace with honour. The first is whether the National Council of Reconciliation and Concord is given some fairly crisp instructions about its job of supervising a future election. The fact that this curious body will have to operate on the unanimity rule, as Mr Kissinger said it would on October 26th, means that it is not going to be the coalition government the communists have been asking for; the existing Saigon government will stay in power, and it can tell its man on the council to veto anything it does not like. Even so, "supervising the election" is a dangerously loose phrase.

It certainly includes deciding who the candidates should be, and watching over their freedom of speech during the campaign, and superintending the counting of the vote. It ought not to include taking over the other jobs of local government, least of all the work of the police. The danger that one side or the other will nevertheless try to twist the council to its own purposes is increased if the council is not just a single committee based in Saigon but is allowed to set up branches in the 44 provincial capitals and, below them, in the 268 dis-

strict capitals, and worse still if it tries to go into business in every village in the country. The proper function of the National Council is to be a sort of loudspeaker through which any candidate who thinks he is not being given the normal freedoms of a democratic election can make his voice heard. One sub-council in every province is probably enough to do that, and each of these sub-councils should be told in advance what the Saigon government and the National Liberation Front have agreed that it can and cannot do. President Thieu, who has been saying since 1969 that the NLF can help to supervise the election that follows the settlement, ought to be able to accept that.

No veto on the checkers

The second test by which the settlement will be judged is the power given to the team of international supervisors; and it is important that these, unlike the National Council, should be given as loose a rein as possible. Of course, nobody expects this handful of men to find out everything that is happening everywhere in Indochina. There is too much jagged tree-covered emptiness around the place for that. But they can do better than the old fiasco of a control commission under Indian chairmanship did in the years after 1954 if certain things are made clear to them. They should be able to check whether North Vietnam really does take its troops out of Laos and Cambodia, as it promised to do in October; if it does, its only remaining route into the south will be across the fairly short, and relatively more easily controlled, border between the two Vietnams along the 17th parallel. And in South Vietnam itself it should be made clear that the four-nation supervisory commission does not have to be unanimous, or even to have a majority in favour of action, before it goes out to check a report that somebody is breaking the rules. That was how the Indians ruined the old commission; they usually voted with the Poles in favour of sitting on their hands when the Canadians wanted to do something about a communist violation. The new system could avoid that sort of nonsense if any two countries were entitled to inspect a reported violation, and say what they thought of it, without having to get the permission of the other two. No doubt that would mean most of the work being done by the Indonesians and Canadians, if Mr Trudeau agrees to let his country take part; but at least it would prevent the supervisors fiddling with mutual vetoes while the ceasefire agreement was burning to ashes around them.

The third test, of course, is what happens to those North Vietnamese divisions sitting in the corners of South Vietnam. It is as wrong that they should be there as it would be if most of the west German army were sitting inside east Germany in support of a rebellion by east German non-communists against Herr Honecker—especially since North Vietnam agreed in October that the future of South Vietnam was a matter for “the two South Vietnamese parties” alone to decide. The failure of so many western liberals to make that comparison with Germany is part of the moral ambivalence they have shown during most of the Vietnam war. Unfortunately, the United States long ago gave up the power

to insist on the withdrawal of all of Hanoi's men before peace was signed; Mr Nixon proposed a ceasefire-in-place, which meant with quite a lot of North Vietnamese over the border, as long as 1970.

The real test of this part of the peace agreement, or of the private protocols that go with it, is not whether all of General Giap's men get out. The settlement can still work if, by the time the last American troops leave South Vietnam three months after the ceasefire, the number of North Vietnamese left in the south, and the places they are concentrated in, are no more than sufficient for these troops to perform the legitimate function North Vietnam is said to want them to perform.

The legitimate function that North Vietnam sees for these troops, as described by the sort of Europeans who usually speak for Hanoi, is to prevent Mr Thieu breaking his part of the deal. North Vietnam now realises, these men say, that the most it can hope to do for the National Liberation Front is to make sure that the NLF can take part in a reasonably free election, and operate as a normal opposition party afterwards. It is resigned to the fact that, given the way most South Vietnamese feel at the moment, the NLF will win no more than a minority of the votes. In fact, if this story is true, the North Vietnamese are prepared to accept the sort of settlement that happened in Greece after the end of the civil war there in 1949. But they know that the NLF's own armed forces are far too weak to make sure that the election really happens, and that the NLF's minority of elected candidates are allowed to take their seats afterwards; so they want to keep enough of General Giap's men in the south to make sure that Mr Thieu lives up to his side of the bargain.

There is nothing in this that the United States need object to: if North Vietnam is at long last ready to accept an elected government in Saigon, it is necessary to make sure that the election takes place. The arrangements for the North Vietnamese withdrawal can therefore provide for the temporary leaving behind of a deterrent force. There will have to be an understanding about how many men this needs, and where they should be. They will have to be open to inspection by the international supervisors, and it must be understood that they will go home once the whole deal is seen to be working. If the North Vietnamese presence can be defined in these terms—and the Americans make it clear that any other movement by it will bring their air force back into action—it need no longer be an obstacle to peace.

The penalty of being seen to fail

If the agreement that Mr Kissinger and Le Duc Tho eventually produce comes reasonably close to passing these three tests, Mr Nixon will have the sort of peace he wants. There is no democratic way of prescribing the sort of government South Vietnam will have in ten years' time; it was to stop the North Vietnamese prescribing it, in their own non-democratic way, that the Americans went into the war. The most that can be done is to make sure that the war ends with a political system in South Vietnam that leaves the choice of the next government to the preference of the majority of the people who will have to live under it. That has been, through all the

years of bloodshed, the necessary justification of the American part in the war. It should be a matter of embarrassment to many American liberals that they failed to keep their eyes fixed on that principle. Mr Nixon and Mr Kissinger have tried to. The working out of the Paris agreement will show whether they succeeded. They will not want the negotiations of the next four

years—with the European community, with Mr Brezhnev, with Mrs Meir and Mr Sadat—to take place to the accompaniment of the slow rumble of a collapsing peace in Indochina. But if they can show that they have held to their principle through all the difficulties of the past four years, and have made the principle stick, they are men who are going to be listened to.

Time to be tough

Mr Heath must not risk being hung for a 7 per cent lamb.
Phase two needs to be a near-freeze

A month has passed already since Mr Heath announced his wage-price freeze. Two months remain for him to decide whether to extend it for another 60 days. In five months' time, at the very most, the freeze must end and effective machinery for phase two must take its place. Time is desperately short, but the first month has passed without anything very positive emerging from Whitehall.

When he announced his freeze, it looked as if Mr Heath had taken control and knew where he was going. In the past month this drive and initiative seem to have been lost.

The most worrying reports are that the Government would be willing to forgo the 60-day extension to the freeze if the unions would come back to Downing Street and do a deal on phase two. There is nothing that the Government could possibly offer the unions which would, at the same time, reduce inflation to a tolerable pace. This is no time to pretend otherwise.

The worst thing that could happen during the freeze would be for the Government to pin its hopes on a resurrected package deal which might, at best, hold down price increases next year to 7 per cent, with talk of a further de-escalation to 5 per cent in 1974. This would be an improvement on the double-figure increase forecast for 1973 before the freeze, based on wage rates rising by 20 per cent a year or more. But the window cleaner is little better off when he falls from the seventh floor than when he falls from the twelfth. Britain came perilously close to disaster on the eve of the freeze. The inflationary momentum is still around. The Government should not look for glib promises from the unions which everyone knows will never be kept. Mr Heath must keep on playing it tough for as long as he possibly can.

This will not be easy. Those who advocate caution and unambitious targets argue that there are already 4.5 per cent price increases built in for 1973: $\frac{1}{2}$ -1 per cent for the effect of the common agricultural policy; 1 per cent for a 10 per cent value-added tax; $1\frac{1}{2}$ per cent from import prices, partly the result of sterling's effective 10 per cent devaluation from its Smithsonian level; and 1 per cent from rents. So wage rates will need to go up by at least 7 per cent and earnings by 9 per cent next year, as in the original £2 a week proposals, if real incomes are to continue to rise. This

would bring the minimum price rise to 7 per cent or more. But no one could seriously expect the Government to face all the difficulties and risks of legislating for complex and permanent machinery to control wages and prices merely to perpetuate and sanctify an intolerably fast rise in prices. This would be political suicide.

Consumer-led growth to nowhere?

On this view it is hardly surprising that the Government is taking its time. It is better that it should do so than rush into half-baked schemes. There is also merit in giving the freeze a little time to affect expectations. But, as before, there are very real dangers in delaying too long before it shows its hand. The economy is by no means as robust as the Chancellor of the Exchequer, Mr Barber, has been suggesting. Mr Michael Clapham, the CBI's president, was nearer the mark on Tuesday when he told Conservative backbench MPs that the Government's target of sustained 5 per cent a year growth was open to some doubt. Output and productivity have risen at record rates in recent months and the economy is at present hitting the 5 per cent growth target, but the growth in demand is still uncomfortably lopsided. As the latest economic indicators show, most of it has come from consumers' spending. The volume of retail sales is now running some 6 per cent up on a year ago. But industry's investment and stocks are still falling. The third quarter investment figure was $5\frac{1}{4}$ per cent down on a year ago; for manufacturing investment it was the worst individual quarter's figures for at least five years. Stocks, which were expected to recover, are still being run down at the same appalling rate as in the first half of the year.

Mr Clapham is not alone in believing the present 5 per cent growth rate will not be sustained, as the table on the next page shows. At a conference on Tuesday members of the Society of Business Economists, representing most of the major companies in the country, collectively forecast growth of only 3 per cent through 1973.

Britain has experienced lopsided, consumer-led growth in the past and it has never led anywhere. The Government desperately needs to carry conviction that it will be successful in its fight against inflation if it is to get

investment, upon which sustained growth must depend, rising once more. There is no reason why the Government should be complacent or settle for an intolerably fast rate of inflation. Price rises of 7 per cent a year or more have neither economic nor social justification. Price increases throughout 1973 should be subject to the most stringent control. The Government could take powers on the American pattern to roll back any increases above a very low norm, even a zero norm, unless they had been previously sanctioned. Permission to exceed the norm would be given only where profits were intolerably squeezed. It should never be given merely because of increased labour costs. Industry will be very unhappy, but most companies will receive a substantial boost to cash flow from the ending of purchase tax and Set and the changeover to Vat.

Stable real wages, plus tax cuts?

On wages *The Economist* has suggested £1 for all and 1 per cent for each 1 per cent rise in prices. There is no reason why the £1 for all should come from the employer as part of his wage costs. Wage increases could be limited to the rise in prices. Since this would stabilise real incomes, the room for reflation by way of tax cuts and higher pensions would be increased. If all the increase in demand for 5 per cent growth has to come from wages rising faster than prices there is little hope of getting either down to tolerable levels. By limiting severely the growth of both wages and private sector prices the Government could get room to deal with some of the in-built price increases. The rate for Vat could be put at 7½ per cent; further tax cuts and higher social security benefits would be possible; and the Government could then aim at a much more ambitious price target: say 3 per cent inflation instead of 7 per cent.

This would be virtually an extension of the wage-price freeze through the whole of next year. It will be claimed that this is unfair. For a very few, such as the agricultural workers, this would be true, and some exceptions would be necessary. But in reality very few indeed are now worse off than they were a year ago, despite the rapid rise in

prices. Real disposable personal income is estimated by the Treasury to have risen by 9 per cent in the past year. Any unfairness arises from some people doing better than others. Ending inflation is bound to be unfair in this way. It will be less unfair with a virtual freeze than if wages continue to rise. The people who lose most from a freeze are those who would otherwise get the largest increases. The people who gain are those who lose out in the wage grab.

There is also every reason why the Government should be ambitious in its price target. America apart, no other major industrial country looks like being very successful in controlling inflation next year. Most are also expanding again and many, by the end of the year, could be reaching full capacity. The prospects for world trade are very favourable. Mr Nicholas Plesz, chief economist for the Gatt, told the SBE conference that world exports could well increase by 16-18 per cent in 1973, "the largest rise in many years." Britain, with more spare capacity than most, and with a tough control over wages and prices, would be well placed to exploit this. Mr Heath's choice lies between drifting cautiously back into crisis, or else boldly seizing a remarkable opportunity.

Business Economists' forecasts* for 1973

	Changes, per cent			
	1973 on 1972	1973 4th qtr on 1972 4th qtr		
Gross domestic product at current prices	+10.8	+10.6		
at 1963 prices	+ 4.8	+ 2.8		
Consumers' spending at 1963 prices	+ 4.7	+ 3.1		
Investment at 1963 prices	+ 6.6	+ 6.4		
	Levels			
	Years	4th quarters		
	1972	1973	1972	1973
Stocks, £m at 1963 prices	— 50	+400	+100	+100

Current balance £m	+200	+ 50	+ 40	+ 40

*The median results from 52 replies received from members of the Society of Business Economists. The majority of the answers to the questionnaire were received after the announcement of the freeze.

predecessors is the first fact of life that secretaries of state for education learn to live with, and even to turn to their advantage. For example, Mrs Thatcher's white paper announces two special £10m building programmes for the replacement of old secondary schools, for 1975-76 and 1976-77. This is an obvious counter to criticisms that she has concentrated too heavily on primary schools—at a time when secondary schools are having to cope with increasing numbers while the pressure in primary schools is easing. It is, of course, equally obvious that not one of these schools will be built by June, 1975. There is nothing necessarily machiavellian in such a time-lag. Mrs Thatcher's most innovatory proposal in the white paper is for an expansion in nursery schooling to meet the Plowden targets—part-time nursery schooling for 90 per cent of four-year-olds and 50 per cent of three-year-olds—by 1981. She proposes two £15m building programmes for 1974-75 and 1975-76. (The Scottish programme, covered in a separate white paper†, is for three £4.5m programmes for 1974-77.) But even for a programme set as far ahead as this, the first batch of local authority bids will have to be tendered and accepted, and the pattern for provision set, within the next year. It is therefore fair both to credit Mrs Thatcher with the ability to extract the resources from the Treasury—and even Mrs Thatcher's unkindest critics must admit that she has proved remarkably good at that—and then to criticise her for the way that it seems that the pattern of provision will be allowed to develop.

Too much choice

Mrs Thatcher in this is remaining dangerously true to her favourite principle of local authority freedom of choice. This sounds admirable; there has been plenty of argument that the selection of particular local authority areas for special treatment is too arbitrary a way of concentrating special educational help. Meanwhile, the campaign for nursery schooling has been made up as much of middle-class mums as of social workers in educational priority areas: Mrs Thatcher will do more to satisfy it by spreading successive thin layers of nursery schooling all over the country than by concentrating it in slum areas. The urban programme has already provided 18,000 nursery class places, and it is projected forward to 1976-77. "Some preference" is to be given in this new programme, which will provide 40,000 places a year, to disadvantaged areas; but in essence this money is to be allocated in response to local authority demand. Again, while local authorities are to be encouraged to concentrate their allocations in problem areas, the choice is essentially to be left up to them. It is worth remembering that, even when a small number of local authorities were picked for inclusion in the first urban programme and offered particularly generous grants, one declined to apply for inclusion. And, since nursery schooling is not being made compulsory, nursery school places will obviously be filled according to demand. There is an obvious danger that, all along the line, those who need it most will find themselves last in the queue.

The greatest hostage to fortune in Mrs Thatcher's white paper is the bland statement that the Government has

"carried through to finality a great reform, the raising of the school-leaving age." The schools will not, in fact, contain extra 15-year-olds until next term, and the summer term. Some secondary schools, especially in the north, will be under strain throughout the mid-1970s. Mrs Thatcher has, of course, extended the Labour government's special leaving-age building programme; but if her nursery school programme is not to be concentrated in epas, some of the money earmarked for that might be better spent advancing the secondary school replacement programmes. Primary schools will, over the next decade, find themselves with space for an extra 150,000 children below school age anyway, because of the decline in the birth rate.

The building programmes are, of course, only the bricks of Mrs Thatcher's programme. She does propose an extra dollop of mortar, in the shape of a reduction in the pupil-teacher ratio from 22.6:1 in 1971 to 18.5:1 in 1981. To allow for this, for the nursery school programme and for the proposals in the James report on teacher training, the teaching force in England and Wales must increase to 510,000 by 1981. That will still mean a sharp reduction in initial training places required in colleges of education, from 114,000 to 60,000-70,000. (In Scotland, the intake has already been cut.) The colleges themselves will need about 15,000 more places for the James retraining schemes, but this will still mean the closure of some colleges, the amalgamation of others with other higher or further education institutions and a sharp reduction in their intake of school leavers. That will mean a rather brighter intake. At present, only about 40 per cent of entrants have two General Certificate of Education "A" levels.

Degrees of difference

Teachers constantly press for an all-graduate profession. By this they usually mean that teaching skills should be recognised as worthy of degree status. The James committee came up with the bright idea of a two-year post-school course, to lead to a Diploma of Higher Education, for which the entry qualifications were to be the same as for university—two "A" levels. An education degree would be awarded after a further two years of training (one spent in school) just as students might go on from the Dip. HE to complete other degree courses. The Government has jettisoned this idea in favour of a degree course education-centred throughout. The dangers are obvious. Either the new education degree will be viewed as a second-rate degree—with the usual subsequent grumbles about status from teachers—or the entry standards will be so high as to debar very good potential primary (or, for that matter, nursery) school teachers from the profession. In a typical education compromise, its status will probably hover somewhere between the two. Another archetypal compromise is that the Dip. HE is meanwhile to be developed throughout the higher education system—including a special course for education students.

There is another fact of life that secretaries of state for any expenditure department must find particularly hard to accept: that any decline in the rate of increase

The Thatcher factor

The Secretary of State for Education has wrung a new expansion programme out of the Treasury. Parts of it are excellent

This Government's two achievements in education will have been the raising of the school-leaving age to 16 and a heavy capital investment in primary school buildings. Halfway to the next general election, it can expect to see no other large ideas translated into reality before going to the polls. Even the universities' quinquennial settlement for 1972-77, delayed to form part of the catch-all white paper* published by Mrs Margaret Thatcher on Wednesday, had to be anticipated nearly a year ago

*HMSO. 314p.

by building programmes for 1972-73 and 1973-74. But just as the raising of the leaving age, her principal achievement as Secretary of State for Education, was a left-over commitment by the last Labour government which she could not refuse to honour, so Mrs Thatcher's own white paper, covering what she described as three-quarters of the education system, sets targets that whatever government is in power in the late 1970s can retreat from only at the cost of intolerably odious comparisons.

The inheritance of the unfulfilled promises of their

of government expenditure is likely, and most unfairly, to be greeted as an actual fall in expenditure. Poor Mrs Thatcher has made this particularly hard for herself by delaying the settlement for the university quinquennium. The provisional target on which the universities have been setting their sights was for 320,000 places (representing 331,500 students) for 1976-77. The settlement in the white paper is for 310,000 places (or 321,500 students). That is still a formidable increase over the total of 236,000 students in 1971-72. The department's projection for the number by the end of the decade is 375,000. The non-university sector of higher education (mainly, the polytechnics and colleges of education) will show a much faster rate of increase, to accommodate another 375,000 full-time students. The rate of growth of expenditure on higher education will be 5 per cent a year, as against 3 per cent a year on schools. The education budget for Britain will grow by about £1,000m (at constant prices) between 1971 and 1981. But in 1961-71, while the rate of expenditure on schools grew by only 2½ per cent a year, expenditure on higher education grew by 6½ per cent.

The polys' decade

This will still mean an increase in the proportion of 18-year-olds entering higher education from 15 per cent in 1971 to 22 per cent in 1981 (in 1961 it was only

7 per cent). The numbers in each school-leaving age-group will anyway be shrinking in the late 1970s. In the late 1960s it was the new universities that needed building up to an economic size; now, it is argued, it is the new polytechnics, where the student-teacher ratio is expected to increase by 1981.

The overall ratio in higher education is pegged to a target of 10:1. The other side of the equation is, of course, the ratio in the universities, at present rather over 8:1. The white paper makes it plain that unit costs in universities are to stop rising. Ministers have been hunting for cuts in university budgets since 1968. It would obviously help if some higher education candidates could be channelled into Dip. HE courses, though the budgeting in the white paper takes no account of this possibility. The danger with the Dip. HE is, in fact, that it could be just too convenient for everybody: a dilution of university standards to save costs and increase student numbers. Mrs Thatcher is determined that it should not be a soft option, and that entry qualifications should be the same as for university. But the standard of a course is determined not only by those who run and examine it (and it remains to be seen how many universities, in particular, will want to do so), but by those who follow it and by their employers. The saving grace is that there really is a gap in post-school education between the under-used Higher National Certificate and the degree.

Chile joins the pensioners

President Allende is telling the Russians it will cost them \$500m to keep him in power

President Allende of Chile did what he was expected to do in the United Nations General Assembly on Monday. He made a speech in which he argued that the economic confusion and Weimar-like inflation he had left behind in Chile are the result of the intrigues of the multinational corporations, and that the developing countries are now locked in a do-or-die struggle with capitalist exploitation. This is a fashionable view of the relations between poor nations and rich companies that is shared by more than a few development economists in the west, and indeed the poor nations do have plenty to complain about. But those who happily bent their backs beneath Dr Allende's verbal flail might have taken the trouble to discover that in fact Chile has become a prime example of the economic and social cost of a hasty programme of state confiscation of private investments, and that the man who complains so bitterly about economic dependence on western banks and corporations is now actively promoting an even greater dependence on Russia.

The real purpose of Dr Allende's two-week trip, which has already taken him to Mexico City, Algiers and Moscow as well as to New York, was not to have another public bash at ITT and the Kennecott corporation in the best available forum but to persuade the Russians

to give him the foreign exchange to cover Chile's rapidly mounting import bill. It is true, as Dr Allende complained, that the World Bank, the Export-Import Bank and the Inter-American Development Bank have all suspended lines of credit to Chile. This was mainly the result of the Chilean government's decision to take over American copper interests last year without paying compensation. But it was also, so far as the World Bank was concerned, related to Chile's failure to maintain wage controls in order to curb inflation, which is now running at a rate of 160 per cent a year. And Chile's finance minister admitted last month that its foreign exchange reserves have now dropped below \$80m. The bill for food imports has more than doubled since Dr Allende came to power at the end of 1970, the result of the disastrous decline in agricultural production that has accompanied the land reform, and the cost of imported food is likely to rise to \$600m next year. Meat rationing and the chronic shortages of food and basic consumer goods have inspired housewives' protest rallies and brought people out on to the streets to support the whole succession of strikes that lasted 27 days in October, drove Dr Allende to bring three military men into his cabinet at the beginning of last month in order to restore confidence, and shook the

marxist parties in the government far more than their leaders were publicly ready to confess.

It is clear that, two years after he took office, Dr Allende is what he started out as: a marxist with a highly controversial programme who can claim to represent only a minority of the Chilean people. He was elected in 1970 with only 36 per cent of the votes; his supporters have been beaten in every by-election since, with one solitary exception, and recently even lost the election for the rectorship of a traditional bastion of the far left, the university of Concepción. Dr Allende must now realise that he can avoid a stinging humiliation in the parliamentary elections next March only if he can find the hard cash to buy favour by putting goods back into the shops. He has gone to Moscow in the hope that the Russians will be ready to underwrite him.

With France and Italy in mind

He is not likely to be disappointed. When Dr Allende first came to power, it was widely assumed that the Russians would be highly reluctant to shoulder the economic burden of subsidising a second Cuba. But Chile is rather special because of the demonstration effect of the victory of a popular front movement including communists in a free election, and the subsequent success of the Chilean marxists in building up their political power by extending state control over the private sector of the economy. With a popular front movement taking shape in France, and perhaps in prospect in Italy before long, the Russians may now feel that they cannot let Chile's marxist experiment founder. Last June they gave it trade credits worth \$260m, and agreed to import 130,000 tons of Chilean copper over a three-year period, despite the fact that Russia is a net exporter of copper. Since Dr Allende took office, the Russians have probably granted Chile about \$400m in credits and long-term loans. Only Cuba has done better in Latin America.

Now it is said that Dr Allende has arrived in Moscow hoping to receive some \$500m in hard-currency loans. He may also ask the Russians to take on responsibility for the marketing of the bulk of Chilean copper exports, a move that would clearly be designed to bypass the Kennecott corporation's attempts to recover its lost assets by appealing to courts in France and elsewhere to place an embargo on incoming shipments of Chilean copper. It is doubtful whether the Russians will be ready to go that far. But they probably calculate that a big loan to Chile at this stage is a worthwhile gamble; after all, Chile is basically a much richer country than Cuba, the present depressed world price of copper is temporary, and Russian technicians could help to sort out the management problems in the nationalised mines, where production costs have doubled since the Americans were pushed out. Paradoxically, President Nixon may even have provided the Russians with one way of helping Chile on the cheap. The Americans' agreement to supply cheap grain to Russia could result in Russian shipments of wheat to Chile, in many of whose cities it is now very hard to buy white bread.

But there is a political problem attached to any deal that Dr Allende concludes with the Russians. It involves the

man whom he left to run his country while he was away. General Prats, the army commander and the new minister of the interior, remains a man of mystery to most Chilean politicians. Last month the world was presented with the unusual spectacle of an alliance between communists and orthodox military men. The question is whether General Prats and the other two military men in the present cabinet—Admiral Huerta and the air force General Sepulveda—intend to apply the brakes to Dr Allende's programme.

Unless a major crisis develops, it is probable that they will hold their hand until the March elections, which will test the government's support. If the opposition really does manage to get more than 60 per cent of the votes (as many observers believe it can) the armed forces might then decide to present Dr Allende with a kind of ultimatum, telling him either to respect the wishes of the electorate by calling a halt to his programme of state takeovers of private firms and taking some firm action against left-wing extremists, or to resign in order to hold new presidential elections. But one thing that would test the loyalty of the armed forces in the meantime would be a greatly increased Russian presence in the country; it is significant that so far the Russians have not been asked to supply military equipment to the Chilean armed forces. The reaction of the men in uniform is a factor that Dr Allende will have to keep very much in mind as he bargains in Moscow.

In the eyes of the Russians themselves, Dr Allende has probably found approval. Of course, in one sense Chile's marxist experiment has already failed, just as Dr Castro's revolutionary experiment failed before it. It has certainly not provided a model for other societies. The poor have seen their temporary gains through income redistribution whittled away by unchecked inflation; landless peasants have exchanged one employer for another, the state; there have been steady inroads into the freedom of the press; and now the polarisation of forces in the country is so great, with would-be guerrillas actively rehearsing civil war, that it is increasingly hard to see a democratic outcome in Chile—unless Dr Allende himself calls a halt to the process he has set in motion.

They can have one more friendly dictator

But there is another sense in which Dr Allende's experiment may still succeed. It may result in the total concentration of power in the hands of the marxist parties. That is the logic of the extension of state control over the entire economy, and the harnessing of the trade unions, whose national leader, a communist, is also the new minister of labour. What has happened in Chile has raised very grave doubts about whether marxism is compatible with any democratic idea of the relationship between government and electorate. But then the Chilean marxists have never professed to respect that political system; it was liberal opinion in the outside world that hoped that somehow they might come to live with it. The Russians, watching from a wary distance, may now calculate that Chile may soon become their permanent ally if Dr Allende can be shored up for a few months more.

WE CARE ENOUGH TO FIGHT THE SEA

North Sea gales often wreck rigid steel pipe-lines and halt dredging for days and sometimes weeks – seriously delaying Dutch and German land reclamation projects.

Not any more; the unique giant 'Selflote' hose arrived from Dunlop, to ride the waves and keep dredging operational even in Force 9 gales – a vital link in the shifting of sand from the sea bed to create new land.

WE TAKE CARE. To the man on the dredger that means saved time and money . . . to others it can mean safe tyres or efficient air filters or sureflight golf balls . . . but always it means relentless care in the development of new ideas, better products.

BRITAIN

Terrible for Ted— but disastrous for Harold

The significance of Thursday's by-elections in Uxbridge and Sutton and Cheam will be argued over for months. But on the night one thing was absolutely clear: Sutton and Cheam was terrible for Mr Heath, but Uxbridge was a triumph, whereas the results in both constituencies were dreadful for Mr Wilson. And what can the Liberals claim? They did brilliantly at Sutton and Cheam and if Uxbridge had not polled on the same night it would look—following their recent victory over Labour at Rochdale—as if a really serious Liberal revival was under way. But whereas the Liberal vote shot up in Sutton and Cheam by more than 12,000 it actually dropped in Uxbridge.

At Sutton and Cheam the Liberal candidate, 29-year-old Mr Graham Tope, boosted his share of the poll from 14.6 per cent at the general election to 53.6 per cent. The Tory share fell from 58.2 per cent to 31.9, and Labour's collapsed from 27.3% to a mere 8.7, and its candidate lost his deposit. At Uxbridge nothing near so dramatic occurred in a poll which was nearly 20% down on the general election. Mr Michael Shersby's vote dropped

but he held the seat quite comfortably in the end. He polled over 14,000 votes to Miss Sykes's 13,000 for Labour, and the Liberal could not manage more than 3,650, compared with the 18,328 chalked up by Mr Tope at Sutton and Cheam.

So what does it mean? If the by-elections are regarded as the first electoral test of Mr Heath's prices and incomes freeze the answer can only be that the result was a draw. Yet it cannot be that the more prosperous Tories in Sutton and Cheam are more opposed to the freeze than their fellow voters at Uxbridge. Perhaps the Sutton and Cheam Tories are a bit more sophisticated and were prepared to give what Mr Jim Prior, the Leader of the Commons, called on television after the result a bit of a kick in the by-election while being certain to return to the true blue fold at the general election. But if that is so, why are the Tories in Sutton and Cheam and Rochdale, where the same thing happened, more sophisticated than in Uxbridge? A more likely explanation is that the voters of Uxbridge take their national politics rather more seriously.

The Tories had a very good inkling of what might happen at Sutton and Cheam—which probably accounts for Mr Heath's signs of edginess in the run up to the result. And it may be that down in Sutton and Cheam the Tory voters have been more offended by the Government's present political difficulties with its right wing. Such Tories might be more prepared to vote for a Liberal in a by-election than merely abstain, for there is some evidence that Mr Enoch Powell has almost as much relative support among Liberal voters as he has among the Tories.

Obviously, the Liberals have benefited in Sutton and Cheam, as they

Tope: Liberal revivalist

did at Rochdale, from the concentration on local issues: they have shown before how they can win by-elections by appearing to be all things to all voters. But there is one point about Sutton and Cheam which might deserve serious attention when the shouting has died down. It is very clear, as was proved at Rochdale, that the Liberals will always attract more support if the electorate believes they have a chance of success. At Sutton and Cheam that effect was achieved by leaking partial and misleading bits of a private opinion poll.

But if there is the considerable consolation for Mr Heath that he held Uxbridge against the odds, there is no comfort at all for Mr Wilson anywhere. As Mr Denis Healey said before the Uxbridge result was known, defeat there would be a serious setback for Labour and would cause them to seriously examine where the party was going. This is Labour's second such setback this autumn and there will be voices in the Labour party calling for a fundamental reassessment of the party's leadership and policies. Mr Wilson will no doubt feel that it is his duty to ride out these blows (Sutton and Cheam was, after all, worse for Mr Heath than even Orpington was for Mr Macmillan), but any further disasters—for example a Labour defeat at Lincoln—might make even that resilient man wonder whether it is still all worth the struggle.

Shersby: Tory retriever

Angry Brigade Long time ago

On Wednesday, more than three months since the beginning of the trial, and after over 50 hours of deliberations, the jurors finally returned a majority verdict of 10 to 2 against four of the defendants (three of whom had conducted their own defence) in the "Angry Brigade" trial and acquitted another four. One of the four acquitted, Mr Stuart Christie, had been in prison on remand for about 15 months, which is all a convicted criminal sentenced to nearly four years' imprisonment might hope to serve if he was lucky with parole. This is far more serious than the criticisms that are being made of the convictions.

All four who were found guilty were convicted on the main count, "maliciously conspiring... between January 1, 1968, and August 21, 1971, to cause explosions in the United Kingdom likely to endanger life or cause serious injury to property." There has been much criticism of conspiracy charges: that they are used when there is too little evidence to connect the defendants with the actual commission of a particular crime. A finding of guilt in a trial such as this does not show which of those convicted the jury thought was involved in which particular bombing attack. (There were also two specific charges against two defendants of attempting to cause explosions on particular dates, but the jury did not convict on either of them.) But it is not obvious that an overhaul of the law would abolish conspiracy charges altogether. They certainly seem to have been the appropriate indictment in this case.

The judge's comments on passing sentence were restrained, almost sympathetic: he "was sorry to see educated people in your situation. . . . Undoubtedly a warped understanding of sociology has brought you to the state in which you are. . . . I treat you all as persons of good character." But he still gave each of them a total sentence of 10 years, adding that he had reduced the total by five years because of the jury's recommendation that he should show mercy. Mr Justice James had also, incidentally, said that jurors had been sifted before they were empanelled: had they "prejudged" views about anarchists, were they members of the Conservative party (two of the targets had been Mr Robert Carr and Mr John Davies), had they

relatives serving in the army in Northern Ireland? He did not mean this to be a precedent, though it has already been quoted in other trials: will it become so, just the same?

Ulster

Task force

The Provisional IRA seems determined to prove that it can still do business with bombs and rockets in Ulster, however much some of its leaders may want another truce and however hard Mr Lynch cracks down on it in the south. But it is not the open confrontations between the army and the extremists in both communities which is worrying Mr Whitelaw quite so much now as the mounting toll of hideous, sectarian murders.

When Mr Whitelaw announced on Wednesday the creation of a new army-police task force specifically to hunt down these killers, the total of sectarian murders this year had reached 106. Seventy of the victims were Catholics and 36 Protestants; most had been murdered simply because of their religion and had been brutally tortured before being killed. As over a hundred detectives have been investigating these murders without success, the addition of uniformed military police to the task force can be of only limited value. As Mr Whitelaw said on Wednesday, the killers must be known or strongly suspected within their communities, and the real breakthrough must come from there.

The worry among MPs at Westminster this week, however, has been the prospect that IRA men might take refuge in Britain from Mr Lynch's actions against them in the republic. The IRA is an illegal organisation in

both the Irish Republic and Northern Ireland, but it is not in England, Wales or Scotland. But there are no grounds yet for emergency legislation against it in Britain.

It is true that if any IRA man is found in Britain, the Irish police would be unable to lodge a case for his extradition from Britain on the ground that he belonged to an illegal organisation. Under the 1965 Backing of Warrants (Republic of Ireland) Act extradition between the republic and Britain can apply only to offences which are stipulated as criminal in both countries. But that should not prove much of a drawback. The republic's special court has sentenced 108 men under the Offences Against the State Act, but only two of them because they belonged to the IRA; the rest were jailed for criminal offences. It is quite probable that the Irish police could provide other grounds of a criminal nature, such as the possession of firearms, to convince a British court that it should agree to apply to the Home Office for an extradition order on the accused. In fact the main trouble lies in the other direction. The Royal Ulster Constabulary has made 47 extradition warrants to the republic over the past year on a range of criminal offences but only nine have proved successful.

The other means of dealing with IRA men coming to Britain is through deportation. Under the 1962 Commonwealth Immigration Act it was possible for an Irish citizen residing in Britain to be deported only on a court's recommendation. Under the 1971 Immigration Act which comes into force on January 1st the Home Secretary will also have the power to deport anybody he believes is behaving in any way which is not "conducive to the public good." If the Home Office decides the matter is "of a political nature," then the Irishman, like the alien, will have no right of appeal against that decision. This measure is not retrospective and it will not apply to any citizen of the Irish republic who has moved to Britain before the end of this year.

The Home Office also has substantial powers at present over refusal of entry. Any Irish citizen can be turned away from Britain at the point of entry or within 28 days of arrival. This provision will apply after January 1st if the Home Secretary decides that an arrival's presence in Britain is not conducive to the public good. Some IRA leaders have already experienced that particular measure.

Whitelaw: moving against murders

How British Steel is helping to give Britain more beautiful bridges

At the time of its construction, the old Forth Rail Bridge was a magnificent achievement both in design and engineering.

The contrasting modern elegance of the new Forth Road Bridge is due partly to developments in bridge design and partly to improvements in steel technology. Modern builders are able to slim today's bridges down to their beautiful lines by using many times more efficient High Yield Stress Steels.

World's longest span

The new Humber Bridge, although much longer than the Forth Road Bridge, will contain only slightly more steel.

When built, the graceful sister to the Forth and Severn bridges, will have a clear span of 4,850 feet — the longest in the world. It will cut the journey from Scunthorpe to Hull by over one hour.

'Self-painting steel'

Other developments in bridge design fostered by the British Steel Corporation are the introduction of special protective finishing processes for the steel used in bridges like the Forth Road. These cut out the mammoth painting tasks that the old bridge is famous for.

British Steel can now supply a remarkable self-protecting, weathering steel called 'Cor-Ten'. 'Cor-Ten' steel actually 'paints' itself by a slow, controlled weathering process which deposits a smooth, colour consistent coat of iron oxide on to the surface of the steel. For environmental reasons, Northumberland County Council have already specified 'Cor-Ten' steel for a bridge in an area of outstanding natural beauty.

British Steel is keeping Britain a land of beautiful bridges.

BRITISH STEEL CORPORATION

S Steel Appeal

Opposition spokesmen

A switch in time

It is always a pleasure to watch Mr Wilson at work making appointments to his front bench. He is highly dexterous, eager to be seen conciliating the various warring groups that make up the parliamentary Labour party. The appointments announced on Wednesday night will probably be Mr Wilson's last major reshuffle before the next general election. They represent some concessions to the moderate wing of the party which did so well in last month's shadow cabinet elections; but they were devised so neatly that they are unlikely to create any trouble from the left.

Mr Wilson's deputy, Mr Edward Short, replaces Mr Michael Foot as shadow leader of the House. Mr Short has been in charge of education for four years, for two years as secretary of state; he wanted a move because he believed he was in danger of becoming a one-subject man. His replacement, Mr Roy Hattersley, a pro-marketeer who stayed close to Mr Wilson when Mr Jenkins resigned, is not a member of the shadow cabinet, but he is a vigorous debater, and he has, in Labour party terms, the enviable task of shadowing Mrs Thatcher.

Mr Fred Peart is not regarded as a threat by anyone; either by the Government or in his own party, where he is one of the most passionate, and least effective, of the anti-marketeers on the front bench. He is, though, a fairly hardline right winger, which is presumably why he has been chosen as defence spokesman. This job will bring him into contact with some of his socialist ministerial colleagues in Nato, who will be able to give him a rough idea about the degree of enthusiasm with which the Labour party is regarded by its sister parties in Europe.

Mr John Silkin replaces Mrs Barbara Castle as the shadow secretary for health and social security. This is an important job, but for some odd reason it seems to go to those who lose their seats in the shadow cabinet. Last year Mrs Castle received the post after being defeated, this year it is Mr Silkin's turn. There is another similarity. Mr Silkin, an amiable former chief whip, is likely to be just as easy a pushover for Sir Keith Joseph as Mrs Castle was. Mr Silkin presumably gets preferment on the strength of his membership of the Tribune group.

One of Mr Wilson's mistakes is

Hattersley: new shadow for a lady

retaining Mr James Callaghan as shadow foreign secretary. This is not because Mr Callaghan has failed there but because this appointment has more prestige than political significance. It seems a mistake for the Opposition to allow him to waste his time in this political backwater when he is its best front bench debater. No doubt Mr Callaghan will do well if there is a party rough-house on Rhodesia, but there does not seem much sense in keeping him in this job when the Opposition is suffering from such a severe lack of cutting edge on the floor of the House of Commons.

Security

Off the rails

Mr Richard Hope, the editor of the Railway Gazette, must be a grateful man. Until last week he was simply running a specialised journal owned by the International Publishing Corporation. Now it appears that he stands a good chance of becoming a celebrated figure in what may turn out to be a fairly bitter dispute between the Government, the Opposition and some sections of the press.

Scotland Yard officers raided Mr Hope's offices last week on a warrant issued under section 26 of the 1968 Theft Act after they had been called in by the Director of Public Prosecutions, Sir Norman Skelhorn. They were attempting to find a missing Department of the Environment document arguing the case for massive cuts in the British rail network, which had been leaked to the Sunday Times in October by someone who did not much like its contents.

As a result of the leak the Minister for Transport Industries, Mr John

Peyton, had a fairly unpleasant few days; but he eventually succeeded in convincing many of his critics that the document was just one of a number that had been prepared so that a whole range of possibilities could be studied by ministers and officials. In those circumstances it is rather hard to understand why the authorities are quite so excited: raids on newspaper offices are, after all, a rather serious business. The trouble appears to be that, as a result of the outburst of indignation that followed the Sunday Times story, the Government ordered a searching inquiry in an endeavour to discover the identity of the leaker; and some officials took the whole thing a bit too seriously.

There is hardly anything particularly novel in any of this. Members of the last Labour government, its predecessor and the present Government have spent many blissful hours debating how leaks have taken place. Once, under Mr Wilson, the lord chancellor was asked to interview every member of the cabinet in order to track down a culprit (he failed, of course). But normally it is assumed by ministers, for all too obvious reasons, that officials are responsible. Then the investigation is carried out by departmental security officers, sometimes assisted by members of the security service.

The procedure is nothing if not simple. All officials who have seen the papers are sent a questionnaire. They are asked to say whether they know anyone on the newspaper carrying the leaked story (connoisseurs in the civil service believe that it is always desirable to claim a number of friends on the newspaper), whether they have discussed the confidential information with him or know how the leak occurred—this in case a kind friend is prepared to turn in a colleague. Not altogether surprisingly the answers to these last questions tend to be rather negative; except that on one notable occasion an official wrote on his form (accurately) that he had not the slightest doubt that the leak in question came from ministers.

Leak questionnaires are, in fact, regarded as little more than a tiresome joke by the civil service; the guilty men are not discovered, and the whole procedure wastes a great deal of the time and energy of senior officials. However, every now and then a leak inquiry gets out of hand, as the D-notice affair did during the lifetime of the Labour government. That episode did Mr Wilson a lot of damage,

to some extent unfairly. But it proved that it behoves ministers to handle these investigations—if they insist on having them—with caution, particularly if newspapers are involved. A concern for national security is no doubt praiseworthy, but not if it seems that it is being used as an excuse to spare politicians embarrassment.

Mr Wilson has obviously decided that he can make trouble for the Government on the Railway Gazette affair; thus his probing questions to Mr Heath last week and on Tuesday. The Government realises the potential difficulty of its situation and has been quick to indicate that Sir Norman is not investigating this leak as an alleged breach of the Official Secrets Act—which the Franks committee has recommended should be amended. But it is hard to see the Government emerging from this episode with its credit enhanced.

Football

Absentees

Football is far and away Britain's most popular sport, both for playing and watching. Yet it is so incredibly ineptly organised and administered that it goes through more recurring crises than even the British economy. The three which are exercising the football world and its attendant millions of readers and viewers now are, inevitably, Georgie Best, falling attendances and hooliganism.

But it is only Mr Best who makes the front, as opposed to the sports, pages (even in *The Times*). Mr Best has never been able to cope with the fame his immense talents have brought him, and as a result of his latest night club escapades and absenteeism his club, Manchester United, has finally decided that it cannot cope with him. Mr Best is now on the transfer list for anyone foolish enough to write a cheque for something approaching £300,000—news which caused consternation among the supporters of the half dozen or so clubs who could afford him, for few such fans are convinced that the foolishness of their clubs' directors knows any great bounds.

Mr Best is not the only one who is staying away from football. Attendances have been dropping through what has been a very mild autumn, and the winter is yet to come. The Daily Mail has added up the figures this week: attendances at football league matches are down by over 14m compared with the same period last

year, and the football authorities lament that if the slide continues on this scale many clubs in the bottom divisions will be forced to close. The only argument for keeping most of these clubs alive and struggling seems to be that if they were forced to close this might affect the football pools without whose money the third and fourth division clubs would have to close.

The attention being paid to declining attendances is as much part of football's campaign to escape value-added tax as anything. For the reasons put forward by most people in football for the decline are pretty nonsensical: it is either that there is too much televising of matches or that hooliganism is driving the decent spectator away, or both. In fact, as the Daily Mail's figures show, this cannot be so: television concentrates on the first division, as do the hooligans (the crowds are vastly bigger). Yet the decline in attendances is: first division, 197,417 (3 per cent of the aggregate); second division, 644,839 (23 per cent); third division, 503,701 (32 per cent), and fourth division, 172,806 (where attendances are, in any event, minuscule).

There is no evidence that hooliganism is increasing: indeed, it may well have passed its peak a year or so ago. It is also probably true to say that there is no ground in the English football league where hooliganism cannot be easily avoided. But the fact that there are thousands of youngsters anxious to go on the rampage across the country every Saturday afternoon is a serious social problem. It would also be a problem if television were shown to be producing an almost totally passive society. But the answer to the decline in attendances is more likely to be the simple one that if the football and the facilities provided are

Best: just one of a large crowd

not good enough people are not going to watch it outside the comfort of their own homes.

Scotland

Fife and muffled drums

Scottish affairs do not appear to arouse much passion even among Scottish MPs nowadays, to judge by Monday's mild-mannered debate on the second reading of the Government's Scottish Local Government Bill. True, Mr Willie Ross, Labour's frontbench spokesman, promised the measure would provoke many heated (and presumably verbose) hours during its passage through the Scottish Grand Committee, but even he could find no suitable reason to force a division. Certainly, plenty of local vested interests exist in Scotland which object to particular bits of the bill with its 231 clauses and 24 schedules, but the rows are over details, not principles. For instance, the ancient kingdom of Fife is not relishing the prospect of its imminent division between two separate regional authorities and wants to stay intact. A local Tory MP, Sir John Gilmour, has threatened to vote against the bill on its third reading next year if Fife does not get its way.

But the Government is going to have no real trouble in seeing this measure on to the statute book this session. The lack of controversy stems mainly from the Government's decision to formulate a bill to reform Scottish local government on the lines recommended by Lord Wheatley's royal commission in 1969. The present hotchpotch of counties burghs and districts is going to vanish in 1975, to be replaced by a two tier system of government with eight regions and 47 districts. The Shetlands, Orkneys and the Western Isles will become all-purpose authorities, much to the pleasure of Mr Jo Grimond.

Unlike the top tier authorities in England and Wales the Scottish regions are going to have substantial functions, from major planning services to education, social work, police, fire and consumer protection. The districts will have responsibilities for all housing matters, as well as that diverse range of subjects which come under the trendy heading of "environmental health." This useful and uncontroversial measure will equip Scotland with a more sensible local government system by 1975.

When you've got the most cars to rent, you're not just a pretty face. You're the Hertz girl.

Saying Yes so often keeps a Hertz girl's face free of worry lines. Yes, she'll say, when you fancy our latest Fords or other fine cars.

With the *widest choice* of cars in the world, Hertz girls find it easy to say Yes to you. Yes, with the

Hertz rent-it-here, leave-it-there service*, you can pick up a car in Milan and leave it in Copenhagen. Yes, Hertz girls can rent you cars from more cities and international airports all over Europe. Can you have a free Hertz Credit Card?

Yes. Hertz girls say it beautifully. To reserve a Hertz car, call your travel agent or Hertz direct.

*Available in most locations. In some cases a modest charge is added. Check with Hertz for details.

We say Yes!

We rent more cars than anyone in the world.

THE WORLD

International Report

The bombs that blew Irish politics into a new shape

FROM OUR DUBLIN CORRESPONDENT

On Friday morning the votes started being counted in Ireland's double referendum. The voters had been asked to decide whether the voting age should be lowered from 21 to 18, and whether article 44, setting out the special position of the Roman Catholic church, should be deleted from the constitution. Since there is almost no opposition to lowering the voting age, this one was expected to be approved by a big majority. And since all the main political parties support the amendment about the church—the only organised opposition came from a small group of right-wing Catholics calling itself "Defend 44," and the church itself made no official pronouncement, except for Cardinal Conway's statement two years ago that the change would not make him shed a tear if it helped the reunification of Ireland—that should go through too.

But the referendum has been overshadowed by the dramatic political developments of last weekend. They go far beyond the immediate repercussions of the two bomb explosions in Dublin on December 1st, when two people died and more than 100 were injured. The blasts, heard clearly in the Dáil, resulted in the new anti-IRA bill being rushed through all its stages that night. A general election was thus averted. The prime minister, Mr Jack Lynch, broadcast a warning to the nation of a threat to its democratic institutions, and then held emergency talks with the acting chief of staff and the chief commissioner of police. One could have been forgiven for concluding that a coup d'état was being attempted.

The government is satisfied now that public support for the tough new measures has been fully demonstrated. The Provisional IRA has been effectively disowned by the Irish people, the

planned campaign of protest in support of Sean MacStiofain has apparently been called off, and Mr Lynch has a free hand to take whatever other action against it he considers necessary. Arrests of suspected IRA men are expected soon, if only to justify the dramatic rushing through of the new legislation at the weekend. Police leave has been curtailed and army units put on standby. Mr Lynch has denied suggestions that the government is waiting until the referendum is out of the way before swooping on the IRA: the matter of arrests is one for the police, he said on Tuesday.

On a broader front, the Irish government now believes it has made it possible for Mr Heath and Mr Whitelaw to crack down on the extremist Protestant organisations in Northern Ireland, as a preliminary to the publication of the British white paper in the new year. This is the course which Mr Lynch urged on Mr Heath at their meeting on November 24th.

The ruling Fianna Fáil party, which

would have welcomed a Dáil defeat on the IRA bill in the belief that it would gain five or six seats in the subsequent general election, is gearing itself for an election fairly soon anyway. The party has at last clearly come off the fence and purged itself of any lingering pro-IRA sympathy. All the backbenchers have aligned themselves with Mr Lynch's new-style republicanism—unity through reconciliation.

It is, however, in Fine Gael, the main opposition party, that recent developments will have the biggest effect. Before the bombs went off, the party was tearing itself apart in one of the periodic manifestations of its bitter leadership struggle. Against the strongest advice of its leader, Mr Liam Cosgrave, the party had decided to fight Mr Desmond O'Malley's anti-IRA bill.

As the debate on the second reading progressed and the voting line-up became clear, it looked certain that the government would be defeated. Mr Lynch's backbenchers, smelling a new lease of life in a successful "government versus IRA" election, were cockahoop. Recognising the risks, Mr Cosgrave threatened to vote with Fianna Fáil. Only seven of his colleagues are believed to have supported him. The rest of the party's 50 members of the Dáil were thus faced with splitting the

The echoes came through loud and clear in the Dáil

What they say

Two amendments to the 1937 constitution were put to the voters on Thursday. The first proposed to reduce the minimum voting age from 21 to 18. The second proposed to delete subsections two and three of article 44 of the constitution, which provided that:

A. The state recognises the special position of the Holy Catholic, Apostolic and Roman Church as the guardian of the faith professed by the great majority of the citizens; and

B. The state also recognises the Church of Ireland, the Presbyterian Church in Ireland, the Methodist Church in Ireland, the Religious Society of Friends in Ireland, as well as the Jewish Congregation and the other religious denominations existing in Ireland at the date of the coming into operation of this constitution.

The following views were expressed during the campaign. "The reason for the change is simple. To an outsider the reference to the special position of the Catholic church sometimes has sectarian undertones... Opponents of Irish unity are prepared to use any excuse to spread a false picture of church influence here"—Mr George Colley, minister of finance, and director of Fianna Fáil's referendum campaign.

"The present constitution introduced distinctions of a sectarian kind which

have bedevilled the development of better understanding between Irishmen of different creeds... They were introduced into the 1937 constitution for party political advantage and they should now be taken out by the majority will of the people in the national interest"—Mr Liam Cosgrave, leader of Fine Gael.

"The proposed amendment of article 44 is the first positive step in a process of reconciliation with our fellow countrymen in the north. At this time of national crisis the whole country needs a clear signal as to the way forward"—Mr Brendan Corish, leader of the Labour party.

But there were voices on the other side. "Secularist pressure groups are using the political situation to pave the way for a godless Ireland, their aims being to have divorce, abortion and voluntary euthanasia guaranteed as fundamental civic rights throughout Ireland"—Mr Sean Loftus, chairman of the Christian Democratic party of Ireland.

"If the lights of freedom go out in Ireland, the world will be dark... What is there left? There is only the appeal to public morality. But what standard of public morality do they mean—that of England, Sweden, America or perhaps Russia?"—Mr Desmond Broadberry, chairman of Defend 44.

party openly and going into the lobbies with Labour and the Fianna Fáil dissidents led by Mr Neil Blaney, who had boasted in the Dáil of having helped to start and encourage the IRA men of today.

The Fine Gael men leading the move to isolate Mr Cosgrave and so discredit his leadership were trapped. If they voted against the bill they would either precipitate a general election in which the party would be severely damaged or bring into the open a major internal split. The bombs saved them. Less than two hours later, the anti-Cosgrave brigade withdrew its opposition to the bill and Mr Cosgrave survived the most dangerous threat yet to his leadership.

But the split remains and is too deep to be papered over much longer. Front-bench men such as Mr Tom O'Higgins, second-in-command to Mr Cosgrave, and Mr Garret FitzGerald are in a hurry for power. They see their only chance of office through a firm pre-election coalition pact with Labour. Mr Cosgrave's unconcealed hostility to Labour, his strong personal commitment to tough action against the IRA and his determination to stay at the

head of the party which his father founded (as Cumann na nGaedheal) suggest that his opponents in the party face an impossible task in forming a coalition while he is leader.

The present Fine Gael policies are almost indistinguishable from those of Fianna Fáil. A breakaway left-leaning Fine Gael splinter group could be the nucleus for a new party of the centre-left which would attract recruits from the right wing of the Labour party and the left wing of Fianna Fáil, giving Irish politics the division it has lacked for so long. Last weekend's manoeuvres saved Fine Gael for the moment. But they may have only postponed an overdue development in Irish politics.

Mr Lynch, who has shown himself the shrewdest politician in Ireland, can read the signs better than anyone. It would surprise no one if he were to go to the country soon to get the overall majority he wants and to remove from the Dáil the four Fianna Fáil dissidents on whose unwelcome support he now depends. A general election next October was the best bet up to this week. Now the horizon has contracted and an election in the spring is on the cards.

Russia

Back to cursing the darkness

It looks as if even the faint flicker of ineffectual political opposition that has been visible in the Soviet Union in the past few years is doomed to burn still lower. On Tuesday the tiny handful of dissenters who, each year since 1965, have tried to assemble for a few minutes' silence in Moscow's Pushkin Square on Constitution Day were, as usual, bundled away by the police. And the near-desperate plight of the dissenting movement is illustrated by the reports from Moscow that Mr Pyotr Yakir, the 49-year-old historian who had long been regarded as the dissenters' unofficial leader and was arrested in June, is soon to be put on trial on charges of providing anti-Soviet information to foreigners.

The story is that Mr Yakir, who spent many years in labour camps as a boy, is now providing the police with the names of other dissenters and of their western contacts in Moscow. It may not be true; but certainly an intense war of nerves is now being waged by the KGB, Russia's secret police, against the authors and distributors of the various underground *samizdat* publications.

One of these, in particular, the *Chronicle of Current Events*, which has been appearing at regular two-monthly intervals since 1968, has infuriated the government by its detailed coverage of repression in the Soviet Union. The KGB may now have decided that the time has come for a final crackdown that will silence this embarrassing source of unfavourable publicity and at the same time deprive the dissidents inside Russia of their chief means of keeping in contact with each other.

The unofficial political opposition in Russia is plainly in a bad way. Imprisonment, exile to Siberia and confinement to psychiatric hospitals have reduced the dissenters' already thin ranks; they have probably never numbered more than a few thousand activists and sympathisers in a country of 240m people. General Grigorenko, Vladimir Bukovsky, Andrei Amalrik and a number of others have been put out of action in this way over the past few years.

Others, more recently, have been banished from the country, or allowed to leave in the hope that they will not return. One of the involuntary exiles

Yakir: part of the war of nerves

is Alexander Yesenin-Volpin, who is now teaching logic at an American university and, from the KGB's point of view, causing far less harm than when he was trying to stir things up in Russia. It was announced this week that Zhores Medvedev, who was briefly put in a psychiatric hospital in 1970 for his opposition activities, is to be allowed to come to Britain for a year. Valery Chalidze, a member of Professor Sakharov's gallant "committee for the protection of human rights" in the Soviet Union, is also now in the west.

It seems that the Soviet authorities are now treating these dissenters in the same way as the Jews who have been prominent in agitating for free emigration to Israel. The policy seems to be to let the most vocal and troublesome protesters go, in the hope that those who remain may prove more amenable. Will it work? That depends on how demoralised Russia's dissenters have become.

They have clearly been disheartened by the failure of their main hope—dating back to the years after Stalin's death in 1953—that the pursuit of greater economic rationality in the Soviet Union would bring liberal political reforms with it. According to Professor Sakharov, one of their veterans, they have also been demoralised by the Soviet leaders' recent success in getting economic help from the west without having to give more freedom to their own people. The fact that the west has never demanded some such return for the help it gives adds to the despair of the Russian dissenters. One test of how far their despair—and the KGB's success—have gone will be whether or not the *samizdat* publications, especially the *Chronicle of Current Events*, continue to appear in the future.

East Germany

Poles go home

Willy Brandt and the average Pole have at least one thing in common: both are equally unwelcome in east Germany at the moment. The west German chancellor's problem is that he is too popular with the people of east Germany. It is his popularity that has prompted the east German government to make it clear that it would not be pleased to see Herr Brandt in east Berlin for the signing of the inter-German treaty on December 21st. Herr Brandt has politely agreed to send Herr Egon Bahr, who did the negotiating, to do the job for him.

By contrast, it is the insatiability of the visitors from socialist Poland that is responsible for their frosty reception in east Germany. Since visas between Poland and east Germany were abolished in January, 9.3m Poles have poured across the frontier to raid their more prosperous neighbour. They have almost emptied many shops of everything from children's shoes to tin-openers. This gigantic shopping spree has strained east Germany's already over-stretched supply system and, in consequence, east German-Polish relations. What started as an attempt to dispel eastern Europe's claustrophobia has threatened to rekindle old hatreds.

Last week the two prime ministers met to tackle the problem. They decided that the answer lay in replacing individual foraging by organised group travel. To discourage the individual there is now to be a limit of just over £20 on the amount of east German currency a Pole may buy for trips lasting less than six days. The east German customs officials have already started searching returning Polish tourists and have been impounding any goods found on them over the value of the permitted £20. The threat of a huge pre-Christmas buying orgy by Poles in east Germany has been averted, but at the cost of making a lot of Poles very angry.

East-west

Talks about talks about what?

The talks between representatives of 34 countries that opened in Finland on November 22nd now look like running on for another week or so and then breaking off for a Christmas recess of three or four weeks. Down in

the forest at Dipoli, the craggy setting for these talks just outside Helsinki, nothing much has stirred. After a first week devoted to settling procedural questions, the assembled diplomats embarked on a series of somewhat predictable policy speeches which, since everybody had to have his say (and that included the spokesmen for San Marino and Liechtenstein, and the Vatican's man, Monsignor Zabkar), ran on until Tuesday. On Thursday discussion turned to the agenda for the conference on "European security and co-operation" which these talks about talks are about.

As was expected, the Russians' idea of an "agenda" turns out to be little more than eyewash. By their own account, "co-operation" would mean merely a continuation of the tightly controlled exchanges of delegations, ballet troupes and trade missions that are already a discouragingly prominent feature of the Soviet block's relations with the outside world. "Security" would mean merely the incantation of precepts about international relations; and even on this abstract plane the Russians flinch when Rumania calls for a pledge that the use or threat of force by one nation against another should be permitted "in no circumstances whatever, in no form and under no pretext." Mr Brezhnev's problem is that he wants to exchange vague promises of good behaviour with everybody else without prejudicing his right to roll his tank divisions across their frontiers if, as in Czechoslovakia in 1968, he feels a sudden urge to do so.

A conference limited to these Soviet suggestions would do nothing for European security or European co-operation; it might well impair both. No amount of evasion or stonewalling by the Russians in these talks should deter the representatives of democratic states—Nato members and non-members alike—from insisting that Europe will not feel secure, or even co-operative, until Europeans regain the kind of normal contact with each other that the communist governments now deny them. When the Russians declare that a general opening of frontiers is unthinkable, they should be urged to let other east European states participate in limited schemes from which a general opening up might in due time develop. It is lack of free contact that breeds fear, misunderstanding, suspicion and hence insecurity. A "security" conference that evaded this vital point would be a cruel mockery of Europe's hopes.

*Europe and America***The first shots**

So 1973 really is to be Europe year for Mr Nixon's second administration. The American Secretary of State, Mr William Rogers, used his speech to Nato in Brussels on Thursday to talk as much about what the United States wants from the common market as about Nato and the military alliance. His remarks were unusual fare for the ministerial meeting of what is after all a military alliance. Trade talks with Europe clearly mattered as much to Mr Rogers in this speech as his renewed reassurance that the United States means to keep its soldiers in Europe. But this should no longer cause surprise. In the American mind the two subjects, freer trade and continued military support, are increasingly linked to each other—as each is linked to monetary reform.

Before going to Nato Mr Rogers saw the outgoing Brussels commission of the common market on Wednesday afternoon. There too he went to some lengths to show his interest in the trade issues which it will be the new commission's job to handle on behalf of the Nine next year. There are two aims behind this American campaign to promote the common market, as one American puts it, "to the same political status as Nato itself." One is to prod the nine members of the European Economic Community into raising their own level of political debate on trade above the eternal dogfight about things like the reference price for oranges. The Americans think that the presidents and prime ministers of the Nine should give the Brussels commission more real room to negotiate on trade with the broader interests of the alliance firmly in mind; this in turn, they concede, will call for a commissioner in charge in Brussels (such as Sir Christopher Soames would like to be) who can talk in Washington and Tokyo at a more political level than before and then report his impressions back to the Nine.

Mr Nixon's second aim is to improve his own present less than equal chance of getting a decent trade negotiating mandate from Congress. This might be made easier by bringing the new EEC of Nine alive in the minds of Congressmen in Washington as a political creature on a par with Nato in the alliance. The Nine's summit in Paris in October, coming when the United States could think only of its

own election campaign, had little effect beyond the words of praise which Mr Nixon himself gave it at the time. So at Nato this week Mr Rogers listed the ingredients of an American trade bill—tariffs, farming, non-tariff barriers. He made particular play of the preferences which the Six have arranged for themselves in the Mediterranean and Africa, and he suggested that Europe's doors should open a little wider to imports from Japan.

But these familiar words, unfamiliar in Nato, were put forward in a notably unbelligerent way. Mr Nixon's approach to the economic bargaining of 1973 contrasts markedly with the sabre-rattling which the present EEC commissioner for trade, Professor Ralf Dahrendorf, has indulged in during recent weeks. The time will come late next year for fighting over details in Geneva and Brussels, and it will be quite a fight. What matters more now, according to Mr Nixon, is to give the larger Europe a chance to come good in the eyes of such men as Mr Wilbur Mills. If Europe can show promise of "fair play" (a favourite Nixonian phrase) on money and trade, then the Atlantic alliance is an asset and commitment which Congress should grab the chance, in its turn, to keep going. If not, then Mr Nixon will have to think again.

*Canada***Le fait anglais**

Mr Trudeau's weekend at Chequers with Mr Heath yielded, by the Canadian prime minister's own account, ample reassurances to Canada about the implications of Britain's entry into the common market, and a nice eye-catcher for the general public: the Queen's acceptance of an invitation to come to Canada next August, when the Commonwealth's prime ministers and presidents are due to meet in Ottawa. For Mr Trudeau, this is all very timely. After his Liberals' severe setbacks in the elections on October 30th, they were left looking painfully like a French Canadian party; half of all the seats they won were in Quebec, and in no other province did they win a majority of seats. Before facing parliament again on January 4th, he would presumably like to improve his government's image in the eyes of English-speaking Canadians.

In the sweeping cabinet changes that he announced on November 27th, it was particularly noticeable that Mr Jean Marchand and Mr Gérard Pel-

*Were they speaking French?*

letier, his two old fellow musketeers from Quebec, were switched to the relatively calm areas of transport and communications. Mr Donald Jamieson and Mr Hugh Faulkner took over their former posts, which respectively concerned regional economic expansion and the promotion of bilingualism. Mr Jean-Luc Pépin, who had lost his seat, was replaced as minister of trade and industry by Mr Alastair Gillespie. The only notable French Canadian advancement was the choice as minister for health and welfare of Mr Marc Lalonde, the prime minister's former principal secretary.

It is true that, in the elections, the Liberals got twice as many votes outside Quebec as they did inside it, and that their total vote of 3.68m was well ahead of the Conservatives' 3.36m. But the figures that must have burned themselves into Mr Trudeau's brain were those for votes cast outside Quebec: 2.9m for the Tories against only 2.4m for the Liberals. The cabinet reshuffle, the trip to Chequers and the invitation to the Queen all look like prudent responses to a backlash among Canada's "Anglos."

*Australia***What's a battalion between friends?**

FROM OUR CANBERRA CORRESPONDENT

Australia's preferential voting system means that it will not be until a week before Christmas that the exact size of the Labor party's majority is known. The party's rule that the ministry must be elected by the parliamentary party before the prime minister can allot

*Continued on page 41***Grand Marnier for Socialites**

Take a generous shot of Grand Marnier in a tall glass, swoosh in a bottle of tonic water, chunk in a couple of ice cubes, add a twist of lemon, *et voila*—the new mix that's sweeping South America (no, seriously).

Marnier and tonic.

Those who haven't tried it, laugh.

Those who have, smile.

Knowingly.

**-and for Conservatives**

There is no cause for alarm. That seemingly sacrilegious offering over on the Left is merely a novel serving suggestion.

Grand Marnier is still the superlative liqueur it always was, the same subtle blend of wild oranges and the finest old Cognac.

Something to sip reflectively after a good dinner.

And conserve for your special friends.

The oranges are wild. The taste is civilised.

One Swede in ten

To be quite honest, they're not all as big as the one in the picture.

On the other hand, there are lots of them. No country in Europe has as many pleasure craft per head as Sweden.

The merchant fleet is by no means insignificant, either. And only Japan builds more ships than Sweden.

Other vigorous industries are pulp and paper, steel, and — above all — engineering. Fully 40% of the industrial output is exported.

With only 0.2% of the world's population, Sweden in fact accounts for 2.0% of international trade. And Sweden's recent free trade agreement with the Common Market means that this share will increase.

If you want to do business with Swedish industry, there is an obvious way in for you — Skandinaviska Enskilda Banken.

A large majority of the biggest companies in Sweden do foreign business through us. (Which of course doesn't prevent us from having many clients among the smaller companies, too).

Our clients include the biggest shipyards and the biggest shipping companies — we are an international leader in financing ship construction.

In fact they represent all significant branches of Swedish commerce and industry. Skandinaviska Enskilda Banken occupies a key position in Sweden's economy.

Our Bank resulted from the consolidation of

Sweden's two leading international banks, each with more than a century of foreign experience.

We now handle more than half of all the foreign business conducted by Swedish banks. And are the largest bank in Scandinavia. Admittedly, our total assets of US \$ 5000 million do not make us one of the world giants. But when it comes to international operations and foreign exchange business, we are well up among the leaders.

We have an office in every significant centre of population and industry in Sweden. More than that: we have the people you need. Both in Sweden and throughout the world.

If you really want to find out how much business you can do with Sweden, why not start by writing on your company letterhead for our

publication "Some Data about Sweden"? That will give you a lot of clues. Please write to Skandinaviska Enskilda Banken, S-106 40 Stockholm, Sweden.

If, after that, all you need is a bright idea or two, maybe we can help you there, too. Our Head Office is in Stockholm, and we have Central Offices in Stockholm, Göteborg and Malmö.

Offices, affiliates and participations worldwide, including Geneva, London, Madrid, New York, Paris, São Paulo, Tokyo, Zürich.

Skandinaviska Enskilda Banken

NATIONS DO NOT MOVE FORWARD ON BACKWARD METHODS

We respect the man with a load on his back. He is a symbol of honest labor.

But there are, you will agree, far more efficient ways to move essential materials.

Throughout the world, whole industries are suffering because of obsolete handling methods.

It need not be so. And our company is proof of this truth.

Helping people and nations move their materials is only one part of our company's business, but a part in which we are world leaders.

To convey minerals over mountains, for example, we build massive conveyor systems.

To transport coal to the crushers, grain to the granaries, raw materials to the refineries, or foods to the factories, we engineer ingenious bulk handling systems.

We manufacture machines to put products into packages, load the packages into containers, and automatically stack the containers on pallets.

We design and build automated warehousing systems, including equipment to sort and stock products, then gather them when orders need filling.

We build mobile cranes that will handle anything from small products to steel for heavy construction.

We even manufacture pumps to move oil, water, and chemicals.

Our company has innovated many of the ideas which are propelling nations, regions, and industries into a new age in materials handling.

And we offer those ideas to the entire world.

FMC has offices in principal cities throughout the world. To learn more about this versatile company, please write for our booklet, "Achievements."

FMC CORPORATION

San Jose, California 95106, U. S. A.

A VERY USEFUL COMPANY

Exclusively smooth. 3.3 litre Ventora.

Lazy, long striding luxury. 6-cylinder power at your command – 140 bhp.

In a word, Ventora.

Leaping from idle to action in seconds, Ventora makes light work of long journeys. While you relax in style. In reclining front seats. And surround yourself in luxury with deep pile carpeting, sumptuous brushed

nylon upholstery.

7 dial instrumentation set in burr walnut finish fascia. Heated rear window. Immediate response ventilation. All there for your comfort.

So are power assisted brakes and steering. Take a lazy test-drive in Ventora. At only £1,856 it's no effort.

Facts, figures, features. Included in the basic price are front discs, radial tyres, alternator, complete factory applied underbody seal, 11-stage anti-corrosion treatment, vinyl roof, four headlamps and twin reversing lamps, fitted front seat belts, centre console, cigar lighter and wall-to-wall carpet. GM Euroservice 365 to simplify regular maintenance. Full safety package. GM Automatic Transmission or overdrive are optional.

Ventora

-it's a joy to drive!

Price ex-factory, inc. p.t., correct at time of going to press.

Whitlam isn't dropping Singapore flat

Continued from page 34

portfolios means that government posts cannot be filled until the full membership of the parliamentary party is known. So Mr Gough Whitlam has taken office as prime minister with only his deputy, Mr Lance Barnard, to help him.

Mr Whitlam is keeping fairly quiet about policy except in those areas which he and Mr Barnard are likely to control, especially foreign affairs and defence. In foreign affairs, Mr Whitlam has been redefining Australia's position at the United Nations and preparing the way for diplomatic relations with China. In matters of defence, conscription has been stopped and draft resisters are being let out of jail.

Mr Whitlam is taking his time before making any decisions about the five-power agreement with New Zealand, Britain, Singapore and Malaysia. The British defence minister, Lord Carrington, will be in Australia next month and the new Labor governments of Australia and New Zealand will discuss it with him then. In the meantime Mr Whitlam is reiterating what he and Mr Barnard—with whom, as he says, he has not had a difference of opinion in 18 years in parliament—said before the elections. The gist of this was that the Labor party agreed with the Malaysian idea of neutralisation in south-east Asia but that, pending neutralisation, it would honour the full terms of the five-power agreement under which Australia agreed to provide Malaysia and Singapore with training and equipment. Australia would seek similar arrangements with Indonesia, Papua New Guinea, New Zealand and Fiji. It would not, however, keep the Australian battalion in Singapore; the agreement did not require this.

Mr Barnard had anticipated some of these points in a speech in August. He was particularly critical of the outgoing government's policy of keeping a battalion in Singapore with wives and families. In his view this was being done because the army wanted to raise morale "by holding out the lure of Singapore." Instead a Labor government would, he said, send Australian troops to hold exercises in Malaysia or other countries for short periods of up to three months without their families. This would give more units a more spartan training. Mr Barnard accepted an interim obligation to help Malaysia with air defence, but thought that Malaysia's divergence from Australian air defence technology and the vulnerability of Australian aircraft exposed in the open, at the air base at Butterworth, to the possibility of terrorist attack were reasons for bringing air co-operation to an end before too long.

The Australian battalion is due to be relieved at the end of 1973; it will probably be kept in Singapore until then. How long the air force will stay in Malaysia is anyone's guess. The navy will presumably continue in its present role. The five-power arrangements can thus be spun out for quite some time, since the battalion is not essential to them. There is no indication at present that either Britain or Singapore is putting pressure on Mr Whitlam to change his mind. If they do they may be met with the obvious answer that the five-power arrangements are very vague and commit Australia to little but the equipment, training and consultation which the Labor party is willing to give. If the British do not like this they may be asked why they did not show more resolution when the arrangements were being negotiated. It is a bit late to start afresh and suggest some binding treaty, especially since Mr Kirk's government in New Zealand would probably agree with Mr Whitlam.

Victory in the south-east

FROM A CORRESPONDENT

Although 10 seats are still in doubt after last Saturday's Australian general election it seems certain that Mr Whitlam's final majority will lie between seven and 17. His Labor party fared well in the populous south-east corner of the country but disappointed itself elsewhere. On the likeliest assump-

tions it has gained five seats in Sydney, four in Melbourne and one in Hobart. It also seems to have captured two seats from the Country party in New South Wales. It has lost one seat in South Australia and two in Western Australia. Probably the only two changes in Queensland will be mutually cancelling switches between the Liberal and the Country parties.

Using very cautious assumptions, it seems that the distribution of seats in parliament will be as follows:

	Certain	Probable	Total	Old Parliament
Labor	66	3	69	59
Liberal	26	11	37	46
Country	18	1	19	20

The overall swing from the Liberal-Country coalition to Labor works out at a little under 3 per cent. There was a swing of around 4 per cent to Labor in Victoria, New South Wales and Tasmania. The change in Queensland and South Australia was negligible, and in Western Australia there was a 4 per cent swing in the coalition's favour. The results in South Australia, and still more in Western Australia, can be ascribed to the unpopularity of the state Labor governments there.

In Sydney the speaker, Sir William Aston, lost his seat, and Mr Bowen, the outgoing foreign minister, has probably been defeated at Parramatta in Melbourne. Three "safe" Liberal seats are in danger, including Henty, where Mr Fox, the Liberal whip, suffered an 11 per cent swing against him—the biggest in the election. One of the most notable features of the results was the decline of the breakaway Democratic Labor party. Although it fielded more candidates than in 1969 its overall vote fell from 6 per cent to 5 per cent. In many metropolitan areas the fledgling Australia party outpolled it.

Japan

The high price of power

The second most expensive election campaign in an election-ridden year will grind to an end in Japan on Sunday. Nowhere outside the United States do candidates spend so much in the effort to get themselves elected. Nowhere, perhaps, do hand-outs play so flagrant a part in a campaign.

The Japan Times has estimated that the elections will have cost more than £30m—about as much as both President Nixon and Mr McGovern spent in battling each other. About £13m of this will be paid out by the govern-

ment to cover the administrative costs of the election; £14m will be spent by the ruling Liberal Democratic party; some £1.5m by the Komei party, and a bit under £1m by the poor relations on the left, the Socialists, the Democratic Socialists and the Communists.

The opposition parties are putting up many fewer candidates for the 486 seats in the lower house than the Liberal Democrats, but this difference does not begin to account for the money gap. The Liberal Democrats, who have monopolised political power in Japan since the American occupation ended, also command the backing of Japan's business circles, whereas the Socialists and the Democratic Socialists have to depend on affiliated trade unions for their campaign funds. Komeito and the Communists rely on party contributions.

Each of the 336 Liberal Democratic candidates was given about £9,000 at the start of the campaign by party headquarters—half as a grant and half as a loan. Leaders of the factions within the party drummed up their own campaign funds as well, and doled out £14,000 or so to each of their protégés. Individual candidates naturally did their own fund-raising on top of all this. They had to. Japanese politicians claim that if a candidate has less than £100,000 to back him he is doomed to defeat. If Japanese elections are really rich men's elections, the opposition is in a sorry state, since most opposition candidates fall into the under-£100,000 category. The 161 Socialist candidates merely received a loan from their party enough to cover their deposits—£424 apiece. This is one-twentieth of what Liberal Democrat candidates got from their party. Komeito gave each of its 59 candidates about £700 although, like the Socialist party, it does offer additional loans when required.

Japan, like most countries, has its legal limits on campaign spending but, even more than in most countries, these are cheerfully ignored. It is calculated, for example, that a candidate must spend £140,000—or more than 20 times the prescribed limit—if he wants

to be certain of victory. Much of this goes in outright gifts. Trifles like umbrellas or packets of soap are distributed to the voters. But community opinion-formers are often given cash gifts of up to £1,400. This kind of largesse is, of course, strictly illegal and its distributors are liable to end up in jail; the party workers who do the job are dubbed kamikazes.

All this spending is expected to produce hardly any political change at all—not surprisingly, since the richest party is spending its millions to keep things as they are. The Liberal Democrats are said to be aiming at about 300 seats but will do well to hold their own; anyway, the real fight is within the party—between the factions led by the prime minister, Mr Tanaka, and his rival, Mr Fukuda. The Socialists are also warring among themselves and are not expected to recover many of the 50 seats they lost at the last election. The Communists may gain a little. But there are no prizes for guessing which party will win.

China

The 20,000 who have got away

FROM OUR HONGKONG CORRESPONDENT

Most international roads may now lead to Peking, with the local Kissingerettes expected hourly from Canberra and Wellington; but the flow of escapers from the people's paradise to Hongkong's hell continues to set new records, with embarrassment on both sides of the 22-mile border.

The colony triumphantly welcomed its millionth tourist of the year last week; it simultaneously reported less enthusiastically the detection of its 5,100th illegal entrant. Last year only 3,694 arrests were recorded. By official computer average, Hongkong reckons, conservatively, that it detects only one of every four "freedom-swimmers." The People's Liberation Army reckons, perhaps extravagantly, that it catches or kills five of every six attempting escapers. So the Year of the Rat, with still another month to go, has set a record, by Hongkong reckoning, of 20,000 successful escapers. The PLA reckoning in Canton is unknown but it should be equally formidable—as penalties for the arrested have recently become.

Here then is a potential problem of colonial coexistence which could become more urgent and which is receiving top-level attention in Hong-

One who died in the effort

kong—in furtive anticipation of Mr Heath's eventual first visit to Peking. The Chinese have remained encouragingly or deceptively silent, even after escapers hijacked a fishing junk in Chinese waters in September, forcing it to sail to Hongkong after picking up 18 more refugees on the Chinese mainland at gunpoint. This was the second hijacking this year; another 56 escapers hijacked a junk to Hongkong on July 20th, and although the junk with its crew of five was immediately and apologetically returned to Canton the hijackers, Cuba-fashion, were allowed to remain.

The Chinese government could have demanded the return of the September escapers under international law, but made no public protest. In the United Nations it has twice insisted that the rising flood of escapers are not refugees because "Hongkong is China." However, there has been no insistence—which the kowtowing Portuguese accepted after the Red Guard terrorism of 1966—that all these non-refugees must be arrested and returned.

Hongkong still remembers gratefully the infuriated aside by a party spokesman when Philippine students hijacked a plane to Canton not long ago: "Peking will never become another Cuba." The disillusioned Philippine students, by last report, are labouring, homesick, on a commune outside Peking—not "imprisoned," of course, but merely "learning to know the masses."

Jordan

One bank only

FROM OUR SPECIAL CORRESPONDENT

Jordan's East Bank is gradually sliding out of its isolated Arab corner—partly at the expense of its Israeli-occupied West Bank. On December 1st the Syrians formally reopened their fron-

For gentlemen

The last two elections

	Seats won	
	1969	1967
Liberal Democrats	288	277
Socialists	90	140
Komeito	47	25
Democratic Socialists	31	30
Communists	14	5
Independents	16	9

tier and their sky to Jordanian traffic; a couple of days earlier the Jordanians had announced new restrictions on people and goods crossing the bridges that link the two banks of the Jordan river. Goods are to be taxed and East Bankers will be able to visit their relatives on the West Bank for only two weeks every two years and may not take much money with them.

True, the Jordanian government, on the eve of its third attempt at a thundering great development plan, is undoubtedly concerned to protect both its currency (Jordan's dinar is stronger than Israel's pound, or Britain's for that matter, and is eagerly snatched up) and its own farmers in the eastern Jordan valley. But Jordan may be winning both ways by doing something that is financially convenient and, at the same time, bowing to Arab, including Syrian, pressures. Arabs have criticised the open bridges policy, partly because of their well-founded suspicion that Israeli produce slips across under a West Bank label and partly because of the collaboration with Israeli authorities that the policy entails.

The opening of the Syrian-Jordanian frontier, officially closed since July, 1971, is a bit of a fraud. Under various pressures, the Syrians have already been allowing many Jordanian exports through, including phosphates on their way to Europe. But it will cut down the cost of Jordan's imports, which at present mostly come the long way round through Aqaba, Jordan's port on the Red Sea. And the reopening of Syrian air space is an unmixed blessing to Jordan's airline and its passengers.

The next move, although there is no intimation when it will come, is presumably the resumption of some form of diplomatic relations with Syria and, more important for Jordan, with

Hassan takes the driving seat at home

Egypt. The theory in Amman is that this would give the green light to Kuwait to resume payment of the subsidy that it, together with Saudi Arabia and Libya, promised to pay to Jordan after the 1967 war but stopped when King Hussein forced the Palestinian commandos out of the country. The Saudi Arabian subsidy never stopped; the Libyan one is shrugged off.

Jordan has not suffered from the defection of Kuwait and Libya. Other countries have stepped generously in, notably the United States but also the Gulf states, including Oman and Abu Dhabi, in thanks, no doubt, for the military services Jordan is rendering them. At the grand, and on the whole very efficiently run, public relations fiesta held last month to present the 1973-75 development plan for the East Bank, the International Monetary Fund delegate was able to describe Jordan's balance of payments position as "generally strong." But more than half the country's public revenue (as compared with a quarter in 1956) comes in the form of foreign assistance. The planners assume that straight budgetary support will continue at its present rate of £48m a year for the three years encompassed by the plan. It is a fine way of making ends meet, if one can do it—and nobody even mentioned the substantial military assistance that Jordan also gets from America.

The plan, the first to be prepared by Jordanians themselves although with advice from the United Nations and World Bank thick on the ground, is the fine healthy infant (weighing 5lb 14oz) of Crown Prince Hassan, who at 25 has taken over most internal affairs from his brother. It aims at a growth rate of 8 per cent a year, and total spending of £215m, of which £120m will come from the public sector (£84m from foreign loans and technical assistance) and £96m from private investment. The bulk of the foreign loans have, in fact, already been pledged, including a whopping sum from west Germany for connecting the old Hejaz railway line to Aqaba, and thus enabling a faster flow of phosphates and other exports to eastern markets. The private investment, at present scarcely visible, may prove the more elusive.

Priority is given to the creation of 70,000 new jobs; the East Bank's present labour force is estimated at 340,000 and unemployment, excluding the enormous amount of underemployment, is around 8 per cent. The birth

rate is guessed to be 3.1 per cent. One of the quickest ways of easing this situation is to concentrate first on agricultural projects in the Jordan valley.

But where does this leave the competitive farmers on the West Bank? The basis of the plan is that Jordan cannot afford to stick around, cap in hand, until such time as the West Bank, "the dearest part of the Jordanian structure," is liberated. Fair enough. But the plan's preamble promises a section on West Bank development pointing the way to eventual economic integration. There is no such section. However theoretical such speculation would inevitably be, its absence, together with the small signal of new restrictions on traffic, underlines the divisive effect of Prince Hassan's regional realpolitik.

Zanzibar

The windows open an inch

FROM OUR SPECIAL CORRESPONDENT

Zanzibar's ruling Afro-Shirazi party opened a week-long delegates' conference in the Fidel Castro secondary school at Chake Chake on Pemba island on December 1st. The conference was the first of its kind since before the revolution in 1964 when the former sultan's government was overthrown. And it was the first big Afro-Shirazi get-together since the assassination of Zanzibar's erstwhile ruler, Sheikh Karume, in April.

Whether or not the conference will achieve its stated long-term aims of socialism and of democratising government in the Zanzibar islands by transferring more power to the people through the party, its short-term consequence will almost certainly be a strengthening of the position of Mr Aboud Jumbe, the new party leader. Students of the party's new constitution, approved by the 900 delegates at Chake Chake, were arguing that it indicated a subtle shift of power away from the party's revolutionary council in the direction of its previously rather unimportant political committee. And they pointed out that responsibility for appointments to the political committee was placed firmly in Mr Jumbe's hands.

The conference, which was an attractive mixture of the technically high-powered (instantaneous translation of speeches into Kiswahili, French and English) and the homespun (delegates and guests after lunch sitting on the

ground under raffia awnings), was important for two reasons. First, it represents an important landmark on the road to normalisation and to the opening up of windows which Mr Jumbe clearly favours. The press was welcomed, and was able to see some of the features not usually associated with Zanzibar, from which it is clear that there is some of its record of which the Afro-Shirazi party can be proud. The typical Zanzibari peasant, with his three-acre plot, is certainly getting a fairer deal now than he was as an estate worker under the sultan's regime. And some of the economic achievements—flat-building by the east Germans and a tractor scheme run by the Chinese—look rather impressive.

Second, it can be assumed that by agreeing to attend the conference, and to speak after Mr Jumbe, President Nyerere of Tanzania was signifying his support of the new leadership. It is no secret that Sheikh Karume was more like a hornet than an agreeable bed-fellow in the rather anomalous union between mainland Tanzania and Zanzibar. President Nyerere is entitled to expect that the relationship will be much less difficult and much less embarrassing in the future.

Sudan

Don't be mean

Next Wednesday a biparty parliamentary delegation will ask Mr Richard Wood, the Minister for Overseas Development, why Britain is being so mean in its contribution to refugee relief in southern Sudan. Britain, which ruled Sudan for nearly 60 years, allowed the black southerners to believe that, come independence, they would not be abandoned to northern Arab domination: independence came, and so did northern domination. So the southerners fought a long, bloody civil war to win the substantial autonomy that was at last promised them in their peace agreement with President Numeiry last March.

In the process their country was devastated and some 800,000 south-

erners driven to exile or the bush. Now they are coming back, but if the peace agreement is to hold they must return to the minimum necessities of living—food, shelter, simple medical care, seed grains and hoes to prepare next year's harvest. Sudan by itself has not got the money to provide these things or, more important in a war-torn country, to get them to the right places. The UN High Commissioner for Refugees appealed for at least \$17.7m in immediate relief aid, and has so far obtained \$14.7m in cash, kind or pledges. In May (before the UN appeal) Britain promised emergency relief worth £200,000; of this, three-quarters has actually been donated in the form of trucks and Land-Rovers. But this, to date, is the sum of Britain's help to southern Sudan.

The MPs intend to ask Mr Wood for a substantial contribution to the UN appeal; this, it is believed, would carry the added bonus of encouraging France and west Germany to follow suit. They also stress that aid is now most needed in un-earmarked cash, rather than kind. The fear is that the ministry, which has already this year dug deep into its pockets for the much larger refugee crisis in Bangladesh and India, may respond with token relief—which might also be copied by France and Germany. Maybe for good reasons or maybe just to postpone the moment of payment, Britain is concerning itself more with the longer-term problems of reconstruction; a British economic planning team is now in Sudan studying the needs. Fine, but why, given the perils and hopes of Sudan's fragile peace, not both reconstruction and relief?

United Nations

It's still too much

The Americans look like getting their way over the reduction of their share of basic United Nations dues to 25 per cent. This will get Mr Nixon out of the difficulty created for him by Congress's demand for a 25 per cent ceiling. It may appease some of those Americans who, particularly since the assembly voted Taiwan out a year ago, have complained that the present assessment of 31.52 per cent is altogether too much. But the most relevant comment is that the other member states ought to be ashamed of having left it to the Americans to demand this change.

An organisation of 132 member states that depends on one member

for nearly a third of its revenue, and on five others for nearly two-fifths, is not in a healthy state. The 126 members who between them provide only 30 per cent of the UN's basic budget are not all penurious micro-states; and the sums involved are so small that, if it were agreed that no one state should pay more than 5 per cent, the consequent increase in the others' shares would be imperceptible to their taxpayers. The Dutch and the Australians, for instance, now pay about 15 US cents per head per year, the Poles about 7c, the Spaniards 5c, the Mexicans 3c. If the dues of these and other countries above the poverty line were doubled, in order to free the UN from its financial dependence on a few major powers, the new burdens would be negligible, but the organisation would be in better shape.

The principle that there should be a ceiling of some kind was agreed upon 15 years ago. If it had not been, the Americans would now be assessed, by national income, at around 36 per cent. (Be it noted that they have been contributing more than 40 per cent of the UN's voluntary funds, which are much larger than its budget.) The admission of west and east Germany, and the raising of the Japanese and Chinese assessments, would anyway have brought the American share down by 4 or 5 per cent during the next assessment period. So it has been something of a sham fight in the budgetary committee. But the fact remains that 25 per cent is still too high a ceiling, and that somebody other than the Americans ought now to pursue this point.

The ceiling is still too high

**You and
64 799 others can now talk
simultaneously over one
cable like this:**

(Actual size)

**It's not the
first record we've broken.
And certainly won't
be the last.**

Technology is an incredible thing.

It wasn't so long ago that we introduced the world's first terminal equipment capable of handling 2 700 telephone conversations at the same time on a single pair of 9.5 mm coaxial tubes; making a possible total of 8 100 conversations going over an ordinary six-tube cable.

That was in 1959. We felt then that we were pushing technology to its limits.

Now it's 1972.

We've just delivered the first terminals in the world capable of handling 10 800 simultaneous conversations per pair of tubes. With the new Ericsson 60 MHz carrier frequency system, that same old cable converted for 60 MHz can now carry 32 400 telephone conversations — 64 800 voices.

Technology is a wonderful thing. Sometimes it helps to bring people closer together.

The Ericsson Group with world headquarters in Stockholm, Sweden, specializes in the development of better telecommunications. Manufactures, markets and installs all kinds of public and private telephone exchanges, telephones, transmission equipment, cables, wires and network supplies.

The Ericsson Group
—our business is to put people on speaking terms.

ACRECREST LIMITED- LONDON

A new name to watch out for in Europe.

Acrecrest Limited, the London-based property group, have recently acquired Comptoir Commercial du Caoutchouc, one of the largest and best known clothing stores in Paris. CCC stands directly opposite the also famous Galeries Lafayette and covers an area of 150,000 square feet.

Included in the acquisition (which was carried out in conjunction with the Phoenix Insurance Company) is CCC's wholly-owned subsidiary known as SEZA, a property holding company with assets of about £1,500,000.

Acrecrest have also received permission for the formation of a French company, Acrecrest S.A. with capital of 5,000,000F. Offices will be at 7 rue Caumartin and the chairman of the proposed company will be M. Bernard Mallet of the well-known French banking family.

As for the retail part of CCC, a new management team is being formed to improve profitability and to this end, M. Gerard Erstein, who has been with the company for the last six years, is named as chairman. He anticipates an annual turnover for the store of £5,000,000 sterling.

Acrecrest Limited, who are already involved in development and investment in Britain to the tune of some £17,000,000, are planning to expand their French and European operations even further. At the moment, they are negotiating the acquisition of property valued in the region of £25,000,000.

THE WORLD

American Survey

Government for a new phase

Washington, DC

Mr Nixon, when newly elected, unveiled his first cabinet in a body on television. This time it is different. Appointments to the second Nixon Administration are being let out in twos and threes and the press secretary does the announcing: though the words of praise are Mr Nixon's, the President himself is never there. Of that first cabinet only two will remain to start the second term, and only one, Mr William Rogers, the Secretary of State, will not have changed his job. The other sticker, Mr George Shultz, has risen steadily since, as Secretary of Labour, he won Mr Nixon's esteem by his judicious interventions in the Administration's internal arguments about social policy.

That was at a time, in 1969, when the whole social climate either was, or seemed to be, more threatening than it is now and when the Administration was more receptive to the idea of direct action to cope with social problems than the second Nixon Administration appears likely to be. There was also then, or at least there appeared to be, some money with which to attempt something. Thus the Nixon welfare reform was born, and Mr Shultz interceded in its favour, and the Nixon proposals were duly announced and went to Congress. But they are dead now and most of the men who worked on them have left Washington.

Mr Shultz, who was not involved in the failure, took over first the Budget Bureau and then the Treasury when Mr John Connally left. He is now to combine the position of Secretary of the Treasury with that of Assistant to the President and will preside over the Council on Economic Policy which Mr Nixon has decided to set up. This new body does not supersede the Council of Economic Advisers to the President, which will

be represented on it along with other agencies and departments.

Other bodies with not dissimilar names, including the Council on International Economic Policy, are also intended to be subordinated to Mr Shultz and his new council. When the press secretary, Mr Ziegler, said the words in Key Biscayne last weekend their meaning seemed almost plain:

Secretary Shultz will be the focal point and the overall co-ordinator of the entire economic policy decision-making process, both domestically and internationally.

Should that really happen, the responsibility would not be in bad hands. Thoughtful, sensible, thorough and sparing of words, Mr Shultz is a sound Chicago economist with a background in labour issues.

In foreign economic questions his predispositions are towards flexible exchange rates and free trade, but in fact he had never dealt much with any foreign subject until his arrival at the Treasury last spring. In getting the conduct of foreign economic policy into his hands he may face stiff competition from several sides of Mr Nixon's house. By giving him the twin hats of Secre-

tary of the Treasury and Assistant to the President Mr Nixon appears to have given him the necessary authority to enable him to hold his own, but what will really happen is not so certain. Mr Nixon relishes a bit of competition, even a bit of friction, among his servants and said so last month in discussing the relationship, which all but he consider a terrible thing, between Dr Kissinger's national security staff and the State Department.

Setting up a new council is often Mr Nixon's way of recognising that a subject is going to need handling: how it will be handled, and by whom, can remain veiled for a time. The reorganisation of the Administration, as it dribbles out bit by bit, contains many indications that Mr Nixon is preparing himself for a new phase of his foreign policy in which European relations and foreign economic policy (including trade negotiations and the reform of the international monetary system) will have a much bigger part than in the past. At the State Department, for instance, Mr William Casey is to take the new post of Under Secretary for Economic Affairs: Mr Casey, at present chairman of the Securities and Exchange Commission, is a strong appointment. The move of Mr Kenneth Rush from Deputy Secretary of Defence to Deputy Secretary of State also lends colour to the Administration's talk, usually belied in the past four years by its actions, of making serious use of the State Department

Coffee and economics for Shultz and Connally at Key Biscayne

and the foreign service.

Yet Mr Nixon, still deeply preoccupied with the search for a ceasefire in Indochina, is not quite ready for the new phase and his appointments for it are correspondingly incomplete. Mr Rogers has been confirmed in his tenure as Secretary of State, which has been principally made possible so far by his patience in subordinating himself and his department to the man on the flying trapeze, Dr Kissinger. Also confirmed in his tenure is Dr Kissinger, but that could be considered necessary to maintain his effectiveness as the negotiator for Vietnam. Here are two appointments better left alone until the Vietnam negotiations are concluded and the only way for Mr Nixon to leave them alone is to confirm them with all show of permanence.

Locked up in Paris, Dr Kissinger cannot have been participating fully in the aspects of Mr Nixon's shuffle that concern European and foreign economic policy. If he had, he might not have wanted the job of advising the President on foreign economic policy to be separated from that of forming foreign policy as a whole. He has experienced the effects once already, when Mr John Connally was riding herd on the foreign central bankers and trade ministers last year; then the political relations of the United States with western Europe, Japan and Canada were expected to take the strain. Not only Dr Kissinger but his deputy, General Alexander Haig, are wrapped up in the Vietnam question. General Haig, an intelligent, well-organised soldier who has risen rapidly in Dr Kissinger's and particularly in President Nixon's estimation, is to move to the Defence Department as vice chief of staff of the army as soon as the work on Vietnam permits. A reorganisation of Dr Kissinger's own staff, so far untouched by President Nixon's shuffle, cannot long be avoided.

One man who aspires to a distinct place in the making of foreign economic policy is the Secretary of Commerce, Mr Peter Peterson, but the outlook for his aspirations has become rather unpromising. Until February Mr Peterson was an assistant to Mr Nixon and chairman of the Council on International Economic Policy. He then became Secretary of Commerce when Mr Maurice Stans left the cabinet to raise the funds for the Nixon re-election campaign.

Why Mr Peterson should now have to leave his post at the Commerce Department is unexplained: the guess

The other White Houses

FROM CORRESPONDENTS WITH THE PRESIDENT

The one restaurant in Thurmont, Maryland, says it is the place where Winston Churchill once had a meal. This is one of the few visible indications that a seat of presidential power is nearby. Thurmont is, in effect, the post-office address for Camp David, seven miles away, the rustic retreat where President Nixon, as he has said, feels more at ease than in the formal splendour and inescapable visibility of the White House. Mr Nixon has also said that he intends to use the place more often in his second term. This is where he has been making most of the decisions involved in the reconstruction of his Administration. It was here that his new economic policy was secretly formulated in 1971. Since his re-election he has spent more time here than anywhere else and, as he told the newsmen in attendance at a recent brief talk, he intends to use it as a place to make "major decisions."

The camp is well hidden in the Catoctin mountains. "No stopping" signs meet the motorist as he approaches the formidable barrier of double steel cyclone fences, topped with barbed concertina wire, floodlit at night, that surrounds the enclave of 135 acres. Just inside the gate, where marines stand guard, is a caravan for the press; when a briefing occurs, buses take the reporters to a hangar fixed up for the purpose, and bring them back. Few of them have seen the grounds or the lodges where the President and his assistants are accommodated. They have no direct way of knowing who comes and goes, or when.

The camp was built during the depression of the 1930s to make work for the jobless. President Roosevelt chose it in 1941 as the site for a hide-away where he could relax and be free of the humid heat of the Washington summers before air conditioning. He sketched the plan for the presidential residence, now known as Aspen Lodge. FDR called it Shangri-La and he did indeed meet there with Churchill and other allied leaders during the

second world war, starting a tradition.

President Eisenhower renamed it Camp David after his grandson, who is now Mr Nixon's son-in-law. The short-lived "Spirit of Camp David" derived from Mr Eisenhower's meeting there with Mr Khrushchev.

The living quarters comprise two main lodges and 10 guest cabins. Relaxations are available, from swimming to pitching horseshoes. Stone fireplaces and exposed beams contribute to an atmosphere of rusticity. The presidential "cabin" cost \$60,000 to build; no information is available about the cost of subsequent changes or improvements either to the cabin or to the rest of the camp. Because the place was originally served by the crew of the presidential yacht, the staff at Camp David remains naval still. Seabees do the housekeeping.

At Key Biscayne in Florida, by contrast, President Nixon is on his own property and—for all that the key is an island reached by a causeway—in mid-suburbia. A 10-foot hedge of hibiscus hides an iron spike fence, beyond which is a small collection of one-storey villas of beige brick and stucco. Two buildings house military and other support facilities. A third houses Mr Charles (Bebe) Rebozo, the Florida land speculator who is probably the President's closest friend, from whom Mr Nixon bought the property in 1969.

The two remaining villas are Mr Nixon's, smallish three-bedroom affairs bought at about \$125,000 apiece. No figures are available concerning the public cost of equipping the compound as a presidential residence. The President lives in one villa. The other is mostly kept for members of the family. Official visitors, of whom there are many when Mr Nixon has a working session, do not stay there and there is no record of one even being asked to dine. Local flora abound: hibiscus of watermelon pink, oleander, umbrella and eucalyptus trees, coconut palms and lawns of the unattractive wire-grass which is a Florida staple.

Inquisitive people approaching by sea are warned away from this piece of shoreline. Mr Nixon's appearances on the beach, however, are pretty well confined to his late afternoon walk. When he goes out for recreation it is more likely to be for a promenade on Mr Rebozo's houseboat or a helicopter ride over to the estate of his other Florida friend, Mr Robert Abplanalp, on Grand Cay.

Both retreats differ from the third one at San Clemente, in California, with its 14 rooms and the Pacific surf booming at Mr Nixon's door. Each place evidently fulfils a distinct and separate presidential need.

The press is kept in its place

Magnificent Commerce Court, Toronto, Canada. International headquarters for one of the world's largest banks.

One good idea led to another.

Over 100 years ago, we saw Canada's need for financial backing to develop her rich natural resources. That was our first good idea. Today, we have over 1,500 branches from the Atlantic to the Pacific and over \$12 billion assets. During the last 100 years, we've helped a lot of little businesses become big

businesses, and we've seen a lot of good ideas become realities. While we were helping Canadians, we didn't forget about the rest of the world. We set up offices and helped businessmen in London, New York, Tokyo, Hong Kong, Zurich, Brussels, Frankfurt and other financial centres throughout

the world. Today, we are one of the world's largest banks. Our first good idea has led to a lot of other good ideas throughout Canada and around the world. For more information on our international banking services, contact our London Office at: 2 Lombard Street, EC3P 3EU.

WESTERN MINING CORPORATION LIMITED

HIGHLIGHTS OF CHAIRMAN'S ADDRESS

The Annual Meeting of Western Mining Corporation Limited was held in Melbourne on Friday 17th November 1972. Highlights of the Address delivered by the Chairman, Sir Lindesay Clark, include the following:

FINANCIAL

The Company's profit was substantially lower than in the previous year, due to difficult conditions in the nickel market and the revaluation of the Australian dollar against the U.S. dollar. The Company's proportion of consolidated profit for 1971/72 was \$14,237,000 after deducting from the operating surplus of \$25,875,000 an amount of \$11,638,000 for depreciation, amortisation, exploration and other expenditure written off. Of the total funds generated, \$8,539,000 was appropriated for dividends to shareholders. \$3,145,000 was spent on exploration outside operating mines. \$8 million was used for repayment of the term loan and the balance \$34,361,000 was used for capital expenditure mainly in nickel operations.

NICKEL SALES

Sales of nickel in concentrates and as refined metal decreased by 10.6%, from 68.7 million pounds of nickel in 1970/71 to 61.4 million pounds in 1971/72. Stocks of finished product increased from a market value of \$8,855,000 to \$21,718,000 at June 30, 1972. Because depreciation, amortisation and other fixed expenses were charged in full against sales, the increase in stocks had an adverse effect on profit. The major nickel producers base their prices on the Canadian producer price, which is fixed in U.S. dollars. The Company therefore had to absorb the reduction in revenue due to the revaluation of the Australian dollar against the U.S. dollar to remain competitive in world markets and the profit in 1971/72 was thereby reduced by an estimated \$3,400,000. When continuing inflation causes costs in Australia to increase more rapidly than in other countries, the ability to compete internationally is lowered. Revaluation of the Australian dollar has the same effect. These conditions could eventually lead to a reduction of the Company's activities and a consequent loss of employment rather than the increase which could be expected under more favourable circumstances. All major nickel producers suffered a set back in 1971 because of reduction in consumption, currency charges and cost increases. The resulting economic pressures on producers forced the increase in nickel prices announced in September and October this year. Most of Western Mining's sales of nickel metal, matte or concentrate, were under term contracts which provided for price adjustment in the event of changes in world prices. When the new prices are fully effective the average price for WMC nickel products will increase by 15% which will approximately balance the loss due to revaluation and increasing costs. Sales of nickel throughout the world increased somewhat in 1972 as consumers built up stocks in anticipation of a price rise. As a consequence WMC's stocks of refined metal had been reduced since the

close of the financial year.

The Company is strengthening its sales efforts by establishing overseas offices in the major markets of Europe and USA. Competition remains keen but the Board believes that the basic position of WMC is strong.

NICKEL OPERATIONS

Kambalda Nickel Operations produced 33,000 tonnes of nickel in concentrate in 1971/72. Improvements in milling practice increased the grade of concentrate from 11.5% to 13% nickel and reduced magnesia content. These improvements would increase the efficiency of the Kalgoorlie Nickel Smelter. Detailed drilling was in progress to evaluate five new areas of mineralisation located during the year at Kambalda. Exploration had commenced under Lake Lefroy, between Kambalda and St. Ives and results to date suggested that the same structure which contained the nickel sulphide ore bodies at Kambalda and St. Ives underlies the lake. Exploration continued in the Paris-St. Ives reserve. The Kwinana Nickel Refinery operated with greatly improved efficiency during the year and reduced the effect of increases in the costs of wages and supplies. The capacity had been increased to 20,000 tonnes of refined nickel per annum. Initially the Kalgoorlie Nickel Smelter will have a capacity of 200,000 tonnes of concentrate feed per annum. This capacity could be increased by approximately 75% with the use of oxygen. Construction of the Smelter was on schedule and it should begin operation early in 1973. WMC and Sherritt Gordon Mines Limited of Canada will each purchase one half of the nickel concentrates to be produced by Poseidon Limited at Windarra, W.A. for a period of five years from late 1974. This concentrate would be treated in the Kalgoorlie Smelter.

URANIUM EXPLORATION

The Yeelirrie uranium deposits discovered by WMC during the year occur in sediments filling an ancient river bed. The mineralisation occurs in horizontal layers, mainly within 25 feet of the surface. Exploration had outlined an area of 28 miles long by 2 miles wide containing anomalous uranium values. A zone 6 miles long, had been tested by auger and rotary drilling and ore reserves in this area were estimated to be 32 million tonnes containing 0.15% uranium oxide (3.3 lbs. per long ton). This was equivalent to 46,000 tonnes of contained uranium oxide, of which 24,000 tonnes was contained in ore which averaged 0.36% uranium oxide (8 lbs. per long ton). Whilst metallurgical and feasibility studies were not yet completed, it was clear that an economic operation could be established at Yeelirrie. It was anticipated that with the rapid increase in demand for uranium for power generating purposes the supply-demand position would come into balance towards the end of the 1970's and prices would firm. In the 1980's there was expected to be a strong demand for uranium. Indications were that production at Yeelirrie was likely to begin late in the 1970's. The Company

currently held 280 square miles in Western Australia, either wholly or under joint venture, in which systematic exploration had just begun.

COAL

Studies of the feasibility of establishing mining operations at Hail Creek, inland from Mackay, Queensland, were completed during the year. Alternative plans had been prepared for a range of outputs up to 5 million tonnes of washed coking coal per year. Negotiations were begun with Queensland State Government Departments regarding provision of rail, port, housing, water supply and electric supply. The Joint Venturers were seeking long term contracts with Japanese Steel Mills, whilst European Steelmakers had also shown interest in this class of coking coal.

GOLD

Since the increase in the free market price of gold and the liberalisation of the Federal Government's Gold Subsidy scheme, both Gold Mines of Kalgoorlie (Aust.) Limited and Central Norseman Gold Corporation N.L. had resumed development.

ALUMINIUM

Alcoa of Australia Limited, which is 20% owned by WMC, earned a net profit of \$16.4 million in 1971. WMC received a dividend of \$800,000. The enlarged output which Alcoa had now attained was expected to result in increasing returns so that it should in due course become a much more significant contributor to WMC's income. In spite of difficult conditions in 1971/72 Alcoa continued to make significant progress. It was now the largest producer of alumina in Australia. With the completion of the first two units, Pinjarra Alumina Refinery had an annual capacity of 600,000 tonnes of alumina. Following the signing of a new long term contract with AMAX, starting in 1975, it had been decided to increase the capacity of the refinery to 800,000 tonnes of alumina per annum.

FUTURE DEVELOPMENT

Production of nickel from Kambalda in the last two years, including ore purchased from the Nepean mine, had been at a rate of about 33,000 tonnes of contained nickel per annum. It was expected that production this year would be approximately 36,000 tonnes of contained nickel, and that further gradual increases in output would take place in the next few years. With the completion of the Kalgoorlie Smelter, shipments of matte should commence early in 1973. Long term contracts were held with two Japanese nickel refining companies for the sale of high grade nickel matte. These sales will partially replace current shipments of nickel concentrates but will result in an overall increase in the quantity of nickel sold to Japan. Nickel sales for the first four months of this year were substantially higher than for the same period last year. With the higher price for nickel and improved sales, prospects for the current financial year were appreciably better than last year.

15/91

that many debts of honour to the business community were piled up in the spring and summer of political fundraising, and that Mr Peterson is not thought the best man to preside over the payment of such debts, can only be hazarded. At all events he is to go.

After a few months as travelling ambassador for the President, in preparation for the trade negotiations of Mr Nixon's second term, he is to return to private life and the Administration will have lost a valuable man. His replacement at the Commerce Department, Mr Frederick Dent, is a textile manufacturer from South Carolina who enjoys the recommendation of President Nixon's old ally in southern politics, Senator Strom Thurmond.

Mr Peterson's trouble may have been that of being brought by chance into too close contact with, but yet not belonging to, the little group of Mr Nixon's old campaign workers who still, under the President, run the White House. Mr Nixon and they have said that the swollen White House staff is to be cut severely. And so it will, for a time, especially among the multitude of thinly disguised political campaign operators whose services the President no longer requires. One of the more powerful of the inner group, Mr Charles Colson, is leaving to establish himself in a law practice close to the Administration. Mr Haldeman, Mr Ehrlichman, Mr Flanigan, Mr Ziegler and others long associated with Mr Nixon's fortunes are to stay, the true nucleus of the Nixon Administration.

Nixon disposes of waste

The President is heading for a showdown with his new Congress. Defying the wishes expressed by both congressional parties, he has ordered the Environmental Protection Agency to allot only \$2 billion this fiscal year and \$3 billion in the following year to clean up America's waterways. Before it adjourned in October Congress authorised \$11 billion for this same period. The President vetoed the bill on the grounds that it was "budget-wrecking," that it would be inflationary and that avoiding a tax increase was a much higher priority. But both houses of Congress stuck to their guns and over-rode the veto by repassing the bill by large majorities. President Nixon might have left it at that. Although under the terms of the bill he is required to allot the full

Ruckelshaus, man in the middle

authorisation made by Congress to the states, he was left enough power to turn down plans for sewage and waste disposal facilities when they are submitted to the EPA for approval. There is one snag to this approach. If the authorised money is not spent within the two years it can be used again at a later date. President Nixon therefore decided that he would slash the authorisations themselves. Even the head of the EPA, Mr William Ruckelshaus, questions whether the President has the power to limit funds in this way.

President Nixon is courting trouble not only from Congress but also from states and cities, which have to put up a quarter of the funds; the rest is supplied by the federal government. The move is also a blow to industries which were hoping to save money by renting the use of public waste disposal facilities rather than building their own. As public authorities are now forced to cut back their original plans, industry will have to shoulder a much heavier cost. The mayors of large cities have already made known their disapproval of the President's action and have said that there is now no hope of meeting the deadlines of clean water set under the act. Congress wants the first stage of the clean-up to be completed by 1977 and the second—an end to the discharge of all pollutants into navigable waterways—by 1985. Mr Ruckelshaus maintains that part one can be achieved by 1982, only one year later than he estimated was possible under Congress's bill.

Local governments are now likely to insist that if the money is put on ice then the penalties for not meeting the standards should also be put in cold storage. Some states may be more drastic in their reactions. Those, such as Florida and New York, which are already well ahead with their plans for sewage-treatment plants and have

been banking on federal money to pay most of the bills may decide to challenge President Nixon's action in court.

Goodbye Apollo

The last of the Apollos had an exciting send-off. Only 30 seconds before the launch the flight had to be delayed for almost three hours while the engineers hunted for a mysterious fault. The last days before the blast-off also had their troubles. A strike over pay was threatened by 59 artists and writers employed by the Boeing Company and there was a fear that other workers at Cape Kennedy would observe the picket lines and force the delay of Apollo 17 if the strike materialised. It never did. There was also a possibility that a strike by electricians against the Columbia Broadcasting System might jeopardise the television coverage not only of CBS but also of the two other commercial networks. Some of the National Aeronautics and Space Administration's employees belong to the same union that has struck CBS and they threatened to stop all television coverage in order to prevent the other two networks leaking film to CBS. In the end the blast-off went out to the world as usual.

There were about 500,000 spectators at Cape Kennedy for blast-off on Wednesday night, the largest crowd since Apollo 11 took the first men to the moon in 1969. Another 700m viewers in five different continents were expected to turn on their television sets to watch the last men for a generation set out for the moon.

The crew of Apollo 17, Captain Eugene Cernan, who went up in Apollo 10, Commander Ronald Evans and Dr Harrison Schmitt, the only scientist to go to the moon, was the first to take off in the dark; this was to give them the right conditions in which to work. The blaze left by the Saturn rocket could be seen from North Carolina to Havana.

The days between take-off and touch-down—all being well Apollo 17 will splash into the Pacific on December 19th—have lost their excitement and fascination for television viewers. Almost 22 hours of colour transmissions are planned for Apollo 17 but probably not much of this will be broadcast unless something goes wrong with the mission. During the last flight the three commercial networks showed less than eight hours each of the 21 hours that were televised. This time CBS may be forced to show even less.

At one point it seemed possible that

It was all very well
in
grandpa's day

The pace was leisurely then, but today we, like you, recognize the vital need for speed. That's why we developed the kind of software expertise that has been pleasing big finance houses around the world. Backed by 5,500 financial experts interpreting the Japanese industrial scene, our London and European offices are well placed to aid you too.

THIS ANNOUNCEMENT APPEARS AS A MATTER OF RECORD ONLY

225 public television stations might fill the gap. In November Nasa, which is unhappy about the public's declining interest in space, proposed that these stations should cover the whole mission. But apart from the problem of who would finance this massive operation—Nasa was not prepared to foot the bill and the public television service is chronically short of money—there were matters of principle at stake.

The Corporation for Public Broadcasting, the federal agency that channels funds into public television, by-passed the Public Broadcasting Service, which normally controls the programming and the distribution of material, and took Nasa's proposal straight to the stations. Both they and the PBS saw this as an effort by Mr Henry Loomis, the new president of CPB who is close to President Nixon, to gain a greater control over what is put out over public television. They also felt that letting a federal agency put its own packaged view of space on the public airwaves without any editing would be opening another door to governmental control.

Bart derailed?

FROM A CORRESPONDENT IN SAN FRANCISCO

The supremacy of the machine over man is being challenged in California, where the legislature, the state Public Utilities Commission and the national authorities are investigating the adequacy of the much touted electronic controls which operate San Francisco's new Bay Area Rapid

Transit (Bart). Riders on the 28-mile section of Bart which has been opened do not seem to have been put off by the accident in October, when a train crashed through a barrier and down an embankment, injuring five people. But it has been established that the signals warning an oncoming train of the presence of a train ahead of it do not always function. The signal is carried through the rails, picked up by the train's wheels and, in theory, transmitted to the operating controls which slow down or halt the following train. But sometimes the computer loses track of real trains or reports phantom ones.

This engineering problem is something which Bart's experts have been trying to solve and which they themselves disclosed to the legislative investigators, but its persistence has raised questions about the reliability of the whole computer-controlled system. At present the risk of electronic failure makes constant manual supervision necessary. The train has to keep in telephonic communication with stations ahead to make sure that no previous train has lost its power and come to a halt. Although human supervision ensures safety on the present run, which has no switch point, it would not do when service to San Francisco opens. Then trains from different parts of the system will converge on a single line; this flow of fast traffic (a train every 90 seconds) could not be controlled safely by time-consuming "calling-ahead." Critics also claim that Bart has no "back-

up" system, should its electrical plant fail; one state legislator compared it to a *Titanic* without lifeboats, built on the assumption of perfect performance.

This wave of serious criticism, accompanied by charges that Bart pays too high salaries and fails to supervise its contractors properly, is expected to result in an inquiry by a panel of independent experts. Bart supports this proposal. Its contract for automated control of trains was carried out by the Westinghouse Electric Corporation, which argues that the October accident was due to a "one in an umpteen million" failure. But the view among Californian officials appears to be that this much mechanical sophistication is not to be trusted; men are better.

Unfortunately, accidents can also happen with men at the controls. At the end of October 44 people were killed in Chicago and 320 injured when an Illinois commuter train, which was backing into a station that it had overshot, was run into and crushed by a following express. Last year 11 people were killed in a derailment, the result, it seems, of faulty maintenance. An all-round tightening up of safety rules, tests of rolling stock and standards for passenger carriages appears likely; Bart's officials will be gratified if it includes the wider use of automatic controls which stop a train if a crash seems imminent.

Uncle Sam's commonwealth

FROM A CORRESPONDENT IN SAN JUAN

Puerto Rico and the United States have a unique form of association: a peculiar blend of statehood, independence and colonial status. The Caribbean island, three and a half hours by jet aircraft from New York, has a population of 2.8m—not counting the more than 1m Puerto Ricans living in the United States. Puerto Rico is certainly a colony in some respects: for example, Puerto Ricans are conscripted in the American army but cannot vote in the presidential elections. In important areas such as fiscal policy the island is autonomous. Yet in other respects there is no difference between the status of Puerto Rico and that of, say, California: thus, Puerto Ricans carry American passports, and trade, migration and capital movements to and from the United States are free.

Last month the Puerto Ricans made it clear that they do not want any

Sophistication comes to a dead end

change in their present status that would link them more closely to the United States. In their elections for governor and the island legislature they voted decisively against the New Progressive party (PNP) and its candidates who are in favour of the island becoming the 51st state of the union. They ousted Sr Luis Ferré from the governorship and replaced him with the young and attractive Sr Hernandez Colón of the Popular Democratic party. The PDP brought about the present commonwealth status but it has been out of power for

four years after a long period in control. Last month in a surprising comeback the candidates of the PDP were returned to the legislature from all sections of the island except the two major cities. But Puerto Ricans have also indicated that they are not prepared for total independence. Three small parties advocated breaking away from America. The largest and most successful is the Puerto Rican Independence party which has a socialist platform. But it came in a weak third and failed to win a seat in the senate for its leader, Sr Ruben Berios.

The real contest was between the PNP and the PDP. The ideological shallowness of the campaign was to some extent due to a broad consensus that things had gone pretty well. Income a head is by far the highest in Latin America; income distribution is less unequal than in other Latin American countries.

Sr Colón has already said that he intends to do something about taxes in an attempt to narrow further the gap between rich and poor—though not by weakening the tax incentives by which the island attracts industry.

Shifts on the Hill

Already the jockeying for position in the new Congress has begun, with the leadership in both parties and both houses unusually unsettled. The most important job up for grabs is that of leader of the Democratic majority in the House of Representatives; this post was formerly held by Mr Hale Boggs of Louisiana who is now presumed killed in an air crash in Alaska in October. Well ahead of the field is Mr Thomas O'Neill of Massachusetts who was picked by Mr Boggs as the House majority whip—the usual stepping-stone to higher party office. The only other declared candidate is Mr Sam Gibbons of Florida who, like Mr O'Neill and despite his southern constituency, is a critic of the Vietnam war and a liberal in domestic politics.

The strong possibility that Mr O'Neill will go one higher has thrown his present post of party whip into the arena. The job is by custom in the majority leader's patronage and so the leading contenders are Mr John Brademas of Indiana and Mr John McFall of California; Mr O'Neill made them his chief assistants last year. Not surprisingly Mr O'Neill opposes the attempt by the liberal Democratic Study Group to make the post elective. The group argues that the post deserves such treatment because of the way that it has become a regular rung up the ladder towards majority leader and then Speaker of the House. As for the Republicans, there is a good chance that the conservatives may again challenge the present middle-of-the-road chairman of the party in the House, Mr John Anderson of Illinois.

What will have a greater effect on the actual workings of Congress is the unusually large number of new committee chairmen—six in the House and four in the Senate—because of retirements, defeats in primary elections and, in one case, death. One of the most dramatic changes will be in the House Rules Committee where, by the seniority tradition, Mr Ray Madden moves up to replace the retiring 82-year-old Mr William Colmer of Missis-

sippi. This liberal from Indiana will thereby break years of "Dixiecrat" sway over the Rules Committee.

By succeeding Mr Wayne Aspinall of Colorado in the chairmanship of the Interior Committee, Mr James Haley of Florida ends a long period of western predominance (the federal lands which the committee supervises are mainly in the west). More important, Mr Haley will probably show more sympathy for conservation interests than did Mr Aspinall, who was named by the League of Conservation Voters as one of their "Dirty Dozen." Mr Peter Rodino replaces the 84-year-old Mr Emmanuel Celler as chairman of the House Judiciary Committee. Oddly, the new younger chairman may well put much more emphasis on issues of law and order than did Mr Celler, whose great work was the passage of civil rights bills in the 1960s.

In the Senate important changes have already taken place, following the death last summer of the chairman of the Appropriations Committee, Senator Allen Ellender of Louisiana. Senator John McClellan of Arkansas took over that committee, moving from Government Operations, where he was succeeded by Senator Sam Ervin of North Carolina. Next

year the aggressive Senator McClellan is expected to scrutinise "waste" in the executive branch while Senator Ervin, a constitutional expert, is likely to concentrate on encroachments by the executive on the legislature.

How long the seniority system will last in its present automatic form, at least in the House, is in some doubt. In both the Senate and the House the Republicans—perhaps because, not having control of the committee chairmanships, they have fewer vested interests than the Democrats—have taken the lead in reform. At the start of the 92nd Congress they agreed in the Senate that a Republican could only be the top-ranking member of one committee at a time and in the House they actually agreed that every top-ranking Republican on each committee must be elected. The Democrats were not prepared to go nearly as far in 1971.

Today's mood may not be very much changed in the Senate—although a Republican, Senator Mathias, is again holding hearings, this time with a Democrat, Senator Stevenson, on the House there is growing support for evils of the seniority system. But in the some kind of reform. However, the system may prove easier to modify in theory than in practice.

Cram course for new members of Congress

Once upon a time...

industry's solution to a bulging order book was to add an extra bay or two to their existing factory and put in a few more machines. Nowadays the solution is not quite that simple. Planning permission and Industrial Development

certificates, availability of labour with the necessary skills, land for extensions, communications, raw material and many other factors have to be considered.

The prudent industrialist's solution to the problem is to have a team of experts make an appraisal of the advantages and disadvantages of the plan; what possible extensions or establishing in other parts of the country. Not known with their concentrated development and specialised facilities with their own own facilities.

Aerial view of a section of the Washington Highway.

high on the list of alternatives. Washington (the one in County Durham) has both these advantages – it is a new town and it lies in a Special Development Area.

During the past 5 years (since the Master Plan was approved) more than 100 new companies have realised the benefits to be gained by moving to this new town in the North East. Many have expanded very quickly – some, such as Timex, fourfold within four years.

The Western Highway.

Although still a relatively 'young' new town, Washington has been widely acclaimed for its advanced planning concepts, architectural and environmental standards (11 design awards to date) and its social policies. Its road network compares favourably with the world's best and the town is generally recognised as being one of the most successful examples of regional planning in this century.

The new town offers a wide variety of well designed standard factories in various sizes and set in landscaped parkland. Alternatively we will build one 'tailor made' to your requirements or lease you land on a fully serviced site to build your own.

There is an abundant supply of skilled and semi-skilled labour available in the area.

The New Town road network is based on a mile grid of dual 'carnageway' roads built to motorway standards and linked to the adjoining regional and national motorway network. There is a freightliner depot and an airfield on the boundaries and the ports of the Tyne, Wear and Tees are but a short distance away.

Washington is a co-ordinated development. New factories, roads, houses, schools and all the amenities that modern society demands are provided at the right time.

Residential development is being provided in 18 villages, each with about 1300 houses and a population of around 4000. Each village has its own school, shops, pub or club and community hall.

A wide range of well designed houses in a variety of styles and sizes are available for sale or for rent.

Corporate housing for rent, Rye Hill Avenue, Harrison Village. This scheme has won 7 awards for good design in housing.

Housing for rent, Rye Hill Avenue, Harrison Village.

The nineteenth century invented both sociology and statistical data. And Mr Gradgrind was among its archetypal figures: "A man of facts and calculations. . . . With a rule and a pair of scales, and the multiplication table always in his pocket," inhabiting his windowless observatory where "the most complicated social questions were cast up, got into exact tables, and finally settled." But Dickens's lampoon was unfair. The modern obsession with measurement is an indispensable route to an understanding of society and social change. And nowhere is this more true than in that half-charted area where the ideal of a quantitative sociology encounters the reality of demographic change. Behind Thomas Gradgrind loomed Thomas Malthus.

The statistical study of modern population is particularly favoured by that characteristic bit of Gradgrindery—the census. How much more difficult, then, to discuss the population problems of pre-modern, pre-census societies: a task undertaken with admirable judiciousness by the late Professor Chambers in his book on pre-industrial England. In some ways this is "old-fashioned" demographic history, appraising the patchy and ambiguous evidence of population change and exploring its relationships

with prices, production and economic performance. The questions, although not the answers, are Malthusian, for Chambers concluded that by and large demographic change was not a strict function of the availability of resources. Rather, in so far as mortality was a critical variable, it is to exogenous changes in the incidence of disease that we must look for our explanations. Above all, he claimed, it may be that industrialism could proceed unchecked by decimating death rates because of "the permissive role of the microbiological world . . . a fortuitous decision of nature": the disappearance of the black rat, the free-roaming flea, and the plague bacillus. In his discussion of this and other critical questions (notably the extraordinary increase in the age of marriage, which for girls roughly doubled between the late Roman empire and the eighteenth century in England and France), Chambers justified his view that "demographic studies, as an aid to historical interpretation, have arrived."

If Chambers's writings are among the latest in an old tradition in population studies, those edited by Dr Wrigley and Mr Laslett are at the beginning of a relatively new one. Indeed, within a decade their Cambridge Group for the History of Population and Social Structure has helped transform historical demography in this country. Its best-known form of research ("family reconstitution" on the basis of parish registers) is hardly at all represented here; and in any case it has not yet quite lived up to the portentous promises of Mr Laslett's "The World We Have Lost" (1965). Nevertheless, these two new books from Laslett and Wrigley amply indicate the group's academic potential: the painstaking collection and discovery of data, the application of computer techniques to transform the problems of calculation, the ingenious elaboration of new perspectives for social and economic history.

"Nineteenth-Century Society" is basically a handbook for researchers. Its various authors introduce the reader to the detailed problems of using census material for the study of population, migration, family structure and occupational distribution, as well as

explaining the mysteries of sampling techniques and offering quantitative case-studies of two social issues (crime and education). It is an accomplished work by obvious professionals. And although it is only likely to be read by those who wish to train themselves in the new techniques, for them it will be of enormous use—albeit also of enormous expense.

Mr Laslett's collection of papers on Europe, Japan and America is devoted to a topic—changes in the size and pattern of families and households—of considerable interest to sociologists as well as demographers. Apart from population measurement, two quite fundamental social questions are involved in this sort of work: first, the validity of the convention which treats the family as "the final unit of society, and the citadel of its values"; second, the credibility of the supposed long-run transition from extended to nuclear families. Both views are now under attack: the former by the alternative concept of the family as an instrumental institution, shaped by socio-economic pressures and needs; and the latter by the mounting and more concrete evidence (abundantly, and perhaps excessively, deployed in this book) that certainly for the past 400 years, and for all we know for much longer, the dominant family-household form has been simple, small and elementary rather than complex, large and extended.

Thus "Household and Family in Past Time" successfully explodes "the myth of the extended family." It has somewhat less detail to offer on the presumed "myth" of the family as a basic social unit and cultural value. That view is much more strenuously challenged in Dr Anderson's "Family Structure in Nineteenth-century Lancashire," parts of which are also summarised in the former book. Dr Anderson shares a large and powerful battery of techniques with other modern demographic historians. But his main approach is also fairly distinctive in that his hypotheses and methodology derive from a somewhat formal sociology. As a result, he has produced a fascinating book, although its language and conceptual impersonality will not be to everyone's taste. His primary aim was to assess the familiar thesis that "industrialisation leads to disruption" of the family. His data were derived from a detailed examination of migration, family and co-residence patterns as revealed primarily in the 1851 census in Preston. His model assigns a "calculative" and "instrumental"

role to the family such that its members will maintain their ties only so long as their personal goals can be satisfied by the short- or long-run exchange of "resources" through a kinship network. From this viewpoint, he argues, mid-nineteenth century kinship offered many solutions to personal problems (eg, those involved in migration or home-finding in early marriage). At the same time, however, the "exchange networks" which we call families were in some instances weakened by the provision of such alternative resources as independent wages for the young—which enabled them to discard the support, and therefore membership, of the family.

Much of this is persuasive, even if expressed in a forbidding way. Further, while substantiating the author's view that what he calls "middle-class familistic values" were not universal in expression or application, it can be accommodated in a tentative theory of working-class family history. On this view the pre-industrial family was nuclear, and the coresidence of parents and married children was rare, because the shortage of resources together with the presence of the old poor law encouraged "a short-run instrumental orientation to kin." During the early phases of industrialism kinship was strengthened under stress, but still vulnerable to the calculative independence of the young. By the late nineteenth or early twentieth centuries, however, a new affluence and increased welfare provision eased the cost of kinship and produced "a really strong affective and non-calculative commitment to the kinship net" (ie, the "traditional" working-class families and communities described by Hoggart in Yorkshire and by Young and Willmott in Bethnal Green). Since 1945, by contrast, the great reduction in critical life situations and the much increased supply of private resources and public welfare have led to a significant eclipse of conventional family ties: "relationships with kin can now and only now become a matter of choice within the working class."

Of course, such hypotheses are still very much guesswork. But they can never be more persuasive than Mr Anderson's arguments about Preston in the mid-nineteenth century. And in this respect, in spite of his formidable techniques, there are two principal reasons for remaining unconvinced. First, there is very little direct evidence that members of the family looked upon it as an exchange network of the sort described. Certainly the fact that

the young moved away from the household does not in itself indicate a "breaking away" from or "rejection" of the family. For that one has to use good, old-fashioned, fragmentary literary evidence—with which Dr Anderson is impressively familiar, but which is fairly inconclusive. Second, in emphasising calculation as the cement of the family, he largely ignores that aspect of "giving" which is only part of an exchange in so far as it is its own reward (for example, maternal affection). Such an instantaneous, and possibly unthinking, reciprocity can make a profound mess of any neat theory of exchange. And for both these reasons, while Dr Anderson has written a very important book, there is a danger that in lesser hands his methodology would not entirely escape the pitfalls which awaited Mr Gradgrind, who:

had no need to cast an eye upon the teeming myriads of human beings around him, but could settle all their destinies on a slate, and wipe out all their tears with one dirty little bit of sponge.

Tea and melon seeds

THE THEATRE IN ASIA

By A. C. Scott.

Weidenfeld and Nicolson. 289 pages. £6.50.

A treatise on the theatre embracing most of Asia might be expected to involve unwarranted generalisation; but this short survey, for the non-orientalist, avoids that pitfall. The author closely relates the development of the theatre, during the past 300 or 400 years, to the social history of each of the countries in turn: from Turkey and Egypt in the west to Japan in the east.

All the same, there have been striking similarities between one country and another. They range from trifles like the habit of theatregoers, in places as far apart as Turkey and China, of sipping tea and cracking melon seeds throughout the performance, to the almost universal recourse to a learned speech to mystify unlettered audiences and so, judges Mr Scott, confirm the political power of Asian social elites. Puppets and their "shadow" variant were common throughout most of Asia: and everywhere song and dance have been more prominent than dramatic construction. The Asian actor's concern, basically didactic, was with expression of emotion rather than exposition of character.

The social factor which did most to condition the organisation of the theatre in Asia, and the life of the actor, right through to the nineteenth

China: the impact of patronage

century, was the ever-deepening subjection of women. In the Hindu cultural area, including both the Buddhist and Moslem countries of south-east Asia, women had a monopoly of the court stage, lest men should threaten the person of the sovereign; the actresses invariably doubled as his concubines. But female subjection more often had the opposite effect, as for so long in Europe, of excluding women from the stage. Male specialisation in female roles then produced, in Moslem countries as well as in China and Japan, a class of catamites. When Chinese actresses returned to the stage, around 1900, they had to learn the conventional expressions of femininity their audiences had come to expect.

The vicissitudes of the Asian theatre in recent decades have included, universally, a keen interest in western drama, with many efforts to combine styles, and a whole series of crises over patronage. In India under the Raj, the native rulers used to pay for the theatrical troupes, lavishly; but independence turned the latter on the streets. The Communist party of India offered some of them a haven, but its ideological yoke proved intolerable, and most turned sooner or later to the cinema. The sole patron of the Chinese stage today is, of course, the Communist party of China. One must hope that the last of Mr Scott's score of photographs is not also the last word on patronage. It shows a political haridan in Bermuda shorts, poised with more force than beauty on Russian ballet points, six-shooter held skywards, in symbolic representation of the unique didactic message of actress Madame Mao's revolutionary culture.

Looking for lessons

THE ENIGMA OF ECONOMIC GROWTH

By David Horowitz.

Pall Mall. 174 pages. £5.75.

In the postwar world Israel ranks with Japan for a high and sustained growth rate. Between 1950 and 1970, gross national product per head trebled, while the population grew by nearly 6 per cent a year. A country without any natural resources to speak of, and living in a state of combat readiness, Israel's agricultural as well as industrial growth must, it would seem, have lessons for the second development decade. Mr David Horowitz, a distinguished economist and central banker, tries in this short monograph to tackle the causes of Israel's rapid economic growth and its relevance for the third world.

Mr Horowitz's discussion is put in the general context of what he calls the economics of population transplantation: the migration of large numbers of people and their transplantation from a relatively affluent European background to the barren wastes of Israel had interesting economic consequences. These people had a high degree of literacy and clerical, professional or commercial skills. They had to adapt to totally new activities such as farming and industrial work. The Israeli proletariat has lower middle class urban origins.

The migration of relatively skilled people was accompanied by massive imports of capital. In 1950-70, the total was \$10 billion. Despite the growing population, an increasing capital-labour ratio could be maintained in all industries. This is precisely the factor that renders Israel's experience irrelevant for countries of the third world. Population growth in these countries is internal, with consequent high demands on social capital until the newborn children reach working age; and there is no prospect of a massive flow of capital.

Mr Horowitz's book provides a valuable summary of Israel's growth experience. He does not neglect issues of social growth and of income distribution. But he does not fully discuss the prospects for the future, when the migration must dry up and the high savings rate sustained by the first generation of immigrants will become difficult to maintain as their children clamour for consumer goods. The problems of inflation and unemployment which have plagued the Israeli economy recently are only mentioned.

The Israeli economy has also pioneered much-discussed economic institutions. These are the collectives, kibbutzim, and co-operatives, moshavim, as well as the Histadrut, which owns and manages many economic activities. (Mr Horowitz discusses the activities of the Histadrut in some detail.) If Israel has lessons for other countries they are rather to be found here.

OUTLAWS OF AMERICA

By Roger Lewis.

Penguin/Henrich Hanau. 204 pages. £2.95 cloth, 40p paperbound.

There are at least 180 underground newspapers in America; in Europe there are another 50 or so. Of these, some 40, all of them in the United States, are the by-products of women's lib. There is also a vegetarian press, a black press, a religious press, a music press and a pot press. Then, of course, there is the peace press. In 1970, there were another 73 papers put out by servicemen on active duty, opposed to the war in Vietnam.

Mr Roger Lewis does his subject less than justice. Most of his energies are taken up with an explanation of what

Underground cover story

he calls the cultural revolution of the 1960s. This takes in the black power movement, the war in Vietnam, the craze for health food, homosexuality and much more besides, in about 200 pages. Mr Lewis repeats himself and he is inconsistent. On one page, he refers to the militant left-wing group as the Weathermen, changing this two

lines further down to Weatherpeople, as a sop to women's lib, and then returning to his old male chauvinist ways only three lines later.

But there is interesting information here, for those who are prepared to hunt. For the most part the underground newspapers are produced and sold locally. They do not pretend to be objective; people turn to the underground paper because they think that the regular press misinterprets their views. The underground newspapers are sold on the street by the people who help to produce them. According to underground sources about 30m people read them, though Newsweek's more conservative estimate is about 2m. The underground has its own press service, performing a function similar to Reuter's service. Mr Lewis has some interesting notes on the graphics and art of the underground newspapers. And in a revealing aside he mentions that the underground pornographic press has managed to knock the profits out of the overground pornographic press by selling its material at a mere 25 or 50 cents a copy.

Unfortunately, Mr Lewis leaves a great many questions unanswered. He writes about underground newspapers, semi-overground journals and left-liberal news sheets. But when is an underground newspaper not an underground newspaper? Mr Lewis is short on definitions. He is also vague about the economics of the business—how much the papers sell for, how much they cost to produce, how the overheads are met. He gives one clue to their peculiar advantages en passant: while it is easy to start up an underground paper with a minimum of capital and manpower, it is just as easy to close one down when the money runs out and the willing helpers lose interest.

Pocket archaeology

MALTA

By D. H. Trump.
Faber. 171 pages. £2.50.

SOUTHERN ITALY

By Margaret Guido.
Faber. 222 pages. £4.

Given the growing public interest in antiquity, these small guides fit into an ecological niche. Dr Glyn Daniel, the general editor, is a guarantee that the standard of the series will be maintained and that the authors will be well chosen. These are strict guide-books, with all necessary details of how to get there, what to see, when the

Pompeii: guide to the maze

museum opens and what to concentrate on in each room: even, in the case of the less frequented sites, whom to ask for the key. They are confined to prehistoric and classical sites and objects. Maps, plans and illustrations are excellent.

Mrs Guido faces an almost impossible task of compression. Hers, therefore, is the purer guide-book of the two, with fewer frills. Every word counts: for each town, a brief ancient history and a guide; rightly, she gives proportionately more space to the lesser-known sites. Dr Trump's task is slightly easier. Malta, with Gozo, is more of a single entity, and needs more general explanation, since prehistoric relics of this particular kind are confined to the two islands. He therefore starts with a general account of them, to which he adds excellent and sometimes caustic comments on food, drink and so on. Neither book is intended to be read as literature; they are for reference. But Dr Trump has just enough space (as Mrs Guido has not) and quite enough humour to make his guide excellent reading for its own sake.

Mr Stanley, I presume

THE EMIN PASHA RELIEF EXPEDITION, 1886-90

By Iain R. Smith.
Clarendon Press: Oxford University Press. 355 pages. £6.50.

The German doctor and botanist, known as Emin Pasha, who served the Khedive of Egypt as governor of Equatoria (the southernmost province of Sudan), was cut off in the heart of Africa after Khartoum had fallen to the Mahdists. The expedition to relieve him was the last and most controver-

sial of H. M. Stanley's African exploits. For, the Mahdist threat having receded, Emin and his garrisons were getting along not too badly. All they needed, so they thought, was ammunition from Britain. The last thing that Emin wanted was to be "rescued" and marched to the coast. But that is what took place. The expedition was paid for by the Egyptian government and private British subscribers. But in deference to King Leopold of Belgium—who was technically Stanley's employer—the journey to Equatoria was taken by a way-out route through uncharted regions of the Congo.

In this hideously hostile terrain the toll of life was appalling. When at long last Stanley reached Emin it was Stanley who was in distress and Emin who succoured him. The expedition's real achievement was in its great geographical discoveries. There were also, as Emin realised, considerable political and commercial interests at stake. Dr Smith places the saga in its full historical perspective—the European scramble for Africa. His assembly of the facts is most skillful and he has done a first class research job on the copious documents available, among them Emin's own remarkable diaries.

MILTON, 1732-1801

Edited by John T. Shawcross.
452 pages. £6.

Routledge and Kegan Paul.

The volumes in this well-established series come off the assembly belt in profusion. As a whole, the Critical Heritage series (sometimes known as the Dons' Delight) does provide most useful books of reference. Of the latest batch, Mr Eric Homberger's collection of essays and reviews deserves special mention, for it was designed to be the first in the series to be devoted to a living author. Pound's literary career lasted so long, and his genius provoked such varied reactions, that it was possible not only to amass a great many articles, reviews and comments but also to chart a curve of his reputation even before his death, which has made the

publication of this volume timely. The period covered is not far short of 70 years. There are solid and judicious assessments of his work here, like the article by Richard Eberhart, dating from 1949; there are diatribes from various quarters; and there are flashes of brilliance, like J. B. Yeats's comment:

It is wonderful how people hate him. But hatred is the harvest he wants to gather—great sheaves of it, beneath a sky of disastrous moonlight. . . .

The H. G. Wells volume is a salvage effort. Like Shaw, Bennett and Galsworthy, Wells stands at an awkward distance from the present-day reader. His political enthusiasms, his emancipated social and moral ideas, even his brand of humour, have lost their pristine attraction and have not yet acquired a historical patina. As an originator of science fiction he still holds his own, and "Kipps" and "Mr Polly" are perennially regarded as suitable fare for candidates for CSE or GCE "O" levels. But it is salutary to be reminded that in his heyday H. G. Wells was regarded as an intensely modern and controversial writer. As Dr Parrinder remarks, he attempted to give a complete commentary on the world in which he lived. His very up-to-dateness has proved his undoing. If the intention of this series is to document authors of literary-historical significance, the inclusion of Wells required no apology. If sheer literary distinction were the criterion, he would scarcely make the grade.

With Defoe and Milton we are on uncontroversial territory. Anybody who consults these volumes does so because he is working on one of the authors concerned, or has a serious reason for wanting to know how they appeared to their contemporaries or near-posterity. This volume on Milton is in fact the second to appear in this series. It charts his reputation during a period when his position as a great English poet, the successor to Spenser and Shakespeare, had already been established, and when his works were being subjected to the same kind of scholarly scrutiny accorded to classical texts.

Soc-fi

TRIAGE

By Leonard C. Lewin.
Macdonald. 215 pages. £2.

Mining the same vein of fantasy and plausibility as he discovered in "Report from the Iron Mountain," Mr Lewin is out to shock us again. The minds in the think-tanks, previously concerned with military planning, overkill and

second-strike capability, are set loose to work in the same realm of the unthinkable but on the world's economic and social problems.

He starts in a small way with the disposal of a rich old man who is becoming difficult about giving his money to a poor college. Next, euthanasia is fostered to make hospital beds available for those who can be helped: the book's recondite title fits this piece. Untreatable drug addicts die in large numbers when purer heroin unexpectedly replaces their tainted supply, and mysterious fires occur in homes for the elderly and the "socially incompetent."

Soon, more ambitious projects with equally desirable social aims are tackled. Riots provoked in prisons kill worse-than-useless recidivists; dying industries are polished off together with their employees who, in the main, are unredeemable; a non-polluting car engine is introduced whose only vice is that if the driver is aggressive, impatient or incompetent—and therefore a public menace—it explodes and kills him.

But the author is not much interested in ingenuity or in technical detail. His thesis is that institutional morality does not exist and that institutional authority gives the individual a sense of moral immunity that is extraordinarily dangerous. He has a splendid command of the euphemisms that dehumanise bureaucratic man in committee (people are, for example, "scheduled for participation"). Those who do the killing belong, naturally, to the SS—the Special Services.

Does he really go too far? Nazi death camps may be a special case, but can we be too certain about what is happening in medical research? In one assault, at least, this piece of social fiction is wide of the mark. The medical profession and hospitals are now criticised for quite the reverse offence: for using medical technology to prolong the life of people in extreme old age and of spina bifida babies who can only look to an unhappy, burdensome existence. The campaign for euthanasia comes not from institutions, which resist it, but from individuals.

Sadly, Mr Lewin's technical skill as a writer does not match his ideas and his imagination. Much of his book is in the form of conversations between characters who are indistinct, talk alike and are all-too-obvious mouthpieces. Without looking back, it is often difficult to remember who is spouting. Swift, Samuel Butler and Orwell need not fear competition.

Business Brief

More licence for liquor

There is no drinkers' charter in the report of Lord Erroll of Hale's committee on liquor licensing*, published on Tuesday after nearly two years' gestation. The tied-house system of pub ownership was specifically excluded from the committee's terms of reference, much to many people's disappointment. The committee, in any case, makes it clear that it does not consider the licensing laws are the right instrument for dealing with this sort of monopolistic restraint. It just wants to lift from the British drinker the tyranny of the hangover from Kaiser Wilhelm's war.

If its recommendations are adopted—by no means a certainty if the pigeon-holing of the 1969 Monopolies Commission report on the supply of beer is any guide—then by 1974 British drinks laws will shed some of their more blatant absurdities, after more than 50 years of restrictions. Although the laws on hours and drinking conditions were amended, and slightly liberalised, in 1961, in substance they have changed little since emergency measures were introduced to deal with drunkenness among munition workers during the first world

*Report of The Departmental Committee on Liquor Licensing. Cmd. 5154. HMSO. £1.90.

The shape of drinks to come?

war. The Erroll committee makes three main proposals to bring legislation up to date: changes that will give licensing judges less discretion to refuse applications; greater flexibility of opening hours; and more scope for allowing children under 14 into pubs. The biggest storm will no doubt be caused by the plans to change licensing hours. Opening times now are 11 am-3 pm; shut from 2 pm-5.30 pm; open again from 5.30 pm-10.30 or 11 pm—with shorter hours on Sundays and some religious holidays. The committee wants a 14-hour drinking day from 10 am-midnight. This would not place licensees under any legal obligation to keep open during the whole of the time, but simply allow them to choose which hours suited their trade best. If anyone wants to stay open for the entire 14 hours, he will presumably need extra staff. Many publicans will argue that longer hours are bound to increase overheads without necessarily improving turnover.

The young

The proposals about children are likely to be controversial too. Children under 14 are not now allowed into the bars of public houses. Unless the pub keeps a

British pub, anno 1972

special room for children, most of them are confined to the garden if there is one, the street, or the car outside the pub, with a bag of crisps to keep them quiet. The original object of excluding them from turn-of-the-century gin palaces and the sight of drunken parents was fair enough at the time. But by now the rule has become distinctly inconvenient, particularly for families on holiday with youngish children.

The Erroll committee knows better than to suggest throwing every bar open to a mob of howling toddlers; enough (mainly male) adults acknowledge that they go to the pub to get away from the family. But it does propose that landlords should be able to apply to the licensing justices for a certificate which will allow them to admit children, either in rooms specially set apart for them or throughout the whole pub. The old spit-and-sawdust sort of pub will therefore still be able to protect its hard-drinking customers from invasion by simply not applying for a

certificate. Pubs in holiday areas can count on a much-increased turnover of orange fizz. The other major proposal for young people is to lower the legal age for buying and consuming alcoholic drinks in pubs from 18 to 17, an admission that landlords nowadays have a lot of trouble guessing the age of teenagers. This new rule would simply mean the law is flouted less often. Boy scout and girl guide organisations apparently wanted 16 as the minimum age.

The committee's proposals for experimenting with continental-style café-pubs, selling both hard and soft drinks and food, are also aimed at the family market. They reflect the committee's view that the justices who dole out liquor licences have at present far too much discretion. The committee did look into the possibility of leaving the whole licensing business to the local authorities—who are already responsible for licences other than those to sell drinks—but concluded that the present system was working well enough and that a shift in

responsibilities would leave the local authorities with too much on their plate. What it does want to change is the way the licensing justices can refuse a licence on almost any grounds they like.

If the committee has its way, there will in future be two kinds of licences. One will be personal, and can only be refused if the applicant is not a fit and proper person to hold a licence. The other will cover the premises, and will need to take into account whether they are suitable, structurally sound, and comply with fire regulations, and that there are adequate safeguards against public nuisance from noise, unruly behaviour and the like. But the licensing justices will no longer be able to preserve the semi-monopoly of existing pubs by ruling that the area already has enough of them. If any new entrant thinks he can make a commercial go of a new pub, he may in future be allowed to try. The same logic will apply to off-licences.

This is an important provision, and could make more impact in the medium term than the more eye-catching proposals. Despite a steadily rising consumption of liquor of all sorts (but particularly wine), the number of pubs has been declining steadily since the early 1960s. Quite a few country pubs have been shut by the brewers, and not so many new ones opened up. Starting a new pub can cost as much as £100,000, and could be risky. But if the committee's proposals are accepted, there could be a much wider variety of places where drinks are sold. This represents a challenge to the brewers' hold on the drinking man's market and would go some way to

offset the effects of the growing concentration in the liquor business. It is not desirable that a few suppliers should have an ever increasing hold on the retail end of the trade.

Restaurants might have an easier time: if they can prove that their main concern is selling food, and they serve drinks merely to help this along, they may escape restrictions on their hours altogether. On the other hand, registered members' clubs, which now escape most of the rules, will be brought into the net, and might go into a decline. But most importantly, a new breed of café-pubs on the continental pattern might eventually emerge.

Nation of drinkers?

If opinion polls are to be believed, there is a pent-up demand for this kind of facility. Two years ago, the Office of Population Censuses and Surveys carried out a survey of public attitudes on the licensing law which suggested that two-thirds of the people questioned would like "somewhere where the whole family could be together." There was demand for places serving sandwiches and snacks, tea and coffee as well as drink; play gardens for children; and adequate lavatories. What the survey also demonstrated was how enormous the market for liquor is. Apparently, 92% of the population drinks at least occasionally, and some of the rest may still take a soft drink in a pub from time to time. Not far off half the adult population goes to a pub regularly (at least once a month). Among men, predictably, the proportion is higher: over two-thirds. Among young people (18-24), three-quarters are regular pub-

goers. One reason why the committee came up with the new opening hours was that half of the young people in the survey wanted later opening hours, against only 21% of all respondents (of whom 9% would actually prefer earlier closing than now). Taking a 20-year view ahead, the committee thought the younger people should have more emphasis.

Will the new proposals lead to more public drunkenness, alcoholism, drink-and-drive offences and violence if they are enacted? There are an estimated 300,000 alcoholics in Britain already. Making drink more freely available is quite likely to increase their number; whether this is a reason for inconveniencing the rest of the community by making drinks harder to come by at certain times of the day is another question. Experience in other countries does not really provide much of a guide; it seems that both a liberal stance (France, Italy) and a restrictive policy (some of the Scandinavian countries) on the sale of alcohol can produce a drink problem. Nor is ready availability all: price can be equally important. The introduction of Vat, for instance, may bring down the prices of some drinks in the lower range and so encourage sales. All the same, the committee is right to criticise the lack of information about the impact of changes in the licensing laws on consumption—and indeed the paucity of drinks statistics generally. If the law is changed, it would be useful to set up, as the committee suggests, a monitoring body to gauge the effects on consumption.

The committee claims that even if there is a change in legislation, most pubs will at the beginning keep much the same hours as at present, until they have had time to see what their customers want. The brewers—who owned 52,600 of England and Wales' 64,700 pubs in 1971—have apparently given undertakings that they will not hold tenants to specific opening hours if the rules are liberalised. But once longer hours are available, it is hard to imagine that publicans will not want to use them if the market can bear it—particularly if the pub down the road opens earlier and shuts later. To judge from the crowds in many pubs at closing time, quite a few customers would stay longer if they could.

Their convenience apart, there could be other advantages from a spreading of hours—and the subsequent spreading of home-going pub traffic, particularly at night. Under the new rules, there would be no 10-minute drinking-up time; publicans could stop serving at 11.30 pm and give their customers a leisurely half-hour to drink up.

The brewers themselves seem pleased with the proposals, and reckon the general public will like them too. But they are probably not too worried whether the package is enacted or not.

The worst that can happen to them is a proliferation of independent outlets for liquor under the new rules. But this is not going to happen overnight; nor is there anything to stop them from making a bid for any extra business themselves. Even if all the extra outlets are run by independents, the brewers will still sell much of their beer, wine and spirits to them.

BUSINESS

Iraq wants to deal

The long, bitter dispute between Iraq and the western-owned Iraq Petroleum Company is likely to be resolved within the next few weeks. For the first time both parties are negotiating seriously

The new talks began in Baghdad shortly after the arrival of the Iraq Petroleum Company's negotiators there on Wednesday, and they are the first really hopeful signs in a situation that has been stalemated since June 1st, when Iraq nationalised the rich Kirkuk oilfields belonging to IPC, which in turn is owned by British Petroleum, Royal Dutch/Shell, the Compagnie Française des Pétroles, the Standard Oil Company (New Jersey), Mobil and the Calouste Gulbenkian interests.

The talks have apparently been made possible by two favourable occurrences: the substantial acceptance by the other Arab oil-producing countries of participation agreements with western oil companies and the reasonableness of the terms offered to the Iraqis by IPC's negotiators on November 20th. Dr Saadoun Hammadi, the Iraqi oil minister, has indicated that he would want certain modifications but at the same time has expressed a sincere wish to negotiate—and quickly. The talks could fall through at any moment but observers think the odds favour a settlement.

What was offered on November 20th amounts to an umbrella deal that would cover not only the Kirkuk situation but also two other outstanding issues: the Iraqis' seizure of the North Rumaila field in 1961, for which IPC has never been compensated, and the future of two IPC affiliates, the Basra Petroleum Company and the Mosul Petroleum Company, which so far have been running normally, almost as if there were no dispute at all between Iraq and IPC. It is now thought that the package deal proposed by the IPC negotiators puts forth a figure for Kirkuk compensation, plus the terms on which the former owners will receive future oil, proposes conditions for the purchase of North Rumaila oil by IPC parent companies and opens the way for the Basra and Mosul companies to be gradually handed over to the Iraqis along the lines laid down by the participation agreement with other Arab countries. The idea is to avoid trying to achieve perfect justice on all matters provided a working formula can be found.

If an agreement does come in Iraq, it will not only end the drama there but conclude what is likely to be regarded as one of the most important chapters in the trials and tribulations of the international oil industry.

It revolves around the participation agreement and, as

this has yet to be formally accepted anywhere, the house of cards could collapse at a breath. However, this is unlikely. The agreement was negotiated with the western oil companies by Sheikh Ahmed Zaki Yamani, Saudi Arabia's oil minister, so it is presumably to Saudi Arabia's liking. Kuwait's negotiators have reportedly obtained the pricing arrangements they sought, although the deal must still be sold to Kuwait's national assembly. Qatar and Abu Dhabi both have minor points they want to argue but are expected to accept the agreement with little trouble.

The agreement will also affect oil-producing countries outside Sheikh Yamani's representation, such as Nigeria, which is expected to start its own negotiations in earnest next month but which is likely to settle on the lines defined by Mr Yamani. Iran used the pressure from the drive for participation to make its own highly attractive deal with the oil companies last summer. However, Sheikh Yamani managed even better terms so the Iranians are now demanding more for themselves. They will undoubtedly get more because there is little at issue between them and the oil companies. Libya, on the other hand, which of all the members of the Organisation of Petroleum Exporting Countries (Opec) has taken the hardest line against the oil companies, will probably not reach an agreement with the companies for some months, if then. Having failed to move the other oil producers to a more extreme position, the Libyans are unlikely to accept the Yamani formula until time and events have obscured the issues a little. In the meantime, they can be expected to continue their policy of harassing the weaker oil companies operating in their country with immediate demands for a 50 per cent participation stake, which compares with the 25 per cent accepted by Sheikh Yamani, rising by steps to 51 per cent in 1983. The Libyans cannot expect to budge the major oil companies with such tactics since the companies would put the whole, hard-won participation agreement in jeopardy if they agreed to give the Libyans more than the rest. They would sooner lose Libyan oil.

The participation agreement will not have much effect on the other three Opec members, Algeria, Venezuela and Indonesia, all of which have their individual approaches to these matters, but their absence is hardly

going to change the big picture for the oil companies once the participation agreement is signed all around. It is going to be different in major ways from the picture up till now but it may not be as different as many people think. Alongside the new pressures for change in the industry there will continue to exist many of the old stabilising forces.

On the face of things, the producer countries appear to have had largely their own way in the participation talks but the fact that they were negotiated peaceably indicates that most of the producer countries now accept that just as the oil companies need them, they need the oil companies to provide access to the world's major markets, without which the oil would be worth only what it could be bartered for with Russia and the other communist countries. As time goes by, the producer countries

will accumulate more and more control over the oil produced in their own fields and may well make direct deals with consumer countries, some of which, like Japan and west Germany, would leap at the opportunity. However, these deals are unlikely to amount to much unless the consumer countries can offer them more than the major oil companies, and in such a competition most of the advantages lie with the oil companies. The producer countries may also make good their expressed wish to invest in the downstream operations of the oil industry, taking an interest in tankers, refineries and even service stations, but there is great doubt about whether they have the technical and managerial resources to do this on their own. Their likeliest partners in such ventures would be the oil companies, so how much control would the oil companies lose?

If you stop the roar of London's traffic . . .

The traffic round Oxford Street is giving way to instant trees, and the surrounding streets to instant chaos

Step by step the Greater London Council has been converting Oxford Street and some of its adjoining streets into pedestrian and bus malls. On the first few days this week after Oxford Street was shut from 11 a.m. onwards to ordinary traffic, driving rain kept a lot of shoppers and motorists at home, but the sun brought them out on Thursday, with a foretaste of trouble to come. While the jay-walkers could hardly believe their luck as they wandered across Oxford Street, the load of traffic that Oxford Street used to carry diverted itself to Wigmore Street and residential by-ways and slowed to the familiar crawl. This is an area already overloaded by lorries trying to reach the rail terminals. It carried 50 times the national average of traffic before taking Oxford Street's load as well. The GLC has made no provision for where all this is to go.

Several Dutch, German and Scandinavian cities have already banned cars from parts of the city centre—though none of them is as big as London—and Hamburg is so delighted that it is going to ban buses too. In Gothenburg, in Sweden, car traffic has been cut by 70 per cent with a one-way system that forces motorists on to a ring road around the entire city centre if they only want to get into the next street. Pavements are centrally heated and some streets are being covered over. In Britain, Leeds has successfully removed cars from the city centre and even Glasgow's Buchanan Street has potted plants in the roadway. These experiments in banning the car have nearly all been acclaimed a success. Pedestrians are delighted, the shopkeepers often find that turnover rises, and the motorists' wails die away. But can it be done in London?

The Oxford Street scheme is just a beginning—paradoxically, this is partly because of the mess it is creating. Inside London Transport this is taken to mean that bus lanes will have to be established in the approach

streets, too, because much of what the buses are gaining in Oxford Street they are losing on the approaches. There are fears that that could spread traffic jams back into the approaches to the approaches; until the private car and, presumably, the milkman, the wine merchant, the plumber and even the irate Prime Minister himself are choked out of central London. There are those who would like that to happen.

But there is at present no attractive alternative to the car, and London is too big for pedestrians. People who surrender their cars tend not to entrust themselves to public transport; they cut their travel down by more than half, making only essential journeys, and the city suffers. At present buses and cars endure the same congestion together, but cars get through it three times faster, even after excluding bus queuing time. One reason why the bus is slow is that its size prevents it from negotiating the little streets.

There certainly ought to be a way of making public transport as attractive as the private car in central London, especially since the car is going to be handicapped by a growing number of controls. In the far future we may have such things as "people-movers" (see *The Economist*, May 27th), operated from a central computer. But for the 1970s we have to improve either the bus or the underground. A host of proposals have been put forward, from tube investment, on which London Transport is to spend £380m, to free fares, but none of them gets over the biggest disadvantage of public transport compared with the car: its lack of flexibility. How do you get the bus or the underground to wait while you pick up the laundry, collect the children from school, buy their supper, look at that wallpaper you saw in a window yesterday? Nothing, except the car, can do all that, but public transport as we know it is not geared to flexibility. Nor will it be while it remains a monopoly.

Competition is the unspeakable in public transport out-

side the successful road haulage industry, and even that is tainted by monopoly tendencies in some countries. In the United States truckers argue that the whole industry would collapse if its price-fixing cartels were abandoned, oblivious of the fact that British and Canadian road hauliers have cut-throat price competition and thrive on it. It is just the sort of argument used to justify bus monopolies: allow competition, says the monopolist, and services will fold up one by one.

Running buses and running lorries ought to be much the same. There is no reason why the techniques of profitable road hauliers should not be applied to the dismally unsuccessful bus industry. There are no economies of scale in road haulage, as was discovered by the Committee of Inquiry into Small Firms, which also found that one-vehicle operators still account for half the total in the business. The few large haulage companies try to organise their lorries into small, independent profit centres. The Transport Development Group, for example, is split into quite separate, and competing, subsidiaries of 100 vehicles each. In this way they can each identify, and respond quickly to, small changes in demand, where it takes the railways three months to change a freight schedule and by that time the business may be lost for good.

Fragmentation would benefit public transport in several ways. Someone who drives a delivery van the rest of the day might run an express minibus service for commuters during the rush hour—when his van is best off the road. He would thereby avoid the crippling financial burden that London Transport suffers of having to hire two shifts of staff to satisfy a peak demand of little more than two hours a day. Another idea could be borrowed from the Philippines, where six- and 10-seat "jeepneys" travel the main routes, and stop whenever they are flagged down, offering almost door-to-door service at a tenth of a taxi fare. What we should be aiming at is 57 varieties of bus, ranging from a shared taxi to a double-decker.

The traditional public transport answer to this is that services would be here today, gone tomorrow, whereas with the monopoly system your great-grandmother could

rise from the grave and find something like the same service that she used in the horse-drawn era. Public transport is inhibited from trying to cater for changing demands for fear that new services will take business away from great-grannie's bus. Also, being a monopoly (and a loss-making one at that), it is subject to political interference if it tries to cut out redundant services. London Transport is running a small experiment with minibuses which is losing money, but pressure from local councils makes it impossible to discontinue the trial. The experience does not actually encourage other experiments.

The public has a choice between keeping the services it has although the traffic has steadily fallen (which suggests that the buses are less and less in tune with what the public wants), or letting anyone who can prove he employs a safe driver and safe vehicle try to find what services people do want.

The trend towards banning more cars from existing streets makes it all the more important to have roads where the longer-distance traffic can move without causing so much noise, pollution, congestion and danger to lives. The Greater London Council's long-term strategy has for many years revolved rather too exclusively round such a system. The pressure groups against it have now triumphed; the GLC has had to abandon its proposal to build two ringways, in favour of one composite motorway (the Government is still expected to build another, outer ring).

Whatever movement by road is to be allowed in London, it makes sense to have it on a segregated track, where it interferes as little as possible with houses and pedestrians. The trouble is that soaring property prices are knocking the economics of London road-building for six. But what about the many hundreds of acres of railway land in London, much of which is under-utilised, and none of which carries more traffic than a road system could handle in the same space, at the same speed and at half the cost? The railways once again want a massive financial reconstruction. In return they should relinquish much of the land they hold, at no rent, while road users, through road taxation, more than twice cover the cost of the facilities they use.

Instant trees; instant torrents

MEPC

Profits before taxation reach a new record

Highlights from the statement by the Chairman of Metropolitan Estate and Property Corporation, Sir Henry Johnson, KBE

Sir Henry Johnson, KBE,
Chairman

Peter Anker, FRICS, FRI,
Managing Director

PROFITS

For the year to 30th September 1972, the profits before taxation were £13,578,000 compared with £10,431,000. This increase was due to the benefit of reversions, continual growth in our overseas subsidiaries, the acquisition of new investments, and the re-investment of funds released by the sale of most of our residential properties.

FINANCE

MEPC has continually maintained a policy of making adequate arrangements for finance before embarking on major development or investment programmes. There is considerable scope to raise additional funds whenever required.

VALUATION

Last year the Board planned to revalue the Group's properties. Subsequently, they felt that it would be of more help if a partial revaluation were to be carried out each year involving one-third of the United Kingdom properties and one overseas subsidiary, so that the entire investment portfolio is revalued over a three-year period. Developments will not be included in the revaluation until completed.

The first partial revaluation shows that approximately one-third of the Group's properties in the UK and all of the Australian properties have been revalued at £119,000,000, a surplus of £48.7 million.

PROPERTY DEVELOPMENT AND INVESTMENT

The total cost of our development programme is over £300 million, including two very major schemes in London.

THE FUTURE

Sound investment, exciting prospects for developments and a good team of men are the right ingredients for the successful future of any property company and the Board is confident that these ingredients are contained within MEPC.

PROFIT AND DIVIDEND GROWTH

Year ending 30th September	1970 £000	1971 £000	1972 £000
Total share capital and reserves	110,874	119,402	181,326
Gross revenue	25,496	27,028	30,383
Revenue before taxation	9,065	10,431	13,578
Revenue available for ordinary dividends and reserves	4,896	5,973	7,734
Ordinary dividends	4,115	5,092	5,354
Rate of ordinary dividends	17.0%	21.0%	22.0%

Ask us about revaluation after the weekend

Japan goes to the polls on Sunday, after which the government will have to face the economic issues swept under the carpet in the run-up to the election. Our special correspondent reports on what may happen

Tokyo

Most of Tokyo's business community expects an early upvaluation of the yen after this weekend's general election. When, and by how much? Opinion is bunched in favour of this month and 10 per cent, but with respectable minorities arguing that action could be delayed until March or April and/or that a float may precede the final decision about a new exchange rate.

The official government line, right up to the election, has been that another upvaluation will be avoided by a combination of direct controls (supposedly temporary), the quickening tempo of domestic economic growth, and a liberalisation of imports and capital exports. A package of five main measures, collectively known as the Third Yen Defence Programme, was unveiled on October 20th; it was said to be capable of spectacularly reducing the balance of payments surplus by over \$2 billion a year. The flanking "temporary" measures included a ban on net new portfolio investment in Japanese securities by overseas investors, and other attempts to strengthen exchange controls over incoming funds.

Government spokesmen pound out three other arguments: that the full impact on the balance of payments of last December's 16.9 per cent revaluation has still to be felt; that this, and the unwinding of leads and lags which are directly attributable to renewed fears of revaluation, would eventually reveal something much closer to an underlying equilibrium than the speculators now imagine, and that, apart from these speculators, there has been no international pressure to revalue the yen to compare with last year's. It is, however, asking a bit much to put the "speculators" on one side. They are pouring money into Tokyo. In October alone, even the published reserve figures rose by \$1.3 billion, to push the total to \$17.8 billion; they have gone on rising since,

adding a further \$616m in November and are apparently heading for even more again this month. This indicates a certain amount of international pressure, even if this year Tokyo has no Mr John Connally shouting at it.

What the spokesmen do not add is that on Japan's side there is appreciably less resistance now to revaluation than there was in 1971. Then the prospect was treated like a threat of the end of the world. It proved not to be, even though it came at a time of recession (in Japanese terms, that means during a year of real growth of gnp of under 6 per cent). Now most ministers and officials regard it as not much more than a serious political inconvenience. The exceptions are those in the Ministry of International Trade and Industry (Miti), who have to face across the table the relatively few trades, like the shoe industry, that were stricken by the last realignment, and the much larger number who wail that they will be hurt by the next one. There is no doubt that Miti will oppose upvaluation to the last.

The prime minister, Mr Kakuei Tanaka, who seems certain to be re-elected on Sunday, has a clear internal economic policy, even if a fuzzy international economic one. His internal policy is to pile massive reflation on top of already massive economic recovery. After being presented in October with forecasts showing that the planning agency then expected real gnp to grow by 9.5 per cent in the year to next March (a forecast now revised up to 13.4 per cent), the cabinet gaily went ahead with an expansionary supplementary budget and greatly increased capital spending in the public sector. Approved before the Diet's dissolution last month, the supplementary proposals of the finance minister, Mr Koshiro Ueki, have added 5.7 per cent (more than \$2 billion) to current public expenditures. Capital spending under the state's auspices (including utilities) is now slated to exceed previous estimates by

You can't keep the growth in exports down...

...nor in those embarrassing reserves

Sometimes Chemical Bank does more for your money by saying "no".

No "yes-man-ship".

Whenever we counsel a client "No", it's because we believe that the surest way of doing more for your money is by being scrupulously objective. We look upon clients' financial affairs from a standpoint that they may not have thought of - nothing strange in that. It may be just a routine transaction, or a question of exchange between Hong Kong and Paris, or a financing project planned in Brussels for Tokyo but - whatever the problem - we can discuss the alternatives.

Know-how.

In the world's biggest financial centres you're sure to find Chemical Bank. For our specialists, the complexities of international finance hold no secrets. Our structure, organisation and type of operation enable us to develop a most sophisticated concept of financial affairs.

Problem solvers.

So, if one of our officers happens to see things differently from a client, he doesn't merely say "No". He produces a solution to the problem, and it's often an original one... to do more for your money. By the way: has your bank ever said "No" to you?

How to find us.

London Branches:
10 Moorgate - Phone: 606-8040

Representative Offices: Beirut, Birmingham, Madrid, Milan, Bogota, Buenos Aires, Caracas, Rio de Janeiro, São Paulo, Mexico City, Hong Kong, Manila and Sidney. Correspondent Banks in over 185 nations.

CHEMICAL BANK

We do more for your money.

8.5 per cent or \$1.7 billion.

Even more noteworthy, considering the normally heavy reliance on monetary policy in Japan's economic management, has been the government's insistence on a continuation of the easy money which was most appropriate to the reflationary requirements of a year ago, but for which the Bank of Japan may be presumed to have less enthusiasm now. The governor, Mr Tadashi Sasaki, is on record that a slight seasonal hardening of interest rates does not mean the bank is beginning to tighten credit, much as it might like to. Mr Sasaki admitted he did not like the look of the wholesale price index, up markedly since July; however, hardening interest rates abroad may now give him more room for manoeuvre.

Officialdom stubbornly adheres to its original forecast that consumer prices will rise just 5.3 per cent in the 12 months of this fiscal year, despite the unpalatable fact that August's figure was already up 5.6 per cent.

Is Mr Tanaka trying to reflate himself out of the need to revalue? There is no doubt that the Japanese

are, by their own past standards, running dangerous risks of economic overheating and inflation. What they may wittingly be doing is to build up a good head of economic steam to take care of the deflationary impact that would follow another upvaluation. The goodies (higher public expenditure) would then have come before the elections. The less popular step (an upvaluation) would come after it. The upvaluation could (and should) be accompanied by a lifting of the seemingly drastic ban on security purchases and the surely unworkable exercise in export restraint. This assumption that a revaluation may be around the election corner would also explain certain other recent oddities, such as that some companies in vulnerable industries (notably shipping) have been getting the nod to raise or recycle non-yen loans. These add to the foreign exchange reserves, and will do the borrowers no earthly good unless there is an upvaluation before the loans have to be repaid. In that case, of course, there will, in yen, be less to be stumped up, so they will score handsomely.

We know only one way to go

Miti insists that in Japan, even more than in other countries, the short run effect of a revaluation is to increase the trade surplus, and not to reduce it. Its argument runs as follows: an overwhelming preponderance (87 per cent by value) of Japan's overseas purchases are raw materials, foodstuffs or capital goods, the intake of which is governed less by price than by the economic tempo in Japan. Volume will therefore stay much the same even if prices (in yen) fall, in which case the value of imports could actually fall. As for exports, the argument is the familiar one that when a Japanese manufacturer is pinched (as it is to be believed he would be in the aftermath of revaluation) his reflex action is to pump out more exports, and the tighter the home market the more frantic his efforts. There is another, more credible view that some industries—those for which imported raw materials are a substantial cost item—can afford to use their windfall on imports to absorb part of revaluation's potential impact on export prices. That, too, would tend to sustain exports at a high level. There are also a number of export lines in which the Japanese have a virtual monopoly—desk calculators for one—and for which foreign demand is not particularly price sensitive.

No wonder Japanese manufacturers are gloomily asking themselves whether the yen has been launched into an orbit in which the thrust is all one way

—up and up. For they know only too well in present conditions that the export effort is by no means yet at full throttle. The time when exports really hum is when money is tight, and when the only way to get your hands on ready cash at a reasonable price is to have export paper which the banks will discount. Money has been far from tight throughout the past year. But there will come a time (or so every manufacturer must tell himself) when a credit squeeze will again be ordered to restrain price pressures. What then?

This question has begun to arise. There is no reason to suppose that it would be finally disposed of by a second revaluation, even if it can be argued that the deflationary impact of the revaluation would temporarily compensate for any deliberate withholding of the usual monetary discipline earlier on (ie, now). Revaluation in conditions of expanding business activity at home could have more acceptable results (as well as being less fearsome to contemplate) than changes made, as last year's had to be, in the trough of a recession. But that does not necessarily mean that it would have the desired effect of greatly reducing the trade surplus. Nobody seriously argues that a second revaluation will solve everything, on its own. What it can do is buy time—and short-circuit protectionist lobbies abroad—while supplementary policies are pursued.

How the situation develops must depend on the adaptability of Japan's economy. The least hopeful view here does not give Japan many marks for flexibility. Pessimists say that it is liable to be leaden-footed if nudged in any but its "natural" direction of export-led growth. The Liberal-Democratic party (which appears certain to be returned for yet another term), the bureaucracy, the decision-making processes in industry, the emphasis on consensus, the employment system and the peculiar dependence of companies on their bankers—all are said to militate against rapid and abrupt change. Those who see it this way consider Japan's export machine a relentless steamroller, moving largely under its own impetus, which does not lend itself to any other purpose. And

The luxury of betting

God help Japan should it stop.

Japan's admirers see a very different picture; one of probably the world's most responsive economic organisation. They recall past adjustments to changed circumstances and opportunities, including the wholesale scrapping of outmoded industries (such as coal) and the efficient concentration of research, capital and effort into new generations of more promising growth leaders. They see a wise bureaucracy and an unusual alliance of political and industrial decision-makers who have always been quick to detect and respond to a change in the wind.

On this view, Japan in the 1970s will start to be transformed into the welfare-leaning, construction-orientated and home-market-led economy which Mr Tanaka's outgoing cabinet has been talking about with growing insistence and conviction. The five-day week will become a reality. The five-year plan to extend waterborne sewerage from 23 per cent to 38 per cent of the urban areas will be implemented. There will be a much-needed drive for cleaner air and water. The construction ministry's proposed \$155 billion expenditure over five years on public housing and other amenities will roll on to more than double the spending of the past five years. It will cease to be the most remarkable feature of the annual transport white paper that, as recently reported by the Tokyo press, it deals with transport and traffic problems . . . from the standpoint of promoting the welfare of the Japanese people; in past years it dealt with the problems chiefly from the industrial viewpoint.

Prime minister Tanaka may have his way in launching an ambitious decentralisation programme, pushing people out of the overcrowded south.

The export-led miracle economy of the past two decades could then turn into a welfare-led miracle economy of the next two. But the mind still boggles a bit at the gap to be leaped.

Devil take the hindmost

Part of Japan's success as a growth economy has been its singleminded concentration on excellence. The best performers have always had first call on whatever support and encouragement might be going, and small or weak companies disappear in droves in the course of any one of the Bank of Japan's periodic credit squeezes. Dead-end exports have at times been actively

helped on their way to oblivion to protect the prospects of promising new ones.

Now, however, the world must wonder whether all has changed. The 18 products which have been caught in the net of the export control ordinance are precisely the star performers. They are the ones whose increased shipments in January-July this year accounted for more than 1 per cent of the total increase in Japanese exports during the period over the same months of 1971; whose export

growth rate over the same six months exceeded 20 per cent; and which contributed at least \$100m to export revenue in the 12 months ended July 31st.

Articles falling under the bane of the export control ordinance include everything from bicycles (January-July exports up 150 per cent) to cars which just scraped in, producing exports 942,757 vehicles in January-June, volume rise of 18.8 per cent. Excluded among admittedly likely-looking

Nibbling at the surplus

Where last May's measures were mainly successful in what the Japanese call the creation of second-line reserves and the rest of us would call window-dressing, the new third yen defence programme is supposed to make a real difference to Japan's balance of payments. Officials are guarded about the short-term impact, but estimate the effects in a full year, as compared with the October forecasts for the current fiscal year which put the likely current account surplus at \$5½ billion, as follows:

● **20 per cent tariff cuts:** Applies to 1,863 items, namely 85 per cent of dutiable items (examples: dishwashers, ceramics—down from 7.5 per cent to 6 per cent; motor cars—down from 8 per cent to 6.4 per cent). Main exclusions are primary agricultural products and revenue-raising duties but also selected industrial goods, including computers and other electronic items, and some products of small industries. Already implemented. Expected impact: \$200m to \$300m.

● **Increased import quotas:** Increases of 30 per cent upwards, but only 33 items, accounting for under 5 per cent of imports, are subject to any quota restrictions. Expected impact: \$200m.

● **Other import-promotion measures:** Export-Import Bank credit made available for an expanded range of goods and interest rates on import finance cut 1 per cent to 5.5 per cent. Import procedures to be simplified and private gold purchases permitted. Department store chains are making inroads into Japan's constricting sole agency and tortuous distribution systems, by importing direct. Expected impact (counting in the expected effect on exports of a 1 per cent increase in the cost of Ex-Im bank credit): \$450m to \$600m.

● **Export control:** Due to be applied to the 18 most sizzling performers, for six or 12 months. Miti insists there is a fund of exporter goodwill for this

exercise, reflecting a widespread desire to ward off revaluation. However, the original plans for mainly voluntary restraint were modified on November 10th to provide for quarterly export quotas, which will limit export growth for each industry in the 12 months ending next September to a set proportion of the percentage annual rate of growth achieved in January-July this year. Within industry ceilings, exports will also be redirected, for example, to ensure a decline of shipments of ball bearings to Britain. Other goods subject to control include tape recorders, cars, bicycles, home appliances, seamless steel tubes, heavy electric machinery and communications equipment. Hoped-for result: \$500m to \$1 billion.

● **Expansion of the domestic market:** Supplementary budget designed to accent welfare spending and whittle back the balance of payments surplus; likewise capital expenditure programmes, previously beefed up in August. Counting earlier addition, increased spending of nearly \$5 billion. Net expected payments effect: £300m to \$500m in the current fiscal year.

These measures, according to Miti, "are the paratroops." The full defence capability will not be seen for "about a year." It will consist of a high level of economic activity, underpinned by another expansionary budget, combined with progressive reorientation of the economy along the lines of the October 20th cabinet communiqué. That enumerated

the extension of social overhead capital, the improvement of social security, the expansion of environmental preservation measures, the promotion of a five-day working week, and the encouragement of the shift to a welfare-orientated type of economy.

The weapons still in reserve do not, says Miti, include resort to an export surcharge. But on that it is in disagreement with both the Ministry of Finance and the Bank of Japan, both of which would have been happy to have seen a surcharge in action already.

How a Pan Am pilot tells the time in New York in New Delhi.

Imagine you're a Pan Am pilot, and you've just landed a giant 747 on the steamy tarmac of New Delhi airport.

Your three hundred and sixty two passengers have alighted, and you're beginning to relax.

You start wondering what your family's doing right now, back home in New York. You look at your watch. It's a Rolex GMT-Master, showing local time correct to the nearest second. So you turn the revolving outer bezel, and it tells you the time back home in New York and will keep telling you New York time as long as you wish.

This unique feature obviously has many uses, both professional and otherwise.

But it's by no means the only reason why Pan Am chose the GMT-Master to be their official timepiece.

The main reason was that the GMT-Master is a Rolex Oyster.

And Rolex Oysters are built with care and patience by the most experienced craftsmen in the world.

They work on each watch for over twelve months. The final result is not a watch at all, but a 'chronometer': a fact we signify with the Rolex red seal, which you can see below.

'Chronometer' is one of the most sought-after titles in Switzerland. And it can only be bestowed by one of the Swiss Institutes for Official Chronometer Tests after they've tested the movement's accuracy over a gruelling two weeks.

Our rotor self-winding 'Perpetual' movement has won us nearly half the chronometer certificates ever awarded—although the time it takes to make each

Rolex means we're responsible for only a fraction of the annual production of Swiss watches.

But accuracy alone is not enough. To keep their precision timing, movements have to be protected from dust, dirt and water.

The protection we give our 'Perpetual' movement is the Rolex Oyster case. Each one is carved out of a solid block of surgical stainless steel or 18ct. gold. Our craftsmen perform 162 separate operations to turn this chunk of metal into the toughest watch case in the world. Then they carry out a further 38 operations making and fitting the Twinlock Winding Crown, which actually screws down onto the case, rather like a submarine hatch.

You'll get some idea of how well the 'Perpetual' movement is protected by reading this extract from one of the many letters which we keep (rather proudly) in Geneva:

"Two of us spent ten days climbing in the Ruwenzoris in Western Uganda. On the third

day we reached a hut at 13,000 ft., after a tiring march; it was in the evening and very cold with rain, sleet and snow falling. During a brief break I went to a stream nearby for a quick wash, and as I was taking off the Rolex it slipped through my numb fingers into the stream. A foot downstream from where it had fallen, the stream dropped into a five-foot hole and continued its course for the next twenty

yards underground. It being nearly dark and cold I was unable to see the watch and offered a reward to anyone who could return it to me next day.

"The stream was almost freezing having come from a glacier a mile higher up, nevertheless next morning the porters were in the stream and after half an hour found the watch caught by its strap in the fast-flowing water and still working . . . The watch has continued to keep perfect time ever since, without even a cleaning."

This was sent to us by an Englishman living in East Africa. Obviously, owning a Rolex gives him a great deal of satisfaction.

Almost as much as it gives our craftsmen, who spend their lives making sure that each Rolex they make is a superb example of their craft.

Owning one is almost as satisfying as making one.

ROLEX
of Geneva

Pictured: The Rolex GMT-Master. Available in 18ct. gold, stainless steel or steel and gold combination. All with matching bracelets.

**Last year, United States Steel's
process produced 70%
of the world's tinplate.**

Wouldn't you expect us to have first-rate metallurgists?

United States Steel is the largest steel company in the western world.

So it's not surprising that tinplate lines owned or licensed by United States Steel account for almost three-quarters of the world's supply—or three-quarters of the world's tin cans!

We're United States Steel's worldwide sales organizations and distributors. And we can offer you more products and services than any other steel producer or distributor.

Take metallurgical assistance. When you need to talk to somebody with worldwide experience, our metallurgical engineer is never farther than a jet away.

He can help pinpoint specifications on products you haven't even made yet. Make on-the-spot suggestions on how you might cut production costs. Recommend changes in procedures that are causing you headaches. Determine which of United States Steel's products will best fit your application. Or even tailor-make a product to your specifications.

Besides every kind of steel you'd ever need...and every kind of know-how you'd ever need to use it...what else can we offer you?

Raw materials and chemicals. Products made from them. And products made from steel. What's more, we build bridges, oilfield equipment, office buildings and homes.

We perform complete shipping services everywhere we sell. And that's everywhere.

Our prices are competitive. So are our credit terms. And we've been successful in arranging financing for our customers.

Whether your needs are large or small, we're eager to talk business with you. Just say where and when.

ports in foreign eyes, are colour television sets (up 12.7 per cent to 1.4m units in the nine months January to September), desk-top calculators (up 96 per cent to 1.2m units in January-July, by volume, but up only 1 per cent to \$137m by value), and electronic and computer equipment in general.

Steel products have also escaped the axe, with the exception of seamless tubes, and exports of these will be permitted an 18.5 per cent rise to \$340m in the 12 months to August 31st next.

Officials and industry spokesmen all insist the emergency has dictated interference with exports that have lots of life in them yet. That is enough to make others doubt that it is seriously intended, especially when they remember the messy business of curtailing textile shipments to the United States last year. The operation has public relations overtones, designed to create a big effect with a minimum of action. A special effort is being made to curb exports to the United States (which is still where most of the screams are coming from). Miti is believed to want to reduce Japan's surplus with the United States by \$500m. There is the attentive regard for other specific irritants, notably ball bearings.

On almost any view these export controls are part of an essentially short-term strategy. It is hoped that they will take the edge off international carping, and persuade Japan's customers to abandon such unnatural practices as the persistent prepayments which have been artificially boosting this year's trade surplus. That is the basis on which the policy has been sold to the Keidanren (Japan's equivalent of the Confederation of British Industry). However, if Japan really hopes to achieve these objectives it had better think twice about, for example, pushing its exports to other destinations where they apparently do not hurt so much. Others will remember that trade is multilateral.

Two export destinations that spring to mind are Brazil, recently host to a high-powered trade mission, and China. Probably nobody yet knows what the Chinese market is going to mean, but there is no doubt that Japan's businessmen are excited by its possibilities. It is pretty certain what everyone else will make of recent decisions to provide export finance to

How we want it

China at rates 1 per cent cheaper than the October-raised norm and to give the go-ahead to the Export-Import Bank's planned \$30 billion quota for credits to China in the 12 months starting next April. Still, the Japanese are probably right in thinking that aggressive competition in such third markets will cause fewer howls than a concerted drive into Europe.

Come in, Cosmo

The Economic Planning Agency's economic research institute wrestled long and arduously with the notion of net national welfare (NNW), trying to formulate the concept in a useful way, and thereby, as one baffled statistician put it, "to satisfy the many politicians who thought gnp was old hat and it was now the age of NNW." Alas, it could not be done, so that in Japan, at least, forward planning remains firmly based on guesses about demand and gross national product. However, say the planners, "we must hope for peaceful coexistence" between gnp and NNW.

What that may hold for the future is anybody's guess. It is on the cards that, on the government's instructions, the next medium-term plan will be coloured by welfare to an unprecedented degree. It depends on how well Cosmo can cope. Cosmo is the computerised economic model which throws out gnp and other forecasts to two or three decimal places. In Japan such models have for long been standard aids to management, though usually greeted with suspicion if not hilarity by the average European. The signifi-

cance of Cosmo, now in the process of being introduced to the Japanese public by the planning agency, is that it is the latest and most sophisticated of its kind, so that its programming is capable of throwing out hints of changes to come.

The most striking innovation is that Cosmo for the first time calls for data about anti-pollution investment, a type of expenditure unheard of a few years ago. Cosmo has yet to be harnessed to a five- or 10-year plan (one or the other is due to be commissioned soon), but a preliminary print-out shows the effect of anti-pollution investment by industry rising to as much as 15 per cent of private fixed investment. What it has suggested by way of a trial run, and compared with real gnp growth of more than 11 per cent in 1970 (and 13.4 per cent expected this year), are figures tapering off by 1990 to a maximum 9.6 per cent growth and a minimum of just 4.2 per cent, for Japan, an almost inconceivable low.

If this is how the Japanese want it, and growth becomes the unmentionable concept, the result by the end of the century would threaten to be a gnp at 1970 prices of not much more than \$1,500 billion. That would disappoint Professor Herman Kahn, on whose projections Japan could end the century with the world's biggest gnp of up to \$4,500 billion, or something like \$34,000 per capita (1970 prices again). Still, the \$1,500 billion would bring \$11,000 per head, twice what it is today in the United States. Not bad? Cosmo volunteers no opinion. Those who could don't either: as a topic it is simply no longer on the agenda.

This special report

THOS. W. WARD LIMITED

Profits increased to £5.7m

Mr. Arnold Carr reports a year of great activity

Mr. Arnold Carr presided at the annual general meeting on 1st December, 1972 and in the course of his review, said:

It is a pleasure again to report further progress and increased profit. The Group trading profit is £5.7 million which is an increase of more than £1 million over the previous year and your Directors are recommending an increase in dividend.

TRADING

The year has been one of great activity. We have supported the C.B.I. efforts to restrict price increases and used every endeavour to offset escalating costs by greater efficiency. There are companies within the Group where results have not been commensurate with the efforts made, but better results must eventually accrue because of those efforts.

Substantial acquisitions have been made which we expect to serve us well in the future. Certain under-utilised assets have been sold and some activities curtailed or discontinued.

Demand for cement and quarry products was well maintained, enabling record tonnages to be delivered. Due to the low level of activity in the steel industry the Iron and Steel Division experienced very difficult trading conditions but we are hopeful that the now improved position will continue. The companies within the Engineering Division had mixed experiences but are well equipped to respond to demand as capital investment is increased, as it surely must at some stage. The companies within the Industrial Services Division performed well and profits were substantially increased. We have reason to be confident in the future progress of this division.

ACQUISITIONS

On 15th February, 1972 the Group acquired John Lee & Son (Grantham) Ltd., together with its subsidiary and associated companies. A. D. Crompton Ltd., which was acquired in May 1972, manufactures protective clothing and is a leader in the direct application of retro-reflective material to a variety of products. On 20th June, 1972 we announced our intention to bid for The Skipper Group Ltd., and on 2nd August our offer became unconditional.

EXPORTS

The value of goods exported from the United Kingdom during the year amounted to £11,254,000 (£8,511,000).

PROSPECTS FOR 1972-73

We shall undoubtedly benefit from the increasing activity in the steel industry, by concentrating our engineering on fewer sites and by increasing merchanting activities. We expect to make progress towards more acceptable results and are confident that our recent acquisitions will perform as expected. There is much industrial unrest but if our own efforts are not frustrated by events over which we have no control we can look forward to further improvements in our overall profit.

SALIENT FIGURES FOR THE LAST 5 YEARS

BUSINESS

Britain

Fair's fair up to the time that I say that it isn't

The Government's plans for curbing monopolies and protecting consumers got a tepid reception when they were published last Friday because they were not at all what had been expected. Most people had a mental picture of some watchdog organisation designed to stop exploitation and fraud before they happened. That is not going to be possible as long as there are mugs about and knaves to take advantage of them. All that the Government has attempted is to cut down the time-lag between recognising that there are abuses and doing something about them.

Even that is a more ambitious target than it sounds. The exploiters inevitably have better lawyers and shrewder advisers than the exploited. Mergers and takeover bids have been scrutinised for some years now by the Department of Trade and Industry—but by civil servants who were not in any sense experts and were liable to be moved on to other departments as they became more experienced. References to the Monopolies Commission have been like dipping into a bran-

tub, the tone of the final report being decided by which of the available part-time members happened to be free at the time the reference was made. Investigations could be and were strung out for several years. Nimble traders have also had time on their side. Consumer legislation is always messy: the present bill has 121 pages, 123 clauses and 13 schedules. It is child's play to find loopholes but almost impossible to find the necessary parliamentary time to close them, and, in the interval, the unscrupulous flourish mightily.

The ways to close this gap are necessarily rough and ready. The proposed Director of Fair Trading and his staff of 175 are going to be professionals on a par with the men they are dealing with and possessing considerable powers of delegated legislation. In some ways this breaks dangerous new ground. But it recognises that technology is changing the face of industry so rapidly that laws which protect in today's circumstances may be wholly inadequate tomorrow, and the only way to catch up is to give the director power to change the rules as he considers neces-

sary. In practice, it means that new offences are going to be added to the law all the time, carrying quite severe criminal penalties, on the Director of Fair Trading's say-so. And there will be no ducking these offences by pleading that you are no longer connected with the company; the Government has decided that a man will not be able to go on side-stepping his legal responsibilities merely by changing his hat. This cannot quite have sunk in, or the bill would not have been received so placidly.

There are no guidelines for industry to indicate how the director might react to size or the concentration of power in conglomerate hands; that is being left to his judgment. In practice, that will probably mean a black mark against a successful takeover bidder who shut factories after he had assured the director before the bid that they would be left open, or otherwise switched policy after a deal had been approved. Future takeovers or mergers put forward by that management would in all likelihood be blocked. If the success of Sir Rupert Sich as Registrar of Restrictive Practices is any guide, this informal approach could turn out to be very successful.

The consumer part of the job is bound to be tougher. Since Victorian times, the law has favoured shoppers and come down heavily against shopkeepers, but to this day people remain reluctant to claim their rights to re-

If it doesn't work as it should, weigh as it should, taste as it should, or there's no beach, the law helps

dress. It does not seem worth suing a shop over a saucepan when to lose carries the risk of paying the shop's large legal costs. Enforcing some consumer laws calls for greater expertise than even Weights and Measures inspectors possess. If the director of fair trading does not do it in future, a lot of it is still not going to be done at all.

This is going to apply particularly to important test cases over services, which are being specifically brought into the net for the first time.

Industrial court

Here we go again

The second round in the battle between the National Industrial Relations Court and the Amalgamated Union of Engineering Workers is turning out rougher than the first. On Thursday, the engineers at the CAV plant in Suffolk threatened to strike if Mr James Goad was not sacked. The CAV branch of the engineers had refused to admit Mr Goad, despite an order from Nirc. The management promptly sent Mr Goad home, but it has not agreed to sack him.

A week ago, Mr Goad was once again refused admission to the fortnightly meeting of his branch, even though the AUEW had been fined £5,000 in the meantime. So Mr Goad, with admirable perseverance, has decided to return to the Nirc yet again. His contempt plea will be heard on Friday, and could lead to a fine of around £50,000 on the union.

The union is still livid that the first fine got paid. Officials had claimed that its bank accounts were all overdrawn, but the four sequestrators found sufficient at the merchant bankers, Hill Samuel, to meet the bill. Mr Scanlon immediately sacked Hill Samuel, but he will be lucky to find any bank prepared to defy court orders.

It is hard to see how rounds three and four can be avoided. Mr Goad and the engineers are equally determined not to give way, and there looks no way for the Official Solicitor to intervene this time. If the engineers decided to attend the Nirc they might persuade the court that Mr Goad did not deserve union membership. But the union has said it never will. If sequestrators are called in again, they will find it harder to put their hands on the union's money. The AUEW could quickly find itself bankrupt, and Mr Scanlon knows the TUC voted specifically in September not to set up a fund to help unions that run into trouble with Nirc.

Smithfield

Happy on the hoof

The Government's decision not to curb meat exports gave a lift to the Smithfield Show which opened at Earls Court on Monday. The Minister of Agriculture, Mr Joseph Godber, explained that reimposing restrictions would dampen the enthusiasm of British farmers in building up their breeding herds. But the decision must raise retail prices. Meat prices are explicitly excluded from the freeze and have risen in line with increasing exports to Europe. Prices for beef cattle have risen by more than 20 per cent since EEC import duties were halved in November.

The show remains an excuse for farmers to come to London and for their wives to do their Christmas shopping. There was a slight and welcome change in judging standards. This year's top beast was traditional enough: a three-quarters Angus/one-quarter Shorthorn. But among the runners-up were several Charollais crosses reflecting the judge's interest in meat (he is the Scottish buyer for FMC, Britain's largest meat organisation) rather than appearance. But farmers still prefer a judge who goes by what an animal looks like on the hoof; it is so much easier for them to know what to aim for in a champion. Any idea of using modern and proved techniques for judging its edibility, like the ultra-sonic measurement of fat, would be laughed

Wacko won on form

but part-Charollais Paul came close

out of the judging ring.

The machinery makers who do the show's serious business are set fair for a record year for exports, with sales topping £275m. There has also been a sharp upturn in the British tractor market. Firms like Massey Ferguson report a 50 per cent increase in demand, although imports have doubled over the past year and now take around 10 per cent of the £100m market. The main change has been the move to ever-larger tractors with 100 hp engines; of the five now on the market three are imported from the United States and two built in Britain.

Cars

Staying put

Fears, most of them groundless, are reviving that Detroit is secretly spiriting away its British assets to the continent. The latest arise from the news that the Chrysler Corporation plans to buy the remaining 6 per cent of shares in Chrysler UK, coming on top of Ford's interest in Spain. The Chrysler deal, officially approved on Wednesday, is puzzling, as it is accompanied by a statement that shareholders will not receive a dividend for years. But this is because of the complex arrangements made when Chrysler originally gained control in 1967, and the ordinary shareholders agreed to accept all the losses for the first two years, and only half the profits after that. In the event Chrysler UK lost £16m in those two years, so £32m of profit has to be made before shareholders can expect a dividend.

The new capital structure will ease that problem, and also make it easier for Chrysler to increase the capital of the British company. This it badly needs to do if it is to wipe out its disadvantage in fixed assets per worker, a meagre £2,880 a head, compared with Ford of Britain's £5,220, and probably about £8,000 in Ford of Germany. British Leyland is even worse off than Chrysler with assets of £2,530 a man.

Part of the British industry's disadvantage lies in the stagnant home market it had until last year. The common market tariff explains why French Chrysler exports 212,000 cars a year within the community and British Chrysler only 5,000. Ford UK sold 14,000 to the community during last year's strikes, compared with 224,000 by Ford of Germany. Vauxhall sold 13,000, compared with 180,000

7th December, 1972

by Opel, the General Motors' subsidiary in Germany.

Productivity has been improving rapidly on the continent. Opel has raised the value of its output by half since 1965, and the number of cars produced by over a quarter, with only a 10 per cent increase in workers. Rapid changing of models, encouraged by a rapid growth in demand, has helped the introduction of new technology. In 1965 a car door was made up of several sub-assemblies, but today it requires just one stamping. By contrast, Vauxhall produced slightly fewer cars last year with slightly more men.

Understandably, these trends are accompanied by a weakening in the market position of British firms where they ought to be strong. In the first six months of 1972 Chrysler France's sales to Britain increased by slightly more units than Chrysler UK's. In Efta, where it ought to have a tariff disadvantage, Opel's exports are six times those of Vauxhall.

It only takes a container leaving Dagenham destined for Germany to suggest that Mr Henry Ford II is putting his threats about British workers into practice. But this year the output of Escorts in Britain has risen 50 per cent, and in Germany has fallen by a fifth, again reflecting market trends. This year production of Fords in Britain is likely to overtake production in Germany, and the balance of trade on Ford parts between Britain and Germany is heavily in Britain's favour. The tariff reductions on Britain's entry to the common market should make the agents of Ford, Chrysler and Vauxhall in Europe a little more willing to take British products. The worst is probably over.

Handicapped workers**Charity begins . . .**

The Spastics Society has been so aggressively successful, having shot its income up from zero to £2.3m in 20 years, that it may not be exactly everyone's favourite charity. But it deserves great credit for the way that it is switching its attack and its substantial resources to the painful issue of jobs for the handicapped, spastic or not. The society has had so little success in getting jobs for its own members that it has now decided it might be better tactics not to differentiate between spastics and other handicapped workers, but to treat them as a common problem. So it is offering to pay for, and advise upon, modifying factories, buildings

Surprising what can be done

and individual machines to enable the limbless, the paralysed and the uncoordinated to use and operate them. It is also offering to pay the wages of a welfare officer, for transport to and from work, and for housing.

There are an estimated 65,000 handicapped people out of work, and the law which says that companies are obliged to give 3 per cent of their jobs to them is a farce. Managements comb their staff lists for enough workers with very minor physical defects to fulfil their quota. Government departments are not above offering members of their staff with a slight limp such inducements as free parking (on double yellow lines) and part-payment of car licences if they will register as disabled persons. The prejudice against the genuinely handicapped is huge.

It is too early to say whether the cash offer to employers will break it down. In the few weeks since the shift in policy, two companies have made tentative inquiries and by coincidence both were rubber manufacturers. The society badly needs advice from senior managers in industry on what sort of openings could be found for the handicapped if a determined effort were made. Its own leanings are for more desk jobs that make use of their undamaged minds, rather than their flawed bodies; some spastics at training centres have IQs upwards of 130. One of the City's property developers has recently offered the society the air space above his next development, which is to be a five-storey office block in Liverpool Street. On top of it the society plans another five storeys of flats for the handicapped, which will cost it £500,000 and could form the basis for what it describes as an "intellectual workshop" for com-

puter programmers, translators and other jobs requiring high intelligence but low mobility.

Housing has up to now been the society's strong point, and it has made most headway with new town authorities and their architects, both in putting up its own flats and in advising them on the minor changes to layouts which have to be made to public buildings under the Chronically Sick and Disabled Persons Act, 1970. But the pressure is still to put the handicapped away where the rest of society does not see them. Planning permission for a £100,000 hostel in the Midlands was forcefully opposed by, of all people, the chairman of the hospital management committee whose house was on the next site; other neighbours sent the society the bill for planting screens of trees to shut out their view of the hostel. This is why the society has decided that all but 17 of the 58 flats in one of its recent developments in Haringey were to be offered for rent to normal tenants, and that less than one-third would be reserved for the handicapped, in the hope that this might break down the ghetto outlook.

Employee share schemes**Shop floor shares**

Legislation on share incentive schemes and stock options is causing a lot of headaches. Mr Patrick Jenkin, Chief Secretary to the Treasury, promised amendments on October 15th but nothing has happened yet.

The 1972 Finance Act made some stock option profits liable to capital gains tax, instead of income tax and surtax. Whatever the exercise price, an option always has a value since it does not have to be exercised if the market price has not reached that price. The warrant market shows how to value long-term options. So the granting of an option involves an element of remuneration, which should properly be liable to income tax and surtax. And some of the snags in the share scheme legislation have driven many companies into options when they might have been liable to income tax and surtax. The Government has implicitly admitted the element of remuneration by saying that new option and share schemes may not be introduced during the freeze.

To counter this, share schemes are being designed that reach right down to the shop floor, thus extending the benefits to all employees. Lowndes Management Incentives has devised an ingenious scheme for Schreiber Wood Industries, linking a share scheme to SAYE, although it has been held up by the freeze. Each employee is allotted a given value of shares in the company and takes out an SAYE contract designed to produce that sum at the end of five years. Meanwhile he is sold the shares by the scheme's trustees, with an interest-free loan from them, and he gets the dividends.

Value-added tax

Vat a performance

The Chancellor of the Exchequer leapt so aggressively to the defence of value-added tax in the Commons on Tuesday that not only was the Opposition's motion to postpone it for a

year defeated, but the threatened Tory revolt fizzled out into a mere four abstentions from the most dyed-in-the-wool anti-marketeers. But there was a rather more serious note to some of the Opposition's complaints. For months Labour spokesmen have been drumming up sympathy for the little old ladies who own corner shops and will soon have to face the administrative horrors of Vat (which are in fact far less formidable than the income tax returns she has battled with all her trading life). Belatedly, they have realised that the real danger—and the worthwhile target—is not what Vat is going to do to retailers, but what retailers are going to ascribe to Vat when they realise the opportunities that it could offer for them to make a killing.

As Mr Barber pointed out, the more wolf cried over the effect of Vat on prices, the more unscrupulous traders are going to use it as an excuse for raising them. Signs have already appeared in some electrical shops on the lines of "buy now and beat Vat"—although these are the very goods whose prices should drop as soon as Vat is introduced. The Government promised, rather vaguely, new controls to see that the full benefits of the end of both purchase tax and selective employment tax were passed on in prices. The threat has come none too soon. Hotels and boarding houses in the west country are already blaming Vat for rises of 20-30 per cent in next season's rates and the English tourist board is rightly worried. It would be no bad thing to insist that Vat was for a time shown separately from the price, as purchase tax used to be when it was first introduced.

Steel

BSC rebels

The British Steel Corporation took everyone by surprise on Wednesday by, in effect, brushing aside the findings of Lord Hirschfield's report that it had been unfairly manipulating certain prices: that is, over-charging private buyers and under-charging its own plants. It was the opposite of what what had been expected and of what the Minister for Industry, Mr Tom Boardman, seemed to have announced to the Commons. The private steel industry, which had been complaining about BSC's unfairness, asked the Brussels commission on Thursday what to do. Mr Boardman asked Lord Melchett for an explanation.

The Government had been under the impression that at the end of the freeze the BSC was going to amend the prices of three products (reinforcing bar, soft wire rod and hot re-rolled bar and section) so that there was an adequate margin between the price of the starting billet and the end-product rolled from it. The private sector was more than happy to wait for what amounts to a relatively short time for its just deserts. But now the issue is back in the melting pot.

This may prove to have been a hollow gesture for the corporation to have made, even if the European commission does not direct it to modify its price. The BSC needs the Government to approve its major investment plans quickly. Capital spending is already slowing down to pre-nationalisation levels. This roughshod riding can only make enemies in Whitehall.

The remedy against long-distance travel fatigue.

RECHARGE YOUR BODY BATTERIES!

Next time you plan a trip to Japan, following points are worth remembering:

1. Our flights on the Trans-Siberian Express to Tokyo via Copenhagen and Moscow arrive Sundays at 9.10. That gives you 24 hours to get your "body batteries recharged" before Monday morning.
2. If you travel from any place in central Europe, the route via Copenhagen is, by far, the shortest to Tokyo. From London, however, it is 7 miles longer—from Paris 61 miles.
3. There are morning connections to Copenhagen from all over western and central Europe for the Saturday noon departures of the Trans-Siberian Express.
4. Your return flight leaves Tokyo at a comfortable hour on Sundays—11.00. You fly in daylight all the way to Copenhagen (arrival 16.50), and you'll be back home by Sunday evening.

"The Daily Telegraph", Oct. 6th, 1971

Key indicators: British economy

Capital spending
Down again in the third quarter, with manufacturers' spending on plant and machinery falling most sharply. Some investment could be being delayed deliberately until the more favourable tax year 1973-74.

Stocks
Reduced further in the third quarter. Ratio of stocks to output at new low of 82.8 (end-1962=100).

Retailing
Strong again in October.

Official reserves
In a quieter month for sterling, reserves rose \$36m.

C.T. Bowring

& Co. Limited

now
quoted on five
major Bourses
of Europe

London • Paris • Frankfurt • Amsterdam • Brussels

C. T. Bowring & Co. Limited are proud to announce that the ordinary shares of the Company have been introduced to the Bourses of Paris, Frankfurt, Amsterdam, and Brussels, and application has been made for a quotation in Milan. Bowring is the first company in the world to obtain simultaneous introductions to the major

Bourses of Europe. The Bowring Group has taken this initiative in order to help encourage the international expansion of the Bourses, and closer co-operation between the major financial centres of the EEC. The shares of C. T. Bowring & Co. Limited have been quoted on the London Stock Exchange since 1964. The Group has a current market

capitalisation in excess of £150,000,000. The Bowring Group of Companies forms one of the largest and most broadly based financial services organisations in the world. Its operations include insurance broking, insurance underwriting, credit finance, leasing, merchant banking, shipping, trading and property.

How Euro are the Eurocrats?

Brussels

Civil servants do not yet go on strike in Britain, but things are different in Europe. The EEC commission struck for one and a half days at the end of last week, with a threat of more to come if the French and Germans refuse to stick to the procedure for revising staff salaries agreed last March, also after a series of warning strikes.

The strike was also used to air other grievances: over the arrival of 500 new officials from Britain, Ireland and Denmark next year. The British quota of commission jobs is to be filled by the end of 1973. Britain has insisted from the start on its fair share of the top jobs: director-general, director and head of division. The commission and the staff unions have bowed to this as a political necessity. However, the Italians, now under-represented in the commission, want their quota to be brought up to full strength. So the commission will be recruiting an extra 20 Italians next year, at a time when it will be getting rid of up to 300 established civil servants from the Six to make way for incomers from the three new members. The staff was angry—the more so as the decision about who goes will now be made at least partly on national lines. If national quotas came to be rigidly enforced at each grade, this could make it hard in future to replace a retiring senior official of one nationality by someone of another. A rational career structure would become impossible.

The commission has tried to allay fears by emphasising that any arrangements made with the British are merely transitional, but the staff unions are worried about London's long-term intentions. Whitehall is suspected of looking on Brussels as a place where young men are sent for a few years' tour of duty before recall to London and promotion. The French have

always been keen on the idea of rotating civil servants between home and the EEC. If the practice became general it would undermine the principle of a European civil service.

The suspicion is probably unfounded and unfair. The few technical experts apart, British civil servants are being recruited for the EEC with the idea of making a career in Brussels, and their right to return to London at the same rank will expire after four years. Unless they could keep their option open at least for a while, it would be hard to get enough volunteers for

Brussels. Past experience shows that even Frenchmen do stay on there, and become completely Europeanised. Many senior officials have worked their way up through the commission. But it is still a toss-up.

Even after 15 years of the common market there is still ambiguity about the proper relationship between the EEC and the national civil services. The Dutch and the Belgians are the most European: a Dutch civil servant who goes to Brussels gives up all rights in the Dutch civil service. French civil servants not only keep their rights, but get automatic promotion while they are with the EEC. Given the role played by French officials in Brussels and the fact that far more of them tend to go into the civil service, those who want a genuine European civil service naturally tend to twitch when they look across the Channel.

Musical chairs in the Berlaymont

The 13 members of the new EEC commission will take up their portfolios in the first week of January. The decisions on who will land which job are being settled by a game of musical chairs.

1.—Germany is eligible for the economics portfolio, a senior job. After a great deal of arm-twisting from the re-elected government in Bonn the senior German commissioner, Herr Wilhelm Haferkamp, a social democrat, has put in for it.

2.—Up to this week he has resisted this, preferring his present job (harmonisation of laws, energy), almost anything except economics. It was therefore expected that Baron Snoy et d'Oppuers (the former Belgian finance minister) would be drafted by Belgium for the economics job.

3.—For this to happen the Dutch (whose commissioner is informally supposed to provide political balance to the Belgian commissioner) would have needed to draft a socialist, as the baron is Catholic and moderately right wing. Given the swing to the left in the Dutch elections, this looked easy. But forming coalition governments in Holland is so subtle a process that the

Dutch might yet have to give a job at the commission to a Catholic (or other non-socialist) as a trade-off.

4.—Now that Herr Haferkamp has put in his bid, Germany's junior commissioner, Professor Ralf Dahrendorf, cannot also have a top job. He is now likely to have to give up his present one of external relations and trade.

5.—This is the job Sir Christopher Soames is bidding for. He had begun to look nervy when Herr Haferkamp seemed set on staying put in a relatively modest seat. But now it is Herr Dahrendorf who is on the defensive. So Herr Dahrendorf is campaigning to have external relations split into three:

- (a) Gatt, trade negotiations, America, etc (Sir Christopher Soames);
- (b) Aid, all poor countries (M. Jean-François Deniau, France's junior commissioner, who already handles the African associates);
- (c) Efta and the rest of Europe including the east (Herr Dahrendorf himself).

6.—Sir Christopher Soames would be happy to work in harness with M. Deniau. But he does not want a troika with Herr Dahrendorf.

Someday you may be happy we ran this ad.

Someday you may want to know where to find a good banker in one of these cities. And then these little maps will come in very handy. Right now we have two full-service

branches (London and Paris), three representative offices in Europe, and a merchant bank in London. And we're growing and expanding every day.

Giscard pulls out the same stops

France

Eating cake

Paris

The finance minister, M. Valéry Giscard d'Estaing, gave Frenchmen a popular anti-inflationary pre-Christmas package on Thursday. He "cordially invited" industry not paying value added tax to introduce a three-month price freeze, while the rest of industry gets a six-month Vat cut where the top rates come down from 23 per cent to 20 per cent and the bottom ones from 7½ per cent to 7 per cent. Patisserie gets a special Vat reduction all of its own, down from 17 per cent to 7 per cent, and Vat comes off beef altogether. The government is going to lose around £600m a year from the concessions. At the same time, some of the huge official stockpile of butter is to be released on to the market at prices 15 per cent below the current levels. The average Frenchman is at present understandably obsessed with his cost of living. France's official price index rose in October by nearly 1 per cent, with food prices far outpacing the general rise.

But the cost of credit, particularly for housing, will go up. In an attempt to garner private funds, interest rates on long-term savings will be raised. In the past few weeks, the price and volume of trading in gold napoleons and the 1952 government loan, the Rente Pinay, both traditional havens for French capital, have risen sharply. Now the government has chosen once again to launch a £420m, 15-year public loan, with interest tax-free and exchange rate guaranteed; it is intended to compensate for what it will lose in Vat, and to bring in some of the "mattress money." Another loan is scheduled for 1974. The government is also promising to cut the present 20 per cent a year growth

in money supply to around 15-16 per cent.

There is no wage freeze as such. But wages are to be linked to prices in a sliding scale system similar to the one in the public sector in an attempt to hold the rise in wages throughout 1973 to 6 per cent, provided that inflation is kept to within 4 per cent. The unions do not like it, but there seems little bite in the policy.

For the past 20 years, from M. Pinay to M. Valéry Giscard d'Estaing, the same stops on the organ have been pulled out: tightening of credit, encouragement of savings, tampering with prices. In this pre-electoral period the main point is to please as many voting interests as possible.

Challenger

On our way, just

The launch of Apollo 17 early on Thursday morning will go down as the most nerve-racking yet, with a fault 30 seconds before lift-off and a run of further faults and computer trouble for the next 2½ hours until the launch crews had almost run out of time.

This is going to be the longest moon mission yet, as well as the last: a total of 21 hours on the surface, covering more than 20 miles on the lunar rover. But, ironically enough, what scientists really want to know about the site will be discovered within minutes of landing. The six-mile wide valley between mile-high mountains is covered with a black soil that looks from photo-

graphs like the volcanic cinders found on earth. If it is, the two astronauts will know as soon as they set foot outside Challenger. The rest of the mission will be concerned largely with filling in the details.

Where, for example, did the volcanic cinders come from? Both the astronauts and the scientists on the ground will be surprised if, when they get to the sharp-edged, black-rimmed craters that are scattered round the valley, these do not turn out once to have been the little vents through which rumbling volcanoes relieve their internal pressures. Some of them may still occasionally puff out gas. Alternatively, the long scarp edging one side of the valley may be a fault through which lava has oozed and flowed across the valley bed. Both are plausible explanations for how the valley acquired its black floor, but not for why it should be so utterly different from any of the six other sites on which men have landed before.

These sites all show signs of violent upheavals that have churned up the moon's original mountains and sent torrents of lava flowing to form great plains around them. But other things can turn rock into lava besides volcanoes—internal radioactivity, for example, or the impact of meteors. All the previous Apollo sites have been within the ambit of whatever cataclysm gouged out the Copernicus crater. That is partly why scientists were so anxious to get away to the Taurus mountains, and a site obviously different from the others.

Volcanos mean steam, and steam means water. Almost no trace of water has yet been found on the moon. Some of the most interesting scientific experiments next Monday night, after Challenger lands and the instruments are set, will be looking for vestigial traces of it; they will, in particular, be trying to get a measure of the moon's internal temperature. The heat probe set up by Apollo 15 astronauts worked only partially and the power feed to Apollo 16's was broken before it was ever set in position. This is the last chance. The seismographs left in position after other moon missions have recorded shocks which suggest that the moon still has a liquid core, even if a very small one. Scientists now expect to be able to measure quite significant flows of heat.

Because there have been landslides in the Taurus mountains, the astronauts should be able to collect rock that has fallen from the mountain tops. This rock should be indisputably the oldest thing on the moon, just as the soil in the valley ought to be the newest, separated by a gap in time measured in billions of years. The scientists hope that there will be enough moon rock accumulated on earth by the end of this mission to keep the laboratories busy at least until 1978. If Carmen, Shorty and the rest turn out not to be volcano cones, but something completely different, there are going to be a lot of red faces.

Germany

Tighter money

Germany's Bardepot legislation—designed to stop currency inflows by making it twice as expensive for companies to borrow abroad as at home—will be more difficult to evade after January 1st. On Wednesday the German cabinet plugged a sizeable loophole by announcing a lower threshold for the "Bardepot," from about £66,000 to only one-tenth that amount. The "Bardepot" rule (introduced last January) requires companies to deposit with the Bundesbank interest-free, DM50 out of every DM100 they borrow abroad. A lot of business was being transacted just below the former limit, and banks suspected that bigger deals were being parcelled up to avoid the regulations. With the new limit so small, parcels of £6,600 will be needed.

Despite the cheating, the Germans are well pleased with the way their controls have worked. The large inflows of foreign currency, which earlier this year threatened to cause upvaluation of the D-mark, have stopped. Some money has actually flowed out recently as companies repatriated funds that had become too expensive. This is why the Bundesbank last week was able to raise the discount rate by $\frac{1}{2}$ per cent for the third time in

two months, to 4 $\frac{1}{2}$ per cent. It also cut the banks' rediscount facilities by 10 per cent as from February 1st, taking some £200m of liquidity out of the system.

This should please the government's council of five economic experts, who this week delivered their statutory annual report on the state of the economy—and called for urgent action to stop Germany's annual rate of price inflation from going well above 5 per cent. They want credit to be tightened, taxes to be raised, and public spending to be cut.

Air crashes

Disastrous year

With three weeks still to go, this year's toll in air crashes is close on 1,860, nearly 50 per cent up on last year's 1,262. The crash of a chartered Spanish airliner last Sunday is the ninth this year in which more than 100 people died. In chronological order, these major disasters were:

Crash	Aircraft	Airline	Dead
Ibiza	Caravelle	Iberia	104
Arabia	Caravelle	Sterling	112
Palermo	DC 8	Alitalia	115
Kharkov	Antonov 10	Aeroflot	108
Heathrow	Trident	BEA	118
Berlin	Il 62	Interflug	156
Moscow	Il 18	Aeroflot	100
Moscow	Il 62	Aeroflot	176
Tenerife	Convair	Spantax	115

major European countries—Britain, France, Germany, Belgium, Holland, Switzerland and Austria to combat domestic inflation, and in Italy to help counter a new wave of speculative pressure against the lira. Suddenly, the Americans look the odd men out, although their Treasury bill rates have continued to climb. But Dr Burns is not unaware of the limits to his policy. He is quite capable of talking out of the other side of his mouth next week.

Bank prime lending rates

The end of their holiday

A rough count suggests that there may have been fewer actual accidents than in either of the two previous years, possibly no more than 31 compared with 44-45. But in only three crashes last year did more than 100 die. The airlines have yet to face the public reaction when one of the wide-bodied jets crashes with upwards of 300 people on board, as one of them is bound to do one day.

Although old aircraft still occasionally break up in mid-air, continuous structural testing usually picks up the weak points in the newer jets in time. There is surprise among engineers at Thursday's news that the landing gear of a Boeing 727 had collapsed without, apparently, the warning tell-tale cracks being detected. Half the 727s now flying are going in for test.

What is common to this year's major disasters is that, although they are evenly divided between holiday and regular scheduled traffic, they tend to take place at take-off or landing. Sunday's crash looks as if it could be attributable to engine trouble, but in a number of the others blame attached to the way that the airports were run. It does not have to be anything so obvious as the iron hook that caused a VC 10 to crash and kill 40 at

Addis Ababa, or the flooded runway that miraculously killed only one passenger on a British Caledonian One Eleven at Corfu. The public inquiry being held into the crash of BEA's Trident has been told that the third pilot on board might have been able to prevent the tragedy if he had not been wholly preoccupied with air traffic control procedures at a critical stage of take-off. Moscow has been unusually accident-prone this year with three known crashes, the last of which took place little more than a week ago when 63 people died in a Japanese DC8.

Such a run of take-off and landing accidents must be more than a coincidence. The consequences of a major crash are now so appalling that airport authorities must look at their procedures and their equipment again to make doubly certain that they are not contributing even a minor element of unnecessary risk.

Mexico

Left turn

Mexico City

The Mexican government announced a rather socialist programme this week—including a 40-hour week and a more

centrally-planned economy—one week after the visit of President Salvador Allende of Chile. Apart from Brazil, Mexico is the largest and most rapidly expanding economy in Latin America, and has welcomed American capital with fairly open arms. But in the past six months President Luis Echeverria has moved distinctly to the (nationalist) left, seeking higher taxation and a loosening of trade dependence on America (which takes 70 per cent of Mexico's exports). With \$3.5 billion of investment in the country the United States has begun to be perturbed. Last week the governor of California, Mr Ronald Reagan, went to Mexico City, three days before President Allende's arrival, to warn President Echeverria against threatening American capital. Nationalism has grown against a background of economic success. Despite a trade deficit at annual rates of around \$1 billion, foreign reserves have risen by 70 per cent in two years. Inflation is low; and the peso, which has not been devalued in 18 years, remains strong. After a slack period during the recession in the United States, Mexico's economy is now back on a 6 per cent real growth rate. But many of the 50m Mexicans are still outside the cash economy altogether; half those who are in it still earn under \$500 a year. Too much of the country's wealth is funnelled into the hands of a few families who have traditionally controlled the government machine. Mexicans also say that too much goes back to the United States. Last year \$400m was sent north in profits.

President Echeverria is reviewing the conditions for foreign investment. He recently completed a programme which gave Mexico a 51 per cent stake in all its mineral industries. But his repeated attempts to increase taxes have been defeated by business interests as effectively as those of his predecessors were before him. This week's new programme will certainly require more government spending.

There is little alternative to trade with America. Mexico has recently got large loans from Japan, and is encouraging Japanese industry to use the country as a springboard to the American market. If America introduces generalised preferences soon, allowing industrial goods from developing countries to be imported at lower tariffs, Mexico will probably be the main beneficiary—and will be tied even closer to the American economy. Its greatest asset is that it is the last pool of cheap labour that the Americans have within reach.

Key indicators: world commodity prices

Grain gains

Grain prices moved up again this week after rumours of more Chinese buying of maize. Bad weather is delaying harvesting in America. There have been crop failures in Brazil, India and Mexico. Russian demands continue high, and stocks are dwindling; the International Wheat Council's estimate for 1972/73 closing stocks (of wheat) is the lowest for 20 years.

Burns bucks the tide

New York

Whatever happened to that clever idea of a floating prime rate, introduced a little over a year ago by the giant First National City Bank of New York and adopted by half-a-dozen other major American banks? In mid-November New York's Bankers' Trust announced that it was temporarily abandoning its use of the floating rate. A few days later Pittsburgh's Mellon National followed suit. Now Citibank has beached its own brainchild.

It is a sad little story. The appeal to politically sensitive bankers of allowing their prime (or minimum) lending charge to float automatically in line with changes in short-term money costs was that market-orientated fluctuations are fractional—and thus seemed less likely to be noticed by government officials than the rarer but more patently administered prime rate changes of the past. During the 57 weeks that Citibank operated its floating, the rate changed no less than 32 times (15 increases and 17 decreases). But lately the increases have predomin-

ated, and the politics of the scheme have backfired.

As interest rates have edged upward in the past month in line with accelerating economic activity and loan demand, the Nixon Administration's committee on interest and dividends, headed by the Federal Reserve System's chairman, Dr Arthur Burns, has been exhorting the banks not to let their rates go above their present 5 $\frac{1}{2}$ -5 $\frac{3}{4}$ per cent range. He apparently warned that the banks could face official controls on interest rates if they returned the prime rate to above 6 per cent (where it stood when President Nixon proclaimed his new economic policy in August, 1971). So Citibank has temporarily modified its formula in order to leave the rate at 5 $\frac{1}{2}$ per cent, $\frac{1}{4}$ point below what it would otherwise have been. Now that Dr Burns has landed the big fish, the others are expected to swim in after.

Will America really buck the world-wide tide? Interest rates have been raised and credit restrictions tightened during recent weeks in virtually all

Wallace Brothers Sassoon Bank Limited

Mr. Desmond FitzGerald reviews a year of change and rapid expansion.

Since 31st December, 1970 a number of important changes have taken place in the capital and composition of the Bank.

Change of Name

The name of the Bank has been changed to Wallace Brothers Sassoon Bank Limited, reflecting the event which took place on 23rd March 1972, whereby the whole of the issued share capital of E. D. Sassoon Banking Company Limited was acquired by Wallace Brothers & Co. (Holdings) Limited.

Increase of Share Capital

As a result of the subsequent integration of Wallace Brothers & Co. Limited, the merchant banking subsidiary in the Wallace Brothers Group, with this Bank, the issued share capital of Wallace Brothers Sassoon Bank has been increased from £2 million to £5 million and the balance sheet demonstrates the substantial increases in assets and liabilities consequential upon this integration.

Following this integration we were in a position to dispose of Wallace Brothers & Co. Limited, and on 3rd November 1972 we completed the sale for cash of the whole of the issued share capital of that company to Drakes Limited. Wallace Brothers & Co. Limited has now been renamed Drakes Trust Limited and no longer forms part of our group.

A number of changes have also taken place at Board level, including the resignation of the majority of the directors and the appointment to the Board of the former directors of Wallace Brothers & Co. Limited, with the exception of Mr. A. L. P. F. Wallace, who, as Chairman of Wallace Brothers & Co. (Holdings) Limited, resigned from the Board of Wallace Brothers & Co. Limited to devote himself full time to the Group's long-term policy. It is my own great pleasure to advise all our friends at home and abroad that the integration of the two banking companies has progressed smoothly and efficiently to the considerable benefit of the combined Bank's results.

Copies of the Annual Report and full Chairman's Statement are available from the Company Secretary.

Commercial Banking • Company Finance • Investment Management

HEAD OFFICE

Winchester House, 100 Old Broad Street, London EC2N 1BN.

Expansion—Home

It has been a period of considerable expansion in all the departments of the composite Bank, and several interesting developments have taken place, both at home and abroad. The Bank has acquired a 50 per cent interest in Hermes Securities Limited, the parent company of Hermes Credit Corporation Limited, a company of growing importance in the corporate finance and investment field. The Bank also owns a 40 per cent interest in Western Industrial Leasing Co. Limited, operating in the general equipment leasing field. Other significant interests were acquired in Bear Securities Limited, a retail banking operation, subsequently merged with the Bristol Merchant Group Limited; and Chapel Land Company (London) Limited, a fast-growing property investment and development company.

Expansion—Overseas

On the international side, we have established (in conjunction with the Crown Agents for Oversea Governments and Administrations) a new banking company in Nassau, Bahamas, E. D. Sassoon Bank and Trust International Limited, to take over the existing business of our own wholly-owned

subsidiary, E. D. Sassoon Banking International Limited. This will enable us (during the course of the current financial year) to repatriate the capital and reserves of our subsidiary, leaving ourselves with a 25 per cent interest in the capital of the new banking company.

Since the end of our financial year we have completed the capitalisation of a new wholly-owned banking subsidiary in Jersey—Wallace Brothers Sassoon Bank (Jersey) Limited.

Our wholly-owned Australian subsidiary, Wallace Brothers Sassoon Limited, has continued to make sound progress, and during the early part of 1972 was responsible for the establishment of Wallace Brothers Finance (Australia) Limited (in conjunction with The National Bank of Commerce of Seattle and the Bank of Queensland), to operate comprehensively in money market and banking activities in Australia.

It will be seen that growth has taken place in every section of our operation and we can look forward during the course of our first year as Wallace Brothers Sassoon Bank Limited to a continuing demand for our services and a further increase in the overall level of our activities and profitability.

Consolidated Financial Statement as at 31st July, 1972

BUSINESS

Investment

Must interest rates go on rising?

The Bank of England wants to bring the annual rate of increase in Britain's money supply down to about the neutral 10% implicit in Mr Heath's target of 5% real economic growth plus 5% inflation. How goes the battle, and with which weapons? Fairly brisk sales of gilts in late September and October gave a push in the right direction: the annual rate of growth of money supply eased back to 17% in the three months to October, just about half the tearaway rates of 30-35% earlier in the year. But there is still a gap to be closed.

Is the gap going to be closed by pushing short-term interest rates, including bank lending rates, still higher? In the past month it has looked as if these are the Bank of England's tactics. It first made a call for special deposits and then three times forced several discount houses to borrow seven-day money at its new penal minimum lending rate. To be sure, the call for special deposits was tailored to offset the bulge in bank reserve assets expected as the Government's borrowing requirements moved

to a seasonal peak and as large bank holdings of government stock became reserve assets by having less than a year to maturity. Similarly, the first use of the penal lending rate was designed to do no more than halt an earlier slide in short-term interest rates. But last week's decision to force the discount houses once again into the Bank, repeated this Thursday, was widely read as a signal that the Old Lady wanted to encourage short-term rates to rise.

Discount houses dutifully took the point and refrained from bidding aggressively at the last week's tender. Accordingly, both Treasury bill rates and the Bank of England's minimum lending rate pegged to them rose smartly, the latter to 7½%. It seemed only a matter of time before the banks pushed up their base lending rates as well, from 7 to 7½%. The cost of key marginal money has gone up a ½ point since the last adjustment in base rates in July, and the clearers have a considerable overhang of credit lines committed but still much under-utilised. That none had yet moved its base rate by Thursday may have reflected no more than an understandable reluctance to stand out as a wicked price-raising moneylender in the present political climate of the freeze.

There are two arguments that could still save interest rates from going up. Obviously, the first is if one gives credence to the Government's prices and incomes package. A 9½% long-term interest rate on gilts did not look at all attractive at the end of October, when price inflation in the year ahead was still expected to rip ahead into double figures. But it does now promise a positive real yield if price rises are expected to come down to next to nothing during the freeze and to, say, 5% or 6% in phase two.

The second argument is more technical, and more dubious. But there is a school of thought in the City which says that the Bank could sell more gilts if it edged short-term money rates down a bit, rather than up a bit still more. With Treasury bills at 7.15%, 1974-dated gilts at 7½-8%, and six-month certificates of deposit nearing 9%, the temptation for investors to stay short is large: these yields will even support the 7½% obligations of insurance companies. Our chart shows how the yield differentials have narrowed over the year. One market operator, with his tongue protruding only slightly into his cheek, was suggesting this week that the Bank should have used £50m of its £250m in special deposits to support the money market. He thought this would have led to £400m of sales of longer-term gilts.

Not many people will buy that argument whole. But there may be some truth in the view that the Bank of England should not strive officiously in the next few weeks to give the impression that it wants to be pushing gilt-edged prices ever lower; otherwise the institutions will hold off from buying them. The Bank's best tactics may be to disguise very thoroughly what it is trying to do; it is usually rather good at such disguising, unfortunately especially from itself. The economic test of its efficiency this winter will not be what happens to gilt-edged or any other interest rates. The absolute test will be whether it at last manages to slow the growth in money supply to about 10%.

Wall Street

Even glammers go

New York

Little daunted by several recent sessions of profit-taking, Wall Street's protracted rally in expectation of a Vietnam settlement has been remarkably strong. The Dow Jones industrial average struck still another peak in active trading at mid-week, closing on Wednesday

Sources: To August, Bank of England Quarterly Bulletin, from September, Pender & Boyle

at 1027.54. And the index of stocks traded in the more speculative over-the-counter market similarly edged into new higher ground.

The contagion has spread even to many of the glamour growth stocks that had gone into eclipse lately. On Wednesday, for example, Polaroid gained \$1½ to \$121½, Eastman Kodak \$2½ to \$142½ and Honeywell \$4 to \$129, while Avon Products advanced \$3 to \$133. At the same time, among the Dow's 30 blue chips, Chrysler rose \$½ to \$41½ and Du Pont \$1 to \$174½.

Worries that interest rates might yet shoot upward in line with rising economic activity, and that retention of price and wage controls beyond their scheduled expiration next April might prove a deterrent to corporate earnings in 1973, have been pushed into the background—for the present at any rate. The market seemed cheered by indications that the Federal Reserve is pumping into the banking system enough reserves to head off any immediate increases in bank lending charges.

Australian market

New men, old doubts

Sydney

The Australian Labor party's return to power after 23 years made no impression whatsoever on share prices at first. Then they did move up, but not exactly cheerfully. At 522.37 on Wednesday, the Sydney index of all shares (other than metals) was within 3% of June's all-time peak, but it had been higher during the previous fortnight. Mining stocks have had a bumpier ride all year, so that while the Melbourne metals and minerals index reached an 11-week high at 526.65 on Tuesday, that was some way from June's 621 and a lot farther from the boomtime peak of 1,231 reached in January, 1970.

So the bulls and bears still eye one another warily, as they have been doing ever since British participation in the Australian stock markets was left in doubt by the sterling measures of June 24th. Those who were running scared find nothing reassuring in Mr Gough Whitlam's victory, noting that the government will set up a "prices justification" tribunal at an early date as well as crack down on restrictive trade practices. There are also those noises Mr Whitlam made in favour of

possible upvaluation while in opposition, echoing the central bank. Moreover, the bears see equities too close to untrodden ground for safety, with the risks greatly increased by the prospects some see of upturning interest rates or other anti-inflation moves.

Yet the bulls may have more going for them. Instead of deflation they see the reduction of unemployment as the new government's overriding priority, which does seem more likely in view of the crop of school-leavers and the thousands opting out of the now-volunteer armed services who are about to go on the labour market. They argue, too, that there is unlikely to be upward pressure on interest rates, unless the government actively wants there to be; there is as much liquidity as ever despite the last administration's attempts to strengthen exchange controls.

Then, again, if the market looks high it is only so by comparison with itself: Tokyo and Wall Street are both in dizzier realms. Australia's reverse dividend yield gap is less than 1% and the average p/e is under 13. Finally, even if a revaluation is more likely than not in the next 12 months the bulls see this as assuring a continued net capital inflow in the meantime and with market implications only against some mining companies. Most mining share prices probably already discount the sort of modest upvaluation that Australia would contemplate. Such heavies as Colonial Sugar Refining and Western Mining have been, and may remain, among price leaders, along with retailers and (curiously) the over-liquid banks.

Broken Hill Proprietary may be a soft spot, affected by both currency fears and the need it will undoubtedly feel to justify its steel price increases to the prices tribunal. But it gets marks from some brokers for its latest

venture: the development of the revolutionary Sarich engine (named after its designer, the Perth engineer, Mr Ralph Sarich), an investment of possibly up to \$A50m.

One other consideration is what the Labor government will do about foreign investment, particularly investment in land and mineral resources. There is no doubt that opportunities for foreign ownership will be hedged in, but the government has yet to think out its election promise to retrieve some assets from overseas control. If this leaves a question mark over leading stocks—apart from such obvious targets as Outfits, in which there is no local participation—they would have to be the likes of Conzinc Riotinto of Australia.

SECTOR ANALYSIS

Juggernauts' joy

The consumer boom is having some playback on the lorry business at last. After experiencing the worst recession since the war, specialist manufacturers of commercial vehicles like Seddon Diesel, ERF Holdings and Fodens are heaving sighs of relief.

They have all produced very depressing figures in 1972. Seddon even managed a loss of £124,000, after a profit of over £1m in 1971. Consumers always tend to trade down in a period of low demand; they find they can manage with a 24-ton truck in place of a 32-tonner, or a 12-tonner in place of a 16-tonner. In the heavier end (14-ton plus) the specialists are particularly vulnerable. Then the commercial sector—and again the heavy end in particular—was hit harder during the recession than the motor industry as a whole. Suppliers to commercial manufacturers were more easily able to raise prices, which could be neither absorbed nor passed on. Margins were cut. And then the new regulations announced in June—eight-wheel rigid (as opposed to articulated) trucks can now carry 30 tons against 24 tons before—were widely anticipated and orders fell off as consumers waited for their introduction. All in all, it was a nasty experience.

But all the growth of the past decade, which disappeared at a stroke during 1970 and 1971, could be made up over the next two years. Demand is running "at least" 25% up on last year: Seddon, which concentrates

Catching up can be fun

on trucks around 20 tons, has found demand particularly buoyant. It was this weight that suffered most in the recession; its production fell by 50%, compared with 20% for the heavy end. Fodens, too, is optimistic. It survived a little better than Seddon because it buys in only about 10% of its components; as a consequence, it is finding it difficult to keep abreast of demand and aims to have a new assembly plant on stream in about six months, with a 50% increase in production planned over the next few years. Fodens is more of a specialist in the heavy rigid trucks and is therefore benefiting more than most from the recent regulation changes.

A growing concentration on the rigid market is also taking place at ERF. Its output has been boosted from 44 to 50 vehicles a week, with emphasis on the rigid variety, even though at present 65% of its production is of articulated trucks.

Competition is pretty severe in the heavy end of the commercial market. British Leyland alone, under the AEC, Guy and Scammell labels, probably accounts for about 40% of total sales in the 24-ton-and-above bracket. Then come the independent specialists with about 35%, followed by the internationals (Ford and Chrysler's Bedford) with about 25%. The independents should be able to maintain their market share; their quality product gives users the reliability they require.

But a real threat is coming from abroad. A few years ago it used to be said that the more expensive trucks from ERF, Fodens, Atkinson and Seddon can run rings round the less high-quality vehicles on grounds of operating economy, but that they fall down on comfort. The Swedish Volvos and Scania are both efficient and comfortable.

Common market entry should be a gain to the industry. The big articulated lorries, in particular, will

be in demand and ERF will benefit here. Its prospective p/e of around 10 is not demanding, and for those who like a yield while they wait the loan stock has an 8% coupon (compared with 3.4% on the ordinary) and sells at a 13% discount. Conversion, however, is not until 1975. But Fodens looks a better bet. The yield is a healthy 4% and the slightly higher p/e of 11 is not too high a premium for a company concentrated more on the fast-growing rigid truck market. Also the new models the company has up its sleeve look more than just interesting.

Stock exchange

Another quaint device

The London stock exchange is following the example of Paris and Frankfurt and is installing a computer system manufactured by International Business Machines. Although the mechanics of trading on the three exchanges differ widely, London's decision brings that much closer the day when deals and settlements can be done automatically via linked computer systems throughout Europe and, eventually, America.

The London system goes live early next year on matching and checking all deals done between brokers and jobbers. Other jobs will follow over a four-year period, and will include a market accounting service for London firms and the later extension of both the checking and accounting services to cover the whole of Britain. The final phase will be the establishment of a pool of stocks dealt in by jobbers to enable bargains to be settled as dealt.

The system will cost £8m, with the computer itself accounting for about

£3m of this, and will include computer terminals in brokers' offices. At present the operations of the London exchange require about 7,000 clerical staff, costing in 1970 at between £20m and £25m. The computerised system is expected to produce savings of at least £4m on that cost. The Stock Exchange Council could then start rethinking the scale of commissions to be charged by brokers and jobbers.

A large institution can pay out as much as £1m a year in brokerage fees, and it was for this reason that the Accepting Houses Committee set up its own independent trading system outside the exchange. Large equity transactions can take place between subscribers to the system without paying brokerage fees. And the Ariel service is now starting to be marketed. It is not slow to expand if the opportunity arises. Approached by a number of discount houses, Ariel is now to add the Government's 20 stocks to the list it now trades. The idea is that if trading on the exchange gets difficult the market can be kept moving by deals done anonymously through Ariel.

Ariel is already helping to make the council of the London exchange think about supplying other goodies. It is considering setting up a company information service using its new computer and based on the service currently provided by the brokers Hoare and Company, Govett. This service would be made available to all members of the exchange. Such a system is already in operation in Frankfurt and will start next year in Paris as part of its portfolio valuation services. It is also likely that the London exchange will offer a service similar to New York's Block Automation System (BAS) which, after a shaky start, is now beginning to blossom, with over 100 brokers and about 120 institutions signed up.

CHAIRMAN'S STATEMENT

The South British Insurance Company Limited

Highlights from the Review of the Centennial Year by the Chairman—Mr. Kenneth B. Myers, M.B.E.

A Hundred Years of Progress

Most appropriately our Centennial Year has been marked by a record consolidated Group Net Profit, after provision for depreciation and deduction of minority interests, of NZ\$ 5,573,000, being an improvement of NZ\$ 850,000 on last year's figures. Final Dividend for the year is 12½ NZ Cents making 20 NZ Cents for the year (20 NZ Cents) and the Board can only express its disappointment that the plans for payment of a special additional Centenary Cash Dividend of 5% and a 1-for-3 Bonus Share Issue have had to be postponed until the restrictions imposed by the Companies (Limitations of Distributions) Regulations 1972 are lifted, which it is hoped will be early in 1973. Fire, Accident and Marine Premiums expanded by NZ\$ 10,785,000 to NZ\$ 71,508,000 and the Underwriting Surplus at NZ\$ 2,155,000 is an increase of NZ\$ 634,000 on 1971. Investment income, after tax, rose to NZ\$ 4,352,000. Life Assurance premiums brought to account amounted to NZ\$ 4,503,000 and a credit of NZ\$ 6,000 was transferred to Profit and Loss account (against deficit of NZ\$ 28,000 in 1971). Total number of life policies in force at the end of the financial year was 61,245 with total sums insured after reinsurance NZ\$ 157,413,000. Underwriting policy has resulted in a healthy and continuing expansion of Fire business with satisfactory results notwithstanding substantial claims arising from cyclone 'Althea' and a sharp increase in statutory levies imposed for the maintenance of fire brigades in New Zealand. Accident Department premiums expanded but inflationary pressures continued to add to the cost of claims. Marine business continues to reflect further improvement with a modest expansion of premiums. Once again, Cargo business, the bulk of the account, was satisfactory but Hull business is still marginal. The Company thus enters its second century fully confident that its progress will surpass the very creditable performance of the first 100 years.

Summary of Results (NZ\$)

	1972	1971
Group Net Profit	5,573,000	4,723,000
Dividend	2,910,000	2,910,000
Shareholders' Funds	53,084,000	47,482,000
Total Assets	153,553,000	135,502,000

Head Office: Auckland, New Zealand.

APPOINTMENTS

University of
London

School Examinations
Department General
Certificate of Education
Economics
Geography

Applications are invited for the post of Subject Officer for a group of subjects including Geography and Economics.

Applicants should have a degree in Geography and/or Economics. Teaching or administrative experience and an interest in multiple-choice objective tests are desirable.

The Subject Officer will be responsible to the Assistant Secretary for the administration and co-ordination of the GCE Examinations in the relevant subjects and will be expected to contribute to the development of the examinations.

The School Examinations Department conducts the GCE Examination of the University for approximately 350,000 candidates annually at over 3,000 home and overseas centres.

Initial salary, according to qualifications and experience, will be on the scale £2238 x £159 to £3310 plus £162 London Allowance. There are prospects of promotion to the scale £3192 to £4299. Membership of FSSU; 6 weeks' leave.

Further particulars and application forms are available from Michael Root Personnel Officer, University of London, Senate House, WC1E 7HU. (E83)

Closing date for applications is 22 December 1972.

For further
announcements see pages
5, 7, 104 to 109

CITY OF
LONDON
POLYTECHNIC

B.A. ECONOMICS

This full time degree course gives a thorough academic education in the mainstream of modern Economics. The course includes related disciplines in which there is an element of choice. By appropriate selection those wishing to do so may prepare for careers as professional economists.

Further details may be obtained from The Registrar (EC), City of London Polytechnic, School of Business Studies, 84 Moor-gate, London EC2M 6SQ. Telephone 01-283 1030.

APPOINTMENTS

INVESTMENT ANALYST

A medium sized stockbroking firm wishes to recruit a first-class experienced analyst to work within a small team specialising in the financial area with particular reference to the shares of clearing banks, hire purchase companies, merchant banks and finance houses. The successful applicant will probably have had at least five years' analytical experience, preferably with a leading firm of research-orientated stockbrokers or with a merchant bank's research team. He should be accustomed to conducting interviews with top level management. Above all he should be capable of original thought and of taking the lead in the generation of business.

The remuneration will be geared to the success of the team, of which he will form a leading part. However, initially the appointee will be guaranteed a minimum annual payment of £5,000 per annum. We would expect him to be earning a five figure sum within two years.

Please write, with full particulars, in strict confidence, to: Box TE/154 c/o Hanway House, Clark's Place, London, EC2N 4BJ.

COMPANY STATEMENT

Outstanding year for Lifeguard Assurance

* In the year to 30th June, 1972 there has again been a tremendous increase in new business. Net sums assured at £91.6m. compared with £60.7m. in 1971.

* The life fund has increased from £23.9m. to £30.8m. in the year to 30th June, 1972.

* A tax free bonus for the triennium of 25% of premiums paid on 'with profit' life policies, including a special non-recurring bonus of 2½%, has been declared, compared with a bonus of 20% at the last declaration.

* The directors had recommended a dividend for the year of 6%; the declaration has had to be postponed until the end of the statutory standstill of wages, prices and dividends. This will be the first dividend declared by the Company and is an important milestone in its history. The Board has also decided to make a rights issue of ordinary shares.

Copies of the Report and Accounts and of Mr. A. C. Grover's statement to the shareholders may be obtained from:

LIFEGUARD ASSURANCE LIMITED
SWAN COURT, PETERSFIELD, HAMPSHIRE

Cranfield
CENTRE FOR
TRANSPORT STUDIES

There are a number of vacancies in this expanding Centre for which we are seeking suitable staff. Specifically we require:

A Lecturer with a special interest in transport economics. He will take part in the M.Sc. teaching and in regular short-courses, as well as assist in supervising the large research activities of the Centre. The position is tenable from July; salary will be in the range £1764-£4143 (with FSSU) according to ability.

Six research officers to work on the development of improved transport assessment methodology and to apply this to a varied research programme, including studies of V/STOL aircraft, airports, the future of cars, a river ferry service and automatic vehicle system. There is a multi-disciplinary approach to these studies, and suitable applicants might have backgrounds in economics, sociology, psychology, marketing, urban planning, mathematics, the pure or applied sciences, or other relevant fields. Appointments in the salary range £1764-£2866 (with FSSU) would be for initial periods of one to two years. Full details and application forms may be obtained from: The Assistant Registrar (ref. 110) Cranfield Institute of Technology, Cranfield, Bedford; telephone Bedford (0234) 51551.

Rhodes
University
GRAHAMSTOWN,
SOUTH AFRICA

Junior Lecturer/
Lecturer in Economics

Applications are invited for the above-mentioned post with effect from 1 February 1973 or as soon as possible thereafter. The salary scales are:—
JUNIOR LECTURER: R3,600 x 150-4,500 per annum.
LECTURER: R4,800 x 300-6,900 per annum.

A candidate with broad, rather than highly specialised interests, will be preferred. Consideration will also be given to appropriate teaching and research experience. A Junior Lecturer is appointed for a maximum period of three years with the possibility of promotion to a permanent post of Lecturer thereafter. The initial salary in either grade will be determined according to qualifications and experience. The person appointed to a permanent post of Lecturer will become a member of the University's pension and medical aid schemes.

Further particulars and application forms may be obtained from the Secretary-General, Association of Commonwealth Universities (Acps), 38 Gordon Square, London WC1H 0PF, or the Registrar of the University. Applications close on 31 December 1972.

Department of Trade and Industry

Research Officers £2,597-£3,313

1 post in Manchester as a member of a team providing economic research support for the Regional Office's operations in the field of industrial development chiefly in the administration of Section 7 of the Industry Act, 1972. Duties will also include participation in the work of the regional economic planning board, strategic and structure planning.

1 post in Glasgow organising and undertaking research projects on industrial growth and decline in Scotland and monitoring the success of government policy. The work will also include interdepartmental economic studies and the organisation of a wide range of records in the fields of employment and industrial development.

Candidates, normally aged at least 28, should have a degree in economics. Relevant practical or research experience is also required.

Starting salary may be above the minimum of the quoted scale. Non-contributory pension scheme. Promotion prospects.

For full details and an application form (to be returned by 29 December, 1972), write to the Civil Service Commission, Alencon Link, Basingstoke, Hants RG21 1JB, or telephone Basingstoke 29222 ext 500. Please quote A(E)/640.

APPOINTMENTS

Research Posts in Government

There are vacancies for Assistant Research Officers (normally under 28 years of age) in the following departments:

MINISTRY OF DEFENCE—8 posts (London). The work, under the Defence Intelligence Staff, concerns the interpretation of economic, topographical, and scientific information about certain foreign countries. It includes studies of economic organisation, finance, trade, civil and defence industries, raw materials, agriculture and labour. Some travel involved, including visits overseas.

SCOTTISH DEVELOPMENT DEPARTMENT—1 post (Edinburgh). The work, in the Central Planning Research Unit, is concerned with research in the fields of employment and industrial studies. Responsibilities include demographic and employment forecasting, labour supply and demand analysis, and labour catchment area analysis.

QUALIFICATIONS: Normally a degree with 1st or 2nd class honours, or post-graduate degree, in an appropriate subject. Relevant experience would be an advantage.

Salary scale £1530-£2476 (£175 less in Edinburgh). Starting salary may be above the minimum. Promotion prospects. Non-contributory pension scheme.

Other vacancies may arise in these and other departments.

For full details and an application form (to be returned by 29 December, 1972), write to Civil Service Commission, Alencon Link, Basingstoke, Hants., RG21 1JB, or telephone BASINGSTOKE 29222 ext 500. Please quote A(4)/013.

Duties: Work in one of the following fields: National Accounts and input/output analysis, Balance of Payments statistics, Industrial or Labour or Prices statistics.

economists

Trade & Industry — Candidates should have an Honours Degree in Economics with some practical experience in trade imports and exports promotion.

Duties: To advise the Ministry on sources of supply for imports and to study export possibilities.

Development & Planning — Candidates should have a degree in Economics or equivalent with post graduate experience as an Economist.

Duties: To assist in formulation of National Development Plan in the macro-economic sphere, particularly financial projects and input/output tables.

If the successful candidates are British they may be eligible for an additional inducement allowance payable by the British Government.

Please apply by sending full personal and professional details to: Appointments Officer (N), Zambia High Commission, 7-11 Cavendish Place, London W1.

National Economic Development Office

Adviser to the Director General on Industrial Policy

Applications are invited for the post of Adviser on industrial policy to the Director General of the National Economic Development Office.

The Office is concerned with general questions relating to the management and growth of the economy, with the contribution made to economic growth by specific sectors of industry, and with the implications for industry of economic policy. It is a Government-financed but independent body which serves the National Economic Development Council and the Economic Development Committees on which the Government and both sides of industry are represented, and its work is based on the principle of tripartite consultation.

The person appointed to this senior post will advise the Director General on industry matters and will be responsible for the overall direction and coordination of the work of those sections of the Office which serve the Economic Development Committees and other special industrial working groups.

The person appointed will have made his mark as a senior executive and will preferably have had some boardroom experience possibly at the divisional or subsidiary operating company level. He will also have had some experience with the corporate strategy or financial side of company activity. He should be used to dealing with trade bodies and trades unions and should have the capacity to develop influential contacts in management, trades unions and government departments.

Appointment will be for two years in the first instance and the salary will be negotiable around £10,000 per annum.

Applications, giving details of age, qualifications and experience, including the names of two referees, should be sent not later than 1st January 1973 to:

M. P. N. Odell, National Economic Development Office, Millbank Tower, Millbank, London, SW1P 4QX

APPOINTMENTS

Senior Banking appointments in the City

International Manager, Co-operative Bank Group - to direct the Group's conventional Foreign Exchange business, its Euro-Currency operations and to develop its potential with other Co-operative Banks in Europe and elsewhere.

London Manager, Co-operative Commercial Bank Ltd. - to develop medium term sterling lending and merchant banking operations.

Manager, City Office, Co-operative Bank Ltd. - to manage and develop the business handled at our new and enlarged city branch.

Co-operative Bank Group

Co-operative Banking is growing both in size and in range of activity. The development of our City business is an integral part of our overall strategy for expansion and these new appointments will spearhead that development. They call for men with relevant and successful experience in the City, probably aged over 30, who will welcome the challenge of managing change and growth.

Salaries for all three posts will reflect their importance and be negotiable, and fringe benefits are those usual for senior banking appointments.

Applications, which will be treated in strict confidence, should be addressed personally to:-

Lewis Lee, General Manager, Co-operative Bank Ltd., New Century House, Manchester M60 4EP.

University of Canterbury

CHRISTCHURCH, NEW ZEALAND

Senior Lecturer or Lecturer in Business Administration

Applications are invited for the above-mentioned position. Applicants should have qualifications and experience in the functional area of marketing.

The salary for Lecturers is on a scale from \$NZ\$589 to \$7149 per annum, and for Senior Lecturers \$NZ\$7276 to \$8579 (bar) \$8839 to \$9358 per annum.

Particulars, including information on travel and removal allowances, study leave, housing and superannuation, may be obtained from the Association of Commonwealth Universities (Appts), 38 Gordon Square, London WC1H 0PF (Tel: 01-357 8572).

Applications close on 31 January 1973.

SCHOLARSHIP

SCHOLARSHIP TO STUDY FOR MASTER OF BUSINESS ADMINISTRATION DEGREE

Due to the generosity of a number of institutions, Iran Center for Management Studies (ICMS) invites applications for five scholarships covering tuition, room and board on its second eleven-month Master of Business Administration Program beginning September 1973.

These scholarships are open to Foreign applicants as well as Iranians residing overseas who are fluent in English and who meet the high entry requirements of the Program which is based upon the teaching methods and curriculum of the Harvard Business School.

For further information apply:

Admissions Board,
Iran Center for Management Studies,
P.O. Box 11-1573, Tehran, Iran.

FELLOWSHIP

University of Oxford

ST ANTONY'S COLLEGE

Research Fellowships

If suitable candidates present themselves, the College proposes to elect to one or more Research Fellowships, tenable for up to two years. Applications are invited from men and women with successful postgraduate or other relevant (not necessarily academic) experience, who wish to engage in a clearly defined piece of research or writing, in any of the subjects in which the College is active.

Studentships

Applications are invited from men and women graduates, and from undergraduates in their final year, who wish to work for higher degrees in nineteenth and twentieth century history and in social studies. The College is ready to consider candidates whose first degree is in another discipline (e.g. languages, literature, geography), and who now wish to undertake historical, social, political or economic studies. The College has a particular interest in the following areas: Europe, Russia, the Middle East, the Far East, Latin America and Africa.

The College may also admit a few students in the history and sociology of literature, in the history of science, of philosophy, of art and of music, in the social anthropology of complex societies, particularly in Southern and South-Eastern Europe, and in other subjects relevant to an understanding of modern society.

Further particulars and application forms may be obtained from the College Secretary, St. Antony's College, Oxford. The closing date for applications is 1st January, 1973.

APPOINTMENTS

Statisticians and Economists £4095 to £5240

The Post Office's Statistics and Business Research Department provides a research and consultancy service to the various Post Office businesses (Posts, Telecommunications, Data Processing, Giro and Remittance Services) in the fields of statistics, economics, econometrics, operational research, manpower planning and marketing research. Its task is to identify and solve problems requiring substantial expertise in these fields, and more generally to develop and validate new approaches to a wide range of management situations. The Department is based in London. On-line computer facilities are available and there is access to an extensive range of other computer services.

There are vacancies for Statisticians and for at least one Economist or Econometrician. Candidates should preferably be honours graduates and should have some 5 or more years' relevant experience; e.g.:-

Statistician - preferably with experience of one or more of large scale sampling design, multivariate analysis, stochastic processes, scientific analysis of business systems and operations, statistical type operational research, statistical modelling.

Econometrician - with experience of econometric model building and forecasting.

Economist - knowledge of the theory and practice of mathematical economics, econometrics and an interest in solving business problems is essential.

The starting salary will be determined by qualifications within the range £4095 to £5240. Benefits include 5 weeks' holiday rising to 6 weeks' after 10 years' service.

ASSISTANT STATISTICIANS

There are also vacancies for Assistant Statisticians. Candidates should possess at least a good honours degree or post-graduate qualification in statistics or other subject with a high content of mathematical statistics. They are normally appointed within a salary range of £1650 to £2690 and after 2 years' satisfactory service move into the range £2760 to £3260. Benefits include over 4 weeks' holiday.

For further details and an application form please write to:-

A. J. Hann, Post Office Appointments Centre (Ref. S.634), Euston Tower, 286 Euston Road, LONDON, NW1 3DD.

The Post Office

Cranfield, Bedford (or
Telephone Bedford 0-234 91151,
extension 284).

TENDER

BRITISH AIRPORTS AUTHORITY PROVISION OF ADDITIONAL BANKING FACILITY - GATWICK AIRPORT - LONDON

Enquiries are invited from banks interested in operating, possibly on a joint basis, a single Bureau de Change and a Deposits/Withdrawals service in the new Arrivals Building at Gatwick Airport—London due to open in Spring 1974.

The new Arrivals Building is part of a £32m development programme required to meet the Airport's continuing traffic growth. The number of passengers through the Airport in the past five years has increased from 2m to more than 5m. More than 80% of these passengers are on world-wide international large-jet charter and scheduled flights.

The British Airports Authority hopes to establish a facility that will ensure speedy and efficient service at peak periods. For this reason it is quite possible that in place of an arrangement with a single bank consideration may be given to the award of a concession contract for a joint operation by a consortium of, say, four banks of which two must be British and the others European and/or North American.

Enquiries and suggestions which it is hoped will assist the Authority finalise its policy and define the terms of an invitation to Tender and Form of Contract before 28 February, 1973, should be addressed to:

Mr David Livingston, General Manager,
British Airports Authority, Gatwick Airport—London,
Horley, Surrey RH6 0VP.

For those who care about their appointments

THE DESK DIARY makes keeping appointments a pleasure. This truly handsome, craftsman-made volume has long been the highly treasured possession of connoisseurs all over the world.

It is the incomparable desk-top work of reference for people of affairs. It contains 100 pages of valuable facts and figures specially distilled from international research surveys and official statistical analyses covering public affairs, commerce, industry and the professions. Special sections on U.K., U.S.A., E.E.C., World. New in the 1973 edition, a totally revised 60-page, fully indexed world map section, including special highly informative statistical maps and charts and 16 street plans of important world city centres. A loose, durable, six-year calendar. Two blue heavy silk markers to find those reference sections you use most and 117 superbly designed diary pages. Beautifully bound in rich red leather with its title, and your initials, in real gold.

The Economist Diary has been designed to be used as a permanent personal or business record and makes the ideal gift for even the most difficult to please.

THE POCKET DIARY

This slim pocket diary, delightfully practical to use, has been designed to keep its immaculate appearance the whole year.

Luxuriously bound in red leather. Specially stressed covers finished with gilt metal corners. Pages edged with gold and a blue silk marker to add an extra note of distinction. The same sensible day-to-day layout as the Desk Diary, a three-year calendar, world times and public holidays—to meet all essential needs. Tear-out slips of blank paper for notes and messages. Gold embossed blue Duplex end papers. The pocket Diary is a justifiable extravagance for those who care about quality. Order one for yourself and give others to your nearest and dearest. Let us add your initials—or name—in gold leaf.

We will be happy to despatch The Economist Diaries in attractive gift sleeves, with your card enclosed, to anywhere in the world.

Obtainable only from The Economist
Price including inland and surface postage. Desk £5.00 (\$12.50).
Pocket £1.75 (\$4.40).
Gold-blocking: initials 40p (\$1) names 75p (\$1.90) extra per diary.

Once again, you've endorsed our promise to be the helpful bank. Thank you.

Banking, above all else, is a people business.

Successful banking is based simply on successful relationships.

We wish to stress this point since a financial statement really summarizes the results of relationships, of working with people to build better things. Our results for 1972 clearly show that this human approach to banking works very well, all round.

"Royal Bank — the helpful bank" is not just a phrase. It is a commitment throughout our 1393 branches and offices around the world. It continues to commit our people and our resources to your service.

Head Office,

1 Place Ville Marie, Montreal.
Over 1390 branches and offices in Canada, Argentina, Bahamas, Belgium, British Honduras, Cayman, Colombia, Dominican Republic, Eastern Caribbean, French West Indies, Germany, Great Britain, Guyana, Haiti, Hong Kong, Japan, Puerto Rico, United States, Virgin Islands.

More than 1,150 offices in Canada, the United Kingdom, Continental Europe, United States, Mexico, Argentina, Australia, Japan and Hong Kong. Wholly-owned subsidiaries: Bank of Montreal Trust Company, New York; Bank of Montreal (California), San Francisco; Bank of Montreal (Bahamas & Caribbean) Limited, Nassau; Bank of Montreal Jamaica Ltd., Kingston; Hochelaga Holdings B.V., Amsterdam, the Netherlands. Affiliates: Australian International Finance Corporation Ltd., Melbourne, Australia; Montfield Trust Company Limited, Hamilton, Bermuda; Joh. Berenberg, Gossler & Co., Hamburg, Germany; Banque Transatlantique, Paris, France. Banking correspondents throughout the world.

Lady Resident requests your support

For many years the great ones of the land have asked you to support our Christmas appeal. This year, as one of the nine hundred elderly residents of the Methodist Homes for the Aged I thank you for your generosity in the past and trust you will be able to continue your help. There are now thirty Homes and I feel I am greatly privileged to spend my old age in such comfortable, happy and friendly circumstances. There are many thousands who are not so fortunate and it is for their sake I appeal for funds to build even more of these truly wonderful havens of freedom and security. Please help all you can this Christmas.

Methodist Homes for the Aged

General Secretary Rev. R. J. Connell, M.B.E., B.A., B.D.
1 Central Buildings, Westminster, London SW1H 9NS

Star Copier moves through your machine as clean as a whistle

Available through stockists and wholesale stationers.

Star Copier is made for all copying machines using the xerographic process. Its trouble-free feeding and running needs the barest minimum of handling, and that means beautifully clean copies time after time. Each 500 sheet ream is waterproof wrapped, and every 5 reams are packed in a double carton that can be used as an easily stored container for the reams not in use.

Star Paper Ltd

Head Office: Feniscowles, Blackburn, Lancs., BB2 5HX
Tel: 0254 21521

Star Copier is ideally suited to small offset printing as well as copying. It is a superb paper that does both jobs equally well, giving you an efficient solution to your ordering and storage problems. One paper — two jobs; why not give it a try.

A bank
that combines
youthful energy
with sound business management
and friendly, efficient service
is a good bank to
do business with.
Don't you agree?

Maybe that's why
we can't stop growing.
(Who wants to?)

The Annual General Meeting of Société Internationale Pirelli S.A. was held in Bâle on October 23rd, 1972 and the following are the main points from the Directors' report to the Shareholders:

For the first time the published report and accounts included the participation in Dunlop, following the implementation of the Pirelli/Dunlop Union on January 1st, 1971. The consolidated sales of Pirelli/Dunlop show a modest increase to Sw Fr. 9,700m in 1971. During the year under review, the Pirelli/Dunlop Group invested approximately Sw Fr. 920m in fixed assets.

The sales of Société Internationale Pirelli's subsidiaries were slightly down at Sw Fr. 2,450m in 1971, compared to the 1970 figure at Sw Fr. 2,500m. The short fall was mainly due however to the devaluation of the Swiss franc; in real terms, the sales figure is slightly higher than last year.

Pirelli limited in the U.K. developed favourably during the year and closed with a small profit which was retained. The present situation shows encouraging progress. The results for Pirelli General Cable Works Limited in 1971 were very favourable and higher than in the previous year. Pirelli General took over the cable manufacturing company Aberdare Cables Limited. The sales of Productos Pirelli S.A. in Spain were approximately as in 1970, and the company was able to distribute a dividend of the same amount. Also the two other Spanish companies of the Group, Compañia de Inversiones S.A. and Comercial Pirelli S.A., distributed a dividend. The Greek company, Pirelli Hellas S.A., improved considerably and distributed a gross dividend of 10%. The results of Turk-Pirelli Lastikleri A.S. were in part affected by the difficult economic situation in Turkey, but the company was able to distribute a dividend of 12%. The results of the American companies (Canada, Mexico, Brazil, Argentina and Peru) were satisfactory and particularly the Brazilian affiliate shows very good results. Pirelli S.p.A. was affected to some extent by the difficult conditions of the Italian economy and distributed a dividend of Lit. 50 per share as against Lit. 110 in the previous year.

The balance sheet of Société Internationale Pirelli, closed at June 30th, 1972, shows a net profit of Sw Fr. 28,117,322 as against 26,621,788 for the financial year 1970/71. The gross dividend was increased from Sw Fr. 12 to Sw Fr. 13 per share.

*...should be glad to make up personally
...cigarettes for your approval.*

*I am Sir,
Your most obedient servant
Louis Rothmans*

Louis Rothmans Select

Tobacco matured
not one but three full years, in
a blend of costly Virginia.
Wrapped in filigree paper and
presented in sealed packets.

Louis Rothmans Select: 35p

The finest cigarette
in all our eighty years.

Jeremy's bubbles

Mr Jeremy Thorpe is jubilant about his Liberal party's successes in the by-elections. But the idea of a Liberal revival, like the hankering for a third great, moderate party, is a bubble which should burst, page 11. The Liberals back out of Lincoln, page 25. The dangers and deficiencies of opinion polls, pages 13 and 25.

Cover: adapted from Millais and Pears Soap.

From Santiago to Paris

If the rise of Georges Marchais's Communist party in this week's French opinion poll means anything, the Chile problem could come to France, and maybe Italy too, in the 1970s, page 13.

Out of their hair

The last McGovernite has been swept out of national party office. And her successor is a Conservative-Democrat from Texas, page 47. The Republicans, too, have turned to Texas for their new chairman, page 48.

That mechanical heart

The Midlands: a special survey, after page 62.

How's your inflation?

The sooner the Heath Government announces its phase two policy and makes it a near-freeze the better, page 81. The immediate concern is strikes, token ones in engineering but potentially serious in gas, page 91. The Irish have a cure of their own and so have the French, pages 85 and 98.

No Tanaka Shokku

Japan's radical new prime minister did just about as expected in Sunday's election—but that's good news for Japan's trading partners, see page 14.

They struck water

On their last moon flight the Apollo astronauts found the one thing that might have saved the American space programme: a trace of water on the moon, page 16.

The voice of Palestine

Our special correspondent describes the widening gap between Yasser Arafat's guerrilla movement and the Palestinians who live in Palestine, page 44.

Letters

By-elections

SIR—You state (December 9th): "At Sutton and Cheam [the effect of attracting more support by convincing the electorate that the Liberals have a chance] was achieved by leaking partial and misleading bits of a private opinion poll."

This implies, whether intentionally or not, that the poll was deliberately used to create a picture more favourable to the Liberals than was the case.

As the editor of the magazine which commissioned the poll, let me put the record straight.

The fact that there was an NOP was first discovered by a reporter in Sutton, almost certainly from one of those interviewed. After it became obvious that there was a poll and failure to publish it might cause misunderstanding a statement was issued as to the main findings. The reason that the whole poll was not issued was that it was (and is) intended for publication in New Outlook in March.

When the statement was misunderstood by one or two papers (notably in The Times which interpreted it to be worse for the Liberals than it was) NOP, who are rightly concerned that the findings of their polls should not be manipulated, after consulting me immediately wrote a letter of correction.

Lastly, I know that the Liberal party was considerably embarrassed by the publication of the poll since it was far less favourable than that of the Sutton and Cheam Advertiser which, while open to objection on methodological grounds, nevertheless had gained wide currency in the constituency itself.—Yours faithfully,

TIM BEAUMONT
Editor, New Outlook

SIR—Your analysis of the voting results in the Sutton and Cheam and Uxbridge by-elections (December 9th) is incorrect in attributing the poor Liberal vote in the latter constituency to the "likely explanation . . . that the voters of Uxbridge take their national politics rather more seriously." The difference in performance can be attributed to the fact that, whereas Graham Tope had nearly six months at Sutton and Cheam in which to campaign, Ian Stuart, the Liberal at Uxbridge, was only adopted just prior to the writ being called. It was impossible for him to develop a "community-politics" campaign in that short time. Given a little longer, he would have produced a much higher Liberal vote.—Yours faithfully, JACK BARNETT
London, NW6

Heavy lorries

SIR—Your comment on heavy lorries (December 2nd) misses what most of their critics would regard as the main point. It is alleged that such lorries cause damage, out of all proportion to their weight, to the roads and bridges over which they travel, to the buildings which they pass, and to any vehicles or buildings with which they may happen to collide, as they occasionally will. The length of the lorries is a relatively minor issue.

You tell us that "less than 10 per cent of Britain's lorries are over eight tons." In that case, if each existing lorry were replaced by two lorries of half its weight, the total number of lorries would increase by a good deal less than 10 per cent, while the number of those over 16 tons would fall by 100 per cent. Many people would regard this as an excellent bargain.

The main advantage that lorries have over rail freight is that goods can be carried anywhere from door to door without trans-shipment. If heavy lorries were to be restricted to certain routes, then this advantage would be lost. You point out that "the average freight haul is 25 miles in Britain, and neither begins nor ends near a rail terminal." As the motorway network still has a length of only about 10 per cent that of the remaining railway network, the average freight haul is even less likely to begin or end near a motorway access point. Even if the motorway system were doubled, this situation would not be changed much.

You tell us too that "the Six are trying to . . . create a common market in lorries by standardising their dimensions." Why? This desire for standardisation cannot be justified on the orthodox theory of comparative economic advantage. If the people of one region are more willing than their neighbours to accept lower environmental standards in exchange for a higher monetary income, then that region will tend to gain a comparative advantage in environmentally-damaging industries. A willingness to accept lower environmental standards may be a scarce and localised resource, just as much as a coalfield is.

The mystique of integration apart, why should the French have to accept a limit of 11 tons on their axle loads when they prefer 13; and why should the British have to accept lorries of 40 tons on their roads, when they are plainly unhappy about lorries of 32? Not the least of the faults of the EEC is its policy of imposing standardisation on all member countries, regardless of different conditions in each. The result is that the EEC serves, not to resolve conflicts between its members, but to create new ones.—Yours faithfully, JOHN KISSIN
London, NW5

SIR—If on the subject of lorries (December 2nd) you want to discuss it as an economic subject, why stop at 40 tons. It would be more economical to move 50-ton loads, and even more so with 60-ton loads; and the economies of scale from 100-ton lorries are simply breathtaking! And what

THE ECONOMIST DECEMBER 16, 1972

is a mere extra nine inches. Don't be penny-pinching. Advocate an extra nine feet! What do the people matter, or the environment, or any other decent value, on the sacred altar of economics.

Your argument on distance against British Rail destroys your whole rationale (is that what it is?) on lorries. If the average freight haul is only 25 miles, then nothing in creation can demand lorries larger in size than around 5-10 tons.—Yours faithfully, H. GRAYSON
London, E11

Vat

SIR—Your expectations (December 2nd) that prices in service industries would go up by less than the standard rate of Vat, due to the abolition of other taxes, does not apply to Post Office telecommunications.

These services pay very little Set and are not liable to purchase tax. Standard rate Vat will, for example, have to be collected on telephone and telex connection charges, rentals and call charges, and also telegrams.—Yours faithfully,

W. O. RICH
Deputy Director (Central) Public Relations,
London, W1 Post Office

Eurocrats

SIR—Your headline (December 9th) asked "How Euro are the Eurocrats?" This is a relevant question. But an equally relevant one would be: "How Whitehall will be Britain's Eurocrats?"

All the signs are that the businessmen have been pushed off the list and that Whitehall has merely put forward Civil Service nominees. Fortunately this has not been automatically accepted by the commissioners.

The next two years will be vital for Britain, and it is imperative that our nominees to Brussels should not merely be Whitehall men.—Yours faithfully, J. LEROY
London, NW3

Professional promotion

SIR—Your comment (November 25th), "Private argument, public interest," dealing with the General Medical Council's disciplinary action against a woman doctor for advertising, in a sense misses the issue. Her defence that she was not promoting herself may have been accepted by the disciplinary committee but it presupposes that there was any virtue in the charge in the first place.

The doctors' and senior professions' rear-guard action against all forms of marketing has never been justified by the doctors except in terms of professional pride (or is it arrogance?) which is not the same as pride in their profession. Public interest has never been served in any industry or profession by keeping from the public information which will enable them to make better decisions in regard to the product or services they wish to purchase.

THE ECONOMIST DECEMBER 16, 1972

MANAGEMENT APPOINTMENTS £7000 PA AND OVER

MANAGING DIRECTOR DESIGNATE

Title on appointment: General Sales Manager. Salary (negotiable) £7,000—£10,000

This is an exceptional senior executive's opportunity to take two brisk steps to the very top of the domestic electrical appliance industry.

Our Client's company, which is Japanese, is engaged in the manufacture of television, radio and high fidelity record-playing equipment, and in distribution of these products to retail outlets throughout the country. Turnover during 1973 will be about £13 million, but conservative estimates are for considerable multiplication of this figure during the years to follow, even in the face of the best the competition can do.

The successful candidate for this position will probably be in the 37-48 age bracket. Initially, he will take control of the complete sales operation instituting whatever changes and additions are appropriate to the strengthening and success of the forces in the field.

Broadly, he will undertake implementation of overall policy laid down by the Board of Directors. But, in particular, he will be responsible to the present Managing Director for all forecasts, budgets and profitability, marketing policy, product development, purchasing and divisional administration—including supervision of executives concerned with accounting, advertising, sales promotion and public relations.

The executive selected, therefore, will have

been able to demonstrate outstanding previous achievements in most or all of these roles, whether in the electronics field or not. (Some knowledge of the industry would be an advantage, although not essential.)

Certainly he will have developed ability to operate effectively at the very highest level, both at home and abroad. And his successful application of this experience and ability on behalf of our Client's company will be liberally rewarded.

In addition to a substantial salary and all fringe benefits normally associated with a post of this importance (including, of course, a personal car), he will be expected to merit election to the Board upon his assumption of the Managing Directorship.

Applications for an appointment to discuss this position should be conveyed, either directly or through an intermediary, to Mr. Laurie Grant at the address below. Needless to say, all communications will be dealt with in strictest confidence. Quote Ref: M/535.

Osborne-Grant

(Appointment Consultants) Ltd., Hesketh House, Portman Square, London W1H 9FG. (01-486 4381)

Chief Engineer and Director

Civil Engineering

up to £7,500 p.a.

A leading British Civil Engineering Contracting Company wishes to appoint a Chief Engineer. He will become a Director. His responsibilities will cover all engineering aspects of the planning and execution of heavy and complex civil engineering contracts ranging up to eight figures in value. This is an opportunity to join the team leading a Company of high repute and to contribute to its further growth.

Candidates are expected to be highly qualified—F.I.C.E. plus other appropriate qualifications—and to have had wide

experience of site operations as well as a thorough understanding of civil engineering techniques.

Remuneration: basic salary over £6,000 p.a. plus profit sharing. Car provided; assistance with removal expenses; contributory pension scheme.

Based in the Southern half of England. Please write to us stating current salary and how you meet our Client's requirements, quoting reference CE/3296/E on both envelope and letter. No information will be disclosed to our Client without permission.

Urwick, Orr & Partners Limited

Selection Division
2 Castle Lane London SW1E 6DL

The argument advanced by the Law Society to the Monopolies Commission, for example, that if advertising were allowed business would go to the partnership with the longest purse and least scruples, not the greatest ability, is, at its kindest just nonsense. If this were true it would apply across the economy as a whole and large organisations which do advertise might be presumed to be less competent and less scrupulous than those that do not. This is the logic of the professions' response.

It is surely time the Government acted on the recommendations of the Monopolies Commission, which to a very large measure came down against all forms of restraint in marketing and pricing in the professions. The old arguments which were current before resale price maintenance was made illegal will certainly be trotted out, but history is against the professions, senior and junior. Public interest must come first even at the expense of doctors, lawyers, accountants and architects having to go into the market place against all their professional instincts.—Yours faithfully,
London, SW1 AUBREY WILSON

Immigrants

SIR—Mr Duncan refers to the language problem in connection with the integration of immigrants in this country (Letters, November 18th). Not all adult immigrants can afford the time (or the fees) to attend classes where English is taught as a second language, if such classes are available at all, and there is thus scope for an army of volunteer tutors to teach individuals in their own homes. In London, anyway, there is no shortage of pupils, whether they be Asian or Cypriot, east European or West Indian, Chinese or Latin American. A number of local authority community relations offices organise tuition schemes. Previous teaching experience or knowledge of the immigrant's own language is not necessary: the direct, situational method is adopted, encouraging the pupil to speak meaningful language from the outset. (How I wish I had been taught French and German during my schooldays in this way!) Those who are concerned to see good race relations in this country would do well to support or initiate such voluntary tuition schemes in their neighbourhood.—Yours faithfully, M. B. CORRAL
London, W8

SIR—I was greatly upset by Mr G. J. A. Stern's views (Letters, December 2nd) on immigration. I would remind him that the free movement of labour applies only in the EEC and it is ridiculous to talk about the market and then give examples concerning the rest of the world.

Even in his example, he implies that the immigrants from the poorer countries are layabouts. I would point out that the majority of these people contribute enormously to this country by way of intelligence (I support this by the fact that the former controller of London Transport is an intelligent Asian).

He talks utter nonsense by referring to

the emigrants as "better workers" because they earn more. This is due to the higher standard of living in those countries where these British emigrants may be doing the "menial" jobs, that he mentions, for example, the Americans reject. May I also remind Mr Stern that Turkey is not a member of the EEC and thus it is in his imagination that millions will be flooding from there as free movement of labour in the EEC.—Yours faithfully, J. SMITH
London, SW16

Chile

SIR—In your article "The army waits" (October 7th) you say that Patria y Libertad is a right-wing extremist group. This is false.

Patria y Libertad celebrated when the bill giving control of firearms to the army was approved some weeks ago. That bill was approved because the government vetoed it incorrectly and did not send it back to congress within the statutory 30-day period. The bill then became law. It was a great conquest for the democratic people of Chile.

Do not compare the Movement of the Revolutionary Left (Mir) and Patria y Libertad, because the Mir acts illegally and Patria y Libertad always respects the constitution and the law.

The Mir has killed a lot of innocent people, has robbed banks, and committed other crimes. It is just a group of delinquents, and Dr Allende's government does nothing against them.

Patria y Libertad has been accused of a lot of things, but no allegations against it have been proved in court.—Yours faithfully, MARIO ACUÑA BRAVO
Santiago

Holland

SIR—In your article (November 25th) you rightly make the point that Holland's great weakness is to produce shaky coalition governments and face them with serious economic problems. However, the solution is by no means obvious, and in my opinion the Dutch experience does not, as you suggest, demonstrate a system of proportional representation pushed too far.

In the first place it is easy to give examples of countries where far fewer parties have produced weak governments—west Germany before the recent elections, and Canada now, for instance. Secondly, the proliferation of parties in Holland is an expression of part of the Dutch character. Holland has expended a great deal of effort in protecting democracy and freedom of speech, and one of the ways in which it demonstrates its belief in these ideals is its willingness to form political parties to represent minorities. It would be a hard thing for the Dutch to abandon this practice.

Nor would it make any practical difference to the situation if the smaller parties were excluded from the parliament, by introducing, for instance, Germany's

5 per cent limit. In the last Dutch parliament there were seven parties with more than 5 per cent of the vote and between them they held over 80 per cent of the seats in parliament. It is between these seven that the traditional search for a workable coalition takes place.

The real irony of the present situation is that little is likely to change. In all probability the only parties capable of forming a government will be the three main confessional parties joined by the liberals. DS-70, which back in July caused the cabinet to fall by its resignation, may once again join forces with them to provide a majority in parliament. Holland would then have been through two general elections to produce the same result twice—and it may well ask itself whether a coalition which has already fallen once can survive a second term of office. Whatever the outcome, Holland will be lucky to produce a government capable of dealing with its economic difficulties, and it will be even luckier to discover a way of avoiding this state of affairs.—Yours faithfully, M. J. C. G. CARLISLE
Rotterdam

English language

SIR—I am a student of Esperanto, and I agree with Mr Meulen (Letters, October 28th) that it is but a brave attempt.

In the Encyclopaedia Britannica (1912 [?] edition) I came across the following specimen of an auxiliary language, which was published by the ex-Volapük Academy:

Idiom Neutral es usabl no sole pro skribasion, mu et pro perlasion; sikaue in kongres sekuant internasional de medisnisti mi av intension usar ist idiom pro mie raport di maladitet "lupus," e mi esper esar komprended per omni medisnisti present.

This I feel shows some promise.

I have also dabbled in reformed orthographies, and produced one which bears a resemblance to that of Mr Smith (Letters, November 25th):

An amser for bowth foñiners and aur own cildren is ei simpoul orthografy tou serv az an opshonal orlternativ tou aur kweint heñitij.

However, I finally discarded this idea as impracticable. Mr Tallack's idea (Letters, December 2nd) though original is, I feel, more impracticable than that of a reformed orthography; it would be almost impossible to change the pronunciation of the few hundred millions who use English as a first or second language, much harder than trying to change the present "kweint" orthography to a simple logical one, based, perhaps only vaguely, on the sounds of the language.

I can, at the moment, see no alternative but to encourage the growth of English as it is as the world's most important language, a position which it to some extent already holds.—Yours faithfully, JULIAN PARDOE
Ottershaw, Surrey

Avis checks every car 43 ways. Others aren't so fussy.

Before any Avis car is rented, it's checked. Inside, outside, underneath, on top, back and front. A total of 43 different checks. And when we're happy, we put a signed check card in every car. And we do all this because we won't take chances. Especially with our customers.

Avis. We try harder. We give Green Shield stamps.

In the confused French office space market,

you need a tool.

The future of your company is linked to the headquarter premises you select. The matter needs careful thought: where, how big, partitioned or open-office scheme, what price can we go to, when to move, who can help us? The office accommodation market is so bewildering. But we are in a position to look at your particular case in a rational way.

To give you a brief idea of our business, our methods, services and project schedules we have compiled a handy file which we see as a basic working tool. May we suggest you obtain a copy and contact us after perusal? In any case, it will be a useful addition to your other data. SACI, a building development company, was formed by the Banque de Paris et des Pays-Bas, Crédit Foncier de France and some leading insurance companies to study, work-out and offer solutions to accommodation problems.

To: SACI, Offices Department, 2, 4, 6, rue
Jules-César, 75012 Paris - Tel.: 346.12.10.

Blowing bubbles

Party politics has few friends and even fewer admirers in Britain today. Nothing, therefore, has given more people more widespread, simple pleasure for a long time than the bloody noses dished out to the Tories and Labour in last week's by-elections. Neither party can be surprised at its unpopularity, for it is not undeserved. But there is nothing particularly amusing in the fact that neither of the major parties is greatly admired or respected, for the conflicts and complexities of modern society, plus its sheer vulnerability to militant challenge by small groups, raise too many doubts about how really governable Britain is without that. But while it is widely recognised that the need for at least one majority party which can command public respect has never been greater, there is a growing body of opinion which does not believe that either the Tory or the Labour party can fulfil that role, except possibly for very short periods. Such people—and they are generally among the most politically literate—hanker for a third party of the committed centre, and they welcome any sign of a possible Liberal revival as a step towards its creation. Yet it is doubtful whether they, like the Liberals' jubilant leader, Mr Jeremy Thorpe, are doing much more than merely blowing political bubbles in the air.

A familiar pattern

No one should get too excited about the present Liberal revival, least of all the Liberal party. It is true that whereas the Liberals normally win only one by-election in a whole Parliament, they have now won two seats within two months: Rochdale from Labour and Sutton and Cheam from the Tories. Yet the fact is that both those victories are in the depressingly familiar pattern of earlier Liberal revivals. It is, for example, not quite as inexplicable as it seems that on the same night the Liberals can put on 12,000 votes at Sutton and Cheam and drop votes a few miles away at Uxbridge (although there was a tiny increase in the Liberals' share of the poll there). And it has nothing very much to do with organisation or community politics or candidates or Liberal policies.

It is simply that disgruntled Tory or Labour voters are prepared to vote Liberal only when they know there is no chance of letting in their main enemy if they do so.

The only seats Liberals have shown they can win are those where there is either such a massive Tory majority that there is no prospect of Labour succeeding (Sutton and Cheam), or where there is such a large, existing Liberal bridgehead that both Tory and Labour voters are convinced that the Liberal can win and ditch the other side (Rochdale). The Liberals have yet to prove that they can win seats like Uxbridge, where Labour and Tory voters believe that if they switch to the Liberals they would let the true enemy in. Unless they can win their Uxbridges, too, the Liberals' present bubble will burst just as surely as it did in previous parliaments. Of course, if similar situations to Sutton and Cheam and Rochdale arise, the Liberals may pick up a few more seats before the bubble does burst and they may also expect to see their fortunes rise in the opinion polls, despite Thursday's Gallup poll in the Daily Telegraph which showed a 2½ per cent drop in their national support. But it will be no more than that.

For the Liberal party's unresolvable dilemma is that the more it closes the gap between itself and the two major parties in the opinion polls as a result of by-election successes, so the wider and more apparent becomes the credibility gap between it and the electorate. The Liberal party still does not possess the political manpower to convince the country that it can become a major parliamentary force, let alone a governing party. The electorate is far from stupid, particularly when it is acting nationally. And however disenchanted it may be with the Tory and Labour parties, when it is forced to look at the Liberal party closely, it is sensibly unable to take the Liberals' claim to parity with any seriousness. The idea, therefore, that a reviving Liberal party can form the nucleus of a powerful, moderate party is a chimera, and not a very helpful one at that.

For what are the splits in the two major parties that are conceivable in the foreseeable future? There are only

two: Mr Jenkins and his closest friends might hive, or be hived, off from the Labour party, and the same might happen between Mr Powell and the Tories. If Mr Powell did break with the Tories and formed his own party it could well become a considerable, if baneful, force; certainly it would not lack funds or militant members.

It is a prospect which has been known to haunt the thoughts of some Tory leaders, and they can only rely on Mr Powell's fastidiousness about the company he keeps to prevent it. But there would be nothing in such a split for the Liberals, and to do men like Mr Thorpe and Mr David Steel justice they would not want it. But what it would mean is that in those ultra-safe Tory seats which the Liberals might otherwise occasionally win the whole of the disgruntled Tory vote would go to the official Powellite party candidate. And the Liberals could not expect to gain very much from a Jenkinsite split in the Labour party either, for if that ever occurred the men of consequence would be more likely to leave politics altogether than go in with the Liberals. Indeed, if the split were that big and important, the ex-Labour men would expect Liberals to come in with them. But apart from a few hotheads on the extreme left, no one in the Labour party really expects such a break-up; certainly it is only the unthinking militants who want it.

Why kick Ted?

There is reason for hoping as well as believing that there will be no such massive realignment of party politics which would leave this country with one moderate party opposed in Parliament by minority parties of the extreme left and right. For if that happened the alternative government would be so intolerable that the governing moderates

would be in power so long that they would succumb, in the end, only to discredit and decay. And there is almost as good a reason for hoping as well as believing that the Liberal revival will not go very much further. The idea that there is no harm in a Tory government's supporters giving their chaps an occasional kick in the pants is attractive in theory, but may not work out quite so well in practice. One wonders, for example, which of the Heath Government's actions since the by-election at Kingston in May have caused 25 per cent of the Tory vote in neighbouring Sutton and Cheam to want to give their own leaders a kick. Was it Mr Heath's move from confrontation to attempted conciliation with the trade unions? Or perhaps his belated conversion to a prices and incomes policy? Or did those Tories cross over to the Liberals because Mr Thorpe's welcome to the Ugandan Asians was a shade more enthusiastic than Mr Heath's? It seems inherently unlikely that those Tories were taking even half a step to the left.

On the contrary, if there are more Liberal victories in safe Tory seats it is going to make it more difficult for Mr Heath and his colleagues to hold to sensible economic policies and humane immigration gestures. However, if Sutton and Cheam is not repeated the Tory desertion there will be rightly seen as a protest not so much against the new course of Mr Heath's politics as against the number of political U-turns he has made since arriving at No. 10. But such an argument will not be tenable if the Tories are still losing such seats in five or six months' time. The outlook for party politics in this country would then be gloomier than ever—except, of course, to those who want the Tory party to go more Powellite.

The politics of suburbia

Britain is fast becoming a suburban society: its Parliament, however belatedly, reflects this. The south-east, outside London, gains 18 parliamentary seats in the redistribution that takes effect at the next general election, while London loses seven. And that was based on 1965 populations. Constituencies like Sutton and Cheam and Uxbridge, on the farthest fringe of big cities, neither wholly urban nor wholly rural, confuse the simple distinction between borough and county seats and return an ever-growing slice of Parliament.

The 1971 census showed how fast the fullest and emptiest parts of Britain were both being vacated in favour of the semi-rural, suburban in-between. City life—at a density, in inner London, of 37 people to the acre—and rural life—at a density, in Cumberland or Northumberland or mid-Wales, of about one person to every six acres—are both becoming minority existences. If the population of Britain, including all its city-dwellers, were spread evenly over its surface, there would be about one person to every acre. With the single exception of

Oxford, every single "rural" county of south-east England now has a density well above that figure.

There is a wide belt of land around Greater London, known as the Outer Metropolitan Area, making up 8 per cent of England's land surface and cutting through the 11 counties of south-east England, whose population has grown from just under 3½m in 1951 to rather under 5½m in 1971, with a population density twice the national average. The pattern is repeated round all major cities.

Sutton and Cheam and Uxbridge are superficially very similar constituencies, both on the extreme edge of the Greater London area. While inner London's population has been declining, and the Outer Metropolitan Area filling up, the populations of the outer boroughs have remained pretty static. The population of Hillingdon (containing Uxbridge) rose very slightly; that of Sutton (containing Sutton and Cheam) fell very slightly. But they make up, in fact, quite different sorts of electorates.

The population of Sutton is markedly older than the population of Hilling-

don. Hillingdon is emptier, with half as many people to the acre as Sutton, which is nearer the average for the outer London boroughs. More women work in Hillingdon than in Sutton.

Detailed figures from the 1966 census, calculated for individual constituencies, show up greater differences: Sutton and Cheam's relative prosperity, for example, is made plain. Some 80 per cent of dwellings were owner-occupied, as compared with a bare 50 per cent in Uxbridge. Nearly 30 per cent of the men in Sutton and Cheam were professional people, employers or managers, as compared with under 20 per cent in Uxbridge. Sutton constituents were archetypal commuters: an exceptionally high proportion of them (three times as many as in Uxbridge) travelled to work by train and tube.

What does all that mean, politically? Nothing much, perhaps—except, maybe, that Sutton's constituents are fed up with rail strikes, or that discussion of the abolition of tax allowances for mortgages might be quite enough to bring Sutton's voters sharply back to Tory allegiance at the next general election.

And the effects on the Labour party of further Liberal advances may not really be any more encouraging. Certainly, if Labour loses many more by-elections, or fails to win those that it should, Mr Wilson's leadership will become even shakier. But even those Labour MPs who were quite bucked by their party's failure to win Uxbridge have no confidence that the loss of a few more by-elections will actually bring Mr Wilson down. And in electoral terms there is no percentage in a party continuing to heap insults and wounds on its leader if it is not going to get rid of him. The Labour party will solve its intense internal problems, and regain some large measure of respect in the country, only when its moderate majority rediscovers the will to lead the party; and it is arguable, to say the least, whether further evidence that Labour is unlikely to win the next general election will encourage the moderates to find that will. Of course, if it did, the Liberal revival, however shortlived, would have served its most useful purpose.

That leaked opinion poll

But whatever the Liberal victory at Sutton and Cheam might portend there is one aspect of the campaign in that by-election which should cause concern among all three parties. Lord Beaumont, a former president of the Liberal party, explains in a rather cautious letter to *The Economist* (see page 4) how bits of a reputable opinion poll on the constituency, which he had commissioned privately, apparently for publication three months hence, came to be published in several variations during the campaign. No doubt the leaking of some of the findings of that poll did not, in the end, fundamentally affect the result,

although Labour might not have thrown in its hand quite so early and so readily if it had known that a quarter of the electorate's original voting intention was to stick by Mr Wilson. But it ought to be recognised that a potentially very dangerous element was introduced into British elections.

How dangerous can be shown by considering what could happen in the forthcoming by-election at Lincoln—where the Liberals have sensibly decided not to stand (see page 25)—if someone wanted to be tricky. A private poll by a reputable organisation would probably find, in answer to the straight question on voting intentions, that Mr Taverne had a clear lead over both the official Labour and Tory candidates (as the Tory had in answer to the same question in Sutton and Cheam). It does not take much ingenuity to frame subsequent questions in that poll which would produce authoritative-sounding leaks that a substantial number of Labour or Tory voters, or both, who were intending to vote for Mr Taverne had changed their minds because of the danger that they would let the other party in if they did so. Nothing could be more damaging to Mr Taverne or more calculated to distort the real wishes of the electorate. Yet the door was opened, however unwittingly, in Sutton and Cheam and it needs to be slammed shut. The best, and quickest, way to do that would be for the opinion polls to insist that they will publish all the findings if any part of a privately-commissioned poll on political or public issues is leaked, and for the newspapers themselves to follow the American practice of refusing to publish any part of such a poll if all the information is not available to them. The electorate does not like being gulled.

The wind behind Marchais

The leader of France's Communist party is doing well enough for 1973 to be quite a year in Paris

There are a lot of people in Europe who will not like to be told that events in far-off Chile hold a lesson for them. But they do for France, on this week's evidence of what Frenchmen are thinking about politics; and they could for Italy too. One of the problems of the 1970s is going to be how liberals deal with marxist parties, or alliances that include marxist parties, which come to power in free elections. Those who believe that the relationship between government and the governed has to include some fairly regular and fairly precise test of the popular will cannot complain when marxist parties win one of those tests. They can and should take care to observe how those parties use the power this gives them; and in particular whether they leave it open for the test to be repeated when opinion turns against them. That is why since 1970 Chile, governed by a coalition that includes the Communist party, has been a test-tube experiment of the phenomenon of elected marxism; and why western Europe, as it prepares to go into a conference with the Russians in which it will tacitly recognise the

permanence of communism in eastern Europe but the Russians will not recognise the permanence of a non-communist western Europe, should be applying the lessons of Chile to France and Italy.

For the first time since 1945, it has now ceased to be an entirely academic question whether the next ministry in France might be organised by an alliance of Communists and Socialists. The French will go to the polls to elect a new parliament some time between February 4th and March 25th; President Pompidou has still to name the day. In the latest opinion poll, published in *Figaro* this week, 45 per cent of those interviewed said they would vote for the Union of the Left composed of Communists, Socialists and left-wing Radicals. Only 38 per cent planned to back M. Pompidou's gaullist party and its allies, who have enjoyed a huge majority in the national assembly for the past four years. Another 15 per cent said that they would support the Reformist Movement of M. Servan-Schreiber and M. Lecanuet. The gaullists suffered the indignity of discovering that, according to the same

poll, the Communists, favoured by 22 per cent of the voters, have now usurped their former place as the strongest single party in France.

Of course, French opinion polls may be no more reliable now than British opinion polls proved to be in the weeks before the 1970 election. The latest poll may reflect a passing mood of alarm about rising prices, disgust with the recent series of scandals involving government deputies, and sheer boredom with General de Gaulle's untheatrical successors that will dissolve as the new anti-inflationary measures start to take effect and M. Pompidou throws himself into the campaign and goes looking for left-wing Frenchmen's votes by holidaying with Mr Brezhnev in Byelorussia. Even if his supporters fail to get a majority in the assembly, they might persuade the Reformists to form a centre-right coalition that would turn a responsive ear to M. Faure's ideas on social reform and M. Servan-Schreiber's rather more suspect yearning for decentralisation.

The fight for the prime minister

But it has become necessary to think about how things would develop if the Union of the Left did win a parliamentary majority. The first problem would be the selection of a prime minister. M. Pompidou's choice would presumably be unacceptable to the new majority. The majority's preference—probably M. Mitterrand, the Socialist leader—might be equally unacceptable to him. M. Pompidou would then have the option of dissolving parliament and holding new elections. But that is a weapon that he is entitled to use only once every 12 months; and he would run the risk that the Union of the Left would re-emerge with its majority intact.

He might then have to choose between invoking the emergency powers that the president is allowed under the controversial article 16 of the constitution, which have not been exercised since the Algerian crisis, and resigning. The only alternative would be to use his wide-ranging executive powers to keep a left-wing prime minister on a very tight leash. But that would mean that France would become a country with a left-wing cabinet (with the Communists in three or four key ministries, though not, presumably, in defence or the ministry of the interior) and a shrewd, conservative president deftly sabotaging its more radical initiatives. It is hard to imagine a better prescription for stalemate and its probable consequences: political strikes, demonstrations on the streets, and a re-run of 1968.

It is true that in the past few years the French Communists have watered down their programme and laboured hard to make themselves look like a democratic party. The joint programme adopted by the Communist and Socialist parties earlier this year is a considerably tamer document than the text put out by the Communists at the end of 1971. It has dropped the tired polemics against the EEC ("that common market of cosmopolitan trusts") and Nato (that "instrument of American domination"). But some of the key points are still there, couched in politer language. The Communists and Socialists plan to nationalise all private banks and insurance firms, as well as "strategic sectors" of the economy

such as the petrochemical, pharmaceutical and aerospace industries and most of the big chemical and electronics companies. They also propose to press for the break-up of "military blocks" in Europe and to "democratise" the EEC through the setting-up of workers' committees that would debate commission proposals; and to halt France's nuclear programme. It is not hard to imagine what most other west Europeans think of all that.

But the emergence of a popular front majority with that sort of programme in France's parliament would certainly have an effect in Italy. A substantial part of the Socialist party there, together with the left-wing fringe of the Christian Democrats, has been looking for some time at the attractions of a working arrangement with Italy's much more open-minded Communist party. It is hard to imagine that they would not make a serious attempt to imitate the French example if it were shown that an alliance with communism was a recipe for electoral success in Europe as well as Latin America. And the Italian constitution does not provide Italy's president with powers to fight even a half-effective, delaying action against the parliamentary majority.

It is conceivable, if not more than that, that the next decade in Europe will see the creation of Chile-style coalitions in France and Italy. It becomes more conceivable as the western communist parties continue to assert the claim that they have lately developed a new affection for the system of parliaments and elections. The French communist leader, M. Georges Marchais, made that the theme of this week's party congress at Saint-Ouen: "we are not the party of the raised fist." Certainly, the western communist parties have held themselves aloof from the guerrillas and student rioters of the new left who terrify most voters. The question remains whether this is tactical opportunism or a fundamental change of goals.

The necessary conditions of being able to choose

What has happened in Chile since 1970 is relevant. The Chilean Communists have worked from the assumption that political pluralism depends on a modicum of economic pluralism: take over industry, the credit system and the big farms and squeeze the advertising of the opposition press, and you take away the economic resources that support opposition parties and the independent media. The opposition in Chile is still there, and fighting, but it feels the steadily increasing pressure on its life-support system. You can hope to get what amounts to a one-party system, it seems, without actually banning the other parties by law. It is at least plausible to assume that the strategy may be the same in Europe. The "changes in the system of production," as they are euphemistically called, are meant to be irreversible and to bring about the concentration of political as well as economic power in the hands of the government. There is almost certainly a substantial majority of votes against Dr Allende's government in Chile at the moment. It has still to be seen whether that majority will be given a chance to express itself. That is why it must still be asked whether a coalition containing Communists that came to power in France or Italy would not try to create the conditions that would prevent it being voted out again.

Good luck, Kakusan

The world's central bankers, as well as a lot of Japanese living in cities, will be glad Kakuei Tanaka did reasonably well in Japan's election

The Tanaka bumu (Japlish for boom) has at last been measured; and it isn't all that big. Japan's go-getting new prime minister rushed to the polls on Sunday, five months after his election as party leader, to capitalise on the popularity of his recognition of China and his own unorthodox personality. He also hoped to win a mandate for an ambitious programme of economic decentralisation and social reform. What he got, when the votes were in, was a stamp of qualified approval: to the Japanese he is only the best of the bunch in a Liberal Democratic party they are still increasingly doubtful about.

Nothing short of an earthquake could have dislodged Mr Tanaka's Liberal Democratic party from its overwhelming majority in the lower house, and there was no such act of god or man in Japan on Sunday. But this majority is now at a new low, with the Liberal Democrats down from the 288 seats they won in 1969 to 271 (by a curious Japanese tradition, a group of conservative independents, 11 this time, 13 the time before, always jump on the LDP bandwagon the morning after, bringing the party's real total now to 282). Mr Tanaka did not manage to stem the gradual decline in the LDP's share of the popular vote; it slipped again this time, though only slightly, from 47.6 per cent to 46.9. And he did not pull enough allies along on his coat-tails to make his own faction the largest in the party. The Tanaka faction grew from 42 to 49 members but it remains in second place after the 55 members (down from 65) led by Mr Tanaka's rival, the former foreign minister, Mr Fukuda.

The main beneficiary of the election was the Communist party, which exceeded all predictions, including its own, by shooting up from 14 seats to 38. This makes the Communists the third largest party in the Diet and gives them a new credibility plus the bargaining power that comes with membership of the Diet's steering committee. The main opposition party is still the Socialists, who recovered somewhat from their bad battering in 1969 by winning 118 seats. But this is still a far cry from their former strength of 140 or more and was largely the result of correcting their costly error of running too many candidates last time. In fact, the combined vote for the Socialists and Communists this year was only a handful higher than the average vote for the two parties in the 1960s before the Socialist debacle of 1969; the only change was that the balance within the left shifted towards the Communists.

The left-wing vote in general and the Communist vote in particular have always been largely protest votes against the ruling conservatives. But the Communists did a good deal to earn their share of it this time by building up a strong grassroots organisation, by putting up younger, more attractive candidates and by plugging popular issues such as higher pensions, better transport and less pollution. They also profited mightily from the

collapse of the smaller parties. Komeito, that curiously aimless party of discontented ex-peasants having a hard time in the cities, which was rated as a potential ruling party during its meteoric rise a few years ago, dropped from 47 seats to 29, just above where it was in 1969. The Democratic Socialists, an idealistic, welfare-minded party that has always impressed western liberals more than Japanese voters, kept its former share of the popular vote but under the country's multi-member constituency system many of its candidates were outdistanced by Communist competitors and its number of seats in the Diet fell from 31 to 19.

But Japan's elections are rarely plebiscites on policy questions, and this one was no exception. Mr Tanaka was openly disappointed at the absence of a resounding vote of confidence. But the minor decline in LDP support should certainly not be read as a vote against his reform proposals. After years of cheerfully accepting the official policy of putting growth, and especially export growth, above everything else, Japanese voters are in a new mood now; and virtually all the parties reflected it by speaking the fashionable new language of welfare spending and pollution control. Mr Tanaka gave it as much substance as anyone. In his bestselling book, "A Plan for Remodelling the Japanese Archipelago," he called for the creation of 25 new towns to draw industry and people away from the Tokyo-Osaka axis. To encourage movement to development areas he would build 6,000 miles of new railway lines and 32 expressways and provide tax incentives and government subsidies. He would also spend a lot more on welfare and anti-pollution programmes.

The benefit for the outsiders

There could well be an advantage in this for the countries suffering from Japan's monstrous export surplus. Mr Tanaka's ideas are not shared by the more conservative elements in his party. They oppose the massive reallocation of resources that would be involved—a transfer of up to 10 per cent of Japan's sky-rocketing gross national product out of investment into personal consumption and government expenditure—and they say his policy would cause an inflation which would among other things raise the prices and cut the volume of Japanese exports. This is the best hope in the long run of bringing Japan's apparently uncontrollable export surplus back into balance. Neither export controls nor more devaluations, not even a whole succession of them, will do the job unless the whole structure of the economy is changed. Less investment in the export industries, and a rate of inflation that began to bring export prices up towards those of Japan's competitors, would be such a change. So the governments of Japan's trading partners, as well as the inhabitants of its jam-packed cities, have cause to wish Mr Tanaka well.

They struck water

Cernan and Schmitt, the crew of Challenger, found on Tuesday night what men have previously only dreamed they would find on the moon: traces of water

After the brightest moment for man's hopes in space, the Challenger lifted off the moon on Thursday evening, and seemed to end the vision of a generation. After six attempts, the astronauts had found signs of water on the moon. What this means to scientists is that the moon is a living, pulsating thing, not the dead lump of stone that older men had so confidently forecast—and that it could respond to human treatment and human habitation and blossom as many a desert has blossomed before it.

Water does not have to flow in streams before this can happen. As long as it is present, locked up in minerals or sublimated in rocks, men can tap it if they have the will, and that is the sort of water that the astronauts found. It started off as an ordinary enough sort of moon-day. They had spent Monday setting up instruments, a tough and boring job made tougher by the fact that they tended to hit bedrock on the floor of the valley whenever they tried to dig down into it. Commander Eugene Cernan bored a 9ft core and had great trouble getting it out, but he got a sample that goes right through from the grey dust that covers everything in the valley and the black, cinder-like deposit to the mare crust beneath and through that to the bedrock below. It was hard going.

The next day they drove off as instructed to the south massif, where a landslide had brought down boulders from the mountain tops a mile above, probably the oldest samples of the moon that men will bring back with them. And it was on their way back to Challenger that they passed what had looked in the photographs taken before the mission like an odd-shaped crater, where the material thrown up had not spattered out around the plain as it normally does, but had fallen back in again. It was covered by the same uniform grey dust that covered everything, but when Commander Cernan disturbed it, he saw orange colouring beneath. All round and inside that crater the soil was orange, yellow and red, where water had at some time contaminated it and left rusty traces behind. The astronauts bored a core nearly 5ft long, red and orange all the way down until it faded into what looked like black lava at the end. And they knew that they had struck the sort of fracture made by volcanoes when they relieve internal pressure by belching out gases and juices without actually erupting. It was a mirror image of the fumaroles found round volcanoes on earth.

Although it was what the astronauts had expected to find—for it was precisely why Apollo 17 was sent to the Littrow-Taurus area—the sheer excitement of the discovery sent life surging through the dying hours of the space programme and made the controllers on the ground take risks that they would never have contemplated before. The astronauts worked at Shorty crater for so long, and were encouraged from the ground to do so, that they tore up that part of the safety code which says that,

because their lunar rover might break down, the astronauts must keep enough oxygen in reserve to get back to the lunar module on foot. They worked at Shorty well beyond that safety limit, and had the rover refused to start when they asked it to, both would be dead now.

Up to this point in the space programme there have still been scientists ready to argue that there is nothing that astronauts have done which cannot be done more easily, more cheaply and at less human risk by instruments; the most valuable scientific work to date has come less from the astronauts than from the small robot research stations that they have set up on the moon. But no robot can tear up its instructions as the astronauts have done because they have found something more interesting to do. In the last hours of the Apollo 17 mission human initiative took over in response to the challenge of the unexpected. They found no more water traces the next day, though, when Van Serg turned out to be just a typical impact crater. But the real point had been made: there have not been enough Apollo landings in enough interesting areas to let man know what the moon is capable of.

The Americans have decided that they will not face this challenge on the moon again in this century. They have grown middle-aged and lost the edge of their once-fabulous enterprise. A nation that trekked across wildernesses after the merest whiff of gold, or in search simply of room to breathe and space to rear its children, has lost its taste for new frontiers. The moon turned out to be a less dangerous place than man expected, and more adaptable. With this new confirmation of water locked in it (some scientists had predicted it would be there from their first glimpse of the Apollo 11 samples four years ago), the last major barrier that it seemed to hold out against man has proved as much a chimera as the rest. But who are we in Europe to criticise the Americans? They went to the moon. We did not even try.

When you're dealing with a market as different as the Orient

The Orient is a place of contrasts, none more apparent than between the traditional junk and a modern cargo ship.

you need a bank that's different

The Hongkong Bank Group is the only truly international banking organisation with its headquarters in Hong Kong, the financial heart of the Orient. The Group has branches throughout the Orient—in Singapore and Shanghai, in Macao and Malaysia, in Indonesia and every other Asian country of current and potential financial importance.

Today the Hongkong Bank Group is providing a vital financial bridge between Europe and the East. It can link the business enterprises of the EEC with the world's biggest underdeveloped markets. It is the bank that knows these markets better than any other. There is an office or a representative near you to provide services, information and advice.

BRITAIN

See Brussels and die

The Labour party has succeeded in making itself look even sillier over Europe. On Wednesday, when Mr Heath was announcing the names of the Tory delegation to the European parliament and the Liberals were asking for their representation to be increased, the parliamentary Labour party finally came out against sending its MPs to Strasbourg. That had been expected; what had not been was the passion of Mr Harold Wilson's criticisms of the British press and of those among his colleagues who had declined to run away from the pro-European policies of the last Labour government.

It was a remarkable performance. Speaking to a meeting of over 220 of his MPs, Mr Wilson announced that the issue before them was a minor matter, a procedural question. And then he got going. The leakers and briefers—familiar figures from the days when he was prime minister—had once again been doing their best to damage the party. The Evening Standard had been handed a message from the French socialists indicating their anxiety about the line they feared the Labour party was about to take. "If they have a message to address to us," said Mr Wilson, "the address is the Labour party, not the Labour Committee for Europe, copy to the Evening Standard. There is one Labour party and this is it."

Then there was the case of Herr Willy Brandt's letter. In this, the German chancellor urged the Labour party to participate in the European parliament; it was handed over to Mr Wilson last Friday by a German member of a socialist delegation from the European parliament which had come to appeal to him to change his line on Labour representation. "This," said Mr Wilson, "found its way into the press—not from Bonn."

After a few more swipes at the Tory press and, as an afterthought, one at Mr Heath, Mr Wilson turned with evident pleasure to Labour's pro-Europeans. He had, he said, praised the sincerity of those who had taken a different view from him about Mr Heath's terms for entry into Europe. But there were times when he wished that those tributes had been reciprocated, that "just once in a while that some of our own colleagues might have perhaps dissociated themselves from the press and the Tory smear campaign."

The pro-Europeans, who had consistently urged that the party should accept Mr Heath's terms, should, he said, admit that everyone else in the party had been equally consistent. He had been consistent, so had the party, so had the conference—right from the time of the document accepted by the 1962 Labour party conference after Mr Gaitskell's speech. Mr Wilson, the man who launched the great European initiative as prime minister, got away with this without the derisive laughter it deserved. "From today," said Mr Wilson, "I for one will have no patience whatever with anyone who rocks the boat."

The debate was rather confused, largely because so many amendments had been tabled to the shadow cabinet's recommendation. Mr George Cunningham, an intelligent moderate who is an anti-marketeer, moved the first—which was the one the marketeers had decided to throw their main support behind. This was a straightforward demand that the party should send its men to Strasbourg. Mr Cunningham, a former member of the international department at Transport House, spoke well. He must have known that the prospects for success were pretty slim, but the vote went

against him by only 134 to 88. There were several rather poorish speeches from the hard-line anti-marketeers, but Mr Ian Mikardo was direct. He attacked the pro-marketeers and the self-appointed, self-chosen individual pundits who professed to speak for the socialist parties of Europe—and who had come down against Labour boycotting the European parliament.

This, said Mr Roy Jenkins, when he came to speak from the body of the hall, seemed a rather curious way in which to describe Chancellor Willy Brandt. Mr Jenkins said that if Labour boycotted the parliament it would be staying away from an institution that included everyone from the Italian communists to the Danish social democrats. And what about the party's demand that the terms of entry into the EEC should be renegotiated by the next Labour government? That could only be done if the party received the goodwill of the progressive forces within the community—precisely the people who would be dismayed, mystified and ultimately disillusioned if Labour were to boycott the European parliament. And then, after a majestic tirade from Mr Michael Foot, Mr Wilson secured his majority. This meeting, Mr Wilson had said earlier, was the end of a chapter, not the beginning. Mr Wilson is deluding himself—but not his party.

Jenkins: boatrock-in-chief?

You seldom see  this name on it...

Plastic taps and showers in beautiful colours are made by IMI Opella, one of the companies in the fast-growing IMI group.

Each company is free to decide how best to meet the needs of its customers.

Each is backed by IMI's strength in planning and financing.

The facts speak for themselves:

1966 turnover £69 million (IMI's first year as a public company). 1971 turnover £180 million.

Refiners and Producers of copper, copper alloys and new metals such as titanium and niobium. Fabricators of non-ferrous metal and plastic products and components—car radiators, coins, sporting cartridges, taps, carburettors, chemical plant, plumbing fittings, water heaters, beer coolers, zips, superconductors, and hundreds more.

IMI means more than metal

THIS IS A PICTURE OF YOUR COMPUTER MANAGER ABOUT TO DEVELOP A HEADACHE.

When lightning strikes a power line, it could send pulses of 1,000 volts or more racing to the computer system.

On the other hand, it could cause a complete breakdown.

Either way it could be very painful to a Computer Manager.

Any power fluctuations or momentary breaks will cause computer errors, malfunctions and processing interruptions.

However, relief is to hand.

It's called the 'Accupower' system.

It's an uninterruptable power supply, which will filter the excess voltage and provide

stand-by power.

The storage battery in the system can be sized to prevent processing interruptions during complete power failure and also allow computer operation during power reductions or increases.

If you've made a big computer investment, you ought to find out about 'Accupower' systems.

The people to contact are:

Borg-Warner Controls, Division of Borg-Warner Limited, Elgin Drive, Swindon, Wiltshire. Telephone: 0793 24121. Telex: 449101.

Don't leave it too long, you never know when a strike may make your computer redundant.

Accupower is a registered trade mark.

Swann: map-reading

BBC

Back to the old ways

The many speculations about Mr Heath's search for a successor to Lord Hill as chairman of the BBC's board of governors ended on Thursday morning with the announcement that Sir Michael Swann would take over from January 1st. It had been obvious since the Minister of Posts and Telecommunications, Sir John Eden, had announced that the new chairman's salary would be frozen at £6,000 a year that the Government had abandoned any thoughts others might have had for it that the BBC was due for a radical restructuring at the top. Sir Michael's appointment is in the old tradition of BBC chairmen: a respected public official or administrator backstopping part-time for the BBC's professionals.

Sir Michael Swann, who is 52, is a distinguished scientist and university administrator; he has been principal and vice-chancellor of Edinburgh University since 1965. In government circles he has the reputation of being a good committee man: that talent will come in useful in his relations with the top echelon at the BBC, as will his experience with militant students when it comes to his relations with some of the younger BBC current affairs producers. It was with that in mind, perhaps, that Sir Michael said he did not think there was a great difference between running a university and the BBC.

If Sir Michael plays his role according to the script worked out by the BBC's professionals—past and present—much more authority will now flow back to the director-general, Mr

Charles Curran. Sir Michael used a motor car analogy when he gave a press conference on Thursday. He said the director-general would be driving and the chairman would be sitting next to him—map-reading. In a real sense, the new chairman's appointment is as much a test for Mr Curran as it is for Sir Michael. Mr Curran is not without his critics, either within the BBC or among politicians, and Mr Heath is, perhaps, giving the BBC a last chance to prove that the old system works. It is worth noting, for example, that although the chairman is normally appointed for five years, Sir Michael's term runs only to July 31, 1976, when the current BBC charter expires. Mr Heath has left himself with plenty of room for manoeuvre if it seems necessary to restructure the corporation then.

Homelessness

There is an emergency

No one knows how many people, or families, are homeless in the literal sense of having no house at all to live in, but even without the latest Shelter report* on the subject it was becoming obvious that the problem was increasing—often in places well outside the big cities where the authorities have little experience or will to cope with it. There are families with several children who live in cars; there are parents sleeping in railway stations while their children are in local authority homes; there are more and more London boroughs which adopt the desperate expedient of putting homeless families into boarding houses where they are turned out between breakfast and tea each day.

The best measure that exists, and it is a poor one, is the numbers of families recorded as applying to local authorities for temporary accommodation. They rose from 21,678 in 1969 to 24,691 in 1971, an increase of nearly 15 per cent, and a sharper rise is expected to show this year. Only a minority of these families—5,630 in 1971—were actually admitted. The Shelter report looks at this gap, which contains very painful stories. It does not, incidentally, cover lone individuals or childless couples because these are never eligible for this type of help—although they fall between so many other stools that there is reason to believe their plight may have become relatively even worse.

*The Grief Report. Shelter. 25p.

The causes, usually a mixture of economic pressure and personal crisis or inadequacy, have changed little since they were analysed in two reports (one by Professor John Greve) commissioned by the Government and published in May last year. But some pressures have intensified as property values rocket by about 20 per cent annually and lead landlords to sell off houses as fast as they can get rid of their furnished tenants. The turnover in the property and investment market also affects tenants of tied accommodation, who appear in many of the Shelter case histories. And such is the cost of housing in some areas now that it is possible for a man earning £40 a week to find himself in a homeless hostel. The plight of a homeless family in a prosperous part of the home counties may indeed be more hopeless than in London, where though pressures are fiercer the problem at least is recognised. But Buckinghamshire, for example, has only just begun for the first time to provide temporary accommodation.

The Shelter report argues that local authorities have a much more definite legal obligation than they admit to look after homeless families on the street for whatever cause—not just an "unforeseeable" one. But if the law is ambiguous, it should be amended. Far more important is the need to overcome the "sturdy beggars" attitude of so many authorities, which use administrative means to pass on responsibility to some other authority or to define their rules so narrowly as to exclude almost everybody.

A start has been made in London, where a working party followed up the Greve report on homelessness there and has at any rate got the boroughs to work a bit more uniformly and co-operatively. Most inner boroughs have accepted the recommendation that the housing department, rather than the welfare department, should be responsible for homeless people, and this is encouraging the adoption of homeless families as full council tenants along with people in other sorts of acute need. (This method should be encouraged, and as a measure of good intentions makes Shelter's use of hostel accommodation look rather old-fashioned.) Outside London, after the reorganisation of local government, there will be more areas where housing and welfare will be at completely separate levels of government. This makes it increasingly unlikely that homeless people will easily get permanent council housing, even

where it exists to spare, and likely that families will continue to be made homeless by eviction by councils.

Another possible outcome of the Greve report is the development of an early warning system whereby courts warn councils when eviction orders are about to be served on tenants; the Lord Chancellor's approval is still awaited. For years furnished tenants have been recognised as the most vulnerable sector and for the first time since 1965 a step has been taken in their favour this week with the publication of proposed amendments to the law which would bring them within the scope of the new rent allowances for private tenants. It should help about half the 600,000 furnished tenants—and incidentally help to sort out people who are homeless because they cannot pay the rent from those who cannot help not paying the rent. There is a lot more to homelessness than anyone would guess from reading the Shelter report but there is also good reason for the indignation of its authors and others who have made the cause of the homeless their own. It is just a pity when tactics are sometimes self-defeating, as when Shelter-backed squatters occupy houses belonging to Shelter-backed housing associations.

Nursing

Away from home

The complaints of doctors from overseas working in the hospital service have been widely publicised in recent years. Now it is the turn of the nurses. PEP has published the report* of a survey of nurses from developing countries that was undertaken for the benefit of the Briggs committee on nursing. Briefly, it finds that these nurses are chosen haphazardly in their own country and given by the hospital recruiting them a letter of acceptance to satisfy the immigration authorities, but are neither properly assessed to see what type of nursing they are suitable for nor consulted on which form of training they should undertake.

The inquiry found that overseas nurses are as well-qualified educationally as British-born nurses, but they tend to be found disproportionately in the least popular type of hospitals—mental illness or geriatric—and in training for the state enrolled nurse qualification, which has less prestige than the state registered nurse one and

*Overseas Nurses in Britain. PEP. £1.

Overseas nurses: vulnerable

may be valueless in her own country. Often, too, an overseas nurse finds herself arriving to nurse in a psychiatric hospital, when she thought she had been accepted by a general hospital.

Yet only a third of nurses training in a psychiatric hospital said they would have preferred general nursing, so perhaps this criticism of the way nurses are recruited is not so valid as is made out in the report. And though it found that a "substantial minority" of overseas nurses were not happy in their first weeks, this is not really surprising. Au pair girls—whether Italians in England or British girls in France—have similar feelings of unhappiness, as indeed have any young people who leave their own homes and countries for the first time. But this does not, of course, excuse the hospitals for their haphazard methods of recruitment and for the lack of advice and guidance that the overseas nurses receive. It is high time that the senior officers responsible for recruiting and training realised that these "pairs of hands" are particularly vulnerable.

Ulster

Talking again

Mr Willie Whitelaw's latest round of separate discussions with Ulster's political parties should be completed before Christmas. This week the Secretary of State saw the six MPs from the main Roman Catholic opposition, the Social Democratic and Labour party. This was an event in itself, for since the SDLP walked out of Stormont in July, 1971, it has kept up an obdurate refusal to talk with the British Government until all internees are released. That the SDLP is now

prepared to talk about its proposal for condominium in Ulster, a joint sharing of sovereignty between the Irish Republic and Britain prior to a reunification of the whole country, is another sign that the Provisional IRA is on the run. But it is not a proposal likely to find favour with Mr Whitelaw; it even has few backers in Dublin nowadays.

Mr Whitelaw is finding the Protestant community as divided, confused and angry as ever, particularly in Belfast. Without power or patronage, and precious little influence over Government policy, the Unionist party has been steadily deteriorating since direct rule. Mr Brian Faulkner is still the party leader, but his leadership is increasingly questioned. He still believes Protestant unity is essential, but the balancing act of keeping the extremists within the party while retaining credibility with his own moderates and the British Government is taking its toll. At the meeting of the Unionist party's standing committee on Monday he blocked the attempt by two moderates, Mr Stratton Mills, Westminster MP for North Belfast, and the former Stormont community relations minister, Mr Basil McIver, to make the ultra Protestant Vanguard movement a proscribed organisation. It has not endeared him to the moderates in either community.

But both Mr Whitelaw and Mr Faulkner know that the dangers of a violent Protestant reaction to the Government's proposals on the future of Ulster are still very real. The plebiscite on the border will now be held on March 8th—the earliest date possible after the electoral registers come into force in February. And the promise of an increase in the size of the Ulster contingent at Westminster would help to dilute anger at the prospect of a regional administration without the trappings of a separate government. The suggestion that Ulster's 12 MPs might be strengthened by the addition of a further four or five on a strict population basis has support in the Tory party, including the former home secretary, Mr Reggie Maudling; but it will not go down well with Labour.

One former Stormont minister has begun to think about the province's troubles in a wider context. In a Chatham House paper on Wednesday, Mr Robin Bailie suggested that the proposed Council of Ireland might devote its energies to the development of a common regional policy across the Irish border, under the umbrella of

Our banking bridge has crossed an ocean and now a continent to reach California.

European-American Banking Corporation has opened a branch in Los Angeles. This new banking facility establishes a link between the Pacific Basin, New York and 8,000 offices of six of Europe's leading banks.

European-American is unique among international banking organizations. American by charter, it has as its shareholders: Amsterdam-Rotterdam Bank of the Netherlands, Creditanstalt-Bankverein of Austria, Deutsche Bank of Germany, Midland Bank of the United Kingdom, Société Générale (France) and Société Générale de Banque of Belgium. Their total resources exceed \$53,000,000,000.

European-American Banking Corporation, Los Angeles, offers a broad scope of banking activities on the West Coast, ranging from export-import services and foreign exchange operations to domestic and worldwide financing.

We've crossed an ocean and a continent to bring you our unique blending of international banking expertise, one-part European and one-part American.

Let's get acquainted. Come in and meet Christian L. Vontz, Senior Vice President and Manager of the West's newest international banking organization.

Baillie: thinking about the future

the EEC commission in Brussels. Joint co-operation for the economic recovery of the impoverished north-west in counties Donegal and Londonderry might reduce the political divisions. But Mr Baillie appreciates that such a project could not be imposed on the people of Northern Ireland, for that would merely intensify what he calls the "colonial neurosis" in Ulster. The political will and the recognition of mutual self-interest may not yet be strong enough to get the idea off the ground, but it is time Ireland's political leaders started thinking of these matters.

Liberals

After the ball was over

Public celebrations by the Liberals of their by-election victory at Sutton and Cheam lasted several days—starting with the party's annual ball at which Mr Thorpe was able to give the first news of Mr Tope's success. But within hours of that success they were faced with a dilemma familiar to those who had known earlier revivals. Should the Liberals fight on a broad front or a narrow one?

There was immediate pressure to put up candidates in every future by-election, although experience has shown the wisdom of being selective and concentrating all possible organisational and canvassing effort in particularly favourable seats. Mr Thorpe was understandably anxious to capitalise upon the Rochdale and Sutton and Cheam victories by calling for an all-out fund-raising campaign, accompanied as usual by a mass rally of the faithful in somewhere like the Albert Hall in London, with an ultimate

target of £250,000. The justification for such an appeal is to allow the Liberals to carry the fight more effectively to their two major opponents; but that does not mean that Mr Thorpe, skilful tactician that he is, wants to see his troops offer themselves as cannon-fodder in hopeless battles.

After Mr Tope's achievement there were immediate calls for the party to reverse its decision not to fight the Lincoln by-election. The parliamentary party stepped in quickly to stifle that notion before it took on the guise of a crusade and on Wednesday evening proclaimed its view that the Liberals should stay out of the Lincoln fight and give their support to Mr Dick Taverne. The fact that the Labour party so obviously hoped the Liberals would stand—and hence indirectly help the Labour official candidate against Mr Taverne—may well have influenced that decision. The last cause the Liberals want to help at the moment is that of the Labour party.

The Lincoln decision was a sensible one on many counts, not least because a Liberal candidate standing in such a curious by-election would poll humiliatingly. But two other by-elections lie ahead, both of them, like Lincoln, in Labour seats, and they may well come before Lincoln. Neither, to say the least, looks a likely gain for the Liberals, although they could hardly fail to get a respectable second in the solid mining constituency of Chester-le-Street. The Scottish Liberals are trying to put over a positive middle line about north sea oil, agreeing that Scotland ought to derive some direct revenue from it while condemning the Scottish Nationalists' claim to the lot. But it would need a bottle of that celebration spirit to imagine that Dundee, East could bring much joy to the Liberals.

Taverne: no Liberal opponent

Polls

Election recount

There have already been several post-mortems on the dismal predictive failure of the public opinion polls (except for the very last estimate by Opinion Research Centre) to pick the winning party before the 1970 general election. They have had to face a disheartening truth. The pollsters could partially cover themselves against failure by shouting (rather louder than they did in 1970) about the limitations of sample surveys. Sampling theory decrees that, given the size of their samples, the figures the pollsters come up with for the gap between the parties merely indicate a 12 per cent range within which the true values lie.

But that would mean they can pick a winner only when one party is at least 6 per cent ahead of the other—which was true in just two postwar elections, 1945 and 1966. (Even then, sampling theory dictates that they would be only 95 per cent certain of the winner.) And that is not the whole story. Marplan's final estimate before the 1970 election was for an 8.7 per cent Labour lead, Gallup's was for a 7.0 per cent Labour lead and National Opinion Polls' was for a 4.1 per cent Labour lead, which were all more than 6 per cent from the final result (a 2.3 per cent Tory lead). Apart from ORC, only the Louis Harris organisation could argue that its final estimate—for a 2 per cent Labour lead—covered the actual result. Something, plainly, had gone badly wrong.

A report* published on Wednesday by the Market Research Society, contains both a particularly thorough attempt, by a committee of market researchers and statisticians, to assess the polls' performance and some recommendations for the future. Inevitable sampling errors can be so large that the committee found it difficult to apportion blame for the rest of the discrepancy between such obvious sources of error as sampling practice, non-response, bias in the interview techniques, differential turnout and, of course, late swing. It found that the sampling technique and response rate achieved by those using random samples were "normally" successful, but the evidence that there was no difference between the voting intentions of the 10-15 per cent of the sample the interviewers failed to contact and those of the rest was

*Public Opinion Polling on the 1970 Election. Market Research Society. £1.25.

inconclusive.

As for bias and differential turnout, there certainly is evidence that the polls have consistently overestimated the Labour vote; Gallup and NOP, the only two polling organisations to have covered every election since 1964, both overestimated the Labour vote each time. Pollsters do ask questions on the respondent's likelihood to vote, but the answers are obviously difficult to interpret. (They may, of course, simply be untruthful.) The possibility of a late swing will always remain the pollsters' let-out, though the committee does recommend the experiment of sample surveys right up to and on polling day. It is perfectly possible to attribute the apparent trend to Labour in the polls during the 1970 campaign to sampling error, but their consistency does suggest some movement in opinion.

The committee is rather more precise in its recommendations for future practice. It is possible, but difficult, to reduce the standard error of the result very much by increasing the size of the sample: it would have to be increased by the square of the required reduction in the error—for example, 16 times to reduce the error to a quarter of its present size. And the potential error in the estimate of one party's lead over the other—which is what everyone is interested in—must always be double the error inherent in estimating one party's share of the vote. Estimates of changes in inter-party gaps are susceptible to errors twice as large again, but the committee recommends the use of linked samples, which can reduce this error by as much as two-thirds. The danger is of conditioning respondents or reducing their response rate.

The committee believes that only random samples should be used (ironically, the only one to pick the winner, ORC, used a quota sample) because then, at least, genuine estimates of possible sampling error can be made. It sensibly suggests that polling should be concentrated in "unsafe" seats (defined more widely than marginals, to include about 150), arguing that it is pointless estimating swing in constituencies which are not going to determine the outcome of the election. There is also a discussion of the framing of sample questionnaires. The key factor is the build-up of questions to the crucial one on voting intention: ORC achieved a particularly high rate of response to this question.

The committee finally recommends the creation of an independent com-

mittee to comment on the meaning and accuracy of poll results as they are published during the campaign. There is an appendix containing the code of practice that the five polling organisations under review laid down for themselves and their publishers in May, 1970, designed to eliminate the main pitfalls of interpretation—insisting, for example, that major changes in the numbers saying they would not vote or they were undecided should always be published; that pollsters should make available information on sample questionnaires and methods; and that (where they retain the copyright) they should be ready to make available any findings not published by their newspaper clients. This report argues that not enough use was made of the data in 1970: a committee, perhaps, could make sure that it was, and not only at general elections. There are worse dangers inherent in political opinion polls than making their organisers look foolish.

Hospitals

Fire risks

No hospital can be completely free from risk of fire, any more than any other public building. Even if the premises are up to fire authority standards (in 1971 it was estimated that to ensure such standards throughout the country would cost nearly £6m) the human element remains. All that can reasonably be done by hospital authorities is to eliminate unacceptable fire hazards in their buildings, determine to eliminate remoter ones when budgets allow them and see that their drill for dealing with a fire, should one break out, conforms to the regulations.

The committee of inquiry into the terrible fire at Coldharbour hospital in Dorset in July, in which 30 mentally

handicapped patients died, found* that the authorities there had accepted too great a risk in their laudable attempts to make the villa concerned more homely. The difference between a long barrack-like dormitory, with rows of beds almost touching, and the same dormitory broken up by partitions giving the patients some sense of privacy and domesticity, is striking. In carrying out this form of upgrading the hospital authorities at Coldharbour were aware that it would involve fire risks; the question was, were they acceptable in the light of what they were trying to do? The committee thinks that these risks were not acceptable and that all partitions and furniture should be made of, if not non-combustible, at least highly flame-resistant materials.

The fire spread rapidly at Coldharbour because of the materials used for the furniture and bedding. Once alerted to the outbreak the staff acted promptly and in some cases with gallantry, and though the committee makes a recommendation to improve the fire drill, it did not find the hospital's fire prevention arrangements seriously at fault. The fire started because a patient somehow or other lit a flame, and he did so when the night nursing assistant was absent from the dormitory and was talking with the charge nurse in the kitchen.

The committee accepts that the assistant could not be expected to remain in the dormitory all the time and if he had been absent for only five minutes the fire could still have broken out. But an absence of half an hour was unacceptable and ought not to have been allowed by the charge nurse.

The Coldharbour tragedy was the result of a human failure in a progressive and humane hospital.

THE WORLD

International Report

Little, very little, from Erich

Next Thursday's ceremony in east Berlin for the signing of the general treaty between east and west Germany is likely to be regarded differently by the east German leaders and by most of their people. For Erich Honecker and his colleagues, this treaty does more than just normalise relations with west Germany. It signifies the removal of the last obstacle to east Germany's full international recognition. Once the west German envoy has taken up residence in east Berlin, some time next year, even the Nato governments, which have looked down their noses for years at east Germany, will have to follow suit.

But the treaty is a great deal less exciting for many east Germans, especially those with relatives in west Germany, because it has brought with it new worries. The main anxiety is about the new east German regulations which seek to discourage almost all east Germans from closer contact with their relations and friends in the west. The people in question are the "official secret-holders," who apparently include not only senior party and government officials and army and police officers but anybody, even a teacher, who works for the government.

All these "secret-holders" have been asked to fill in forms giving details of relatives in the west and their own contacts with them. They have also had to sign an undertaking that they will not pass on to visitors from non-communist states any information that could be used against east Germany. In some factories and offices employees have been "persuaded" to abandon their arrangements to visit relatives in the west on approved urgent family business like funerals or weddings. This may explain why visitors from the west have recently been finding that even their relations have been reluctant to

see them or talk to them.

The growing evidence that the east Germans are clamping down on human contacts has clearly disturbed the west German government. The subject was raised on Tuesday when Herr Egon Bahr, who negotiated the general treaty for Herr Brandt, met his opposite number, Herr Michael Kohl, in Bonn. But there is little that the west Germans can do unless the east Germans can be shown to be flagrantly disregarding the letter of the various agreements, even though they may ignore the intention behind them and much of the finer print too.

With no incentives to make further

concessions, the east Germans must now be tempted to whittle down the relatively few they have granted in order to ensure that the eastern treaties would be ratified by the Bundestag and Herr Brandt re-elected. With all that in the bag and international recognition assured, the east German leaders can sit back and hope that economic incentives will keep their people from dangerous thoughts.

Last week the party's central committee resolved to improve domestic production of shoes, textiles, furniture, television sets and other consumer goods. The output of the consumer sector is to grow slightly faster next year than that of the rest of industry. The ministers in charge of light industry and domestic trade were sacked a few weeks ago and replaced by younger, more dynamic men.

But Herr Honecker may face one disappointment. At west Germany's request, most western countries will

"My stepbrother. With luck he'll relax a bit later on"

Frankfurter Allgemeine Zeitung

probably refrain from declaring any outright recognition of east Germany, even though they will quietly establish diplomatic relations. This will underline the theory that the normalisation of relations between east and west Germany does not mean that the German problem has been solved. But this gesture is unlikely to worry the east German leaders too much. Nor are they likely to worry about disclaimers that the sending of western ambassadors to east Berlin recognises east Germany's legal title to their half of the city. The reality of recognition is what matters to Herr Honecker, and that is what he will be getting next Thursday.

Old, familiar faces

FROM OUR BONN CORRESPONDENT

Willy Brandt was duly re-elected west Germany's chancellor for the next four years by the new, seventh, Bundestag when it met on Thursday morning. The size of his majority—there were 269 votes in his favour compared with 223 against—was the exact measure of the extra margin of security he won in last month's election, allowing for the two members on each side who did not vote. It was a comforting moment for the chancellor as he sets out into the uncharted waters ahead. And in choosing his cabinet, due to be sworn in on Friday morning, the chancellor has evidently been guided by the old political maxim of not changing a winning team. Almost all the old faces will be there.

Herr Scheel, the leader of the Free Democrats, remains vice-chancellor and foreign minister. Herr Genscher, his Free Democrat colleague, stays at the interior ministry, having resisted an attempt to move him to the ministry of economics. The economic and finance ministries, which were merged under Herr Schiller, will again be split. Herr Schmidt retains the finance ministry, as he wished. Also as he wished, he will keep for himself some of the more important functions of the now downgraded economics ministry, which goes to a Free Democrat. It seems that the Free Democrats will have five ministers in the new administration, compared with three in the old—a generous repayment for their 11 extra seats.

The horse-trading between the Social Democrats and the Free Democrats about people, posts and policies went on until the last minute. There is reason to believe that if Herr Brandt had not been laid up with throat

trouble during much of this period the cabinet might have had a slightly different look. It is strongly rumoured that the chancellor wanted Herr Genscher to take the economics ministry to counterbalance the powerful Herr Schmidt, but that on his return from hospital he found the two ministers had worked out the new division of labour for themselves. Faced with this fait accompli, Herr Brandt quickly gave notice that he may reshuffle the government in two years' time.

During these two years the chancellor will have to face some political home-truths. He is already trying to tackle them head on. First, he has had to warn both right and left in the party to show a little solidarity. The left must not allow the freedom of an unexpectedly large majority to go to its head. Herr Brandt has also wagged a finger at certain ambitious figures on the right who have been hinting that the chancellor or the government may run out of steam in mid-term.

Second, the chancellor has condemned talk of a split between the Social and the Free Democrats at the next election. The Social Democrats do not have an overall majority and such talk, to put it mildly, is politically premature. But differences remain between the two coalition parties on a whole range of domestic issues, notably that of management-sharing between employer and employee in industry. So compromises will have to be reached as the new Bundestag gets into legislative gear in the new year.

When the new Bundestag met on Wednesday it was a former Christian Democrat chancellor, Herr Ludwig Erhard—now, at 75, the father of the house—who called the deputies to order. A mere 30 were women but one,

Frau Renger, the new speakeress

Frau Annemarie Renger, was chosen to be the new speaker. Frau Renger, a Bundestag veteran, has been described as "liked, but not well-liked."

The house has 149 newcomers, 193 members entitled to call themselves "Doctor," and an average age of 46½. Many old and respected faces are missing. One of them is Herr Walter Hallstein, who in the Adenauer days gave his name to the doctrine which barred west Germany from having relations with any country which recognised east Germany. He will be spared witnessing the final burying of the Hallstein doctrine when the Bundestag ratifies the inter-German treaty in a few months' time.

Ireland

Canny Jack

FROM OUR DUBLIN CORRESPONDENT

After all the recent excitements, both inside and outside the Dáil, life in the Irish republic now seems to go on much as before. So far the authorities have hardly used the wide powers conferred on them by the anti-IRA act passed on December 1st, and have thus stung the Labour politician, Mr Conor Cruise O'Brien, into declaring the legislation "window-dressing." Two reasons are given for this. The prime minister, Mr Lynch, a master of timing, is believed to be waiting for another occasion, such as further bomb blasts, before encouraging the police to round up suspected members of the IRA. Alternatively, he may be holding the new powers in reserve until Mr Heath moves against the Protestant extremists in Northern Ireland.

His other worry has been to put the best possible face on the results of the double referendum of December 7th. They seemed conclusive enough—an 85 per cent majority in favour of lowering the voting age to 18 and an 84 per cent majority for deleting from the constitution the recognition of the special position of the Roman Catholic church. But on a deeper examination they are less satisfactory. Only 51 per cent of the electorate voted and of these about 5 per cent spoiled their votes. Only some 43 per cent of the total electorate gave its approval to the church measure.

The reason for the lowest poll in any referendum since 1937 may have been the absence of any real campaign, since all the parties were agreed on the proposed changes. And the bombs that went off in Dublin the previous weekend had monopolised

Worldwide headquarters for disease control is the Atlanta based national Center for Disease Control. CDC participates in global programs to eradicate and prevent the spread of communicable and vector-borne diseases, and conducts extensive applied research activities toward developing methods of diagnosis, control, and prevention. The Center trains about 10,000 health workers

from around the world and conducts seminars for thousands of members of professional societies and health associations every year. Teams of specialists are mobilized within hours to help quell such emergencies as an outbreak of smallpox in Yugoslavia or the spread of bubonic plague from Java. CDC adds international medical importance to Atlanta—the world's next great city

For more about Atlanta contact Harold Carter, Atlanta Chamber of Commerce, 1368 Commerce Building, Atlanta, Georgia 30303 USA. Cable: Atlanta fax.

exchange parities and trade, and one has all the ingredients of panic.

It was not Mr Sonnenfeldt's intention to foster such panic, and Mr Rogers, speaking a few days before him, was specifically authorised by the White House to link the numbers of American soldiers in Europe with trade concessions from the EEC only in the most indirect and friendly way. Indeed, Mr Sonnenfeldt said that the Administration looks for partnership and sounds tough and "imperious" only when it is under pressure from Congress and the lobbies. It is the familiar cry, maybe, of an American administration looking for an excuse to twist arms, but it happens to be true this time. The trade quarrels next year in Geneva and the disputes about monetary reform in the Committee of Twenty will not be pretty. But Mr Nixon's men are asking for political co-operation and a fair deal from the European allies before those quarrels about detail are allowed to go too far. Europe is being warned, not sand-bagged.

Russia and China

The paper war

It may not be true, but if it isn't it would be interesting to know why it was invented. On Tuesday the Chinese foreign ministry formally denied that there had been a fight between Chinese and Russian troops on the Kazakhstan border in November. A Soviet foreign ministry spokesman said the same day that he knew nothing about it, which, Soviet foreign ministry spokesmen being what they are, is not quite the same as saying it didn't happen. For all that, it does seem that a document describing an alleged fight on the border in which five Soviet soldiers were killed came into the possession of a number of Russian journalists in late November, presumably by permission of the Soviet authorities, and that one of the Russian journalists let somebody from the west see it.

There are two possible explanations of this. The first is that, whether or not this particular skirmish took place, the Soviet government is genuinely worried about the situation on its China border, and wants to keep its public opinion worried about it too. This is the explanation that most people in the west would like to be true. It is not in the west's interest that there should be a war between China and Russia; but it is a western interest that they should remain so preoccupied with

one another, short of war, that they are willing to be reasonable about their other border areas—the Soviet Union about eastern Europe, China about its relations with the small countries of south-east Asia. This is the basis of the Nixon and Brandt foreign policies. The only trouble with this theory is that the document in question does not actually seem to have been read by any significant number of Russians.

The other explanation is that the document was designed, from the start, for western consumption. Its aim would then have been quite different. It would have been to persuade western governments that, with a crisis simmering along the Chinese-Soviet border, it would be impolitic to press the Russians hard about the liberalisation of eastern Europe—in particular, about freer movement of people and ideas between the two parts of Europe. This is precisely what the Russians want to avoid being nagged about at the coming conference on "security and co-operation" in Europe. In the mind-bending world of counter-intelligence and disinformation the true explanation of things like this mysterious document is generally the most complicated one. The second theory could be the better bet.

Holland and Belgium

Tale of two cities

Both Holland and Belgium are now in dutch, politically. The search for a viable coalition government goes on in both capitals—without much hope. The Belgians are starting to think of holding fresh elections in the hope of shaking their kaleidoscope into a more manageable pattern, whereas the Dutch have just held elections—for the second time in only 20 months—and found themselves in as big a mess as before.

The new Dutch lower house contains 14 parties, like the old one. Labour has gained ground again, but it and its allies hold only 56 out of 150 seats. The chances of reviving a Labour-Catholic coalition have been diminished by the Catholic party's continued loss of support. Until last year it was the largest party, with 42 seats; now it has only 27, and its members are visibly divided about the best choice of partners. Mr Andriessen, its parliamentary leader, has proposed the installing of a temporary government on a non-party basis. Meanwhile Labour's leader, Mr Joop den Uyl, has declared himself ready to form a

Eyskens has had enough

minority government; but it is widely expected that the haggling will go on for months.

On the surface, the Belgians' situation seems far simpler. In a 212-seat lower house, 128 seats were won in the elections of November, 1971, by the Social Christian (67) and Socialist (61) parties, the partners in the coalition headed by Mr Gaston Eyskens. On paper, this comfortable majority still exists. But Mr Eyskens has resigned (and, indeed, has announced that at the age of 67 he has had enough of Belgian politics), and the new crisis in Brussels may last as long as the one in The Hague.

Constitutional reforms providing for regional decentralisation have not relieved Belgium of the strains and stresses of the antagonism between Flemings and Walloons. Ironically, it was Mr Wilfried Maertens, chairman of the Social Christians' Flemish wing, to which Mr Eyskens himself belongs, who brought the government down by insisting that one of the last of the decentralisation measures must be approved by a two-thirds majority. It is feared that the holding of fresh elections against this background would benefit only the overtly communal Flemish and Walloon parties, whose recent electoral gains have already heightened the communal tensions within the older parties.

The idea of building up a two-thirds majority by bringing the (conservative) Liberals into a larger coalition has been flatly opposed by the trade union leadership. On Tuesday Mr Josef de Saeger, a prominent Flemish Social Christian, abandoned the search for a new coalition formula which he had undertaken, at King Baudouin's request, on November 25th, three days after Mr Eyskens had resigned. On Wednesday the king asked Mr Edmond Leburton, a Walloon Socialist, to try to form a government. His chances were not rated high.

The Edwardian Christmas Dinner.

A gourmet's guide.

To begin. A dish of finest caviar. The addition of chopped onion and lemon juice is to be discouraged. Serve simply with thin slices of buttered rye bread and a glass of well-chilled champagne.

After the caviar a tureen of game soup. To complement the flavour of partridge or hen pheasant a glass or two of Madeira.

Onwards. To poached fillets of Brill, coated in a delicate shrimp sauce garnished with shrimp tails and sent to the table with melted butter. With this—a deliciously crisp Chassagne Montrachet.

Oysters. Served in the English manner with the juice of fresh lemons and, perhaps, a dash of cayenne pepper. After this a dish of mutton cutlets, grilled and placed on a dish around a mound of mashed potatoes and garnished with parsley.

Having thoroughly whetted the appetite we come to the zenith of the festive feast. A roast turkey. Garnished with bacon and sausages and served with bread sauce, or chestnut sauce or a good rich gravy. To drink? Claret.

To accompany the beautiful bird—a tureen of plain, boiled potatoes and a pyramid of buttered Brussels sprouts. Then to lighten the senses what better than a dish of Russian salad? Not of the tinned and turgid variety

so popular today. A genuine Salade Russe. Complete with truffles and mushrooms, french beans, beetroot, lobster, tongue and ham, mayonnaise et al.

A short respite and on to holly-decked plum pudding, with brandy sauce or brandy butter whichever you prefer. For those with lesser appetites an alternative of maraschino jelly. For all, the luscious and incomparable Château Yquem.

To end. No bits of this and that. No meagre pots of cheese. An English Stilton. Ripe and round. With bread or biscuits. And celery—taken with a little salt.

The napkins lie crumpled. The cigars are lit. The Port is passed from

right to left. Croft Port from the house founded in 1678. Today, two Ports represent the great Croft tradition.

Distinction. Very rare, very old, aged in the wood for ten years, sleek and tawny as a lion in sunshine.

Commemoration. A fine vintage character, rich and full-bodied. As full of promise as the bride of Solomon.

CROFT

Purveyors of Port since the reign of Charles II

Neil Chrisman (second from left), head of Morgan Guaranty's Petroleum Group, reviews engineering reports with some of the unit's specialists

When you need bankers who know the petroleum industry, consider Morgan Guaranty

If you are in the petroleum industry, where capital needs are immense and tax considerations are complex, you need bankers who understand the business of natural resources. Morgan Guaranty has a petroleum group comprising specialists with this kind of expertise.

These experienced bankers devote full time to serving our oil and gas customers in the U.S. and around the world. They know today's engineering and energy problems, and they know how to meet the industry's financing needs, from project lending to production payments. Because our special group understands the business, they can tailor the best all-around financial program to fit specific requirements...whether it's providing a development loan for a medium-size company, arranging anti-pollution financing, or managing multi-bank syndicates. Recently Morgan played a key role in helping to organize a \$900-million loan to a British company for developing a North Sea oil field—

the largest private bank financing ever.

Morgan's specialists travel extensively to petroleum centers the world over. They also have immediate access to the bank's international banking experts in New York and in all our overseas offices, where, in addition to petroleum experience, you will find experts in foreign exchange, international money management, lease financing, export finance, corporate trust—the complete range of corporate financial services.

Whatever your banking needs, consider Morgan Guaranty. You'll be in good company. We're already helping 96 of the world's 100 largest corporations solve their financial problems.

MORGAN GUARANTY TRUST COMPANY, 23 Wall Street, New York, N. Y. 10015; in London: 33 Lombard Street, E.C. 3; 31 Berkeley Square, W. 1 • BANKING OFFICES: Paris, Brussels, Antwerp, Frankfurt, Düsseldorf, Munich, Zurich, Milan and Rome (Banca Morgan Vonwiller), Tokyo, Nassau • REPRESENTATIVE OFFICES: Madrid, Beirut, Sydney, Hong Kong, São Paulo, Caracas • Member, FDIC • MORGAN GUARANTY INTERNATIONAL BANK OF SAN FRANCISCO • Incorporated with limited liability in the U.S.A.

Morgan Guaranty - the corporate bank

A quiet place to go after work.

The inside of a Rover is a great place to relax after a hard day.

Orthopaedically designed seats hold you firmly from three directions. De Dion rear axle suspension gives an unusually smooth ride and the instruments are scientifically arranged to minimise eye movement. There's wonderfully soothing sound insulation and, of course, a wealth of deep pile carpeting and rich upholstery.

One motoring correspondent described the sensation of driving a Rover as 'wearing it'.

And a very comfortable fit it was, too.

Passenger Protection.

The strength of a Rover springs from an all-steel base unit which carries all the mechanical parts and cocoons the passengers' compartment in a high-tensile protective steel cage.

When the AA awarded Rover the first-ever gold medal for safety it was, you can be sure, no accident.

Confidence.

Rover gives you more than safety and comfort.

It gives you confidence, the confidence that comes from control: when you put your foot down in a Rover, on accelerator or brake, things happen smoothly, quietly, at once (that's having all-round servo-assisted disc brakes plus power to spare under the bonnet).

It's this special brand of confidence that promotes a refreshingly tolerant attitude towards other road users and makes you a nicer person to drive with.

There are five versions of the Rover to choose from, ranging from the elegant 2000 to the all-powerful V-8 3500.

Take a quiet drive in one soon.

Travel First Class.

Vietnam

The question of Thieu's signature

President Thieu has still not made it clear whether or not he will sign a peace agreement between the United States and North Vietnam—assuming, that is, that Henry Kissinger and Le Duc Tho eventually work one out. Mr Kissinger flew back to Washington from Paris on Wednesday night, still with nothing signed, and the almost daily alternation of elation and despair in the newspaper headlines duly switched from A to B. But an agreement remains the probability. "You can bank on it," Mr Nixon said last month, and he has apparently made his proposed trip to Europe in 1973 conditional on a Vietnam settlement.

The first reports of President Thieu's speech to South Vietnam's parliament on Tuesday made it sound as if he was rejecting out of hand any terms on which the agreement is likely to be signed. He was not: like most statements by this very Vietnamese politician, this one had many layers.

The first layer was a tough-sounding restatement of what he dislikes about the original draft agreement Mr Kissinger and Le Duc Tho drew up in October. He said that he wanted North Vietnam's troops to get out of South Vietnam (although he may have been hinting that some of them could stay for a time when he said that "there cannot be a political solution" in the south so long as they are there). He repeated his objection to a National Council of Reconciliation and Concord if it amounted to a coalition government—which it will not if his representatives on it have a veto—and he called once again for the re-establishment of the demilitarised zone between the two Vietnams.

But underneath this was another layer, with quite a bit of elastic in it. Mr Thieu suggested a truce for Christmas, which would be extended into the new year, and might even go on being prolonged after that. On the first day of the truce he would set free 1,015 sick and wounded North Vietnamese prisoners of war, and all his other captured North Vietnamese later if North Vietnam released its American prisoners. The truce could also see the start of negotiations between the Saigon government and the National Liberation Front.

The importance of this extendable truce is that, if Mr Thieu decided not

to sign the document that emerges from the Paris talks, the truce would make it possible for him to slot his own actions into the coming into force of an American-North Vietnamese ceasefire. South Vietnam's army would stop firing too, provided the Vietcong did; the talks about the future political structure of South Vietnam could get under way, as the Kissinger-Le Duc Tho draft agreement says they should; and the argument about those North Vietnamese divisions in the south, and the functions of the National Council, could roll on while the guns fell silent. If the other side agrees, that is. Mr Thieu has kept all his possibilities open. If Mr Kissinger gets enough concessions from Le Duc Tho to satisfy him, he can sign the ceasefire deal. If not, not—but he can more or less go along with it.

The main advantage to Mr Thieu of not signing the ceasefire agreement is that this would leave South Vietnam's army free to deal with the campaign of "tyrant elimination, abduction and assassination" the communists have told their men to carry out in the post-ceasefire period. He would also be relieved of the obligation, set down in the October draft agreement, to "do his utmost" to reach a political settlement with the communists within three months of the ceasefire. The main argument for signing, on the other hand, is that he would then be in a stronger position to call on the Americans for help if the North Vietnamese or the Vietcong violated their side of the deal. No doubt Mr Thieu is waiting to see what the Paris negotiations produce in the end. He is making the most of such room for manoeuvre as is left to him; and his record since he was first elected in 1967 shows that there are few politicians who are better at it.

Philippines

Tough but popular

FROM A SPECIAL CORRESPONDENT

Manila

The sick but plausible jest in Manila is that, if the local still-suppressed press had remained "free," the stabbing attack on Mrs Marcos on December 7th would have been front-paged in many public prints as a cunning political plot by President Marcos—with or without his wife's sanction. The serious point is that many people in Manila believe that, Mr Marcos being Mr Marcos, pressure from abroad will delay and not hasten

Wife damaged, policy intact

a relaxation of restrictions on the press and the continued release of political prisoners. President Marcos will politely receive foreign emissaries, but his long-range martial law plans will only be hardened by threats from, say, the current chairman of the International Press Institute. Mr Marcos reacts as General Chiang Kai-shek did to the IPI ultimatum over those earlier Marcos victims, the Yuyitung brothers, both of whom would have been released by now if there had been less thunder from Zürich and Helsinki.

Mr Marcos, all objective authorities here agree, still enjoys overwhelming popular support for his martial law restrictions as his early reforms begin to operate—especially the restoration of land to the farmers. The plebiscite on the proposed new constitution is set for January 15th. Martial law is almost certain to prevail until the constitution is approved.

The test or showdown will come then. If the reforms do not continue, and particularly if the fundamental changes in university education do not register, the new Marcos policy, discredited, will restore old problems with sharper teeth. Mr Marcos, of course, was far more disturbed about disaffection in the universities than maoist revolution in the barrios. The new educational programme, modelled on Lee Kuan Yew's Singapore lines, sets more importance on training urgently needed technicians than on awarding empty degrees to surplus lawyers, doctors and clerks.

India and Pakistan

Tit for Thako

FROM OUR INDIA CORRESPONDENT

The Indian-Pakistani tangle finally began to be unravelled this week just in time for the first anniversary of the ending of the war for Bangladesh. On Monday commanders from the two sides put their signatures on a series of maps demarcating a new "line of control" between the Indian and Pakistani-held parts of Kashmir. The line, which follows roughly the position of the two armies on December 17, 1971, was immediately ratified by the two governments. Now that India's principal precondition has been met, the long-delayed troop withdrawals can get under way. The armies in Kashmir will move to the new line by Sunday and withdrawals to the international borders in Punjab and Sind are expected to be completed before Christmas.

The new line gives India 341 square miles out of Pakistan's part of Kashmir whereas Pakistan gains 65 from India. But more important than any exchange of real estate is the accompanying agreement that the line of control will be respected by both sides until the Kashmir issue is settled for good and all. Since this may never happen the line is effectively a permanent partition—which is why both sides bargained so long and so hard over every inch.

At first Pakistan resisted the concept of a new line because it was anxious to retain the United Nations' supervision associated with the 1949 ceasefire arrangements. But President Bhutto gave in on this in August. Then negotiations got stalled again at the end of October when Pakistan demanded Thako Chak, a tiny patch of ground it had occupied in Indian Jammu, which was not part of the disputed ceasefire zone. India's counter-arguments were legally feeble but this did not stop it from digging in its heels to make the debating point that the border between Pakistan and Kashmir is an international frontier—unlike that between the two parts of Kashmir.

Mr Bhutto also made his stand on "principles," although he said he would be willing to trade one patch for another. So a compromise was possible. But Pakistan held off until last month's UN General Assembly debate on the admission of Bangladesh was out of the way. This was necessary because Pakistan was argu-

ing that Bangladesh's entry into the UN should wait until the consequences of last year's war were undone, and it did not want that to happen too quickly. After the Pakistanis won the round in the UN, a compromise on the Kashmir line was arrived at, with India giving up two villages in return for the troublesome Thako Chak.

Uganda

Giving the country a black face

FROM OUR UGANDA CORRESPONDENT

As December 18th approaches, Uganda's British community of 3,000 or so people feels the breath of General Amin blowing now hot then cold down its neck. So many contradictory statements have been made in the past 10 days that it is well-nigh impossible to predict what the general will say when he meets representatives of the community on Monday, the 82nd anniversary of the raising of the British flag in Uganda. Despite an official assurance that the British are welcome to stay, it is hard to believe that General Amin has abandoned his plans to Africanise British-owned tea estates and commercial and industrial undertakings, which employ perhaps 30 per cent of the Britons working here. Africanisation is less than expulsion, but there is little difference in the effect.

Anyway, some 800 British teachers and doctors, who make up with their dependants half the British community, will leave within the next two years after Britain's decision to stop topping up their salaries with supplementary payments. So even if the "drastic decision" that General Amin has promised fails to materialise on

Amin waits for Monday's inspiration

Monday, the ceremony at which the raising of the British flag is re-enacted still looks like symbolising the end of Britain's Ugandan role. Whether with a bang or a whimper, it will come to the same thing.

The difficulties being encountered in the Ugandanisation of Asian-owned businesses might have been expected to persuade President Amin to lay off for a while from his grand design of making Uganda the world's first "genuinely black African state." Instead he has forged ahead into new fields, promising to Africanise the churches because "the imperialists may try to come back through religion," and laying down new ground rules for technical aid. In future Uganda's experts will be recruited wherever possible from other African states, and if they must be white, their contracts will be short ones.

Zambia and Malawi

Whose Witnesses?

FROM A CORRESPONDENT

Lusaka

Zambia is now the reluctant host to some 19,000 "visitors," to use the word of Mr Lewis Changufu, the minister of home affairs. According to the minister, the visitors are not going to be given refugee status and must therefore return to Malawi, from where they fled. But at the moment there are no signs of their going.

The visitors are terrified Jehovah's Witnesses, members of the Watchtower Sect which was banned in Malawi in 1967. In September, during the annual convention of the ruling Malawi Congress party, the sect was denounced and a resolution passed condemning its activities. This was followed by wholesale persecution of the estimated 25,000-30,000 Jehovah's Witnesses in Malawi; there were reports of burning of houses, looting, savage assaults and deaths—although the official clampdown on news meant that few details were confirmed.

Most of the reports came from the refugees who began streaming into Zambia's Eastern Province and also into Mozambique in late September. When their plight became known during October the United Nations provided £18,000 for their relief. But conditions in their temporary camp near Chipata in eastern Zambia are appalling, with few amenities, sanitary or otherwise. Some 265 people have already died in the camp; yet, despite starvation and suffering, more are still arriving, declaring that they would

rather die there than remain in Malawi.

The Zambian government is supported by the UN High Commission for Refugees and says it now awaits a written assurance from the Malawian authorities of the safety of the sect's members before repatriation begins. Negotiations for their repatriation started towards the end of October and Mr Changufu has since said that the visitors must return because they have nothing to fear. But in spite of such open declarations there are many contradictions, such as unconfirmed reports that another camp near Petauke, which is also in eastern Zambia, is being made ready for the Witnesses. If true, these reports suggest that the government intends to remove the refugees from the border; this would be in keeping with a resolution passed at a recent Zambian police seminar that no refugee camps should be maintained close to any border areas. If the move is carried through it is not expected that the Malawians will be granted either refugee or residential status, but will have to live with UN aid indefinitely. If so, their future is almost as grim as if they were to be returned.

The Watchtower Sect has been in trouble in various African states, particularly Malawi, where its banning in 1967 followed a series of bloody incidents. The Witnesses consider God's kingdom above any state and therefore refuse to join any political party. It was their refusal to buy Malawi Congress party cards that is thought to have set off the current crisis. The sect's members follow puritan principles, are hardworking and generally nonconforming to the society in which they live. It is this last characteristic which seems so unpopular.

Indian Ocean

A European force?

Britain and Holland are to send a joint naval squadron into the Indian Ocean next year. The number of ships is not yet decided, and both governments have emphasised that it will be no more than a passing visit. All the same, it might just be the kernel of something larger.

In November, the North Atlantic Assembly passed a resolution calling on the Nato council to authorise plans for the protection of west European shipping in the Indian Ocean and the south Atlantic. True, only 26 of the 200 members of the assembly were present when the resolution was passed, and only 14 of these voted in favour.

True, also, the Nato council often ignores such resolutions. Nor has Russia's naval presence in the Indian Ocean this year increased at the rate of previous years. At the moment there are six Russian warships and six auxiliaries in the area, which is about average. The Russians may have reached the maximum number of ships they can support without a regular base.

But some of what were regarded last year as the firmer elements of western defence in the Indian Ocean look rather shakier now. The French still have a number of bases in the area, and have recently been building up the strength of their force in Djibouti. But Madagascar, where the main French naval force is based, wants to revise its defence treaty with France. And although the Americans announced in January that units of the Seventh Fleet would be making more frequent patrols in the Indian Ocean, there have been few signs of these. The results of the recent antipodean elections place a question mark over Australian and New Zealand participation in the five-power force in Singapore and Malaysia.

India, buoyed up by its naval successes over Pakistan, looks like taking a more active interest in the ocean named after it—although the ships the Indians like best, in particular the *Osa*-class guided missile boats, are Russian. It does seem that there could be a role for a European naval force in the area. Perhaps the west Germans, with their growing investments, might join the British and Dutch in thinking about it.

Multinational Business

Can multinational businesses survive in developing countries? This question is examined in depth in the latest issue of the EIU's quarterly *Multinational Business*. Another report looks at the prospects for a truly international equity market.

Argentina

The old dictator fades away

When Argentina's former president, Sr Juan Perón, leaves Buenos Aires on the first leg of his return trip to Madrid, one thing seems certain: the old man will never rule his country again, even though he says he will come back next year. It is even debatable whether his month in Argentina has done very much to pull together the oddly assorted groups that call themselves the Justicialist Liberation Front.

He probably thought he was going to be their candidate in next March's election. But the armed forces refused to waive the ruling that all candidates must have been living in Argentina since August 25th; and last week the supreme court declared that they were right to do so. This left Sr Perón with no option but to stand down. The peronists will choose a substitute candidate rather than boycott the elections altogether; it remains to be seen whether some of them will agree to support Sr Ricardo Balbín, the leader of the Radical party, the second largest political group in the country.

In the short term, however, it seems that the main effect of Sr Perón's trip was to induce the military men to close ranks against a leader whom most of them distrust and who, indeed, clamped many of the present set of generals into jail in the years before he was overthrown in 1955. The high command agreed, for example, to allow President Lanusse to remain in power until the election, although theoretically the air force commander, General Carlos Rey, was to have taken over at the end of the year. The generals were outraged by reports that Sr Perón had said the army of Paraguay, of all places, was "the most glorious in Latin America," although it was subsequently claimed that his remarks had been distorted.

Meanwhile, some of Sr Perón's less reputable supporters may have been involved in the kidnapping of the local representative of the Vestey group, a British businessman called Mr Ronald Grove. He was kidnapped last weekend on his way to play golf, and his kidnappers are demanding a ransom of about \$1m. They are thought to be members of the trotskyite People's Liberation Army, now split into two factions, one of which has formed a tactical alliance with the "revolutionary peronists."

Palestinians

But whose is the conscience of the nation?

FROM OUR SPECIAL CORRESPONDENT

"Psst, the leader of Black September? For you, a special price . . ." Beirut's Black September Market is not yet a going concern but members of the Palestine Liberation Organisation, harried by correspondents and, no doubt, by spies who come questing the one secret the Arabs have so far managed to keep, occasionally throw it a quick thought. It might, after all, be one way to keep the interrogator busy, turn a needed if dishonest penny, and lay yet another dubious trail to the ones already established. If the trail leads to Abu Omar (Yasser Arafat), the PLO and Fatah boss, the seeker could well have been hoaxed. It seems to be a widely shared opinion in guerrilla circles that Arafat has neither the steeliness nor the ruthlessness to direct a secret terrorist outfit.

Getting rid of the "Abus" (the pseudonym meaning "father of" that was widely adopted in the early days of the guerrilla movement) is a favourite topic of talk within the movement. And the first Abu many would like to see go is Arafat himself. He is the target for a familiar brand of criticism: he runs hard to stand still. His full-time manoeuvring, with the Arab regimes and with his fellow guerrillas, keeps the movement roughly in one piece and himself in charge but, say his critics, so what? One answer is that few of his potential rivals are prepared to match his single-mindedness: he, in a sense, is married to the movement; the others have, at least, their own families to worry about. Nor, at present, is Fatah's leadership of the guerrilla movement under active challenge from the other, more politically orientated groups. The left-wing Popular Front, for example, has not recovered from its triple disaster of Dr George Habash's serious illness, the murder of Ghassan Kanafani and the disabling by letter-bomb of Kanafani's successor Bassam Abu Sharif.

The guerrilla movement's troubles are compounded by shortage of money and the need this year to dip into its shallow reserves. Most of its money

comes from Palestinians living outside the conflict area: 5 per cent is deducted from the salaries of Palestinians working for Arab governments and many other Palestinians voluntarily contribute the same proportion of their incomes. Despite Colonel Qaddafi's claim to hold the purse strings of the commando movement, no Libyan money has reached the PLO central fund, although a little is said to be going to a splinter group led by Mr Ahmed Jabril; the Libyans have even caused currency difficulties over the transfer of Palestinian contributions.

The commandos do little and so get little money and less respect. Their more radical leaders suggest drastic remedies. They propose pruning some 90 per cent of the movement's members; the remaining 10 per cent would then be trained intensively in guerrilla and terrorist warfare. War in the area, that is, Black September's world-wide terrorist tactics arouse conflicting responses but the consensus of most senior PLO men would seem to be that such operations, if carried out at all, should be marginal to the central battle in the Middle East. But at this time the "marginal" activities have taken over the centre.

To change this, it is vital, the commandos argue, to get back to Jordan—on their own terms. Not, they would say, to return to the foolish swank and bullying that characterised the guerrillas in Jordan before September, 1970, but in order to have access to Jordan's long frontier with Israel and the Israeli-occupied West Bank. The limits on operations from Lebanon were brought home again last week when two days of clashes between guerrillas and the Lebanese army were followed by a warning from the prime minister, Mr Saeb Salam, that his government would not tolerate any action that might "engulf [Palestinians and Lebanese] in tragedy."

Israel's bombing, and constant buzzing, of targets in south Lebanon and the plague of letter-bombs and parcel-bombs haunting Beirut are

evidence, the guerrillas argue, of a sustained effort by Israel and Jordan (whose anti-guerrilla interests run parallel) to force the Lebanese government towards "the Ammanisation" of Beirut. By this they mean an army crackdown to throw the guerrilla movement's headquarters and research centres out of Beirut. They do not believe that it will come to this, but the threat makes the PLO leaders tread as carefully as their increasingly mutinous junior officers will allow them.

Nor is Syria regarded as a reliable alternative since its discipline over the commandos on its territory is tightened or loosened for reasons that are beyond the PLO's own control. On the other hand, if the Israelis are correct in crediting Syria with master-minding the novel Arab-Jewish spy ring now in the process of being revealed in Israel, Syria's intelligence men have got further than any of the others in achieving one of the guerrilla movement's major aims. The guerrillas have long been under a barrage of justifiable Arab criticism for their failure to implant cells in Israel or Israeli-occupied land.

But to be successful, say some senior strategists in the guerrilla movement, such implantation must be preceded by the guerrillas' return to a Jordan from which the Hashemite regime has been eliminated—and elimination equals assassination. Let alone what the Israelis would do then, the murder of the key people in Jordan (not very many but enough) is unlikely to happen tomorrow. For the present, the PLO sees its main role as the negative one of helping to prevent any developments

Arafat's running on the spot

that might lead to an Arab-Israeli settlement on terms that ignore or compromise the rights of the Palestinians. Inactive, troubled and negative this may be; even so, say the guerrillas, their movement must be regarded as "the conscience of the Palestinian nation."

Let us decide

Not so, said a Palestinian in the West Bank who has had his share of knocks during five and a half years under occupation, including deportation (temporary, as it turned out) for suspected resistance activities. We must, he went on, find the most realistic view of the future that we can honourably square with our own consciences. And, he added with gentle bitterness, we should be allowed by our brothers outside (the guerrilla movement) to decide our own attitude for ourselves.

He was not hopeful, since he did not believe that Israel's leaders were prepared to allow the West Bankers either the land or the independence that might amount to what he, and moderate, responsible people akin to him, could consider "honourable." He saw Israeli towns and settlements rising like mushrooms around him on land confiscated from Arabs: Mrs Meir has said that 44 settlements have now been established on land conquered in July, 1967. He believed that this process would continue and that the only policy at present open to him and his fellows was to refuse to be squeezed out: "Just to be here is to be an activist." But if or when an opportunity came up, he wanted to be free to act on his own initiative without being dubbed a traitor.

West Bank Palestinians want their voices to be heard even if it must be in a minor key. The municipal elections held this spring, under Israeli auspices but following the restrictive Jordanian voting pattern, offered such a chance. The Israelis started the experiment on a small scale in the smaller towns: the hue and cry raised by the commandos caused the Israelis to respond in kind and the experiment deteriorated into a propaganda battle. At this, many of the Palestinians who had intended to stand changed their minds and the candidates eventually returned were either the old "notables" who had held office since Hashemite times or younger men who tend to be dismissed, possibly unfairly, as nonentities.

Another development that many Palestinians feel went wrong was the launching by President Sadat of his proposal for a Palestinian government-

A new settlement is opened in the Gaza strip

in-exile. This idea, in theory, has the strong appeal of providing a forum for a concerted—well, maybe concerted—Palestinian voice. It fell flat partly because it was opposed by the commandos (though not by Mr Arafat), partly because of the general belief that Mr Sadat had proposed it for his own wrong, domestic reasons.

Then, in March, there was King Hussein's projection of a United Arab Kingdom encompassing substantially autonomous Palestinian and Transjordanian regions. The plan was castigated by the commandos, several Arab governments and the Israelis; the people quietly interested were the 900,000 Palestinians on the East Bank and the 700,000 on the West Bank. True, the bitterness against the Hashemite regime that followed the army's onslaught against the guerrillas is still alive, if less keen than a year ago; true, also, that many West Bankers echo the commando sentiment by saying they would welcome Jordanian rather than Israeli rule only because they believe the Jordanians to be easier to get rid of. (East Bank Palestinians, discriminated against rather than persecuted, might have a word or two to say about this.) Other West Bankers, watering their hopes with realism, see the king's proposal as the nearest step to nationhood that has come remotely their way—and Israel's response keeps it strictly remote.

In Gaza as in the West Bank, the Palestinians look to their own interests, many of them earning good money as building labourers in Israel, but all believing that their most effective contribution to the common cause is to stay put. When, in August, 1971, Israeli bulldozers cleared wide roads and open squares in Gaza's main refugee camps, the epidemic of violence was ended but 2,500 refugee families

suddenly found themselves homeless. Yet few accepted the inducements to go elsewhere: of the 400 families that were taken to El Arish in Sinai, about half have so far returned; the UN records show that only 29 families transferred themselves to the West Bank. Many of the evicted refugees have by now shackled up with relatives or found accommodation of a kind but, according to the UN, 900 families, meaning about 5,000 people, are still reckoned homeless. The Israelis, disputing this calculation, say that 350 families are homeless, but that houses are becoming available, on application, in the southern sector of the strip.

There are still isolated acts of violence in Gaza but the links between local terrorism and the guerrilla organisations outside would seem to be broken. Passive resistance is thought about but, as in the West Bank, abandoned because of lack of organisation (the exception to this could be Hebron, where the intermingling of religious and political conflict between Arabs and Israelis may lead the Arabs to some form of action). The worst thing for the people of Gaza is that their future comes at the baffled bottom of almost everybody's list of possible solutions. They themselves say, hopefully, that the Egyptians will not let them down; Egyptians, on hearing this, shrug hopelessly.

Palestinians, exasperated, ask how they can be expected to agree among themselves when nobody concerned in or with the Arab-Israeli conflict seems able to agree about anything. All that can be depicted is a trend—and this shows a widening disparity between the Palestinians who have to live under the Israelis and those outside who are dedicated to fighting them. And neither side can, or should, claim to be the keeper of its brother's conscience.

Manufacturers Hanover can help you make the right business decisions about Western Europe.

Because, as a leading international bank in Western Europe, we're thoroughly familiar with the complexities of doing business there.

For example, we can help you decide which currency to use for your financing. We can tell you what areas of Europe offer subsidized financing. And tax benefits. You should know what effect the narrowing of bans on trading limits between Common Market currencies will have on your present and future financial plans. And how to use government sponsored export credit facilities in the U.S. and other countries.

Not only do we have the expertise to help you reach decisions about Western Europe—we have the resources to help you implement them.

Manufacturers Hanover can arrange short, medium, or long term financing in any con-

vertible currency, for virtually any amount and any purpose. And by pulling together funds from a number of sources we can create special project financing packages far in excess of any one bank's capability.

And through our network of branches, representative offices, correspondents, merchant bank, and other affiliates, MHT has invaluable links with money managers in every Western European country.

With \$14 billion of assets, Manufacturers Hanover is able to offer the full scope of services necessary to do business in Western Europe. Yet,

for all our size, we can respond to your needs instantaneously. Because at MHT, decisions are made by individuals, not committees.

Isn't this the kind of bank you'd like to have behind you in Western Europe?

Westwood follows her leader into limbo, while Florida's liberal governor rejoices with her successor

Getting the McGovernites out of their hair

Washington, DC

The Republicans had a problem in 1964 similar to that faced by the Democrats last week: how to get rid of a national chairman hand-picked by an ill-starred presidential candidate, so that the work of piecing the party together again could commence. The Republican solution preserved dignity and avoided a fight; Mr. Dean Burch was left in office until the following spring on the understanding that he would then make way for a new man. The Democrats are different: why put off a fight till the spring when you can have it in December? Accordingly Mrs. Jean Westwood, chosen by Senator McGovern as chairman of the Democratic national committee on the day after his nomination at Miami Beach in July, was forced to step down last Saturday, when the committee met for the first time since the election.

Mrs. Westwood, who farms mink in Utah, came to national prominence by the accident of being Senator McGovern's earliest known supporter on the old Democratic national committee. Senator McGovern was inclined to keep the existing chairman, Mr. Lawrence O'Brien, but was persuaded by

some of his staff, against his better judgment, to choose Mrs. Westwood instead. While she has done no good in her office she has done nothing wrong either, and some of the Democratic notables who did not care for her much still thought it indecent to push her out so hastily. Her removal is probably as pointless a piece of symbolism as her appointment was. The forces hostile to Senator McGovern have scored a famous victory, but six months too late to do them any good in 1972. What will become of it by 1976, none can say.

As an organised force the McGovern movement has melted from the national political field. Before the battle of the Washington Hilton hotel last Saturday Senator McGovern had abandoned Mrs. Westwood, and she him. His captains have disbanded to mountain resorts, islands in the sun, universities and law offices. The substance and muscle of his army consisted of local people who were politically active; they will remain a force in their towns and districts, but not a McGovern force. Some thoughtful politicians are already considering how to organise their energies in future local campaigns, but nationally

they have lost their leader and have no new one in view.

Mr. McGovern's enemies are a more cohesive and continuous group, held together by the burning desire to fight the 1972 campaign all over again. They are the group that used to meet in Washington in June to plan the unseating of Mr. McGovern's Californian delegates. They thought out the procedural rulings that might have blocked Mr. McGovern at the Miami Beach convention, and they have not forgiven the convention's chairman, Mr. O'Brien, for not ruling on their side.

Prime movers in the group were Mr. George Meany, the president of the American Federation of Labour and Congress of Industrial Organisations, and his political organisers: they declared themselves neutral in the presidential campaign but helped with the campaigns of many Democratic candidates for Congress and for state offices. Senator Henry Jackson of Washington State and his allies and supporters, together with former campaign organisers for Senator Humphrey, were other members of the group. Taken together, they are men who have rendered great service to the Democratic party in the past but have little prospect of doing much for it in the future. Their first aim was to get rid of Mrs. Westwood, partly from sentimental motives but also with a view to influencing the party's constitution, the methods by which it selects delegates to future conventions

and the course of its conference on party organisation and policy planned for 1974.

These can have an influence on the presidential nominating process in 1976 if the mid-term conference ever comes to be held. A party commission, not yet named except for its chairman, will have the task of recommending a charter or party constitution to the mid-term conference. A separate commission, which is to pronounce on the rules governing the selection of delegates, has been named already and its membership will not be affected by the change of national chairman.

But most of those who fought to get Mrs Westwood out, the labour leaders and southern governors particularly, object vehemently to the reformed selection rules which filled up the last convention with delegates who were young, female or black. They blame the reformed rules for Senator McGovern's nomination, and they blame Mrs Westwood's predecessor, Mr O'Brien, for having insisted that the state parties comply with the rules. The suspicion that the new chairman will not insist quite so hard, and that consequently the next convention will be more white, more male and more middle-aged than the last, is hard to avoid.

Mr Robert Strauss, the new chairman, is a Texan politician who has never sought elective office but who earned good opinions in the party by his service as its treasurer since 1970 during the years of its deepest financial depression. When Mr McGovern foolishly spurned his help in this year's presidential campaign Mr Strauss gave his energies to the effort to raise funds for Democratic candidates for Congress, thus earning debts of gratitude and making allies who stood him in good stead last weekend.

Against him, in the eyes of most Democrats, is the fact that he owes his introduction to national political affairs to the friendship of Mr John Connally, who, though a Democrat in the Texas sense, worked actively for President Nixon this year. Thus Mr Connally has cut himself off from his party, a fact which Mr Strauss formally acknowledged after being elected chairman. Mr Strauss never cut himself off, and the general belief is that he is less conservative than Mr Connally in his views. Still, he is associated with the conservative faction in the politics of the Democratic party in Texas.

In Mr Strauss's favour is that he

is no political preacher or philosopher, but an amiable and skilful man of action. As American political parties work, a strong national leader is not wanted in between presidential campaigns. The state and local politicians whose success or failure determines the composition of Congress and of the state and local governments want a reasonable degree of co-ordination of local and national campaigning efforts, but they do not want to be told what to think. Mr Strauss is likely to put a modest interpretation on his job and to do it in a smooth, efficient manner. For this reason, many Democratic politicians whose own views are more liberal than Mr Strauss's little-known views are supposed to be, are not disturbed unduly by the thought of Mr Strauss in charge of the national party office.

Considerations of this kind played a part last weekend in the long-deferred victory of the old alliance, organised labour and the "regular" party men in Congress and the state-houses. But the decisive factor was the absence of an opposing force. No more than a handful was prepared to die for Mrs Westwood, but an actual majority was found for restraint and propriety in the form of her execution. When her enemies moved to declare her seat vacant, their motion was rejected by 105 votes to 100. Agents of Mr Meany and of Senator Jackson were lobbying strenuously for votes against Mrs Westwood. But there is a strong resistance in the Democratic party to being dictated to by the trade union leaders, while Senator Jackson's personal influence is somewhat limited by his own lamentable vote-getting performance in this year's primary elections. Still, the chairperson fended off the motion to remove her only by promising several members that she would resign of her own accord after lunch.

Somewhere in the middle of the field were the supporters of two moderate liberals, Mr George Mitchell from Maine and Mr Charles Manatt from California, but attempts to persuade one or other of these to withdraw in favour of the other failed. Mr Strauss got the majority. Once elected, he said and did a number of things to reassure the party's liberals that they were not being rejected. His preference is, and his policy will be, to damp down the arguments of principle that have flourished in the party's recent history, and to do what he can to make it once more comprehensive, diverse, bland and capable of national electoral success.

Another Texan

The Republicans have a Texan as their new party chairman too. On Monday Senator Robert Dole announced that he was retiring and that Mr George Bush, the ambassador to the United Nations, was to succeed him. Mr Bush will continue at the United Nations until the present General Assembly ends, which should be before Christmas, and his election by the Republican National Committee when it meets on January 19th should be something of a formality.

Unlike Mrs Westwood, Senator Dole was toppled from above. Mr Nixon took strong exception to the Senator's open criticism that the President had been too busy building his own landslide majority to help his party; the Republicans suffered a net loss of two Senate seats and one governorship and only gained 13 seats in the House of Representatives. Mr Dole's criticism is widely shared within the party, whose members feel that a few more campaign trips outside Washington and more vigorous endorsements by Mr Nixon might have made all the difference to individual Republicans. For this "self-centredness" the President is not being forgiven lightly. Senator Peter Dominick, chairman of the Senate Republican Campaign Committee, predicts that attempts by the White House to invoke party loyalty in the next Congress may go unheeded.

Much of the resentment in the Republican rank and file is directed towards the Committee to Re-elect the President (Creep), which soaked up most of the party funds. Apparently many regular Republican contributors, when approached by needy candidates, claimed that they had already given their all to Creep. Senator Dole has said that it would be a mistake to let an independent committee run the presidential campaign again in 1976.

Senator Dole is said to have argued for a full-time role for the party chairman, something which, with his duties in the Senate, he himself could not possibly fulfil. He did not want the national committee to "go underground" until the 1974 mid-term elections, which is what usually happens. He also argued for a bigger budget for the committee. While ditching Mr Dole, the President seems to have accepted his argument by appointing in Mr Bush a man who will have no other commitments.

Mr Bush has the great advantage of being very much the President's

Britains off-shore banks Dogger, Leman Chase, Manhattan

The company looking for oil fields in the North Sea needs a bank with its feet on the ground.

That's where Chase Manhattan's feet have been since 1935, when we got the idea that the petroleum industry—which was pretty big then—was going to get even bigger.

We saw it as an industry that in the future would be needing experienced bank financing. So we got experienced.

We started Chase Manhattan's Petroleum and Energy Division, and we staffed it with financiers, engineers, economists and technicians.

And that future we were looking forward to is here now: North Sea petroleum and natural gas.

And right here, on your doorstep, is the bank with 37 years of petroleum expertise in every aspect of the industry's requirements.

Let's put it this way. You find the off-shore oil fields...we'll find the on-shore funds. The Chase Manhattan Bank N.A., Woolgate House, Coleman St., EC2 and 1 Mount St., W1 01-600 6141.

man and one without any associations with Creep. Senator Dole's comment on Mr Bush that "he has political interests of his own" was something of an understatement about a man who is believed to harbour presidential ambitions. His new job—at least as Senator Dole defined it—will be to transform "this new American majority into a Republican majority in Congress."

Time to share?

Christmas came early this year to about 38,000 state and city treasurers, who on Monday received their first instalments under the revenue-sharing bill signed by President Nixon in October. Just over \$2.6 billion of this largesse was distributed and there will be another \$2.6 billion next month, to complete payments for 1972; by the end of 1976 \$30.2 billion will have been paid out to states, cities, counties, even tribal Indian governments. The states will be able to spend their money on any lawful purpose and the limits on lesser governments are only slightly narrower: education alone is excepted. Some hard-pressed cities will be thankful for money to pay their firemen and police; others are planning improvements ranging from new city halls to gaols, from better parks to better sewers. Many recipients—the State of Wisconsin, for example—are using all their money to lower taxes, particularly the oppressive property tax which bears hardly on many people, including those who have retired.

Some of the recipients can hardly be classed as needy. Under the law the government of a state gets one-third of the state's allocation, but California, to name one, which received \$94m this week, is on the way to a \$500m surplus. Florida is not far behind. Indeed, state and local governments, so long in rags, are, with some glaring exceptions, enjoying something like riches. Partly this is because of prosperity; partly it is because in recent years they have

been forced to impose new taxes; in some cases it is because, with the falling birth-rate, spending on new schools has been declining. Most, though not all, experts think that this prosperity is not necessarily permanent and all agree that this year's revenues have been swollen by some \$4 billion paid earlier than expected by the federal government for its share of the costs of public assistance. Whatever the cause, some of the recipients will, for the moment, at least, be investing their share of the new bounty in government bills and bonds—in effect lending it back to the central government.

Whether the federal budget, deep in deficit, should be strained further and popular federal programmes, such as the fight on pollution, should be slashed to assist local governments which are doing well already is a question which is bound to be asked. In private, the Administration may feel some embarrassment but in public its spokesmen insist stoutly that what matters is the philosophy underlying the programme: that state and local governments should be strengthened and money spent locally, where the taxpayer can see that it is doing good—or, if it is not, demand to know the reason why.

Complaints that the "haves" are doing better than the "have nots" are also acute this week among the recipients. The formulae (there are two) under which the money is distributed take account mainly of population, but also of relative poverty and of the amount raised by local taxes. When the allocations were announced last week many communities whose growth over the past five years has been slow or non-existent found themselves penalised; the Treasury, after publishing estimates of what each state and city would get, had redone its tax arithmetic on the basis of revenues in 1971, not 1967, with the result that rural areas—Alabama for example—and some static cities—New York for instance—found their cheques much reduced. It is the fast-growing suburbs, many of them wealthy, which have come out ahead.

Nixon's new men

Those who had hoped that the Departments of Transport and of Housing and Urban Development would be treated kindly by President Nixon have been disappointed. The men who will take over the two departments if their appointments are approved by Congress in the new year are good managers and are expected to do what the White

Brinegar: too road-minded?

House wants. But neither has the ideal experience for the job.

The Department of Transport is due to come under the control of Mr Claude Brinegar. He has no previous experience in government and he has not shown much interest in politics. But he knows a great deal about the oil industry and he likes fast cars. This does not endear him to those who think that the department should be concerned less about cars and roads than it is about clean air and alternative forms of transport. Mr Brinegar is a senior executive of the Union Oil Company which has caused considerable controversy in its home state of California. It was responsible for the devastating oil spill in Santa Barbara in 1969 and the following year it campaigned hard for the defeat of a proposal which would have allowed the state's petrol taxes, now reserved for the construction of roads, to be used for public transport and the control of pollution.

This philosophy does not accord with what has been going on in the Department of Transport under Mr John Volpe. Mr Volpe, who now goes as ambassador to Italy, has been energetic—some within the White House would say too energetic—in undermining the supremacy of the car and has advocated that some of the money for public transport should come from the federal highway trust fund. So far Mr Brinegar's views on public transport and its funding are not known. But it is expected that he will be questioned closely by Congress on the matter. The White House has already felt it necessary to reply to its critics that Mr Brinegar does not intend to reverse Mr Volpe's good work.

The feelings about Mr James Lynn, who takes over at HUD from Mr George Romney, are more of disappointment than of opposition. The mayors of the big cities, even those who support Mr Nixon, are upset that the appointment has gone to a man who has no experi-

ence of their problems. They had hoped that the President would select a man from their own ranks or a well-tried friend from within Hud. Mr Lynn, who is young and clever and who has a good record in his present job as Under Secretary of Commerce, knows little about the problems of the cities, admits that he has no knowledge about housing beyond owning a couple of houses and thinks that "damn near everything the government does could be done better by private industry." He arrives at a time when Hud is going through acute difficulties, when the whole question of federally subsidised housing is under scrutiny and when President Nixon is known to want to cut the department's budget.

After considerable speculation Mr Richard Kleindienst has been confirmed in his position as Attorney General although it is still not certain how long he will stay. But six other officials in the Department of Justice, including the Solicitor General, have been replaced. The man who will now argue the Administration's cases before the Supreme Court is Professor Robert Bork of the Yale law school. He is in tune with President Nixon's conservative views about the role of the courts. Mr Butz, who did much to bring in the farmers' vote for President Nixon, stays at Agriculture. But question-marks hang over Mr Richard Helms at the Central Intelligence Agency and Mr Patrick Gray at the Federal Bureau of Investigation. Neither has found favour in the Administration's eyes lately.

Signals of restraint

Washington, DC

The announcement this week of a set of presidential decisions on economic policy contained no major surprises, but the decisions supply additional evidence of what the President calls his "highest priority"—a further slowing of inflation and prevention of a new round of excess demand caused by large deficits in the federal budget. The Secretary of the Treasury, Mr Shultz, disclosed the decisions in his new capacity as chief spokesman on economic policy. The first and least surprising revelation is that the President intends to continue wage and price controls next year, which will mean asking Congress to extend the relevant legislation; this expires on April 30th. In an attempt to improve the working and increase the acceptability of the controls, there will be

intensive consultations with business and the trade unions and also with the various government bodies, such as the Pay Board and the Price Commission, which administer them. Few unions oppose wage guidelines, but most feel that they should be accompanied by more effective controls on prices and by restrictions on profits.

Mr Shultz's remaining items of news all involved the federal budget in one way or another and all signalled restraint on spending. There will be a freeze on new hiring of civil servants until the end of January, when new and stringent limits on personnel for each government agency will be established in the new budget. Federal employees at the "executive level"—essentially those earning \$36,000 a year or more and including members of Congress and the judiciary—will receive no pay rise at all next year.

Most importantly—but most elusively in terms of details—the President disclosed that he is now confident that he can hold federal expenditures in this fiscal year, which is about half completed, to his target of \$250 billion; this will mean not spending some of the money which Congress has appropriated. And, said Mr Shultz, the President's new budget, for the fiscal year which begins next July, will have a spending level no higher than the hypothetical figure of "full employment revenues," which he regards as non-inflationary. These are the revenues which would be produced if the economy were operating with only 4 per cent (instead of the present 5.2 per cent) of the labour force out of work.

This figure has not been calculated officially but it will be in the range of \$267 billion to \$270 billion. Since increases of \$20 billion over this year's spending are unavoidable, such a figure would unquestionably mean a very austere budget. The cries of pain have not started because Mr Nixon has not disclosed yet the programmes on which the axe will fall. If the better-paid government executives and legislators are feeling some pain in private, they have the good sense not to show it.

Safety reaction

As America's first atomic breeder-reactor, the Enrico Fermi facility in Michigan, always experimental and never satisfactory, was closing down permanently, the Westinghouse Corporation was awarded the contract for

Fish don't like it hot

the first large-scale demonstration plant of this type. This project is being undertaken jointly by the Tennessee Valley Authority and the Commonwealth Edison Company of Chicago, with a large subsidy from the federal government; it is hoped to establish a commercial basis for reactors which will "breed" more fuel than they consume. Unless this can be done the time will soon come, or so it is thought, when uranium will be so scarce, and therefore so expensive, that nuclear reactors may be unable to compete with other methods of generating electricity.

In any case nuclear reactors are turning out to be more expensive both to build and to run than was originally estimated. Partly this is because of the general rise in costs, partly because of unexpected problems in construction and operation, partly because of modifications required by the environmentalists. For example, New York's Consolidated Edison Company has recently been told by the Atomic Energy Commission that, for the sake of the fish, it must stop warm water flowing into the Hudson River from its new nuclear generator at Indian Point. In practice, according to the company, this means building a cooling tower to recirculate the water. This will add nearly 50 per cent to the \$200m which the reactor is costing and will probably be attacked as unsightly and a source of air pollution. As a result Con Ed has given up the idea of building another group of atomic plants on the river.

Other electricity companies are also having second thoughts about the economic advantages of nuclear generators. And at the same time a new round of opposition is piling up. Having

All these securities having been sold, this announcement appears as a matter of record only.

largely succeeded in their insistence that greater protection was needed against air and water pollution from nuclear plants, the critics have now returned to the question of safety. They allege that the emergency core cooling system (ECCS) has never been tested and may not be reliable. If it did not work when the cooling system of a nuclear plant broke down, then the plant would blow up and a radioactive cloud would spread over a wide area. Officially the AEC maintains that almost certainly there will never be such an accident, although some of its experts admit to having doubts about the efficiency of ECCS. But the commission has been holding an enquiry since the beginning of this year and has also proposed, as a temporary safeguard, that there should be a reduction in the temperatures at which nuclear reactors are permitted to operate. Soon after the new Congress meets in January hearings are to be held on this matter by the Joint Atomic Energy Committee. Several of its old members, including Senator Anderson, will no longer be there and the committee may be less friendly to the AEC than it has been in the past.

F-14 collision

The stage was set this week for the first showdown between the Defence Department and one of its major contractors, the Grumman Aerospace Corporation, about "cost overruns." On Monday the navy decided to hold Grumman to producing another batch of 48 F-14 fighters at the 1970 contract price. Grumman promptly refused, saying that it has lost \$1m on each of the first batch of 86 F-14s and that it would lose over \$2m on each of the next 48.

The company holds that the 1970 contract is now "invalid and unenforceable," and to back this telegrams were sent to its subcontractors ordering them to stop all work on the latest batch. Advertisements also appeared in the New York Times and Wall Street Journal putting Grumman's case. Grumman's problem is not only inflation, which is particularly difficult to gauge on lengthy, sophisticated projects, but also contraction of its aerospace business. A major blow has been the ending of the Apollo programme, for which Grumman has built the lunar excursion module. According to the firm this has meant that all the overhead costs have been concentrated in the F-14 programme.

Although the F-14 is a version of the ill-fated F-111 swing wing aircraft and two F-14s have crashed during testing, the navy seems pleased with it. One man who is not is Senator William Proxmire. He has undertaken the battle against cost overruns which the General-Accounts office puts, in all, at \$29.4 billion on 47 major new weapons systems. All too often firms underprice their bids to win a job, in the expectation that they will be bailed out later, as the Lockheed Aircraft Corporation was when it ran into similar trouble over the C5A transport. Mr Proxmire is determined to halt this practice and the navy cannot ignore him; he has too much power over other appro-

priations for weapons. The Senator says that the Defence Department should "go to court and require Grumman to produce the planes or be held in contempt of court."

It could come to that. If it does and Grumman loses, the company says that it will go out of business. Last April, the chairman of Grumman, Mr Clinton Towl, told the Senate Armed Services Subcommittee that if the navy insisted on the extra 48 planes "we will have to close the doors." But that would not be immediately, because the company's 24,000 employees will be working on the original batch until mid-1974. And Congress or the White House may yet come to Grumman's aid.

Life bows out

All kinds of remedies were applied but none of them succeeded in keeping Life magazine alive. First came the treatment which prescribed a large circulation—it was at its peak of 8.5m only two years ago—low subscription rates and high prices for advertisers. When this failed to pull in the money a new cure was tried of lower circulation, costlier subscriptions and less expensive advertising. The formula of plenty of photographs and sparse script was changed to fewer photographs and more articles and then back to an emphasis on photographs again. The staff was cut back and the foreign editions were closed down. Television and radio stations owned by Time Inc were sold to raise capital to tide Life over the bad times. There were the hopeful moments when its competitors, the Saturday Evening Post and Look magazine, died off.

But after four years of losses and with dim prospects for the year ahead, Time Inc decided at the end of last week not to prolong the agony further. The magazine, which has been going for 36 years, will cease publication after a bumper issue of December 29th. A fund worth \$7m has been set aside to cover the costs of the close-down. Over 600 employees will lose their jobs, subscribers are to be offered a choice of Time Inc's other magazines, such as Time, Sports Illustrated and Fortune, and the company's present commitments in printing and the production of paper will be scaled down.

Life was the wrong type of magazine for the latter half of the twentieth century. It made its name before the days of television and the impact of its startling photography was diminished still further by the advent of colour transmissions. Television also drew the advertisers away; it offered them a larger audience at a comparatively low price. The costs of production soared and the final blow was the increase in postal rates. Over the strong

Life's art director takes the blow

opposition of those who claimed that the move would weaken the industry, postage will go up 170 per cent in the next five years.

But the fate of Life is not typical of the whole magazine business. The papers which cater to specialist tastes are doing well. In the first six months of this year 71 new magazines were launched compared with only 76 for the whole of 1971. Oui magazine, the new project which Playboy Enterprises started in October, has already raised its print run by 50 per cent to over 1m copies for the December issue. Ms, the women's lib magazine, is doing better than expected with over 500,000 copies printed in October. Time Inc itself had a good start with Money, its first new magazine for 18 years. Already a quarter of a million subscribers have paid the annual fee of \$12 to be told how to look after their finances. As the head of Time Inc announced the end of Life, he also said that the company would launch at least one new magazine next year—about television. These specialist magazines are the dream of the marketing men and advertisers who can be sure that they are reaching potential customers.

Rand soldiers on

First came the insult, then the injury. The Rand Corporation, the original and most celebrated of the non-profit-making institutions which perform research and analysis on problems of national defence, was forced in July, 1971, to surrender custody of its classified documents because Rand's former employee, Dr Daniel Ellsberg, had copied 47 volumes of them and given them to the New York Times. Then several months later the House of Representatives' Appropriations Committee ordered the Department of Defence and the military services to give up their dependence on "think-tanks" like Rand and to do their long-range planning themselves. The committee reduced the proposed spending in the current federal budget on Rand and similar institutions by 25 per cent. Almost immediately, 3,000 miles away in Santa Monica, California, Rand's president, Mr Henry Rowen, resigned.

Rand is now in its post-Ellsberg phase and it is a sober one. Its new president is Dr Donald Rice, a tall and circumspect young systems analyst from the federal Office of Management and Budget. Its staff is about 30 researchers fewer than a year ago. It has as its new chairman of the board the chairman of the Coca-Cola Company. Security is tighter. About a thousand people at Rand lost their top clearances after the Pentagon Papers affair (not because of any complicity of their own but because they had no "need to know"). Life in Rand's two sun-baked orange and cream buildings just up from the Pacific surf is now more than ever a matter of guards and badges. Visitors should not be surprised to find themselves chaperoned when they go to the lavatory.

Yet the shake-up at Rand was not so much the result of Dr Ellsberg's defection as the culmination of a conflict in Rand's line of development. Rand's work has become split into two not entirely complementary parts. The larger part, accounting for about two-thirds of Rand's annual income of \$25m, is concerned with national security: it includes work done for the air force under a broad contract with the title of "Project Rand," and also work done for the air force's boss, the Defence Department. Then there is Rand's newish domestic division, created in 1966, to apply Rand's formidable skills in economic modelling and systems analysis to social and tech-

nical problems of modern urban life.

At Rand, they like to think that there is no contradiction between military and civil research, for their proudest boast is that Rand is above all inter-disciplinary. The economist sits down with the physicist and the behavioural scientist; sometimes they think about limited war and sometimes about intensive care units for hospitals. Yet Rand's military sponsors have not been entirely happy about the corporation's commitment to civil research—a task for which Mr Rowen was recruited as president in 1967. And opposition to the Vietnam war finally cracked the neutrality of Rand's staff.

The idea that Rand's analysts were both dispassionate and discreet was shattered in October, 1969, when five Rand researchers, including Dr Ellsberg, sent a letter to the New York Times asking that the United States withdraw unilaterally from Vietnam within a year. In June, 1971, when the Pentagon Papers burst into print, Mr Rowen's days as president were numbered. He was, as all knew, a particular friend of Dr Ellsberg's and had himself persuaded Dr Ellsberg to return to Rand in 1967 after five years' work for the Defence Department. When Mr Rowen finally resigned, the question was raised whether the military distrusted all think-tanks for their potential anti-militarism and whether Rand might give up the basic air force contract which has sustained it from the beginning and devote itself to domestic studies.

The new man at the top, Dr Rice, is determined that Rand will continue in both military and civilian directions. He sees the task ahead as one of "strengthening the national security side of Rand's work while fleshing out the civil side." He insists, and one assumes that the trustees chose him to reverse the Rowen direction, that problems of national security will always command a major share of Rand's attention. If his hopes are realised, Rand will not expand appreciably; rather it will regain its size of the mid-1960s. There would be 500 to 600 professional researchers (in contrast to the 400-plus of the moment) with the greatest increase on the strategic side where the recent lay-offs occurred.

There is no question of securing Rand's future by turning it into a profit-making consulting firm, even though its budgets have not grown

Rand's fresh face, Dr Rice

appreciably over the past few years and \$25m a year is not a great deal of money. Rand does earn fees for the domestic assignments that it performs for other government agencies and for philanthropic foundations (a likely source of increased funds in future). But the trustees consider, probably correctly, that "research and analysis for government"—Rand's stock in trade—is incompatible with profit-making and with filling contracts for profit-making industries.

Uncertainties hang heavy over Rand's future. But it is certain that it cannot continue as it was during the days of the 1950s and 1960s when it gained popular notoriety as the home of the war game and the megadeath, and a distinguished professional reputation as the host to such intellectual heavyweights as Dr Henry Kissinger, John von Neumann, and Dr Herman Kahn. Rand's greatness came from making computer models of intercontinental nuclear warfare and recommending policies which have, in no small measure, helped that war not to occur. But strategic problems do not come that neat anymore and one wonders how widely applicable mathematical models based on limited wars

Dr Daniel Ellsberg is at last about to be tried in California for conspiring to publish secret material on the war in Vietnam—the "Pentagon Papers"—which he obtained while working for the Rand Corporation. Our special correspondent reports from California on the present condition of this research organisation.

like Vietnam can be.

If the nature of war has changed, so has the nature of intellectuals and of the federal government's interest in scientific research. Rand may not be able to recreate the freedom it offered in its prime. In the late 1950s when Dr Ellsberg, then a young economist laden

with Harvard honours, was delighted to be invited to go there, Rand was known as a good place to do basic research. There were no classes to teach, you could swim in the Pacific at lunchtime and talk with people who were the very best in any number of fields (no inter-departmental segregation of the

type found in universities).

But now, even for supposedly academically-orientated agencies like the National Science Foundation, the emphasis has shifted from basic research to applications—"research applied to national needs" is the catch phrase. Rand is more and more

A military base

Understanding the Rand Corporation's relationship to the air force is essential to understanding why Rand has been unique among think-tanks. Rand is scarcely older than the air force (as a separate service) itself. After the last world war when the air force was being detached from the army, those in command, notably General H. H. (Hap) Arnold, saw the need of an advisory institution which could give the new force the kind of technical expertise that the army and navy had built up within their own organisations.

General Arnold, moreover, had been impressed by the contribution made during the war by civilian scientists and mathematicians and was inclined to believe that they would work better outside rather than within the air force structure. It so happened that the air force had particularly good relations with men at the Douglas Aircraft company in Santa Monica. Therefore the arrangements that created Rand (whose name stands for Research and Development) in 1946 placed it within Douglas. The inevitable conflicts of interest were not long in appearing and in 1948 Rand was incorporated as a non-profit research organisation.

From the beginning, Rand had an independence remarkable for an institution dependent on a military patron. Part of the credit goes to the Ford Foundation. By giving Rand interest-free loans and guaranteeing its bank credit, Ford enabled Rand to start life on its own without a direct subsidy from the air force. Rand's location—facing the Pacific, a long way from Washington—also encouraged its sense of freedom. But the main credit goes to the air force and what is known at Rand as the "one-sentence work statement."

In its original contract with Rand, the terms of which have hardly been altered over the years, the air force asked only for "research into inter-continental warfare, other than surface." Almost any line of intellectual endeavour could be fitted into this generous framework and, in the 1950s, it was. With independence from Douglas, Rand became bold, wove a strong thread of social science into its fabric and let its staff and consultants do virtually what they chose.

Rand will refuse requests from the

air force for projects that are not its style. The air force has had to create another think-tank (the Systems Development Corporation, which has been split off from Rand) simply to do nuts-and-bolts thinking about new aircraft and weapons. And it is obvious that all Rand's broad studies on possible techniques of predicting and controlling costs on new technology have not saved the air force from disaster after disaster on new types of aircraft.

So what does Rand contribute to the air force? The classic example always cited is the bases study of 1951-52: a research team, under Dr Albert Wohlstetter and including Mr Rowen, undertook to consider where would be the best places for the air force to locate the new bases that it was planning to build in Europe. The team soon realised what the air force had overlooked—that the concentrations of bombers sitting on the ground near the enemy's territory were sitting ducks for a surprise nuclear attack. What they recommended, therefore, was a complete reversal of plans: build the bases at home in the United States and let the bombers touch ground overseas only for refuelling. This was logical, and much cheaper.

The basing study saved the air force \$1 billion, after it decided, with much agony, to accept the advice Rand offered. Yet the study had a much wider influence—it made clear to American politicians and military leaders the

difference between the first and second strikes in a nuclear war. Since then, American defence policy has been based on maintaining the ability to strike back if struck, rather than on the ability to deliver a massive first blow. And the study spread the news about systems analysis—that problems must be identified in their entirety and that the possible solutions must be delineated and weighed against each other.

The balance between the strategic studies done for the air force and for the Defence Department has been shifting since the late 1950s. Then the air force decided to freeze its spending on Project Rand and the corporation responded by taking up substantial contracts with the air force's superior—the Department of Defence. Yet it seems likely that the air force will remain Rand's biggest single and most easy-going client. As one Rand man said simply, "We're good and they know we're good." And he might have added, "We're cheap." The \$10m spent by the air force on Project Rand in 1971 is peanuts compared to that service's total budget of nearly \$3 billion for research, development, tests and evaluation.

Project Rand at present includes studies of such sweeping questions as: is deterrence dated? What will future war consist of? What will be the implications of the spread of nuclear weapons to many countries? Another preoccupation of Project Rand is removing the pilot from the aircraft through the development of remotely controlled vehicles. A good third of Project Rand's effort is devoted to developing techniques of assessing increasingly complex technology. It should be said that less than 25 per cent of Rand's entire written output is classified as secret, and that its publications and reports are available through special libraries around the world.

At Rand there is a general belief that the demands of warfare have changed. What the military now wants is accuracy, low cost and minimum loss of life. If this sounds strange in the light of the Vietnam war, the people at Rand will reply that there never will come a day when the United States does not need to defend itself, and that defence strategy now is more humane, being more precise, than it was in the blunderbuss days of the last world war "when anything east of the Channel was the enemy."

Year after year Falconbridge delivers nickel.

Falconbridge began delivering nickel in 1930.

Highest purity electrolytic nickel. Then in 1969... NICKEL 98 granules as well... again, nickel in a very pure form.

In 1971, iron-nickel pellets... and in 1972, ferronickel for cost-conscious steelmakers.

Nickel in more forms, and increased production.

It means new nickel supplies are available now from Falconbridge—the only producer in the world that ships from three countries.

Steelmakers, electroplaters and other nickel users seeking a main or second source of nickel—an assured source—should be in touch with Falconbridge now for their near and long term needs.

Nickel... the improvement metal... from Falconbridge... the assured source.

A granule of NICKEL 98, an iron-nickel pellet, and a square of electrolytic nickel.

A ferronickel pig.

FALCONBRIDGE
Toronto Canada

And 60% more capacity is expected now.

Citibank's remarkable money-back offer.

As an exporter, you're no stranger to a situation like this:

Your customer abroad has 'paid' days ago for the goods you delivered. However, the money is still not where it should be. Back in your account, earning interest.

Instead, your money is 'floating'. It's being passed along from one bank to another. And it could take two weeks or more to find its way back to you.

To short-cut this process, more and more exporters are using Citibank's International Money Mobilisation Service.

Its basic benefit is speed. Through our worldwide branch network and telecommunications system, we can cut collection and remittance times dramatically. In fact, most transfers can be made and received within 24 hours.

At the same time, IMMS minimises

exchange and transfer costs. This in turn increases your daily working cash, gives you tighter control of export receivables, and lets you apply your export proceeds more effectively.

So if you're having cash flow problems, get in touch with Citibanker Terry Fitt and his IMMS group.

They'll analyse your present procedures, offer specific recommendations for the more profitable control of your corporate cash flow, and try to help you find a more efficient way of handling your funds.

Think-tank by the Pacific

in the position of delivering the goods to contractors—something that may make it less attractive to academic super-stars.

Because of the hostility of American intellectuals to the Vietnam war, the tide has also turned against strategic studies. To be sure, Rand has now completed most of its Vietnam research and has closed its Saigon office. Moreover it can produce reports showing that it gave the Defence Department the cold truth about the strength of the North Vietnamese willingness to go on fighting. In answer to the question: whose side is Rand on—the Defence Department's or the public's? Dr Rice answers unhesitatingly "the public's." But there are still a number of cheerful military planners at Rand who engage in the kind of talk—"splattering the target all over the landscape," "increasing efficiency of lethality"—that is taboo at most American universities these days. (Twelve universities have withdrawn from contracts with the Institute of Defence Analyses, a think-tank affiliated with the Defence Department.) Rand, in other words, may get only certain kinds of intellectuals in future, not a broad range as in the past.

This possibility is hotly denied at Rand. The leaders there maintain that there has been no decline in the quality of staff, no difficulty in recruitment, not even any problem with young men insisting that they will work on civilian projects only. But some of the staff feel that they are less free now and for that they resent Dr Ellsberg, even if they (as some do) admire what he did. One scientist who has left Rand said:

One of the essentials of the old Rand was to think the unthinkable. You could talk with or show papers to any individual in the absolute faith that he would not show it to anybody outside the building. Ellsberg decided that his professional obligation to his colleagues was

subordinate to his obligations as a private citizen.

Arrogance, in other words. Arrogance may be a basic component of the personality of the systems analyst. So, too, may be despair, which is what overtook Dr Ellsberg and which is another problem that Rand must face. The very bright people who choose to work at Rand, in spite of the security restrictions, do so because they want to work with real problems. But some are not prepared for the frustrations of working for a bureaucracy. Imagine the man (and there are very few women researchers at Rand) who has collected the only really good data to exist on a subject, subjected it to a barrage of analysis and computation and emerged with seven policy options of which three are demonstrably workable and economical. What can he do when the mayor or the secretary or the President ignores them? Give his information to the New York Times? Go back to academia? Soldier on?

Dr Rice, a very young (32 years old) president for Rand to have, believes that some of the staff need to learn humility and to take a longer view of the way that policy is influenced. Ideas that are denounced in Washington when they appear in a Rand report often find themselves adopted as policy or law a few years later.

That this happens was clearly shown by the House Appropriations Committee in its caustic report last year. In the same breath as it told the Defence Department to "phase out" the think-tanks, the committee scolded the department for not being faster to adopt the policy of prototyping in awarding new contracts for weapons and aircraft. Yet this policy came straight out of Rand, in a classic study done in 1963.

Whether Rand can maintain its pre-eminence remains to be seen. But chances are that it will survive. The Defence Department has persuaded

Congress not to seek to reduce staffs at think-tanks for three years. Moreover, the "in-house capability" that Congress wants government agencies to develop, now that civil service salaries can nearly match those of the think-tanks, is unattainable. No department of government can be its own best critic, nor can civil servants think inter-departmentally. Expensive computers and high salaries will not buy ideas that challenge conventional thinking and the civil service structure is not conducive to the recruitment of temporary consultants from universities and industry. Congress is deceiving itself if it thinks that the new Office of Technology Assessment which it wants to establish will do its heavy thinking in-house. One of the office's first acts may well be a rash of contracts with Rand.

On the home front

One of Rand's prime skills is the handling of massive amounts of complex data. And those who work within Rand's domestic division have an urgent sense of the enormous amounts of information going to waste in city halls, school departments, insurance companies and hospitals. In explaining their enthusiasm for rescuing it, they offer a vision of public policy made on the basis of "really good data"—a blending of the perspective of the theoretician and the pragmatism of the bureaucrat. Idealism is not discounted: the attainable goal is seen to be to use the techniques of objective rational analysis to help bring about positive changes in social policy.

Data analysis, as Rand sees it, leads to policy analysis. One project is concerned initially with making an enormous accurate mathematical model of the behaviour of pollutants in estuaries (the Netherlands government is one of the sponsors). But the questions

that are expected to come in the wake of this are: how much return do local governments get from investing in special treatment plants for handling sewage overflows during storms? Or, more bluntly, how much will it cost to make an estuary like New York's Jamaica Bay swimmable?

For the State of California, the National Science Foundation and other sponsors, Rand is considering the kinds of public power policies that might reduce the expansion in consumption of electricity in the next 30 years without stultifying economic growth. The answer will probably have to be found in pricing policies—a middle ground between exhortation (asking the public to use less) which does not work and compulsion (banning the use of electricity for certain purposes) which is politically unpopular. But first Rand must develop better methods for estimating future demands for energy and the possible economic effects of various levels of demand.

Health and bioscience may seem (at least in Britain) an unlikely field for the practice of systems analysis. But these have been among Rand's earliest and most successful domestic ventures. Rand has developed a number of techniques for using computers to assist in the diagnosis and treatment of such diseases as leukaemia, stroke and heart disease and a special kind of closed-circuit television camera to enable the partially sighted to read.

Rand's major medical effort now is to design policies to improve the delivery of medical care to the public. It is trying to find incentives to entice doctors to practice in rural areas, for one thing. Its major programme in this field is an experiment (being conducted for the federal government's Office of Economic Opportunity) to test the effects of various kinds of health insurance on the quality and quantity of medical care received by poor families. The long-range goal of the experiment is no less than to provide measured data for use in drawing up a national health insurance scheme for the United States and to avoid the chaos caused when Medicare (medical care for the elderly) was adopted by Congress with virtually no informed predictions about its effects on the cost and supply of medical services.

In urban studies too, Rand is taking both the short and long views. It did a study for the City of San Jose in California, after city officials complained that "growth is killing us." Rand found that in the first place the city's prosperity was singularly tied to

the construction boom that had turned farm fields into housing developments. It also found that, like it or not, the city government actually had little power to stop the wave of housing development. What had produced this growth was a combination of federal policies—aerospace contracts, which brought an influx of new, fairly affluent families into the area, and government loans and tax shelters that encouraged home ownership.

The San Jose study, however, is part of a larger urban studies programme which will take in Seattle and St Louis as well and consider what a national urban policy might be. Is downtown dead? Should industries be concentrated in the centres of cities, leaving the workers to live in the country? Should metropolitan government (taxing city and suburbs together) be fostered? It is already clear that small changes in federal policies are more important to what happens to a city than major changes in local policy.

Rand's work in education, one of its earliest domestic ventures, is much concerned with finding ways to assess the effectiveness of schools and assessing incentives to innovation. Rand is also monitoring an experiment for the Office of Education in which parents are given vouchers to buy education for their children where they choose. Radical questions are being asked. Should education be an agent of social reform or of social stability? Is the best attack on educational problems through the schools at all? Is there any evidence to link spending with quality in education?

Rand's boldest and most difficult exercise in domestic operations is the New York City-Rand Institute founded in 1969. The institute, a separate non-profit-making organisation, tries to use Rand techniques to help New York get the best use out of the resources that it has and to make some data-based predictions about the likely growth in the demands for its hospitals, welfare services, schools and police. But the experience has not been entirely happy—it has been often a case of the computer in the jungle. The institute has been controversial because entrenched organisations like the police department did not appreciate what were seen as latter-day versions of the old work-study men and because newspapers criticised the city for spending on consultants when money for essential services was short.

For almost 12 months a complex dispute involving the courts and state government deprived the institute of

its backing from New York. But believing in the worth of the project, Rand kept it going with its own funds and federal assistance (and a reduction in projects and staff). The institute now has a new black president and it points with pride to its measurable accomplishments in New York—developing computerised methods of dispatching fire engines which doubled the capacity of the Brooklyn fire-fighting force, suggesting that the city revise its rent control law to eliminate heavy regulation which was hurting, rather than helping, the poor, by discouraging landlords from modernisation. It has designed programmes for recruiting, keeping and placing nurses (giving them a transport subsidy for night work, for example) and for keeping a city-wide inventory of hospital beds. Rand claims that it saves New York City \$20m a year.

But the work is not easy, physically or intellectually. The causes of the problems are hard to discern, the effects of changes in city policy hard to predict and the natives often unfriendly. "You meet the enemy not the client, the Russians instead of the air force," said one analyst, who has worked on both strategic and domestic sides of Rand.

In its domestic programme, Rand could spread itself too thin. Already its projects cover almost every field that the mind can imagine—transport, communications, population, housing, medical education. Rand's enthusiasm for socially relevant work is beyond question. Yet it does not depend on them for its living. Could it? The answer depends on whether local, state and federal bureaucrats come to share Rand's conviction that the public's demand for government-controlled social reforms can be satisfied only if these are preceded by analysis of available data and of alternatives in policy.

Where Rand's money comes from

If you're there, we're there.

Wherever you choose to do business, Wells Fargo Bank is there to help.

Europe, Latin America, the Far East; our global network of branches, affiliates, and representative offices—including our new, wholly-owned merchant bank in London, Wells Fargo Ltd.—are strategically located to offer all the banking services you require, wherever you require them. All, backed by the strength of \$7 billion in assets and the knowledge gained through 120 years experience.

In addition, Wells Fargo makes it a point to maintain close working relationships with banking, government and corporate interests all over the world in order to serve you better wherever you choose to do business.

If you're there, we're there: Auckland, Buenos Aires, Bogotá, Caracas, Dubai, Hong Kong, Lima, London, Los Angeles, Luxembourg, Managua, Manila, Mexico City, Miami, Nassau, New York, Panama City, San Francisco, San Salvador, São Paulo, Sydney, Taipei, Tokyo.

The
Economist

A survey of the Midlands

It's worth a small fortune.

*Price includes P.T. (seat belts, delivery and number plates extra). Optional automatic transmission available on Mini 1000 Saloon, Clubman Saloon and Clubman Estate. Recommended price £106 extra inc. P.T.

Last month British Leyland delivered the three millionth Mini to its fortunate owner.

Which makes it the most successful and wanted British car in history.

And it seems to be more wanted with every passing year.

Why? Because the Mini gives more. In mileage, comfort and performance.

It also takes less. The Mini costs from £695*. A wealth of benefits at a distinctly unwealthy price.

The Mini found a very successful

formula, and the benefits of this success are widely shared.

Not only in this country, but throughout Europe and as far as the other side of the world, the Mini has earned itself a very desirable reputation.

All of which earns over £100 million a year in exports for British Leyland and this country.

And the Mini is just one of a range of cars, buses and trucks which together make British Leyland Britain's largest exporter.

That's worth a small fortune.

Austin, Daimler, Jaguar, MG, Mini, Morris, Rover, Triumph, Vanden Plas, Wolseley.

Right in the centre

Britain's melting pot

Nobody is quite sure where the Midlands begin nor where they end. Neither mountains nor rivers have shaped their appearance or their character. The Midlands have no edges. In the south they run without a pause into the mellow shires of southern England or, along the M1, into the home counties and the London metropolis. To the east they shade into the Fen country and East Anglia. In the west the Welsh hills have not been an obstacle to the pull that the Midlands have exerted on people looking for better jobs. And now a motorway links Birmingham with South Wales and Severnside which, in their turn, seek to attract what can be described as the industrial overspill of the Midlands. And to the north the region merges into industrial Lancashire and Yorkshire.

Once the innovatory revolution in mechanical engineering gathered pace, the Midlands became central to the British economy. Then the motor car carried them up to first place in the industrial pecking order. Coal, clay and iron ore were once all there in plenty in the region providing it with a solid base for its growth. Metal-working skills were passed from one generation of workers to another and managerial skills from one generation of entrepreneurs to another. Almost as often as not, the Midlander today is the son or daughter of immigrant parents who left the decaying industries of the older, depressed regions of Britain in search of a new prosperity. And, more often than not, the immigrants found it.

The planners have split the Midlands into two regions. This makes some sense, for there are obvious differences between them. The East Midlands, for example, are the more placid and perhaps the more contented of the two. But the two planning regions also have a lot in common, for, in a social as opposed to an economic sense, the industrial urban sprawl of Birmingham and the Black Country sets the style for the Midlands as a whole. That style is empirical, aggressive, brash and self-confident. The Midlands appear to harbour few regrets or romantic illusions about the past. Its people judge themselves—and like to be judged by outsiders—by their own worldly success. Essentially this is a region of doers, not thinkers.

The West Midlands

I'll be all right, Jack

The West Midlands work. This is where the mechanical revolution took off more than a century ago in the furnaces and foundries of the Black Country. The region remains Britain's industrial—and more specifically its engineering—heartland. It contains over 5m people, that is around 9 per cent of the country's total population. Nearly half of them live and work in the conurbation of Birmingham and the Black Country, 20 miles long and 12 miles wide. Much of the rest of the West Midlands is comforting to the eye. The region has its salubrious spas like Leamington and Malvern and its sleek county towns like Worcester and Shrewsbury. There is plenty of rural variety across its flat landscape. But it is the conurbation which has stamped its strident and uncompromising personality on the region as a whole and it is what goes on there that matters.

Take the 20-minute train journey from Birmingham to Wolverhampton through Smethwick, Dudley, Tipton and Coseley. On either side stretch the acres of industrial wasteland, stagnant pools, pylons and power stations, chimneys and tiny terraced houses. The West Midlands were once the engineering workshop of the world. Now they are just one of many. In the heyday of Joseph Chamberlain the West Midlands became the champion of industrial protection. The region began to look to the safety of the Empire for its markets and not to the world as a whole. It did not really find it, but unlike other old industrial areas in Britain, the West Midlands survive and, more often than not, thrive. Its indus-

tries have never needed the government props which have made the decay of shipbuilding, coal and cotton less painful. The region has acquired a reputation for secure jobs and high wages. Between the wars and since then the more go-ahead of other, less fortunate regions have clocked into its towns and factories for work.

As a result the West Midlands were taken for granted, as a region free from headaches. Indeed, successive governments have made the region pay for its success. Along with the south east, it has become a nursemaid for the care and protection of the development areas, in the sense that it is supposed to go on pumping out high profits, wages and taxes to help cosset the less prosperous. Its businessmen always found it difficult to get industrial development certificates for the growth of their firms, while newcomers were discouraged from putting down roots in the West Midlands. It is reckoned that over 83,000 jobs have been denied the region since the war. These have gone to Scotland, Northern Ireland, Wales and the North of England. Only tiny Oswestry in the north west corner of the region has been granted intermediate development status. The rest of the region has had to fend for itself and put up with the twists and turns of national economic policy.

Local businessmen and politicians like it that way. And they are right to do so. There is a hardheaded suspicion of paternalism. The virtues of *laissez faire* capitalism die very hard in the boardrooms of Birmingham. The

region thrives on healthy competition. It has a self-confident versatility. Its down-to-earth pragmatism is not going to disappear in this century. There is so much inherited skill and sheer nous in the West Midlands that the idea that they could end up like their less well-off neighbours is absurd. And yet over the past couple of years a few nagging doubts have crept in. The West Midlands are no longer quite as self-assured as they were.

The main reason for this change in mood is that unemployment now stalks the region for the first time since the early 1930s. Over 70,000 people are on the unemployment register, which amounts to 3.1 per cent of the total labour force, compared with a national average of 3.4 per cent. This is nearly as high as the unemployment rates in intermediate areas like the north west and the south west. The locals put the blame for the start of their present troubles on Mr Wilson's deflationary package in July, 1966. Each winter since then has witnessed a further jump in the numbers of unemployed. The West Midlands have experienced short sharp downturns in their economic fortunes before, notably in 1963, but there has never been anything quite as persistent as the present trough. This has done a good deal to stimulate arguments whether the region really has much of an economic future in front of it unless it receives more positive government support.

Local Cassandras point to the region's dependence on manufacturing industry. Over 53 per cent of its labour force is involved in manufacturing, while 38 per cent is working in the service industries, compared with the national average of 38.4 per cent in manufacturing and 51.0 per cent in services. More important, almost three-

The kingdom of the car

Coseley build on trust...

With their pre-engineered steel framed buildings Coseley have developed a world wide reputation. Span, height, length, roof pitch—whatever the problem a faster and more cost effective building can be supplied and erected.

Coseley customers have real confidence—proved by the large numbers of buildings of all shapes and sizes providing cover as warehouses, factories, harbour buildings and garage showrooms etc.

Send for the latest catalogue for quick, confident cover from 500 to 500,000 square feet.

have confidence in Coseley... others do

quarters of those employed in manufacturing work in the production or use of metals. A few years ago this was not cited as a handicap; but now it is. A closer look at the character of these metal-based trades shows how much the region depends upon their prosperity. First, over 140,000 workers are in metal manufacture. Their output of castings, forgings and other kinds of ferrous and non-ferrous metals accounts for nearly a quarter of the country's total output. Second, over 305,000 workers are in mechanical engineering, some 13.5 per cent of the entire West Midland labour force. Just over a third of the industry's output is exported directly. Five big firms are responsible for nearly half the machine tool production in the region, which accounts for 31 per cent of the country's employment in that industry. Third, the West Midlands is the heart of the British motor-car business. Over 203,000 workers make vehicles and tyres, some 34 per cent of the country's

total labour force in that industry. They are largely employed by the two giants British Leyland and Chrysler (UK).

In contrast, the West Midlands have a comparatively meagre stake in insurance, banking and finance. There is a shortage of doctors and dentists. And it is nothing more than pious hope which argues that the hotel and catering business will pick up in the future. At the same time the region has few of the science-based growth industries, such as chemicals, electronics and computers. All this has begun to worry some West Midlanders. There is a feeling that the region, which for very many years exploited and profited by new technological innovations, has been living off its fat, while the very latest in technological progress has passed it by. But such sentiments are liable to prove premature.

In the next few years there will undoubtedly be some kind of increase in service trades. But an upturn in the

national economy, which has already happened in the motor car industry, will probably revive confidence and end the present sluggishness in investment. Since the middle of July the West Midlands has experienced a relaxation in the controls that the Government imposes on the granting of industrial development certificates (IDC's). Certificates have become more easy to get for schemes of factory modernisation which require an increase in the number of employees. This should dilute angry opinion in the West Midlands that the region has been made to suffer restrictions because of the failures of other areas.

But it may well be that the West Midlands will have to rest content with a higher rate of unemployment than it was prepared to tolerate in the past. There are already signs that employers have begun to step up production, but without having to expand their labour force. Growth in output is likely to come more from further investment in

BMA-the Midlands' own airline

British Midland Airways are one of the leading airlines in Britain, flying more miles within the U.K. than any other independent carrier. As major operators at East Midlands and Birmingham Airport our scheduled services link the

whole of the Midlands with the key

centres of Glasgow, Dublin, Belfast, the Channel Isles, Amsterdam, Brussels and Frankfurt.

BMA: the Midlands own airline - you should fly it sometime.

Just write to us for a copy of our Winter Timetable or ask your local travel agent for details.

be central and save effort, distance and money in Derbyshire & Nottinghamshire

re-siting existing factories/siting new factories

We offer you homes for your factories and a labour relations climate second to none. The cost of expansion or new development here—only 2 hours (by A1 or M1) from London—is unbelievably low.

20% of your factory building cost is a free gift—(a Government incentive to 'get cracking'). Up to 75% can be provided by very cooperative County Councils as a 5-20 year mortgage loan. Land costs are still substantially below those a few miles south. (Typical recent prices: £6,000 per acre, £6,750 per acre, £7,250 per acre. Odd cases go up to £10,000 or down as low as £5,000.)

In the 'Intermediate Areas' near the M1 and A1, (and now also in and near Buxton) there are also:—

- (A) A guaranteed 'Liberal' IDC policy.
- (B) Training grants of £15 per week per man, £12 per week per woman.
- (C) Generous resettlement grants for key workers.

Alternatively we will help you explore the possible advantages of the new selective Capital Assistance from the Department of Trade and Industry which could give you reduced interest loans in relation to any part of your capital expenditure, complete with up to 80% grants for any plant transference costs.

capital equipment and a more sensible use of buildings, plants and skills than from a devil-may-care expansion in the numbers employed. All this will speed up the mergers and the processes of industrial rationalisation which have become hard and accepted facts of economic life in the West Midlands.

The pressure for bigger wage packets for less work is the real reason why local businessmen are adopting such a hard-headed attitude towards the future. Some of them even talk of the West Midlands "committing economic suicide" unless its workers curb their greed. So far, to the amazement of many local observers, high unemployment has done nothing to soften wage demands. And yet, no one is in any doubt that the wage packets are higher in the region than anywhere else in Britain, even the south east.

Earnings have been so high that it was thought that they might stamp a middle-class, suburban way of life on of what Mr J. B. Priestley once brilliantly and disparagingly called the "Admass." Yet the West Midlands retains its working class tastes and habits. It is still a long way, for instance, behind the south east and Greater London in the ownership of telephones, television sets, refrigerators, washing machines, central heating and even motor cars. But the region has fewer slums than the industrial areas

of the north. The last housing survey suggested, on the evidence of a 3,000-strong sample, that 28 per cent of all houses in the Birmingham conurbation were built before 1914, which is far below the national average, although it seems that the older houses in the area are more likely to prove unfit to live in than houses of a similar age elsewhere in Britain.

The West Midlands are the land of the wealthy worker. This is not going to change. But, perhaps because of all those fat wage packets, a region which is still working class in tone displays few signs of the old-fashioned political working class solidarity that can be found, say, in South Wales and Northumberland and Durham. It has never been a rock-solid stronghold for the

Labour party. Persistent shopfloor militancy in the Midlands has little to do with socialist doctrines. It is the logical outcome of the kind of abrasive, empirical world which the West Midlands are. The region has few illusions, fewer myths. It has spurned the romanticism which has provided a kind of solace to depressed regions farther north. The Black Country has never given birth to its own novelist, not even its own angry young man. Whatever happens to the national economy, the brittle, brassy and often tawdry quality of life in the West Midlands will remain largely unaltered. It is still a place where long-headed and sometimes hard-faced men will do well. It is not an accident that the local accent remains as ugly as ever.

The East Midlands

The placid counties

The East Midlands are Britain's forgotten region, living under the shadow of their more assertive neighbour to the west. The region does not really hang together. It lacks the hard, dominant centre which the Birmingham conurbation provides for the West Midlands. The planners treat the East Midlands as an administrative whole, but its 3.4 million people (making up 6 per cent of the country's total population) do not really agree with them. The textile towns of the Peak district on the edge of Lancashire, for instance, having nothing in common with the thatched cottage villages of Northamptonshire. The four sub-regions make better sense. The most important is that for Derby and Nottingham. The two towns sit side by side, and they may in time gradually become one. Leicester holds sway over its large hinterland. Northampton, too,

is a nodal centre. Finally, the flat lands of south Lincolnshire prosper, the northern part of that county having been hived off into Humberside in 1965.

The region comes up against no physical barriers until the start of the Pennine chain in the north. Its neighbours to the north and south are pushing their problems over its borders, with people from Sheffield and London finding new homes in overspill towns in the East Midlands. The real barrier is the intangible one to the west, for the two Midlands hardly in any proper sense meet. Their economies remain almost totally separate. Rail and road links between them are inadequate. By the 1980s new roads should have brought them closer together, but the fact that these links are taking so long to materialise suggests that the two regions do not consider themselves interdependent. Possibly the west's principal

Aspiration

Concentration

Inspiration

Resignation

contribution to the east is to pollute the river Trent.

The eastern region has little of the brashness of its neighbour. It is a mellow, comfortable, easygoing place. It does not suffer from the economic ups and downs of the west. It has the third lowest regional unemployment rate in the country after the South East and East Anglia, with 2.7 per cent of its labour force out of work. The region's fortunes are unlikely to change much in the immediate future. But, like every other region in Britain, a stagnant economy has given it something to gumble about. Closures and mergers in the engineering industry have, for instance, hit the towns of Lincoln, Newark and Grantham, where the male unemployment rate has risen above the 6 per cent mark. The lucrative Nottinghamshire-Derbyshire coalfield has been made an intermediate development area in an attempt to soften the blow of the mining industry's steady contraction, although the National Coal Board has slowed down the pace of closures, so that the region is not losing

the 3,500 or so miners each year which it was predicted would happen in the early 1970s. In fact, the NCB is recruiting more labour locally at the moment. All the same, about a dozen local authorities in the region have applied for intermediate status without success over the past few months. With its 6.0 per cent male unemployment rate, Chesterfield feels particularly sore that

it is still being left out in the cold—but this may change before much longer.

But, apart from these local pockets, the East Midlands are comparatively prosperous. Just over 47 per cent of the 1.4m labour force are employed in the service trades, with a third of them in either distribution or professional and scientific jobs. Unlike the West Midlands, no one industry can be said to dominate its economy, in which nearly 45 per cent of the labour force are employed in manufacturing industries (with nearly another 8 per cent in coal and clay mining). While 116,000 of the workers are in textiles (for the East Midlands contain 60 per cent of the country's hosiery industry), a further 103,000 are employed in mechanical engineering and 70,000 in clothing and footwear.

This comfortable spread of industry is associated with the large number of small firms in the area. The region has branches of the big combines like Courtaulds, GEC-AEI and Rolls-Royce. But there are nearly 4,000 firms employing less than a hundred men each and there are only three companies that have over 5,000 workers on their payrolls. This may help to explain why, as compared with the more turbulent west, industrial relations are relatively peaceful. The wage packets may be smaller than in the west, but the number of days lost through strikes remains much fewer.

The East Midlands have never been so attractive to footloose workers and industries as the West Midlands and south-east. Some new people and some new firms have come into the region; but, basically, its people are locally born. Contentedly, they stay put. There is, admittedly, no sense of regional identity; but, in comparison with the strident cries for help which go up from other regions, this atmosphere of quiet, local self-sufficiency in the East Midlands is positively enjoyable.

Industrial development certificates

Industrial development certificates (IDCs) have been an essential part of British regional policy since 1945. Their aim is to restrict the amount of new industrial building (and the jobs that go with it) in the better-off areas of Britain. The theory is that if new developments are kept in check in such regions the employers have no choice but to set up their new factories, warehouses and so on in the development areas. Before July, 1972, they faced the likelihood of a refusal from the Department of Trade and Industry if they sought to build new premises of over 5,000 square feet outside the development areas. Since that date the exemption level on IDCs in the Midlands has been raised to 15,000 square feet. At the same time IDCs have become more easily obtainable for schemes of factory modernisation which involve some increase in the number of a company's employees.

Over the hump?

Birmingham

A place fit for the motor car to live in

Most of Birmingham's admirers are to be found in Birmingham. They like to call the city Britain's Detroit, not merely because it is the centre of the motor industry but because of its gritty, go-getting atmosphere. Huge urban freeways now gouge through what is left of the old heart of Birmingham in a maze of concrete underpasses and flyovers. Over half the city's commuters are reckoned to travel to work by car. Even the old Snow Hill railway station has been converted into a car park.

Birmingham has become an easy place to escape from. The recently opened Aston expressway, which cost £13.2m and led to the demolition of over a thousand houses, gets the motorist from the Bull Ring in the centre of the city to the M6 for the North or London in no more than five minutes. And Birmingham's council has just decided to seek Government approval for an annual grand prix around the town, Mille Miglia style.

England's second city of just over 1m people has become a place fit for the motor car to live in. Few Brummies really object. Little of that

middle class resistance to motorway plans so apparent in Greater London is to be heard. The Labour party has never wanted to antagonise its often equivocal support from the car workers and the Tories have spoken up for the virtues of a car-owning democracy. So the city has never had a debate on the matter and planning remains firmly under the grip of the engineering department. The motorway link at Gravelly Hill, known as Spaghetti Junction, has, it is true, led to some second thoughts. This £30.2m maze has brought misery to those unfortunate enough to live next to it. One block of flats, which was built a mere fourteen years ago, has had decibel recordings well above the stipulated limits laid down in the 1963 Wilson report. But, typically, criticism of the concept that all must give way to the motorway has been toned down—into talk of having to pull that particular block of flats down.

Birmingham has none of the stolid civic grandeur of other English provincial cities. The ornate Council House, whose foundation stone was laid in 1874 by the local radical Joseph Chamberlain, still stands at the

top of New Street. But very few other monuments remain from the time when Birmingham had the reputation of being "the best governed city in the world." Today, the city is hard, metallic and grey. Office blocks and high-rise flats dominate its landscape. There is not much sign of any sense of community. At night the streets in the city centre look as though they are under curfew. Birmingham is no longer as depressingly ugly as it was. It continues to exude an air of prosperity. But, perhaps, somewhere along the line of progress it lost its soul. No wonder, then, its car workers drink at the pubs out at Longbridge and its businessmen head off for their rural Arcadias, which now, thanks to the motorways, extend as far as Malvern and Worcester.

But, to be fair, Birmingham is now making an effort to rid itself of its image as being a city devoted solely to the making of big wage packets. A £1m repertory theatre and a massive £3½m concrete and glass library complex have just been opened. The council provides financial help to the ailing local symphony orchestra. The Midlands Art Centre stumbles along out in leafy Edgbaston. Some of Birmingham's citizens grumble at the cost and at the council's concern for prestigious projects. They are wrong. Britain's second city should not be a complete cultural wilderness. It still has to live down its lack of good restaurants. The best food is served at the local college of catering. Those who live in Birmingham wonder where that college's graduates go.

Birmingham may be only an hour and a half from London by train, but it harbours a deep suspicion, even distaste, for the ways of the metropolis. Over the past decade both the major parties in the city have been at loggerheads with Whitehall. The stainless steel Tories under Alderman Sir Francis Griffin were often ready to call themselves the "Conservative government in exile" during Labour's tenure of office at Westminster. The council then refused to introduce comprehensive ideas into secondary education. There was an equal determination to sell off council houses to those of the city's tenants who wanted to own their own homes. Then, in turn, the Labour group which won back control of Birmingham in May became a thorn in the Government's side in resisting rent increases under the Housing Finance Act until the eleventh hour.

How to make better heat exchangers than Serck

All you need is 40 draughtsmen, 67 project engineers, 72 years of experience.....

... and you'll be getting close to our standards. Of course, you'll have to add production and quality control engineers, experienced craftsmen and lots more, but it'll be worth it. You'll have an utterly reliable heat exchanger, designed and built to do a specific job.

Of course, you could always come to us in the first place. As Europe's number one, we can offer all this at a highly competitive price. And we provide full technical and after sales services into the bargain.

How to make better heat exchangers than Serck? Don't try. It's impossible!

Waiting for it

Both parties share a common resentment at what they view as the downgrading of Birmingham under the reorganisation of local government. The city is to become one of the nine district councils in the West Midland metropolitan authority. With only 39 out of the 104 seats in the top-tier council, Birmingham can harbour no hopes of domination over the conurbation. The inclusion of Tory Sutton Coldfield within the city's boundaries should make Birmingham more marginal politically, but that is no compensation to those who are outraged at the thought of the massive overspill estate at Chelmsley Wood, the municipal airport and the site of the national exhibition centre at Bickenhill all going into neighbouring Solihull. Such men also wax indignant at the Government's plans for the creation of regional water authorities. This is going to mean that Birmingham's supply from the Elan valley will come under the control of the Welsh authority.

All these changes might begin to shake Birmingham out of its old, inward-looking ways. But the corporation, whichever party is in power, has won a reputation for resistance to innovation. It is true that a new policy advisory committee has now been set up but, as yet, modern ideas about corporate management and programme budgeting have found few advocates at the Council House. And what will yet one more committee do in the midst of so many others? The

atmosphere of the closed shop in local government affairs can be found throughout Britain; but nowhere is it more noticeable than in Birmingham.

The council has, however, one impressive success to its credit. Many of the slums have gone. It is still possible to discover grimy relics of the past in the streets of Handsworth and Aston, but over 53,700 houses have either been demolished or closed down since the war, and of these nearly 29,000 have disappeared in the last five years. The housing department reckons that another 32,900 dwellings will have to be bulldozed down by 1980 and that a further 40,800 will require improvement and modernisation. And with over 15,400 families in the city still in need of a home at the moment there are no grounds for letting matters slide. But this is a task that Birmingham, on past performance, should be able to tackle successfully—just so long as it becomes less sceptical than it has been about the value of overspill estates administered by other rate-collecting local authorities.

As it is, Birmingham's new arrivals still find themselves herded together in the inner city ring. The city has long been an El Dorado for the poor and dispossessed. In 1961 only 14.4 per cent of the city's population were born in Birmingham itself. The bulk came from the rural west, Wales and Scotland or from the depressed regions of northern England. During the 1950s and 1960s high wages and labour

shortages attracted thousands of coloured immigrants to Birmingham from the West Indies, India and Pakistan. The city is thought to have 20,000 or so West Indians and 12,000 Indians and Pakistanis. They work on the buses or in the hospitals, or in the dirtier, lower-paid jobs in the foundries and engineering workshops. Most of the coloured immigrants tend to live in such seedy twilight areas as Handsworth and Balsall Heath. The West Indians would like to go out to the outer ring of modern suburbs; but, apparently, the Asians prefer to stick to their own stable communities around their own shops, temples and cinemas.

Birmingham has more than its share of race bigots, but local efforts to stir up prejudice over the Ugandan Asians have proved fruitless. Worries persist, however, about the relations between the police and the immigrants, particularly young West Indians, for unless the local authorities act with alacrity real trouble could arise when Birmingham's first born generation is decanted on to the labour market with higher expectations and qualifications than their fathers ever had. The 56,000-strong Irish community has fewer problems of assimilation, although the bulk of them still work on building sites in unskilled jobs. In Birmingham the atmosphere is restless. It is still the free-for-all city of rampant individualism. But now behind the social problems of assimilation lies a new economic anxiety: a fear of unemployment.

The tarnish on the brass

Birmingham's army of unemployed has, temporarily at least, eroded the city's self-confidence. There is a good deal of talk nowadays that the good times have gone for good. Birmingham had a few nasty jolts in the past, but they were soon over and they did nothing to halt the insatiable drive for greater material prosperity. Now genuine doubts are voiced on whether the city can really recover its former role as the drum-major of any national economic boom. Since July, 1966, the number of unemployed people in Birmingham has risen steadily. Last year that number doubled. Today 3.7 per cent, or about 21,000 people out of the city's 654,000 labour force, are jobless. The male unemployment rate is not far short of 5 per cent. In the golden years of the 1950s and early 1960s there were two jobs on offer for every man on

the Birmingham unemployment register. Now there are 20 men chasing every job that turns up.

There is, however, one good sign. Last year between 14 and 20 firms were getting rid of up to 500 employees a week. Now that rate has fallen, with no more than ten firms dismissing between 150 and 200 employees each week. But once a man has been made redundant, he has less chance than before in getting another job quickly. In 1970 no more than four in every ten men were without a job for more than six months; now that number is six men in every ten. Moreover, two-thirds of the men out of work are under 45 and a long way from retirement.

Businessmen in Birmingham like to blame their troubles on the Government. They argue that many firms that have been encouraged to go to the

development areas would have come to Birmingham if they had not been held back by Whitehall. There is some truth in this charge. Quite a large number of local firms would have preferred to expand their factories rather than being forced to set up new ones in, say, Merseyside or Scotland. But this is not the whole story, for Birmingham has inflicted wounds upon itself. These are due in part to the peculiar structure of Birmingham's economy. More than anywhere else in the West Midlands, except possibly Coventry, it is a city which has built up its prosperity on a narrow manufacturing base. Over 53 per cent of Birmingham's workers are in manufacturing industries and only 46.2 per cent in the service and construction trades. Moreover, Birmingham has three-quarters of its manufacturing workers in metal-based industries, such as mechanical engineering, electrical engineering and vehicle production.

So a reduction in demand in any of these sectors always has an immediate effect on Birmingham. But, in the past, employers were prepared to hold on to their labour force until the good times came again. This time they had no sensible option but to cut costs in the face of wage inflation. They have had to get rid of the fat they were carrying by modernising outmoded methods of production. Birmingham has a relatively low level of output per head, but this is likely to improve now that the industrialists have realised that they can make do with a smaller labour force. Rising car sales should eventually boost the sluggish car accessory business in Birmingham which provides jobs for 13 per cent of its labour force, for many of these firms were still working this autumn at least 20 per cent under capacity. But this is not likely to produce any noticeable fall in the numbers out of work.

What surprises many people in Birmingham is that the pace of wage inflation has not slackened in the face of the stark fact that bigger pay packets means fewer jobs. Semi-skilled workers are reckoned to earn at least £30 a week, and the skilled worker can take home £40 a week and more. Inevitably, the pace is set by the city's biggest single employer, the British Leyland works out at Longbridge. They provide jobs for over 25,000 workers. Directly and indirectly, the livelihood of possibly as many as a quarter of a million people in the Birmingham area depends upon British Leyland's fortunes.

British Leyland is well aware of its responsibilities, both nationally and

locally. It has at last weaned its workforce away from piecework methods of payment, which was the cause (or excuse) for an enormous number of stoppages and which produced a wage drift of over 6 per cent a year. In the past 10 months of the piecework system, British Leyland's Longbridge division lost 1.8m man hours of production (which was equivalent to an output of 43,000 cars and 93,800 commercial vehicles). More than fourth-fifths of the disputes and stoppages stemmed from the piece-rate system.

In November British Leyland got 10,000 of its Longbridge workers to agree to an 18-month-long agreement which will cost the company £4m and add between £4.50 and £10 to each worker's weekly wage packet. In return, the piecework system is to be scrapped. In the short term, this will push up the wage bill. Average earnings of workers at the Cofton Hackett division of the company at Longbridge which are on time rates are running at £2,274 a year, while the average piecework rate was only £1,950 a year. None the less the shop stewards' committee maintained a strong rearguard action against the proposed reforms, because its militants feared that the new system might curb their power to hold the company up to what used to be virtually ransom. That their militancy pushes other men out of employment has not seemed to bother them. They are all right, Jack. And it still remains to be seen whether the end of piecework will assure a quiet life for British Leyland in the future.

Birmingham's two other giants,

Software

Joseph Lucas and Guest, Keen and Nettlefold, employ between them a further 60,000 workers in the West Midlands as a whole. They too face trade union militancy. The three big combines together are the heart of Birmingham's economy. But its body is made up of little men and little firms. A recent survey has shown, for instance, that there are nearly 3,700 separate firms at work today in central Birmingham which employ less than 100 workers each. Only five minutes' away from New Street station lies the congested district of Hockley where small family and one-man firms carry on their traditional trades on a tiny amount of working capital and tight margins. Here the old craft skills flourish in the manufacture of costume jewellery, the making of guns and rifles and the moulding of silverware. Hard times have hit some of these firms. Some have gone under. But most of them have managed to survive.

Birmingham is an extraordinary mix of firms, large and small, independent and yet interdependent. There is no lack of diversification and inventiveness in its metal trades, and there is no reason to believe that they will fail to adapt themselves to shifts in technology, in fashion and in demand. But Birmingham's past prosperity has blinded many of its inhabitants to the fact that the years of easy affluence were those the locusts ate. Because in the past the next pay-rise and the extra bit of profit always seemed to be there for the asking, Birmingham will probably never have it quite so good again.

Hardware

Wolverhampton Unwilling satellite

Nowadays, Wolverhampton is a touchy, bewildered town with not very much idea of quite where it is going. In the face of the lengthening dole queues its self-satisfaction has given way to doubt over the past year. Wolverhampton has begun to recover from a drastic slump, which nobody could really explain. About 3.8 per cent of the town's labour force is unemployed. This amounts to over 5,500 people, nearly 4,500 of whom are men, and businessmen emphasise the fact that 1,500 of them were once skilled or semi-skilled workers in the engineering industry.

In the past, Wolverhampton has displayed a self-assertive independence. It has deliberately stood aloof from the undistinguished urban sprawl

which separates the town from Birmingham. The town has never seen itself as a satellite of the bigger city, but equally it has never been able to escape from its pull. The reason is quite simple: Wolverhampton's economy is inextricably tied up with the rest of the West Midlands. It is the handmaiden of the car industry, with its firms providing that vast assortment of accessories the motor manufacturers need. Wolverhampton makes the bolts, screws, bearings, tyres and so on that other people assemble elsewhere. As a result nearly half of Wolverhampton's labour force is employed in metal-based trades. So the town's prosperity lies, in effect, in the hands of decision-makers who live and work outside its boundaries.

In recent years, too, Wolverhampton's old family firms have disappeared. In 1969 only two of the town's top 10 firms were in the hands of outsiders; but now only one remains under local control. Some 18 companies have closed their gates for good and the town has suffered 4,600 redundancies. This shake-out was long overdue and now, with every businessman in the Midlands concerned about the size of his wage bill each week, there is no likelihood that an upturn in demand will completely remove the queues at the employment exchanges.

Wolverhampton is feeling the draught, but the cooler economic winds have not as yet blown all the cobwebs away. There are all the usual silly demands for intermediate development status. But, rightly, the Government has turned a cold eye at such requests. It is true that new

National Exhibition Centre Magnet or white elephant?

Businessmen in the Midlands are expecting great things from the national exhibition centre (NEC) when it opens its doors on January 1, 1976. Certainly those 310 acres at Bickenhill out in the green belt between Birmingham and Coventry provide an excellent site for this £17.2m project. Communications could not be better. Elmdon airport is right next to it and there are hopes for a new terminal and an extra runway. British Rail intends to chip in with a station and trains will leave Bickenhill every half hour to London. The road network will eventually lap right round the site's perimeter when the M42 from Bromsgrove to Nottingham is completed and the M40 snakes by from Oxford. Already the M1-M6-M5 motorway link has brought the cities of Liverpool, Leeds, Bristol, Cardiff and Manchester within two hours' driving time of the site.

The Birmingham-based organisers of the NEC hope that it will give the Midlands an economic and psychological boost. It should, it is believed, directly provide 6,000 jobs while the Birmingham chamber of commerce is keeping a close check on the increasing number of hotel bedrooms in the area. So far two exhibitions have decided to come to

Bickenhill in its first year. They will be organised by the Machine Tool Trades Federation and the International Toys Fair. The NEC needs 150 days of occupation a year to break even and in Birmingham they are confident that that number will be easily exceeded.

On completion, Bickenhill will have nearly 1m square feet of floor space. The exhibition halls will be grouped round a central piazza with restaurants, offices, warehouses, shops and lecture theatres. The centre has its critics, and they are not just confined to London (where the Lyons group sought the go-ahead from the Government for an exhibition site at Northolt). The Department of Trade and Industry was not altogether happy about the idea and it took a high-powered all-party delegation from Birmingham to reassure the faint-hearts in Whitehall this summer.

The trouble arose largely from the tight credit conditions which private lenders demanded for their backing of the scheme. The Government never intended to fork out more than £1.5m towards the cost of the site and Birmingham corporation had hoped to get by with a £3m loan, leaving the remaining £13m or so to be raised from pri-

vate lenders. Naturally enough, the private investors demanded a high rate of interest and they wanted to secure their loan against the freehold value of the land. In the end, Birmingham council had to finance the project itself, apart from the Government's contribution. To do so, it had to secure a special loan sanction from Whitehall—and it did not get that until Alderman Sir Francis Griffin had spoken to the Prime Minister about it.

The centre's organisers believe that Bickenhill will help to diversify the region's economy. In particular, they hope that, through the building of offices and hotels, the NEC will stimulate the service trades. But its critics say that the NEC could prove to be as big a white elephant as the Concorde. They argue that even if buyers and businessmen are attracted to Bickenhill the excellent communications with London will mean that most of them will head out of the region in the evenings, and that the stimulus to the local service trades will therefore be slight. The real test for Bickenhill is yet to come, for until the car and commercial vehicle industries opt for the new site instead of London's Earls Court, the industries of the Midlands will not have given the idea the vote of confidence which it needs to be an unmistakable success.

Low-rent factories grow at Telford

From 3,000 sq. ft. units to 80-acres sites, manufacturing and service accommodation at Telford has the ability to grow.

It's a quality built-in at the design stage and made possible by the provision of ample expansion space.

Units start at rentals as low as 42p per square foot.

There's a ready supply of skilled labour, new homes to rent or buy immediately and a planned 15-mile motorway link to the M6.

We've a new 30-page brochure entitled "Telford - your opportunity"

Write or phone for a copy to
Mr. R. G. Tilmouth, Commercial Director,
Telford Development Corporation,
Priorlee Hall, Telford, Shropshire, TF2 9NT

Together or apart?

firms are no longer positively discouraged from settling down in Wolverhampton; but few of them have bothered to come, although a bicycle factory is due to open shortly in Bilston, and a very large footage of industrial space is still lying idle. There are hopes that local MPs might press Wolverhampton's cause in Whitehall, but Mr Enoch Powell is hardly the man to champion the cause of government assistance.

Wolverhampton has always been quick to assert its independence but now the troubles of its engineering industries seem to have reinforced its underlying sense of inferiority. In many quarters, there is a defensiveness about the town's future. Even Telford, plagued with its own problems, is seen as a danger, its planned hypermarket being talked about as a threat to Wolverhampton's role as the market town for North Worcestershire.

Modern, let alone liberal, methods of management can hardly be said to characterise the local administration. Three years were spent by the corporation, for example, in a futile attempt to stop Sikh bus conductors from wearing their turbans while at work. And the Race Relations Board criticised the council for requiring a two years' residential qualification from foreign-born citizens who sought a place on the housing list. The council has just recently scrapped the qualification altogether.

To find itself Wolverhampton will have to learn to be more sympathetic, more tolerant of the ways of its neighbours. In the past the town has preferred to turn its eyes away from the conurbation of which it is unmistakably part and to look longingly over the green fields of Shropshire to the

Welsh Marches a short car drive away. Out in comfortable Tettenhall with its executive-type houses, golf clubs and tennis courts, Wolverhampton might be mistaken for a well-off London suburb. But one suburb does not make

Coventry

Where the Joneses do keep up

Coventry is a contradiction. It is both an old and a new city. The old cottage factory of the silk ribbon weavers, Cash's, still stands by the canal while the prewar shadow factories and postwar plants crowd together close to the motorway. It is both a city where, on the back of some of the biggest pay packets in Britain, keeping up with the Joneses is a way of life and a city where, in contrast to that kind of go-getting individualism, a keen sense of civic pride still dominates the thinking of local politicians and officials over 30 years after the blitz. In Coventry, it seems, the tenets of the Manchester school of laissez faire liberalism live in the same street as the doctrines of Fabian socialism. Cobden, whose free trade treaty with France in 1860 jerked Coventry out of its past by ruining the local silk weavers, would have understood the attitude of its inhabitants and Beatrice and Sidney Webb the zeal of its local council.

But these two attitudes towards life do not always make happy neighbours, for what the council does is accepted, rather than appreciated, by those whom all the planning and all the work is supposed to benefit. This is the outcome of 30 years of uninterrupted Labour party rule between 1937 and 1967 in an overwhelmingly working

a town. Wolverhampton's future lies in its own capacity to realise that, with its prosperity dependent on the fortunes of other towns and other industries close at hand, it can never stand alone.

class town where power on the factory floor is nakedly exercised.

Coventry long ago forgot it was George Eliot's Middlemarch. Except in the tool rooms, it may have even forgotten it was once a city of engineering skills. Today, it is given over to the semi-skilled labour of the assembly line. Unlike much of the rest of the urban West Midlands, Coventry no longer has the little men of the metal trades. Since the decline of silk weaving and watchmaking, its growth has gone hand in hand with mass production and the standardisation of consumer tastes. For all the imagination that was put into its rebuilding, it has become the standardised town of the last half of the 20th century. For many years it has had one of the great Rugby football clubs in the country. More recently, its soccer team got into the First Division. It has been carried to the top of Britain's prosperity league. Coventry has made it, only, it seems, to discover that life at the top is not necessarily full of joy.

Typically, nearly two thirds of Coventry's labour force work in manufacturing industries and only just over a third in the service trades. Big companies in big industries dominate the city: Courtaulds in textiles; Chrysler and British Leyland in motor vehicles; A. P. Herbert and GEC-AEI in

Corby is the right place for a lot of people. We've got over 100,000 square feet of office space situated right in the new town centre that's nearly ready, from only 87p per sq. ft. p.a.

If you're looking for factories, we've got them, too. On industrial estates with full main services, from only 45p per sq. ft.

Corby has good access to major ports and centres, with Birmingham only 60 miles away and London 80. An ideal location for a warehousing and distribution operation!

In addition to all this, we can offer ready built houses for all grades of staff, a steady supply of qualified school leavers and skilled labour. Why don't you come to the centre of things.

The reputation of FHL is stronger than steel

If you think of F. H. Lloyd Group as being strong on steel castings you'd be right. And not just castings, of course—because the Group has gone ahead in other fields, so that today it is equally strong in re-rolling, fabrications and forging.

Together, the Group's three Divisions can supply anything from a casting weighing 11b. to 80 tons, from a hoop for a beer barrel to a giant pressure vessel, from railway draft gear and ships' deck equipment to gas valves and switchgear—to name but a few. Amongst other things, the Group is helping to cut the cost of motorways (with its quarry crushing machinery) and speeding ships' turn-round (with its quick release jetty hooks). There's much more than meets the eye with F. H. Lloyd—the Group that's stronger than steel.

PROFIT SAFELY

WITH THE WESLEYAN & GENERAL
EQUITY POLICY

Do you wish to invest money profitably but avoiding the fluctuations of ordinary share investment? Then the Wesleyan & General Equity Policy is for you.

It is an endowment assurance with a difference. As in similar policies you pay premiums (on which income tax relief is obtainable) for an agreed number of years. At the end of the period you receive a guaranteed amount. In addition, a bonus is added each year, together with a special bonus at the end of the period.

The difference is that the Equity Policy is based entirely on the Wesleyan & General Equity Fund, which has at present a ledger value exceeding £15 millions. When you invest in an Equity Policy you gain the benefit of equity growth without the risks involved in owning individual equities. The bonuses declared per £1,000 policy for the last two years have been £53 plus a special bonus payable at the end of the term of years.

Investment in a Wesleyan & General Equity Policy can bring a NET RETURN OF 8% equivalent to a GROSS YIELD OF 13%. And, of course, you get full life cover.

mechanical and electrical engineering; and Rolls-Royce in aero engines. These industries employ over 100,000 of Coventry's workers and as many as 80 per cent of these men and women have jobs in no more than 20 factories owned by 14 companies.

Inevitably, then, Coventry is also the town of the big trade unions. It was the city of piece rates and wage inflation, where from high to low, from the toolmakers to the bus drivers, wages were tied to earnings on the assembly lines. Coventry, like Merseyside, acquired a reputation for industrial militancy. Strikes and stoppages became commonplace. And now that time rates are being introduced, following the belated demise of the 1941 tool room agreement, no one is at all certain that they will become any less so than in the past. Indeed, some predict that the disputes will become even more protracted.

So far, the currently high unemployment rate in Coventry has made no impact upon either the stridency of wage demands or upon the militancy of those still in work. At the moment, nearly 8,000 people are without jobs, that is about 3.6 per cent of the labour force. Just over 1,200 of them come from the car and engineering factories. Nearly another 1,000 are temporarily laid-off, as strikes elsewhere in the country have halted the flow of components on which the assembly lines depend. The local employment offices have the air of casualty clearing stations.

In contrast, the local council offices have the air of a modern, well run maternity ward. The plans and ideas still pour out from the local offices which pioneered the techniques of corporate management and programme budgeting in local government and which, under the chief executive, Mr J. H. Hender, run the city in a brisk, businessman's style. But, alas, few people in Coventry now seem to care. They take what the council has to offer for granted, just as they take those unlucky enough to lose their jobs for granted. Those in work in Coventry on the assembly line seem to be content to live from one weekly pay packet to the next, so long, that is, as their shop stewards keep pressing for more. Even affluence, it appears, can curdle.

This survey was written by Robert Taylor. The photographs were taken by Mark Edwards

Living down the past

Redditch and Telford

The margin between success and failure

New towns are in the doldrums nowadays, and none more so than those in the West Midlands. Neither Birmingham nor the towns of the Black Country are in a mood to relish the loss of firms and people to new so-called growth points outside their boundaries. So Redditch and Telford face an uphill struggle, without many local friends to help them. But there is no danger that Redditch will fall flat on its face. Six miles south of the Birmingham boundary, it has kept up a steady pace of development over the past eight years since the small, drab town of 30,000 people, with the biggest needle factory in the world, was designated a new town. Redditch's population is still expected to grow to at least 70,000 by the end of the decade. So far nearly 3,500 houses have been built. Only 750 of them are for owner-occupation, but eventually Redditch wants to create a 50-50 balance between rented and privately-owned property.

At the same time 3,325 new jobs in about 150 factory units spread over 1.6m square feet of land have been created in Redditch. Almost all the companies have come to the town from the Black Country. Halfords moved out its car accessory business lock, stock and barrel from Birmingham in June, 1971, and it now employs just over 500 workers. BKL Alloys brought its tube fittings business to Redditch and it provides work for 540 people. Other big West Midland firms have put some roots down in Redditch as well, with GKN bringing its design office from Wolverhampton and Alfred Herbert setting up a machine tool offshoot. Naturally Redditch would like to land even bigger fish for its new industrial estates. But it has taken the trouble to entice the smaller sprats from the metal trades as well and, as a result, most of the firms in Redditch employ less than ten men. In all, it is perhaps unavoidable that the town appears to be mirroring the industrial structure of the enormous conurbation to its north.

Indeed, with Birmingham's centre no more than half an hour away in a car, the town is going to find it extremely difficult to develop any momentum of its own. The network of roads simply reinforces Redditch's

attraction as a dormitory town. Already half the town's workers go out of Redditch to jobs elsewhere. But Redditch is in a major growth area of the West Midlands, and with Elmdon airport close by and with the M42, once it is built, skirting Redditch to the north, it has a good chance of becoming a major distribution centre.

On the other hand, Telford could well become the region's problem child. The original idea was to make this area around Wellington and Oakengates in Shropshire into a city of 250,000 people by 1991. This looks over-ambitious. First, Telford is isolated, 16 miles away from Wolverhampton and surrounded by the green fields of Shropshire. Communications are poor. A motorway extension to the M6 is promised but no earlier than 1976, and at the moment the roads from Telford are narrow and congested. This means that the new town cannot expect for the time being at least to attract many commuters. In fact, only about 15 per cent of the newcomers are reckoned to travel from Telford to work.

Second, Telford already has a male unemployment rate of nearly 6 per cent. The area also suffers a little from unattractive dereliction, for this is where Abraham Darby set up its blast furnace at Coalbrookdale in the 1790s. Industry then moved eastward to the Black Country and the Telford area

was left out on a limb. The immediate task is to find jobs for the unemployed. That will not be easy now that the Government is adopting a more relaxed attitude towards the issue of IDCs throughout the West Midlands.

Third, the economic climate of the past three years has plainly held up Telford's take-off. There are now 89 firms in Telford's industrial estates, and they employ just under 4,000 people. Half of them came from Wolverhampton and the Black Country, but none are big employers. GKN Sankey at Wellington with its 6,000 workers making car accessories, and the army's central ordnance depot at Donnington, which employs 4,000 civilians, are by far the biggest employers in the area.

Fourth, Telford has failed to attract the number of newcomers it needs to get anywhere near its ambitious targets. At the moment between 4,500 and 5,000 people move into the town each year, but it needs between 7,000 and 8,000 a year to keep up to schedule. Over 200 houses lie empty.

All this has begun to worry the planners, particularly as a recent planning study report suggested that the main future growth areas for the West Midlands to take overspill should be to the north east in Staffordshire around Tamworth and Lichfield and to the south of the Birmingham conurbation stretching in an arc from Daventry to Worcester. Before much more good money is poured into Telford, Whitehall and the West Midland authorities should take a sober look at the prospects, for there is nothing more depressing and wasteful as a new town set up in the wrong place at the wrong time.

Building anew

What he does for your suits, we'll do for your steel.

We take steel making an important step further than most other steel companies.

We're spending a fortune on steel processing so that you don't have to.

We've set up a high-precision boring and cutting plant to process our structural steel exactly as your blueprint specifies.

When your steel arrives it is cut, slit, sized and shaped. It is perfectly finished and ready for fabrication.

Your building, bridge or elevated highway can be completed faster—with fewer man hours.

Your steel inventories can be kept at an all-time low. Your scrap losses are nil. However you view it, your cost of possession is less.

But tailor-made structural steel is only one of the ways in which we're saving money and time for our clients.

At our Chiba works alone we have fifteen research laboratories working on all aspects of steel making from raw materials pretreatment to improving deep-drawable steel sheet, silicon steel purity, welding and surface treating techniques and much more.

Perhaps there's a steel-related problem we could help you with. If so, please write us at the address below.

We're customer oriented.

Stoke-on-Trent

Now we are six

Stoke-on-Trent stands apart, in a kind of quirky isolation. The planners have lumped the city in with the West Midlands, but it looks and feels like the North of England which begins just beyond its borders and not like the Black Country to its south. Stoke is a city of slag heaps, marl ponds, pit wheels, kilns, rusty railway sidings. Almost 40 per cent of its dwellings were built before the first world war. It is a land of Coronation Streets. There, as in Lancashire, are to be found the fish and chip shops, the bingo halls, the billiard rooms,

and the dirt-stained churches and chapels (for this is where primitive Methodism began).

Stoke remains a collection of six over-sized villages dotted like beads on a thread along an eleven mile narrow street running from north to south. Parochialism dies hard in these villages: it is not uncommon to meet people up at Tunstall who have never gone as far south as Longton. Only three miles wide the city has never formed a cohesive whole. Hanley sports a new shopping centre, but the two-storey family shops still predominate.

Stoke has its Wake weeks when it closes down so that many of its 265,000 inhabitants can head off to Blackpool and the resorts of North Wales for their summer holidays. Stoke has its choral societies and its club cricket matches on Sunday as well. It gets its gas, electricity and television programmes from the Midlands, but in the words of its most famous novelist, Arnold Bennett, it is "of the North." That comment does not please the locals, who have never forgiven Bennett for leaving the six towns—Bennett erroneously believed there were five—for good once his reputation was established. But, at heart, they do not disagree with it.

Stoke's city fathers worry about its future prosperity. They would like the Government to give the region intermediate development status, a doubtful badge of discrimination which Lord Hunt did not believe the city needed three years ago. What worries the local businessmen and politicians is the narrow base of Stoke's economy. Nearly a quarter of its labour force engaged in manufacturing is employed in the making of pottery, and these men and women account for 80 per cent of the labour force employed in the pottery industry in Britain. And over the past decade or so that labour force has fallen from 48,000 to 32,000.

An even more drastic fall has occurred over the same period in the local coalfields, where the number of employees has nearly halved from 25,000 to 13,000. The fear persists that further pits will be closed, even though at the moment the NCB is recruiting new workers locally. In contrast, engineering has been expanding. Over 25,000 people now work in that industry in the six towns and Stoke's biggest single employer, apart from the town hall, is Michelin, which came to the Potteries in the 1920s and now employs 9,000 workers in making tyres. Even so, some doubts are being expressed about the future of electrical engineering at Kidsgrove, and about British Steel's Sheldon plant (which alone employs 2,700 men). The local pessimists also make great play with the current unemployment rate of 2.9 per cent and the annual net emigration rate of 2,900 people out of the city. They appear to be talking themselves into the belief that Stoke will become yet another lame duck.

This is just not true, for, despite all the immediate anxieties, Stoke has a promising future. First, the city is getting down to the task of clearing away the debris of the industrial

revolution which scars the landscape. About £3½m, for example, is being spent up to 1981, with most of it coming from a 75 per cent government grant, to deal with over 1,400 acres of derelict land. At the moment Stoke has the biggest acreage of polluted land of any city in Britain; but by the 1980s it will have enormous tracts of green grass for recreation. That will not make the city a tourist attraction, although some local optimists have the gall to believe that it will. But it will make Stoke more attractive to new industry. With £6.5m being spent on the construction of new sewers and the cleaning of the river and with a £27.2m motorway plan in the offing, there is clearly the promise of an escape route not merely from dereliction but from isolation.

Second, the slums are being pulled down. They should all have gone in the next two years or so. This will leave a lot of old property standing: red brick terraced houses will still dominate the city. But grants are available to improve such properties and before long Stoke will have 10 general improvement areas.

The third and most important factor of all is the continuing health of the pottery industry. Last year the industry manufactured over £119m worth of goods, of which £45m was exported. North America is still a booming market (importing £16.7m worth) followed by West Germany (£2.5m) and Australia (£1.5m). Mergers and rationalisation have drastically reduced the number of pottery firms over the past decade. Royal Doulton and Allied English Pottery are about to join forces and along with Wedgwood they will dominate the industry. As a result, the industry will be more efficient than it was. There has been some sluggishness over the past few years in the sale of electrical ware because of a fall in demand and Japanese competition; but good times appear to be ahead for body china, earthenware and tiles.

The city's highly skilled and loyal workforce may not enjoy the high wage packets of the West Midlands, but they are in an industry with a future. Behind a grimy facade, the Potteries have a good deal going for them. Once the slums are down and the slag heaps have become grass covered hills, Stoke should become more obviously the vibrant, self-sufficient community that it already is in essence. The local pessimists should think again and look more towards self-help than governmental aid.

Derby

Picking up the pieces

Derby was once an uneventful and rather languid town. If it never suffered long dole queues in the 1930s, it equally missed out on the big wage packets of the 1960s. There was never really much pressure for innovation. Rolls-Royce's crash in February, 1971, changed all that. The town had sheltered for too long under the comfortable illusion that its biggest employer was as sound as the Bank of England. There was momentary panic. Confidence was so shaken that crowds of people lined up outside the local building society to withdraw their money when rumours spread that it too was about to fold up.

The Government stepped in and took over Rolls-Royce. It proved to be one of the first of Mr John Davies's lame ducks brought home to roost. But the Derby division has a fully secure future now that the American Congress has agreed, in effect, to underwrite the Lockheed Tristar. This means the RB211 engine contract is safe for Derby. That is just as well for the town, for 40 per cent of the 18,600 workers at Rolls are involved in the construction of the RB211. The division is also responsible for the building and testing of engines for the TF41 and the Adour as well as for the repair of the supersonic Spey. Local estimates suggest that 60,000 people in the area, that is a quarter of the population of greater

Derby, depend for their livelihood upon the success of Rolls-Royce.

In fact, the company's collapse led to more trouble to many small component firms in the West Midlands than to anybody in Derby itself. Many Derby workers did lose money, which they had invested in the company's shares, and there was some genuine hardship among some of Rolls's old age pensioners, who had ploughed savings into the firm. Rolls-Royce has shed around a quarter of its 1969 labour force over the past 18 months; but a good number of these men were in technical and managerial grades and they have moved outside the region to get new jobs. Derby's unemployment rate did shoot up a few notches in the spring of 1971, but by the summer of that year it had settled down to under 3.5 per cent where it has remained ever since. Today short time working in Derby is negligible, and the only real worry is to be found in the noticeable fall in the number of jobs waiting to be filled. This has gone down from an average in the mid-1960s of 2,000 to around 500.

All the same, Derby has not fallen back into its old comfortable ways. Anxieties remain, for the town does not want to find itself out in the cold again. It is a town of big firms. Eight companies employ over a thousand workers each. Together they provide jobs for

Still in business

nearly 40,000 of the town's labour force of 54,000. Once a massive centre for the railway industry, Derby retains the largest workshop and technical complex in British Rail, which employs 9,000 workers. Then, British Celanese—a subsidiary of Courtaulds—has 7,200 workers manufacturing man-made fibre in the town. There are also a few foundries, which appear to have kept their heads above the economic waters a good deal better than the heavy engineering firms of the West Midlands. Derby does not have many small family firms and outside local government it possesses few service industries. A food processing company is about to set up a plant in part of a new 40 acre industrial site in the town, and there is the hope that the relaxation of IDC controls will attract some new firms.

The town hall is making an effort to give the place a face lift. It is not before time. Derby has some old churches, but the town has not had much going for it since the birth of Herbert Spencer—except for the success of Derby County football club. The shopping centre is rather drab, as are many of the housing estates

in the south of the town around Rolls-Royce. Derby let the world pass it by for too long. It acquired a bit of an inferiority complex. The town fought for city status, but it lost that battle. Its local technical college failed to win the status of a polytechnic. And after next April the council is to be stripped of many of its powers, which are going to the county authorities which will run Derby's education and social services from gentle Matlock, 16 miles away in the Peak District.

Even so, Derby has numerous plans afoot to change the town's image. After some Government pressure the council has speeded up its slum clearance drive. So now 6,500 houses will be down by 1980. The town is going to have its own inner ring road, its pedestrian shopping precinct, a new market, a civic centre and a new library. Acres of the town to the south east of its mundane centre have become wastelands of rubble, so there is room for redevelopment. The question for Derby is whether the Rolls-Royce debacle produced a big enough shock wave for it to use its new opportunities imaginatively. One hopes so, but suspects not.

The job in hand

Nottingham

A city for all seasons

Nottingham is a pleasantly mixed-up city. It belongs neither to the north nor to the south; but it shares some of the qualities of both, although none in sufficient abundance to swamp the city's own individual character. Nottingham is a city which has never experienced an economic depression, but it has known widespread poverty. There are clean factories out in its suburbs—and grimy Victorian ones near its centre. Nottingham has still too many squalid slums, but it also possesses some fine Victorian middle-class houses. It has its old men in cloth caps puffing their pipes in the sun, and perhaps more than its fair share of pretty girls. Like practically every other town in Britain, it has its flash restaurants with piped music; but it retains its art nouveau pubs as well. In its own way the city from medieval times onwards has been able to strike a happy balance between the old and the new, between the north and the south.

Some recent changes, however, threaten to tilt that balance just a little. Lofty office blocks affront the eye in the attractive town square with its fountains and flower beds. So does an ugly

tower of luxury council flats near the centre of the city. A chunk of inner ring road Birmingham style, called inevitably and unimaginatively Maid Marian Way, has found few admirers. There are grumbles too, and not just from local retailers, about two multi-million pound pedestrian shopping precincts.

Paradoxically, Nottingham's sense of identity may have remained strong because it was slow to get its post-war redevelopment programme under way. It was not until as late as 1967 that the council began to tackle the city's worst slums in St Anns to the north east of the city centre. Only five years ago the district's 340 acres housed 30,000 people, three-quarters of whom lacked a fixed bath. Now vast tracts of St Anns have been cleared. Many of its houses are now boarded up with corrugated iron. The whole area should be completely redeveloped by 1976. The hope too is that the Meadows district to the south west of the city centre will all be down by the end of the decade as well. It ought to be, for over two-thirds of its 17,400 houses are reckoned to be unfit for habitation.

ESPLEY-TYAS
CONSTRUCTION LTD

This late start should help Nottingham avoid the mistakes that more impetuous towns made in going all out for urban redevelopment. The city is not dominated by high-rise flats and the corporation intends to keep matters that way, even if it means land scarcity by the 1980s. There is a hope too that Nottingham will be spared the excesses of over-enthusiastic road building. The Labour party, which won back control of Nottingham's toughly disciplined council last May, put an end to years of indecision recently with the announcement that the motorway plans were to be scrapped. Instead, some effort will be made to strike a balance between the car and the pedestrian, even though this may well mean further subsidies for the public transport system.

Nottingham lacks the acquisitive drive of the West Midlands. Its wage rates are still below the national average. But it is a settled community which long ago lived down its own Luddite past. Unemployment is no real problem, even though 3.2 per cent of the labour force is out of work (5.2 per cent for men and 1.2 per cent for women). There is, in fact, almost a permanent shortage of women workers and even today nearly 40 per cent of its 264,000 strong workforce is composed of women. This has helped to encourage a tolerant and sensible moderation in industrial relations locally and strikes are rare.

The city's broadly based economy has proved the best insurance against bad times. As a regional administrative centre, Nottingham has a large number of offices, shops and hotels, so that over half its workers are in the service industries. Some businessmen have even begun to wonder whether the city is not in danger of tilting the balance too far away from its manufacturing side, although in fact Nottingham's mix between the manufacturing and service trades is close to the national average. No single firm or industry dominates the city. Its 3,000 miners work in pits which remain part of one of the most productive and profitable coalfields in England. Boots employs 9,700 people in its booming pharmaceutical business. Then Raleigh, part of Tube Investments, has 8,000 workers making not just bicycles but car seats and a wide range of children's toys. Players, part of Imperial Tobacco, employs 7,000 workers and has just opened a new £8m plant in Nottingham. Finally Plessey, over in Beeston, has 7,000 workers making electrical components. But these four firms alone employ no more than 15 per cent of Nottingham's labour force. A third still work in

hosiery, lace and the making of children's wear. And the city retains a wide range of heavy and light engineering firms.

Occasionally Nottingham gets overconfident. A good deal of money has been spent on making it the cultural centre for the region. But the Playhouse theatre is losing money nowadays and is playing to half empty seats. A grandiose festival, which some locals

believed might be England's answer to Edinburgh, was a flop. Nottingham, it seems, will have to make do with its Goose Fair. But that is no bad thing, for as long as it retains its balance Nottingham should remain self-sufficient. It lies on that imprecise frontier between what its citizens regard as the more rugged North and the softer, possibly lush south. But compromise suits Nottingham.

Leicester

Prejudice before pride

Leicester is enjoying the good life. The city has never experienced a serious economic setback and it probably never will. But nowadays Leicester is in a bitter and unreasoning mood for all the hustle and bustle of its streets. Ever since President Amin decided to throw out all the Asians holding British passports from Uganda, Leicester has done its level best to make it quite certain that none of those unhappy people would get a warm welcome in its particular patch of the East Midlands. It seems that one of England's most affluent cities with a population of 280,000 can absorb no more than the 36,000 coloured immigrants it already has in its midst.

Some local officials talk the language of Enoch Powell. The local paper, the Leicester Mercury, has been the very reverse of being liberal and helpful, with its almost daily diet of thundering editorials and a letter column which often contains racist nonsense of the worst kind. The Monday Club, whose chairman Mr Jonathan Guinness lives in neighbouring Bosworth, has, of course, been at it locally as well. National Front posters besmirch hoardings in the city centre. But Leicester's behaviour is not just confined to the Right. A mere nine Labour councillors screwed up enough courage to defy

their ruling council group's negative attitude and decided to extend a welcoming hand to any Asians who might come to the city. The council went to the lengths of publishing a full page advertisement in a Kampala newspaper to warn the Asians that there was no room for them in Leicester. The city got its reward. Sir Charles Cunningham of the Resettlement Board came, saw, and agreed to try to persuade arriving Asians to stay clear of Leicester. But many Ugandan Asians came all the same. Nearly 1,500 told the Resettlement Board that they intended to go to Leicester.

Certainly Leicester has got its share of problems, but so has every other city. There are still 3,000 slums to come down, but they should all have gone by 1976. Then improvement schemes are going to bring renewed life to a further 26,500 houses. Leicester does claim to have a 10,000-long council house waiting list, although it seems that 6,000 of that number are in council accommodation at the moment but are seeking a second and better home. The schools do have to cope with high numbers of immigrants and over 750 coloured children have turned up since August in search of school places. It is reckoned that 15 per cent of Leicester's 53,000 schoolchildren are

coloured. But even so the education authority has managed to find places on average for a hundred immigrant children a month since 1967 without much fuss or publicity, and with very little extra financial assistance from the Government. This has meant some busing of immigrant children to where school places can be found for them out in the suburbs away from the crowded twilight areas like Highfield where the immigrant community is concentrated. This has not provoked tension. Indeed, the turnover of teachers is reckoned to be less of a problem in schools where coloured children predominate than in those where they do not.

Racist prejudice sits most oddly with the fact that Leicester, unlike many other towns in the Midlands, is not faced with an unemployment problem. Indeed, Leicester is in need of both skilled and female labour. Employers cannot get enough of either. About 2.3 per cent of Leicester's labour force is out of work; that amounts to no more than 5,000 people and the bulk of them can expect to find another job within five weeks. Only 750 men have had no work for over a year, but they must be virtually unemployable, for there are 1,800 vacancies on the register.

Leicester's economy is broadly based. Various kinds of engineering outstripped the traditional hosiery and knitwear industries as the main source of employment some years ago, but many of the 38,000 employed in engineering make machinery for Leicester's older activities such as hosiery and boots and shoes. Around 25,000 people work in the hosiery and knitwear industries proper; about 18,000 of them are women and Leicester's female activity rate is well above the national average. A further 22,000 people are employed in scientific and professional services and 23,000 in distribution. Some 9,000 make women's footwear. Leicester also manufactures among other things television lenses, clocks (including those in the UN building in New York) and lead gargoyles for churches. It remains a market town and distribution centre for the county as well as the administrative nub of a growing urban complex. Office blocks are shooting up everywhere.

All the same Leicester's wealth is wrapped up in its hosiery and knitwear firms, which account for a third of British production. Despite the inevitable round of mergers and closures small firms still predominate. As many as six out of every 10 hosiery and knitwear companies in Leicester each employ less than a hundred

workers. Very few labour troubles have plagued the industry. In 1971 there happened to be three disputes, but that was regarded as exceptional. But some employers harbour doubts about the future. Over half the firms are working below capacity, and foreign imports of seamless hose and tights as well as underwear are rising. Last winter Leicester's outwear manufacturers had to introduce some short time working when President Nixon's 10 per cent import surcharge reduced orders in the

Northampton Grafting on

Until a few years ago, Northampton was just a sleepy East Midlands market town of 130,000 people. It lived with and off its memories. Now progress is beginning to catch it up. The bulldozers and cranes are out in force in the old town centre. The northern end of Northampton's splendid cobbled market square is being torn down for new development. This has woken the town up to the fact that it is about to become one of London's principal overspill centres. So, too, have the acres and acres of new building sites on the north eastern outskirts. So too has the debate about where the town's two expressways are actually going to go.

It was as long ago as 1965 that the planners decided that Northampton was a sensible place for growth. The Government gave the go-ahead in 1969 and Northampton was given the designation of a new town. Its local council, of course, remained in office but it is now working in tandem with the development corporation. This is a genuine partnership. The town clerk acts as the corporation's solicitor, while the estates officer looks after industrial and office development in the town itself and the borough's surveyor stands in as the corporation's engineer. There does not yet seem to be any of the petty bickering which often afflicts such arrangements.

Northampton is supposed nearly to double its population in the next decade. The hope is that around 70,000 of the newcomers will emigrate from greater London. These are early days, but the economic climate has not as yet encouraged enough new industry to move into Northampton to provide enough jobs for the proposed influx of population. There are at the moment some 4,500 jobs in the pipeline and the new firms are beginning

industry's valuable American market. The wage push on costs is also causing concern, but as a whole the hosiery and knitwear industry remains confident that Britain's entry into the common market will do nothing but good. Leicester can be proud of its prosperity. It is therefore a pity that so many of its people have lost their heads over the arrival of Ugandan Asians. At the moment, unfortunately, Leicester does not seem to be able to separate pride from prejudice.

to trickle, rather than flood, in. Levi Strauss intends to have a large warehouse complex at Northampton. Carlsberg Lager is going to make the town its principal brewing centre in Britain. And Hartmann and Braun has started the production of electronic control equipment. Henry Telfers, the meat products subsidiary of J. Lyons, intends to build a plant in Northampton too.

Only 450 families have moved into new homes, about two-thirds hailing from London. The building programme has fallen behind target. The corporation hopes to see 3,000 houses going up every year, but so far the figure has not got above 1,000. Londoners are reluctant to move out to somewhere like Northampton without a job to go to. Equally the development corporation has no wish to house families until work is available for them.

Once, however, there is growth in the British economy as a whole, the new jobs should come Northampton's way. The town is blessed with an absurdly low unemployment rate of 1.2 per cent—just under 1,000 people, with up to 900 vacancies on the register. There is a shortage of skilled men and the demand for female labour remains unsatisfied. Engineering provides most of the jobs—amounting to just over 9,000 in all. The town's biggest single firm is Timken Roller Bearing Company which employs 3,000 workers. But Northampton's economy is widely based. Over 9,000 people work in the distribution trades and 8,000 in professional services. Barclaycard has its headquarters in the town and the Barclays clearing house is there too. Anglia Building Society is based on Northampton. The hope is that while 35,000 new manufacturing jobs will be found by 1991 in

Anglia Building Society

For when neither you nor your client can afford to take a risk.

As a member of the Building Societies Association, with assets exceeding £275 million, and authorised for investments by trustees, Anglia Building Society is able to offer the safest, most accessible investment opportunities currently available.

For more information, please contact our head office at Abington Street, Northampton, NN1 2BJ (Telephone: 34800), our London office at 28 Kingsway, WC2B 6LB, (Telephone: 01-242 8392) or your nearest Anglia Building Society Branch office.

AMSTERDAM

Twelve important reasons why Amsterdam is the choice port of entry into the European Common Market:

1. Accessible under any conditions to ships drawing up to 45 feet in salt water.
2. Only ten nautical miles from the open sea by the 270 m (886 ft) wide North Sea Canal.
3. Excellent connections with the hinterland by canal and river, rail and motorway.
4. Distance to the heart of the Ruhr area only 220 km (130 statute miles); within two hours driving time of the German and Belgian borders.
5. Fully equipped for all methods of cargo-handling, with special terminals for containers, grain, coal and ore and free of tides, thus simplifying modern techniques such as roll-on roll-off and sideloading.
6. Numerous cranes ashore and afloat with lifting capacity up to 300 tons.
7. Next door to the highly modern and efficient Schiphol (Amsterdam) Airport, with direct passenger and freight connection to all parts of the world.
8. Special passenger terminal for cruise ships and liners, within walking distance of city centre.
9. Large specially prepared sites for distribution centres and industrial plants readily available.
10. Full support and co-operation from governmental and municipal authorities and equal treatment of national and foreign enterprises.
11. Fully equipped international school.
12. Free of congestion (as yet).

the town, a further 92,000 service jobs will materialise as well. But for many people Northampton still means boots and shoes. That impression is now well out of date.

Over the past 20 years or so, Northampton's boot and shoe industry has suffered a massive contraction in its labour force, which has fallen from 13,000 to 5,000. These men and women work in 20 firms in the town, five of which are less than half a mile from its centre. Even so, the output of shoes, mainly in high quality men's wear, has remained fairly constant at 7,500,000 pairs a year, of which roughly 20 per cent goes overseas. But the rise in foreign imports, particularly from Hongkong and Italy, has lit up the warning signs and pressure is growing locally for the Government to do

something about it. But Northampton's specialist skills should see the shoe industry through.

There are worries too that the development plans are overambitious. The lure of Milton Keynes, a new city planned for a quarter of a million people, as an industrial magnet, to the south provokes anxiety. So do the developments planned to increase the size of Wellingborough, Corby and Peterborough with London overspill in the next 20 years. Poor railway communications are another problem. There is a dearth of executive-type housing in the area. And planners fear a dearth of female labour in the future.

But one thing is certain. The new developments will not blot the old town out. With care, the new will be grafted on to the old.

The swing of the pendulum

Once Britain achieves a growth rate of 5 per cent or thereabouts, both the East and West Midlands will again be out there in front, ahead of the regional pack. They will have to go it alone. Nothing is likely to come their way in the shape of a further relaxation of industrial development controls or in the granting of intermediate status to their more laggardly towns. But something of the old vigour and old exuberance will have gone from their stride. The other regions of Britain will be closer on their heels.

That will be the result of economic learning. Britain's less attractive regions have begun to learn how they can seduce new firms and new citizens. The more attractive, like the Midlands, have realised that even the beauty of success fades. This is a region which burnt the candle at both ends, where everything for employers and employees alike came easily. Once upon a time, employers in the Midlands were blithely prepared to take any labour, good, bad or indifferent, that came on offer. In the next boom, they will

count their pennies. They will buy machines, rather than men. So, the Midlands will probably become a region of average unemployment and not, as in the past, one of overfull employment.

This is all part of the levelling-up process that, hopefully, regional policy on a national or international level is supposed to bring about. But it does not happen painlessly. As far as the Midlands are concerned, the pain will continue to be most immediately apparent at the employment exchanges. But it could also be seen, more viciously, when the children of the first generation of coloured immigrants leave school, better qualified than their parents were, and start looking for jobs for which their talents qualify them.

More openly than other towns in the Midlands, Leicester in the past few months has been flying the warning signals about coloured immigrants. One reason for this is that Leicester, as a town of the East Midlands, is aware that, looking forward over the next decade, it is the eastern part of the region which may well have more going for it in terms of economic growth and urban development than, say, Wolverhampton or Coventry. Both in the east and west the Midlands will continue to hustle, setting the pace for other regions. But where once, like the forlorn girl in the old music hall song, they wanted to go to Birmingham, they may well now want to go Leicester, Nottingham, and other eastern places.

Bass Charrington reports record profits

"The remarkable progress which the Company has made in recent years has continued and, indeed, continued at an accelerated rate. We have achieved record profits in every division of the Group."

Mr H. Alan Walker, Chairman

Further extracts from Mr. Walker's statement:—

Imaginative efforts have been made throughout the country to improve our licensed estate and it would seem, judging by results, that we are finding an acceptable blend between what is traditional and what is novel in catering for the tastes of our customers.

The total volume of beer consumed in the United Kingdom is in steady rather than dynamic progression. There is, however, a marked trend towards the better quality beers and lagers. This trend is particularly favourable to us with our premium brands of Worthington 'E', Bass, Carling Black Label and Tennents Lager. Furthermore, our premium regional beers have also been most successful, in particular Brew XI which strides ahead of all competitors in the Midlands.

Practically half our draught beer sales are still in the form of traditional cask beer. We pride ourselves on the quality of these beers embracing such famous names as Bass—the first ever trade mark to be registered in the United Kingdom—and Worthington and many other names with strong local loyalty; we expect to sell a considerable volume in this form for many years to come.

Production An important feature of our overall plan for rationalising production has centred around the new brewery we are building at Runcorn in Cheshire, where site works started towards the end of 1970. Construction progress continued steadily until last summer, but at the end of June all work was brought to a standstill due to strike action involving the building trades. Considerable progress has been achieved since the site reopened and we hope to start bringing the plant on stream during 1973.

Wines and Spirits Growth of all brands has been most satisfactory, with substantial gains by Hironde table wines, Mouton Cadet claret, the Antiquary de luxe Scotch Whisky and Salignac Cognac. Bacardi Rum, Vat 69 Scotch Whisky, EMVA Cyprus Sherries and Mateus Rose Portuguese wine all improved their position.

New representation is an important part of company strategy and there have been two major additions during the year—Krug Champagne and Remy Martin Cognac which are leading brands with great reputations.

Hotels The Crest Hotels development programme continues to be concentrated upon high standard motor hotels, catering primarily for the business executive.

Soft Drinks Canada Dry (U.K.) Limited, our soft drinks subsidiary, has had an excellent year and has maintained its steady growth at a faster rate than the soft drinks market as a whole.

Overseas In Belgium the Lamot group has made good progress with an excellent increase in profits.

Accounts and Dividend The profit before taxation of the Group, which includes the results of the principal

U.K. trading companies for a 53 week period, is £48.9m and shows an increase of £10.7m over last year which included the results of those companies for a 52 week period. It is estimated that the pretax profit for the comparable 52 week period would amount to £47.5m.

In the light of these results the Board had intended to recommend an increased dividend but the introduction of the Counter-Inflation (Temporary Provisions) Act does not permit this; your Directors are therefore recommending the payment of a final ordinary dividend of 14%, the same as last year, making a total of 20% for the full year.

Extracts from the Accounts for the year ended 30th September, 1972

	1972 £ million	1971 £ million
Turnover	440.5	385.0
Profit before taxation	48.9	38.2
Available for ordinary shareholders	30.3	23.3
Ordinary dividends	13.9	13.9
Transfers to reserves	16.4	9.4

(English, the 5th national language of Switzerland.)

Only big countries have big airlines.

SO NATURALLY AN airline from a little country like Swissair confines itself to 78 destinations. Forty of those are in Europe, which after all means only the fourth closest-meshed European network.

True, Swissair does fly 24 times a week from Europe to North America, but it hasn't managed anything bigger than a Boeing 747B yet.

And the handful of African cities (17, to be exact) that Swissair serves can't obscure the fact that

the competing airline with the most destinations in Africa flies to a few cities more.

Not to mention the Far East, to which Swissair flies but once a day. (Even the exclusive nonstop flights between Geneva and Bombay and between Athens and Bangkok hardly make up

for this.) As you can see, it's no picnic being the airline of a small country; so we won't even talk about our flights to South America.

Why don't you just ask a Swissair office or an IATA travel agency for our time table, and you'll appreciate the pickle we're in.

And here are the remaining handful of places where you'll find a Swissair representation.

Abidjan	Boston	Firenze	Lagos	Montreal	Santiago

Why should a German company turn to Bank of Montreal for help in financing a plant in Australia?

Or why should a Japanese exporter seek financing from the same source for a distribution center in the United States? Or to get raw materials from Asia?

The answer is: People. Bank of Montreal people, who've made it their business to bring companies, countries and opportunities together with profitable punctuality. People who can do the same for you. Anywhere in this changing world. With the surety and dispatch of international bankers who know what they're about.

Call on Gustav Fischer in Düsseldorf. Bill Hill in Melbourne. Peter Blonar in Tokyo. Al Horton in New York. Hal Hartmann in Hong Kong. And 19,000 other Bank of Montreal people in over 1,100

offices in major business centers of the world.

This imaginative team of global bankers is at your service most everywhere in the world. Their in-depth knowledge of political and financial realities, plus \$10,000,000,000 in assets, make them a logical starting point for expansion-minded companies.

The time to call them in is now.

Bank of Montreal

The First Canadian Bank

The bank that gets it done—internationally

London, Paris, Düsseldorf, Amsterdam, Milan, New York, Chicago, Houston, San Francisco, Los Angeles, Sacramento, San Diego, Mexico City, Buenos Aires, Melbourne, Tokyo, Hong Kong. Wholly-owned subsidiaries: Bank of Montreal (Bahamas & Caribbean) Limited, Nassau, Freeport, Bank of Montreal Jamaica Ltd., Kingston.

Give and Take.

VW - A Partner in World Trade.

At the moment Volkswagen produces about 10,000 automobiles every day. In addition to the 6 plants in the Federal Republic of Germany where VWs are produced, they are also manufactured in Brazil, Mexico and the Republic of South Africa. Other subsidiary and sales companies in Germany and abroad help us to make the best of the sales opportunities which the world's markets have to offer. About 200,000 people work within this industrial group and to these must be added the thousands upon thousands who earn their livelihood within the international Dealer Organization. Nearly 10,000 authorised VW outlets in 140 countries are responsible for looking after Volkswagen automobiles — total production so far adds up to almost

22 million. And with 70 ships — with a cargo capacity of over 1 million tons — VW has the largest private fleet of oceangoing ships on charter at its disposal. However, before shipments go off all over the world, materials have to be purchased from all over the world. VW is a major customer for some 5,000 suppliers who send huge quantities of coal, iron, sheet steel, magnesium, copper, lead, zinc, nickel, aluminium, textile materials, tyres, cables, lamps, glass, batteries, speedometers, clocks, horns, paint, switches (to name a few). These facts show that the Volkswagen Story is not only a tale of success on a world-wide basis. It is also an example of what free enterprise is capable of achieving on the

world's market. Give and Take: that is the deeper significance which lies behind every commercial transaction. For — who does not benefit from an exchange of products, from the interplay between the economies of nations and of the world as a whole? Everybody knows that today, economic and technological developments have a far-reaching effect on the life of the private individual and on society. Developments in these fields concern us all. And in addition, human relationships and ties extend across frontiers and are of great significance too, since they assist in breaking down prejudices and building understanding. We all profit from the countless avenues which World Trade opens up for us.

Our quiet takeoff

can replace two noisy ones.

The TriStar takes off with less than half the noise annoyance of older jets.

And it takes off with more than twice the people.

So airports all over the world will have quieter takeoffs. And fewer of them. Or at least, fewer than there would be if only the smaller, noisier jets were flying.

The Lockheed L-1011 TriStar.
The quietest big jet in the world.

Tokai is the capital of Japan.

When you get acquainted with Tokai Bank, you'll necessarily become acquainted with Japan's Tokaido megalopolis. That's where Tokai Bank maintains the lion's share of its over 200 domestic offices.

The Tokaido megalopolis in the heart of Japan, with Tokyo on the northern end and Osaka on the south, is an industrial/financial/shipping region unparalleled in any other country. It is as if New York, Pittsburgh, Chicago, Detroit, Birmingham and Southern California were all located within 400 miles of each other.

Not only did Tokai Bank get its name from the Tokaido region, it's also where we get our capital. We are most active in the most active part of Japan.

Which is a fine thing for you to remember the next time you have dealings in Japan. We know Tokaido like no other bank. Which means we know Japanese business like no other bank.

Books

Hammering it out in inflation workshops

AN INCOMES POLICY FOR BRITAIN
Edited by Frank Blackaby.
Heinemann Educational. 258 pages.
£4.

INCOMES POLICY AND INFLATION
Edited by Michael Parkin and
Michael T. Sumner.
Manchester University Press. 295
pages. £3.60.

Mr Cecil King's diary for February 7, 1968, records that a group of very important personages:

... were agreed that the country is in a mess and that Wilson won't do. What, however, should they do? What about a joint letter to The Times? This did not find favour, so what about a deputation—but who to? Eventually they decided to see if they could get Roy Jenkins to dine.

If the Social Science Research Council had a diarist, one suspects something similar would have immortalised their attitude to inflation some time in the recent past. Inflation is a problem, but what should be done? Sponsor research, organise seminars, arrange for books to be published? Two books published this week dealing with incomes policy seem to be the SSRC's equivalent of an invitation to dinner. Both stem from seminars, contain much of value, and are admirably well-intentioned; but the conclusions are precious little use to policy-makers.

"An Incomes Policy for Britain" is a "synthesised" report of a conference organised (in London, in January) jointly by the SSRC and the National Institute of Economic and Social Research. "Incomes Policy and Inflation" is a collection of papers, some previously unpublished, considered by a seminar organised (in Manchester, in March) by the SSRC and the Manchester University Inflation Workshop, a group of some 20 economists, econometricians and accountants who began a three-year research programme on the problem of inflation in July, 1971, with financial backing from the SSRC.

The first snag is the long delay between the conferences and reports, which makes the bright ideas of the contributors so painfully out of date. In Mr Blackaby's case this appears to

have been filled by the compilation of a summary of the discussion at the conference which, for no obvious reason, opens the book, preceding the papers that were under discussion. This 21-page introduction is so out of place that it is not even mentioned on the contents page, and is itself preceded by a half-page summary explaining the order in which the discussion is summarised.

From the Manchester conference, the time lag is shorter (and filled only by one-and-a-half pages of "subsequent developments"). The contents are far better presented; the result, within its cautious limits, successful. This is a convenient collection of academic papers, designed to be the first of a series. The light it throws on the preoccupations of researchers is not, however, very encouraging. Much of the book is devoted to various backward-looking discussions of whether or not the Phillips curve works and how Phillips curve analysis can or cannot be applied to determine the past effects of incomes policy. Too many academics are like the man who, on dropping his wallet, walks 50 yards farther on to the next lamp-post, so that he has some light in which to search for it. But as the book progresses there are some welcome signs that they are timidly probing the darkness a little. Expectations are mentioned. Movements in real incomes start to play a part.

Indeed, by the time one reaches Mr J. A. Bisham's piece on forecasting, on page 250, one at last discovers an analysis of price changes from 1968 to 1971, showing the effects of indirect taxation and devaluation. Any hopes that in the remaining pages of the book someone will start looking at the way resources are shared in the economy are, however, dashed. The reader is instead treated to a patronising lecture on the futility of defying "basic economic principles." That the editors regard this sterile contribution, provided after the conference, as a "bonus" is amazing.

The Manchester conference looked at causes but did not get as far as considering cures. The London conference looked at cures without giving

more than a passing thought to the nature of the problem. The fact that the symptoms this time round are wildly different from any previous occasion when incomes policies have been applied hardly seems to have registered at all. There is, however, an admirable account of experience in other countries. Before that, the book offers four suggestions for a workable incomes policy for Britain. The first, by Mr Alex Jarrat, concludes:

The main message I would like to get across is that I cannot envisage, nor would I like to have any personal part in trying to arrange, the re-imposition of a policy similar to the one we had last time.

The second is an ambitious plan from Professor E. H. Phelps Brown for a complex "Central Consortium" of the negotiating bodies. A splendidly chatty piece by Professor Hugh Clegg follows, which contains so much sound common sense that it ought to be obligatory reading for all officials and ministers involved with the phase two incomes policy machinery. Finally there is an interesting but jargon-ridden piece by Mr John Corina. There must be a simpler way of saying:

First-approximation proposals should be based on a flexible policy base, from which penetration can be initiated into the social dynamics of a complex and fragmented industrial relations system.

How about: "Don't make your incomes policy rules so hard and fast that you can't use a bit of common sense when applying them to different cases"? One cannot help feeling that the SSRC would have spent its money better hiring one literate economist for one week in the spring to make an immediate summary of both conferences, whence (who knows) some useful suggestions might have emerged in time to affect policy. As it is, by the time the academics come up with anything (and it has been translated into English) the problem of the wage-price explosion will either have been solved or will have destroyed the type of society for which a solution is being sought.

Middle-aged spread

THE MEDIEVAL ECONOMY AND SOCIETY: AN ECONOMIC HISTORY OF BRITAIN, 1100-1500

By M. M. Postan.
Weidenfeld and Nicolson. 269
pages. £3.

This survey of medieval economic structures and change might appear at first sight to be written at a leisurely pace, with frequent excursions away from the main argument into historical-discussions of widely accepted

but vulnerable theories, or of the ideological origins (particularly among nineteenth-century German scholars) of specific hypotheses about medieval development. But appearances are deceptive: the architecture of the book is taut, the amount of ground covered impressive, and the overall result outstanding.

It was, of course, predictable that a work by Professor Postan would bear the hallmarks of his forthright views. And quite apart from the idiosyncratic distribution of emphasis between the main themes of medieval history, the book's extraordinarily well-informed discussion frequently presupposes a fairly substantial degree of knowledge, or at least of intellectual commitment, on the part of the reader. But in the last resort these are strengths, not weaknesses. The author's prime concerns are with quasi-Malthusian approaches: trends in population, land use, soil fertility and prices, and associated changes in land tenure, social stratification, welfare and commercial and industrial trends.

Not surprisingly, the main conclusions are familiar to readers of Professor Postan's previous work: the growth of population in the early middle ages was associated with an extension of the agricultural frontier and with critical changes in demesne farming; the increase in men and cultivation ultimately tended towards a breakdown in "the metabolism of the field system," so that productivity fell and arable cultivation contracted; the population crisis of the early fourteenth century was followed by a period of retrogression, which, however, was also a "golden age" for the peasant. But in this instance familiarity breeds admiration, particularly since the author has done us the compliment of using a good deal of new, as well as much old, evidence to support his views.

Moreover, the book is by no means confined to one set of hypotheses about medieval economic institutions and trends. It offers a level-headed and healthily sceptical discussion of simplistic views about the measurement of medieval population, the importance of Roman institutions, the origins of the manor, the rise of an exchange economy and linear "progress" in the middle ages. Altogether, it is a most refreshing work to read—the product of a genuinely original and unfailingly stimulating mind. Few other scholars could, with such well-justified *brio*, dismiss the Weber-Sombart approach to the role of custom as an attempt to

tionism of medieval technology" in "the sociological mysticism of cultural patterns."

Paeon for a president

GUSTAV HEINEMANN

By Joachim Braun.

Oswald Wolff. 277 pages. £4.

So devoted are President Heinemann's admirers that it seems sometimes as though he may be in danger of being prematurely canonised in the international calendar of virtuous heads of state. Yet, as Herr Braun makes quite clear, the prospect of unquestioning reverence is genuinely repugnant to this particular specimen of the republican kind. Dr Heinemann is a perspicuously noble man with a mind of his own, dominated by both a strong sense of public duty and some very sensible ideas of the nature of his own singular opportunity in Germany in the later half of the twentieth century. To that extent he is unusually self-conscious. But there is not a whiff of ostentation or any other sort of humbug about the man. Probably his most widely known remark is that which he made concerning extravagant public indignation at the extravagantly angry social criticism of some young contemporaries: anyone pointing an accusing finger at somebody else, President Heinemann observed, has three of his other fingers pointing back towards himself.

Herr Braun has written an instructive, if a shade humourless, account of Dr Heinemann's politically impeccable past and his present active

Heinemann: premature canonisation?

concern, within the limits of the constitution, for the state and the individual. To some eyes the colours may glow too warmly. Those inclined to reject all eulogy on sight would be well advised to begin with the extracts from President Heinemann's own speeches (occupying 30 consecutive pages) and the well-chosen illustrations (occupying 50), which speak for themselves.

Nationalism or provincialism?

THE FORERUNNER: THE DILEMMAS OF TOM ELLIS, 1859-99

By Neville Masterman.

Christopher Davies. 299 pages. £2.50.

The distinction between liberationist nationalism of a small people and rancid provincialism is often lost on the practitioners of national revivals. Roger Peyrefitte in one of his novels of diplomacy has an ambassador who served in Old Vienna remark: "To detest the Czechoslovaks, one has only to see one of their Sokol festivals on a newsreel." Unsympathetic and unfair, no doubt; especially in view of the rejoinder that they were preferable to the displays put on by the Germans at Nazi rallies in Nuremberg. Still, there is a point there to be taken, as Mr Conor Cruise O'Brien is continually reminding his more chauvinistic countrymen.

The first enlightening point of interest about this present study of Thomas Edward Ellis, the "forerunner" of the modern Welsh nationalism, is that its author is himself an old central Europe hand. As a teacher in Budapest before the war Mr Masterman learned much from his study of the nationality problems of the former Habsburg empire. In particular he came to adopt a very critical attitude to nationalists like Kossuth, who persuade people to play a role for which in numbers, power, and character they are unsuited. Central Europe illuminates much about the nationalism of the "Celtic fringe" of the British Isles. Ellis was accorded by his admirers the honorific of "the Parnell of Wales." Mr Masterman thinks more highly of him than that. He prefers Stephen Széchenyi to Kossuth, and Daniel O'Connell to Parnell. Above all, Masaryk is his model, a "man of light." Ellis's "man of light" was Gladstone, and Gladstone's struggle to bestow home rule on Ireland was the cause that Ellis served whole-

heartedly as a Liberal MP from 1886, and as Liberal chief whip from 1894 to his early death in 1899, as part of a larger cause of human emancipation in which Wales would take its due place.

Ellis, the Calvinistic Methodist son of a Merioneth tenant farmer, tried to stand for something essential yet elusive between mere anglicisation and the sort of distorted folkish rancidness which became so dislikable in Irish nationalism. Hence the "dilemmas" of his career, and his very mixed and uncertain reputation among Welsh nationalists, who tend either to acclaim him as something he was not, or to despise him for refusing to become something he detested. Mr Masterman offers this book as an assessment of the true Ellis as a model, modest but serviceable for our times, as a "man of light." The essence of this enlightenment was the ability to stand outside the nationalist movement and see it critically from a larger point of view. Ellis was a provincial Nonconformist tempered by Oxford. He was a Gladstonian Liberal who could yet appreciate the virtues of the imperial vision of Rosebery and Rhodes.

Mr Masterman, as the son of the Liberal politician C. F. G. Masterman and as a teacher in the University of Wales, has thus two further positions of advantage from which to recommend himself as a sympathetic and convincing biographer of Ellis. He has produced a solid, scholarly study, far removed from hagiography. "Perhaps," he concludes:

a new start needs to be made in the Principality today by someone with the genial alchemy that he once possessed. Those who accept such a need may once again sense the peculiar fascination that he exerted for his own generation and find that his all too brief life has a special interest for our own time.

Someone has to lose

FROM THE JAWS OF VICTORY

By Charles Fair.

Weidenfeld and Nicolson. 445 pages. £3.95.

This book must have been a lot of good dirty fun to write. Its object is to pillory military stupidity and incompetence, of which the world, at least to the retrospective analyst like Mr Fair, has never been in short supply. When it is concerned with such a juicy subject as Burnside and the American civil war, it succeeds. Then its spleen is almost splendid. But Mr Fair loves a digression. So, for

example, unimportant engagements like Pea Ridge and only slightly more important ones like Drewry's Bluff get almost as much space as Burnside himself.

In fact, Mr Fair indulges himself, writing about those men, battles and campaigns which happen to interest him. He does not even bother to mention the classic case of blundering, the Crimean war. And, whatever his views on the war in Vietnam, the reader will find the way Mr Fair keeps dragging everything back, or rather forward, to President Johnson and General Westmoreland tiresome.

Much ado about poets

BRITISH POETRY SINCE 1960

Edited by Michael Schmidt and Grevel Lindop.

Carcanet Press. 289 pages. £3.25.

PREACHING TO THE CONVERTED

By Peter Porter.

Oxford University Press. 61 pages. £1 paperbound.

AFTER MARTIAL

By Peter Porter.

Oxford University Press. 48 pages. £1 paperbound.

POEMS 1970-72

By Robert Graves.

Cassell. 95 pages. £1.90.

The Carcanet Press, which operates from Pin Farm, South Hinksey (shades of the scholar gipsy), has been very active in publishing little-known poets and also in resurrecting neglected ones. In this survey of the poetry of the last decade, the editors have concentrated on the less established writers, but they cover a wide range. There is an article on Scottish poetry, and one on Welsh. The Liverpool poets get only qualified approval from Mr Grevel Lindop, and the Tynesiders are mercilessly trounced by Mr W. E. Parkinson; this book is by no means all adulation or taking in one another's washing. Three poets rate a critique apiece—Geoffrey Hill, Jon Silkin and Charles Tomlinson. There is a recorded conversation, too, with Jon Silkin, as well as one with Peter Porter. The latter is well worth reading. Porter is not in any way cliquey, but pungent and dismissive of irrelevancies. The book on the whole engenders the feeling that a great to-do is being made about a lot of very ephemeral talent, but this is almost inevitable when the main emphasis is on the people published by private presses and in little magazines. These magazines, as a phenomenon typical of

Porter: basically serious

the 1960s, receive a chapter to themselves. For the benefit of aspiring writers, there is a long list of awards and their holders—Arts Council bursaries, various memorial prizes, university fellowships, Poetry Book Society choices and so on. In spite of the unevenness of the contributions, the whole book represents a very lively concern for the poetry of the present.

The Oxford University Press, no less, has brought out two slim volumes by Peter Porter; they are in paperback, which makes one wince at the price. Many of the poems in "Preaching to the Converted," including the piece that gives its name to the collection, have been sparked off by cultural monuments—sculpture, paintings, buildings, especially in Italy and Greece. They are usually concentrated and witty, almost Empsonian sometimes, but basically serious. Nor are the translations from Martial—renderings, rather than translations in the strict sense of the term—at all frivolous, though they are often thoroughly bawdy. Mr Porter's familiarity with Latin poets may help to account for the sinewy economy of his style at its best.

Another poet whose craftsmanship allies him with Horace and the Roman epigrammatists is, of course, Robert Graves. He goes on producing his quota of poems every couple of years, in spite of being in his late 70s. The lyric elegance and verbal dexterity are still there, as is, astonishingly, the erotic impulse. The newest poems may not do anything to alter what we already think of as characteristic of Graves, but they are more likely to endure than much of what passes for poetry, poured out by men young enough to be his grandchildren.

Anti-separatists

A HISTORY OF THE MENTAL HEALTH SERVICES

By Kathleen Jones.
Routledge and Kegan Paul. 442 pages. £5.

TAKEN FOR A RIDE
By Michael Meacher.
Longman. 558 pages. £6.75.

Both these books deal with the mentally ill—in Professor Jones's book all of them, and the mentally handicapped as well, in Mr Meacher's old people with some degree of dementia. Professor Jones has already written two volumes of her history; in this one she has abridged them both and considerably revised the second. She has also added a new section of about 70 pages covering the period between the passing of the 1959 Mental Health Act, which marked the end of her original second volume, right up to the end of 1971.

People who already have the first two volumes may feel reluctant to spend £5 merely to obtain her new section. But they should be encouraged to read it somehow. It is a stimulating appraisal of current trends in psychiatry, in particular of the move away from the old separate mental hospital towards community care, and of the reactions this has produced. On the one hand, psychiatry has come closer within the fold of general medicine. When mentally ill patients need hospital treatment it will, according to received doctrine backed up by Government policy, be to the district general hospital that they will be admitted. On the other hand, a movement has developed to abolish psychiatry altogether. This movement contains both the extreme anti-psychiatry writers, like Goffman, Szasz and Laing, and social workers, who see mental illness and mental handicap as social problems that should be solved in a non-medical setting. Professor Jones has written a brilliant essay, but it cannot at this stage be more than that. She should take up her pen again, when current controversies have become history, and expand it into a full book.

Outlining the virtues and vices of separatism as a policy for caring for people with special needs, she points out that it can encourage advanced techniques and co-ordinate specialised services and skills. (Here is one argument for setting thalidomide children apart.) But it can also encourage "occupational in-breeding," failure to adapt to change and stagnation. Mr Meacher's book is, according to part of its sub-title, "a study of separatism in

social policy." He has been clearly influenced by the anti-psychiatry school and the social approach to mental illness, and believes that the mental confusion shown by old people in special residential homes is a natural reaction to their isolation and bewilderment and to the paternalism of those in charge. Told by relatives that they are being taken for a ride (hence the book's title), they find themselves dumped in unfamiliar surroundings and heavily medicated.

Given the avowed aim of running down the mental hospitals, where many confused old people now end their lives, Mr Meacher is concerned that local authorities will tend to build more separate homes for them so that they do not upset the rational residents of ordinary homes. He has steeped himself in the expert literature on old age, but the core of the book is a personal study of three special homes and three ordinary ones. His accounts of the residents, the staff and their interactions, complete with verbatim conversations, complement splendidly the recent rather arid government memorandum on the psychogeriatric services, although he is perhaps too optimistic on the possibility of full integration of the confused elderly with the rational. In any case, has not integration dangers of its own? Professor Jones points out that though it can bring fresh life to an unsatisfactory service, at its worst it means a takeover bid in which the interests of the smaller and weaker groups are submerged.

Cold comfort

THE SEMBLANCE OF PEACE

By John W. Wheeler-Bennett and Anthony Nicholls.
Macmillan. 878 pages. £12.

NUCLEAR POLITICS

By Andrew J. Pierre.
Oxford University Press. 391 pages. £5.50.

"The Semblance of Peace" is on the origins of the cold war, and it is a disappointing book. There is a technical reason for this. At the time they were writing the book, the authors could not have made a thorough study of confidential government archives for the years of the second world war, and were unable to consult such material for years later than 1946. In accordance with the 30-year rule which now governs the release of the official archives in Britain—as a result, indeed, of a generous interpretation of that rule—these have only recently been opened for 1940-45. In the United

States delays in editing and printing have frustrated the policy of releasing the confidential archives more quickly, so that the American material, as published in "Foreign Relations of the United States," is only now reaching into the year 1947. From now on, on the other hand, more of the relevant archives in Britain and the United States, if not in Russia, will be added to the public domain every year; these will include not only official archives, but also the papers of individuals, of which only those of Lord Cherwell and Sir John Wheeler-Bennett himself are referred to in this book; and research will be steadily modifying the emphases which underlie the orthodox interpretation of how the cold war arose.

In "The Semblance of Peace" the orthodox interpretation is firmly adhered to. What caused the cold war was the fact that:

Russia's foreign policy, as disclosed during the war and practised thereafter, was a re-embodiment of those imperial ambitions which in the glory of the Tsarist expansionist period had led to the Crimean war, the Russo-Turkish war, the colonisation of the Transcaucasian territories and of Manchuria, the penetration of the Balkans. . . . To this old-fashioned imperialist policy was added the further threat of the proliferation of communism in Europe.

The authors notice, it is true, that this conclusion is now violently opposed in the United States by the revisionist argument that the cold war was entirely due to imperialism and insensitive anti-communism on the part of the United States. Nor need we blame them for being content merely to state this argument and say that they find it unacceptable. Even before the complete documents are available—simply, in fact, as a result of looking at the existing evidence after the passage of time—the revisionist argument looks silly beside the less dramatic view that the cold war was the outcome of mutual fear and distrust on the part of Russia and the west in an uncertain postwar situation. So, however, does the orthodox interpretation. If "The Semblance of Peace" adheres to it, indeed, it is not solely because it comes out just before the documents are complete but also because, for all its attempts at serious analysis, it lacks historical perspective.

This defect extends beyond the book's discussion of the origin of the cold war to the epilogue in which it considers the international situation a quarter of a century later. There is no recognition here that the cold war has declined in intensity, not to say come to an end. More important, the

"tragic sense of failure" when reflecting on the United Nations Organisation is unrelieved by any recognition of the fact that governments embarked on this experiment with fewer illusions than they had in 1919, while the recognition of the fact that "the Bomb has ensured the peace of our planet for the past 25 years" is accompanied by no understanding of the way in which the Bomb and all the forces which it symbolises have, during most of those years, been slowly bringing into existence an international system that already promises to be more stable than any that preceded it.

Dr Pierre, by contrast, is fully aware of this last development. His last remark, it is true, is that we live in a highly unpredictable world, in which Britain would be unnecessarily foreclosing her options if she gave up her nuclear force unilaterally. But the conclusion he has previously come to is that "it is certain that Britain's nuclear innocence has been lost beyond reach" and that "she will retain her nuclear force in some form . . . in an international system of possibly many nuclear powers." And this sensible conclusion, with its clear implication that the international system has at last required an effective structure of deterrence against major war, rounds off an equally sensible book in which the British development of nuclear weapons, since 1945 as well as before, is analysed as thoroughly as the British 30 year rule as yet permits.

Saucer eyes

THE UFO EXPERIENCE: A SCIENTIFIC INQUIRY

By J. Allen Hynek.
Abelard-Schuman. 288 pages. £2.50.

Flying saucers do not make the headlines very often these days, because people are increasingly reluctant to report having seen them. The main-spring of their reluctance is the official ridicule that has been poured on sensible and honest reports of genuinely puzzling phenomena. This policy of ridiculing what you cannot explain away has made a number of scientists exceedingly angry. They realise—who better—that reports of flying saucers have been the results of frauds, hoaxes and various forms of self-hallucination. But when these have been dismissed, and the unidentified flying objects that can be explained away have been identified as anything from stars and aircraft lights to marsh gas, a balance of genuinely inexplicable reports remains.

The anger that boils through Dr Hynek's book is the result of 20 years spent as adviser on astronomy to the American air force's flying saucer investigators, and watching their inquiries become increasingly careless and cursory. He has debunked plenty of saucer reports in his own time, but considers there are others that ought not to be dismissed so lightly. He has grouped what he considers to be the most important of genuinely inexplicable and properly witnessed reports (which means at least two witnesses) into night sightings, day sightings, UFOs that have been seen simultaneously by observers and on radar—an impressive collection, this—and those that have been seen close to and have left visible tracks, such as scorch marks. And finally, gritting his teeth because he would much rather ignore such tales, he lists reports of UFOs with hominids on board, the traditional little green men. It is a measure of Dr Hynek's scientific honesty that he included these sightings, in order to drive home his point that evidence must not be dismissed just because it makes you feel red-faced.

His is as much a plea for scientific method as it is for UFOs. He does not know what they are or even whether they come from space; they may merely be weapons still on the secret list. But on the criteria he has laid down, Dr Hynek is convinced that a number of responsible people have seen objects for which we have not yet provided a satisfactory explanation. Remembering that public men in the nineteenth century refused for a time to believe in the physical possibility of meteors, he will go on regarding these as unidentified flying objects until science makes the breakthrough that will tell us what they are. This is not a book for the nervous.

Short list

Pig in the Parlour by Rowel Friers (Blackstaff Press, Belfast, £1.50). The sub-title on Mr Friers's marvellous collection of cartoons is "Northern Ireland in Black and White," which is literally accurate but metaphorically too modest. Mr Friers pulls no punches, either with the IRA or with any other extremists, and his representations of Mr Whitelaw's amiable features are classics of caricature: but it is not only his political cartoons that make up this book. He spares no corner of Ulster's soul: sport, religion, drink, domestic life—and, as in the cartoon above, Irishmen's less lethal antics on the border. The phonetic spelling of

"From this attitude I can only conclude that you don't believe in me"

the captions is sometimes rather hard work, but it is worth struggling with, for example: "What do ye say tae a plebiscite on the border, Wullie John?" "Ach, so long as ats no wan o' thon skyscraper blawks!"

The Economics of Business Investment Abroad by H. Peter Gray (Macmillan, £6). Not quite a textbook for economists, nor a guide for businessmen thinking of investing abroad. The author attempts to provide an "analytical framework" for assessing the benefits and costs of foreign investment for all parties concerned. However, he also wants to do this in a way which will appeal to the "practical man." The result is an uneven combination of scattered formulae and diagrams with descriptive taxonomy (three sorts of goods and 18 reasons for investing abroad, etc). There is also a rather superficial discussion of multinational corporations.

Shaking the Money Tree by Winthrop Knowlton and John L. Furth (Harper and Row, £3.50). The choice of title, with its overtones of rich pickings for little effort, is one of the authors' few mistakes. The book is really a no-nonsense account of how to choose shares and what to expect of them. (The answer, for patient and industrious investors, is satisfying, but unostentatious.) At times, it reads like a revivalist cry for the good old pre-conglomerate days of investment analysis, with vintage examples to match. But it also shows how intelligence, and even candour, can still command some premium on Wall Street.

Business Brief

London: development area

The latest proposals for the redevelopment, or renovation, of Piccadilly Circus, published by Westminster Council last weekend, amount to a turnaround on the original plans which caused such a storm last May. Gone are the tower blocks and the high-level pedestrian walkways, and gone also is the take-it-or-leave-it attitude that went with them. This time four options are put up for debate. It amounts to a victory for public opinion, a force which has emerged in London planning only over the past year or two.

Having gained ground on Piccadilly, the public is likely to want more say in a number of other planning issues coming up. One is the future of Covent Garden, which has aroused some very strong feelings about which the new Secretary of State for the Environment, Mr Geoffrey Rippon, will now come under increasing pressure to make up his mind. In January, a report on the redevelopment of London's dockland will spark off further debate. The pressure will be kept up by the Greater London Council elections in April, with the possibility of a switch of control to Labour. And some time soon Mr Rippon will have to decide how much he accepts of the GLC development plan which, after 18 months of public inquiry and a great deal of

further research, looks a very different animal from the one first published in 1969.

Until the plan was drawn up, policies had been based on the belief that London's population would grow unless the planners could stop it, and that employment was expanding so fast that a labour shortage had become a real risk. Up to the mid-1960s planners therefore aimed to control London's growth by office development permits, the setting up of the Location of Offices Bureau to lure companies out of town, and the general strategy for the south east with its emphasis on growth points outside London.

London's population was, in fact, falling at an ever-accelerating rate—by around 75,000 a year between 1966 and 1971, twice the rate of the previous five years. By last year the population was below 7.4m. The figure could be 6.6m or less by 1981.

Almost the entire loss has been from the working population; retired people have increased, both in absolute numbers and in proportion to the total population. In the five years to 1971, London's working population dropped by nearly 250,000 to 3.8m even though married women, in particular, showed greater enthusiasm over going out to work, and now make up nearly

a quarter of London's workforce.

Inner London has suffered a disproportionately large share of the population exodus. Of the 790,000 drop in the 20 years to 1971, inner London lost no fewer than 610,000. Manufacturing industry in the central area was also going down steadily. Unemployment in inner London is now of development area proportions: about 7-8% overall, according to the 1971 census, and as much as 9% in Tower Hamlets.

Dr David Eversley, until recently the GLC's chief strategic planner, has been carrying on a public campaign to draw attention to London's increasing poverty. He is convinced that without government intervention half of London's population could end up in need of special allowances, rebates and free services. As industry and commerce in inner London go down the rate base is eroded, which means even less money for rehabilitating the rundown areas.

Plus points

There are arguments pointing the other way too. If the population is falling, there should be less pressure on essential services like housing, education and the transport system, and less frustration caused by overcrowding. No one has yet proved that real incomes per head in London will fall because of the over-rapid decline in population; nor that London is suffering from social polarisation because of a middle-class exodus, as planners like Dr Eversley fear. The statistics are so shaky that no one even knows whether more people are leaving London, or fewer are coming in (perhaps put off by the impossibility of

finding anywhere to live), or both. One thing is clear: the people who have moved out of inner London have not just crossed the GLC boundary to commute back to work from there. The outer metropolitan area is growing less quickly than greater London is declining. But the bulk of the data on which London's planning is based is now six or seven years old. The full results of the 1971 census (which will include detailed regional breakdowns) will remedy this, but the Registrar General's office is already seven or eight months behind schedule with the work, which is now unlikely to be available before next spring.

On the face of it, the fall in London's population should have eased the housing problem, but it does not seem to have worked out that way. Since the beginning of the second world war, London has lost 1.1m people and built 750,000 new homes; yet it is still several hundreds of thousands of satisfactory homes short. With rising incomes, expectations and standards are also going up. People are no longer prepared to share a home, and the young are setting up on their own earlier. There is a tremendous, and largely unsatisfied, demand for small flats. Rented accommodation is particularly scarce, largely because the law and the tax rules make ownership of such accommodation unattractive. Low-income families come under pressure as rented flats disappear, often to be renovated for sale—with the help of government improvement grants—at prices beyond the reach of the original tenants.

No one really knows what to do about this. Nor have the councils worked out whether

Source: London facts and figures, GLC 1972
Valuation office of the board of Inland Revenue

they should concentrate on building family flats, or take some of the demand out of the market by putting up bedsitters as well. The GLC is now carrying out a filtering study to trace the movement of families, which might help it to decide on priorities.

The GLC does have powers to build in the outer boroughs, where sites might still be available, but Conservative-controlled councils in these areas naturally resist anything that would probably produce an influx of slum, and possibly black, families likely to vote Labour. Inner Labour boroughs are short of sites, which means building at high densities and losing the benefits of a falling population. Lambeth, for instance, has a policy of buying up property which may not be in bad condition but where densities are low enough to allow extra housing when redeveloped.

In a study of housing and employment in central London for Westminster Council, Trevor Williams and James Anderson concluded that office and hotel development, coupled with rising land prices and rents, is forcing workers out of the borough. In the past five years, the number of rooms available for housing has fallen by 10%, while the population has dropped by 64%. Some 10,000 Westminster homes lack basic facilities. Dustmen, waiters, bus drivers and postmen, who cannot commute from the suburbs, often find themselves crowded into furnished rooms for which they pay disproportionate rents, and where they have little security of tenure.

There is now sufficient con-

cern over the decline in industrial employment for some councils to resist redevelopment of sites they would have welcomed only a few years ago. Hammersmith council refused J. Lyons permission to redevelop its Cadby Hall site, and Wandsworth is cool about Morgan Crucible's plans for turning its Battersea Bridge plant into a multi-purpose development including a large number of riverside homes.

Policy on office development, too, has become less clear-cut, with the GLC working on one set of rules and the Department of the Environment on another. The Government's office development permit system is still in operation, with London permits for nearly 20m sq ft a year being handed out. Yet the GLC reckons that only half that amount is needed to balance jobs and workers, and hopes to evolve its own controls through floorspace targets. The Government wants to encourage office building to stabilise rents, particularly with common market entry coming up. At £10 or more a sq ft, City rents are well ahead of Paris (£7), Frankfurt (£3) and Brussels (£3). Meanwhile, the GLC maintains that a large number of planning consents are never taken up, and that many developers have only themselves to blame if they are refused permission, because they will not build at stations and

other points favoured by the GLC. Private houses, however, continue mysteriously to turn into offices and hotels.

Planning trade-offs

Development has too often in the past been dictated by traffic planning. Large office blocks have been given consent because the developers promised to yield part of the site for road widening, or bear the cost of overhead walkways. The GLC has urged developers to assemble large sites because these would allow "planning gains" like housing and open spaces to be negotiated in return for planning consent. Such deals are usually made in private between planning officers and developers, and the public only learns when the planning application is made. If there is an outcry at that stage, enormous delays can result.

More conservation is not necessarily the answer. Covent Garden already shows that rents, even in renovated buildings, can go high enough to force out existing users. About a third of the area will be preserved, another third selectively redeveloped and the final third ripped down and totally rebuilt. Even in the preserved old buildings, advertising agencies may replace the theatrical firms and literary agents that cannot pay the new rents. However, there will be some public gain from the

redevelopment, with some of the profitable office development subsidising housing, open space, entertainments and other amenities.

The proposed redevelopment of 5,000 acres of London's dockland—from Tower Bridge to Beckton—offers far more problems. This is an area with potential for large-scale housing development (homes for up to 100,000 people) and new jobs, but the cost could be forbidding. There would have to be extensive government help with building roads and providing public transport.

The sites themselves are difficult, and developers are not all that keen to get stuck in, except for offices near the City and riverside housing. Any redevelopment will involve both the boroughs concerned and the GLC, with the inevitable power tussles between the two. One pointer to the way things might go is provided by north Southwark, where the borough's guidelines for developers (geared to producing higher rates) encouraged the highly profitable Hay's Wharf proposals. Now the GLC feels the office content in the development is too high, and local people, badly housed and in need of jobs to replace dock employment, object to being taken over by the City and the West End. The same could happen in dockland itself.

The rise and fall of London's population

Why is DSM fond of daughters?

In the chemical industry - and not only there - it may be a blessing to have many daughters. Subsidiaries possessing special knowledge, operating in special fields. These daughters are born, so to speak, from marriages with business partners or they are adopted. If they thrive, the whole family is happy. Such daughters are always welcome.

DSM  **Holland**

DSM, Information Service, P.O. Box 65, Heerlen, Holland

By way of introduction:

Together with Akzo: Methanol Chemie Nederland VoF for the production of methanol, formaldehyde-based resins. Interesting possibilities for the synthetic resins industry and the wood using industry.

Together with five German partners: Aethylen Rohrleitungs Gesellschaft (ARG) for transporting ethylene between the plants connected to an international pipeline network (from the Ruhr area and Dormagen to DSM in Holland and extending westwards to Antwerp). Ethylene is a starting material for plastics and rubbers.

Together with the British NCB: Nypro (UK) Ltd. for the production of caprolactam. Caprolactam is a raw material for nylon 6 yarns and fibres and technical nylon, such as ball bearings, profiles bolts, nuts, wheels, etc.

Nipro Inc. (USA), using a new DSM-process for the production of caprolactam. Besides: Columbia Nitrogen Corporation in Augusta for the manufacture of fertilizers indispensable to plants and therefore most important to man and animal.

Van Egteren Bouwnijverheid nv, an all-round building industry, fully familiar with large-scale building, utility building, civil engineering construction and industrial building, is, for example, the biggest builder of family houses in the Netherlands.

NV Chemische Industrie Synres. Synres produces a wide range of specialities, such as feedstocks for paint and printing ink resins, as well as resins and other materials for further industrial processing.

Together with Univex SA (Mexico): a new plant for the production of caprolactam.

new matter**

New buildings of the 'Anchor' project superimposed on a photograph of central London show the vast scale of the undertaking.

Why British Steel is spending £200 million on the largest new steelworks development in Europe.

At Scunthorpe, BSC's massive 1000 acre Anchor development scheme nears completion. Fed by 7 existing blast furnaces, the new BOS oxygen converters will help to increase Scunthorpe's total steel output from 3.5 million tonnes a year to an estimated 5.4 million tonnes. New continuous casting plant and rolling mills will provide finished

steel to meet customers' demands for products of high and consistent quality. Associated port developments at nearby Immingham will enable very large carriers to bring in iron ore from all over the world. Anchor was begun in 1970 and should be in production by early 1973. The scheme has been carefully planned

to extend the capabilities of an existing works complex—to make the best use of what's there already, and to add what's needed to keep British Steel competitive in the markets of the 70s and 80s. And Anchor is only one of more than two hundred schemes which BSC has under way to re-equip and modernise Britain's steel industry.

BUSINESS

Facts, forecasts and fables

Nobody can agree how well the British economy has done this year, but the National Institute shows how badly it could do next year if phase two is not a near-freeze

This has been the week for raking over the chicken entrails to guess, on the eve of Britain's entry into Europe, where the economy now stands and where it is going. New facts include: bad balance of payments figures (a deficit of £106m in the third quarter); bad trade figures (a deficit on visible trade of £81m in November); good production figures (both industrial and manufacturing production up 6 per cent in October on last year); and the first, post-freeze price figures (wholesale prices up again by $\frac{3}{4}$ per cent in November, but, as four-fifths of any price increases normally occur on the first day of the month, this still mainly reflects last minute pre-freeze hikes). Meanwhile the witch doctors have been hard at it, with reports on the health of the economy in the Bank of England Quarterly Bulletin, the National Institute Economic Review and the Treasury's monthly assessment.

Growth

Like the orchestra on the sinking Titanic, the National Institute goes on producing conventional noises because there is little else a forecaster can do. But as the present is obscure because of the effect of strikes on recent statistics, and as the future is dependent upon when and where the pound's parity is fixed and what follows the freeze, the institute rightly gives warning that it does not really believe itself. If the exchange rate is fixed at \$2.35 to the pound, there is a relatively successful incomes policy, and no further tax cuts, the institute judges that the economy will go on running below the Government's output target up to the end of next year. To hit 5 per cent growth the Government will need to go for a $7\frac{1}{2}$ per cent value-added tax (instead of 10 per cent), and cut £600m off income or other taxes. This is in line with the £1 billion tax cuts which *The Economist* has recently suggested will be needed.

The Bank of England and the Treasury are more bullish. They believe the economy, if not already on the 5 per cent growth path, soon will be. The table shows 20 possible ways of measuring the recent growth in the economy from the latest published evidence. There is evidence here to support a splendid range of conflicting contentions: from that output is falling by 3 per cent to that it is rising by nearly 13 per cent. It all depends upon whether the figures used are out of date and compared over a short period (when the strike distortions are

large and unfavourable), or up to date and over still shorter periods (when distortions are large and favourable). There is even still room for the institute and Treasury to agree. The institute points out that the turnaround on stockbuilding and investment could, in the short term, make it appear as though the economy were hitting the 5 per cent target; but its forecasts were prepared in ignorance of the latest unexpected falls in industries' investment and stocks. A later but sharper upturn in both series would lead the institute to revise its growth forecast for 1972 down and that for 1973 up.

Balance of payments

A deficit on the current balance of payments in the strike-affected third quarter had been signalled by the trade figures. It is nonetheless an important and gloomy landmark—the first quarterly deficit since 1968 and the largest since immediately after the 1967 devaluation. In time, most of the adverse effects of a dock strike should be reversed. The trade figures for October and November, however, which together give a £126m visible deficit, show that the slide back into the red is real enough. On its own, this is not alarming. Since June, sterling has floated down 10 per cent from its Smithsonian parity. Other exchange rates have not followed this time as they did in 1967. Thus the latest devaluation is effectively almost as large as Mr Wilson's. After a devaluation, things always get worse before they get better. The effect

A figure to fit any claim

*Most recent figures: Gdp, income and expenditure estimates: April-June; Gdp, output estimate: July-Sept. Industrial and manufacturing production: October.

of rising import prices comes through before the favourable effect of rising export volume. What is alarming is that the National Institute does not foresee enough of an improvement as time goes by. If we get 5 per cent growth next year, it expects a deficit running at £500m by the end of the year, and no return to surplus in 1974. Despite the buoyant outlook for world trade, it thinks that the favourable effects of devaluation will be offset by the adverse effects from reflation the economy and reducing unemployment. On this analysis Britain is in external disequilibrium again even on the new \$2.35 parity. We are back to the old familiar problem of balance of payments deficit just when we want to expand.

Fixing the pound

The Government faces a dilemma. If it allows the pound to float down in response to the deficit, import prices will rise and the problem of controlling inflation will be exacerbated; but if it does not carry conviction with its anti-inflation policies it may not be able to prop the pound up against any serious run. It must expect a speculative attack. People are bound to be nervous as January 1st approaches that the Government will have to fix the pound at a lower rate than the current free market level. Even when sterling is over this hurdle, monthly trade deficits of over £100m will not be easy to ride.

The bottomless pits

The Government's £1.2 billion Christmas gift to the coal industry, announced on Monday, was generous even in the estimation of Mr Joe Gormley, the president of the National Union of Mineworkers

The Government's handout should reduce redundancies among miners and ease the next round of wage talks, but maybe not that much. After the announcement had been made, Mr Gormley emphasised that the £1.2 billion package, which includes a £475m write-off of past debts, will not influence the miners' wage claim, which calls once again for pay increases of up to 30 per cent, plus shorter working hours for underground workers. The claim could cost the National Coal Board £200m a year, which happens to be the maximum that it could be getting from the Government during the next five years under the terms of the new bill, allowing for £45m for savings on interest and depreciation charges arising out of the £475m write-off. That can hardly be coincidence.

Of course, Mr Gormley and Mr Lawrence Daly, the union's general secretary, have the power to negotiate and may settle for less once formal talks begin on January 10th. However, Mr Daly, who is more closely identified with the union's militants than Mr Gormley, was also at the press conference and he sounded as fiery as he did during the miners' strike early this year. So the Government, unless it wants to forget about holding down wages, may have another fight on its hands, in spite of its unprecedented and eyebrow-raising generosity.

The handout was excused by the Government as necessary to preserve the coal industry against the day when its products may once again be competitive in price with

Prices and incomes

The institute recommends adoption of a compound of the American phase two approach and the original £2 a week package deal. This, it assumes, could limit average earnings increases to 9 per cent between now and the end of next year, with consumer prices rising by 5 per cent and retail prices, presumably, faster. Such a rate of inflation would only be sufficient to prevent a further deterioration of our competitive position and not make good any of the damage done before the freeze. Yet the institute's own arithmetic shows that this is not enough. What Conservative Government would plan to run up to an election with statutory prices and incomes controls, a £500m deficit and more than 5 per cent inflation?

Three clear messages emerge. First, the Government must go for a much tougher phase two and that, as *The Economist* argued last week, would make room for greater tax cuts designed to keep down prices. Second, it must make its plans known before Christmas; the longer it delays the greater the risk that all its hopes will be swept to one side by a sterling crisis. Third, the case for index linking, which the institute ignored, is very strong in the present situation. Wages should be allowed to rise by 1 per cent for each 1 per cent rise in prices, but all increases in real incomes should come through increased social security benefits and tax cuts.

other fuels, thanks to the world-wide energy shortage, which has been so well publicised recently. After all, some American energy experts are now predicting a great expansion for the American coal industry, which had run down drastically in the 1950s and early 1960s. But the British industry must become significantly more efficient if it is ever to benefit from rising oil and natural gas prices, and it is here that the Government's position is weak. Although Mr Peter Walker, the Secretary of State for Trade and Industry, lauded the NCB and the unions for their efforts to reduce overheads and increase productivity, no one connected with the industry has ever spelled out how productivity gains of the proper magnitude—20-30 per cent—can be achieved.

Yet this is vital. Whatever the outcome of this year's talks, it is obvious that the miners will continue to agitate for higher wages until they are again among the most highly paid industrial workers. Unless big gains can be made in productivity, the NCB's costs are going to continue to rise swiftly, perhaps as swiftly as the price of oil. The Middle East countries are unlikely to price oil out of the world market, so the prospect through the 1970s is of gradually rising, rather than runaway, prices. After 1980, the pace could accelerate unless the western countries, particularly America, open up new sources of energy. The likelihood is that America will do just that.

Price has to be the criterion for deciding how much

Lloyds and Scottish

Continuing growth in challenging year.

Main points from the statement by the Chairman, Ian W. Macdonald

Group Profits

The group has again achieved a record profit amounting to £11.77 million before tax, an improvement of 44.6% on the corresponding figure for the previous year. The profit attributable to shareholders at £6.97 million is up 41.4%.

On 4th December 1972 the Board announced a recommended final dividend of 10% (being the maximum permitted under the standstill) making with the interim of 9% a total of 19% for the year which is covered 2.06 times by attributable net profits. (1970/71 — 1.62 times.)

Earnings per share have increased to 8.03p from 5.90p last year. The borrowing ratio has also improved from 3.6 to 4.3.

The group again benefited from the steady decline in the cost of short term money up to June this year, and during that period acquired a substantial portfolio of deposits in the 2-5 year category at attractive rates totalling £68 million.

These deposits were taken at fixed rates which were higher than those prevailing for much shorter periods, but it was considered that the initial adverse effect on earnings was likely to be more than offset during the medium term, and the sharp rise in interest rates since June is already giving support to that view. Moreover, these term deposits might be regarded as matching funds in relation to a large volume of medium-term lending contracts already on the books at higher rates.

The removal of terms control in July 1971 resulted in an immediate upsurge in the volume of business, and since then a relatively high level has been maintained.

DOMESTIC CREDIT STRUCTURE

New freedoms—healthy competition

It is gratifying to be able to review a year in which the finance companies have been free from the burden and frustration of credit restrictions, particularly so since these companies, directly or indirectly received the heavy end of the stick over a long period of years.

These new freedoms have created fresh opportunities and have encouraged greater flexibility in both borrowing and lending methods. The demarcation lines between the activities of the various financial sectors are becoming less clearly defined with a resultant growth in competition which is welcomed. Already there are signs that rigid practices are no longer enshrined as hallowed traditions, that marketing and selling techniques have a

direct bearing on profitability, and that the specialist, with his expertise, is coming into his own with the ever widening range of financial schemes.

The company has now had 12 months experience of the new discipline which, for finance companies, involved a gradual accumulation of 'reserve assets' equivalent to 10% of qualifying liabilities. This results in a small reduction in our earnings. A similar consequence will follow from the recent call for 'special deposits' equivalent to 1% of qualifying deposits.

OTHER MAJOR INTERESTS

British Relay Wireless and Television

In June of this year the Company invested some £10.3 million in acquiring approximately 27% of the ordinary shares of British Relay Wireless and Television. This investment gives us a sizeable equity interest in one of the major U.K. television/relay companies and to participate in the rapid growth of 'colour' sets.

We have not brought into our profit and loss account for the year 1971/72 any contribution from this associated company.

Caledonian Tractor Group

This group which has the exclusive franchise in Scotland for the distribution of Caterpillar machines and equipment has now established itself in the industrial engine market.

A growing volume of business is accruing from developments in the North of Scotland resulting from the successful offshore drilling for oil, and two service depots are being established in this area.

There have been substantial improvements in both turnover and profit.

House of Clydesdale Group

This group has had another successful year with improved turnover and profit. Here again the rapid increase in the distribution of colour television is a significant factor.

Credcor Bank

South Africa has experienced a year of credit restraint and our associated company has done well to maintain its earnings and dividend.

Eurocredit

The operating company in France has made good progress with steadily rising profits. In October of this year a placing was arranged on the Paris Bourse at a price considerably above the cost of the shares.

25% of the total holding was involved in the placing and the balance remains in the Eurocredit portfolio.

On the other hand, the operating company in Italy is still disappointing and the problems associated with real estate investments have not yet been resolved.

Eurocredit again paid a small dividend.

International Factors

During the past year this company continued to broaden the base of its activities and obtained a record number of new accounts. Owing to easier credit conditions there was a reduction in the volume of invoice discounting business. The profit was satisfactory and somewhat higher than in the previous year.

Future Prospects

The Board is confident of the ability of our Company to take advantage of opportunities for growth and development in the numerous financial areas in which we have a stake. It is not, however, possible to forecast the effect of short term influences over which we have no control. In particular, government restraints and rising money costs can slow both growth and profitability. We have experienced difficult conditions in the past and these have not reversed the trend of our continuing success.

CONSOLIDATED PROFIT STATEMENT

	1972	1971
	£	£
Group profit before taxation	11,766,000	8,138,000
Group profit after taxation and minority interests	6,970,000	4,928,000
Gross dividend	3,385,000	3,038,000
Profit retained in the Group	3,585,000	1,890,000
Earnings per Ordinary share of 20p	8.03p	5.90p

LLOYDS AND SCOTTISH

You'd be surprised what we get up to.

From exporting our products and services around the world to building the runways and airport terminals - to fly them from.

And at roof level we really spread ourselves. Not only in Britain where we put the roof on just about every type of building, but overseas too - we export a wide range of roofing materials. And asphalt from our mines in France and Switzerland ends up on European roofs. We're on top of the job everywhere. And just to show we can land the big ones we've recently completed a jumbo-jet apron at Bahrain Airport.

Tarmac
THE MEANS AND THE END
Tarmac Group, Wolverhampton, England.

coal we need. With oil all around us, energy will soon be no problem for Britain, however much the subject may worry other countries. During the 1980s Britain could even become a net exporter of oil.

The danger in what the Government is doing now is that the £210m it provided to slow the contraction of pits in development areas will weaken the whole industry's concern with efficiency. The aim is to prevent marginally unprofitable pits from being closed. The result may be to create more unprofitable pits which, along with the certain rise in wages, could plunge coal further into debt than it has ever been. In a few years the industry may need an even larger handout than it received on Monday. At some point the process will have to stop, but for the moment political expediency has ruled the day.

Contrast the Government's plan to maintain coal output at around its present level of 144m tons with a demand of only 106m-111m tons of coal by 1980 contained in the National Institute's energy forecasts. Who is going to

produce the extra coal and, more important, who is going to use it? Some other fuel is going to have to be replaced to find a market for what could be up to 38m surplus tons of coal a year by the end of the decade. The price of peace today looks like being pain for the Government later because if productivity is to increase at a pace that gives the miners higher wages without crippling the industry again, maintaining the present level of output could still mean dispensing with 100,000 of today's 280,000 miners by the end of the decade, and the drop will be concentrated in the less prosperous regions.

The coal has then to be sold, and it is difficult to see the surplus being disposed of anywhere but to the power stations. Ideally, it ought to replace imported oil. In practice, what it is likely to replace is nuclear power. Whether the Government should deliberately hold back a new technology in order to bolster up an old one is not a question that anyone would have expected to ask of a government headed by Mr Heath.

We're all right, Jack

Inflation is a bigger threat to southern Irish business than the IRA. But the trade unions are friendly and so are foreign investors

Ulster's bloodshed has not left southern Ireland unstained. But the economy, although still highly inflationary, has several encouraging signs of health. Undeniably, there has been a slump of 15 per cent in tourism, and British investment, which used to be one-fifth of all Ireland's new foreign investment, has dried up. But even tourism is expected to improve in 1973. British investment in Ireland has plunged partly in line with domestic British investment and partly because the British seem particularly sensitive to the northern troubles, perhaps fearing that their factories might be special targets for attack in the south. But other, less familiar investors like the Japanese and Swedes are showing more interest than ever before. At the same time, trade between Britain and Ireland is booming. Over 55 per cent of Irish exports come to Britain, and the proportion is still rising.

The land still provides the bulk of these exports and, for the first time in years, Irish farmers are striking it rich. Their only slight worry at present is the news of foot-and-mouth back in Britain; however, Ireland managed to escape even the last British epidemic. But Mr Jack Lynch's Ireland is still a poor nation by European standards; its average income is only half the EEC average. Over a quarter of Irishmen still work on the land, a greater proportion even than in Italy. The opening of Europe's markets and general world trends have sent the price of Irish food exports soaring.

This is excellent news for the farmers, but it is causing a lot of anguish for everyone else. The diversion of food to export has naturally sent domestic prices soaring as well. Beef prices have risen 17 per cent this year and potato prices 86 per cent. Because of the low standard of living, a large chunk of the Irish family budget goes on food, so general inflation has been quickly fed by food price inflation and is now running at 9 per cent a year, the

highest in Europe.

There has been a long tradition in Ireland, beginning in 1948, of central wage agreements, but usually vague and ineffective ones. Then in 1970, under the threat of a statutory prices and incomes bill, unions and employers agreed to an elaborate wage package. Every employee whose contract expired in the period got a £2 rise, but the unions made no attempt to force the employers to agree to restrain prices, as the TUC did when Mr Heath tried to bring in a similar £2 limit. The Irish unions reckoned that Irish prices were mainly determined by world prices, so that Irish employers could not make price restraint stick. But they did extract a cost-of-living clause, which gave every worker a little under a 1 per cent wage rise for each 1 per cent rise in prices above a 4 per cent annual rate. The government subsequently introduced a price commission, but its criteria are not very strict.

When this agreement expired last July, the two parties signed another, more complex, one. Under this, the norm for the year to next July is 9 per cent, but less for those earning more than £30 a week and more for those earning less than £27 a week, who will get a minimum rise of £2.50. This means that the average wage increase will be well above 9 per cent. In phase two, after next July, the norm will be 4 per cent over six months, but there will also be a cost-of-living escalator as in the 1970 deal. The wage norms are clearly far too high. But the employers reckoned that it was better to sign this sort of inflationary agreement than to have a free-for-all which could produce worse inflation and plenty of strikes.

Now the deal is signed, the Irish Congress of Trade Unions promises to discipline any union which strikes for a wage rise in excess of the norm. The Irish Labour Court adjudicates in tricky cases, and its verdict is usually accepted. The ICTU, staffed by a dozen people and

operating from a suburban terraced house in south Dublin, manages to do a remarkably good job. It can suspend erring unions: last year, two unions, including the Irish section of Mr Scanlon's engineers, were suspended for organising a bus strike in defiance of the wage agreement. It also organises the picketing when multi-union plants want to strike. This power, acquired in 1970, has proved very effective: if one set of workers in a plant want to strike, they have to apply to the ICTU for permission to picket for an "all-out strike."

Although Irish industry is more heavily unionised than even British industry, most workers belong to general unions, so there are few plants where workers are all in the same union. This gives the ICTU its power, and its control is increased by the relative absence of British-style shop stewards.

In March of this year, the ICTU smashed a break-away strike by power workers by directing other power workers to do the strikers' job. Such behaviour would be considered outrageous by any British union. The ICTU, relishing its new-found power, is keen to expand. Member unions received details this week of a plan to increase subscriptions fourfold to allow it to do new jobs like representing the Irish unions in Brussels.

As a result of its tough policy, there have been very few strikes. In 1971 there were 73 per cent fewer days lost through strikes than in 1970 and, proportionately, little more than half the number in Britain. This year there have been even fewer strikes. A problem is set by the non-ICTU unions like the bank clerks, who staged a lengthy strike in 1970 and got a bigger wage rise than they should have done. Their contract expires this month, and the ICTU is pressing that they should get a nil wage rise over the next six months.

Irish industry is expanding fast. Tax cuts have helped to boost post-tax profits by 51 per cent in a year, sending the stock market up to dizzy heights. Industrial production is growing at 4 per cent a year, and new investment is being encouraged by the government.

The Industrial Development Authority, which was greatly expanded last year, has produced a detailed blue-

Across the Irish Sea (latest comparisons)

	Ireland	UK
Population	3m	56m
Gnp per head	£630	£1,010
Annual growth (1961-1971)	3.7%	2.6%
Unemployment	7%	3.1%
Inflation	8.9%	7.9%
Average industrial wage	£21.45	£32.10
Per cent of labour in agriculture	27.5	2.9
Strike days lost in industry per 1000 employed	660	1,130
Cars per road-mile	12	63

print for Ireland's development over the next five years, aimed at increasing industrial employment by nearly 20 per cent. It could well succeed. The authority has worked out what kind of industry it thinks will benefit Ireland most and is now tracking down suitable multinationals which might invest. IDA men like to march into the offices of company chairmen and produce accounts showing exactly what investment in Ireland would mean for them in profits, assets and cash flow. This approach seems to be working. The number of jobs created by foreign investments agreed this year will be double last year's total. The IDA's task is made easier by the Irish investment incentives, which are the most generous in Europe. The EEC is allowing them to continue.

In 1969, Professor Colin Buchanan produced a report on Irish regional policy, which suggested that new investment should concentrate on nine growth points, such as Cork. This would involve the depopulation of large areas of rural Ireland. The IDA, however, rejected this strategy. For one thing, it was politically explosive. Few areas like being written off, and many Irish towns and villages have formed their own development associations to attract industry. But the IDA has also found that many foreign firms prefer to set up in the country, where the golf courses are uncrowded and where there is little competition for labour.

As Ireland enters the EEC, the outlook is good. Farmers and industry both stand to gain directly, and new investment will be further helped by the development of an EEC regional policy. But inflation is still the country's biggest bugbear.

Key indicators: British economy

	Month	Index 1963=100	Percentage change on		
			previous month	three months	one year
Overseas trade Deficit of £81m in November. Exports fell back from their post-dock strike high; imports were unchanged.	Industrial production*	October	132.7	+1.5	+2.2
	employment*	September	88.3	-0.3	+6.2
	productivity*	September	147.6	+0.5	-3.3
Industrial output Stronger in October and more than 6% higher than a year ago.	Export trade*‡	November	164	-4	+7.3
	Retail trade*	October	118.8	+1.3	+18
	Unemployment*	November	150.5	-1.3	+5.7
Wholesale prices Prices of manufactures in November 6½% up on a year ago. Basic materials and fuel prices were up 9½%.	Average earnings*	September	214.6	+3.2	+5.1
	Retail prices	October	162.8	+1.4	+13.9
	Export prices	September	154	-1	+2.7
	Import prices	September	141	nil	+2

Export trade, retail trade: in volume terms (value at constant prices). Unemployment: wholly unemployed excluding school-leavers; latest rate 3.3 per cent. *Seasonally adjusted. ‡Provisional

Grand Marnier for Socialites

Take a generous shot of Grand Marnier in a tall glass, swoosh in a bottle of tonic water, chunk in a couple of ice cubes, add a twist of lemon, *et voila* -the new mix that's sweeping South America (no, seriously).

Marnier and tonic.

Those who haven't tried it, laugh.

Those who have, smile. Knowingly.

-and for Conservatives

There is no cause for alarm. That seemingly sacrilegious offering over on the Left is merely a novel serving suggestion.

Grand Marnier is still the superlative liqueur it always was, the same subtle blend of wild oranges and the finest old Cognac.

Something to sip reflectively after a good dinner.

And conserve for your special friends.

The oranges are wild. The taste is civilised.

For those who care
about their appointments

The Desk Diary

makes keeping appointments a pleasure. This truly handsome, craftsman-made volume has long been the highly treasured possession of connoisseurs all over the world.

It is the incomparable desk-top work of reference for people of affairs.

It contains ☐ 100 pages of valuable facts and figures specially distilled from international research surveys and official statistical analyses covering public affairs, commerce, industry and the professions. ☐ Special sections on U.K., U.S.A., E.E.C., World. ☐ New in the 1973 edition, a totally revised 60-page, fully indexed world map section, including special highly informative statistical maps and charts and 16 street plans of important world city centres. ☐ A loose, durable, six-year calendar. ☐ Two blue heavy silk markers to find those reference sections you use most and ☐ 117 superbly designed diary pages. ☐ Beautifully bound in rich red leather with its title, and your initials, embossed in real gold. The Economist Diary has been designed to be used as a permanent personal or business record and makes the ideal Christmas gift for even the most difficult to please.

The Pocket Diary

This slim pocket diary, delightfully practical to use, has been designed to keep its immaculate appearance the whole year.

☐ Luxuriously bound in red leather. ☐ Specially stressed covers finished with gilt metal corners. ☐ Pages edged with gold and a blue silk marker to add an extra note of distinction. ☐ The same sensible day-to-day layout of the Desk Diary, a three-year calendar, world times and public holidays to meet all essential needs. ☐ Tear-out slips of blank paper for notes and messages. ☐ Gold embossed blue Duplex end papers to 'gild the lily'. The Pocket Diary is a justifiable extravagance for those who care about quality. Order one for yourself and give others to your nearest and dearest.

Let us add your initials—or name—embossed in gold leaf.

We will be happy to dispatch The Economist Diaries in attractive gift sleeves, with your card enclosed, to anywhere in the world.

The
Economist
Diaries

Available only from The Economist

Diaries may be ordered by post direct from The Economist Diary Department, 25 St. James's Street, London, SW1A 1HG. Personal shoppers may buy them at The Economist Shop in London on the corner of Ryder Street and St. James's Street. Price including inland and surface postage Desk £5.00 (\$12.50). Pocket £1.75 (\$4.40). Gold embossing of initials 40p (\$1) or names 75p (\$1.90) extra per diary.

where on earth. One recent project: a plant dedicated in 1970 by the Institute of Gas Technology in Chicago.

This is a \$10 million pilot plant utilizing the IGT Hygas® process to convert coal into a pipeline-quality natural gas equivalent without releasing air-polluting sulfur. It was engineered and constructed by Procon and is now operating. In 1972, IGT engaged Procon for the conceptual design of a demonstration plant.

Procon is always looking for new fields to conquer. And our ingenuity and versatility welcome the challenge. We're geared to handle your full range of requirements, from feasibility studies through start-up, including design, engineering, procurement, and assistance in financing. Through our

panies, we provide total services.

Whether you're considering a refinery in Thailand, a petrochemical plant in Brazil, or a new process to make substitute natural gas in the U. S., let us tackle it.

All services of Procon Incorporated are available through the European marketing staff at Procon (Great Britain) Limited, Greater London House, Hampstead Road, London N.W. 1, England, or any of Procon's other offices, world-wide: Bangkok, Des Plaines (Chicago), Houston, Kogarah (Sydney), Los Angeles, Madrid, Makati (Manila), New York, Paris, Pleasant Hill (San Francisco), Rio de Janeiro, Rotterdam, Sao Paulo, Seoul, Singapore and Tulsa.

IGT Hygas® process pilot plant in Chicago

Procon builds to conquer new fields.

BUSINESS

Britain

In this season of peace, goodwill and big pay packets

The indignation among rank and file engineers about Mr James Goad's action in taking their union to the National Industrial Relations Court, where it has now been fined £50,000 for contempt, did not extend to disturbing their Christmas arrangements. Mr Goad's old workmates at the CAV plant in Suffolk tired of their strike in three days and called it off on Thursday morning—provided Mr Goad did not return to work among them. The executive of the union was wary about calling for a national strike for fear that would exacerbate its contempt of the court; so it confined itself to a letter urging all branches to "defend the policy of the union."

The branches interpreted the letter in different ways. Three-quarters of the union membership took it as a sign

to do nothing, and are working normally. The balance of 300,000 took it to mean that they should hold one-day demonstration strikes on various days next week, which will not affect their pay packets until after Christmas.

The militants are making most headway in Manchester, where they have a special committee to organise strikes against the Industrial Relations Act; the committee was set up after the dockers were jailed for contempt of Nirc earlier this summer. Manchester employers expect up to 250,000 engineers to strike, more or less reluctantly, on Wednesday. In London 40,000 are expected to come out on Monday, which may mean no newspapers. Another 12,000 are expected out in south Essex, and that could shut Dagenham.

The Midlands ought to be relatively peaceful. Shop stewards at Lucas voted not to strike in sympathy with CAV, which is a Lucas subsidiary. East Birmingham will have one-day strikes, but west Birmingham, where there are more moderate stewards, will not. Oxford car workers will strike, but shop stewards in militant Coventry voted 200-10 against action. In South Wales there is a lot of resentment at the union's policy.

The sequestrators are due to collect the £50,000 fine on Friday. But Mr Goad had decided to play things cool. He will not try to attend the union's branch meeting in Sudbury on the same day, but will wait until Christmas is over before trying again.

The Nirc has not yet judged the merits of Mr Goad's case, as the decision was taken by an industrial tribunal. It has merely been enforcing the tribunal's ruling. The tribunal ruled that Mr Goad should be admitted to the union because, the exclusion was "arbitrary and unrea-

sonable." Had the union appeared in court, it could probably have shown that the exclusion was not arbitrary. Mr Goad has failed to pay union dues thrice in the past, and has blacklegged during a strike.

If the union is fined again, there will be strong pressure to recall the policy conference before its next meeting in April. The alternative would be the gradual loss of all the union's assets. Neither course would be particularly congenial to Mr Hugh Scanlon, who is under a good deal of fire from his colleagues.

Freeze busters

No gas

There is a growing risk of a gas strike next spring. The 50,000 gas-workers are now being led by Mr John Edmunds, of the General and Municipal Workers' Union, a 28-year-old graduate, who is going to tell the Gas Council that his men's pay has fallen below that of the power workers who do almost exactly similar jobs. He will not demand a rise during the freeze, but will want a promise of a big one as soon as the freeze ends, plus a better deal for redundant gas-workers before then. The gas-workers are worried that many jobs will disappear in the next few months, as more old gas-works close and North Sea gas takes over.

If the Gas Council refuses to negotiate, there could be a strike early in the new year, with a real risk to life and limb.

If the council does negotiate, the Government will be angry. It is already worried about the number of post-freeze agreements struck in the past month. Many of these may have to be rolled back in phase two. It is urging all employers to delay talks until after the plans for phase two are announced.

On Tuesday, Mr Macmillan, the Secretary of State for Employment, issued the first order to stop a wage rise being paid in defiance of the freeze. But the 11 supervisors affected decided to continue striking. They belong to Mr Clive Jenkins's Association of

Dead boring after three days of this

Scientific, Technical and Managerial Staffs. Mr Jenkins has promised to use every trick in the book to try to beat the freeze. He is willing to fight in the courts if necessary, on the grounds that all publicity is good publicity.

The TUC itself has been trying to think of a way of resuming talks with the Government before the plans for phase two are finalised. Mr Walter Anderson, of the National and Local Government Officers, has written to Mr Heath suggesting that talks should be resumed, with the TUC's proposals as the starting point. The TUC's economic committee decided on Wednesday to ask to see Mr Heath to complain about prices that had not been frozen.

Commercial radio

Sounds expensive

The Independent Broadcasting Authority has got only 24 applications to sift through for the first five commercial radio stations. A matter of months ago, hundreds of groups were massing to take to the air, but the huge uncertainties of the revenues, and the huge certainties of the rentals to be paid to the authority have deterred many—and not just the fly-by-nighters.

The initial rental for London General, with its 9.2m potential audience, is £315,000 rising to £385,000, and for London News £185,000 rising to £230,000. On this basis, the authority is aiming for a total revenue, based on the eventual 60 commercial radio stations, of £2m—which is a big budget just to put up the transmitters and monitor the programmes. The authority is clearly thinking big, but may force the operators to broadcast small. Good radio is expensive and the authority has been perhaps over-concerned with making sure that any profit is creamed off; there is the nasty secondary rental which cuts off a quarter, and then a half, of profits which exceed 5 per cent, and then 10 per cent, of the advertising revenue. On top of the levy the stations have to pay over another 10½-14 per cent to the musicians' union and for the rights of broadcasting records. In return, the stations are allowed to play records for half the time on the air. It would have been better to cut both the levy and the needle time.

The worst uncertainties are over the news service, and the more prestigious the group, the greater the

philanthropy expected of it. The group led by Sir Con O'Neill, the former diplomat, and including The Times and Guardian newspapers, the International Publishing Corporation, the Rank Organisation and Thames Television, looks impressive on paper. But the point about the news service is that the £1½m or so needed to run it will have to be met out of syndicating the service to the other—mostly non-existent—stations which might or might not be forced to take the service. One good idea is that the other stations pay for the news by giving free

advertising slots, and then the news channel can charge a premium for the unique service to advertisers of national spots.

For the next four months, the IBA will shuffle around the country talking to the groups, and then try to reshuffle groups to get what it paternalistically decides is the best fit. And then silence for another year or so until the stations in London, Birmingham, Manchester and Glasgow are transmitting. One thing is certain. The authority will not allow the latest thing in California radio: soft porn talk shows.

What can the unions pay?

Many trade unions are skint. They are in no position to pay heavy fines imposed by the industrial court or anyone else. Union contributions have failed to keep pace with inflation. Average contributions were increased by 62 per cent between 1960 and 1970, but this was not enough to match the rise in spending. In the same period payments to members on strike rose eightfold.

Mr Jack Jones's and Mr Hugh Scanlon's unions have already been hit by fines under the Industrial Relations Act. But the act has had an effect on all the unions who refused to register, because they no longer get tax relief on income used for welfare payments. Deregistration is likely to cost the movement a total of over £6m.

Trade union finances have been bedevilled by the reluctance of up to a third of union members actually to pay their dues. Their investment policy has also been appalling. Unions have always been conservative: before 1939 they kept most of their assets in the bank, and now most union assets are in fixed-interest stocks. In inflationary times the value of their assets has plummeted.

Unions began to dabble in equities only in 1961, when the Trades Union Unit Trust was set up and run by Hill Samuel. This has had a pretty average performance, with a rise of 62 per cent in the past five years (compared with 80 per cent for the all-share index). Some £10m is now invested in the

trust by 58 unions, but this is still a small proportion of total union assets. A few unions have done well from property. The engineers have invested heavily in it, and Lord Cooper helped to push the General and Municipal Workers up the assets league with some nifty property dealings.

Declining unions like the railwaymen are far richer than the expanding, new unions like Mr Clive Jenkins's managerial staffs. They have been able to build up their investment income, and spread it between an ever-declining membership. The old unions, who often have a craft monopoly, have been able to raise subscriptions massively, while the newer unions have had to keep their rates competitive. The railwaymen raised dues by 282 per cent in 1960-70.

In 1970 around half of the unions had less per capita assets in real terms than 10 years before. Today's position is hard to measure, since deregistered unions no longer have to produce accounts, but it is certainly worse for nearly every major union. In the past, those with rickety finances merged with others, but a recent study* showed that virtually all mergers in the 1960s led to higher spending relative to income than the individual unions had before. One of the problems is that, unlike businesses, merging unions do not like to make employees redundant.

*Trade Union Finance. By Geoff Latta. British Journal of Industrial Relations. November, 1972.

What's in the cupboard

	Total assets (£m)	Assets per member (£)	Change, 1960-70 per member (%)
Transport and General	22.9	13.9	+ 45
Engineers	18.1	13.7	+ 4
General and Municipal	11.8	13.9	+112
Miners	11.7	28.0	+126
Railwaymen	9.1	45.6	+144
National Graphical	6.2	57.1	+124
Electricians	3.5	8.3	+ 39
Public employees	1.1	2.9	- 6
Managerial staffs	0.4	2.3	- 19
Bank employees	0.1	1.5	+ 22

These figures have been calculated from 1970 returns to the Registrar.

Who cares about another Christmas?

We do.

Christmas may seem like a tired old ritual with its real meaning totally obscured. Its exploitation may make you sick. But the fact remains it's a celebration. And no matter how *you* celebrate December 25, it's impressive compared to the way some poor souls spend the day.

These children in Bogota, Colombia, for example.

They're part of the army of 10,000 abandoned boys and girls who live on the streets and exist by begging,

stealing and prostitution.

Oxfam is helping build an additional home to receive some of these children. Currently, we also support similar projects in Bombay, Addis Ababa and Saigon.

That way, a few get the chance of basic education, care — and love.

We make no apology for asking you for money this Christmas. We have no intention of trying to spoil your enjoyment of what is, after all, a festival.

We simply ask that you help to make someone else's Christmas happy, too.

To Room, E Oxfam, Banbury Road, Oxford OX2 7DZ.

I enclose £ as my contribution to Oxfam's work.

Concorde

The Benn argument

The Government had to put up with much barracking when the bill giving it powers to advance up to £350m to finance the production of Concorde came up for its second reading on Monday. As happens on these occasions, ministers put down their heads, soldiered on and gave nothing away. The Government would not agree to repeated requests for a select committee to examine the project or for a white paper to explain where it had got to. Nor would it give sales estimates, cost estimates or one titlle of information beyond the public relations handout. Not even when Mr Anthony Wedgwood Benn wickedly trailed the red herring of secret escape clauses in the agreement with France did either Mr Michael Heseltine, who opened the debate, or Mr Cranley Onslow, who closed it, allow themselves to be diverted from the stern duty of stonewalling.

The Government is in the process of trying to see how many Concorde's a major sales drive can sell. The total so far is not encouraging. Putting captive customers like the British Overseas Airways Corporation and Air France to one side, the figure is five, and the customers are Chinese and Iranian, neither forces to be reckoned with in aviation nor ones particularly interested in commercial operations. As Mr Heseltine said, the preliminary £125m loan for production would be used up by March unless more were voted: he could have added that would not look good to potential purchasers.

Mr Benn was presumably hinting, when he said that Labour had negotiated a break clause with the French, at the understanding that both governments have had since 1968 about design

changes. The sort of major re-design that would be needed to produce the big, Mark II Concorde that the airlines are bargaining for comes close to being a new aircraft, and it was agreed that the 1962 treaty did not commit either government to that. Mr Benn did say at one point when he was Minister of Technology that if the cost of the present Concorde were to rise more than 15 per cent above the then estimate for finishing it, this would be considered a re-design. If this was the point at which the break clause operated it would have been helpful if he had said so to the Commons on Monday.

Rates

Howls to come

Mr Heath was not wasting his time when he fired a warning shot over the assembled members of the Association of Municipal Corporations at their centenary banquet on Wednesday. Rates could yet be the rock on which his prices and incomes policy founders. Because of the expansion of education and other local authority services, and the resulting high spending on land and labour, domestic rates in the past two years have been rising more rapidly than personal incomes (although they rose more slowly in the four years before that). This pattern looks like continuing next year, for which local authorities will fix their rates in February and March.

But on top of all this is a big new threat. All properties are about to be revalued for rates. The new figures will be published in the next week or so. This is the first revaluation since 1963 (Mr Richard Crossman farked the one due in 1968).

In theory, Mr Heath is right to say this should present no problem. Values will rise about 150 per cent and rate poundages the councils levy on these values will drop by the same proportion. The problem is that some values will go up by much more than others. This seems fair enough. As the Prime Minister said, the ones which go up most will be the properties whose owners have been paying too little up to now. Unfortunately this is equally true of the rents of those council house tenants who are now having to pay more under the Housing Finance Act. It may be fair, but they are just as furious as if it were not.

Revaluation also causes big shifts in the total rate burden between different authorities, according to which types

of property they each have. The result is that some householders will suffer spectacular increases next spring, for reasons that will be obscure and hard to explain. They will make a lot of noise, as bungalow owners in Bourne-mouth did in 1963. Yet, as Mr Heath reminded everybody, to postpone revaluation means perpetuating the unfairness now existing, with even higher adjustments next time. True. But just wait for the howls.

British Rail

Blueprint for survival

British Rail's proposals for its future are likely to be in the Government's hands early in the new year. Any hope that they will present a glowing picture of huge chunks of traffic being transferred from road to rail can be discounted. What BR has been asked to do is to analyse a host of alternative policies (like the big cut in services in a certain Whitehall paper that was leaked recently, but also including proposals to expand the system). The Government will then scrutinise the BR figures, and issue a green paper in the summer that will set out the cost to the taxpayer of supporting various sizes of rail system, and the contribution they could make to national transport. The green paper is unlikely to contain any recommendations; but it will probably include a preface listing the sorry occasions in the past when governments have tried to subsidise the railways out of their financial problems, and failed.

Typical of the misguided belief that the railways can still have a great future in Britain is a statement made in the current journal of the National Union of Railwaymen that BR is turning freight traffic away. Like any business, BR does not accept all the trade it is offered. Many of the contracts mentioned by the NUR could only have been accepted at vast expense: for example, a one-off consignment of steel from Liverpool, which needed specialist wagons. Modern steel wagons are costly, and BR cannot afford to have surplus capacity lying around on the off-chance that they will occasionally be needed.

BR is sensibly concentrating on the traffic it does well: long-distance trainloads. It has been closing small goods stations, and opening area distribution centres instead; a policy that has paid dividends, literally, for the profitable

Tony, Michael: no help

American railroads. But the important difference is that some of America's local distribution centres cover areas the size of Britain.

How big a disadvantage BR has, compared with those American railroads, is shown in a paper presented on Tuesday to the Railway Conversion League by a transport consultant, Mr Lionel Albert. Rail freight volume in America is 44 times the British level, but the cost per ton-mile is a third of BR's, despite crippling manning rules. However, the average haul is seven times as long, at 500 miles; the average wagon-load three times as great; and the average train-load seven times as great. The taxes paid by American railroads exceed the subsidies paid by the British taxpayer to BR, and two-fifths of BR's freight traffic comes from subsidised industries.

Mr Albert's conclusion is that continental European railways should be converted to single-track, broad gauge lines, capable of carrying freight trains 15 times the present maximum in Britain. Though continental railways at present cripple themselves with all the diseconomies BR suffers from, such as short hauls at the expense of long ones, they should in theory have distance on their side. But in Britain Mr Albert says the railways should be converted to roads. Conversion is cheap, and would ease environmental pressures, particularly from lorries. Passengers could be carried, as in America, by bus on short distances, and by air for faster, long-distance hauls.

Banks

Up they go

Led by NatWest, all the big clearing banks have raised their base lending rate by half a point to 7½ per cent. The tripcord was the further rise in the rates on three-month certificates of deposit and interbank money. This not only gave sharp company treasurers opportunities of arbitraging between bank overdrafts and money market investments, but, more to the point, meant higher costs for the banks on this key marginal money.

Just how important CDs and interbank deposits have become for the banks is described in a special article in the Bank of England's Quarterly Bulletin. Together, they now account for 29 per cent of the banks' total deposit liabilities and 20 per cent of their total assets, compared with 8 per cent of both deposits and assets four years ago. Growth in sterling

CDs has shot up since the reforms of September, 1971, allowed banks to compete directly in the wholesale markets for funds. Initially, CDs were designed to attract the liquid funds of non-bank companies, but by September this year over 60 per cent of all outstanding issues were held not by commercial companies but by other banks, while another 10 per cent were held by the discount houses.

The new rules on credit competition have made interbank deposits and CDs attractive to banks as second-line reserves, because they can be counted as offsets in the calculation of eligible liabilities while yielding a higher return than most first-line reserve assets. The build-up in them has been at the expense of gilts, which now represent only 7 per cent of the banks' total assets (compared with 14 per cent in December, 1968) and traditional liquid assets (Treasury bills, call money and cash) whose proportion has dropped to 11 per cent from 19 per cent.

As the Bank of England is quick to point out, once monetary conditions shift from ease towards squeeze, the banks could feel the pinch very hard and fast through these interbank and CD markets. In most other industrial countries, monetary squeezes have hitherto worked more quickly than in Britain; now we could find that we have joined the league. Another implication is that, once the next squeeze starts, the banks may make a new drive to attract small savers. That could cause them to offend against the authorities' present polite request that they should not compete too harshly with the building societies and trustee savings banks.

The growth of CDs
Outstanding issues by banks

Thalidomide

How £5m equals £11.8m

The latest offer by the Distillers Company to settle 342 thalidomide cases has created a great deal of confusion. The company insists that it is going to bear a cost of £5m, but that the trust fund will be getting £1,185,000 a year for 10 years. The two statements are compatible because the annual payments will be under a deed of covenant and will therefore count as an annual charge which can be deducted from taxable profit. Part of the sum will represent the interest on a notional fund of £5m, reducing every year. Since corporation tax from next year will be 30 per cent, the net cost to Distillers is £1,185,000, less the tax it will not be paying, or just over £500,000 a year and £5m over the decade.

However, under the tax laws income tax has to be deducted from annual payments and handed over to the Inland Revenue. Thus Distillers will pay £300,000 (30 per cent on £1m, assuming the balance is the interest element) over to the authorities and the rest over to the trust fund. Only if the trust fund gets the status of a charity will the trustees be able to reclaim this £300,000 from the tax authorities.

That is why Distillers requires an Act of Parliament. The trouble with charities is that they have to take account of "need," which means that the trustees would have to run a means test on the parents. In order to get the charitable tax status and yet give each child a firm financial entitlement, special help from the Government is needed to set up the charitable trust.

Assuming that this is granted the average entitlement will be around £32,000 per child. This compares with the £12,000-odd per child that 62 of the more serious cases were settled for in 1968. Those who are hoping for further generosity from Distillers—and the company has consistently denied any legal obligation—will, no doubt, point to Distillers' profits. For the half-year to September, net profits were £17m, down from £22m in the comparable period, but are back on an upward trend now the dock and other strikes are in the past. No provision has yet been made in the accounts for any payments which might result from a thalidomide settlement.

Zambia Industrial and Mining Corporation Limited

Confidence in Zambia inspires investment and expansion

The following is an abridgement of the statement for the nine month period ended 31st March 1972 by the Chairman, His Excellency Dr. K. D. Kaunda.

Zambia Industrial and Mining Corporation Limited is an instrument of the national effort to establish a society in which no single person lacks the necessities and comforts of life. This can only be achieved when poverty, ignorance and disease are defeated, and the defeat of these age-old enemies of man can be achieved only by the creation of wealth and distributing it equitably. This, as far as Zambia is concerned, is the main purpose of ZIMCO'S operations.

ZIMCO's central position has been strengthened during the past year by the incorporation into it of the State Finance and Development Corporation (FINDECO), National Transport Corporation and National Hotels Corporation. The importance of the ZIMCO group in the national economy cannot be over-emphasised, and its success can be regarded as good indication of the state of the economy as a whole. It is thus gratifying to report a group profit after taxation of K105,359,000 for the financial period ended 31st March, 1972, and a profit for the period retained of K49,192,000. These figures would have been higher if the prices we received for our copper had not been depressed during the whole period.

The low price of copper, however, has not resulted in a halt to development of either the mining industry or other sectors of the ZIMCO group. Indeed, the past year has seen a massive programme of investment and expansion in mining and the initiation of a number of major industrial projects. This development has been made possible by the confidence which we inspire, not only as ZIMCO but as Zambia, in the commercial world at large. We have thus been able to take advantage of both this reputation, and of the physical assets we control, to raise on the international market the capital required for the expansion of the mining industry and for other projects.

H.E. the President of Zambia
DR. KENNETH D. KAUNDA
Chairman of Zimco.

I believe that there are a number of factors contributing to our solid reputation. One of these is recognition of the fact that our policy of partnership with private and foreign investors is regarded by us as a permanent aspect of the nation's economic life. Indeed, it is being acknowledged that this arrangement is a method of development which balances the relationship between the industrialised countries and those on the threshold of economic progress, and is consequently being employed by an increasing number of nations as a means of harnessing resources and obtaining skills and capital. A further factor contributing to our good name, and to the confidence with

which we are regarded, has been our policy of dealing in a straightforward businesslike manner and of honouring our obligations to the letter. This approach will continue to be a cornerstone of the policy of the ZIMCO family of companies.

Management agreements

At the time of the economic reforms, which contributed so largely to the evolution of ZIMCO, it was necessary to retain the services of existing management structures through the establishment of management agreements for specified periods of time, and I am pleased to be able to say that in most cases these agreements have not only worked very well for the companies concerned, but have also fulfilled a useful national function in making possible a smooth transition from foreign control to Zambian control.

A feature of the coming years will be an increasing localisation and direct recruitment of management so that as a contract expires a company will inherit an intact management structure which will enable it to manage itself. It is, in fact, a feature of many of the contracts that they are expected to make this changeover possible at the time of their termination by

having provided for the necessary training for this to be accomplished. These remarks apply equally to the largest and to the smallest companies in our group.

It is essential for us to remember that the companies of the group are controlled and largely owned by the people of Zambia themselves. This control is exercised by the presence of the people's representatives on the boards of all ZIMCO companies. Companies which belong to the people should be discussed by the people, since this is the main way by which they can be integrated into the pattern of our society. But let us always bear in mind that it is essential for the ZIMCO companies to remain successful in the business sense, because only then can they fulfil the function ascribed to them above, as an instrument in the effort to raise living standards.

There is no doubt that our companies are doing this now, not only through the mining industry which provides some 90 per cent of Zambia's foreign exchange and a substantial part of tax revenue, but also through the manufacturing and service industries which are the main feature of the non-mining part of the group. Were it not, indeed, for the existence of the ZIMCO companies, it is difficult to envisage how the Government would be able to bring the Second National Development Plan anywhere near fulfilment.

In this field the Government relies too on a number of parastatal and Government bodies which are outside the ZIMCO group, and looking to the future, it is possible to see an even more diversified ZIMCO than exists today, since a number of these bodies would, it is believed, function better as companies within the group than as they are now situated. Some such concerns which come immediately to mind are the Zambia Electricity Supply Corporation, the Development Bank, Zambia Airways Corporation, the Zambia National Tourist Bureau, the General Post Office, and Zambia Television. Investigations into the future status of these bodies will be made during the year ahead.

Opportunities for investment

The confidence of foreign investors in our economic and political stability has certainly been a factor in easing us over a difficult period, and I look forward to welcoming even more who will provide capital and expertise in developing our economy through participation in ventures which are to the benefit of the nation. This invitation is extended not only to totally new investors, but also to those who already have funds and skills at work in Zambia: they now know the opportunities available and appreciate our sincerity in giving undertakings and guarantees which they know we will respect.

Zambia's industrial import substitution programme is now well under way, and we are looking forward to broadening our export base. A great many opportunities exist, awaiting only investors to take advantage of them.

Copies of the Chairman's Statement and the Report may be obtained from the London office of Mindeco Limited, Cheapside House, 138 Cheapside, London EC2V 6BL.

The Six decide to put the brakes on their lorries

The Six are likely to agree on Monday to put off any decision on lorry sizes until after the new year, which is a victory for Britain, Ireland and Denmark, who have all been fighting for lower limits than the commission proposed. With most of the Six in favour of them, too, France will be increasingly isolated. The haste with which decisions were being forced through for rules that will not take effect until 1980-85 at the earliest can now give way to a cooler assessment.

That should take into account what the lorries are actually going to look like. The maximum lorry size proposed by Brussels is no longer (59 ft), no wider (8 ft) and rather less tall (13 ft) than Britain's present maximum (there are no height restrictions in Britain). It will be no noisier and no more polluting because new regulations coming in on both these nuisances apply to all vehicles whatever their size. The difference is only perceivable in the weight, a maximum of 39.2 tons against the current 32 tons in Britain, which will have the effect of putting up the freight that a lorry can carry by one-third, thus lowering costs, reducing the number of lorries needed, and so reducing the total of noise and pollution. A technical comparison is made in this week's issue of Motor Transport. There are actually 75,000 fewer lorries on the roads in Britain now than there were in 1965 because their size has gone up.

Britain has never objected to the big lorry as such, but to the big lorry with too few axles, because at some point the weight distribution between individual axles reaches levels where it begins to damage the road. The Six were proposing an upper limit of 10.8 tons per axle, compared with the present 10 tons, and Britain has argued forcefully that this will do £200m

worth of damage to the roads of this country in a year. Since less than 1 per cent of lorries would ever be likely to go in for those sorts of weights, some people think the estimate on the high side, but it serves to emphasise the need for time to reflect because more research is needed on the incomplete science of road stress.

France believes that the stress is proportional to the square of the axle-load, Britain that it is the cube, while Pirelli and Fiat say road stress is decided by tyre pressure and that, with wide tyres and low pressures, higher loads need not increase road stress. Jumbo aircraft undercarriages would seem to bear this out, but the Italian research has not yet been checked in Britain.

It also looks as if only a limited number of even the biggest lorries would ever go to the upper axle limits because most of them need more than four axles, and if they are to keep within the 39-ton weight limit this brings down the load distributed on each axle, as the drawings show. At a rough estimate, only about a sixth of the juggernaut lorries would go to the full limit, and that would not be a sixth of all lorries but a sixth of the 5 per cent in the heavy class.

These monsters have become a symbol for the public's general discontent with traffic conditions and all members of the community need time to cool the argument. That goes for Britain as well as for the Six. We have gained in Brussels a considerable tactical victory. The five had arrived at a compromise on lorries acceptable to themselves; France put in a bid for higher limits and the commission struck its own compromise between the two positions. Britain held out against the compromise more or less single-handed, and the Six have with good grace given way.

UK now: weight 32 tons, length 59ft

It all depends on . . .

EEC proposals (1980): weight 39.4 tons, length 59ft

how many axles . . .

Holland now: weight 47.2 tons, length 59ft

the lorries need

France

Their phase one

Paris

Reactions to the government's week-old anti-inflation measures have been typically French. The man-in-the-street has been buying gold napoleons, as he always does when he thinks there's a crisis—to the tune of Fr6m a day, pushing their price to a record Fr79.80. Large department stores have anticipated the cuts in value-added tax and lowered their prices slightly; but small shopkeepers have not. The trade unions have said that the measures are anti-working class.

The communist trade union organisation, CGT, has renewed its demands for a wage-price link based on an "honest" cost-of-living index. Using its own index, it claims that prices have risen this year by 8.7 per cent, well ahead of the official estimate which is accused of minimising price rises in food, clothing and housing. The unions say that the proposal for a guaranteed increase of 2 per cent in real purchasing power is quite insufficient, and that the proposed threshold agreement clause, which would come into effect when prices rose by more

Soldiering's dirty work

than 4 per cent, is unacceptable because it would be applied only after several months' delay.

Negotiations are now under way on next year's wages for Paris metro workers, who are holding out for increases well above the new norm. Railway workers have already had a strike this autumn, as have bank employees. The postal service has been erratic for weeks because of strikes. There have been long-lasting stoppages at the potash mines in Alsace and at the Berliet truck factory in Lyons. On the day that the finance minister, M. Valéry Giscard d'Estaing, announced his new programme, Paris dustmen began a week-long strike, their first in two years. Dustmen, a large number of whom are immigrants, have a particularly unfavourable contract: they work a 7-day, 54-hour week before they have two days off, and earn less than Fr1,300 (£110) a month, with little job security. After a few days, the government called in the army to clear the mountain of refuse piled on the sidewalks. This mobilisation of soldiers as blacklegging strikebreakers against immigrant strikers has made the unions particularly cross.

Germany

Strike ballot

This winter's wage round in Germany, which is just starting in earnest, looks like being much more inflationary than last year's. Early on Wednesday morning, talks on an 11 per cent claim for 230,000 iron and steel workers collapsed. There will now be a strike ballot next Wednesday and Thursday. The 4m workers in the engineering industry—where most of the wage contracts will be running out at the end

of this month—have also asked for increases in the region of 11 per cent. Their union, IG Metall, carries out negotiations on a regional basis; the first batch started towards the end of this week, with more to come early next week. Last year, after a rash of strikes, the engineers settled for a mere 7 per cent. But that was at a time when a mild recession looked quite on the cards. Now the German economy is expected to grow by 5 per cent next year, and the labour market is tightening. With prices 6½ per cent higher than a year ago, the union will almost certainly hold out for 9-10 per cent, in order to get some real increases for its members.

After some sidelong glances at what the engineering workers were doing, the public service and transport union's energetic chairman, Herr Heinz Kluncker, asked on Monday for increases ranging from 8-14 per cent for his 1.4m members. He wants a flat rate payment (equal to about 5 per cent of the average wage) for all, plus 6 per cent on top; so the average claim is for about 11 per cent. The government is anxious to keep the rise in public spending down, and Herr Kluncker should expect resistance.

Krupp

Big Berthold fires again

Hamburg

Herr Jürgen Krackow had been chairman of the Krupp empire for only 66 days when he was fired last week, in the second management crisis to hit the company in less than a year. Herr Krackow, who came from the Krupp shipyard AG Weser, was the successor to Herr Günter Vogelsang, who last January refused to renew his contract because of differences with Herr Berthold Beitz, chairman of the Krupp supervisory board and of the Krupp Foundation. Herr Beitz remains very much the big Berthold of the Krupp organisation.

The official reason for Herr Krackow's departure was a disagreement over who should succeed to the managing-directorship of the Krupp Hüttenwerke AG. Herr Beitz, Herr Vogelsang and, when he took over, Herr Krackow all favoured the appointment of a board member, Herr Heinz Kriwet, mainly because of his reputation as a highly efficient sales manager. But Herr Kriwet was unpopular with the workers' representa-

tives on the board, who turned him down. Herr Krackow tried to get round this by putting up a man temporarily for the job, hoping to switch to his own choice later. Herr Beitz probably felt Herr Krackow would not get away with this. So he foiled the manoeuvre, whereupon Herr Krackow felt he had to resign.

Herr Beitz has already appointed a successor to Herr Krackow's job: Herr Ernst Wolf Mommsen, at present secretary of state in the economics and finance ministry. Herr Mommsen, who will start his new job on January 1st, is considered a first-class man who will make a success of it, and restore public confidence in Krupp's management. But he is already 62. One of his more pressing tasks will be to find a long-term successor who can tackle Krupp's structural weakness and get it back on a proper growth path. He may also have to find somebody who will stand up to Herr Beitz. In the past seven years Krupp has slid from being the biggest industrial empire in Germany to number 14.

Air fares

Going it alone

The British broke up the party on Wednesday, and some think it the most important thing to have happened in aviation since wings. For close on four years the British Overseas Airways Corporation has been trying to get other airlines to cut fares on the North Atlantic by around two-thirds, bringing them down to those charged by the charter airlines which have been creaming off the traffic. Since the middle of this summer there have been almost continuous sessions of talks in which the other airlines argued why they were not going to go along with the BOAC proposals. In the middle of this week BOAC and British Caledonian walked out of the talks and broke them up. As the airlines have failed to agree, governments have no option but to take over the fixing of fares.

The cement that has held the International Air Transport Association together has been the fear of this alternative; the direct intervention of governments in air fares has been the bogey that has never failed before to whip rebellious airlines back into the Iata paddock. Today, the bogey looks less horrific than the chaos inside Iata; BOAC's move was made not only with the full approval of the Civil Aviation

Authority at home but also, if the truth were known, the active connivance of a number of Iata officials, who have been equally exasperated to see Iata reduced to a state of frustrated impotence by the tactics of a handful of airlines. These formed a caucus that has resisted every attempt to cut fares because they are too small and unimportant, in North Atlantic terms, to get any benefit from the increase in traffic that would follow. To them, a cut in fares would mean a cut in revenue and they are agin it.

The next step will be for Britain to open direct negotiations with the Americans for two new types of fare. One will be a return ticket at around the £60 level, the condition being that it is booked some months in advance. This is roughly comparable with the rates now charged on charter flights and is designed to pull the traffic from them into scheduled aircraft. The other fare would not have a specific figure attached to it at all; airlines would sell wholesale blocks of seats on their scheduled flights to travel agents who would then collect a random group of people to fill them much as a freight consolidator now collects freight in order to take advantage of airlines' bulk rates. What the agent charged would be up to him. There would be nothing to stop the airlines from owning the agency.

The British are confident that the Americans will agree to the package; the head of the United States Civil Aeronautics Board, Mr Secor D. Brown, was sounded out about it when he was in London last week. There are legal difficulties in America about carrying block-booked passengers on scheduled aircraft but the CAB's lawyers are working on them. There could also be difficulties with the American airlines, which have taken a much less liberal view of fares than the British in the past few years, and the compromise proposal that they put forward on Tuesday in a last attempt to avoid a breakdown in the Iata talks was more restrictive than anything BOAC was ready to accept. The only fare cuts they offered, apart from the advance-booking discount, was for journeys of more than 14 days, and cut-price tickets exist for them already. Since fewer than a quarter of passengers ever pay the ordinary economy fare anyway, it is difficult to see why the airlines do not cut fares across the board and save themselves the administrative costs of trying to sort out who qualifies for what discount. But they won't.

Air bags Deflated

The air bag as a safety device for those involved in car accidents is deflated, and may even be irrevocably punctured. A United States federal appeals court has ruled that official standards for dummy testing of air bags are inadequate, and that the bags' mandatory introduction in America, scheduled for August 15, 1975, must be delayed. The motor industry's relief was limitless, but the broad significance of the court's ruling is that it may be impossible ever to have satisfactory dummy tests, because dummies will never be able to duplicate the behaviour of living people in a crash.

American law merely states that car manufacturers must install "passive restraint" systems that are effective at all speeds up to 30 mph. The industry, with one or two exceptions, would prefer a system of seat-belts connected to the car's ignition so that the engine cannot start until the belt is fastened. But mechanically minded drivers can disconnect the belts. Tests with baboons show that an air bag that inflated on impact to form a shock-absorber between driver and dashboard enables them to survive 50 per cent more g. On the other hand, it needs only 0.1 per cent of air bags to be defective to create the risk in America of another 10,000 unnecessary accidents a year, if the bags inflate at the wrong time and incapacitate the driver. Seat-belts are almost as effective

Not really human, are they?

tive in saving life-and-limb at a fraction of the cost. Many people have been trying to explain this to the American Administration, but they could have been speaking to a deaf mute. The judges may have saved a lot of lives.

Nuclear power In Gulf's stream

The Gulf Oil Company should soon have the foothold it wants in West Germany for its high-temperature nuclear power reactors, but everyone involved is adopting pious attitudes about the likely consequences for the alternative German-designed high temperature reactor with a radically different fuel system.

Gulf's foothold will consist of its 45 per cent stake in Hochtemperatur Reaktorbau (HRB) that was formerly owned by Krupp. Although there will be no formal sale until next month, a firm agreement seems to have been reached by Gulf and Brown Boveri (Mannheim), which will retain majority ownership of HRB. HRB should then be in a position to bid for a high temperature reactor order that is likely to be placed during the next year or so by VEW, the large electricity supply company that serves the eastern part of the Ruhr district.

There is just one complication: that German-designed high temperature reactor, called the pebble-bed reactor after its unique fuel system. HRB is already constructing a 300-megawatt prototype at Schmehausen. It will not be completed at least until 1976, so the pebble-bed reactor cannot be offered to VEW this time round. The company would like to start construction long before tests on the prototype will have been completed. By the late 1970s, the pebble-bed reactor should be on the scene; but how is it going to fit into Gulf's world-wide marketing plans? The obvious answer is: not at all. So probably all that Gulf and Brown Boveri will do with the pebble bed is to arrange for its decent burial.

This would be exactly the outcome that Professor Rudolf Schulten, leader of the team that designed the prototype, warned against a few months ago. The nationalistic feelings his warning aroused forced the postponement of the deal with Gulf until after the German elections. But the deal with Gulf is much desired by Brown Boveri, which is aching to sell its first commercial-size reactor in Germany—and by a number of electricity supply companies.

The Quarterly Economic Review Service

published by

The Economist Intelligence Unit

Most of today's major business decisions are made in an international context. This is where the EIU's QUARTERLY ECONOMIC REVIEW SERVICE has an important contribution to make.

Every quarter 70 reviews together cover 150 countries—evaluating growth prospects, pointing out the opportunities, analysing the problems. In short, giving subscribers greater control over their international business environments by means of a continuing service of analysis, interpretation and comment, based on the latest economic indicators.

who would like to see the rise of a strong competitor to Kraftwerk Union, the Siemens-AEG subsidiary that so far has dominated nuclear power sales in Germany.

Gulf, which has sold six high-temperature reactors in America, with options taken on two more, has already made arrangements with a French group for the possible sale and construction of a high-temperature reactor in France. Gulf is also actively promoting its reactor in other countries, notably Britain, despite the fact that Britain possesses considerable high-temperature reactor technology.

Gulf has obviously made impressive progress in the nuclear power field in the past few years, but Gulf executives still have a few worries. All its sales so far really depend on the successful operation of its own 330-megawatt prototype at Fort St Vrainin, Colorado, and this reactor is now running behind schedule. Commercial operation, scheduled for last March, will not happen now until next summer.

Commodity prices

Sweet stories

This could be the right time for commodity speculators to sell sugar. The price has bounded up over the past month from around £70 a ton to £95 on Thursday. Operators have bought on both the immediate and the futures market on fears of a sugar shortage because the Australian crop is likely to be bad and because Russia is believed to be a hungry buyer.

A New York trader has bought 500,000 tons of sugar for March delivery, and the argument goes, no trader would purchase in this quantity for so short a shipment without an ultimate buyer in the wings. Who else could this be but the Russians? Their beet crop last year was bad, and coincided with an equally bad cane crop in Cuba, their main suppliers. There are rumours that Russian production has not been so good this year either, and the fact that Australia recently sold 50,000 tons to the Russians adds some credence to this story. In the light of Australia's own potential shortage the price must have been good.

But there are two alternative explanations for the price rise. The first is that the Russians may have no shortage of sugar at all. They may be very cunning communist speculators; anticipating that their very appearance in the market would drive prices up, they may be buying a little sugar in

order to sell it at a profit next year. The second possibility is that a certain New York trading house may soon be pushing about 500,000 tons of sugar on to a swiftly risen market—before laughing all the way to the bank.

Black coffee

Bogota

The international coffee agreement, the world's most important commodity pact, was broken up in London this week when the 22 coffee producing countries decided to stop negotiating export quotas with their customers and to fix for themselves the amount of coffee they will allow on to the world market. The immediate arrangement is for 11m bags to be made available in the first three months of 1973, or 13 per cent less than buyers had suggested was an adequate supply. This seems certain to keep world prices at the present high levels.

In the long run, the growers' refusal to come to the traditional compromise with buyers will backfire on them. About \$3 billion worth of coffee is sold every year. The African countries that grow the cheaper robusta coffees are unlikely to hold the line with the Latin American growers who have always used the quota system to keep the largest share of the world market for themselves. It will take only a few growers to break their self-imposed quotas and sell off their surplus stocks for the producers' front to collapse. Without consumers in the pact, growers will be powerless to discipline those who sell on the free market. There is already a large black market-trade to dodge export quotas. Coffee has become one of the main "currencies" in east-west barter.

The suspension of the pact is most likely to hurt those countries that have killed it: the big four producers Brazil, Colombia, Angola and the Ivory Coast.

Most vulnerable is Colombia, which has 12 per cent of the world market and earns over half of its foreign exchange currency from coffee sales. A drop of only one American cent a lb in the price of coffee in a year cuts \$8m off Colombia's balance of payments. In the short term, however, Colombia will benefit from the breakdown. It grows only high grade arabica coffees which are seldom grown in Africa and of which Brazil, the largest producer, has very low stocks after harvests that have been ruined by blight and frosts. Most African producers have been trying to increase their share of the world market, and Colombia has been deliberately cutting back its excessive dependence on the coffee bean. But the high prices of the past year have boosted the country's foreign reserves and have caused a financial boom in Bogota. Although the economy is now growing at 7 per cent a year, inflation at 16 per cent is undermining many of the benefits. The Colombian peso is being devalued daily, at an annual rate of 10 per cent. Nevertheless, Colombia's programme of diversification away from coffee has been successful; by granting massive tax concessions and a 15 per cent cash subsidy to exports, it has raised its exports other than coffee and crude oil by 40 per cent compared with last year. The promotion of exports has become the government's main concern. To increase beef sales abroad it has used the usual Latin American device of forbidding meat to be sold on two days a week. This obsession with exports may have been one of the reasons why Colombia spearheaded the attack against the coffee pact, claiming that the coffee price had not kept pace with world inflation or the devaluation of the dollar. But in going for a few extra cents a lb of coffee this year, both Colombia and Brazil are likely to find themselves out of pocket in the future.

Key indicators: world commodity prices

Turkey trot

Christmas would not be Christmas in Britain without someone complaining about turkey supplies and prices. As it happens, supplies are the best ever, 7½m birds, and wholesale prices more or less the same as last year's. Cheers.

Rome's current Sparks fly

Rome

For a year, Rome's city fathers have sat on the request by the municipal utility (Acea) to order a 1,000 megawatt power station from the German company Kraftwerk Union, and the Germans are fed up. At £61m, their bid was £10m lower than that of the nationalised Ansaldo group, even after promising to place at least 55 per cent of the contracts in Italy. Ansaldo kicked up an enormous fuss, claiming that Acea had no right to try to get into the generating business and should be content merely with retailing electricity like Britain's electricity boards. Acea replied that it was charged such exorbitant prices for the current that it bought wholesale from the national electricity authority that it had no option but to start generating its own in order to keep rates to consumers down. This brought the generating authority into the quarrel on Ansaldo's side, threatening legal action for underpayment of bills for current bought, but also suggesting that all would be forgiven and forgotten if Acea dropped its plans to go into the generating business on its own.

To the extent that this is a purely domestic row, the Germans are staying out of it. But they are indicating that they could make things hot for Italian industry abroad if, because of the row, the contract fails to go through. There will be a lot of nuclear business coming up in Europe soon for which a group formed by the Germans, the British, the Belgians and Italy's Agipnucleare will be bidding. Ansaldo is not in the consortium and, because of its lack of nuclear building experience, has little chance of getting much work unless it is. The Germans are now in a mood to blackball Italian entry unless the Italians let the Acea contract go through.

Shipbuilding

A little rosier

One Swedish shipbuilder, Gotaverken, reports it has had 3.5m tons of orders, for 25 ships, in the past two months; enough to keep all of Britain's shipyards busy for over a year. Japan says there has been a sharp revival in orders. In Britain there are rumours of several shipowners nibbling at the bait, with Harland and Wolff—where the Government's hand is behind

investments of £6,000 a worker—well in the running. But the revival is patchy, and the yards sharing in it are mostly the few able to offer fixed price contracts.

Gotaverken has a three-year wage deal and long-term contracts with suppliers. Labour relations have been one of its priorities since the Swedish government rescued it two years ago. A trade unionist was appointed deputy managing director; the piece-rate system has been abandoned; workers have been given certain small executive powers. Welders, who used to be particularly scarce, wore such dark glasses that they almost worked in darkness, but they have now been given—believe it or not—special rose-tinted spectacles. The company also took an aggressive attitude towards a politically motivated strike—where the trend is usually to sweep the real reasons under the carpet. This has started a trend in Sweden towards exposing reds under the bed. Gotaverken, and other Swedish firms involved in labour relations experiments, have found a sudden revival in interest in manufacturing jobs among school-leavers, with the result that some university teachers have found themselves redundant.

Eurotroubles

They shouldn't

Brussels

The strike pickets outside the EEC council of ministers and commission this week claimed that they were defending the first-ever European collective agreement. The strike should never have happened. The Eurocrats are still relatively well off by comparison with their national counterparts, and the gap between the 11.2 per cent demanded by the unions and

the 10.4 per cent offered by the ministers hardly seemed to justify an extreme course of action which went against the grain with many commission staff. What provoked the strike was not the money but the refusal of the French and German governments (under pressure to hold the line against inflation at home) to honour an agreement, concluded last month, on the procedure for revising salaries.

Whatever the strikers do, the meetings planned for next week will go on, including the one to argue about lorry weights. The continuing failure to agree on the import levies payable on New Zealand butter, the refining margin for British sugar producers and the use of imported wheat for making whisky—there will be another meeting on this, too, next week—will only become serious if there is no deal by February 1st when the new members are due to implement the common agricultural policy. With luck, all these questions will now be decided in January, by which time Britain, Denmark and Ireland will be full voting members of the Nine.

On other questions Britain already has the delays it wants. The first tariff cuts on industrial goods do not take place until April 1st. Britain and Denmark have already asked for a postponement of the application of the EEC's rules of origin to trade with the Efta countries, which is likely to be granted. The new members will only participate in the EEC's preferences scheme for industrial imports from all poor countries as from January 1, 1974. What Britain does about the EEC's preferential agreements with various Mediterranean countries remains confused, and will come up again at next week's council meeting. But fitting Britain's large market for Spain and Israel into the EEC has fortunately been put off until 1974.

Not really anyone's martyr

All of these securities having been sold, this announcement appears as a matter of record only.

Auditors' Report

We have audited the Balance Sheet and the results of the Hellenic Industrial Development Bank as at December 31, 1971. The audit was made in conformity to the standards accepted by the Institute of Certified Public Accountants of Greece. We found that accounts as required by existing laws have been kept by the Bank and that the above financial statements agree therewith. We noted that (a) The Bank's participations in Companies, which are shown on the Balance Sheet at cost, are not quoted on the Stock Exchange, excepting shares worth \$1,250,000. However, the aggregate book value of the shares as shown in the Balance Sheets of the respective Companies are not less than the amount shown on the Bank's Balance Sheet. (b) The results include items of past years during which the principle of independent accounting periods had not been fully adopted.

The FTC doesn't like the way Xerox is

New York

Mr Joseph Wilson, the late chairman of the Xerox Corporation, ardent exponent of what his fellow directors called "those high goals and almost unattainable aspirations for Xerox and its people," projector of the image of a corporation striving to do more for humanity than simply make profits, sponsor of the Kenneth Clark "Civilisation" series on American television and the progressive "Sesame Street" children's programme, charmed much of the world, but for all this the Federal Trade Commission has this week rolled out its very big guns to accuse Xerox of "using unfair marketing and patent practices."

The action by the FTC against the alleged monopoly power of the Xerox Corporation was not entirely unexpected. The commission had announced in 1969 that it was looking at the company, and for the past two months rumours of a move by it were rife. What comes as a surprise is the swingeing nature of its attack. If the full FTC recipe for correction were adopted Xerox would become a ghost of what it is today, shorn of its overseas strength (Rank Xerox), forced

entirely to revamp its marketing techniques, and made to share with its competitors its essence, the technical prowess that has kept it at the head of its field.

The action marks the second major assault on an alleged monopoly by the FTC, under its activist chairman, Mr Miles Kirkpatrick. One of the question marks that hangs over the commission's resolve to endure what would inevitably become a fiercely fought court battle is the feeling in Washington that Mr Kirkpatrick is likely to leave the FTC at the beginning of next year and that his replacement, chosen by Mr Nixon, will be someone rather more amenable to industry.

The Rank Xerox-Xerox tie-up is under attack because the FTC sees the relationship as a pact to divide the world market for plain paper copiers into two. Its cure for this Pitt-Bonaparte situation is to hive off Rank Xerox and to allow it to compete with Xerox in North America. As things stand at the moment this is rather like suggesting that someone should stamp on his own foot.

Xerox is likely to fight hard against the request to divorce itself from Rank Xerox, its more-than-50%-owned subsidiary in Britain; there is much that it will do as part of the bargaining for a consent decree before parting with the bit of its organisation that "should continue to enjoy growth rates in revenues and profits substantially higher than those in the United States." In 1971, Rank Xerox chipped in a third of American Xerox's revenues, but 43% of its net income. That is partly because the subsidiary bore none of the \$25m-odd that Xerox lost on computers, and because all the heavy \$100m-a-year research bill is paid by the parent.

The very thought of Rank Xerox having to go it alone without the

Xeroradiography: image-conscious

backing of the Americans sent an understandable frisson down the share price of Rank "A" in London. It fell from £10.88 on Tuesday morning to £10.35 on Thursday. The net profits of the non-Xerox activities of the Rank Organisation in Britain have been on a plateau of between £3m and £4m for years. The great coup of the Rank chairman, Mr John Davis, was that he found the right product to sell when he embroiled Rank in the copier world, and made sure that that product line would include every Xerox improvement that came out of the Xerox labs in North America. He can be in no hurry to move into competition with that product and that research.

However, stretching credibility to the limit, the FTC has got an answer to this: for another of its proposals is that Xerox should share its copier patents with the rest of the world. This surely must have the Xerox lawyers gleefully masticating their pipe stems. The patent principle is, after all, one of the basic ingredients of capitalism—the idea that future profit should motivate groups of men to search for new developments. The

basic patents on the process of Xerography collapsed long ago: what Xerox is protecting is the process embodied in its machines today, the machines with which its competitors must compete.

It is early days to make predictions, but the initial bet here is that if any change takes place in Xerox's operations inside several years, it will be in those areas in which the FTC holds its traditional sway, in making sure that a product is marketed fairly—and that means some adjustment to Xerox's leasing system. For the FTC to push through its whole list of suggested atonement would surely require one of the marathon trials of this century.

Earlier this year Rank made a rather ignominiously unsuccessful bid for Watney Mann, and a successful takeover of Butlin's holiday camps. Both operations looked rather depressing. Xerox moved in to take control of Rank Xerox from Rank in 1969 partly because it was worried about the looseness of the management. Rank, without the Xerox in Rank Xerox, is a share to sell. The legal shenanigans will no doubt take years, but shareholders should prepare to lighten their holdings if Rank "A" improves again.

General Electric

Set for the magic £100m

The British spending spree has certainly done the General Electric Company good. Consumer products were top of the bill in its interim profit figures, and the rescue of its British Domestic Appliances division is almost completed. The only division to add substantial sales, it now accounts for a tenth of total turnover and a fifth of the earnings.

GEC has, again, shown its paces by producing much higher profits—£42.5m before tax against £31.5m—on unchanged turnover; it is well on the way to the widely accepted target of £100m pre-tax for the year. With recovery all round, and domestic and overseas orders picking up, the outlook for 1973, barring labour troubles (which cost GEC, it reckons, what would have been a noticeable rise in volume of sales in the first half), is for a further substantial rise in earnings of around 15%. On that optimistic basis, the prospective p/e for 1973/74 profits is 12 at 158p, and is a buy.

That 19-month Casey history

Washington, DC

Mr William J. Casey, a brilliant, impatient, decisive man, will leave behind an impressive record when he gives up the chairmanship of the Securities and Exchange Commission, in January, to become Under-Secretary of State for Economic Affairs. While much remains to be done, Mr Casey, in a short tenure of 19 months, has at least started America's commission and the securities industry on the path to solving its biggest problem: how to turn the several fragmented equity markets into one centralised whole.

The electronic information systems on which the new market must be based—one system showing all bids and offers, wherever made and another showing all actual transactions, wherever executed—are to be under the control of a new, independent corporation, not under the New York Stock Exchange or any other existing entity. New rules have been brought into effect to deal with the weak capital underpinnings of brokerage houses, which led so many of them into failure in the market downturn of 1969-70. They place significant restrictions on the proportion of a broker's underlying capital that may be invested in risky equities.

Final details of the new rules for membership of stock exchanges remain to be worked out. On this issue, Mr Casey has clearly bowed to the wishes of the men who hold the power at the NYSE; brokers who transact appreciable amounts of business for affiliated mutual funds, insurance companies, and the like will not be permitted as

Impatient gamekeeper

members. There are tough new policies governing disclosure of information about corporations that issue stock. Prospectuses have been made more understandable to the layman; charts are now required to illustrate future dilutions of equity. Mr Casey wants profits forecasts. He has tried to give the ordinary investor access to corporate information that has been available only to financial institutions or other major investors. He has tried, in fact, to close some of the special avenues of information for large investors by which he himself became a multimillionaire before entering the government. Some people commented that his appointment to the SEC paralleled that of Mr Joseph P. Kennedy, who was a poacher turned into a gamekeeper by President Roosevelt in 1933. The comparison is wry—but high praise, and mainly deserved.

Property in Europe

Triumph for Charlie

One of Belgium's most colourful property developers, M. Charles de Pauw, known to everyone as Charlie, has decided to get some of that much vaunted British financial expertise. He is popping some of his developments, with a value of £20m less mortgages of £11m, into a company jointly owned with Triumph Investment Trust, the British fringe bank. Triumph will then merge the joint company into an existing quoted Belgian vehicle, Ecuyer, which it controls—and dispose of some of the shares to the Imperial Chemical Industries' pension fund.

The ICI pension fund acted as fairy

godmother to the deal; Triumph is already involved in European property with it. Eventually, M. de Pauw will own just over half of Ecuyer, and Triumph and the pension fund together about a third. The balance will be held by the public, though the market will inevitably be a very narrow one.

Since M. de Pauw is an accomplished developer—he has a finger in most of the big buildings that have transformed the skyline of Brussels, and was once accused of almost turning the city into a giant parking lot—he did not come here seeking property expertise from any of the dozens of British property companies. He has just sought a framework for himself to create a Belgian property company on British lines, with access to the funds that will allow the company to hang on to the completed buildings. M. de Pauw is not loved by the Belgian finan-

NEW PENSIONS LEGISLATION...

Call in the experts NOW

GRE are one of the largest Life Offices in the UK. We set a lead in the introduction of new pension policies to meet the changes required by the 1970 Finance Act. We are ready to meet the challenge of the new Social Security Bill. We can give you the highly expert advice that you must have in deciding what to do for your employees. Let us help you -- now.

- Flexible contracts second to none.
- Protection against inflation.
- Managed Fund where an equity investment service is needed.
- Highly qualified pensions consultants located throughout the UK.

cial establishment. Triumph will be paying him £4½m in cash and another £4½m in shares for the three Brussels properties he is contributing. These are the Westbury building (all 24 floors of it), the Industrie building, and part of the first world trade centre building—plus the site for the third tower of that ambitious de Pauw world trade centre, about which there is still scepticism from agents. But M. de Pauw has confounded sceptics before.

The deal looks a good one for Triumph, but shareholders must hope they will get more detailed information about it. The initial yield from the £20m worth of properties is 7½%. According to a report by Jones, Lang, Wootton, the firm of estate agents, good quality buildings are going for initial yields of 4½% in Britain. Triumph seems to be making good use of its recent £12m rights issue, but the weight of that issue has kept its share price down. Although there has been a dramatic leap to pre-tax profits of £2.6m, from £1.5m for the first half of the year, Triumph's share price is languishing at 118p, against a high for the year of 150p. This is despite the recent rally which has brought merchant bank shares up one-quarter in the past 10 weeks. Last year Triumph took some unrealised investment profits into the profit and loss account; but, with such good results, the market will soon overcome the scepticism this caused.

Gilts

Kinky curves for a new broker

Mr Thomas Gore Browne, who was this week appointed to succeed Sir Peter Daniell as government broker next February, has had plenty of experience of the gilt-edged market. He joined Mullens in 1948—the year that began with an issue of 3% Transport Stock. He takes over with the yield on long-term gilts above 9½%, under orders to try to sell enough gilts to restrain to about 10% the annual growth in money supply (the broader, or M3, version slowed to an annual 17% growth in the September quarter), but with the difficulty that nobody wants to buy gilts when inflationary pressures are generating the belief that their price will soon fall, which is just when sales are most needed.

The Bank of England's best tactics for flogging gilts on a falling market would be to suggest that it may

Gore Browne needs something to sell

be a rising one, and the moderate rally in gilts in the early part of this week was in fact helped by the rather unworried tone of the Bank of England's Quarterly Bulletin. It rightly suggested that the Government's budget deficit is probably going to turn out much smaller than the £2.9 billion anticipated at budget time. In the first half of the financial year it amounted to £960m, and the December quarter would now have to show an "unprecedentedly large" borrowing requirement before we start paying most of our taxes after January 1st for the £2.9 billion to be reached. This should ease the broker's problems, and might help gilts to rise.

Those who expect higher long-term interest rates back their argument by pointing to the flatness of the yield curve. It is flat compared with 1971, but then international interest rates at the short-end were falling and the authorities were pushing out a lot of long-term debt. This situation has now reversed. Anyway, as another article in the Bank's bulletin argues, traditional yield curves—pencil lines to show the best statistical fit between about 40 dots, each of which represents the yield on one of the 40-odd regular gilts on offer—are unsophisticated and misleadingly smooth. They assume implicitly that investors have expectations about the course of interest rates for the whole life of all gilts; whereas in the actual market the time horizon of gilt traders is probably between about one and three years. Even more important, the market is segmented into groups, each of which tends to deal in a range of maturities. Insurance companies, which like to match long liabilities with long assets, tend to be in the longer end; discount houses up to five or seven years. Thus the curve is not likely to be a smooth

one at all, but a snaky, kinky one.

The economists at the Bank of England have now drawn—and backed with a new theory expressed in mathematical equations—a beautifully kinky "par yield" curve which shows the yields of a hypothetical series of stocks of every maturity if they were all issued at par. This avoids a distortion that besets traditional curves plotted from actual yields: lower coupon stocks offer investors a different mix of total return between capital gain (tax free) and income and are thus left out in the cold by the yield line. The Bank's new theory of market behaviour to explain the shape of the line is that, within each market segment, the difference in yields is a result of an attempt to achieve an equilibrium in total return of income and capital. The longer the maturity the greater the capital loss if interest rates are thought to be rising (thus the curve slopes upward)—and, as quite a separate factor, the greater the risk of loss. The par yield curve, says the bulletin, should assist the Bank "in judging the appropriate terms for new government issues." Lucky Mr Gore Browne to have such sophisticated help. But he would be helped even more if he could be given as a christening present some new wares that were actually peddable when interest rates are thought to be rising—ie, if the Government would only abandon its shibboleth of borrowing only on fixed-interest stock.

Process engineering

Too simple, Simon

Davy Ashmore wants nothing to do with the bid from Simon Engineering. It sees no industrial logic in a merger. There might have been some sense in one when the now defunct Industrial Reorganisation Corporation first suggested it in 1969. But the shake-up in the company following the disastrous Conoco refinery contract (which put Simon off at the time) and the virtual clean sweep of top management have left Davy Ashmore a very different animal.

From being predominantly involved in fabrication, DA is now mainly a process engineering designer and contractor in a highly developed and competitive international market. Its process design subsidiary, Power Gas, is now comparable in size with any of its world rivals, like Lummus or Kellogg, and has as wide a range of processes to offer. In fact, DA claims

that its spread—from steelworks to synthetic fibre plants—is wider than anyone else's.

DA is still looking for new partners, but sees little advantage in Simon Engineering, still basically a manufacturer involved in medium-scale engineering. The market reacted to the bid, worth £17m, by raising DA's share price to 81p, but probably for the wrong reason. It thought that the conservative Simon management had missed the boat by a few months, and that a higher bid would be forthcoming.

SECTOR ANALYSIS

Brewers frothing over?

The brewers have never had it so good. Profits up an average 20% is the lily, share prices up around 35% this year is the gilt, and Lord Erroll is Tinkerbell scattering magic dust upon them all.

To the surprise of the drinker, price rises account for only a third of the growth in profits in 1972. Between 1966 and 1969, the trade—then far more dependent upon beer sales alone—suffered from price controls on beer with which Mrs Barbara Castle once sought to cheer a Labour party conference, and profit growth was held down to a measly 5% a year. Then the restrictions were lifted, and price increases accounted for nearly all the profit growth in 1970 and 1971. But this year the hard thinking that was forced upon the brewers by price controls has begun to pay off. A better sales mix, expansion into catering, more aggressive retailing and worse beer are reaping their rich rewards.

The question is whether this harvest will continue or whether the larger

brewers will find themselves in the same position as the big food manufacturers: too big to grow much. Bass Charrington, with a whopping 27% increase in profits to £50m, feels that the swing towards lighter beers and food (where margins are higher) will go further. There has been a class movement from the public to the saloon bar (where, again, margins are higher) and the brewers have exploited this by tarding up pubs and laying on food. The Erroll committee's favourable conclusion on licensed premises for the whole drinking family will be a big boost to pub-cafes. It also told magistrates to grant licences more liberally.

The British excise duty on beer is much higher than the average in the EEC—brokers Sheppards and Chase work it out at over six times as much on standard beer—and if Mr Barber is looking for popular, price-reducing, harmonising-with-Europe tax cuts in April a chop in the duty seems an obvious candidate. Lower excise duties would help sales of wines and spirits, for which demand is more elastic than for beer.

One cautionary factor is that the rise in brewery share prices in 1972 owed a lot to the spate of takeover activity. This is now over except for a resolution of Allied Breweries' 26% holding in Trust Houses Forte. In the EEC beer consumption is generally lower than in Britain, and British brewers' expansion there will have to be largely by acquisition; the continentals do not like the draught beer which is 70% of British output. But such acquisitions have not so far been crowned with success. At home future growth from beer price increases is likely to be less significant to profits, and so further rationalisation and diversification is the name of the game.

Bass Charrington seems particularly well placed to benefit. It has been rationalising hard since the merger in 1968, closing down depots and discontinuing more than a hundred brands of beer. The new Runcorn complex should be fully operational by early 1974, and this should help to cut some of the beer wastage; a 1% volume saving is worth about £600,000 a year in turnover to Bass. With 18% of its beer profits coming from lager sales and about 22% from wines and spirits, there is still plenty of scope to trade up. Meanwhile, its deal with Esso motels should be a good launching platform for Europe. At a price of 180p on a prospective p/e of 14.6 Bass Charrington's shares are not too expensive.

The same cannot be said for Whitbread. Its rationalisation is proceeding less fast, and its lower margins mean that it is more dependent on price increases, now most unlikely. This is recognised by the company's cautious statement about prospects in the second half of this year, after the 20% increase at the pre-tax level in the first half to £15m. A p/e of about 16 at 105p is not behind events.

Many of the smaller companies will probably fall from favour as takeover speculation drops. But two are still attractive. J. A. Devenish operates in the west country and should benefit from the Erroll recommendation allowing holidaymakers—kids and all—into the pubs. A historic p/e of 18 at 870p is not too expensive; but the market is small and a better price will probably emerge when takeover hopes recede. Stock exchange permission is needed to buy shares in Fuller, Smith and Turner, also a tight market. The p/e is about 24 at 750p, but with assets in excess of £30 per share they are worth buying if you can get them.

TENDER

UNITED REPUBLIC
OF CAMEROON

Notice of Shortlisting

A call for tender for the construction of a new airport at Douala will shortly be issued. The building consists of:

- 1 parking level (level 0.00m) of 8,200 m²;
- 1 ground floor (level 4.59m) of 7,300 m²;
- 1 first floor (level 9.18m) of 3,700 m²;
- Boarding jetties and rooms (level 4.59m) of 4,400 m².

Companies interested in this call for tender should apply (in French if possible) for shortlisting, together with financial and technical references, by 30 December 1972 to:

M. le Représentant de l'ASECNA
BP 4063
Douala
Cameroon

Work should start at the beginning of 1973.

CONTRACT AND TENDERS

INVITATION TO BID IIZ.19

TÜRKİYE ELEKTRİK KURUMU

Ankara — Turkey

Will accept Bids before 23.1.1973 for 360.000 pcs. insulators for high voltage transmission projects. Financing contemplated by International Bank for Reconstruction and Development.

Bid documents available from TEK Şebekeler Dairesi Başkanlığı Necatibey Cad. No 3-5 Sıhhiye-Ankara-TURKEY from the date of 23.12.1972.

APPOINTMENTS

The Royal Institute of International Affairs
(Chatham House)

Research Specialists in International Economics

Applications are invited from economists with particular interests in European affairs for the post of Research Specialist in International Economics. The person appointed will be expected to contribute to the Institute's programme of studies on the internal and external affairs of the enlarged European Community, and to conduct economic research of his own in this field. The appointment, for a period of 3-5 years, will be made on a salary scale corresponding to that of university lecturer in the medium range, up to £3,400 per annum, but the ceiling is subject to negotiation. Appropriate provision will be made for superannuation. Further details may be obtained from the Administrative Director, 10 St James's Square, London, SW1Y 4LE.

CHAIRMAN'S STATEMENT

Enormous potential in Common Market Year

Mr. Eric Sosnow, Chairman of United City Merchants reports another year of record results.

The potential for expansion in the field of international trade is enormous.

The entry of Britain into the Common Market and the rapprochement between East and West, including China, open up new vistas.

The Group intends to take full advantage of these possibilities both by expanding its existing activities and by making suitable acquisitions.

Profits for the year 22% up amounted to £1,043,000. This was achieved by internal growth and without acquisitions.

Earnings per share up from 3.92p to 4.79p.

Dividend: The final dividend of 8% makes a total of 16% for the year; but for the Treasury ruling on dividend standstill the total would have been 22%.

Banking arm formed: A new company United City Merchants (Investments) Limited has been formed as the Group's banking arm.

Ancillary services: Shipping, forwarding, insurance, and transport have been expanded on a more sophisticated basis in a new company British & International Commercial Services Ltd.

£M Group Profit before Taxation

Earnings per Ordinary Share of 10p

APPOINTMENTS

University of
Bristol

Research Assistant
in Economics

The Department of Economics invites applications for an Assistantship in research in ocean shipping conducted by Professor E. Bennathan. Candidates should be graduates with training in economics and/or statistics and preferably experienced in simple computer programming and computer use. The position is vacant from 1st January, 1973. Salary within the scales £1350-£1476-£1599-£1722 or £1764-£1923-£2079 according to qualifications. Further particulars may be obtained from the Registrar, University Senate House, Bristol BS8 1TH, to whom applications should be sent by 5th January, 1973. (Please quote reference EB).

The University of
Manchester

Chair of Economic
History

Applications are invited for the Chair of Economic History which will become vacant on October 1, 1973, upon the retirement of Professor T. S. Willan. The salary will be within the normal professorial range with F.S.S.U. benefits. Applications (one copy suitable for photocopying), giving full details of qualifications and experience and the names and addresses of three persons to whom reference may be made, should be sent to the Registrar, The University, Manchester, M13 9PL, and received by him not later than January 26, 1973. Particulars of the appointment may be obtained on request from the Registrar. Please quote ref: 189/72/E.

University of
New England

ARMIDALE,
NEW SOUTH WALES
Research Fellow/Junior
Research Fellow in
Agricultural Economics
and Economic Statistics

Applications are invited to join a four man research team developing an aggressive programming model of Australian agriculture. The model is to be used for policy experimentation and evaluation. Applicants should be qualified in one or more of the areas of quantitative economics, operations research, mathematical programming, econometrics, economic planning or agricultural economics. Applicants for the position of Research Fellow should hold a Ph.D. or have equivalent qualification. Applicants for the position of Junior Research Fellow would be expected to work towards a higher degree and preferably to have had some research experience. Assuming satisfactory service, the appointments will be for three years.

Salary: Junior Research Fellow \$A4,200 range \$A5,400. Research Fellow \$A6,801 range \$A9,390. Assistance will be given towards fares and removal expenses. Further information can be obtained from the Association of Commonwealth Universities (Appts), 36 Gordon Square, London WC1H 0PF. (Tel.: 01-387 8572). Applications close on 26 January 1973.

Portsmouth
Polytechnic

Department of Economics
and Economic History

Applications are invited for the post of Lecturer Grade I or Grade II in Economics.

Candidates must be well qualified, preference being given to those having qualifications in mathematical economics and/or econometrics. Assistance will be required in the teaching of quantitative methods for economists and economics mainly at degree level. Candidates should state their special interest in economics.

The vacancy will occur by the end of February but an alternative starting date can be arranged.

Salary scale: Lecturer Grade I £1,500 to £2,687 per annum. Lecturer Grade II £2,355 to £3,083 per annum.

Application forms and further particulars may be obtained from the Staff Officer, Portsmouth Polytechnic, Ravelin House, Alexandra Road, Portsmouth PO1 2QQ, to whom completed applications should be returned by January 8, 1973, quoting Ref. G17.

COMPANY STATEMENT

THE METROPOLITAN TRUST
COMPANY, LIMITED

The Seventy-fifth Annual General Meeting of The Metropolitan Trust Company, Limited was held on 12th December in London. Mr. David M. C. Donald, W.S., F.C.I.S. (the Chairman), presiding. The following is an extract from the Report of the Directors for the year ended 30th September, 1972, which has been circulated to Shareholders:

Gross Revenue for the year ended 30th September, 1972, which is some £15,000 down on the previous year, suffered from the deferment of dividends for tax reasons by a large number of U.K. companies. The amount of franked investment income deferred in this way was over £50,000 and represents 0.18 pence per Ordinary share.

As a result of lower tax and interest charges earnings available for the Ordinary shares are slightly higher and a final dividend of 2.875 pence making a total of 4.125 pence for the year is now recommended. This compares with a dividend of 4 pence per share last year.

Over the year the U.K. and U.S.A. stock markets, in which this company is predominantly invested, showed modest advances. The F.T.-Actuaries All-Share Index rose 10 per cent and the Dow Jones Industrial Index, adjusted for changes in the exchange rate and dollar premium, improved by 7 per cent. The total net assets of the company at 30th September, 1972, amount to £54,282,473, an increase of 14.9 per cent over the previous year, and the net asset value of each Ordinary share is 179.2 pence.

In the current year we are faced in this country with a completely new system of taxation, the problems of entry into the European Economic Community, and the consequences of the standstill imposed by the Government on prices, rents, wages and dividends. In America the problems are mainly concerned with the future of price controls and the fear of increased taxes. In both countries, however, trade and industry are at the moment enjoying increasing prosperity and while the uncertainties outlined above make forecasting imprudent, it should not be assumed that their impact will be entirely disadvantageous.

Lord Latymer's retirement from the Board after 24 years as Chairman was accepted with regret and he is greatly missed by both Directors and staff.

COMPANY STATEMENT

KENNING
MOTOR GROUP LTD

Distributors and Retailers of Cars, Commercial Vehicles, Petroleum Products, Tyres and Parts. University of Glasgow

Lectureship in Economic History

Applications are invited for a Lectureship in Economic History, tenable from October, 1973. Applicants should have an interest in the economic history of China and Japan, although other fields of study are not excluded.

The salary will be within the range £1764 to £2556 per annum of the Lecturers' scale of £1765 to £4145 per annum. Placement will be according to qualifications and experience. F.S.S.U.

Applications (eight copies) should be lodged, not later than 15th January, 1973, with the undersigned, from whom further particulars may be obtained. In reply please quote Ref. No 32397.

ROBT. T. HUTCHESON,
Secretary of the
University Court.

Thames Polytechnic

Lecturer in Economics

Applications are invited from honours graduates to commence as soon as possible. Industrial/research experience and competence in quantitative methods will be a strong recommendation.

The post is Lecturer Grade II but applicants with insufficient relevant experience can be considered for appointment at Grade I initially.

Salary: Lecturer Grade II £2355-£3083 + £118 London allowance. Lecturer Grade I £1500-£2525 + £118 London allowance.

Application forms and further particulars can be obtained from the Secretary, Thames Polytechnic, Wellington Street, London, SE18 6PF to be returned by 5 January 1973.

The University of Manchester Institute of Science and Technology

DEPARTMENT OF MANAGEMENT SCIENCES

The U.M.I.S.T. Department of Management Sciences is one of the oldest and largest centres of Management education in the United Kingdom, embracing a substantial research school engaged upon a variety of industry sponsored research projects.

SPECIAL RESEARCH ASSISTANT (REF. M5/219/AD)

Applications are invited from suitably qualified mature graduates in Marketing Science, Economics, Statistics and Operational Research, preferably with some research experience, for appointment as the Research Assistant to Professor Roland Smith, Carrington Vivella, Professor of Marketing and Chairman of the Management Sciences Department.

The successful candidate will be required to work closely with Professor Smith on a variety of projects and will also be expected to pursue his own research interests for submission to a higher degree.

The appointment will be for three years at a salary of £1,326 per annum rising to £1,392 after one year. F.S.S.U.

Requests for application forms quoting Reference number, should be made to the Registrar, The University of Manchester Institute of Science and Technology, Sackville Street, Manchester, M60 1QD, to whom completed forms should be returned by 8th January, 1973.

Monash University MELBOURNE, AUSTRALIA DEPARTMENT OF ECONOMICS Lecturers and Senior Lecturers

Applications are invited for appointment in the Department of Economics. Courses are offered to undergraduate students taking a first degree at the pass and honours level and to graduate students taking the Master's degree by course work. In addition, candidates writing theses are supervised for the degrees of Master of Economics and Doctor of Philosophy.

Applicants may be interested in any aspect of economics including macro and micro-economics, monetary and industrial economics, urban economics, public finance, comparative economic systems and welfare economics.

Salary: Senior Lecturer: \$A9,644-\$A11,234 per annum. Lecturer: \$A6,801-\$A9,390 per annum with superannuation based on an endowment assurance scheme, the employee and employer contributing 5 per cent and 10 per cent respectively.

Benefits: Travelling expenses for appointee and family; removal allowance, repatriation after three years' appointment if desired; temporary housing for an initial period. Study leave entitlement accumulates at the rate of one month's leave for each six month's service up to six years, with provision for financial assistance.

Further general information and details of application procedure are available from the Secretary-General, Association of Commonwealth Universities (Apu), 38 Gordon Square, London WC1H 0PF. (Tel.: 01-387 8572).

Closing Date: 12 February 1973. The University reserves the right to make no appointment or to appoint by invitation.

APPOINTMENTS

University of Oxford ST ANTONY'S COLLEGE

Research Fellowships

If suitable candidates present themselves, the College proposes to elect to one or more Research Fellowships, tenable for up to two years. Applications are invited from men and women with successful postgraduate or other relevant (not necessarily academic) experience, who wish to engage in a clearly defined piece of research or writing, in any of the subjects in which the College is active.

Studentships

Applications are invited from men and women graduates, and from undergraduates in their final year, who wish to work for higher degrees in nineteenth and twentieth century history and in social studies. The College is ready to consider candidates whose first degree is in another discipline (e.g. languages, literature, geography), and who now wish to undertake historical, social, political or economic studies. The College has a particular interest in the following areas: Europe, Russia, the Middle East, the Far East, Latin America and Africa.

The College may also admit a few students in the history and sociology of literature, in the history of science, of philosophy, of art and of music, in the social anthropology of complex societies, particularly in Southern and South-Eastern Europe, and in other subjects relevant to an understanding of modern society.

Further particulars and application forms may be obtained from the College Secretary, St Antony's College, Oxford. The closing date for applications is 1st January, 1973.

Paisley College of Technology

DEPARTMENT OF SOCIAL STUDIES

Lecturer in Economics

Applications are invited for the above post within a rapidly expanding Department.

Salary £1,608-£3,636 with placing according to qualifications and experience.

Further particulars and application forms from The Establishment Section, Paisley College of Technology, High Street, Paisley PA1 2BE, Renfrewshire (Tel. 041887 1241). Closing date January 3rd 1973.

Transportation Planning

European consultants require immediately traffic engineers for a three month assignment in Paris starting January 1st 1973.

Applicants should have a working knowledge of French and a minimum of one year's postgraduate experience.

Generous salary and expenses allowance. Please write or phone:

M. Counas,
OTH,
Division Aménagement
OTAM,
16 Rue Jules Cesar,
75 012 Paris,
France.
Tel: Paris 344 24 22.

University of London

School Examinations Department General Certificate of Education Economics Geography

Applications are invited for the post of Subject Officer for a group of subjects including Geography and Economics.

Applicants should have a degree in Geography and/or Economics. Teaching or administrative experience and an interest in multiple-choice objective tests are desirable.

The Subject Officer will be responsible to the Assistant Secretary for the administration and co-ordination of the GCE Examinations in the relevant subjects and will be expected to contribute to the development of the examinations.

The School Examinations Department conducts the GCE Examination of the University for approximately 350,000 candidates annually at over 3,000 home and overseas centres.

Initial salary, according to qualifications and experience, will be on the scale £2238 x £159 to £3510 plus £162 London Allowance. There are prospects of promotion to the scale £3192 to £4299. Membership of FSSU; 6 weeks' leave.

Further particulars and application forms are available from Michael Root Personnel Officer, University of London, Senate House, WC1E 7HU. (E83).

Closing date for applications is 22 December 1972.

DIVIDEND NOTICE

SOLVAY & CIE

The Company declares an Interim Dividend of B.Fcs. 55.00 Net of Belgian Tax payable on 19th December, 1972, on its 'A' Shares.

Coupon No. 9 may be presented for payment at the Offices of J. Henry Schroder Wagg & Co. Limited, 120 Cheapside, London, E.C.2. between the hours of 10 a.m. and 2 p.m. (Saturdays excepted) on or after Tuesday, 19th December, 1972. Payment will be made by Belgian Franc Draft, by transfer to a B.Fc. Account or in Sterling at Bankers sight buying rate for B.Fcs. on day of presentation at the option of the holder.

U.K. Tax at the standard rate will be deducted from the net dividend unless lodgements are accompanied by the necessary Affidavits.

Payment can only be made to persons residing outside the Belgo-Luxembourg Customs Union.

LONDON: 12 December, 1972.

Econometrician For Barclays Bank

Our Treasurer's Office has an immediate opening for an Econometrician.

Candidates should be aged up to 27 with one year's practical experience and preference will be given to those with a post-graduate qualification and an existing interest in the financial sector.

This opening is in an established section of the bank and offers unusual scope for initiative. The work, which is frequently technically sophisticated includes forecasting, research into both fundamental areas and management problems, and the application of results to day-to-day operations.

The successful candidate will be encouraged to develop his own ideas and to contribute to the existing commitments of the section. He will have to be able to communicate his ideas at a high level.

The salary is attractive and progressive, and fringe benefits include a low interest rate housing loan and a non-contributory pension.

Apply, giving details of age and previous experience, to:

The Manager (Graduate Recruitment),
Barclays Bank Limited,
Staff Department,
54 Lombard Street,
London, EC3P 3AH.

BARCLAYS

Economist

Experienced Economist required to join a small team within the Corporate Planning Department of the British Railways Board located in London. The work involves economic forecasting as a basis for planning, evaluation of business plans and provision of general economic advice.

Candidates should possess a good Honours Degree in Economics, be numerate and have practical experience in economic forecasting and analysis. Knowledge of Transport would be an advantage.

Commencing salary will be within the range £3,540 to £4,190, plus £70 London Allowance a year.

There is a contributory pension scheme and the transfer of existing pension rights can be accepted. There are also free and reduced-rate rail travel facilities.

Applications giving age, education, qualifications, experience and present salary should be sent to: Headquarters Staff & Services Manager, British Railways Board Headquarters, 222 Marylebone Road, London NW1 6JJ, quoting reference RB.170.

How good is your judgment?

The success of any responsible person in business or industry depends on the confidence others have in his judgment.

Which in turn depends to a large extent upon how reliably he keeps himself informed about what is going on in the world.

Most people with responsible positions in life turn to The Economist each week for a balanced and authoritative interpretation of events as well as for the facts.

If you haven't been reading The Economist regularly you will be surprised by the width and depth of its coverage of everything from international affairs and their effect on business to the whole business of living in general.

FELLOWSHIP

University College Cardiff

DEPARTMENT OF ECONOMICS
MANPOWER RESEARCH UNIT

Research Fellow/
Assistant

Applications are invited for Two
Posts:—One Research Fellow,
One Research Assistant to join
a team investigating the cost/
benefit analysis of Industrial
Training. Applicants should pre-
ferably have a first degree in
Economics though other disci-
plines will be considered. Some
industrial experience would be
an advantage. Salary compar-
able with other University Posts
and dependent upon age and
qualifications.

Applications, including the
names of two referees together
with full details of background
experience, should reach the
Registrar, University College,
P.O. Box 78, Cardiff CF1 1XL,
not later than January 1st
1973. Please quote: 0763.

FELLOWSHIPS

S British Steel Corporation

Fellowships

During 1973 the British Steel Corporation is
offering a number of Fellowships at Universities
and other educational institutions for work in
any field of interest common to the Corporation,
the Fellow and the institution.

Applicants for Fellowships must be nominated
by Heads of Departments, and be capable of
formulating and carrying out their own research
projects without direct supervision.

The maximum basic award will be at the rate of
£5,000 per annum and, in addition, certain
other expenses will be paid. In determining the
amount of the award, account will be taken of
the applicant's existing remuneration.

Awards will be made in the first instance for one
year, or for a shorter period if requested by the
applicant. Awards may be extended for a further
period of up to one year at the nominator's
request, if the Corporation agrees.

*It is not intended that Fellowships should give
financial support to those reading for Degrees or
further Degrees.*

Closing date for application —
28th February, 1973.

*Further particulars and application forms can be
obtained from:—*

Mr. E. V. Dicker
Fellowships Secretary,
British Steel Corporation,
33 Grosvenor Place,
LONDON, S.W.1.

*Extract from the statement made by the Chairman, Mr P.W. McGrath
at the Annual General Meeting of The Irish Glass Bottle Co. Ltd., on Wed. Dec. 13th. 1972*

Accounts

Shareholders will be pleased to
note that the Company's results
for the year which, excluding
profits of Associated Companies,
amount to £510,765, are back to
the level of the year ended
30th June, 1970.
While this result is very
satisfactory indeed, in real
money terms the profits of your
Company have still not recovered
to previous values as over the
two-year period, due to inflation,
the value of the pound has
reduced. Nevertheless, in the
circumstances, we must be
reasonably satisfied.
Probably the most encouraging
feature of the Accounts has been
the profits earned by our two
Associated Companies which I
will deal with later on in my
Report. In particular I refer to the
turn-around in the fortunes of
Irish Plastic Packaging Limited
which has, for the first time in
recent years, contributed to the

Group's profitability, bringing
the total profit applicable to your
Group to £529,829 before
taxation.

In view of the improvement in
the results for the year your
Board is now recommending a
Final Dividend of 10% which
with the Interim Dividend will
amount to a total of 18% for the
full year thus restoring the
Dividend to the level it had
reached prior to the enforced
cut in Dividend which we had to
effect last year.

While we have every reason to
be pleased with the upward
trend, your Board cannot be
satisfied with the still
considerably reduced margins
of profit existing in the industry.
This year's profits were attained
on sales considerably above last
year's and far greater again when
compared with 1970. As stressed
in my statement last year, static
profits in an economy where
the value of the pound is

reducing are not a healthy sign
either for individual concerns
or the community as a whole.

Development Programme

Due to the improvement in the
level of profits and also to the
fact that the market shows an
increasing demand for glass
containers, your Board has now
decided to proceed with the next
stage of our development
programme which we suspended
last year. These developments
will include installation of bulk
storage facilities and possibly
a third major production unit.
We also intend transferring the
administrative and other facilities
from Ringsend to Pigeon House
Road. The total cost of these
developments will be
considerable and when
completed practically all the
productive capacity of your
Company and all its
administrative and ancillary

facilities will be located on the
new site at Pigeon House Road.
We will still retain a relatively
small productive capacity
on the old site at Ringsend.

Irish Plastic Packaging Ltd.

The result for the year is a profit
of £41,000. This compares with
a loss of £119,000 for the
previous year and the total swing
of £160,000 reflects great credit
on the Board and Management
of Irish Plastic Packaging Ltd.

The Future

In looking to the future I again
pay compliment to the
Management of I.G.B. who in
spite of all sorts of difficulties
have brought profitability back
to within a reasonable striking
distance of the real levels
previously obtaining. I have
every confidence that the
Company will achieve the levels
necessary for its continued
prosperity.

PURE IRISH GLASS The Irish Glass Bottle Co. Ltd., Charlotte Quay Dublin 4

How do you break the law without committing a crime?

By flagrantly ignoring the provisions of the 1948
National Assistance Act.

Shelter's investigation of 106 local authorities in 1972
shows widespread disregard of the law as laid down in
the Act. They were refusing temporary accommodation
to some homeless families. Shunting them from one
area to another. Breaking up families and taking the
children into care. Accepting improperly managed
temporary accommodation.

The Grief Report shows where the 1948 National
Assistance Act breaks down. And outlines a course
of action.

To: SHELTER, Dept. PEC 34, 86, Strand,
London, WC2R0EQ.

SHELTER we know how to help

MOULINEX

At their last meeting the Board of Directors resolved to raise the Company's capital from Frs.40,500,000 to Frs.48,600,000 by making a one-for-five scrip issue of 81,000 shares as announced by the Board at the Annual General Meeting of 27th May last.

The new shares will be available as from 18th December against presentation of evidence of entitlement (coupon 17), at all Head Offices and branches of the four banks authorised to effect payment of Moulinex coupons: Banque Nationale de Paris, Crédit Lyonnais, Société Générale, Crédit Commercial de France.

Furthermore all the resolutions put forward at the Extraordinary General Meeting held on 2nd December were adopted. The Company's affairs as from 1st January, 1973 will therefore be conducted in accordance with its new Articles of Association, providing as they do for the Board of Management and Supervisory Board required by the Law of 24th July, 1966 on commercial enterprises.

Happy Christmas?

The Family Festival is a great time for children—or surely ought to be.

For over a century the Shaftesbury Homes and 'Arethusa' have been striving, at this and all times of the year, to fill the gap in the lives of children deprived of family affection and security.

PLEASE HELP US TO HELP OUR CHILDREN ENJOY THIS CHRISTMAS

This coupon will help YOU to help US. Our grateful acknowledgment will be the thanks to you of a child in need.

as a Christmas gift for the benefit of children in your care.

MAJOR TIMING RECOMMENDATIONS

COCOA — Oct. '71: major buying opportunity expected during this quarter; Jan. '72: prices to average higher in second than first quarter, still higher in third.

SOYBEANS — Apr. '71: B U Y; Oct. '71: complete '71/72 crop year coverage on current weakness.

SOYBEAN MEAL — Nov. '71: BUY AGGRESSIVELY.

SOYBEAN OIL — Jan. '72: New Lows fourth quarter.

WHEAT — BUY on dips towards 1.45 Chicago; June '72: Much further price strength into fourth quarter if significant sales made to U.S.S.R.

CORN — June '72: BUY on weakness.

SUGAR — Jan. '72: SELL ON STRENGTH; June '72: Aggressive buying; Mar. '73 New York Future 5.50-6.00 cent range.

For over a quarter of a century, our basic research has enabled us to anticipate well in advance a major reversal in the price trend. It is indicative of the commodity work performed by us for many large corporations in industrial and agricultural commodities.

39th Year World Wide Service

HIDES — (HEAVY NATIVE) Jan. '71: B U Y; March '71: B U Y; July '71: B U Y; Oct. '71: B U Y; Jan. '72: B U Y; Apr. '72: B U Y.

PORK BELLIES — Aug. '71: B U Y on weakness; Feb. '72 B U Y.

HOGS — Feb. '72: B U Y

WOOL — Mar. '72: Continue view major trend up.

COTTON — Mar. '72: New York futures approaching top levels thereafter major trend down.

SILVER — Oct. '71: B U Y — cover previously recommended short positions; Jan. '72: Prices in second half higher than first half.

COPPER — Aug. '72: SELL Dec. '72 COMEX in 52-54 cent range.

GOLD — We have been bullish for two years; Jun. '72: expect third quarter high around \$70-75 London.

PLATINUM — May '72: B U Y.

On-trend greetings

Knit your own phase two of an incomes policy in a Christmas quiz, page 9, and understand why you will have an unhappy new year if Mr Heath gives the wrong answers. The Government has decided to spend a lot of your money that ought to be given back in tax reductions, page 53, but unemployment is down and annual economic growth is probably already over 4 per cent; page 60.

Joyless Ulster

The warnings from Ulster are becoming increasingly ominous. But both communities are reluctant to accept that there can be no peace while they both shield their own murderers, page 13. Trials without juries are recommended—and, unhappily, will be necessary—there, page 17.

Out and about

That sailing boom is roaring on in Britain, and sensible men like the Prime Minister, are getting in while there's a Vat advantage, page 50. Eating out in New York isn't what it was, page 40, but the young drinker can savour his Pink Tingle and Zapple, page 41.

It wasn't at hand

Mr Nixon and the B-52s have gone back to the argument of force to persuade Hanoi to accept in Vietnam what the west has accepted in that other divided nation, Germany, page 11. The recriminations in Washington over that obstinate war, page 35. Wall Street took it badly, page 71.

The untouchable

Something needs to be done about General Amin, all right; but the appalling fact is that Britain is virtually powerless to touch him, page 14. God should certainly tell Amin he can't get along without the help of those foreign banks, page 64.

Continent cut off

It usually takes half an hour to get through. Why are the telephones to the continent so bad?, page 55.

Letters

Opinion polls

SIR—Your comments in *The Economist* (December 16th) about "that leaked opinion poll" require an answer. The simple facts of the matter are as follows. Three news articles concerning opinion polls results appeared in national daily newspapers on Tuesday, November 27, 1972, one in *The Times*, one in the *Guardian* and one in the *Sun*. That same day, NOP submitted the following letter to those newspapers:

For the record the "secret" NOP poll conducted for New Outlook in the Sutton and Cheam parliamentary constituency between 15th and 19th November, 1972, found:

"Of those who mention that they will vote for or support a particular political party at the by-election (75 per cent of all those 518 electors interviewed), about 42½ per cent (37½-47½ per cent) say they will vote Conservative, 27½ per cent (22½-32½ per cent) will vote Liberal and 25 per cent (21-29 per cent) will vote Labour. 5 per cent claim they will vote for one of the two minor parties (British Independent or Common Market Safeguards Campaign)."

If all those Conservative and Labour supporters who say they would be "certain" or "very likely to vote Liberal, if they thought the Liberal candidate had a chance of winning the by-election" actually do vote Liberal, then the result would be neck and neck between Conservative and Liberal parties, as Trevor Jones, the Liberal party president suggests. As an experienced polling organisation we place more emphasis on the first of the findings (Liberal 22½-32½ per cent) which is itself no prediction and only a reflection of the opinions of the voters of Sutton and Cheam some three weeks before polling day.

The fact that none of them considered it worth while publishing the actual findings is certainly one of regret.

This information was subsequently released to certain other national daily newspapers, with similarly silent results. During that whole period we had one inquiry about the poll from a newspaper, the Sutton Advertiser.

I wholly agree with your point that results must be released if "leaks" occur. But if they are it would be nice to feel that they will appear in print.—Yours faithfully,

J. H. BARTER
Managing Director,
London, WC2 NOP Market Research Ltd

SIR—Your report on public opinion polling on the 1970 election (December

16th) and the errors to be allowed for reminds me that recently a small grandson of mine, asked by his mother what he had been doing at school that day, replied "maths." "What kind of maths, Patrick?" "Probability graphs." He is involved in the new methods in arithmetic.

Should the so-called opinion polls not be renamed improbability graphs as a more exact description?—Yours faithfully,
Brockenhurst, Hants. B. G. GUY

Party politics

SIR—In your article "Blowing bubbles" (December 16th) you say, and many would agree: "Party politics has few friends and even fewer admirers in Britain today."

May I suggest a reason for this. In 1841 Lord Derby said: "When I first came into Parliament, Mr Tierney, a great Whig authority, used to say that the duty of an opposition was very simple—it was to oppose everything, and propose nothing."

That may have been good advice over a century ago, but today—because so many politicians still believe that it is the duty of the opposition to oppose—it contributes very materially to the unpopularity of both the two leading political parties.

If we cannot have a party of the sane and reasonable centre—and your objection to it, namely that it would be likely to be more or less continuously in power, is, I fear, valid—cannot the two major parties be got to understand that what makes them so unpopular is the "politics of confrontation," which their somewhat dated idea of "duty" inevitably forces on them and which bores the electorate so unutterably?

And worse than making them so boring—and childish—it causes them to produce election manifestoes which contain seeds of confrontation, seeds so damaging that within a short space of time both parties have been recently forced to go into reverse—and thereby to look somewhat foolish in many people's eyes.

In the past two years the Labour party has been loud in its criticism of what it calls the Tories' "politics of confrontation" and, indeed, within the last six months the Tories have—thank heaven—abandoned it.

But surely it must be obvious that the reason why parties get trapped into adopting the politics of confrontation is that they still believe that the duty of each party is—on all occasions—to oppose, or to confront, each other.

This Homeric conception of parliamentary democracy may have been acceptable to the electorate in 1830 or 1841.

It is totally unacceptable in 1972. A new style may be difficult to work out. But it must be found.—Yours faithfully,
London, W8 OSWALD MOOR

The freeze

SIR—I was very much interested by Mrs Dommen's letter (December 2nd) pointing out the inconsistency of any wage and price control formulae. Carrying Mrs

THE ECONOMIST DECEMBER 23, 1972

Dommen's argument one step further, I suggest the following approach:

The formula used is $c + p + t - m = w$ where
w = wage/price policy (and success thereof)
c = compulsory wage/price control
p = public opinion
t = official trade union support
m = militants

Since the object is to maximise w, I suggest the use of some elementary calculus: rewriting the original equation, $w = c + p + t - m$ and taking the derivative with respect to public opinion:

$$D_p w = D_p c + D_p p + D_p t - D_p m$$

$$\text{But at maximum } w, D_p w = 0$$

$$\text{therefore } D_p c + D_p p + D_p t - D_p m = 0$$

$$\text{Since by definition } D_p p = 1$$

$$\text{thus } D_p c + 1 + D_p t - D_p m = 0$$

Now, analysing what each of the symbols represents:

$D_p c$ is the rate of change of compulsory wage/price controls with respect to public opinion; this will be 0 under normal political conditions; $D_p m$ is the rate of change of militant activities with respect to public opinion. There is obviously a positive correlation so a value of 1 may be arbitrarily assigned.

$$\text{The equation now reads: } 0 + 1 + D_p t - 1 = 0$$

$$\text{so } D_p t = 0$$

In other words, the rate of change of official trade union support with respect to public opinion is zero

Thus it would mean that for the effectiveness of the wage/price policy to be maximised, there would be no correlation between public opinion and official trade union activities. Perhaps, then, the optimum situation already exists?—Yours faithfully,
Toronto JEFFREY D. SHERMAN

Monopolies

SIR—In your article "Which witch?" (December 2nd) you say that the asset stripping of profitable companies can only occur because those assets can be put to better uses: is Centre Point an example of what one of those better uses might be? Surely there is a conflict between the industrial market and financial market; just as the value of gold as a metal for industrial use is not \$60 per ounce (except in a few marginal cases), nor is a price of £1,000 per acre and more for agricul-

THE ECONOMIST DECEMBER 23, 1972

MANAGEMENT APPOINTMENTS

£7000 PA AND OVER

T. P. O'SULLIVAN AND PARTNERS

invite applications for the following posts in Thailand, Africa and the Caribbean.

1 Planning Engineer with—at least 10 years postgraduate experience which should be predominantly in the highway field and preferably include highway feasibility studies and traffic engineering. Previous overseas experience in a developing country will be an advantage.

2 Transport Economist with a degree in Economics and several years experience, preferably to include studies in highway transportation.

3 Management Accountant/Organisation Expert suitably qualified and with at least 10 years experience. First-hand knowledge of government procedures overseas would be an advantage.

The initial appointments would be on a one year or single project basis, but it is anticipated that there will be opportunities for subsequent employment within the organisation.

Salaries will be commensurate with experience but the quality of staff required is such that we expect to pay at least £7,500 per annum, plus benefits, and normally with some tax concessions. The proposed age range is 30 to 45, but other suitably experienced applicants will be considered.

Applicants should apply in writing, giving full details of their qualifications and experience to F. D. Thomas, T. P. O'Sullivan and Partners, 14 Queen Anne's Gate, London, SW1H 9AA.

RALLI INTERNATIONAL LTD.

have invited us to advise on the appointment of a

YOUNG SOLICITOR or BARRISTER

This is an exciting challenge for an ambitious young man who must have a sound knowledge of acquisitions, disposal, and takeover situations—including prospectuses and allied work. Taxation experience and knowledge of current exchange control and Treasury requirements are also essential.

The appointment is London based but there will be travel world wide. Depending on PROVEN experience the salary is negotiable up to £10,000.

London Age 25-35 Salary £10,000

ALL applications handled in the strictest confidence should be forwarded as soon as possible to:

ROBIN R. WHALLEY

INTERNATIONAL APPOINTMENTS (LONDON) LIMITED

Calder House, 1 Dover Street,
London W1X 3PJ

Telephone: 01-629 6867

tural land justified by the expected yield per acre, but as the market price of the financial security token called "land."

We cannot export land or property (excluding London Bridge, of course); real national wealth is made in the industrial market; it should be protected.—Yours faithfully,
PETER WARRY
Weymouth, Dorset

Football

SIR—The discussion of declining football attendances is hardly advanced when you simply agree with the Daily Mail that neither increased television coverage nor hooliganism is the cause (December 9th). Can it really have escaped *The Economist's* attention that the basic admission price was increased by 33 per cent at the start of the season? Or do you share the Football League's faith in zero price elasticities?—Yours faithfully,

K. F. WALLIS
The London School of Economics and Political Science, London, WC2

Ireland

SIR—Let me state briefly the fallacy in the reasoning of Mr G. E. W. Johnson (Letters, December 2nd). Six north-eastern Irish counties (christened Northern Ireland) were cut off in 1921 to give the Protestant Unionists a permanent, artificial majority. The result was one-party rule for 50 years. Therefore, the normal rules of democratic government are inapplicable.

The position is in no way analogous to the pre-1776 condition of the American colonies.—Yours faithfully,
Omagh, Co. Tyrone EDWARD WINTERS

Vietnam

SIR—As if to emphasise a fact which does not become wholly self-evident to the reader, your article on Vietnam (December 9th) bears the misleading title, "We're all watching." I was more than dismayed to realise that *The Economist* has been not so much deceived by Mr Nixon's record of diplomatic pay-offs as charmed by it. I can think only that what is called a "small miracle" in the article (Mr Nixon's attempt to legitimate a criminal policy by trying to make it viable) must seem more like murder to the apparently faithless Vietnamese, who lack the psychological distance of the British intelligentsia.

It would appear that you have watched not Henry Kissinger but Ronald Ziegler if at this late date you persist in seeing the 25-year-old American commitment to war in Indochina, and now the objectives of the current ceasefire negotiations, as a continuing struggle to free American prisoners of war and prevent—heaven forbid—an undemocratic government from being imposed on the "majority of the people who will have to live under it." After a glance at the Pentagon papers one should realise that a major goal of Ameri-

can involvement—as well as British complicity, I should add—has been precisely concerned with undermining the possibility for democracy in South Vietnam.

"If North Vietnam is at long last ready to accept an elected government in Saigon," you observe, "it is necessary to make sure that the election takes place." Permit me to remind you that the insistence on free elections has been a part of the Democratic Republic of Vietnam's position since 1954 and an official part of the National Liberation Front's position since its statement of objectives in 1962. The fact that this central item is finally being recognised by America is a great victory for the Vietnamese.

What I must decide from your article is that it constitutes, at best, an endorsement of Mr Nixon's right to enforce "the kind of peace he wants"—which is a dishonourable peace if it leaves 100,000 political dissidents in Saigon concentration camps, and Mr Thieu with any foot at all in the government.

In short, the article is consistent with the traditional British concept of the war as an exercise of the "freedom to establish freedom," as the former foreign secretary put it—in utter blindness to the moral dimension of the conflict. The last line states that if Mr Nixon and Mr Kissinger succeed in pulling off their plans, not only will that make them right, but it will make them "men who are going to be listened to." The sad fact is that that will make Mr Nixon the second man to be listened to after creating 6m casualties (the total of civilians killed, wounded, and made refugees since 1968). The irony is that he will be the first to be applauded.—Yours faithfully,
ROBERT ELLSBERG

Space

SIR—Your article "The last men on the moon" (December 2nd), although painting a rather gloomy picture, nevertheless presented, in my opinion, a realistic view of the present state and future hopes of America's space programme.

I do, however, have one serious objection to make to your reference to the joint link-up of an American Apollo craft and a Russian Soyuz craft, planned for 1975. Your comment: "He [President Nixon] has allowed the remaining Apollo rockets to be diverted to such public spectacles as a joint link-up with the Russians which will do nothing more useful than foster a sense of togetherness that could come unstuck if anything goes wrong."

This, I feel, is an altogether unfounded criticism of the project. You seem to ignore completely the most important practical use of such a link-up. The fact that such a project could provide the facilities, which do not exist at this moment, for either Russia or America to effect a rescue in space in the face of any accident or near-disaster, such as happened with Apollo 13.

You seem also to overlook the fact that

this joint project could lay the foundations for future co-operation in space of the two world powers. This, as well as improving relations between the two countries, would cut by half the costs of any future mission undertaken jointly by the two nations. When one bears in mind the fact that the main criticism levelled against America's space programme is the enormous cost involved, it seems that if all this link-up accomplished were the halving of America's expenditure on future manned missions, then at least something would have been achieved.—Yours faithfully,
West Knighton, Leics. MICHAEL C. BUTLER

Hijacking

SIR—I understand that the airline pilots wish hijackers dealt with on the ground. May I suggest that, if they and the airlines regard this problem as sufficiently serious, there is a way of ensuring that no aircraft can be hijacked while in flight. It is simply this: in any situation where hostages are taken it is essential that the person to be coerced should know that the hostages are being held. A strong partition isolating the passenger compartment from both the pilot and the outside world, permitting no communications from the cabin to the flight deck, would suffice.

Although I can conceive of circumstances in which the cabin crew would require to communicate with the outside world while in flight (eg, illness) it may well be considered that the risk of violence is too great. A "once and for all" line from the cabin to the pilot, instructing him to land as soon as he can, would alleviate this aspect, and if this device were used in a hijacking it would generally result in a landing on friendly territory. Of course, there is no reason why the pilot should not be able to speak to the passengers.

As regards the general problem of hostages, may I point out that the tactic of hostage-holding did little to dissuade resistance during the war, for reasons that I need not elaborate.

I would not like to be in the position of the responsible German leaders during the Munich incident but in the circumstances it would have taken only immense courage on their part to have issued an ultimatum to the terrorists (needless to say, not offering them a glorious shoot-out) promising them an ignominious eradication. A few doses of this bitter medicine and enough politicians prepared to sacrifice themselves for the common good—not in glory as substitutes, but in ignominy, destroyed by those not in their invidious position—and this scourge would have lost much of its effect. May I never have to take such a decision, not because of the human life involved—I take risks with my own and others' lives every time I drive—but because the issues involved are too momentous for me.—Yours faithfully,
Methwold, Norfolk

Last year our steelmen helped to earn more than half of Britain's export income.

BSC is Britain's third biggest exporter.

In 1971-72 BSC's export earnings were £265 million, achieved through sales of steel products to 147 different countries.

When you add to this the quantities of steel in items like motor cars and

refrigerators, our steelmen helped to bring in more than 50% of Britain's export income!

And it doesn't end with steel and steel products. There's also know-how. Recently, for instance, the British Steel Corporation was appointed Technical and Operating Adviser for the new greenfield *Las Truchas* steelworks

in Mexico. The biggest job of its kind in the world today, this entails overseeing the planning, design, procurement, personnel training and the commissioning of the whole new works, which will add 1½ million tonnes of steel per annum to Mexico's output.

A quiz for phase two

During the Christmas and new year holiday the vital decisions about phase two of Britain's incomes policy are going to have to be made by three ministers: Mr Heath, Mr Barber, and, perhaps as an interesting new influence in the big league, Mr Walker. The other nine ministers who attend meetings on the subject are there mostly to be seen but not heard.

The first proposals for phase two from the civil servants, under Sir William Armstrong, were submitted some weeks ago. On the usual precedent, they will have been too weak (because they will have been an amalgam that included the views of some people who do not want an incomes policy at all), and ministers will have thrown them back and asked that they be considerably toughened. Following custom, they will have been very slightly toughened and re-submitted. Now the three ministers will have to decide whether to accept this second edition, or to dare to put in proposals that will have some hope of working.

This game of making (or, so far, avoiding) decisions on incomes policy has been in progress in Britain for a generation. It can therefore now be put into pro-forma style so as to allow everybody to join in. Since it is more fun to be a rational decision-maker than a designer of cosmetics, the pro-forma below avoids setting questions on price controls for phase two. Price controls are a cosmetic because everybody knows that competition in production and distribution in Britain, while by no means perfect, is sufficient to prevent purely employer generated price-push inflation from getting out of hand, at any rate so long as unemployment is not hugely below 1½ per cent. The present steady ruination of the country springs wholly from trade union monopoly cost-push. It is the questions that the three ministers answer about wages policy which will affect the whole future of the country.

Below we have divided what seem to us the relevant questions under eight headings. Five relate to the pay control machinery that will need to be set up in next year's legislation, and three relate to the norms. They

are divided in this way because it has probably already been decided that the legislation should be what Whitehall calls "open-ended"—ie, will merely set up some sort of new pay control board, and define its machinery and powers. The norms (if any) that the Government will ask the board to apply will be a quite separate matter, varying at different periods of the board's life.

Beside each of the eight questions, we have put three possible answers. If you want to play the game, take a pen or make a mental note whether you would choose answer (a) or (b) or (c); only when you have answered all of the questions, look at our answers to see what marks we would give you for your choices. Much more important, keep the questionnaire into next year to see how many marks Mr Heath eventually gets.

On the legislation

The five questions about the machinery for the pay board start with what might seem a relatively unimportant one about the timetable, but increase in importance after that.

(1) To which of the following timetables should the Government preferably be working:

- (a) Green paper on Government's proposals in January, but do not introduce bill until TUC and CBI sounded out for their views;
- (b) White paper and bill both in January;
- (c) No hurry?

(2) How long should the new legislation last:

- (a) Require parliamentary renewal every year;
- (b) Every three years;
- (c) Permanent powers, unless or until the bill is repealed?

(3) What should decide which wage claims the pay board should report on:

- (a) Discretionary procedure—should look at any excessive wage claims or increases which the Government chooses to refer to it;
- (b) Negative procedure—no trade union should be allowed a centrally-bargained pay increase above a stated norm unless it appeals to the board and wins;

(c) Positive procedure—all wage claims affecting more than 100 workers should automatically be examined by the board?

(4) What methods of enforcement?

(a) Generally voluntary, but occasional roll-back orders in most flagrant cases, enforced by fines;

(b) Automatic tax collections from workers in firms who are paying increases above the norm (eg, if the norm increase is £2 a week above a year ago, any firm whose wage bill per head is £3 a week above a year ago must add £1 a week to weekly national insurance stamp paid for by each worker, unless it wins exemption after appeal to pay board);

(c) By taxes on firms who pay excess wage rises (eg, as soon as an employer's wage bill is over 8 per cent higher than a year ago, he can no longer treat the excess wages as a pre-tax expense)?

(5) Which of these would be preferable composition for the board?

(a) A backroom staff, possibly headed by a professional economist, which provides advice to representative tripartite courts (an employer, a trade unionist, an independent) chosen separately for each major inquiry;

(b) A single body, possibly headed by an ex-civil servant, which has to approve any major exceptions to the norm, and keeps its job performable by limiting the grounds on which appeals for exemption can be made (eg, appellant must be able to show that his firm could not recruit sufficient workers if they are not paid wage increases above the norm);

(c) A high court and several lower courts, each usually headed by a lawyer, which hears all arguments by the parties for or against a pay rise above the norm, and establishes case law on the subject (but perhaps saying that any rise which costs more than £10m a year must be passed by the high court instead of a lower)?

On norms

The three questions about norms also start with what may seem a relatively unimportant one about the timetable, and then rise in importance.

(6) Even if the bill is introduced in January, there have been suggestions that the guideline wage norms (if any) may not be announced until near to the freeze's presumed end in April. Would this be?

(a) Wise, because there could then be quadripartite consultation about the attainable norm between Government, TUC, CBI and whoever is chosen to chair the pay board;

(b) Probably politically disastrous;

(c) Probably economically disastrous?

(7) Should the initial norm for the rest of 1973, above which the pay board should only relatively rarely grant increases, be:

(a) Realistically flexible, something like the 11 per cent that unions were winning in the rushed claims that got under the wire in the last weekend before November's freeze;

(b) A simple instruction that any claim for a pay rise above the rise in the cost of living since the day after the last pay rise must be approved by the board;

(c) Some variant of Mr Heath's £2.60 a week package plus, perhaps, an earlier threshold clause (which would probably mean around 9 per cent rise on average, more for the lower paid)?

(8) Should the eventual relaxation from the first rules

for the norms:

(a) Consist of a promise to discuss relaxations with the TUC and CBI once certain targets for the economy have been successfully hit;

(b) Consist of a standing offer to the TUC and CBI that the Government will be ready to accept any formula for norms they propose which fits into a given quantitative limit (eg, the Government could say that £2½ billion will be available from the expected rise in money gnp for rises in collectively-bargained incomes during 1973-74, and the pay board will be willing to work to any TUC-CBI formula which would distribute only that amount);

(c) Keep all rules for future changes entirely flexible?

Now check your score

The Economist's view of the right answer to each of these questions is (b); give yourself 10 marks for each (b). We can see an argument for each answer (c), but would not ourselves support it; give yourself 5 marks for each (c). We can see no rational argument for answer (a) to any of the questions, but are afraid that Mr Heath's Government could conceivably give answer (a) to every one of them; give yourself nil marks for each (a), and feel scared for Britain when the Government gives any. If you score more than about 50 out of 80—either in the answers you have already given, or on second thoughts, after reading the arguments below—you seem to us a more realistic decision-maker than any British government since the war. If the Heath Government gets less than 50 out of 80 in its eventual legislation and policy, even after umpteen thoughts, then our forecast for the unhappy new year of 1973 is that Britain will continue on its present primrose path to ever-increasing economic and social disaster.

Argument for the answers

The rationale for answering (b) to each of the eight questions is as follows.

(1) It is true that each day of phase one of full freeze up to end-April is an anti-inflationary gain, so Mr Heath should reject the CBI's plea to end phase one in February. But early introduction of the bill is democratically desirable so that the Government does not have to try to crash through another major measure, hard against a timetable, unable to consider amendments (as with the Europe, freeze and Ulster bills). The proper place to consider reasoned amendments from anybody, including the TUC, is when the bill is before Parliament; the idea of negotiating clauses in secret, before a bill is published, has already been tried—and did not work.

(2) A three-year term would mean that the machinery and powers of the pay board would be reconsidered after the next general election, which will happen and be desirable anyway.

(3) The unions themselves should have to decide to appeal to the board if they want above-the-norm increases; when the board rules against them, there should usually be no backdating even of their equal-to-the-norm increases, thus discouraging otiose appeals. Strikes in favour of above-the-norm increases would then merely delay appeals to the board.

(4) Automatic claw-back of excess wage rises from each worker through the tax system is an obvious remedy. The usual argument against it is that "union opposition might then bring the tax system into disrepute." But the object of the tax system is to control inflation; it is no good having an excellent tax system which is universally respected because it does not do its main job.

(5) Preference for a single and consistent arbitrating body follows naturally from the preferred answers to (3) and (4) above.

(6) Since some powellites and all the Labour party will vote against effective incomes legislation, it is going to be difficult to get the bill through Parliament unless the Government shows from the beginning that it has a firm idea of where it intends to be going (ie, unless it mobilises the same parliamentary majority as voted for the full freeze bill).

(7) The few remaining wage rises which apply to 1972, but are still due to come immediately after the freeze (eg, the gas workers), may have to be something like the immediate pre-freeze average of around 11 per cent; but any cost-of-living increases which refer back to settlements last made more than 15 months before are going to be something like 10 per cent anyway. The problems for later 1973 claims are: (a) they must be slowed dramatically below late 1972's norm of around 11 per cent (and the only hopeful way seems to be to tie them to a cost-of-living rise which might also slow dramatically—if it does not, this will be a sign that the 1973 norm

has actually been too high); (b) average real basic wages are already something like 8 per cent above a year ago, which uses up most of two years' permitted rise in income, so it will be better to make most other real income rises in 1973 depend on increases in social security benefits, tax cuts, and cases where the board feels a rise in real income is needed in order to redeploy labour; (c) if there is to be any incentive for the TUC and CBI to accept an effective voluntary policy for 1974, then it is important that this alternative voluntary formula, while not being grossly inflationary, should seem to bring them more than would come from a repetition of the 1973 formula (and if the 1973 formula is index-linking, while the best guess for price rises in 1974 has at last been brought down to about 4 per cent, then the bait could just conceivably succeed).

(8) The only voluntary TUC-CBI policy that can make sense is one based on sharing out what seems likely to be available. When Mr Heath meets the TUC on January 4th, he should make the sort of standing offer in 8(b), but offer them nothing else except whisky.

Some people will say that the "stern" policy suggested here would lead to great industrial strife. Less than two months ago it was said that a freeze would lead to a general strike. In practice, industrial strife is always the result of a brittle policy which claims to intend to enforce incomes restraint, but which retreats before any trade union which makes a rough threat. The cold fear over this Christmas is that the three ministers might be planning that sort of a phase two.

The peace that wasn't

The Russians, as well as Henry Kissinger and the North Vietnamese, had better look at the consequences of more war in Vietnam

There is no reason that a liberal should accept why the two Vietnams ought to be reunited until it has been shown that a majority of the people in both of them, or at least of those in the south, wish it to be so. Until that happens, a liberal would add, South Vietnam should have a government of its own based on some sort of reasonably accurate measurement of the preferences of the South Vietnamese. Most people in the west would accept those principles, as principles; after all, it is what they say about that other divided nation, Germany, and they would be outraged if one half of Germany sent its army into the other half in order to insist on putting its own preferred sort of government into power there. The difference in Vietnam is the reluctance of so many people to apply these principles as the necessary test of the terms on which the war is ended. It was imprecision in applying this test that led Mr Kissinger to say on October 26th that "peace is at hand," when it turns out that it was not. The same imprecision is now making many bone-weary people say that he should nevertheless embrace in December the consequences of what he let his eye slide over too easily in October.

By sending his bombers back north of the 20th parallel this week, and losing quite a lot of them, President Nixon has reverted to the argument of force to end the war. He is using the means at his disposal, as the North Vietnamese used the means at their disposal when they sent their army over the 17th parallel in the spring. They employed the firepower carried by their army; he is using the firepower of his air force. The pictures from An Loc and Quang Tri show that there is not much difference between them in what they do to the places where the artillery shells or the bombs fall. But there is a fundamental difference, and it should be recognised, between the purposes for which Mr Nixon and the North Vietnamese politburo are using the different sorts of power available to them. Mr Nixon is using the argument of force to try to get the North Vietnamese to agree that the next government of South Vietnam should be chosen by a more or less violence-free election. The North Vietnamese are using their sort of force to try to insist that that government should itself be the product of the further violence which they and their friends in the south would bring to bear after a nominal ceasefire. These are the two very

different meanings that lay concealed beneath the skin of the agreement that seemed so close in October.

Mr Kissinger, and those who hoped he was right, had their eyes fixed on the passage in clause 4 of the agreement which said that "the internal matters" of South Vietnam were to be settled between "the two South Vietnamese parties." By saying that, North Vietnam seemed to be renouncing its own claim to decide what should happen in the south; and if the North Vietnamese kept out of it all there was little doubt that the non-communists would win a large majority in the election. President Thieu has long been offering to hold after the ceasefire. It is true, of course, that clause 1 of the agreement paid due respect to the unity of Vietnam. But it was hoped that that was the equivalent of the letter the west Germans have sent to the east Germans about German unity, a formal but at the moment non-operative reminder of their right to bring the subject up again later on. If North Vietnam carried out its promise (clause 7) to withdraw its troops from Laos and Cambodia, and if its men in South Vietnam had a real team of truce supervisors watching over them, it seemed that the North Vietnamese army could be more or less neutralised. And from 1965 onwards the removal of the North Vietnamese intervention has been the main argument used to justify the American intervention.

That was the pattern Henry Kissinger thought he saw in the agreement, but Le Duc Tho plainly saw a different one. It has been known for some time—from Cosvn-6, the document the communist headquarters issued in mid-September—that the Vietcong has been telling its men to organise undercover squads for a campaign of "tyrant elimination, abduction and assassination" after the ceasefire. Mr Thieu's army and police force could probably cope with that if North Vietnam's 14 regular divisions really did stay out of the war. But the sort of international inspection system the North Vietnamese turn out to have been calling for makes it highly unlikely that they ever intended to stay out of it. They apparently proposed a total of 250 men for the whole of Indochina, only half of whom would actually be allowed to travel around the countryside, and even those few would have had to rely for transport on the people they wanted to inspect.

Two states in one nation

It would be a bad joke, if the old control commission set up in 1954 had not stopped people laughing about supervisors who supervise nothing. Such a handful of inspectors could not possibly know what General Giap's men were doing in South Vietnam, let alone check that they had got out of Laos and Cambodia. This is not the proposal of men who, in the Guardian's bland phrase on Wednesday, "know that they . . . cannot win." It seems only too likely that North Vietnam's leaders wanted nobody watching their army while it pursued its own definition of victory in the south after the last Americans had left. The question of the supervisory force is not in itself the one last decision that Mr Kissinger says the North Vietnamese still have to take. That decision is to leave the politics of the south to the southerners, within the procedures already agreed to in October; but the

powers of the supervisors are a decisively important test of whether North Vietnam is really ready for that.

What Mr Nixon is still trying to get is the Vietnamese version of what Herr Brandt has settled for in Germany: the acceptance by North Vietnam's leaders that there are "two states within one nation." The North Vietnamese went part of the way to accepting that in October, when they dropped the idea that the United States should remove Mr Thieu from power, and put a coalition government in his place, before they would agree to a ceasefire. But they will still be evading the central issue so long as they refuse to accept any real limitations on what their army can do after a ceasefire. Perhaps they are trying to take advantage of the difficult moment Mr Nixon has created for himself just before Christmas, by allowing the expectations of peace to outrun reality and the wives and mothers to think that the American prisoners were as good as home. Perhaps they believe that the new Senate, with two more Democrats in it, will cut off funds for the war. But they know that, if that does not happen, Mr Nixon is pretty well free from political constraints at home until 1974 or 1975, when he will want to start making his preparations for America's bicentenary; and although he is not going to make it his policy to bomb them back into the stone age—that brutal phrase used years ago by one foolish American general, and so often put into other Americans' mouths since then—he can cause a great deal of damage to North Vietnam. They have their calculations to make.

The Brezhnev calculation

So do the Russians. What happens now will be a measure of whether there really is a new relationship between the Soviet Union and the United States. It is Russian-supplied missiles, and Russian training in using them, that shot down six B-52s by Thursday; since the B-52s seemed almost invulnerable until recently, it is even possible that the equipment which brought them down was sent into North Vietnam during the two-month halt of bombing north of the 20th parallel. It is almost certainly Russian oil pumped in over the Chinese border that keeps North Vietnam's war machine in action.

There is assumed to be a tacit understanding between Mr Nixon and Mr Brezhnev. If the United States provides the help that Russia needs to overcome the inefficiency of its economy, and underwrites the political division of Europe, the assumption is that the Soviet Union will help, among other things, to end the Vietnam war in a way compatible with Mr Nixon's definition of peace with honour. It is hard to imagine Mr Nixon quietly proceeding with his part of that understanding if the Russians continue to help the North Vietnamese to make the other part impossible: if the centrepiece of Mr Nixon's second term has to be a choice between continued war in Vietnam and the acceptance of defeat. That is not how Mr Nixon wanted his next four years to be. The Vietnam war stretches out its consequences into many parts of the world. That is why it has been so long and terrible a war, and why it is so difficult to end; and why Mr Brezhnev, on reflection, may not choose to use it as a rug to whip from under Mr Nixon's feet.

The unlearnt lesson

The warnings of a Protestant backlash in Ulster are increasing and cannot be ignored. But Mr Whitelaw will have to risk it

Mr Whitelaw's lot gets no more enviable. If he reflects on the state of the province at the end of his first nine months as Secretary of State for Northern Ireland he can, it is true, point to some considerable achievements. The IRA is more on the run than on the defensive, and the political leaders of the Catholic community feel sufficiently secure to talk with him about Ulster's future. The bombings have declined although they have certainly not been stopped, and Mr Whitelaw has won a measure of goodwill and trust from the decent people of Ireland—and abroad—which is truly remarkable. But there is a black side. The society Mr Whitelaw is attempting to shape is still very sick indeed, and to the outsider, at least, shows no great vigour in curing itself.

Some politicians, in Ireland as well as Britain, doubt whether such a society can be governed first and cured later, but Mr Whitelaw has no option but to try. Some time next year he must produce, and the Parliament at Westminster must enact, a plan for the future constitutional arrangements in Northern Ireland. It is impossible for him to devise any such plan which would not have to be imposed in some way on either the Catholic or Protestant community, and most probably on both. It is not a question of what will be most acceptable but what will be least objected to, and that, fortunately, is something the Tories instinctively understand; it was, after all, the way their party leaders used to evolve. Inevitably, too, any plan must favour Catholic advance at the expense of the old Protestant domination, and not the least of Mr Whitelaw's problems in the coming weeks will be to decide how much weight should be given to the increasingly ominous warnings that are coming out of Ulster that the danger of a Protestant backlash is greater now than at any time since the present troubles began.

It would be a dangerous mistake for those Westminster politicians who do not immerse themselves in the problems of Ulster to believe that those warnings are confined to the Protestant extremists, although Mr Bill Craig, the leader of the Vanguard movement, said again on Tuesday that the Government's plan "may necessitate the use of force." The intentions of such men are obvious. The warnings which matter are those coming from the moderate Protestants who not only know their own clan best but who stand to lose most by any appeasement to the thuggish side of their community. They could be wrong, but only, perhaps, if the Protestant backlash is measured, as it all too readily is, by what happens when a mob confronts the British army. In the past those mobs have invariably backed away; but it is not a question now of whether they will always do so in the future, but of whether the backlash has not already begun.

Two weeks ago when Mr Whitelaw set up a special army-police task force to tackle the problem, the number of sectarian murders in Ulster this year had already

exceeded 100; what the total will be by the end of this month is anyone's guess. On Wednesday alone (the day the task force was strengthened) eight more people were assassinated, and the ratio of Catholics to Protestants murdered is around two to one. Neither community has given up a single killer, which is another cause for despair over Ulster. Yet how high must that hideous toll reach before it is recognised for what it is: Catholic terrorism and Protestant backlash? Or is it supposed not to matter any longer if Irishmen are killing each other so long as British troops are not being put at risk? That might be a popular view in Britain, but Mr Whitelaw has shown by his actions and the vehemence of his denunciations of those murders that it is not a mistake that he is likely to make.

The extremists take over

The all-too-evident signs of the disintegration of the Unionist party are a further cause for anxiety. With the resignation from the Unionist party of Mr Stratton Mills, the Westminster MP for North Belfast, this week, Mr Brian Faulkner has probably lost the last genuine moderate of real ability who stood by him as prime minister and as leader of the party since direct rule was imposed. Mr Stratton Mills resigned because Mr Faulkner blocked his attempt last week to cut the growing link between the Unionist party and the extremist Vanguard movement. He is by no means alone in believing that the Unionist party "is bound to become increasingly Vanguard's prisoner," or that the centre of gravity in the party has "shifted to such an extent that there is no longer any point in hoping to seek constructive change from inside." No doubt that is a recognition of the political realities, and as such it was not exactly unwelcome news for many at Westminster. But it will not help Mr Whitelaw very much.

Mr Faulkner does not have many remaining admirers at Westminster and the number in Ulster is dwindling fast. He is regarded as ambitious—always a fault in the other man—and at times since direct rule he has seemed anxious to give the impression that he is an embittered man as well. Mr Faulkner probably should have done more initially to prevent the Unionist party's slide into the clutches of the extremists, although the departing moderates' assertions that they could not work for reform within the party does not suggest that he would have had any great success. The charge against him really is that he has tried too hard to hold an impossible party together. When any party leader tolerates an extremist takeover of policies for the sake of a semblance of party unity he is always open to the doubt whether he is performing one of the less attractive tasks of party leadership or simply trying to preserve his own skin, and Mr Faulkner might have expected some sneaking

sympathy from Mr Wilson, at least, for the role he has tried to play. What still seems true, on balance, is that Ulster stands a slightly better chance of peace if Mr Whitelaw has to deal with a Unionist party influenced—if not always led—by Mr Faulkner, despite its links with Vanguard, than if that party either disintegrates in fact or is completely taken over in name by Mr Craig and the Vanguard movement. Mr Stratton Mills seemed to have believed this up to now; his departure is therefore all the more ominous.

Mr Whitelaw has a tricky problem of timing to decide. It is evident that direct rule will have to be extended for a further period for it is impossible to pass the necessary legislation for the future constitutional arrangements for Ulster, whatever they are, by March. That would seem to relieve him of some of the pressures which the Government's dithering over its Ulster timetable has put him under. There is some argument for delaying the white paper on the future of the province until after the plebiscite on the border, which is now fixed for March 8th, on the ground that the border poll might give enough Protestants a sufficient sense of security at least to give the white paper a try. Against that, however, must be set the very real suspicions that exist among the Protestants—including a number of moderates—of just where their wellbeing stands in Mr Heath's list of priorities.

They do not think it is very high. They believe he has played common market politics on the border plebiscite: hot for it to appease the Protestants at the time of direct rule, cold against it when the Labour party agitated for a referendum on the common market, and all right they can have it when the market issue was over. The Prime Minister has been known to be brusque about Ulster, as about many other matters. But the game of trying to pretend there are real differences between Mr Whitelaw and Mr Heath, which some moderate Protestants are playing, helps neither Mr Whitelaw nor their own cause. Yet what does need to be recognised is that Mr Whitelaw's touch has been surer than most English politicians' in dealing with Ulster,

and his intelligence on Protestant intentions has been at least as good as anyone else's. The timing of the white paper is, therefore, something which could be well left to his judgment, and that might largely depend on his assessment of how quickly the Unionist party is disintegrating.

In nine months as Secretary of State Mr Whitelaw has deservedly, and invariably against the odds, built up a very considerable political reputation. He does not need to be told that he can destroy it within a week by his handling of the constitutional issue. He has not been afraid to risk his political reputation, as over his meetings with the IRA, but he has rightly been cautious at taking open risks with the lives of people in both communities. He will not be helped now by colleagues in London urging him to rid them of the Ulster problem as quickly as possible; Mr Wilson's huffing and puffing and keeping everyone wondering which way he will eventually blow is enough.

What Ulster must learn

It cannot be said that the prospects for Ulster are all that much brighter at the end of the year than they were at the beginning. But that is not Mr Whitelaw's fault, or the British Government's, or Mr Lynch's either. While even the moderates in Ulster think there is not much they can do to help themselves there is even less that the British can do for them. Mr Whitelaw might, with great luck, avoid open violence and still create some form of constituent assembly framework which will allow Ulster to develop both politically and economically. That will not be achieved without risk, but it is a risk which has to be taken. But even if it does succeed without Protestant gunmen doing their worst, and even if the IRA is finally crushed, there will be no real peace in Northern Ireland until both communities become intolerant rather than protective of their own sectarian torturers and murderers. That is a simple lesson; it is one which too many people in Ulster still seem not just reluctant to learn, but are increasingly impatient when it is mentioned to them.

The impunity of Amin

Black Hitler or not, Uganda's ruler is beyond the reach of most of the things most people would like to do about him

One might think that by now Britain would have learnt how to deal with General Amin. The package that he unwrapped on Sunday night was not his first anti-British offering, nor was it his nastiest: most of the Asians whom he kicked out between August and November this year were, after all, British and the suffering caused by that upheaval was certainly greater than what lies in store for the much smaller white community he has now set his sights on. But every kick, in the pants or the teeth, that General Amin gives the British makes people in Britain wonder whether there really is no way of stopping

his career short.

Of course, his latest measures have to be put in proportion. He has nationalised 41 enterprises, all but seven of them British (see page 64). The owners must submit detailed declarations of their assets by the end of this month, and get out of their buildings within a fortnight. If no declaration is made, no compensation will be paid. But, assuming the general does not change his mind and that God does not intervene, the number of Britons affected will be small: not more than 50 of them in all, including dependants, will be dispossessed

from the 26 tea estates, and many of the 30 or so Britons working in the 15 nationalised companies may well be allowed to stay on. General Amin's actions have been high-handed, and they may violate international law. But nationalisation is a hazard of operating in underdeveloped countries now well recognised by all large companies. Unless General Amin refuses to pay fair compensation, his nationalisation decrees cannot be considered worse than par for the African course.

The injustice and the powerlessness

His other measures are. By insisting that British teachers, doctors and other experts must either stay in Uganda on local terms of service or leave the country by December 31st with a maximum of £50, instead of the normal sum of nearly £3,000, he is offering his British helpers two choices, either of which will cause them some hardship, and the second of which is outrageously unjust. The British aid staff in Uganda, with their families, number about 1,000 people. There are about 30 British experts who had already said that they wanted to end their contracts and who must therefore go by the end of the year. There are another 30 lecturers at Makerere university who had hoped to go at the end of the academic year in March, but who may now be forced to break their contracts and leave prematurely with only £50 in their pockets. And there are a handful of Britons in the civil service who may also be affected. They are, in effect, being robbed of their savings.

General Amin has also said that the government will not renew the licences of certain foreign trading companies next year, and he has ordered foreign banks to transfer blocked accounts—most of them belonging to expelled Asians—to Ugandan-owned banks. But, that apart, most of his Sunday night broadcast consisted of name-changing edicts and rantings which were accurately described by Sir Alec Douglas-Home on Tuesday as historical travesties. What General Amin has done got him called a "black Hitler" again by Mr Jeremy Thorpe on Tuesday. Well, maybe: but the scale is different, and the question remains whether Britain today has the power to do anything about this miniature international abomination. The vituperation directed at General Amin from all British parties was even better justified by his earlier actions than by his latest ones. It seems to reflect the helplessness that Britain feels when it comes to dealing with a dictator in a small African republic. After all, even if Britain had the troops to spare from Ulster for an intervention in Uganda, it would be unlikely to judge the rectification of General Amin's injustices worth the row that would be caused by moving against even this most embarrassing of Africa's leaders.

But there are a number of alternatives. The first and most obvious, if not most terrifying, is to raise the matter at the United Nations, and this the Government has said it will do. But General Amin has shown that he cares little what is said about him beyond his borders, and he has little reason to fear even hurtful words from most Africans at the UN. He would be no more embarrassed, anyway, than are the leaders of South Africa and Rhodesia. And since the UN, even if it were

so minded, has no power to intervene in Uganda its condemnation of General Amin would count for little. Cutting off aid is more painful, and Britain has already done what it can here. The £10m development aid that was promised to General Amin after his triumphal visit to London in July, 1971, has been cancelled, and Britain has said that it will no longer top up the salaries of Britons doing aid jobs in Uganda when their contracts expire. This means that Britain is providing only very small amounts of money, mostly to British firms completing contracts started two or three years ago.

But even if there were more aid that Britain could cut off, the desirability of doing so would be debatable: aid is given, not to General Amin, but to the people of Uganda, and to the extent that it actually gets through to them it is an admittedly small bit of succour at a time when they have to endure his misrule. This consideration applies equally to the alternative measure of lobbying other aid givers, such as the World Bank, to hold off too. And there is the additional worry that a total boycott by western countries might drive Uganda farther into the arms of fundamentalist Moslems like Libya's Colonel Qaddafi, with whom the general has already struck up a close friendship.

He still has hostages

There is a further difficulty. It seems that General Amin's move against the British aid staff—most of whom are teachers and are therefore unlikely to be milking the country very wholeheartedly—was largely prompted by Britain's decision not to supplement their salaries. Any attempt to put pressure on General Amin runs the risk of provoking him to retaliate yet again on the British citizens and property that remain in Uganda. This is really at the root of the problem, for General Amin still has many unpleasant things he can do. He can incarcerate, exterminate or expropriate anyone or anything British still in Uganda, which amounts to about 3,000 people and, taking into account the blocked assets of the British Asians, quite a lot of cash. So far the general has respected British lives, if not British property, more carefully than he has those of fellow-Ugandans. Sir Alec does not want to have to wonder what he could do, and be told there was nothing much, if British citizens started disappearing as many Ugandans have.

Perhaps the only action that Britain could take without jeopardising the safety of its citizens—and even then it might—would be to press for the expulsion of Uganda from the Commonwealth. Its membership could be renewed if a better leader came to power and wanted it. But by his recent actions General Amin has shown that he cares little for the principles that the Commonwealth supposedly stands for. Just possibly, if the general defaults on compensation or on the transfer of assets, it might be possible to freeze or expropriate Uganda's small remaining sterling balances. This would have to be done within the context of international law, but it might prove to be one way of settling with General Amin. It is not much; but Britain might as well realise just how little power it has in the face of even an Amin.

UNITED KINGDOM

The Motor Industry

The measures taken by the Government to stimulate the sale of cars were successful, and brought about a very high increase in demand in the United Kingdom during the year covered by the Accounts. Registrations reached a total of 1½ million, 36% higher than the previous year, which compared with a 15% increase in France and an actual decline in Germany and Italy.

The British industry produced a record total of 1,850,000 cars in the year, an increase of 208,000 over the previous year.

Heavy commercial vehicle sales to the home market continued at the depressed level of the previous year, reflecting the lack of expansion in industrial activity generally. The demand for tractors both at home and overseas continued to be weak.

Nevertheless, the United Kingdom still succeeded in exporting some 65% of its total diesel engine production, either directly or fitted to British built vehicles and tractors. Britain still remains the world's largest exporter of multi-cylinder diesel engines, nearly all of which are fitted with fuel injection equipment made within the Lucas Group.

The Aircraft Industry

Last year's report referred to the re-organisation and rationalisation of our companies engaged in the development and manufacture of aircraft equipment. Sales of the Group have been increased, but more importantly the business has passed from being a loss-maker into a profit earner.

The critical aircraft programmes on which so much of our business depends have strengthened considerably during the year and provide a much more encouraging outlook.

Industrial Products

Sales and profits of industrial products were lower than in the previous year as these items of equipment are mainly associated with the building of capital goods for which the demand has been low. There is, however, now some small sign of revival in this field.

OVERSEAS

Our businesses overseas have made good progress in a year when trade has been difficult in many countries. Total sales amounted to some £63m.

In Australia we continue to face severe competition but have nevertheless made good headway.

In India, our partnership companies have had another very successful year and their business continues to expand steadily.

In South America two significant new investments have been made – a 30% interest in the successful brake manufacturing business of Maquinas Varga SA, and a 45% interest in an important producer of batteries, Acumuladores Vulcania SA. Further investment opportunities in this thriving market are being investigated. Meanwhile our long-established factory in Brazil has had a successful year. The business in Argentina is performing well and our Mexican interests are making progress.

EUROPE

Our operations in Western Europe continue to expand and now represent a very important part of our business. Turnover last year amounted to £64 million. It is our policy to continue to strengthen our position in Europe as opportunities arise. Factories and sales centres on the Continent will strengthen our position with European customers and will facilitate the sale of United Kingdom manufactured goods in those growing markets.

PROSPECTS FOR 1972/73

The measures taken by the Government to expand the economy have already shown results in the increased demand for consumer goods, and during the year we have seen the much higher sales of cars in the United Kingdom. The benefits have been slow to appear in other parts of the economy and it is only now that a wider based expansion is beginning to emerge. The demand for commercial vehicles is beginning to rise whilst the output of tractors in the United Kingdom strengthened earlier this year.

The United Kingdom aircraft industry is now much more settled than it was a year ago, and we expect continuing benefits from the rationalisation of our own aircraft business which was commenced last year with the formation of Lucas Aerospace Ltd.

We consider our companies world-wide are well placed to take advantage of any opportunities, and we expect them to continue the steady progress that has been made in recent years.

BRITAIN

Beware the eighth of March (or possibly the fifteenth)

It looks as if Mr Wilson is bracing himself for the black-day-for-Labour headlines to be appearing on March 9th—or the 16th at the latest. That will be the day after Labour will probably have lost the Lincoln by-election, possibly lost Dundee East and held Chester-le-Street with a reduced majority.

Mr Wilson will find it difficult to avoid either March 8th or 15th for his three outstanding by-elections for three reasons. First, they are the earliest days on which elections can be held following publication of the new electoral register in mid-February; and a fresh register helps Labour, because the Tories are so much better at mobilising the large potential postal vote on an old register.

Second, if Mr Wilson does not hold his by-elections in March he will run the risk of getting them mixed up with the campaign for the local elections. Not only would this cause a high degree of confusion, but it would also make it impossible for the Labour party to borrow agents from other constituencies for the by-elections.

Finally, Mr Wilson will probably decide to hold his by-elections on a single day for the same reason that Mr Heath decided that both Uxbridge and Sutton and Cheam should poll on December 7th. If things go wrong, it is better to get all the bad news over on a single day rather than getting a string of disasters at regular intervals. The last person to ignore this golden rule of politics was Mr Harold Macmillan in 1962; and no one is particularly keen to repeat that experience.

Mr Wilson can have no illusion that these by-election results will be other than very nasty for Labour. Either Mr Dick Taverne, the former Labour MP now running as Democratic

Labour, or Mr Jonathan Guinness, the Tory, will win Lincoln, and there are now growing fears in the Labour party that the Scottish Nationalists may win Dundee East, which Mr George Thomson is giving up on his appointment as a common market commissioner. By an act of astonishing folly, the local Labour party chose a Sheffield councillor as its candidate, rejecting by a slim margin the able Mr Donald Dewar, formerly MP for South Aberdeen. Mr Dewar was rejected partly because he was a middle-class intellectual and apparently reminded a number of people of the late John Strachey, a former Dundee MP, but also because he was suspected of being a pro-European. Now the local left-wing unions have got their way and have a left-wing working-class candidate from England who is hostile to Europe; unhappily for them they may end up losing the seat as a result.

Although the Nationalist candidate forfeited his deposit at Dundee East at the last election, this time the Tory there could find himself in the same position as the Labour man at Sutton and Cheam whose supporters deserted in large numbers to the Liberal in order to throw out the Conservative. This time the Nationalist could be the beneficiary; all that is certain is that there is little likelihood that the Liberal in Dundee will even save his deposit.

The only by-election that Mr Wilson can be totally confident about is Chester-le-Street in County Durham, where Labour has a 20,331 majority. Although the Liberals are fielding a candidate there as well the only interest will be whether they succeed in driving the Tories to the bottom of the poll. But although Mr Wilson can be certain of holding the seat with the greatest of ease, he may not be

unduly joyful about the local party's choice at the weekend of Mr Giles Radice, the head of the research department of the General and Municipal Workers' Union. Mr Radice will be a good candidate, and he will make an admirable MP. But he also happens to be a strong Jenkinsite.

Ulster

How to take fear out of court

If certain of the changes in legal procedures in Northern Ireland recommended on Wednesday by the commission under Lord Diplock, a former lord justice of appeal, were intended to be permanent there would be cause for some serious misgivings. But the point of the commission is that it was set up to consider a specific and abnormal problem, how to deal more effectively with terrorist organisations at a time of emergency. As a means to that end, its proposals were rightly welcomed by Mr Whitelaw on behalf of the Government.

The context in which the commission went to work was, on the one hand, the certainty that terrorists, particularly those planning and directing terrorist activities but not necessarily taking part in them, were going free, and, on the other, the Government's wish not to continue with internment. The report

Diplock: emergency report

concludes that detention will still be needed to deal with some cases. It considers that under the 1972 order governing detention the safeguards against abuse of the power to detain and against mistakes of judgment are very much better than they were. But because the risk must exist of an innocent man being deprived of his liberty by a commissioner or tribunal sitting in private, the commission looked for ways to bring more suspected terrorists before ordinary courts of law.

The reason why detention proceedings are held in private is the same reason why men the security forces are sure are guilty are acquitted by ordinary criminal courts: intimidation. Witnesses are afraid to give evidence; jurors are afraid to convict. "The jury system as a means for trying terrorist crime," says the report, "is under strain. It may not yet have broken down, but we think that the time is already ripe to forestall its doing so."

So the commission recommends that in cases involving certain terrorist crimes—and only such cases—juries should be done away with and trials should be by a judge of the high court or a county court judge sitting alone. Normal rights of appeal would remain and so would the usual rules of procedure and evidence subject to certain changes. These changes are proposed because of the impossibility of devising any method by which witnesses can come to court to give evidence without endangering themselves, and to diminish the advantages enjoyed by an accused person under normal court procedure.

First, if there are good reasons why a witness cannot be produced in court but has made a signed written statement to anyone investigating an offence that statement should be admitted as evidence. Next, a confession made by the accused should be admissible unless obtained by torture or by inhuman or degrading treatment and the judge would determine how reliable it was. Then, in cases involving possession of firearms and explosives, the commission recommends that the onus of proof should be altered. It would be up to a person found in suspicious circumstances to prove he did not know the arms were there and had no reason to suspect they were there.

The Diplock commission also recommends that no bail should be granted except by the high court and then only if the applicant meets several stringent requirements. It also recognises the difficulties ordinary soldiers experience when trying to comply with the

requirements of the existing law in making arrests and proposes giving the armed services the power to arrest suspects and detain them for up to four hours solely to give them the chance to identify them. Lastly, the report recommends changes which would make it possible to deal more effectively with young terrorists, including the building of a secure unit to take up to 100 juveniles between 14 and 16. The commission describes the need for such a place as immediate and confesses itself "frankly appalled" at the apparent lack of any sense of urgency. That, at least, should now be corrected.

Parliament

Little to cheer about

MPs of both major parties dispersed from Westminster on Friday in a rather subdued mood. They had experienced a thoroughly bruising few weeks since the opening of the new session of Parliament; the only people who had any reason to look back with relatively unqualified pleasure were the handful of Liberals, who had at least picked up a couple of by-election seats from their opponents.

Labour is in worse shape than the Government, but the Tories have had a fairly wretched time. The Home Secretary, Mr Robert Carr, and the Chief Whip, Mr Francis Pym, suffered a painful setback on the floor of the House when they were defeated on their immigration rules, and the final act of this drama has not yet been written. And Mr Heath and his Chancellor, Mr Barber, had their injudicious pledges of the past on the wickedness of a compulsory prices and incomes policy rammed down their throats when they introduced just such a policy last month.

Nevertheless, despite these parliamentary problems for the Government, the Labour party is still racked with dissension over Europe and has been unable to take advantage of the Government's difficulties. Mr Wilson has not regained his touch, and on almost every occasion he has engaged Mr Heath in debate he has been badly defeated. Mr Denis Healey, the shadow chancellor, has been disappointing; he still seems incapable of getting to grips with his new responsibilities.

Even more surprisingly Mr Foot, who was a dangerous man when he sat on the front bench below the gangway,

has been ineffective. Mr Foot now sounds rather shrill and petulant. On Tuesday night, he was reduced to making a spiteful personal attack on Mr Peter Kirk, the gifted ex-junior minister who will be leading the Tory delegation to the European parliament in Strasbourg. The grounds for Mr Foot's attack were that Mr Kirk is receiving some financial support from the European Movement. It does seem a little harsh for Mr Foot to become quite so indignant about the European Movement's funds, remembering the devoted fundraising activities on its behalf by Mr Wilson when he was prime minister.

On the Labour side of the House the only two members of the shadow cabinet to emerge with their reputations enhanced have been Mrs Shirley Williams, the shadow home secretary, and Mr Reg Prentice, the employment spokesman. On Monday, Mr Prentice again showed his political courage during an arid little debate on the infiltration of extremists into the trade union movement. After one or two rather silly speeches from the Tory back benches, Mr Prentice had to put up with a great deal of barracking from a clique of left wingers led by Mr Eric Heffer and Mr Orme. The parliamentary Labour party has deteriorated to such a degree that it is now regarded as provocative to say, as Mr Prentice did with some vigour, that Mr Scanlon and the engineering workers are behaving less than sensibly in refusing to put their case in the Goad affair to the industrial relations court. The emergence of Mr Prentice has been the best thing that has happened to the Labour party for a very long time. All that is sad is that the courage Mr Prentice shows is regarded as unfashionable by so many of the men who sit beside him on the front bench.

Prentice: Labour's best find

Eurobraz

has come a long way in a short time

Millions of
\$U.S. Dollars

The European Brazilian Bank was founded as recently as April 1972, with the aim—among others—of raising capital, in the European market, for investment in Brazil.

And already, funds of \$US 100 million have been provided for projects being undertaken by the Central and State Governments and industry.

The Bank's first eight months, in short, have been a notable success.

We should like to take this opportunity of thanking the financial community who have helped us to exceed our forecasts so substantially.

And to make it clear that we expect to be going even further in the near future.

Race relations

After Loughborough

Mr Kenneth Robinson did some smart work and on Tuesday produced his report on the dispute at Mansfield Hosiery Mills only four days after his inquiry ended. This strike by 400 Asian workers has taken the lid off labour and race relations in the Midlands hosiery industry.

At this Loughborough knitting factory all the (low-grade) "bar-loaders" were Asians but none of the highest-grade knitters were. The bar-loaders struck on October 3rd over a pay claim and were joined by other Asian (mainly Indian) workers. But it became clear—partly through the Race Relations Board which was meanwhile examining complaints of discrimination—that the real grievance was lack of promotion opportunities for Asian workers into higher grades. When two were proposed by management as trainee knitters, white workers threatened to strike—as they had done over the same issue in 1962 and in 1969 though slight progress had been made since then.

It became clear that the union had connived at the situation and allowed shop floor representation to become a skilled white caucus. The Indians, few of whom speak proper English, remain woefully ignorant of industrial bargaining procedures and felt, with some justification, that the union was only obstructing their cause. The strike was made official only when the company went out and recruited 41 white workers into the very positions—trainee fully fashioned knitters—the Indians were after. But even then white workers were allowed to stay in, and did. The dispute began to be a focus for extremists, and television cameras picked up some ugly scenes between supporters of the strikers and their opponents. A local paper, the Leicester Mercury, which has been violently anti the Ugandan Asians, did not help.

As Mr Robinson says, the most important thing to come out of his inquiry was the declaration by the management that they wished "to recruit and train knitters on merit and regardless of race, colour, creed or ethnic or national origin. The company will do this tomorrow if the union and its membership will give it their support." The union, too, is now making the right noises. Both have agreed a 10-point plan for ending the dispute

Robinson: who picks knitters?

which includes a £1-a-week rise for the bar-loaders, and which is endorsed by Mr Robinson save in one respect. The plan to promote a quota of eight Asians as trainee knitters (which might anyway be against the Race Relations Act) should, he says, be replaced by a new training agreement. Personnel and union functions should be developed.

The thorny question is the future of the 41 white knitters recruited during the strike. Mr Robinson says they should be put, along with any Asians, into a pool of applicants for these and a few other similar jobs within the group, but should not end up worse paid than now. How will the Asians stand when competing with people who will have completed their six weeks' training by now? The strikers may yet feel that the proof of the pudding is in the eating, and on Thursday night they were deciding whether to continue the strike on this issue alone, although in general they feel they have won their case.

Some people believe Mansfield Hosiery to have been relatively enlightened in its policies compared with some of its competitors in this notoriously badly organised industry. A Runnymede Trust investigation into the hosiery industry, carried out before the strike, revealed a chaotic wage structure that tended to put both coloured workers and women at a disadvantage (some earned less than a third of the top rate for the job). The "cream" jobs were nearly all held by whites. The union was inactive and undemocratic and no joint consultation existed between management and union. There is plenty to be revealed if the Government decides to take up Mr Robinson's idea of an inquiry into industrial relations in the entire knitwear and hosiery industry. But then

this is certainly not the only industry which has relied on cheap, uncomplaining immigrant labour. And even an inquiry will not do much to shield immigrant workers from their vulnerable position in an industry that is shedding unskilled workers fast and cutting down its demands for skilled ones too.

Contraception

Yet more confusion

The year of the contraceptive, which began with a group of doctors emphasising the dangers of an overpopulated Britain and the second reading of the vasectomy bill, is ending with a Government defeat in the House of Lords on the question of a completely free family planning service. Their lordships were debating the committee stage of the National Health Service Reorganisation Bill and had reached the clause that places a duty on the Secretary of State to make arrangements for the giving of contraceptive advice and the availability of supplies. In its original form the clause enabled charges to be recovered for any treatment given or articles supplied (though not for advice), but the Lords carried an Opposition amendment stipulating that no charges should be made.

The Government may seek to put back the original words when the bill comes to the Commons. Or it may, given the confusion that Sir Keith Joseph's statement on family planning services last week seems to have induced, decide that a completely free service is the only logical course. At present there is little uniformity among local health authorities about what they charge for. A handful provide a completely free service, including supplies to all their own residents, whether contraception is necessary on medical grounds or not. (The London borough of Hammersmith provides completely free supplies to everyone.) A few more give free supplies to everyone, but only where medical need is established. Others give free advice and free supplies for medical cases but only to their own residents. A few restrict their advice to the married. And so on: the combinations are seemingly endless. And besides the local health authority services, run by themselves or through the Family Planning Association, there are the advice and supplies provided by general practitioners and by some

hospitals for their maternity or abortion cases.

In all this diversity Sir Keith Joseph's proposals are intended to produce some uniformity. When the local health authority services are taken over by the new area health authority services in 1974, more clinics are planned and a comprehensive service of advice will be available free to everyone. General practitioners will be brought into line with the clinics. At present, though their advice is nominally free to all their health service patients, they can charge for writing a prescription for supplies, unless contraception is necessary for medical reasons—in which case the woman gets a health service prescription and pays the standard charge of 20p, unless, again, she is exempt.

Sir Keith proposes that this private fee for prescribing should be replaced by a fee from taxation. He has also added some new categories for free supplies whether obtained on prescription from a doctor or through a clinic: those who have "a special social need" and those who have had a baby or an abortion within the previous year. So what it all amounts to, or was intended to amount to at the beginning of this week, is that advice and services (ie, prescribing) would be free to everyone; that supplies would be free to some indefinitely and to others for a year; that some (general practitioner medical cases) would pay the standard prescription charge for supplies; that all others would pay the full cost for them. Is it surprising that the Lords, in the light of the money that can be spent on an unwanted pregnancy, thought that all distinctions should be abolished?

Personal injuries

It all hurts

The immediate inspiration of the Government's decision to appoint a royal commission on civil liability and compensation for personal injury under the chairmanship of Lord Pearson has been the thalidomide cases. But it certainly did not dream up the idea unprompted. Back in the 1960s, there were already demands for a royal commission to consider the setting up of a comprehensive insurance scheme for all kinds of personal injuries.

This idea was excluded, however, from the terms of reference of the Winn committee which reported in 1968, and the Law Commission did not even succeed in gaining approval

Pearson: sorting out the injured

for including in its programme an investigation into the principles governing liability for accidents. The Robens committee on safety and health at work, which was appointed in 1970 and reported last July, could only mention the general issue.

The Prime Minister's statement to the House of Commons on Tuesday contained no whisper of the idea of a state insurance scheme; but the royal commission can hardly avoid at least discussing it. Permission to do so must be implied by clause (e) of its not-altogether-clear terms of reference. These first cover, specifically, injuries suffered in employment; on other people's premises; on the roads or other means of transport; or through the manufacture, supply or use of goods or services; or (e) "otherwise through the act or omission of another where compensation under the present law is recoverable only on proof of fault or under the rules of strict liability." Proof of fault is necessary if one brings an action for negligence; but employers, occupiers and car drivers also have various statutory duties. If they injure someone while in breach of these, it is not necessary for the injured person, in order to claim damages, to prove that they were also negligent. The defendant has a "strict liability"; there are also some strict liabilities laid down by common law.

But what happens to the injured person if no one can be proved to have been negligent, or in breach of a statutory duty? (It is perfectly possible for this to happen in, say, a road accident.) The injured person gets nothing. Again, it is no good suing someone for negligence if he has no money to pay. Employers and drivers, and most householders, are insured (and the Motor Insurers Bureau plugs at least one gap). The Criminal Injuries Compensation Board now exists to pay out to those injured by criminals, who are seldom

worth suing. But other people can cause injuries. While some sufferers are entitled to large sums in compensation and others to nothing, there is bound to be a demand for a state insurance scheme which will compensate each equally. One can insure against all kinds of personal liability, and a major (and expensive) reform would be to insist that everyone should do so.

But even that would not eliminate all unfairness. What about injuries caused by children, whom the courts are obviously reluctant to find negligent, however much they may be at fault? What about injuries which are nobody's fault? What about self-injury? It is perfectly possible for employers, occupiers and so forth, even when in breach of statutory duties, to reduce the total of damages they owe by proving contributory negligence on the part of the plaintiff. One MP, Mr Ivor Stanbrook, undoubtedly spoke for a strong strand of opinion when he asked the Prime Minister "to bear in mind that it is undesirable in principle for the state to try to absolve every individual from the consequences of his own foolishness." There are strong objections to a blanket insurance scheme; even a "no fault" car insurance scheme would greatly increase motorists' premiums. And even if all the injuries caused by the actions or inaction of other people were covered by a vast and comprehensive state insurance scheme, there would still remain the injuries right outside the commission's terms of reference, caused by natural disaster—or, for that matter, by disease.

Even without considering such grandiose schemes as state insurance, there will be plenty for the commission to discuss. Mr Heath, who seemed to have been badly briefed, had not apparently heard of the Law Commission working paper on one particular, vitally complicated aspect: the methods of assessing the amount of damages granted in personal injury cases. He did, however, announce that another area of difficulty which has complicated the thalidomide cases—whether children still unborn have a cause of action—is to be referred to the commission. There is another possible reform which would have done much to strengthen the hands of the consumer: a creation of something analogous to the contractual duty between retailer and purchaser in the relationship between manufacturer and purchaser, so that the latter would automatically have an action if he was injured by any goods not "reasonably fit" for the purpose for which they were made.

THE WORLD

International Report

First the left, now the centre: gaullism's no longer France

FROM OUR PARIS CORRESPONDENT

The French learned at last on Wednesday when they will vote: the first ballot will be on March 4th and the run-off on the 11th. But how will they vote? Monday's *Aurore* carried an opinion poll confirming the bad news for M. Pompidou conveyed by *Le Figaro's* poll a week earlier: 44 per cent for the Union of the Left, 39 per cent for the ruling majority and 17 per cent for the Reformists of the centre. The figures made nice breakfast reading for M. Georges Marchais, fresh from the Communist party congress which had confirmed him de jure in the general secretaryship which he has long held de facto. Yet they are not nice enough.

The Communists have come a long way since a year ago, when nobody, not even themselves, seriously imagined they could soon be in power. Even after their midsummer agreement on a programme of government with the Socialists, many commentators imagined that the latter at least were not thinking seriously of the coming parliamentary elections but of the presidential vote of 1976.

The opinion polls have changed all that. But they have also proved wrong the many people, including your correspondent, who doubted that the Reformists, however worthy their ideas, could be taken as a serious electoral and perhaps parliamentary force. Now the Reformists are showing their strength—and their growing readiness, being still vigorously anti-communist, to elbow out the left by joining in a government of the centre-right.

In short, the 44 per cent of M. Marchais and M. Mitterrand is not enough. Hence the theme of the Communist party congress: not just a union of the left, but a popular union to which all good democrats are invited to subscribe. Hence in turn the tone of

M. Marchais's five-hour address to the congress: this, he said, was not the party of the raised fist but of the outstretched hand. Hence his repetition of the fairly extensive promises of democracy contained in the joint programme of government, his assurance that for the Communists "socialism and democracy are closely linked" and that "socialism is based on the effective participation of the popular masses in the running of society."

In sum, no dictatorship, no imported Russian model of socialism—M. Marchais said as much, minus the adjective—in France. It is essential for the Communists that this should be believed. The fear of tyranny, of another Prague, 1948 version, has become the theme song, for lack of better, presumably, of the battered gaullist section of the majority.

The past 10 days, indeed, have produced the curious position that, verbally at least, the Communists seem readier to accept the rules of democracy than the gaullists. When the legislature has run its term, M. Jacques Duclos, the party's last presidential candidate, told a business audience on Tuesday, it will be up to the people to judge. It was a striking contrast to the television declaration of M. Pierre Messmer a week earlier. The new government, said the prime minister, "will be formed in the light of the policies of the president of the republic, not of this or that electoral combination." Vote, good people, but M. Pompidou won't necessarily take any notice of you.

This conforms to the longstanding gaullist theory that gaullism is France and that an alternation of power is therefore unnecessary: men like M. Debré have put it in as many words. It also conforms to M. Pompidou's own view, expressed in his September press

Marchais tries to look democratic

conference. Talking of an electoral victory for the left, a journalist was saying, "I won't ask whether you'll then appoint X or Y [presumably Marchais or Mitterrand] as prime minister," when M. Pompidou broke in. "Neither X nor Y," he said.

The implication that the president would simply install a minority government, let the parliamentary crisis come and dissolve the assembly when it did, is probably true and has some constitutional logic behind it. But M. Messmer can hardly have been surprised to be attacked on the more basic constitutional ground that sovereignty belongs to the people, or to hear the secretary-general of his party this week virtually disavow him. Of course the president will take account of the electoral results, said M. Alain Peyrefitte.

In practice, he shouldn't find it difficult, since it will probably mean no more than some tolerable changes in policy and a few Reformist ministers. The Communists' problem today is first to convince the many people who want a change that such modest change is not enough, and second that their party is fit to be partly in charge of a more radical one. And it seems they have not yet convinced even the Socialist

electorate. Only half of it, according to the Figaro poll, would switch its support to a Communist candidate in the second round, under France's two-round voting system whereby the backrunners in the first round are eliminated.

Perhaps it was not as surprising as one might think that the senate this week was unanimous in voting that publication of opinion polls should be banned during the election campaign. Here the politicians appear to agree: truth, as ever, has something embarrassing for all of them.

Germany

Mitbestimmung, no less

FROM OUR BONN CORRESPONDENT

Before going off to the Canaries for Christmas to bask in the thought of an election well won, Willy Brandt has made it clear what the first priorities of his new administration are. They are unavoidably domestic. There is a backlog of domestic legislation that never got through the last parliament for the very simple reason that government and opposition were deadlocked. This week the Bundestag was completing the bizarre process of shoving through the 1972 budget (civil servants have in the meantime been paid out of a special fund), only to contemplate work almost immediately on the 1973 budget.

During his holiday, Herr Brandt will be thinking about the speech laying out the government's proposals for the next four years which he is due to deliver on January 18th. That speech will be keenly analysed for the degree of agreement, or the lack of it, reached by the chancellor's Social Democrats and his Free Democrat coalition partners on domestic legislation. The interest of industrialists and trade unionists is centred on one thing. They call it *Mitbestimmung*, the process whereby employers and employees are represented on the supervisory boards of management in industry.

In the coal and steel industries, workers and managers are equally represented on these boards. The Social Democrats want to spread this parity to the whole range of industry. The trade unions, which gave their full support to the chancellor during the election campaign, are hoping that he will announce specific plans for extending the parity principle to every firm employing more than 2,000 workers or having a turnover of

£20m. The Free Democrat party has other ideas. It rejects the principle of parity and advocates instead that supervisory management boards should comprise four workers, four managers and two "executives"—with the executives, so the trade unions suspect, taking the managers' side in any argument.

This issue is probably the most serious difference of opinion between the two coalition partners. It is important to resolve, not only for domestic political reasons but also to protect Germany's reputation for excellent industrial relations. What seems all too likely is that the problem will be shelved.

Italy

Valpreda's law

FROM OUR ROME CORRESPONDENT

Signor Valpreda and three other Italian anarchists should be able to leave prison before their trial at Catanzaro in March because of an important amendment to the penal code which came into force this week. The anarchists are accused of placing the bombs which exploded on December 12, 1969, in Milan and Rome causing the death of 16 people and the horrible mutilation of several others. They have been in prison for three years while one assize court after another has argued its way out of handling their trial. Various appeals for their release pending trial had to be refused because the law as it stood did not empower the magistrate to use his discretion when the offence called for obligatory arrest.

The amendment to article 227 of the penal code revoking this rule was hurried through parliament unquestionably in order to placate the displays of indignation aroused by the Valpreda affair. There have been marches and hunger strikes for his release and, on December 12th, the third anniversary of the bombing, demonstrations and rioting. Naturally, the minister of justice, Signor Gonella, insisted that his bill was simply part of the overhaul of the penal code which has been in committee stage in parliament for five years. Hundreds of people besides Signor Valpreda will be affected by it and one man has already been released.

But this does not alter the fact that it was strong public feeling about Valpreda which obliged the government to take the initiative out of the hands of the Communists and Socialists, who had presented their own

The rioters made their point

amendments. It is alleged, too, that some discreet pressure was brought to bear upon the government by President Leone himself. Parliament passed the amendment in record time and, significantly, it was approved by all parties except the far-right Italian Social Movement.

Italy's two sets of penal codes are relics of the fascist era. But they have been so useful that in 25 years no democratic government has found the will to reform them, although it was widely admitted that both codes conflicted with the spirit of the constitution. Had it not been for the reaction to the Valpreda affair even this minor reform would probably still be stuck in committee. And its momentum carried over: on the day the amendment went through, parliament also approved a new law legalising conscientious objectors and giving them an alternative to the army.

Ireland

Ouch!

FROM OUR DUBLIN CORRESPONDENT

Special Branch men are no more loved in the Irish republic than anywhere else. But they have been the object of more criticism than usual this week. On Thursday two men appeared in court in Dublin charged with offences under the Official Secrets Act. So much secrecy surrounded the event that very little was known for certain, but there was speculation that one of the defendants was a member of the Irish security police and that the case centred on the unauthorised passing of information between men in the Irish and British security services.

Was O'Connell given the slip?

The Irish Special Branch had already drawn attention to itself earlier in the week. Few would believe it could have bungled things so ineptly—unless it was deliberate—in its attempt last Sunday to arrest Mr Daithi O'Connell, the vice-president of the Provisional wing of Sinn Fein, and the man most frequently mentioned in speculation about the succession to Mr Sean MacStiofain as chief of staff of the Provisional IRA. According to his wife, Mr O'Connell was approached by a Special Branch man after leaving the inaugural meeting of the Irish Civil Rights Association, an organisation whose leaders include many people identified with the Provisional Sinn Fein. With her help and that of others, the Special Branch man was pushed aside, and while he ran for help Mr O'Connell made off in a car.

Two alternative explanations have been put forward for the episode. One suggests that Mr O'Connell was deliberately let go because the authorities, although wishing to appear to be making use of their new powers against suspected members of illegal organisations, do not want at the same time to jeopardise the Christmas truce in Northern Ireland which Mr O'Connell is said to be negotiating. His reputation is that of a moderate who would prefer a political to a military solution in the north.

The other theory is that the supposed arrest was faked by the Provisionals to steal the headlines from the week-end's annual convention of the Official wing of Sinn Fein. Last year the Provisionals reissued an old policy document with the same end in view. And this year the meeting of the Irish Civil Rights Association seems to have been timed to take attention from the

Officials' convention. Certainly antagonism between the two Sinn Fein organisations is growing, and the Provisionals might have used this occasion to underline it.

The Special Branch gave the civil rights meeting close attention and Mr O'Connell could easily have been picked up had the decision been made to do so. No attempt was made to seize Mr Ruairi O'Bradaigh, the president of the Provisionals, who was also at the meeting. But Mr O'Bradaigh's brother, Sean, said that members of Sinn Fein are being kept under surveillance and the homes of younger members searched.

Greece and Turkey

Neighbours in the pillory

The governments of Greece and Turkey, countries which belong to Nato and aspire to full membership of the European community, are both under attack for their policies of imprisoning people for their political views. This is nothing new for the Greek regime, which during its five and a half years' existence has faced bitter criticism for depriving the Greek people of many of their civil rights, and more subtle pressures from its western allies to liberalise its rule. But it is a new experience for the present Turkish government.

The campaign for the release of all political prisoners in Greece was launched in London on Tuesday by a committee of Greek exiles led by Lady Fleming and Mrs Helen Vlachos. Similar movements are being organised elsewhere in western Europe. Had the Greek prime minister, Mr George Papadopoulos, done what it was hoped he would do when he addressed the Greeks last Saturday, the committee would have had the ground cut from under its feet.

But Mr Papadopoulos's Christmas offering was a meagre morsel. There was no mention of an amnesty: his only tangible concession on prisoners was the release of nine men who had been exiled to distant villages by administrative decrees. Among them is Mr John Pasmazoglou, who negotiated Greece's association with the common market and was a strong critic of the regime's economic policies. The prime minister did, however, promise that some 250 prisoners held for political offences may now appeal to a higher military tribunal for a review of their

sentences. This could mean that some who were given long terms of imprisonment in the regime's early days will have their sentences reduced.

Last weekend the Athens newspaper To Vima published a list of all these prisoners. Out of 255 convicted persons, 29 are serving life sentences, 111 sentences of 10-25 years, and 115 terms of less than 10 years. A further 35 have temporarily been released on health grounds and 23 are still awaiting trial. Five foreigners (four Germans and an Italian woman) have been told they may apply for expulsion. The one man who will not be allowed to appeal is Alexander Panagoulis, the former army officer who was sentenced to death, afterwards commuted to life imprisonment, for desertion during a state of emergency and for attempting to assassinate Mr Papadopoulos. He has been held by the army in solitary confinement for four years. His younger brother, Stathis, was lured back to Greece last August and then arrested. No charges have been brought against him and nobody has been allowed to visit him since then. His family fear he is being subjected to the torture his brother is said to have suffered.

The committee working for the release of the Greek prisoners refuses to make any distinction between those convicted of crimes involving violence and those who have merely talked too much or protested too openly. It asserts that, since the Greeks have been deprived of political rights, all politically motivated acts, whether violent or not, are legitimate. This view is not shared by Amnesty International, which does not regard those who have been convicted for acts of violence, or for advocating violence, as true political prisoners.

It is Amnesty International which has drawn attention to the situation in Turkey—although it is still far from clear what the true position is. The Turkish government maintains that no more than 1,000 people are being held for what could be called political offences; other sources say the figure is nearer 12,000. Officially the parliamentary system continues to function in Turkey and new elections are due next October. But since March, 1971, military men have held a heavy stick over the government's head. Martial law is still in force in 11 provinces, all student organisations have been banned, the marxist-orientated Turkish Labour party has been outlawed and many of its leaders imprisoned, and a number of writers, professors, journalists and left-wing intellectuals have

been arrested.

Recently there have been allegations that the Turkish security forces have been adopting methods that were also alleged to have been used, at least until very recently, by the Greek military police to get information from detainees—beatings on the soles of the feet, electric shocks and sexual cruelty. A mission from Amnesty International, led by Mr Muir Hunter, QC, visited Turkey at the end of November and reported last week that it was convinced that the allegations were true. It was allowed to speak to only one of the 32 prisoners it had asked to see; the Turkish ministry of justice said it had no authority over the others, who were in military hands. The woman they did see, Mrs Necmi Demir, had not been harmed but she said she knew of others, including her husband, who had.

The Turkish government has been faced with a well-organised and ruthless campaign of urban terrorism aimed at overthrowing the structure of the state. There have been numerous acts of terrorism, including the murder of the Israeli consul in Istanbul, the killing of three Nato radar technicians (two British and one Canadian), the kidnapping of American servicemen and numerous bomb attacks and bank robberies. By comparison, the opposition to the military regime in Greece is mild; only one innocent person, a policeman, has been killed in bomb attacks.

The counter-measures in Turkey appear to be equally ruthless. The martial law commander in Istanbul has announced that 450 people are to be tried in connection with the Nato men's deaths. At the last meeting of the Council of Europe's political committee on December 13th the question of torture in Turkey was brought up. The Turkish foreign minister denied there was any truth in the allegations. The European Commission on Human Rights has not, as yet, been asked to investigate what is happening in Turkish jails. But the pressure is on.

Tunisia and Libya

The great fighter

President Bourguiba of Tunisia, despite his 70 years and recent illnesses, has lost none of his nerve. Last week-end he did what no other Arab leader has dared to do—he publicly cut Libya's President Qaddafi down to size. It happened in Tunis during

Qaddafi's up there in the clouds, says Bourguiba

Colonel Qaddafi's state visit. The Libyan guest had harangued the crowd for 90 minutes on the well-worn theme that the Arab masses were demanding the abolition of artificial frontiers and he gave warning of the grave consequences that would follow if their aspirations were not heeded. He ended by saying he was well pleased with conversations he had had with his host on the principle of Arab unity.

This proved too much for President Bourguiba. Although he was not scheduled to speak he took the microphone and made an impromptu address which will rank as one of the most notable of his career. Colonel Qaddafi, he revealed, had proposed that Tunisia and Libya should unite and had even offered him the presidency of both countries. "I am certain of his abilities and his devotion, but he lacks experience," the president said, and he then gave the 30-year-old Libyan a fatherly lecture on the realities of the Arab world.

He himself, he said, did not owe his power in Tunisia to a military coup but to half a century of struggle for national independence. He had based Tunisian nationalism on a change in the Tunisian way of thinking and Arab nationalism should similarly be grounded on a change in Arab mentality. The Arabs were lethargic and backward in science and technology. Unity on paper was worth nothing and true unity could not be achieved by wasting time on meetings. The way was through the progress made by individual Arab countries. And Mr Bourguiba had the temerity to remind his guest that some people in Libya were still living in the stone

age.

It would not have been surprising if Colonel Qaddafi had packed his bags and gone home after this homily, but he apparently took it in good part. Before he left he said that President Bourguiba had confirmed the picture he had had of him—he was a fighter. Arabs respected the experience of their elders and he would now meditate on what he had been told. Other Arab leaders may be meditating too.

Terrorism

No help from the UN

Anyone who imagined that the United Nations could make up its collective mind to deal effectively with the new forms of terrorism had the truth brought home to him this week. The General Assembly voted by 76 to 35 (with 17 abstentions, including France) to endorse the decision of the UN legal committee to refer all serious discussion of collective counter-terrorism to a new commission that will meet some time during the life of the next General Assembly. No date has been fixed.

The mood of the assembly was plain in its final resolution. Instead of condemning terrorism, the majority trained their guns on "the violence of the system," which mostly meant "the continuation of repressive and terrorist acts by colonial, racist and alien regimes." The irony of the fact that the Russians, the Chinese and the Iraqis (all of whom are fairly good at bashing their national minorities) sup-

PRIMITIVE?

Yes..... but, without their determination, efforts and imagination to achieve a better life, we would not be where we are or have what we have today. Today, tens of thousands of years later, we, at Mitsui Shipbuilding and Engineering, are making the same efforts, motivated by the same things.

True..... we get better results, more quickly because we have more knowledge and more advanced technology. And..... as long as mankind continues to look for an ever better tomorrow, Mitsui will continue to contribute toward that end, both on land and sea, with ever better products.

ported this motion seemed to escape most of the delegates. So the initiative of Mr Waldheim, the UN secretary-general, to get international action against terrorists who carry their quarrels outside their national frontiers or threaten the lives of outsiders has come to nothing, although the need for it is clear.

On Wednesday the men who kidnapped Mr Ronald Grove, the head of the Vestey group's South American operations, based in Buenos Aires, released him in return for a cash ransom. This followed exactly the pattern of the kidnapping last September of another company chief, Mr Jan van der Panne of Philips. The same revolutionary group—the trotskyite People's Revolutionary Army—was probably responsible for both abductions. It is helping to make the point that companies are often readier than governments to give in to political kidnappers or hijackers in order to avoid bloodshed.

Portuguese Africa Brewing up

Portugal's African wars have been back in the news this week. In Portuguese Guinea, on Africa's west coast, the Portuguese have launched an operation described as the biggest yet in their 10-year-old war against the nationalist guerrillas. Strikes by air, sea and land have been made in the southern part of the country, where guerrillas cross the border from the neighbouring republic of President Sekou Touré's Guinea. How much success they have had is not yet known.

On the other side of the continent the fighting in Mozambique, where guerrillas have recently penetrated for the first time into the central province of Manica e Sofala, is causing concern to the government of neighbouring Rhodesia. In response to the increased guerrilla activity, which the Rhodesians say is "splashing over" the border, Rhodesia has extended the length of its national service from nine months to a year.

The fiercer fighting in both Mozambique and Portugal's third African territory, Angola, is also worrying the South Africans. The chief of their general staff, Admiral Bierman, has just written a long appraisal of South Africa's defence problems in which he draws attention to the likelihood of an intensification of the guerrilla struggle in the Portuguese territories. Of course, the wars there might end if Portugal accepted the unanimous recommen-

Now it's a year for Rhodesians

dation of the United Nations Security Council on November 22nd calling on it to start negotiations aimed at giving the territories self-determination and independence. But so far there is no sign that Portugal is willing.

India

Every region for itself

FROM OUR INDIA CORRESPONDENT

The state of Andhra Pradesh in south India, home to 40m Telegu-speaking people, is caught up in a violent agitation which may split it in two. The irony is that Andhra was the first state to be set up in 1957 on the basis of a common language. If it breaks up, similar demands for creating new subdivisions are bound to be made elsewhere, jeopardising the whole system of linguistic states. This is why Mrs Gandhi is doing everything she can to bring the unrest in Andhra under control—so far without success.

There are historical reasons why the inhabitants of the dry Telengana plateau should be at odds with those who live in the fertile coastal plains. The plains people, once part of British India, had better economic and educational opportunities than the former subjects of the Nizam of Hyderabad. The two groups agreed to join together in unified Andhra state on the assurance that the Telengana plateau people would have prior claim on the resources of their areas and on government jobs for a specified period. Since the state

capital, Hyderabad, is part of the Telengana area, the Telengana people have had the lion's share of jobs there—which constitute 40 per cent of the state's employment—and the period of this monopoly has repeatedly been extended. But still they are not satisfied.

Mounting unemployment in Andhra, as elsewhere in India, makes the Telenganas anxious to retain their privileges. In a bid to find a compromise solution Mrs Gandhi agreed early this month to a further extension of the so-called Mulki rules, which require 15 years' residence for a job in Telengana. But this has so incensed people in the coastal districts that they are now insisting on separating from Telengana. All nine ministers from these districts have resigned.

The conflict within Andhra highlights the dangers India faces as the slow pace of economic development exacerbates social tensions. With many local groups trying to get a larger share of an ungrowing cake for themselves, narrow loyalties are coming to the fore and undermining the political cohesion which Mrs Gandhi restored to the country in the elections of 1971 and 1972. The Congress party in Andhra is badly divided along regional lines. And much the same is true of Assam, where the local Assamese population, 55 per cent of the total, feels that immigrants, mainly Bengalis, have cornered a preponderant share of jobs and other economic opportunities.

In an effort to put the newcomers at a disadvantage, the Assam government recently decided to make Assamese the sole medium of instruction in the state, although it allowed English to be used as an alternative for the next 10 years. Local Bengalis

Britain From Figures

The 1971 census was the most detailed ever carried out in the United Kingdom. It is unlikely that there will ever be another of the same size.

This 28-page Brief Book starts with this prime source of social statistics but makes use of the swelling annual volumes of statistics published by Government departments, together with sample surveys that support and may even replace the long census form.

What portrait does this mass of information provide? How fast is it changing?

greatly resented this move, and the resulting tension led to clashes between the two communities. A peace of sorts has now been restored but scores of Bengali students are sitting it out in Calcutta, claiming that it is unsafe for them to go back to their colleges in Assam.

Australia

All move round

FROM OUR CANBERRA CORRESPONDENT

The final results for the Australian election on December 2nd give Gough Whitlam's Labor government a majority of nine in the House of Representatives, equivalent to one of 45 in the much larger British House of Commons—comfortable, but not excessively so. It is not as large as predicted in the early stages of the counting, but it will serve. The Country party remains at the same strength as before, but the Liberal party has lost a significant number of seats. Its newly elected leader, Mr Snedden, an ambitious but largely untried and unoriginal man, must look for new ways of attracting the younger suburban voters of Sydney and Melbourne among whom the swing to Labor was greatest.

Since Monday, Mr Whitlam has at last had his ministry. The names of the 27 people appointed matter less at this stage than the substantial changes Mr Whitlam is making in the departmental structure. Six old departments are being abolished immediately, and seven more are to be phased out before long. No fewer than 16 new ones are being established. The process is essentially one in which sections of existing departments are moved around to modify old ones and form

It looks comfortable for Whitlam

new ones; nobody will actually be unemployed. There will, however, be much change at the top. The politics of Canberra's bureaucracy, always turbulent, is boiling just now, and the hot weather is not helping.

Mr Whitlam's ministerial team is hard to compare with past Labor ministries, since 23 years in opposition have been accompanied by social changes which themselves have affected the Labor party. There is the normal under-layer of men whose early lives were spent in the trade union movement, but there are 12 ministers with university degrees, including two medical doctors and two PhDs. In general the standard is higher than one might have expected after such a long period in opposition. The great majority of ministers are right-wingers in their party.

Like the Labor governments which took office in 1929 and 1941, this one faces a hostile majority in the Senate. It is possible that the prime minister, well aware of the difficulties experienced in the past, will aim at a confrontation with the Senate on a popular issue and then seek a double dissolution. Before this can happen, however, he must improve Labor's image in South and Western Australia, where there was actually a swing against it, and in Queensland, where it made too little headway for comfort. Special attention to these states' interests, especially in finance to relieve unemployment and stimulate development, is the obvious means to hand. In the meantime the briskness of the new broom is what the ministry will try to display. Mr Whitlam has already set a cracking example.

New Zealand

Norman the conqueror

The new Labour government in Wellington has got off to a brisk start. Mr Norman Kirk's cabinet has taken decisions to withdraw New Zealand's military training teams from Vietnam at once, and to end conscription. Mr Kirk has also announced that a contribution will be made to the United Nations trust fund for South Africa, which the defeated National party had refused to support; and he made it clear that this move portended a new approach to African and other racial problems.

It is being recalled that as far back as 1960 Mr Kirk took a firm "no

Rata is an innovation

Maoris, no tour" position against the idea of picking an all-white rugby team to tour South Africa on behalf of New Zealand's All Blacks. The project for a tour of New Zealand next year by South Africa's all-white Springboks is now evidently in doubt. With 55 seats in the House of Representatives to the opposition's 32, Mr Kirk is well placed to defy the white rugby lobby. He has done nothing new in bringing Maoris into a Labour cabinet—indeed, one of them is the daughter of a former Labour minister—but his innovation here is the choice of a Maori, Mr Matiu Rata, as his minister for Maori affairs. And the defeat in the election of the previous minister for Maori affairs, Mr Duncan MacIntyre, has deprived the National party of its only prominent figure who commanded much Maori confidence.

New Zealand's summer holiday season has begun, and the house will not meet until February. This will give the new team (in which only Mr Hugh Watt, the deputy prime minister, who now takes over a new development ministry, has had previous cabinet experience) a little time to dig in. Parliamentary action will be needed before Mr Kirk can carry out his plans to restore the wool marketing corporation's powers of compulsory purchase, and to reshape his predecessors' anti-inflation programme, with more emphasis on price and rent controls. By February, however, the Labour government will probably have already made its first moves on the foreign trade front, which Mr Kirk has entrusted to Mr Joe Walding, a businessman with a record of spectacular success in exports and a reputation for not letting grass grow under his feet.

Russia

Dissent of the privileged

The brave band of Soviet heretics is dwindling. Yuri Galanskov is dead. Peter Yakir, the historian, is reliably reported to have given up the fight. Valery Chalidze, the physicist who became an expert on civil rights, this week found himself stranded in New York deprived of a Soviet passport. Zhores Medvedev, the biologist, runs the same risk if he takes up the offer to come to England. And these are only a few of the most recent cases. To dwindle need not necessarily mean to vanish. But why should so much courage yield such meagre results? The latest book by Roy Medvedev, the historian and twin brother of Zhores, called simply "Book on Socialist Democracy" and not yet published in English, suggests part of the answer.

The dissidents are a motley crowd, united only by their open dissatisfaction with the existing regime. Mr Medvedev has tried to put some order into these shifting factions. By far the biggest group are the "westerners." They themselves are subdivided into various schools of thought, more or less vaguely socialist, but all fascinated by western development and freedoms. (Professor Sakharov, the physicist and academician, is a good example.) Facing them, as ever, are the "Slavophiles," whose aim is not modernisation but a return to the virtues of old Mother Russia. They get some support from senior men in the army and in the leadership of the Komsomol, the party youth organisation. But nationalism breeds nationalism and the regime is worried by its revival among Ukrainians and others (see page 32).

Another group is less concerned with politics than with "moral regeneration," often with Christian undertones. Andrei Sinyavsky and Alexander Solzhenitsyn fit into this category. Lastly, those to the left of Roy Medvedev—men like General Grigorenko, who want radical changes at once—are branded as "anarcho-communists."

Mr Medvedev and his political friends are really on the fringe of the movement. They call themselves "party democrats," which is a misnomer, since many of them, like the author himself, were expelled from the communist party's ranks. But it is symptomatic, since it conveys their hope for change from within. They see the spread of democracy in Russia as

a possible result of a combination of pressure from below and reform from above. They can be described as the gradualists, the cautious Fabians of the Soviet opposition.

Most of the dissenters are city men. Nearly all of them are intellectuals, mostly writers, lecturers and scientists. That need not preclude them from voicing the wider discontents of the nation. After all, in tsarist Russia intellectuals spoke for the inarticulate peasants and even, for a time, the industrial workers. The basic difference now is that, although there are far more of them than there were then, the Soviet Union's intellectuals speak essentially for themselves. They seem to be unable to link their programme to the needs of ordinary people. The manifesto, for instance, that three scientists published in 1970 admitted the need to elaborate a social programme, but none has yet been produced.

The problems facing professional men in the Soviet Union explain their preoccupation. The writer whose best stuff stays in the drawer, the lecturer who must watch every word he utters, the scientist who cannot communicate with a fellow researcher without official permission are all, naturally, obsessed with these burdens. But the gap between "them" and "us," between the privileged and the rest, runs deep in Russia and the intellectuals will not bridge it if they think only in their own terms.

There are other, more fundamental and sometimes unconscious reasons why the liberals do not direct their thoughts to the people: they fear that a social upheaval could lead to another period of stalinism. But so long as the liberals cannot explain to the collective farmer or to the industrial or office worker what the basic freedoms could mean to him in terms of wages, working conditions and political participation, they will not present a serious threat to the regime.

Does this mean that Russia's rulers are safe? Not quite. Roy Medvedev knows well that the "conservatives," who under Leonid Brezhnev now have the upper hand, would align themselves with the "neo-stalinists" if the structure of the regime were openly threatened. Hence his plea for gradualism and caution. He and his friends, however, think that economic progress is on their side. Economic development has its logic and the managerial reform its requirements. The substitution of technocrats for bureaucrats is seen as a likely step forward. The need for competence and for scientific know-

Roy (left) dissects, Zhores worries

ledge should provide new chances for the "party democrats."

It is true that the number of Russian scientists and technicians is growing, that the Soviet Union now has close to 5m university students and roughly the same number in technical colleges, and that each year more qualified youngsters are entering the labour force. What is not true is that Russia has discovered the secret for putting an end to the alienation between workers and their employers. On the contrary, the number of people doing work below their capacity is rising. From time to time one hears of conflicts in different factories between these more competent youngsters and their disciplined but backward overseers. It is this younger generation, more educated and less frightened than its elders, which holds a potential threat for the regime.

Towards the end of his book Mr Medvedev mentions the fact that Russia's economic planners were compelled to put up their target for consumer goods by the news of the Polish riots in 1970. The Russian dissidents might ponder the lesson from Poland. In March, 1968, isolated students were clobbered into submission. In December, 1970, the workers' rising in towns on Poland's Baltic coast forced the regime to replace or reshuffle its leaders. If intellectuals and workers rose together, driven by a coherent strategy, no east European regime could get away with a reshuffle. Or, if Mr Medvedev, who claims to be a marxist, prefers to put it in Marx's terms: the dissidents will not make a historical impact until they manage to present their interests as the superior interests of society as a whole.

The Soviet Union

The restive non-Russians

Leading figures from all the world's other 13 communist countries, except for Albania and China, joined Soviet leaders in the Kremlin's Palace of Congresses on Thursday for the celebrations of the 50th anniversary of the founding of the Soviet Union. In February a Soviet central committee resolution extolled the Soviet Union as "the most viable and perfected form of organisation for a multinational state." But the growing unrest among the country's non-Russians suggests that its nationality problems are far from solved, and could be getting worse.

On December 30, 1922, Joseph Stalin, then Lenin's commissar for nationality questions, proudly hailed the merger of the Soviet republics of Russia, Byelorussia, the Ukraine and Transcaucasia into a Union of Soviet Socialist Republics as "the triumph of new Russia over old Russia, over Russia the gendarme of Europe, over Russia the butcher of Asia." By an ironic coincidence, his ailing leader, Lenin, was that very day complaining in an official note about the suppression of the independent socialist government in Georgia. That had been carried out earlier in the year by Stalin, a native son of Georgia but by 1922, in Lenin's bitter words, one of those "russified people" who "always overshoot themselves in the matter of the true Russian disposition."

But even before that, when Lenin himself was still well and in control, the government in Moscow had suppressed the "national liberation" movements of such non-Russian peoples as the Ukrainians, the Tartars, the Armenians and others, many of whom had originally supported the Bolsheviks because of their opposition to the tsars' policy of systematic russification of their non-Russian subjects. Stalin saw himself very much as the heir of the tsars. By the time of his death in 1953, all their former subjects except the Finns and Poles had been brought back under Moscow's centralised rule. But this was done without upsetting the formal federal structure of the Soviet Union, and it was done under a "liberal" new constitution adopted at the height of Stalin's great purges in 1936.

That constitution is still in force today. Under it, the Soviet Union is divided into 15 "union" republics, each of which is at least ostensibly identified with a nationality—the Russians, the Ukrainians, the Uzbeks and so on. There are 16 "autonomous" republics which are dotted about on the territory of the biggest, Russian, republic, which extends from Kaliningrad in the west to Vladivostok in the far east. There are also a number of small autonomous regions. The "union" republics have their own governments, legislatures and communist parties. They have, in outward form, the right to their own armed forces and diplomatic relations with foreign

states. (Two of them, Byelorussia and the Ukraine, have been members of the United Nations since 1945.) Under Article 17 of the 1936 constitution, these republics even have the right to secede from the Soviet Union.

This federal structure, like the whole formal political structure in the Soviet Union, is a gigantic piece of window-dressing. Political decisions are taken by the leaders in Moscow without any reference to any of these federal institutions. It is hardly an exaggeration to say that a county council in Britain has more real autonomy than the supposedly sovereign Soviet republics.

But why should it matter, in a country so lacking in even the most basic political rights, whether somebody is unfree merely as a Soviet citizen or, on top of that, unfree also as a Latvian, a Ukrainian, a Jew or a Tartar? Apparently it matters a good deal. The persistence and the growth of nationalist dissent among the Soviet Union's non-Russians show that Lenin and other marxist prophets were wrong when they predicted that national feelings would

It takes all sorts to make a Soviet Union

THE ECONOMIST DECEMBER 23, 1972

wither away under communism. It may be that such feelings help to fill the vacuum left by the declining attractiveness of the official communist ideology. Even more important, nationalism becomes a vehicle for expressing a desire for more freedom and for ventilating various (not always nationalist) grievances against the remote, unresponsive government in Moscow. Moscow's support of "national liberation" movements in Asia and Africa has also acted as a spur to non-Russians inside the Soviet Union.

Whatever its causes, there can be little doubt that non-Russian nationalism is now stirring throughout the Soviet Union. It is not necessarily directed against the Russians as a people; indeed, this non-Russian struggle for national rights has enjoyed the support of some of the Russian dissenters. Men like Professor Sakharov and General Grigorenko have persistently championed the rights of the non-Russian nationalities, especially the Tartars, the Jews and the Ukrainians.

Where is most of this sense of nationalism to be found? The Ukraine has the largest non-Russian population in the Soviet Union—more than 40m—and is by far the most important centre of nationalist agitation, which comes from the fear of assimilation by the Ukrainians' Slav cousins, the more than three times more numerous Russians. After Stalin's death, hopes for a more liberal policy in the Ukraine were disappointed. In the late 1950s many Ukrainians were alarmed by Mr Khrushchev's plans for a gradual "coming together" and even "merging" of the nations of the Soviet Union. The new policy was embodied in the programme which was adopted at the 22nd party congress in 1961, which predicted a rapidly diminishing significance of the boundaries between the republics and even the achievement of "complete unity"

THE ECONOMIST DECEMBER 23, 1972

among the nations of the USSR.

There was a brief period of relaxation after Mr Khrushchev's fall in 1964, followed by another crackdown on Ukrainian intellectuals in 1966 and 1967. A number of leading intellectuals, some of them party members who demanded more teaching of the Ukrainian language and history, were sent to prison camps. There have been more arrests this year; some hundreds of alleged Ukrainian nationalists were reported to have been arrested in January and May. The demotion in May of the Ukrainian party secretary, Pyotr Shelest, was probably a punishment for his failure to deal with the nationalist agitation.

The three small Baltic republics, Estonia, Latvia and Lithuania (total population 7 million), are in a special category because their peoples fear all Slavs—Russians, Ukrainians or Byelorussians. They were independent from 1918 to 1940 but were occupied by the Soviet army in 1940 and incorporated into the Soviet Union after the second world war, when large numbers of their people were deported. But by the 1960s the arrival of substantial forces of Russian and Ukrainian immigrants led to changes in the party leaderships in Latvia and Estonia. Latvian dissidents complain that the proportion of Latvians in the population of their republic has dropped from 62 per cent in 1959 to 57 per cent in 1970; the proportions are similar in Estonia. This year the centre of dissidence moved to predominantly Roman Catholic Lithuania, where a young protester burned himself to death in May. This was followed by riots in Kaunas and two more instances of self-immolation.

Stalin's home republic of Georgia has been involved this year in a series of political upheavals whose climax was the sacking of the party secretary, V. P. Mzhavanadze, in October. The purge was set off by the publication of a book praising the work of the socialist government of independent Georgia before it was overthrown by Stalin in 1922. There is plainly a resurgent sense of nationalism in what has always been one of the most independent-minded of Soviet republics.

Elsewhere, too, there are continuing signs of dissent. The Crimean Tartars, whom Stalin brutally deported to Uzbekistan because some of them had collaborated with the Germans during the second world war, are still asking for permission to return. Even the Meshkethians, a small Moslem people who suffered a similar fate during the war, have started campaigning for permission to emigrate to Turkey, whose language resembles theirs.

A lot of the new pressure for past injustices to be remedied has probably been inspired by the relative success of the Jewish campaign for free emigration to Israel, and by the Soviet government's decision to allow 3,000 ethnic Germans (out of a total of 1.2m) to go to west

SOVIET UNION

Germany. The 2.5m Jews and 1.2m Germans who remain in the Soviet Union are no doubt a continuing source of worry for the Soviet leaders. But the problem of what to do with the other discontented nationalities is far worse. The Soviet leaders may be tempted to apply to them too the policy of selective emigration and expulsion that they have been using with some success on the Jews and the liberal intellectuals of Moscow. But where would exiled Ukrainians or Tartars or Balts go? And what would the effect of further emigration be on those who stay?

The unrest among non-Russians has the makings of a real crisis. To give the republics and autonomous areas some real power is not on the cards: it would dilute the central communist party's monopoly of power and be a step towards the political pluralism the Soviet leaders abhor. Open and harsh repression, on the other hand, could create martyrs; it could widen public sympathy for the nationalists; it could alienate whole regions of the country. Stalin's purges in the 1930s created great numbers of disaffected people who were ready to welcome any foreign enemy provided he was also the enemy of their persecutors. Many Ukrainians and Balts (and even Russians) welcomed the Germans in 1941 not out of any affection for Germany but because they hated Stalin's policies.

The thought that China may now be intriguing with disaffected nationalists in the Ukraine is plainly worrying the Soviet government. But its concern must be greatest for the central Asian republics such as Kazakhstan, Tadzhikistan and Kirgizia. These places have so far seen

the least nationalist dissidence, and have benefited most from the Soviet policy of industrialisation. But they have a major problem in the high birth-rate of the local Asian peoples, which means that the Russians are rapidly losing the numerical preponderance they have enjoyed in much of Soviet central Asia. In the near future they may even find themselves under pressure to give up some of the positions they hold there as the local Kazakhs, Tadzhiks, Uzbeks and others start leaving the over-populated countryside and looking for jobs in the cities. To avoid racial conflict in these strategically important areas near the Chinese border the Moscow government may even have to allow these Asians to emigrate to labour-scarce areas in European Russia—which could cause racial tension there. The Moslem peoples are probably going to number 50m, up to a fifth of the Soviet Union's total population, by 1980, while the proportion of Russians, who still formed a majority in 1970, is steadily declining, and has just probably fallen below the half-way mark.

The Soviet leaders do not want an outbreak of racial tension between their own "white" and "coloured" peoples in areas close to the Chinese border. But the growth of nationalism will be used by Soviet hardliners as an argument against the sort of political and economic reform that could keep the racial problem under control. The sense of insecurity felt by many Russians because of their declining share in the total population could well strengthen the hardliners. So the growth of the spirit of local nationalism is likely to go on as the Soviet Union enters its second 50 years.

How they have grown: Russians vs the others

Very late.
Eleven thirty, and the financial director's still at the office trying to work out how the company lost £5,000 this morning.
It happens to the best financial directors. They get stuck in the wrong currency at the wrong time.
Why does it happen? Because the world's money markets have never been as confused as they are today.
It's a natural business hazard—and there's nothing you can do about it. Or is there?
At financial times like these, you could call Chase Manhattan. One of the first banks to set up a Cash Management service.

A service that can make a substantial difference to your company's financial situation.
Chase Cash Management can make sure you're never at a loss. They'll raise money in the right market, put it out in the moneymaking ones. Transfer your company funds into the company coffers—fast.
And Cash Management is only one of the many facets of Chase Manhattan's multinational expertise at your service to make sure your money works as hard as you do.
Maybe even harder.
Talk to Chase Manhattan about Cash Management. You'll wonder how you ever managed without us.

 **Chase Manhattan acts, while other banks talk**

Oh, what an obstinate war

Washington, DC

Already the stands are going up in Washington for President Nixon's second inauguration, but the happy event that was to have put the seal on the occasion—the end of the Vietnam war—has receded abruptly. The Administration's unusually complete silence during Dr Henry Kissinger's unexpectedly long negotiating spell in Paris from December 4th to 13th left people unprepared for the bad news he announced last Saturday: the negotiations, while not exactly broken off, are bogged down. Up to that moment, the talk of seeing an advance party of prisoners come home for Christmas had still not quite died. "A shattering disappointment," Time magazine called it, but others, not quite ready to accept that the news was as bad as it sounded, concentrated their attention on the apparent discrepancy between Dr Kissinger's cheerful claim of October 26th ("peace is at hand") and his account, gloomy in manner as well as in substance, of the state of the Vietnam negotiations last weekend. Several picked up Dr

Kissinger's remark that "the President decided that we could not engage in a charade." The Washington Post, the Baltimore Sun, and Newsweek magazine all asked whether it was the North Vietnamese, or President Nixon and Dr Kissinger, who had been indulging in a charade. The Sun spoke of "overblown optimism." The Post interpreted Dr Kissinger's analysis to mean that

what remains to be decided, while it may turn on such specifics as the machinery of ceasefire enforcement, is in fact nothing less than the political future of South Vietnam. That is to say, what remains to be settled is what the war has been fought over for decades.

The New York Times observed that the President and Dr Kissinger "were either deceptive or naive in their pre-election assurances to the American people about the imminence of peace." It condemned this week's resumption of general bombing of North Vietnam, calling it "a turn from negotiation once again to confrontation" and expressing the fear that it might postpone agreement indefinitely. The Wall Street Journal defended the President's and Dr Kissinger's good faith, felt that peace might not be so far off after all and concluded that they deserved continued support.

Some reporters, like the Washington correspondent of the Chicago Sun Times, Mr Thomas Ross, have been looking rather closely at what these events may imply for the relationship between the President and Dr Kissinger. Mr Ross noted two points in Dr Kissinger's press conference at which Dr Kissinger appeared to attribute responsibility to Mr Nixon which, according to his buoyant habit, he has in former times been known to assume for himself. Indeed it is obvious enough that Dr Kissinger has been fighting for an

agreement while the President has been adjudicating upon what was offered.

Dr Kissinger would not have said that peace was at hand if he had not believed it. But he may have been relying on the ambiguities and vacant spaces in the agreement to make it acceptable to contending parties which have, in fact, still got vast unreconciled disagreements between them. President Nixon, as he saw his job, had to insist on ambiguities being cleared up in favour of the longstanding American thesis of two sovereign Vietnamese states, one of which must not be permitted to molest the other. Many textual disputes, which are only apparently "of a technical nature" (Dr Kissinger's phrase) seem to have flowed from that insistence. Whether the sequence of events portends any change in the President's choice of his agents or his methods for conducting foreign policy it is too soon to guess.

Shivers over oil

FROM A SPECIAL CORRESPONDENT IN WASHINGTON, DC

In Iowa, a midwestern farm state where heavy snow fell before Christmas, some grain-drying plants have been shut down for lack of fuel and at least one independent oil dealer has told customers that his tanks are empty and they had best look elsewhere. Because of a rather wet autumn grain-driers had been running non-stop for weeks to keep corn and wheat from rotting. That has happened before. This year the driers' heavy use of propane gas and heating oil exhausted fuel stocks temporarily.

Fuel shortages have manifested themselves in enough other places recently to confirm that the problem is national. Texas, of all states, has experienced tightness in the supply of natural gas. Pipeline company reports to the Federal Power Commission indicate that in the north-east, south-east, upper midwest and southern California certain consumers, chiefly electric power plants, factories and some big blocks of flats can expect deliveries of natural gas to be interrupted this winter more

Kissinger breaks the bad news

frequently than ever before. Households are the last to suffer.

Industrial consumers normally switch to oil or propane when they cannot get natural gas. Things are serious when they cannot get their substitute fuel either, as happened in Iowa last week. This is less than a crisis. Americans will not be opening their Christmas gifts this year with gloves on. There is still some heating oil to spare, although not always in the right place, and with more efficient management of supply no plant need be shut down for long. Probably 97 people in 100 would say that while they may have heard about an "energy crisis" they have not been touched by it personally. The other three would be economy-minded motorists (a rare species in North America) who have noticed that the pump price of petrol has not shown its usual autumn decline.

Temporary regional shortages of fuel are noteworthy in a national perspective for two reasons: they mark a profound change in a country that has historically enjoyed an abundance of energy. And they are a harbinger of things to come—higher prices, continued scarcity, political debate about energy policy, more imports of oil from the Middle East and perhaps friction with western Europe and Japan, which are already critically dependent on middle eastern oil. As the American oil and gas industry and the Nixon Administration are fond of saying, the United States does not lack for fuels. They are there, in the ground. But it does lack enough proven, accessible reserves of oil and gas.

The reasons why demand has outstripped supply lead into a thicket of arguments—such as whether federal regulation of natural gas prices at the wellhead has discouraged exploration, or whether the industry has been holding back supplies to force Washington to deregulate prices or at least permit a substantial rise. As for oil,

domestic production has just peaked out, oil men say, and no significant growth will occur until the Administration brushes aside obstructive environmentalists and gets on with offshore leasing, especially in the Atlantic. The Nixon Administration is disposed to do just that, but it cannot ignore the popular support which the environmentalists enjoy.

Nuclear power plants have been delayed for various reasons. Coal, the continent's most abundant fuel, is dirty, and efforts to develop satisfactory methods of removing the sulphur will take years. For these and other reasons, consumption of oil and gas has risen while discovery rates have been falling. Of necessity, the country has turned to foreign sources of supply. Imports of oil have climbed from an average of 2.4m barrels a day in 1965-67 to 3.3m in 1970 and more than 4.5m in 1972. In 1973 imports may approach 6m barrels a day, according to a preliminary estimate.

The Administration has reluctantly raised the oil import quotas several times by small amounts to let in these necessary foreign supplies. The increases have not placated the interests, centred in the urban, oil-burning north-east, that want the quota system done away with altogether. But the Administration is likely to keep the system in being, making further small increases when these cannot be avoided.

The National Petroleum Council has just published projections of imports for 1975, 1980 and 1985. The council, which represents a broad spectrum of interests in the industry, estimated that imports could run as high as 19.2m barrels a day in 1985, but might be as low as 3.6m. The latter was its figure for "supply case I"—the best of all possible worlds for the domestic oil industry. Case I assumes "a maximum effort to develop domestic fuel sources," a high rate of discoveries in relation to drilling, high rates of increase of energy from nuclear reactors and coal and minimal environmental restraints on the production of energy. The council's case IV, which leads to the highest figure for imports, assumes a continuation of recent drilling trends and success rates, continued environmental and siting problems for nuclear plants and coal and no new incentives, such as federal subsidies or tax privileges, for the development of new coal mines. Cases II and III are intermediate scenarios.

These projections for imports,

especially the higher ones which seem the more realistic, give Washington painful pause. They imply an enormous additional burden on the balance of international payments—up to \$30 billion a year, the council suggests. They also generate fears that the United States may make itself politically vulnerable to oil blackmail and economically vulnerable to an actual interruption of supplies. These worries come naturally to an Administration that takes a traditional view of national security. Partisans of Israel are also concerned about a growing American dependence on oil from Arab countries. A few analysts have observed that a soaring requirement for foreign oil could create still another trade issue between the United States and Europe and Japan which, after all, were dependent on it first.

Thus there are good arguments for keeping imports in check. There is even some question whether the Middle East could or would supply the United States with anything like 10m barrels a day; no other region can. Some pessimistic energy experts draw their lessons from experience in Libya and Iraq, the more radical producers, not from the more conservative patterns of Saudi Arabia and Iran, which rank first and second in reserves. "Opec [the exporting countries' organisation] has shown it is interested in more money per barrel, not in more production," said one State Department official.

The department had been encouraging Saudi Arabia to invest in "downstream" oil facilities in the United States—refining and perhaps distribution—long before Sheikh Yamani, the Saudi minister of oil and minerals, publicly expressed interest in such a course in September. In principle, Washington has no objection to giving Saudi oil preferred access to the American market, provided it can square the deal with Iran and other producers. Yet the Administration hesitates.

It hesitates because this whole business of foreign energy supplies is new and very puzzling. Take the Soviet natural gas deal, which officials indicate the Russians are eager to consummate on terms startlingly favourable to the United States (for example, a negative wellhead price by American calculations). There is a basic distrust of doing such business with the Russians. There is also the sticky political matter of justifying to the domestic oil and gas industry the landing of liquefied gas at \$1.25 per 1,000

All these securities having been sold, this announcement appears as a matter of record only.

We generate business in ways you wouldn't dream of.

Of course, imports and exports are still our forte. But strangely, as the world-wide network of Nissho-Iwai has grown bigger we've discovered exciting new ways to help generate business.

We import and export.
We arrange multinational trade.
We create new distribution.
We merchandise and market.
We make investments and loans.
We establish new enterprises.
We develop resources.
We modernize businesses.

But this is only a part of the Nissho-Iwai story. There are other ways and means we can help generate business —your business. Mainly because, wherever in the world you want your product to go, we're there to help.

Give us a call any time.

NISSHO-IWAI
Head Office: Imabashi, Higashi-ku, Osaka, Japan
Tokyo Office: Nihonbashi, Chuo-ku, Tokyo, Japan

We help generate business.

Other Overseas Offices in Hamburg, Düsseldorf, Paris, Brussels, Madrid, Milan, Wien, New York, Chicago, Houston, Detroit, San Francisco, Los Angeles, Anchorage, Vancouver, Toronto, Montreal, Sydney, Melbourne, Johannesburg, Hong Kong, Singapore, Bangkok and 100 other major cities all over the world.

cubic feet when the Federal Power Commission is giving domestic producers no more than 35 cents.

Thus a preference for anything that can expand North American supplies of energy promises to mark the President's second energy message when he sends it to Congress, perhaps in February. This will mean more public money for research and development—to be spent on a breeder-reactor atomic power plant for demonstration purposes, on cleaning up coal and on research into exotic sources of clean energy which are favoured by environmentalists, such as nuclear fusion and solar and geothermal energy.

But oil and gas will still be called on to fill the gap. If the courts will co-operate, the Administration will press for a start of work on the Alaska pipeline by next summer. It still hopes for more oil and gas from Canada, a politically delicate topic as usual. Steps will be proposed to promote domestic exploration for oil and gas: the accelerated leasing of offshore lands, perhaps a search for short-cuts past environmentalist delays, perhaps a deregulation of natural gas prices (this is a step which Congress may refuse to take). A new energy policy is likely to go against many well-established habits.

Miners for Miller

The reformers within the United Mine Workers' Union have won an important victory. After years of struggle this small band of dedicated men has managed to oust Mr Tony Boyle from the presidency. The results of the election which put an outsider, Mr Arthur Miller, at the head of the UMW will also give new hope to the rank-and-file members of the other unions who think that their leaders are acting against their best interests. (It is noticeable that not one union head has yet come forward to congratulate Mr Miller.) On the personal level, the two Yablonski sons and their friends can feel that the unsuccessful and tragic efforts of Mr Jock Yablonski to remove Mr Boyle in the fraudulent election of 1969 have been vindicated at last. Mr Yablonski, his wife and daughter were murdered only three weeks after that election in what appears to have been an effort to stamp out all opposition to Mr Boyle.

But for Mr Miller his successful election, which cost the federal government \$4m to supervise, is just the beginning. The new president, who has

Miller: a vote for change

no experience of union affairs, has promised many changes. For a start he wants to move the union's headquarters from Washington to the coalfields. He says that he will lower the salary to which he is entitled and that of his vice president and treasurer, reformers who are also new to union affairs. And he will do Mr Boyle out of his full-salary pension if he can. He has promised that all pensioners will now get the same benefits—at the moment those from the anthracite regions get considerably less than those from the bituminous mines—and that pensions will go up to \$200 a month. Mr Miller may have trouble here because the miners' welfare fund is low after years of mismanagement. The union's bank, the National Bank of Washington, also needs new managers who are responsive to the needs of the miners themselves. But the new president will have to fight for these changes. A large number of Mr Boyle's supporters remain on the executive board—at present only three of the 23 members belong to the reform faction, Miners for Democracy—and they have already shown that they do not take kindly to Mr Miller's new ideas and that they will not tolerate reprisals against Mr Boyle and his followers.

In the coalfields themselves the new leaders also have their work cut out. They will have to decide whether or not to take a firm stand against the controversial method of mining coal from the surface of the land. Miners see the pros and cons of the problem more clearly than most. Strip mines are often worked by non-union labour. Union members have been put out of work as the small and less profitable underground mines have been forced to close by competition from strip mines, which are cheaper and easier to operate. But surface mines are somewhat less dan-

gerous than those underground. And if controls on strip mining become tight enough to satisfy many conservationists, the production of coal will drop and this in turn will reduce the flow of money into the miners' welfare fund; the union is paid a royalty for the fund by the owners on each ton of coal mined, whether from the surface or from underground.

But the subject most dear to Mr Miller, who had to retire two years ago from the debilitating effects of black lung disease, is safety and health in the mines. Although a strict safety act has been on the books for three years miners feel that its provisions are not enforced strongly enough. Rather than go down mines, which they consider unsafe, the young and militant miners are now resorting to wild-cat strikes. None of this pleases the industry, which claims that the safety act has reduced productivity. Nor are the owners pleased with the election of Mr Miller. While it may be to their advantage that he is inexperienced in the arts of bargaining and contract negotiations—the present contract expires in 1974—he is not the sort of man to see things from the industry's point of view.

Mayoral scramble

New York

Although the dust has not yet settled on last month's elections, the contest for New York City's mayoralty, to be decided next November, is already in full swing. A number of Democratic hopefuls have made known their availability (the city is overwhelmingly Democratic) and others, from left-wing reformers to right-wing conservatives, are forging alliances and seeking funds; it is estimated that \$1m will be needed for an effective campaign. Governor Rockefeller tried to inject himself into the act by suggesting that the city's Democratic leaders decide on a one-term "fusion" candidate who would then get support from the Republican minority. Last week he had to admit that his proposal could not work, although the notion of fusion appeals to some regular Democrats who until lately have been starved of patronage by Mayor Lindsay. The trouble is that with so many aspirants in the field, the leaders cannot unite around any one of them.

In view of the widespread belief that the city is ungovernable, the hectic competition for governing it may seem surprising; moreover, the mayoralty has rarely been a springboard to

Rockefeller and Lindsay are now bitter foes

national office. Yet it is a challenging position that carries its own rewards. It offers instant national exposure. It also provides patronage and power on a substantial—if local—scale.

Some of the putative candidates now vying for the nomination are simply taking the opportunity to get themselves better known so that they can build up support for the future or for one of the city's lesser offices. But at least ten prospective candidates, mostly representing liberal reformist factions, are fairly serious about staying in the race. The fight among reformers means that a more conservative contender has an advantage in the garnering of both money and support. Since the November elections demonstrated that New York City's big Democratic majority is not nearly as liberal as it used to be, there are many politicians who think that the most promising choice would be a relatively low-key candidate who is a strong upholder of law and order. Their ideal is the antithesis of Mayor Lindsay, with definite appeal to the major white ethnic groups—the Italians, Irish and Jews—who have traditionally voted Democratic but who deserted the reformist campaign of Mr McGovern.

Two contenders who fit this prescription are Mr Mario Biaggi, an able, conservative Congressman from the Bronx with strong ties to Italian voters, the city's single largest ethnic block, and Mr Abraham Beame of Brooklyn who, from his post as the city's Controller, is taking every opportunity to expose extravagance by the Lindsay administration. But Mr Beame is 66 years old and faces a fight with Mr Hugh Casey, a hard-working Congressman who also comes from Brooklyn.

Mayor Lindsay has everyone guessing about his intentions. His record is

controversial and in many respects unpopular, but he does have the advantage of incumbency. He has also been mending fences since his disastrous try for the Presidency last spring. In recent months he has shown a much tougher attitude toward people who receive public assistance, a more responsive approach to white ethnic voters (he has visited Israel for the first time) and a heightened concern about crime.

But as a candidate Mr Lindsay, like Mr Biaggi, is apt to stimulate increased factionalism in a party that is increasingly divided. Governor Rockefeller would like to fish in those troubled waters but he is heartily disliked in the city. Even so, the city's Democratic party may have difficulty surviving any intensification of the internal warfare that the quest for the mayoralty is provoking.

Wary Christmas

Mickey Mouse harmonicas and "Lil Jolly Joker" dolls are outlaws in toyland this Christmas: the harmonicas have sharp edges and the dolls have loose pins, faults qualifying both of them for the Bureau of Product Safety's list of banned toys. The bureau, operating within the Food and Drug Administration, has banned over 800 toys since the introduction in 1970 of the Child Protection and Toy Safety Act. But if Santa were to do his Christmas shopping in America, he would be shocked at the number of dangerous toys still on the shelves, including (according to a study by public interest groups founded by Mr Ralph Nader) nearly half of the 800 already outlawed. A number of legislators and consumer agencies have charged the FDA with being far, too

slow in developing standards for toy safety and far too lax in the enforcement of those standards, once they are established, a rather reckless policy when one-third of all toys are bought by children.

The problem is particularly relevant now, for half of all toys are bought during the Christmas season. Toys cause 70,000 injuries a year and this figure does not include those suffered on swings, slides, bicycles, or sports equipment. But it is not toy safety alone which has worried Congress this year. Product safety on a much broader scale has attracted congressional attention, culminating in the passage two months ago of the Consumer Product Safety Act, the only major piece of consumer legislation to emerge from the 92nd Congress.

A special study commissioned by Congress found that 20m Americans are hurt every year by articles in and around the home and school: 30,000 are killed and 110,000 are disabled permanently. The new act establishes a Product Safety Commission to set standards for a wide variety of goods ranging from power tools to pressure cookers and to oversee compliance with those standards by the manufacturers. Items which cannot be controlled by safety standards will be banned. There are provisions for suing manufacturers and for suits against the PSC itself for failure to act against dangerous goods.

The Senate voted to abolish the FDA altogether and to have all aspects of product safety handled by the new commission. But the House of Representatives and the Nixon Administration argued for retention of the FDA, and the resulting compromise left the FDA still intact, but with some of its jurisdiction—including that over toy safety—transferred to the PSC. The impact of the act, which will come into force at the end of the month, will depend on the five commissioners whom President Nixon appoints and on the support he gives them.

Food and Wine

1. Dining in Manhattan

New York

The past few years have been a time of troubles for luxury restaurants in New York City. Squeezed by steadily rising costs and sharply falling volume since the last recession, a number of once-celebrated establishments have been forced to close their doors. In spite of the improvement in economic conditions, the city's general decay,

combined with specific problems confronting grand luxe restaurants, suggests that many more will suffer the fate of the Baroque, Cafe Chauveron, The Colony, L'Almorique and Le Pavillon. Restaurant owners have just concluded new settlements with both the chefs' and waiters' unions, which will raise salaries by about 10 per cent. These increases will be tacked on to restaurant bills; this seems sure to result in a further falling-off in patronage.

New Yorkers like to dine out. They have a choice of some 18,000 restaurants, which offer a bewildering variety of cuisine at a wide range of prices. When expense-account dining was at its height and few people were concerned about crime in the streets, the city boasted an array of elegant continental restaurants that drew substantial numbers of affluent New Yorkers and free-spending tourists. The city still has the best and most diverse dining establishments in the country but relatively few—under 30—can still lay a claim to being in the grand luxe class. Prices—as much as \$8 for Quenelles Nantua, \$13 for Homard Aromatique, \$18.50 for a Chateaubriand Béarnaise (for two), \$11 for a bottle of Sancerre and \$30 for Dom Perignon—have led an increasing number of diners to abandon the luxury establishments, except for special occasions. The closing last September of Le Pavillon which, under the legendary Henri Soule, had been the training-ground for most of the restaurants still offering haute cuisine in glittering surroundings, was an acknowledgement that even the rich can rebel.

While high prices are the main cause of the decline of trade in the luxury restaurants, other factors have contributed. The exodus of middle-income New Yorkers to the suburbs means that the market for fine dining has shrunk. Moreover, the notion of how best to spend a night out has changed. There is increasing emphasis on informal and inexpensive dining, which has spurred a rise in the number of lower priced restaurants, where dinner averages under \$10 a person. Italian restaurants have always been frequented but the shift has proved an especial boon for Japanese, Greek, Indian and Spanish establishments, and especially for new Chinese restaurants featuring spicy Szechuan and Hunan dishes (there are over 1,000 Chinese eating places, none of them with unionised staffs, in the city). Tourists, especially free-spending businessmen, are also much less in evidence, partly because the city has lost

much of its glamour.

Restaurateurs also claim that the decision of the theatre owners to advance curtain-time to 7.30 pm as a means of attracting suburbanites has been a hardship. Theatregoers liked the change because it enabled them to return home at an early—and presumably safe—hour, but it meant that they took to eating sandwiches or light snacks rather than an elaborate and expensive dinner. The Restaurant League, whose members include 100 of the highest priced establishments, has succeeded in persuading the theatre owners to raise their curtains at 8 pm starting this week. But it is doubtful whether half an hour will change the preferences of theatregoers when prices are so high.

There will always be some demand, of course, for the haute cuisine and scrupulous service that grand luxe restaurants provide. Yet proprietors themselves are concerned about their ability to operate profitably. They report that restrictions on immigration have limited the supply of skilled French chefs (and increased the salaries of those available). They complain that they cannot afford to maintain the large staffs of captains, waiters and busboys normally associated with luxury dining. They deny that they have begun to skimp but they accuse their competitors of doing so.

Curiously, the best known restaurants

have changed remarkably little. It is still possible to enjoy superbly cooked meals served with finesse, provided that cost is not a restraint. Even though most New Yorkers have an affinity for novelty, most luxury restaurants have pursued Le Pavillon's formula, which has resulted in similar fare and a good deal of snobbery about dress.

The only change has been the promotion of table d'hôte meals at \$12.50 to \$15 a person without wine. The resistance to more basic changes may stem from dedication to haute cuisine but it can also be traced to the small-business mentality of most proprietors, who are unable to recognise the need to make adjustments. In any event, most of the survivors have done better than Restaurant Associates, the corporate organisation whose managerial skills and showmanship threatened in the boom years of the last decade to take over luxury dining in the city.

Because New Yorkers will continue to frequent restaurants with regularity, there is no danger that the city's plight will diminish the variety or number of available restaurants. On the contrary, low-cost and fast-service outlets are continuing to thrive, especially in residential neighbourhoods. There are now 10 Steak and Brew restaurants, for example, which advertise all of the beer and salad a customer can eat along with steak or roast beef for \$6.75.

New York's haute cuisine

Most of the restaurants listed below will average about \$25 a person for dinner. Tips are generally 20 per cent of the total bill, with 15 per cent going to the waiter, 5 per cent to the captain and \$1 a bottle to the wine steward. **La Caravelle**—At its best, the most inspired cuisine in Manhattan. It also has good service in pleasant surroundings. But, like most restaurants, it favours its regular patrons and suffers lapses when business is brisk.

La Cote Basque—A pretty and popular establishment which is the original offspring of Le Pavillon, it offers classic cuisine and solicitous service. Its menu, however, is limited and it frequently falls short of expectations.

La Grenouille—Another descendant of Le Pavillon that inexplicably has become the favourite of New Yorkers. It differs little from other establishments but its present popularity has brought tables closer together and provoked a high level of noise.

Lafayette—A small and snobbish restaurant which has a table d'hôte menu and generally superior food.

Le Veau d'Or—Offering the best in

bourgeois cooking, the kitchen frequently surpasses more elegant and expensive restaurants.

Lutece—Perhaps the most attractive restaurant in Manhattan, it has a dedicated chef—who is part owner—and a remarkably inventive menu. Its wine list, while expensive, is good.

Peter Luger—The best steak restaurant in New York City (it is just across the river from Manhattan in Brooklyn), it does not qualify as haute cuisine. But it demands inclusion on any list of New York City's best restaurants.

Quo Vadis—A restaurant specialising in continental specialties, from Belgium through France to Italy, it falls short fairly frequently in food and service.

The Four Seasons—The city's most spacious dining-place, its reach often exceeds its ability. In recent times, moreover, it has cut corners on service. Its extensive wine list is the most reasonable of all high cost restaurants.

Twenty-One—Still the hub of expense-account dining, the kitchen offers a vast but not really distinguished array of dishes. It has a superb wine list. Veteran patrons are favoured.

2. Vin extraordinaire

The upsurge in the popularity of wine-drinking in America is not without its pitfalls for unwary guests. One vogue, for example, is for such "sparkling wines" as Cold Turkey—a mixture of carbonated cranberry juice and white wine. But for vintners and major distributors of liquor who are rushing to satisfy millions of educable palates, it is all part of a billion-dollar industry.

Led by a five-fold increase in the drinking of champagne and other sparkling wines, total consumption of wine in the United States has almost doubled—to more than 300 million gallons a year—since 1960 and is expected to redouble in the 1970s. But the stronger, generally sweet dessert wines that once held two-thirds of the market are in decline: that proportion is now claimed by lighter, dryer table wines, which showed impressive increases of 25 per cent in both 1970 and 1971, topping off a rise of 350 per cent in sales since 1960. In the future the major expansion of demand is expected to be for premium table wines, of higher price and quality, which now account for only just over 10 per cent of consumption in volume but for 30 per cent of dollar sales and nearly half of net profits.

The growth is fuelled by an accelerating upward trend in consumption of wine a head and the increasing proportion of the population under the age of 45, a group which drinks twice as much wine as its elders. The very young adults (who in some states can now drink legally, as well as vote) are clearly being weaned directly from soft drinks by "mod" wines, which are fruit-flavoured, carbonated and known by such brand names as Pink Tingle, Thunderbird, Pagan Pink Ripple and Zapple. Those slightly older are being led into wine-drinking by the growing chic of Cold Duck (half champagne, half sparkling red wine) and of "crackling" Iberian wines, several of which are best-sellers among imported wines.

But these are only a frothy one-eighth of a \$1.5 billion mass market; this has developed as a result of rising affluence, increased travel in Europe, and the cannily-promoted spread of the leisurely life-style from California, whose wineries supply 70 per cent of the wine consumed in the United States; New York State is the next largest producer. Imports have, indeed, tripled since 1960, but still claim only 12 per cent of the American market. The French, outsold so far by other foreign producers, have now launched a campaign to double sales of their

After being crushed, the grapes are stored right in the vineyards

regional wines, at \$3 a bottle and under, since the sharply rising prices of their great wines have taken them out of the mass market. (One visiting French expert blandly told Texas matrons that either Côte du Rhone or Bordeaux Rouge was appropriate with hamburgers, but reportedly boggled at recommending the proper variety to accompany peanut-butter sandwiches.)

California's 150-year-old wine industry, shut down in the 1920s by Prohibition, recovered at first by mass-producing for the "cheap drunk" market. But now the market for table wines has become dominant; this too started in California, where consumption a head is twice the national average (but only one-eighth that of France and Italy). Almost all of California's wine is blended from several different types of grape and the industry borrows from the state's huge production of table and raisin grapes for two-thirds of its wine crush. (Grapes of all types are California's largest cash crop.) But premium wines require a higher proportion of specialised grapes and a vast expansion of their production is underway, mostly south of San Francisco, since there is no space left in the famous grape-growing areas, such as the Napa Valley.

More than 50,000 acres were being planted this year, in addition to a like number planted in the past three years. When these new vines reach maturity, by 1975, the total land growing winegrapes will have doubled from the present 132,000 acres. To meet the erupting demand for planting material, the University of California has developed new disease-free rootstock and methods of accelerating the propagation of vines; it is also working on higher-yielding varieties and ones which will grow satisfactorily on less suitable land. Nowadays grapes are often crushed mechanically right in the fields where they have grown and

stored in huge steel tanks nearby. This not only reduces costs and wastage but also makes it easier to ensure the uniformity of product which is essential for mass-marketing.

Because they are blended and because growing conditions in the state vary very little, Californian wines do not have vintage years; the quality of the wine put into the bottle—and the resultant price—is almost entirely under the vintners' control. Their labelling practices appal the French but give the brand-conscious American consumer the reliability that he cherishes. Wine-tasting parties are a popular, economical form of entertainment and even a method of raising funds for charity. The wine industry co-operates eagerly since, according to one survey, 31 per cent of buyers choose a particular wine after having participated in such a sampling. In this type of wine-tasting, the wine is actually swallowed usually in quantity—and the quality sought is not the individuality of a vintage but a characteristic taste which will be uniformly available on the shelves of supermarkets.

As a result of the current boom a major restructuring of the American wine industry is under way. Shares in vineyards and wineries are being sold privately and publicly and are being snapped up at high prices. Food-processing companies and brewing firms are moving into the industry as the distillers and beverage distributors did some years ago, to the concern of the Federal Trade Commission. The grape rush is beginning to take on the proportions of the gold rush of the 1840s and commentators are pointing out that it may also end in much the same way. Grapes are highly vulnerable to disease and weather—the harvest was poor in both California and New York this year. But from the point of view of profits the greater danger is over-production when the new vines begin to bear in a few years' time.

JACKO TAKES A LOT OF CARE - AND SO DO WE

The certain sound that says the drive was sweet . . . the vital four-foot putt that tantalises on the brink . . . you have to take a lot of care when you're an international champion - the sort of man who can win the Dunlop International in Australia with

11 under par even though there's a fishbone stuck in your throat all through the last two rounds - care in your play and care in choosing your gear.

Tony Jacklin's gear is by Dunlop. His club shafts are lightweight steel; his ball is the Dunlop '65', the best-seller, made with care to help him and thousands of other golfers win. WE TAKE CARE. To Tony Jacklin that means dynamically balanced clubs and a ball with extra distance . . . to others it can mean

comfortable beds or strong squash rackets or emergency fire-fighting equipment . . . but always it means relentless care in the development of new ideas, better products.

Children's books

Critics in wonderland

LEWIS CARROLL'S *THROUGH THE LOOKING GLASS*

Illustrated by Ralph Steadman.
Hart-Davis/MacGibbon. 144 pages.
£3.25.

ONCE UPON A TIME: THE FAIRY TALE WORLD OF ARTHUR RACKHAM

Edited by Margery Darrell.
Heinemann. 248 pages. £3.75.

ASPECTS OF ALICE

Edited by Robert Phillips.
Gollancz. 477 pages. £3.50.

A century of Alices has adorned books, film and stage with long, fair-to-honey coloured hair and stiff white pinafores: Fiona Fullerton, the Alice of Mr William Sterling's new film, is no exception to the Tenniel rule. All "Alice" illustrations are, consciously or unconsciously, parodies of Tenniel: all of them are markedly unlike the round-faced, dark-haired Alice Liddell of Charles Lutwidge Dodgson's own photographs. And yet Dodgson was so pernickety an author, so insistent that Tenniel should faithfully follow the sketches he himself made before he was persuaded of the need for a professional illustrator, that he had to find another artist for "Through the Looking Glass"; Sir John found one Lewis Carroll book more than enough for him.

But then, Dodgson's own odd little

drawings are not much of a likeness of any human child, much less of the real-life daughter of the dean of Christ Church. By contrast, his illustrators have usually made her the only normal figure among a bunch of monsters, though the animals are sometimes anthropomorphically endearing. All of the characters in Mr Steadman's new, adult cartoons for "Through the Looking Glass" are predictably weird (except perhaps Tweedledum and Tweedledee, who have a certain blandness). But Mr Steadman's Alice portfolio cannot compete with Arthur Rackham's drawings for sheer malevolence—or, for that matter, for consummate artistry. Some of Rackham's delicate, nightmare Alice paintings are beautifully reproduced in this collection of stories illustrated by him.

No one has bothered much about illustrators' psyches, though their interpretations of Lewis Carroll's dream and mirror worlds must contain rich psycho-analytical pickings. But Dodgson himself was the stuff of which analysis is made: a bachelor who only lost his stutter with children, who loved to photograph little girls—in the nude, preferably, but the conventions of the time and the mothers of his little friends prevented this—and loathed little boys, and whose fantasy worlds were peopled with the symbols of erotica beloved by Freudians (down to the inevitable mushroom).

But in Mr Phillips's most enjoyable collection of essays the analysts are kept in their place. First in line come the biographers, inevitably somewhat repetitive about the picnics up Oxford's rivers, the rainstorm that turned into the Pool of Tears and Mr Dodgson's seaside holidays (on which he always armed himself with safety pins so that little girls he met could be encouraged to pin up their skirts and paddle). Then come the critics, whose contributions include two reviews, from Children's Books and Literature for Little Ones, of 1865 and 1887: the former describes "Alice in Wonderland," with more accuracy than imagination, as a "stiff, overwrought story." Tucked into this section is a highly imaginative piece that more than anything else except the spelling betrays the book's American origins: a summary of a lengthy monograph in which, by an ingenious discovery of remarkable coincidences between "Alice in Wonderland" and Twain's "The Golden Age," of the initials MT and SC on the five of spades in the first illustrations and a literal interpretation of Dodgson's frequent insistence that "Alice's Adventures were written by Lewis Carroll," Mark Twain is credited with their authorship.

The logicians, the philosophers and the chess players that follow this section are in no doubt whatsoever that Dodgson was the author; they rather argue over the aspect of his donnish existence that he wished to satirise. Even the church historians have their representatives: the centenary of the Oxford movement produced a remarkable discussion of "Alice in Wonderland" as a satire on the High, Low and Broad church controversies. The "Wonderland" characters fit easily

Alice Liddell, Tenniel's Alice, Rackham's and Steadman's

into theological slots: the White Rabbit is the average English clergyman (one must remember that Alice noticed a pot significantly labelled Orange Marmalade on her way down his hole). She has a drink of doctrine and passes through the Low door; eats a cake of dogma and becomes alarmingly High. The Cheshire Cat is Cardinal Wiseman, the Duchess Bishop Wilberforce, the Cook Dean Stanley, the Mad Hatter and the March Hare Low and High church parsons—and the Dormouse their congregation, slumbering between them. "Through the Looking Glass" proves rather less malleable.

The logicians have a less fanciful row to hoe. The parodies and examples of philosophical conundrums are obvious. Much of Carroll's nonsense dialogue is in fact highly instructive: philosophy lecturers have been repeating them ad nauseam almost ever since they appeared. The chess moves in "Through the Looking Glass" are plain to see, too, though chess-players settled for the opposite offence of ingratitude, complaining, for example, that White is allowed to make nine consecutive moves. Dodgson was soon forced to defend his skit, admitting in a preface to the 1887 edition that "the alternation of Red and White is perhaps not so strictly worked out as it might be," but that the actual moves are a "correctly worked out" solution of a particular chess problem.

It was fortunate that he did not have to suffer the more punishing cross-examination of the Freudians. These come last in this book, followed only by a small bunch of Jungians and a couple of excursions into psychedelia. It is all fairly predictable stuff, given Dodgson's character; inevitably, it is decided that he was short of mother-love. The line-by-line interpretations of the stories have an unpleasant fascination, replete with examples of "oral aggressivity" and the endless equation of Alice and phallus. There is, tucked behind the terminology, a good deal of percipience; Dodgson's streak of unconscious cruelty is well brought out. But it is the biographers who eschew such new-fangled techniques who provide the greatest insights, not perhaps into Dodgson, but into his satires. For it is the recollection that the Dodo was stuttering Dodgson, the Duck his friend Duckworth and a host of other characters nicknames for the people known to the three Liddell children that reduces them from the nightmare selection of a disordered mind to the familiar inhabitants of a child's world, dressed up for inclusion in a story.

Do you need a thneed?

PLANTS

By Laura E. Salt.
Oxford University Press. 96 pages. £1.50.

DISCOVERING NATURE

Edited by Angela Sheehan.
Purnell/Bancroft. 190 pages. £1.50.

WORLD OF NATURE

By Maurice Burton.
Purnell/Bancroft. 92 pages. 80p.

S.O.S., SAVE THE EARTH

By Giancarlo Masini.
Collins. 49 pages. £1.50.

THE LORAX

By Dr Seuss.
Collins. 9 pages. £1.

Nature books have been standard fare for children from the old, unmilitant days of pressed flowers and bird-watching, and publishers still cater for such simple, old-fashioned tastes. Miss Laura Salt's "Plants" is well up to the very high standards of OUP's Children's Reference Library; Mr B. E. Nicholson's delicate illustrations mesh in with the elementary botany of the text, which demonstrates yet again that it is not necessary to write down to children. The flower and leaf drawings in Miss Sheehan's book are very nearly on a par with those in the best adult nature books—which is high praise. There are plenty of good, hard biological and botanical facts here too, admirably well presented and with only the mildest of postscripts on conservation and the balance of nature.

The protesting Lorax

But the ecologists are creeping in. "When did you last see a frog?" asks Mr Burton accusingly in his "World of Nature," which contains the code of conduct for Young Nature Conservation Volunteers and some suggestions for helping wildlife: in particular butterflies, frogs and nesting birds. This is sensible, straightforward stuff, though Mr Burton's style is a bit too close to the burbling brook. He picks and chooses an intriguing job-lot of subjects (and incidentally propounds a theory that the Loch Ness monster could be eight or nine plump otters swimming in line). Still, there are a lot of good photographs for 80p.

"S.O.S.," on the other hand, contains a lot of nasty photographs of oil-polluted beaches, detergent-foaming rivers and smoke-filled sky, tucked under pull-up flaps and surrounded by big, fat, adult phrases: "ecological niche," "biomes," "homo sapiens." This kind of technique reaches its ultimate with a small piece of real sticking-plaster stuck across a photograph of the earth and a message that pulls out of a cellophane bottle on the cover ("Help! Nature is Dying"). There is precious little real information, and the tone (except of a slightly pompous introduction by Mr Anthony Crosland) is offensively shrill. The back of the book consists of postcards that children were encouraged to post off to MPs or the Department of the Environment, complaining of examples of pollution. "Tell them, if necessary, that you no longer wish to breathe the poisoned air or drink polluted water." Propaganda directed at children is always unpleasant, even in a good cause: alarming them in such a crude way is worse still.

Dr Seuss's ecological technique is, naturally, far more subtle. "The Lorax" is a bold, brilliant and beautiful allegory. The Once-ler discovers "the bright coloured tufts of the Truffula Trees" and knits out of them a Thneed:

... a Fine-Something-That-Everyone-Needs.
It's a shirt. It's a sock. It's a glove.
It's a hat.
But it has other uses. Yes, far beyond that.
You can use it for carpets. For pillows!
For Sheets!
Or Curtains! Or covers for bicycle seats!

The Thneed sells; so, despite the expostulations of the Lorax, who speaks for the Truffulas and the Barbaloots who live under them and off them, the Once-ler summons his family and soon builds up a Thneed industry. The half-starved Barbaloots of course

disappear, the earth, water and sky become disgustingly polluted with the "leftover goo"—and the end? No more Truffula Trees, of course; no more industry; no Thneeds; no Barbaloots; a ghost town and Grickle Grass.

The whole is marvellously drawn, particularly the machinery of the Thneed factory, with the productivity breakthrough invention of the Super Axe-Hacker. Dr Seuss is a very natty word coiner, so that one wonders how the English language could have survived without the verb "to bigger." (Still, it has, and perhaps children struggling with the tedious accuracies of literacy would do better without it.) Dr Seuss is in real life Mr Ped Geisel, who lives on a mountain in California, where the landscape is now being destroyed for a housing development. One can see why he is a convert to conservation. Still, Mr Geisel, one man's view is another man's chance of a home; we never learnt where the Once-ler's employees were living before.

Pick of the warren

WATERSHIP DOWN

By Richard Adams.
Rex Collings. 421 pages. £3.50.

A great children's book is always a great rarity; but this one deserves all the accolades it is currently receiving. It is right outside the mainstream of children's publishing. That is not to say that children's publishing is not, as a whole, remarkably good: for calibre, colour and price it compares increasingly favourably with adult literature. Well drawn, beautifully-produced picture story books can be bought for a pound or much less; good, well-illustrated, suitably brief "children's novels" for not much more—or, in the Puffin range, for a good deal less. This book, by contrast, costs over £3. It is over 400 pages long. There is not a single illustration except for a small sketch on the unglossy cover and a couple of plain maps. Each chapter begins with a quotation, whose sources include Aeschylus—in the original Greek.

This book is in the tradition of both "The Wind in the Willows" and "The Lord of the Rings"; and yet unlike both. It is about rabbits; and not, it must be stressed, about bunnies. The rabbits have a language (echoes of Tolkien), a social hierarchy, folk-heroes and a mythology. They have a Thousand Elil—enemies—because Frith—or God, or the sun—decided they

were growing too proud, and believed they could rule the world because they bred so fast. In compensation, he gave them strong hind legs and the ability to burrow. This book is a saga of the migration of a small group of youngish bucks from a warren threatened by planning permission through dangerous and unknown countryside to Watership Down, and of the capture of does from a hostile warren to perpetuate their own now one. The trick is, at least partly, that Mr Adams has so exact a knowledge of the territory he describes, a real piece of downland and common on the Hampshire-Berkshire border, and so profound a knowledge of animal behaviour, that fantasy is contained within the real and not superimposed upon it; he colours and reinforces nature rather than obscuring or concealing ignorance of it. And he is, above all, a remarkable story teller. He can pile up suspense, convey urgency, relief or fear, melt his characters into the landscape or make them stand out from it with equal facility. This book was, it seems—in the tradition of all classics—rejected by three publishers. If there is no place for "Watership Down" in children's bookshops, then children's literature is dead.

Piecemeal

THE ENGLISH JIGSAW PUZZLE,
1760-1890

By Linda Hannas.
Wayland. 164 pages. £10.

Nearly 15 centuries ago, St Jerome was suggesting cut-out wooden alphabet letters for the instruction of his grand-daughter (and he pinched the idea from Quintilian). So it seems highly odd that no one should have dreamt up jigsaw puzzles until the 1760s, when one John Spilsbury began advertising "Dissected Maps, for Teaching Geography" in London. But so Mrs Hannas informs us, and her research and her own collection of puzzles are both considerable. (Her book is a checklist of antique puzzles as well as a history of them; the second half is for collectors only.)

In the early puzzles, the cutting followed the contours of the subject: that meant, usually, the moderately wavy lines of frontiers and county boundaries, since maps predominated. But their instructive success led to jigsaws being used as teaching aids for the most unsuitable subjects. Mrs Hannas's book is packed with reproductions of now fascinating, but in conception deathly unimaginative, puzzles; chronological tables crammed

Marriage: an either-way-up puzzle

with small print; a series of "Moral Pictures, Being Lessons for the Young and Old, on Industry, Temperance, Frugality, &c . . ." cut in a very dull way; and a curiously illustrated multiplication table. By contrast, some of the maps are gloriously intricate.

The earliest continental jigsaw Mrs Hannas has seen was dated 1796, though the distinctive interlocking pattern was developed in Europe in the mid-nineteenth century, some 60 or 70 years before it was used in England. European puzzles were delicate, squiggly, attractive things, more often designed for adults. But Mrs Hannas is thoroughly indignant that French toy historians should have credited a

MAN AND THE SOCIAL SCIENCES

Edited by
W. A. ROBSON

Twelve lectures delivered at the London School of Economics and Political Science which trace the development of the Social Sciences during the present century both in the School and elsewhere.

"Even when one allows for a certain natural pride, it is evident from most of them that there is an impressive coincidence between the intellectual history and the institutional one."

New Society
£5: paperback £1.
George Allen & Unwin

compatriot with the invention of the jigsaw itself, as late as 1812. She gives nearly the last word to a toy dealer interviewed by Henry Mayhew in the 1870s, who allowed the French credit for their mechanical toys, the Germans for Noah's arks, soldiers and farmyards, and the Swiss for cottages and "their carved six-foot lay figures," but maintained that:

The English excel in the invention of games—round games for children. They also excel greatly in dissected puzzles, geographical, and the like. The foreign articles of that kind are so slight as to be useless. What the English workmen do they do well, solidly and enduringly; it hasn't the tinselly look of the foreign certainly, still it's not flimsy, and it's useful.

Nursery rhymes

THE ILLUSTRATED TREASURY OF POETRY FOR CHILDREN

Edited by David Ross.

Collins. 352 pages. £2.95.

A CHILD'S GARDEN OF VERSES

By Robert Louis Stevenson.

Collins. 108 pages. £1.25.

GREAT FOLK TALES OF OLD IRELAND

Edited by Mary McGarry.

Wolfe. 112 pages. £1.50.

THE PROVENSEN BOOK OF FAIRY TALES

By Alice and Martin Provensen.

Collins. 140 pages. £2.50.

STORIES FROM HANS ANDERSEN

Selected by Philippa Pearce.

Collins. 182 pages. £1.25.

Mr Ross has compiled a remarkably full collection of verse, which is nicely presented and printed and disappointingly illustrated. The choice is excellent: all the old familiars of children's poetry are here—Walter de la Mare, Christina Rossetti—and all the giants, too. Shakespeare, Macaulay, Tennyson, Goldsmith, Shelley, and Wordsworth are well-represented. But by sheer bulk, Mr Ross has managed to fit in a great deal else. First of all, the American originals of this book have meant a generous, but not excessive, quota of American poets. Then, he has included a good selection from poets not normally regarded as children's property but eminently suitable—W. S. Gilbert, for example. The bulwark of books of collected verse—anonymous poetry—is admirably reinforced with a huge collection of jingles and limericks. The selection of both is also, it need hardly be said, eminently suitable—nothing rude.

Robert Louis Stevenson composed his "Child's Garden of Verses" in the 1880s in the south of France, where

Hans Andersen's mice

he had been driven from the Scottish climate by ill-health. He died less than a decade after it was published, in his 40s. But there are none of the maudlin intimations of mortality that drenched so much Victorian children's poetry. Even the verses on sick children dwell only on the pleasures of counterpane games—a remarkable lightening of the horizons of children's literature at the time. There is still a comfortable Victorian complacency: the nearest thing to the expression of a social conscience is:

The child that is not clean and neat
With lots of toys and things to eat
He is a naughty child, I'm sure
Or else his dear papa is poor.

It would be nice if this latest edition could have served to refresh the image of Stevenson's poems, which have a period charm and innocence not wholly destroyed by time, but Mr Gyo Fujikawa's illustrations unfortunately emphasise the strands of sickly sweetness.

The harsh black-and-white drawings that illustrate "Great Folk Tales of Old Ireland" make a welcome change from the usual tinsel fairies; but the impression is of dank Celtic gloom. Myths and folk tales are strong stuff, demoted by time to the status of children's literature. The nurturing of children on the superstitions of past ages is an ancient practice, which preserves tales that would otherwise have been lost to literature. But it is curiously seldom questioned even now: fantasy and the absence of explicit sex seem to be enough to qualify any myth for inclusion in a children's book.

The Irish tales are an uncommon and valuable collection, but the

Provensens. are on more familiar ground. There is no sugar in their illustrations, either. The results are curiously variable; the dust-cover, annoyingly, is the best. Still more familiar are the Hans Andersen stories contained in this unfussy Collins edition with surprisingly good colour illustrations, which at least prove that it is possible to be placid without being flaccid.

Anyone for the terraces?

THE GLORY GAME

By Hunter Davies.

Weidenfeld and Nicolson. 344 pages. £2.95.

PURNELL'S ENCYCLOPEDIA OF ASSOCIATION FOOTBALL

By Norman S. Barrett.

Purnell/Bancroft. 254 pages. £1.80.

Britain's greatest game is supposed to be going through a crisis. Attendances at league football matches have been dropping so much this season that an MP is trying to introduce a bill to make the football pools' promoters pay a levy to help the clubs in the same way that bookmakers and the tote are levied for horseracing. If that proves anything it is simply that a sport which started out as a gentleman's game (who was it who said that football is a game for gentlemen played by louts, while rugby is a game for louts played by gentlemen?) moved into the backstreets to become a working-class obsession and is now, when it is successful, very big business indeed.

There is possibly a grain of truth in all the excuses given for falling gates: too many games—at least for the successful clubs—too much television, too much hooliganism on the ground or just away from it, and too few goals. (This year's decline has perhaps a more national character: if England had won the European nations' tournament this year instead of failing so badly against west Germany would there have been anything like the same decline?) But for the millions who love it more than any other sport is loved football is still very much the glory game—the title of Mr Hunter Davies's book—whether they are sitting in their season ticket seats at a leading first division club or kicking a ball around in the park or the backyard and dreaming of the time when they will be playing for such a club. At the posh end of the trade football is becoming a fashionable game to watch (Chelsea are spending an eventual £5m on their stadium), while at the playing end it is still the best way for a working-class

boy with average intelligence but above average talent to make a lot of money. The £10,000 plus a year that goes to the top players will end shortly after they are 30; but tell that to a working-class kid and see if it is a deterrent.

One suspects that much of the criticism of Mr Davies is mere resentment, expressed by middle-class spectators and trendy commentators because he describes the Tottenham players very much in these terms. Mr Davies lived with Tottenham Hotspurs for a whole season, travelling with them, being a privileged observer in the dressing room and off the field. Of course, he will have upset many of the Spurs people and their friends by his frankness; but it is difficult to abuse a journalist for being honest.

This is a good book to give dad if he wouldn't miss his Saturday afternoon home game for anything; it is even a good book for dad to give the son he takes with him—providing he is certain his boy knows and uses all the four-letter words when no parent is around. If you are not quite so sure your son swears like a trooper (and even if you are) the Purnell Encyclopedia is a very good buy. Such reference books always leave out something you want to look up, but this one is full of good pictures, statistics about the game, the laws, notable matches, etc. It even describes how the iniquitous "goal average" system in the Football League works. It will settle a fair number of arguments in a football home, and mum might think it worth the price for that alone.

Picture books

Penelope by Thelwell (Eyre Methuen, £1). Penelope is the archetypal middle-class 10-year-old, with friends called Fiona and Magnus and Tarquin. Kipper, however, is free of the shackles of class, and of most other restraints, a mean, fat, obstinate, hard-mouthed, vicious little pony. Any horse-mad child should be given this book as an antidote to "Black Beauty."

The Funniest Story Book Ever and ABC Word Book by Richard Scarry (Collins, £1.25 each). The inimitable Mr Scarry is obviously one of those people to whom a blank space on a piece of paper is an irresistible temptation; every page of these large, well-produced books is thickly covered with busy, detailed drawings around which any story wriggles its far less important way. Mr Scarry's characters are bunnies, cats, piggies, any sort of animal,

A Scarry breakdown

but it is in the minutely observed, up-to-date detail of their human clothes, toys, machines and houses that his real skill is displayed. Both these large and glossy books are enormously good value.

Mrs Pepperpot's Christmas by Alf Prøysen (Hutchinson, £1.10). Babar and Tintin have proved that it can be well worth translating stories for even the youngest children: Mrs Pepperpot is another genuine original, of which Bjorn Berg's illustrations are only one ingredient. This good Swedish housewife also appears in the Young Puffin range in Mrs Pepperpot in the Magic Wood (Penguin, 20p). Young Puffins contain larger type and more line drawings than the Puffin range of paperback fiction for older children, but are as well chosen; one could wish that Penguin publishing for adults was as uniformly excellent.

Paddington Bear and Paddington's Garden by Michael Bond and Fred Banbery (Collins, 50p each). These two splendid Paddington stories appear in excellent little hardback, gently-coloured picture books which illustrate just how well and professionally Collins produces children's books. There was a spot of bother earlier this year when large, furry and expensive bears wearing the familiar headgear and luggage label began appearing in smart toyshops; the case has now been settled to Mr Bond's satisfaction.

Jumping Mouse by Brian Patten (Allen and Unwin, 95p) is the story of a wandering mouse, who, curious to find the cause of the roaring in his ears, is led to a river, and thence across a great plain to a range of sacred mountains where he finds happiness and freedom. His adventures are simply and unpretentiously related by the Liverpool poet, Mr Brian Patten, and the story is beautifully illustrated by Miss Mary Moore.

Orlando and the Water Cats and Orlando: the Frisky Housewife (Cape, £1.25 each). The second of these is a reissue, but original Orlando books still keep appearing, in the well-tried format with complicated, peacock-coloured drawings. So too do the Babar books, in two sizes: Babar and the Professor by Laurent de Brunhoff (Methuen, 95p) is a new, large book first published by the Librairie Hachette; but from the same source Methuen has acquired four more short Babar stories and is selling them at the remarkably good price of 30-40p each.

Making a Transistor Radio and The Bunny-Fluffs' Moving Day (Ladybird, 15p each). Two books at the opposite ends of Ladybird's formidably wide and still fast-growing range. Except that it has the usual format, with an equal share of text and illustration, the first, an excellent little instruction manual, is much too sophisticated to be included in a list of picture books. At a price of 0.3p a page, it is almost as cheap as *The Economist*. The second is a simple, rhyming story with old-fashioned, mildly anthropomorphic rabbits: nothing trendy, but good, solid proof that there are some young children's story books within everyone's budget.

Business Brief

The boating urge

Something like 2m Britons messed about in boats of one sort or another last year. Many of them will spend Christmas indulging in fantasies about next summer, and the craft they will order for it at the Earls Court Boat Show (sponsored by the Daily Express), which opens on January 3rd. Around 300,000 of them will actually turn up to the show. Very few will spend more than the price of their entry ticket, a cheese roll and a cup of tea. But the few that are buying are keeping the boat industry more than happy.

For the past two years, sales have been booming. Many boat-builders' order books for this season are full, and they can only take orders for delivery in 1974. One firm is known to have dropped out of the show because it could not possibly handle any more work.

The Ship and Boat Builders' National Federation's latest figures, for the year up to last March, show a growth in members' sales of boats and equipment of 14%, to over £83m. The industry has been bounding forward at over 10% a year for a number of years. The latest jump was all in home sales, which went up by a fifth to nearly £63m. Export sales dropped by 11%, partly because the lucrative American market went through a recession, partly because the British industry has not been pushing exports very hard when it could concentrate on the more profitable home market instead. Mr Barber's various reflationary measures have been a great help—more than the figures show, because they do not yet take in the effects of the last £1,000m of tax cuts. But even in the year to last March, home sales of actual boats (as opposed to fittings and paraphernalia for them) went up by 50%, split almost evenly between power and sailing craft.

Imports naturally went up too; it is hard to say exactly by how much because the Department of Trade and Industry is fairly vague about it. Sales of

foreign pleasure boats this year seem to have been worth around £6m, more than double the year before. There is a long-standing trade in boats with Holland, France, Spain and Scandinavia. In recent months American builders of standard production boats, like Morgan Corporation of Florida, have also begun actively selling in Britain. Tariffs on leisure boats are all around the 5% mark, so common market builders will not have a great new advantage after Britain's entry.

One of the big boosts for the industry has come from the Chancellor's decision in the last budget to re-allow boat mortgages as a tax-deductible item, along with bank loans. As a result, bigger and more expensive boats have done noticeably better. Hill Samuel's new marine division, set up at the end of 1971 to finance sales of boats costing more than £10,000, has done three times as much business this year as expected. Companies are catching on to the rule that boats of more than 100 tons count as ships, so their cost can be offset against cor-

poration tax. National Car Parks and Selection Trust are among the companies who, often inconspicuously, have recently acquired ocean-going craft.

Only a year ago, there were fears that value-added tax on boats from April, 1973, would put a damper on the boom. Until now, boats have escaped any kind of sales tax, except for a very brief period in 1947 (which served only to demonstrate the enormous difficulty of collecting purchase tax from hundreds of small builders). With the outlook now so cheerful, few people in the industry believe that Vat will do much to slow sales. But a lot of business has been drummed up by reminding buyers that Vat is round the corner. Mr Heath himself has slipped in under the Vat net by ordering his new American-designed (though British-built) Morning Cloud for delivery before next April.

Takeovers

However well the industry has done on sales, it has still made little progress towards rationalising itself into larger production units. The famous Camper and Nicholson family firm was taken over for more than £5m by Crest Securities, which has set a sharper tone in the firm's advertising. The only other notable takeover has been by Simpson-Lawrence of Glasgow (which makes chandlery like winches and cleats) of part of Frances Marine (which was in the same line of business)

and of the Dutch firm Bako NV.

The 600 or so boats at Earls Court will present the novice with a bewildering choice, ranging from a dinghy measuring less than 8ft and costing £45, to the 70ft ketch "Falmouth Packet" donated by the Beaverbrook family to the Ocean Youth Club, and worth perhaps £70,000. This year, for the first time, there are also 20 boats on show on the Thames, near the Albert Bridge. This should go some way towards competing with the natural advantages of the summertime boat show at Southampton.

Most first-time buyers start with one of the smaller sailing dinghies or powered runabouts, costing anything from £100 to £350. This year, the British boat industry turned out something like 45,000 in this class with its endless sub-varieties. The most popular single type is once again the Bell Woodworking Mirror dinghy, costing up to £380 complete, but less than one third that in build-it-yourself kit form. Among the more elaborate types—which the hardly can use for overnight camping—is the enjoyably eccentric Drascombe daysailer, which at £650 for the 20ft version has a miniature cabin for hiding from the worst of the weather.

The big advantages of these smaller craft are their low price and high portability—either on the roof rack of an ordinary saloon or, for the heavier ones, on a trailer (which still carries

Moonraker: nice at a price

Did someone say floating caravan?

Drascombe: funny-looking, but good sport

no road tax, despite the amount of road space it takes up). Trailers can be used for boats up to 35ft long. The boat may look out of place wintering in a suburban garden, but this method of hibernation saves a lot of money. Moorings in some of the more popular south coast spots like Poole can set you back £10 per foot of boat a year, or even more for bigger boats. For this, you do get all the facilities—car parks, showers, water—laid on; but not everyone can afford or wants to spend that much.

Novice buyers who want something bigger than roof-rack size usually go for power craft with rudimentary cabins. A lot of them want to use these on inland waterways, like the Thames or the Norfolk Broads, which are already overcrowded. But waterborne traffic jams are still somehow less frustrating than the ordinary kind. The entry price into this kind of boating can be as low as £400, for a two-berth Bonwito 14-footer. The price soon rockets for anything more fancy. The popular 20ft Dolphin can cost as much as £2,500. One of the increasingly popular super-deluxe boats with continental styling, flying bridge and tinted windows for privacy, can set its buyer back by anything up to £50,000. Many of these boats—fitted like high-class caravans with built-in showers, fridges and television sets—rarely leave their marina base; but radar scanners are considered essential equipment on them.

Racing hints

For the serious power cruiser owner, the Monte Carlo power boat race was a good test of reliability. Ford Marine diesels and the Fairey Huntsman range

came out with flying colours from this year's 2,900-mile run from London. The standard, four-berth 31ft Fairey costs just £16,300, and was beaten only by out-and-out racers.

The would-be buyer of a sailing boat will find race results a less reliable guide. Ocean-racing sailing boats have to be designed to rigid sporting rules; most designers then spend a lot of their time trying to find legal ways around them. But there have been some spin-offs from their ingenuity. Rod-rigging, which is increasingly replacing the standard woven wire, had been developed for racing boats because it is much more reliable. Roller reefing of head sails (which makes it possible to roll up the head sails from the safety and comfort of the cockpit in high winds) holds no attraction for racers, because it limits the choice of headsails; but for mainsails roller reefing is now standard equipment on all boats.

The singlehanded transatlantic race provided some clues for the family man in search of a sailing cruiser. Although many entrants were specially-designed monsters with little practical application to cruising, the most notable success was the win on handicap of Lieutenant Guy Hornett's Kingfisher 26, which was virtually a standard boat. It demonstrated, against many traditionalists' view, that a small boat with twin bilge keels and standing headroom inside is not necessarily blown backwards in anything over a force 4-5 breeze. Production versions of the Kingfisher can be had from Westfield Engineering for a little over £2,500.

Most sailing cruisers have an auxiliary engine to get them out of trouble, or home on time

when the wind dies down. This idea has been developed into a wide range of motor sailers, designed to combine the advantages of a large power boat engine with the fun and the economy of sailing. Some types fall between two stools, and the most desirable boats are expensive. If the emphasis is to be on sailing, the Camper and Nicholson 38 is hard to beat. If engine power is more important, the Dutch-built Banjer is an obvious choice; it looks rather like a modern fishing boat and is just as safe. A buyer of either of these boats has little change from £20,000; if he moves up the market to a Camper and Nicholson 55, the price is £51,000. But some bargains are nowadays to be found in the secondhand boat market—mainly handled through brokers—because so many people are trading up to better boats.

Safety

The increase in amateur boating enthusiasts is reflected, sadly, in the number of accidents. The Royal National Life Boat Institution is called out three times as frequently as it was a decade ago, with much of the increase coming in the last three or four years. Even for the offshore life boats, well over a third of calls come from power and sailing pleasure boats. Closer to the shore, pleasure boats (including rowing boats) account for nearly two-thirds of all emergency calls.

Many of these calls arise out of carelessness or sheer ignorance of the sea. The boating world is set dead against the idea of licences to control the sport, but simple controls now might be better than more rigid ones later. Insurance rates have so far been little affected by rising

accidents, but insurers are already getting tougher about thefts from boats; in time they will inevitably adjust accident premiums too.

The boating industry's success is creating its own problems. Overcrowding, particularly in the south-east, means that moorings are becoming increasingly scarce as well as expensive. There are hardly any suitable sites left round the Hamble that have not already been turned into marinas. Property developers now regard marinas as a gilt-edged bet. London's dockland has massive scope for development along the lines of the proposals for the disused Surrey Docks: a marina-cum-housing development. The Royal docks could be the next on the list, with others to follow. Once the tidal barrier is in place, the lower reaches of the Thames could become as congested as the notorious Boulter's Lock at Maidenhead.

Transatlantic Kingfisher

Today's constantly expanding world trade, increasing at a rapid pace, is generating a tremendous amount of diversified products to be transported by sea. This has necessitated the need for ever larger shipping vessels. IHI, the pioneer of super-mammoth tanker construction, will complete the 477,000 DWT Globtik Tokyo in February 1973. It is the world's largest. And two others of similar size are in the works. We are used to breaking our own records.

The Earth. Whatever helps people span it, develop it, live on it, IHI is involved in it.

However, taking into account cost and efficiency, IHI took it upon itself to standardize vessel construction and thus permit mass-production. We did this by developing the multipurpose, dry cargo vessels "Freedom" at 14,800 DWT and "Fortune" at 22,000 DWT. Orders have been pouring in, reaching a total of 109 to date.

BUSINESS

Now for that budget

The Conservatives look like breaking their promise to cut public spending and taxation, but they are doing their best to make it look as if they are not

The first and most important half of the Chancellor of the Exchequer's 1973 budget was extensively reported in the national press on Wednesday. It was a routine event: the publication of the annual white paper on public expenditure to 1976-77 (Cmnd 5178). The information it contains will do a great deal to determine how much the Chancellor will be able to give back, or what more he will have to take in taxation, next April.

It is a quaint and infuriating old British tradition for the Chancellor to separate by well over three months the announcement of his spending plans from the announcement of his tax changes. In this way it is possible, as the Wilson government discovered, to blame higher taxes on the greedy consumer; or, as this Government has discovered, to justify whacking expenditure increases on the need to reduce unemployment. Nowhere is the choice between more public spending or more tax cuts and between less public spending or higher taxes offered to the country in a way that anyone can understand. Every "stop" is the excuse for higher taxation and every "go" the excuse for higher state spending. Thus the public sector waxeth exceeding fat while the private sector wasteth away.

So far, net taxation has come down under the Heath Government; but, unless further cuts are made, inflation will take back every penny by the next election.

The share of public spending in gross national product, on the other hand, has gone on rising, while that of pure private consumption, spending out of earnings (not state transfers such as pensions, welfare benefits, family allowances, etc), has probably gone on falling. Each year, thanks to the probings of the Commons' Select Committee on Expenditure and now with the requirements of common market membership, it is becoming more and more difficult for the Government to maintain this separation between spending plans and taxation. As it is forced to give more details of its plans and the economic thinking on which they are based, the realities of the situation begin to emerge. But the Treasury is a pastmaster at the game of economic hide-and-seek. It knows exactly how to give the illusion of telling more without really doing so. A statistical detective is still needed to get the real story out of the published figures.

The first problem is to find exactly what is happening to public spending plans. This sounds easy. The white paper says last year's figure was for 3.2 per cent a year growth, while this year's is 3.0 per cent for 1972-73 to 1976-77. But if you exclude counter cyclical expenditure from the base period, 1972-73, the Treasury says a fairer rate of growth in public spending for subsequent years would be 3.4 per cent. The chair

Key indicators: British economy

	Month	Index 1963=100	Percentage change on		
			previous month	three months	one year
Labour market					
Numbers unemployed fell sharply this month. Rise in unfilled vacancies continued.					
Gross domestic product					
Third quarter only 1.8% up in volume on a year ago.					
Earnings and prices					
Earnings up sharply again in October to give an increase of 15% over last year. Retail prices increased at an annual rate of 8.6% in the six months to November.					
Industrial production*	October	132.7	+1.5	+2.2	+6.2
employment*	September	88.3	-0.3	-0.5	-3.3
productivity*	September	147.6	+0.5	+0.8	+7.3
Export trade*†	November	164	-4	+77	+18
Retail trade*	October	118.8	+1.3	-0.1	+5.7
Unemployment*	December	144.9	-3.7	-10.3	-14.7
Average earnings*	October	218.1	+1.5	+5.7	+15.1
Retail prices	November	163.4	+0.4	+2.3	+7.6
Export prices	October	155	+1	+2	+6½
Import prices	October	143	+1½	+3½	+6½

Money supply
Still increasing at an annual rate of around 20% in November.

Export trade, retail trade: in volume terms (value at constant prices).
Unemployment: wholly unemployed excluding school-leavers; latest rate 3.2 per cent. *Seasonally adjusted. †Provisional

Never look back

shows what has really happened: the growth from now on may be very little different but the starting point from which the growth is measured has been moved and that makes all the difference to the figures.

To get a true picture you have to go back to previous years' white papers and correct the comparisons for changes in the prices used to calculate public spending.

The Treasury has found a painless way of reducing the growth in public spending. It is based on two principles. Never look back; and it is easier to bump up the present than to reduce the future. The chart shows that, by the next election some time in 1974-75, public spending will be almost exactly where a continuation of Labour's policies would have taken it.

The excuse for the failure to cut public expenditure is that increases were needed as a counter-cyclical measure to boost demand and to reduce unemployment. If this were so, the share of public spending ought to return to normal in due course, and the boost should have come when it was needed and not so late that it spills over into the upswing when other demands may have to be restrained.

The white paper does not give quite enough evidence for this excuse to be challenged. The figures which need to be examined are those for the public sector's demand for resources in each year. These are different from the crude expenditure figures normally given because different categories of public spending have different demand contents: £100 spent on current purchases of goods and services adds roughly £95 to demand—£5 leaks back in the indirect tax content of public sector purchases. But £100 spent on national insurance benefits (gross) adds only £80 to demand because of leakages into taxation and savings; and only £26 to demand if contributions are increased in parallel.

To calculate the public sector's claims each year the right factors have to be applied to the right spending categories. All that is given in the white paper is the growth rate of public sector claims between 1971 and 1977. From this it can be seen that the Government hopes to reduce the public sector share from whatever it may have been in 1971. It plans for a 3.1 per cent a year increase in its own claims against a hoped-for output growth of between 3½ per cent and 5 per cent.

What is missing are figures for the level and share of public sector claims in the base year, 1971—and any other year, for that matter. Great care is taken that these cannot be deduced from the information given.

Even so, certain conclusions do emerge. It is clear from the crude expenditure figures that the peak increase in public sector demand occurs in the years 1972-73 and 1973-74. This is too late to prevent the stagnation which emerged in 1971 or the rise in unemployment to over 1m last winter. Earlier and quicker-acting measures were clearly preferable, and tax cuts in 1970, which the Treasury resolutely opposed, would have been a far more effective counter-cyclical measure than the panic decisions in the winter of 1971-72 to increase public spending.

This belated counter-cyclical increase in public spending now means a danger that, if the economy were to take off, continued high public spending next year could be an embarrassment. Moreover, it is by no means certain that the Government will succeed in reining back the growth of public spending after 1973-74. Public spending programmes always appear to tail off the further one looks into the future. Assistance for the coal industry, for example, in 1976-77 has yet to be fixed, and the derisory £2m provided in the estimates for that year is clearly meaningless.

Even if the Government's plans are realised and it does succeed in hitting its targets, the provision may not be adequate. Even on a 5 per cent growth rate for the economy, the share of privately-financed consumption does not rise between 1971 and 1977, and if investment takes off, it will fall. Given the way privately-financed consumption was squeezed right through the 1960s and the inflationary stresses this produced, the maintenance of the 1971 level may not be regarded as satisfactory. It certainly does not suggest scope for any effective tax cuts—rather the reverse.

Perhaps the Government can claim it is at least trying and ought to be given the benefit of the doubt. But before that can be done it must come clean with the figures. Then we shall have a real autumn budget for discussion like the other EEC countries. That must come in the next eight years anyway.

The lines to Europe are engaged

Three in five telephone calls from Britain to Europe go wrong. Does nobody know that Britain is joining the common market a week on Monday?

Getting through to your new common market partners takes perseverance. At peak times a phone call to Brussels or Paris offers the choice of a half-an-hour's non-stop dialling of 15 digits, or a two-hour wait for an operator connection. In the winter, when Britain's clocks run an hour behind Europe's, things get worse because peak times are telescoped. The Europeans tend to start work earlier, often lunch earlier and go home earlier than we do even in normal times. During the five winter months when we are an hour behind, Mr Smith in London is beginning to make his mid-morning telephone calls when Herr Schmidt in Düsseldorf is getting on his coat to go to lunch. When he gets back, Mr Smith is eating. The overlap when they are both certain to be found at their desks probably amounts to little more than one hour in the morning and again in the afternoon.

Telephone traffic doubles every five years. In 1971-72 international calls to and from Britain were less than 50m. The forecast for 1976-77 is 130m. Mr Edward Fennessy, the post office telecommunications managing director, puts it at a possible 350m in 10 years' time. About four-fifths of international calls now go to Europe even before Britain is actually in the market.

The post office is spending £125m over the next five years to cope with the expected jump in traffic, on exchange equipment, cables, satellites, buildings and so on. Perhaps surprisingly, cross-channel links are well able to cope with the present traffic. Extra capacity to be added between now and 1978, both on sub-Channel cable and across-the-water microwave links, will more than double the present number of telephone circuits to 20,000. The bottleneck is exchange equipment on both sides of the Channel. There is little Britain can do about the inadequacies of continental telephone systems, but there is also great room for improvement at home. Improvements are needed at the level of the international exchanges through which calls from abroad have to be routed, and again at the local exchanges they eventually—with luck—find their way into. Of the total £125m earmarked for developing Britain's international telephone network, £55m will be spent on the international exchanges.

Exchange equipment is a sore point with the post office. In the early 1950s it decided boldly to step into the twenty-first century and all-electronic exchanges. The saga of how boldness failed, throwing the post office back on equipment a good 100 years old in design, is well known and still rankles. Over the past few years, the post office has started putting into small local exchanges a semi-electronic switchboard known as the TXE2, and at the beginning of this year it gave a £15m contract to Standard Telephones and Cables to scale this up experimentally for exchanges of up to 40,000 lines (TXE4). This caused

another political storm; many claimed that the post office was once again making the wrong choice, and, having waited so long, should now wait that bit longer for fully electronic exchanges. The post office promised to say "by the end of the year" whether it intended to put the TXE4s into production on any scale. Even if the TXE4 is a huge success it will bring no immediate relief: the first of the experimental batch is not due until 1975.

According to the timetable, it looks as though things will get a bit better up to the middle of next year, then get much worse, and finally start to improve as large chunks of extra equipment are brought in towards the end of 1974. To cater fully for peak demand will probably always be too expensive (in terms of equipment that would lie idle for most of the time), but the post office is aiming to cater for 80 per cent of peak demand by around 1977. Discounting wrongly-dialled numbers, unanswered calls and a (reduced) proportion of numbers engaged, that should put the chances of getting through at the first attempt at about one in two, compared with perhaps two in five now.

The post office is monitoring international calls to see how many go wrong, and whether the fault is in Britain or at the other end. At the latest count, taken in October, Belgium came out rather well—almost a 60 per cent success rate. So did Holland (which has a rather good fully-automated telephone system). France was about average, despite what is universally agreed to be an atrocious system, and Germany and Italy both came up with a miserable one-third success rate, although one has middling-to-good equipment and the other a truly dreadful network. But if the best that the post office can hold out for the future is a 50-50 chance of finding the line clear, then the Government should consider once more whether it is better to encourage British business just a little by synchronising our clocks with Europe's again. Of course British businessmen could get to work an hour earlier—but that may be asking too much of some of them.

Calling the common market

Number of telephone calls (manual and ISD) from Britain

A typical day on The Economist's switchboard produced: Brussels, 35 minutes and 21 attempts; Turkey, half-hour delay, through operator; Bonn, 15 minutes continuous dialling; Dublin, 10 minutes; Paris, 6 minutes; Amsterdam, 6 minutes.

Who is business's keeper?

The City's ginger group of efficiency-seeking institutional investors will be tame. But the CBI may have tougher recommendations for its members

The Watkinson committee, a prestigious group of businessmen chaired by the Cadbury Schweppes lord of that name, has been considering the "responsibilities and accountability of public companies" for the past nine months. This week it has given birth to a 20-page interim report that will soon be submitted to the council of the Confederation of British Industry. This is the parallel study to that initiated by Sir Leslie O'Brien, the governor of the Bank of England, to see whether the major investing City institutions could more effectively influence the efficiency of industrial and commercial companies—of which, on average, they own nearly half. The tame conclusions of that semi-official group emerged on Tuesday.

The Government was anxious that the full CBI report should be published before Christmas, so that it could have time to consider amendments, if any were suggested by the report, to the Fair Trading Bill. However, it will not be published until the end of January. Mr Heath, sucked ever deeper into the affairs of both public and private industry, wants the checks and balances of private enterprise overhauled and streamlined. Ever since the collapse of Rolls-Royce, the Government has felt that the City has not done a very good job of monitoring efficiency in industry. Thus the O'Brien initiative on the shareholding side, and the effort by the CBI to see whether company boards can become more sensitive to the demands placed on them.

The Watkinson proposals, it is believed, are more radical than had been expected from a CBI committee. Perhaps the single most controversial proposal is to make it clear that the business of business is not just business. The report believes directors have an ethical responsibility to their shareholders, but also to their employees and to society. Ecology and the environment, those fashionable twins, have to be looked after, and the company's obligation to them should be set out in its articles (its constitution). The responsibilities of directors should be clarified. Although it does not propose to make insider dealings illegal, they are clearly thought to be immoral.

The interim report is designed to promote discussion, the fruits of which will be contained in the final one. Many boards will not welcome the proposals to put firm age limits on directors and on the chairman, to limit the duration of his chairmanship and to ensure that he is responsible to the directors. Boards of directors should not be self-perpetuating oligarchies: non-executive directors should be mandatory. Any director who is representing a particular interest, be it a major shareholder or bank or whatever, should disclose this clearly to the shareholders. However, while emphasising that any employee can become a director (this is a bit far-fetched) it is against worker-directors as such and the continental system of two-tier boards. The law should be amended in minor ways—to prevent directors of com-

panies that have gone bust popping up in other companies, and to force companies to file accounts more rapidly. But basically the interim report is a code of best practice for boards of directors.

What the Government will have to decide is whether a board's best practice is good enough, in the light of the refusal of the City institutions to form a strong central body to watch over Britain's major industrial companies. If not, then a much tougher company law might be introduced than anyone is expecting, and there is always the ultimate deterrent of a British securities and exchange commission. Shareholders have rarely, in the history of the joint-stock company, been much good at pressuring their companies to be more efficient. In Britain the major force for change at the company level has been the takeover, but the CBI members, and the Government, now feel that the new takeover merchants are more interested in lining their pockets than underlining industrial efficiency.

Unfortunately, the O'Brien initiative to make the institutional shareholders do a kind of management diagnosis was an advance into a bog. The unit and investment trusts, pension funds, insurance companies, issuing and accepting houses all need a careful eye kept on them to make sure that they, for example, do not con the public into parting with its savings at the wrong time, or salt the future income of pensioners into dud stocks. Let the first industrialist accused by a pension fund manager of inefficiency ask to see a performance comparison of pension funds. They are not available. The British Insurance Association claims that it does good by stealth (see page 59 for an example), but the danger is that inside knowledge is necessary to do it. The BIA wisely refused to have anything to do with a joint monitoring committee—although for the wrong reasons: in the words of one eminent observer, it is "the most pusillanimous body in the City." The merchant banks also refused to join; they have enough conflicts of interest as it is, both advising companies and their clients to invest in them. Also, they are accustomed to getting paid for sniffing round companies. Thus the seven samurai have become three musketeers—the unit trusts, investment trusts and pension funds.

The CBI has made some worthwhile moves in the direction of a greater responsiveness by companies to outside pressure. This needs still more encouragement. A secretive band of musketeer-shareholders, whose methods are themselves not open to scrutiny, could do as much harm as good. All shareholders should be given more, and better, information to judge companies. Institutional shareholders, stockbrokers and banks should use the forum of annual general meetings and the meet-the-investment-analysts gatherings to express their criticisms loudly. After all, Britain's financial press has big ears.

BUSINESS

Britain

The Excess rescue operation sets a precedent

Outside the insurance market nobody has noticed. Inside it there are no illusions any more about just what is going on at Excess Holdings. This is an insurance company rescue operation on a major scale. The industry has seen where its responsibility to the public lies.

There has been murmuring about Excess all this year. Articles in various newspapers have questioned the adequacy of its provisions for outstanding claims, especially in its British motor insurance subsidiary. In August it stopped writing motor insurance altogether and in September the interim dividend was passed, to the accompaniment of a gloomy statement that included references to underestimated claims on the North American side, and "unquantifiable" losses arising from the shut-down of British motor underwriting. Because of the uncertainty, the share price slumped, and the flow of business to Excess, most of which comes from prestigious Lloyd's broking firms, ebbed. Then last week Excess asked the stock exchange to suspend its quote, and revealed that it was to make a substantial rights issue to restock the kitty.

This set off a spate of rumours around Lloyd's in which figures of £10m, £15m and even £20m were batted around. In fact £8m-£10m is to be raised, and, according to accountants who have been through the books, will be enough to put the company back on an even keel. But this is no ordinary rights issue. Although Excess recently caught a slight cold in North America (and may have picked up some bits and pieces that brokers could not place with Lloyd's underwriters), its business now is regarded by the market as a perfectly reasonable portfolio of British and worldwide

fire, liability and reinsurance risks, running at around £20m-£25m a year. But to support a business of this size a company needs a solvency margin of only £2½m. If £8m-£10m is now to be raised it is hardly surprising that market men have been asking what's up. After all, when the V and G fell, calculations showed that the company had lost all its shareholders' capital, and that its creditors would be about £8m short—a total deficiency of £10m.

So the drill now is that Excess will make a huge rights issue to its shareholders. Because many will be unable or unwilling to take up the shares they will be offered, the issue will be underwritten by a consortium of insurance companies and brokers. If £10m is to be raised, shareholders might be asked to subscribe for eight new 25p shares at par for every 25p share they now hold.

With this injection of cash, the company ought to be valued in the stock market at over £15m and up to £25m on its 1971 premium income (other than motor business), though some of this may need to be cut out. Even so, it is far from certain that the rescuers will end up out of pocket.

Somebody will then ask why it is that the industry is prepared to fork out to underpin the Excess, whose customers include insurance companies and industrial concerns abroad, while unfortunate motorists insured with the V and G were left floundering. There are definite points of similarity. Excess did seriously underprovide for motor claims arising from its 1970 motor underwriting (as *The Economist* reported on November 18th); and it is now pretty clear that for 1969 and earlier years there were even bigger underprovisions, and that the deficiency was rolled forward from year to year,

but concealed by the expansion of business, just as with the V and G.

But there are big differences, too. V and G's business was nearly all motor. Even with the huge increases in motor rates that have followed its demise, its business never had the strength and profitability of Excess's substantial non-motor business, and any rescuers might not have got their money back, as they probably will with Excess. So, with the leading broking firms putting in for a large share, the insurance companies are following the lead of the Commercial Union and joining in the rescue.

Steel

Handout time

The Christmas spirit took possession of the cabinet this week. On Thursday Mr Peter Walker, Secretary of State for Trade and Industry, told the Commons that the British Steel Corporation was being given just about everything it has asked for, except a starting date for the £3 billion programme just approved. Even that is likely to be included in a white paper to be published shortly after Christmas.

The Government is putting up half the money in the form of loans, and Mr Walker bears some of the scars of having had to fight harder than usual to get his colleagues to agree to this. The Government is sensitive about the mauling it received after its handout to the coal industry. It must have had misgivings about approving plans that are going to bring the corporation's capacity up to the maximum suggested by a steering committee of the steel industry and the Government earlier in the year. This is a capacity to produce about 36m ingot tons of steel a year. A good many people in Whitehall thought afterwards that it would be wiser to aim for the bottom end of the range, which was around 28m tons.

The plan outlined by Mr Walker bears some marks of this. It is flexible enough to allow annual capacity to be scaled up to more than 40m tons if the demand for steel goes up by more

than the 3½ per cent a year built into the plan; and what goes up, presumably, can be scaled down. There is going to be plenty of redundancy. Modernisation makes it inevitable that the labour force be run down by about 30,000 over the decade, from its pre-nationalisation level of 260,000 to 180,000. Some scope has been left, diplomatically, for expansion by the privately owned part of the industry, around the Hunterston complex, where an ore-processing plant has been approved. But no one suggests where the money is going to be found.

The biggest handouts in the plan are to Teesside, Wales (where almost a third of the money is going) and Scotland (to compensate for the fact that most of the existing Scottish plants will have to close). Losers are likely to be Consett, Corby and at least three steelmaking centres in the north west. The Government is angling to get help from the EEC social fund. If it is going to throw money around like this in the nationalised industries, the least the country has a right to expect is that the industries are run as efficiently as possible. When is the shake-up coming at BSC?

Economy

Seasonally-adjusted greetings

In the week before Christmas the gods guarding economic indicators brought some good cheer. The retail price index for last month was up, but most of the increase pre-dated November 6th, when the stable door was slammed. The rate of increase slowed down. The same was true of November's wage rate figures. Only October's pre-freeze earnings, released on Wednesday, continued to accelerate, with a 15 per cent rise on the year before.

Wednesday also brought squeals from both unions and employers demanding an early end to the freeze. A freeze is useless unless it does hurt and stopping inflation is bound to be painful. The unions would be more convincing if they called for an end to the price freeze, or the employers to the wage freeze, instead of the other way round.

Third quarter estimates for expenditure on the gross domestic product produced no surprises. Investment and stocks registered their expected fall and consumers' spending remained the main stimulus to growth. The precise growth rate remains obscure. Output,

income and expenditure measures continue to go their own separate ways, but it looks as if the economy was growing by 4-4½ per cent in the middle of the year.

Thursday's unemployment figures, the final contribution of the year, were again good: a seasonally-adjusted fall of 29,000 between November and December, with the total down 123,000 below last year's. There should be nowhere near 1m unemployed this winter, but not everyone believes the fall will continue. The first issue of a new quarterly, "Monitor," by the Institute of Manpower Studies, suggests unemployment may not be very much lower in mid-1973 than in mid-1972. This may be right, but for the moment the gods are smiling and it is best not to upset them.

None the less, the Bank of England still thinks that the gods will need a little help in 1973. It has therefore called for a further 2 per cent of special deposits, based on the level of eligible assets on December 13th and to be lodged half on January 3rd and half on January 17th. This call will probably mop up some £440m of liquidity. The further "significant reinforcement" is justified on two scores: lending to the private sector has been accelerating and the exchequer borrowing requirement in the present quarter has turned out to be less than expected. The move will almost certainly be followed by a further rise in the banks' lending rates.

There is still no certainty that the Bank's policy will pay off without further reinforcement. It depends on its effect on expectations about future interest rates, particularly for gilts. The move could be seen as a vote of no confidence in the Government's prices policy and casting doubt on the 5 per cent growth target.

Strikes

Unhappy new year

Five out of every six members of Mr Hugh Scanlon's engineering union did not strike this week. Only London and Manchester were badly hurt during the one-day strikes on Monday and Wednesday called to protest against the £50,000 fine imposed by the National Industrial Relations Court. On Thursday, the court had some of the union's gilt-edged holdings sold to pay the fine.

Traditional militant areas like South Wales, Clydeside and the west Midlands were barely affected by the strike. But it will be hard for Mr Scanlon to assess grassroots feeling because no one likes to strike close to Christmas. Glasgow has just completed its first week without strikes this year.

The strike outlook for 1973 is grim. There is trouble brewing over the Industrial Relations Act, and there is still trouble simmering in the docks. As the freeze thaws there will be big wage battles. On Wednesday, the post office workers put in a big claim, but they are hardly likely to strike again. The same day, railway drivers agreed to lift their ban on the Advanced Passenger Train and dropped their demand for extra money. But these were rare bright spots. The moderate General and Municipal Workers' Union is making militant noises. GMWU gasworkers are very angry since Mr Heath told Lord Cooper, the union's retiring boss, that there should be no negotiations until plans for phase two are announced. The union plans to call a conference in January, which could well vote to strike. The GMWU waterworkers, now enlarged after this September's merger with the National Union of Water Workers, are also threatening to strike, and that threat has to be taken seriously too.

Normally, both gas and water workers get whatever Mr Frank Chapple's electricians get. They have put in an almost identical claim to Mr Chapple's, but they would be lucky to win the same award that he got, just before the freeze. The two worst effects of a water strike would be the health risk if pumping stations were unmanned, and the fact that there would be no one to fix the large numbers of water mains that burst every day. However, troops could keep things running.

It is hard to predict other major strikes for 1973, although Ford is an

odds-on favourite. Other leading employers in the engineering industry are budgeting for a worse year than they have had in 1972. They reckon that their relative victories in the 1972 wage deals will make unions more militant in 1973. This makes the Confederation of British Industry's call for an end to the freeze after its first 90 days all the more difficult to understand.

Flying to Brussels

Quicker by hijack

The next hijacking of an aircraft in Europe will be carried out by a group of British civil servants who will order the pilot at brolly-point to fly them to Brussels. There is no other way in which anyone in this country with urgent business at the EEC can be sure of getting a seat. The airlines have made so little preparation for the likelihood of more people wanting to travel to Brussels after Britain is in Europe that even the Foreign Office has been driven to protest and MPs have suggested that the RAF should take responsibility for getting delegates to their Eurodestinations.

Of the 13 flights a day from London to Brussels only two leave in the morning in time to do any business there, and only two leave Brussels late enough in the evening to get politicians, businessmen or anyone else back at the end of the day. That might not matter if there were enough seats, but the total on these peak flights at either end of the day is less than 300 in either direction and it is becoming increasingly difficult to book any one of them. This is not only inadequate, it is an abuse of the monopoly that British European Airways and Sabena enjoy on this route.

Of late, BEA has been putting on the occasional extra flight, particularly on Friday evenings when there is a queue of British passengers to get home from Brussels at the end of the week. That is no substitute for an adequate scheduled service. The airlines express mild surprise that the traffic concentrates in the morning and evening peaks while relatively few want to fly on the midday services, when aircraft are leaving sometimes within half an hour of one another in both directions. But they know what they are doing.

Sabena has for a long time been a by-word for high-cost inefficiency, and British European Airways is rapidly becoming one. The two airlines operate a capacity-sharing cartel on this

route with the full approval of both their governments and they charge one of the world's highest fares, nearly 8p a mile. In spite of that, they still consider it necessary to force their average loads (on- and off-peaks) up to the 75 per cent mark in order to break even, and they do this through their joint control over capacity. This overcrowding would be unacceptable to a normal airline, to which average loads through the year of more than 60 per cent are an immediate signal of an impending shortage of capacity and the need to buy more aircraft. BEA does, as it happens, complain of a shortage of aircraft. It is particularly regrettable that it has chosen to make the Brussels route the victim of this.

Unless something is done quickly, there is a real possibility that this contrived shortage will impede the business of governing this country. BEA talks mildly of putting on

another flight when the summer schedules begin in April. April is too far away and one extra flight is not enough.

Cars

Ford rolls on

It looks as if Ford of Britain may have marked up a record pre-tax profit of over £50m this year, against its shattering £30m loss in strike-ridden 1971. A recovery on that scale is being inferred from Wednesday's announcement that car sales in Britain have now topped the 1964 record, and the 30 per cent increase in Ford's investment rate in Britain revealed last Friday. The last peak in Ford's profits was £43m in 1968. After that, profit margins declined and strikes surged out of hand. Mr Henry Ford II talked seriously of cutting down investment

in Britain. But this year everything has gone Ford's way: higher prices, hardly any strikes and record sales. Apart from imports, Ford has been the main beneficiary of this year's sales boom. Its recovery is the best piece of news for the British car industry for a long time.

Ford's £132m investment in the next two years will be spent on bringing all the company's British plants up to date. Its investment per worker is already the highest in the British car industry, but nothing like what it is in Ford of Germany. It has no plans to build any new plants in Britain, which suggests that Ford is cautious about its common market programme.

Meanwhile there is more trouble for the industry from the anti-car people in the United States, where the Federal Trade Commission has requested 12 firms (including British Leyland, Volkswagen and Volvo) to justify some of their advertising claims, including one that a car satisfied 26 necessities of life. A host of organisations has emerged to contest car advertising, including Save (Students against Volvo Exaggeration), Ash (Action for Safety and Health), and Soup (Students Opposed to Unfair Practices). One thing such groups protest about is that the industry is allowed to answer the FTC's charges against it in private.

Industry and EEC

Thirsty?

What Italy accomplished with refrigerators when the common market was first formed, Britain is expected to match with, of all things, vacuum flasks. This is one of the tit-bits in a new survey by the Department of Trade and Industry of 100 British manufacturing industries about to enter the enlarged community. Having achieved £500,000 in annual exports to the EEC despite a 12 per cent tariff, and with virtually no imports in reply, the Great British vacuum flask is considered in Whitehall to be able to go from strength to strength. This is one of the few findings that the DTI is prepared to be specific about. Its study, more than an inch thick, is stamped confidential on each page and is going to stay that way. Even the companies analysed will not be told of its conclusions.

One of the several bad excuses for this eccentric secrecy is that the conclusions were partly based on talks that the companies have had from time to time with the DTI's industrial divi-

sions. But the main reason for it is the typically British neurosis about "giving something away to competitors." That should not stop British Leyland being told that, although the report is not unduly pessimistic about the British car industry, it is less confident than its chairman, Lord Stokes, appears to be. The sudden foreign car penetration of the British market of the past couple of years is expected to become even greater.

Chemical companies should be comforted to hear that the DTI is smiling, confidently, as well as confidentially, about their long-term prospects. It also thinks that the aircraft industry might be reprieved; without entry to the EEC, its prospects looked grim. In computers the report strongly advocates cross-frontier developments in Europe, while recognising that outright mergers will be difficult to achieve for some time. It calls for the sort of short-term co-operation that should lead eventually to a European computer industry.

Docksey report

Discretion is . . .

After months of hassling with a reluctant Government, the Commons Select Committee on Science and Technology finally forced the publication on Tuesday of the earlier report prepared by Mr Patrick Docksey on the exploiting of Government patents. It is now of historic interest only, since the Government has decided not to adopt any of its recommendations. And Mr Docksey had himself excised the only two mildly juicy bits before clearing it for publication.

Early in 1971, the then Secretary of State for Trade and Industry, Mr John Davies, asked Mr Docksey to make an informal inquiry into whether British industry was making the best use of inventions coming out of government laboratories and also of the National Research Development Corporation which had funds to help to exploit inventions. Mr Docksey made what he and Mr Davies both regarded as a private report, the burden of which was the need for rather more commercial commonsense in selecting which inventions should be pushed ahead. Research does not cost much. The second stage, turning an invention into a practical product, can cost a great deal. So Mr Docksey reasoned that industry, used to making decisions intended to produce profits, should be the arbiter rather than scientists liable to be

swayed by their enthusiasms.

The proposed machinery was a supervisory board set up on top of the National Research Development Corporation. And once this board of industrial super-brains had recommended backing a project, Mr Docksey then suggested that the NRDC should finance it on a straight cost-plus basis without worrying about whether it would get its money back.

Mr Docksey should have known what the NRDC knew already: that industry itself takes up any invention that looks like having a 50-50 chance of success, and meets all the cost of development work in order to keep control over the patents. Projects that fall to the NRDC or any other government agency to finance have almost by definition a less than 50 per cent chance of success. Nevertheless, the NRDC has picked up winners even from such unpromising material. But Mr Docksey's board, guided by commercial principles, would have turned all of them down.

Mr Docksey should also have known that an inventor must never be allowed to think that paying his way does not matter. To say that the NRDC need not recover its money is to throw financial control out of the window along with commonsense. That is how projects like Concorde get started. The corporation is charitable in private to small inventors who have little chance of producing anything marketable but are original enough to justify support on the faint off-chance that they might.

To plead a statutory need to break even has been the NRDC's most useful refuge against importunate industrialists who ask the Government to finance projects in which they do not have sufficient faith to put their own money. Now, of course, they can go instead to Mr Christopher Chataway and the Industry Act. It illustrates how soft-centred the tough men of industry can be that Mr Docksey, schooled by British Petroleum, should have been so careless of financial control.

Tactfully, the Government shelved the Docksey report, intending that it should never see light of day. The select committee, however, has conducted a vendetta against the practice of reports going to a minister not being made available to the Commons. This time it won, and now it is after a much bigger target, Mr Peter Vinter's recommendations about which type of nuclear power stations the Government should back. Mr Vinter, however, is a civil servant, and may be much harder to wrinkle out.

Laying railway ghosts

The ghost of George Stephenson still haunts the Ministry for Transport Industries. On Monday the minister, Mr John Peyton, approved a £50m grant towards the £65m cost of an ill-conceived and extravagant new 34-mile railway for Tyneside. Manchester is proposing a similar system.

Railways are popularly believed to achieve high densities of traffic. This is only true compared with private cars, not compared with buses operating on an exclusive right-of-way, as the chart shows. Even a combined bus and car lane, as on San Francisco's Oakland Bay Bridge, can carry more passengers than do British Rail commuter services in the rush hour. Peak rail capacity is only attained in appalling discomfort.

The Tyne plan uses existing railway line for most of the route. In the study that advocated it, instead of going for conversion of rail into busway, Alan M. Voorhees, the American consultants, assumed that the 11 ft rail track would have to be converted into a 12 ft bus lane, with 3 ft verges. But the average British bus runs on 10 ft lanes, often less; its fatality rate is slightly less, per passenger-mile, than on British Rail.

An interesting precedent is the I-495 busway from New Jersey into New York, which carries 10 times as much

traffic as the Tyne system is ever likely to do. This is a lane less than 11 ft wide, with no shoulder; it is separated from oncoming traffic only by a few rubber markers. The authorities delayed its introduction for three years because they were worried about safety, but the only accident so far has involved no more damage than a broken wing mirror. The whole specification examined by Messrs Voorhees was on an extravagant scale, which made the busway twice as costly as the rail plan; in Britain railways have been converted into roads for only £50,000 a mile.

Another excuse for rejecting the busway was the growth of traffic expected in the town centre. The authorities thought this would delay the buses once they left the busway. But, if Newcastle does not give substantial priority to buses by 1979, when the new system is to open, it will be about the only city in Europe not to do so. And how about the traffic jams for and from the rail passengers trying to reach the station? The bus at least would involve only one journey.

Contrary to expectations, a bus fleet is much cheaper to run than a train. The subsidies alone on many London commuter services exceed the cost of carrying the same passengers by fast bus. Parliament would do well to reject the bill Tyneside has placed before it.

The myth of rail capacity

BUSINESS

International

God had better tell Amin he needs those banks

For the Ugandan economy, the critical move by General Amin this week was not the seizing of British firms and tea estates, but his threat to starve the foreign banks of business. If the new Ugandan managing directors of the seized firms prove unable to do the jobs taken at gunpoint from their British colleagues on Monday, the country could probably get along without cigarettes from the former British-American Tobacco factory or bicycle tyres from the ex-Dunlop plant, even though the bicycles are important. It would probably miss most the simple agricultural hoes from the Chillington factory.

But the country will find it hard to do without the expertise of the banks to keep its coffee and cotton industries going. Out of total exports last year of £98m, coffee accounted for £57m and cotton £21m. By comparison, tea exports were £6m and copper £8m. General Amin has now insisted that major banking business should be handled by the state-owned Uganda Commercial Bank. In the past year, this bank has already had to be helped out by the local branches of National and Grindlays, Standard and Chartered, and Barclays in the limited volume of work it was responsible for. It is doubtful if it could now cope with the highly technical problem of financing the seasonal swings of the country's two

major export industries, especially as the coffee and cotton harvesting season really gets under way this month and continues through until May of next year. Hitherto National and Grindlays has handled the internal affairs, and the other two banks the shipping and exporting side. General Amin has been meticulous in ensuring that loans due to them are paid off on time, even though some of them stem from the days of ousted President Milton Obote and before. He may yet find he needs them and do an about-turn.

He is shedding the expertise of the banks at the very time that the departure of the Asians is making itself felt throughout the economy. They ran the service industries supplying the coffee and cotton industries. Farmers, through their co-operative unions, used to bring coffee for soaking and processing to plants run by Asians. They also ran the cotton gins. Now, without the Asian managements and the Asian contractors who formerly serviced the machinery, operations are running down. Some of the crops that are being processed still cannot be exported, because there are no hoops for the cotton bales or hessian bags for the beans. Even the Kenyans will sell packaging materials only for spot cash. Now that Mr Inders Singh Gill has left the country, the supply of tea chests for the plantations has virtually

ceased.

The departure of Asian accountants has also thrown into confusion the process of calculating before the year-end deadline the net assets of the 34 British companies now being taken over. The deadline has no significance in international law, as rights to compensation cannot be curtailed arbitrarily like this. The Confederation of British Industry is now pressing British firms involved to stick together and bargain collectively with the new finance minister, Mr Emmanuel Wakhweya, who is regarded as competent but not particularly tough. This tactic worked with considerable success with Ceylon, but it will break down if individual companies start trying to gain advantage by doing their own deals.

Currencies

Next crises

Although Christmas cheer comes hard to exchange dealers accustomed to viewing long holidays with nervous suspicion, they should get through this one without too much indigestion. None the less, the first signs of uneasiness about the prospects for 1973 are already making themselves felt. The yen is still at its ceiling, sterling remains vulnerable to renewed speculation about when and where it will be repegged, and the French franc for a spell was dragged below its Smithsonian parity—alongside the lira—by fears that the gaullists could suffer a nasty setback in the March elections.

The dollar has not been among the casualties of the renewed bombing of North Vietnam, but the Organisation for Economic Co-operation and Development has warned in its latest "Economic Outlook" that a further hardening of interest rates in Europe, coupled with the realisation that America's current account is likely still to be in deficit to the tune of \$5½ billion in 1973 (against an estimated \$8.4 billion this year), could choke back the reflux of short-term funds to New York.

The British authorities are doing their best to forestall any dumping of

The Nomura Securities Co., Ltd.

Report by Mr. Kiichiro Kitaura, President, for the year ended September 30, 1972

We are pleased to report the business results of the Nomura Securities Co., Ltd. for the year which ended on September 30, 1972.

Because the Japanese securities market performed impressively in 1972, there was a substantial increase in the company's operating revenues and net income for the fiscal year. We regard, with great significance, the fact that the Japanese securities market began to function as a more mature issuing market during the year. The growth has attracted the interest of leading issuers throughout the world.

During the fiscal year, seven foreign bond issues were floated, including World Bank Bonds, Asian Development Bank Bonds, Australia Government Bonds, and Quebec Provincial Bonds. Denominated in yen-currency, these were offered very successfully to the Japanese public. The total value of these foreign bond issues amounted to 87 billion yen.

During the current fiscal year, we will continue with efforts to achieve even better business results. This we will do by providing our clients throughout the world with high-quality investment objects and other opportunities. We wish to provide our corporate clients with high-standards of advice in relation to issuing opportunities.

We extend our deep and sincere thanks to our shareholders, our clients, and our friends throughout the world for their cooperation and support.

Not much good picking it if there are no tea chests to put it in

sterling in anticipation of a January 1st refixing, which some might bet on despite Mr Barber's assurance that Britain will float into Europe. The Bank of England grabbed the opportunity presented this week by the maturing of six-month forward contracts opened by speculators last June deliberately to bid up sterling in order to make those hapless bears pay through the nose to cover their commitments. It was a reminder that, over the short term at least, speculators should not count on a safe one-way bet against the pound.

The curious bout of nerves about the French franc only shows how quickly the tide can turn. By any normal economic measure, the French franc ought to look safe enough. As the OECD points out, France's share of world export markets has been rising steadily since 1968 and its surplus on current account in 1972 could total \$700m-\$750m, even though growth in France was much higher than elsewhere in Europe, and could reach \$1½ billion in 1973. But political uncertainties can swamp most such economic arithmetic—as the Italians know. It is easy at present to forget that Italy

has been running a surplus on current account that, measured as a proportion of its gnp, is bigger even than Japan's.

The uncertainties plaguing sterling, the lira and now the French franc have at least one golden lining. The ministers of the enlarged EEC are expected next month to rubberstamp the proposal of their central bankers that the rules for repayments of credits run up to keep member currencies within the "snake" be modified to avoid the unpalatable possibility that debtors might be asked to cough up gold. Italy has already been exempted from the strict rules of the game; Denmark had made it clear that it would not play either. In effect, the problem has been shelved; debtors unwilling to part with gold will be given the option of simply rolling over their debts to 1975, in the hope that by then a broader reform of the world monetary system will have taken the sting out of official gold transfers. But the squabble between the rich countries and the poor that has resulted in the postponement of any new issue of SDRs on January 1st does not augur all that well for the chances of Mr Morse's Committee of Twenty getting quickly through its brief.

Germany

Schmidt takes most

Hamburg

Germany's new finance minister, Herr Helmut Schmidt, did not have it all his own way in the post-election cabinet reshuffle, but he got pretty close to it. His ministry is now not just responsible for budget and fiscal policies but has managed to take over the influential money and credit department from the old economics ministry. Before the elections, Herr Schmidt was running both ministries, a position he took over last summer when Herr Karl Schiller resigned as economic supremo. But the combination of the two ministries had always been regarded as an emergency solution, and the decision to split them up again had been expected. But the way they have been divided now leaves Herr Schmidt with much the bigger piece of the cake.

The new set-up is a setback for the Free Democrats, the minority coalition partner. Because of its good showing in the elections it had been looking for extra power in the cabinet. Herr Hans-Dietrich Genscher, the Free Democrat minister of the interior, was thought to be in the running for the economics

Schmidt and protégé

ministry—but only if it was left intact. Now, with the more interesting policy-making departments split off, the economics ministry has been given to Herr Hans Friderichs, a young (41) and comparatively unknown Free Democrat who is not in the Bundestag but has been holding a regional government post up to now.

Herr Genscher will have industry, Europe, fuel, structural policy and restrictive practices—in short, a kind of department for trade and industry. He will also look after the "concerted action" programme—a tripartite talking shop of government, unions and employers which has so far failed to come up with any very tangible results—and another advisory body made up of regional government and local authority representatives. Just what the power distribution between the two ministries will be remains to be seen. Herr Friderichs, in an interview last weekend, warned unions not to make excessive wage claims, and hinted there might have to be a special "boom" tax surcharge next year, on the pattern of the 10 per cent surcharge in 1970-71. Curiously enough, Herr Schmidt said something very similar on the radio.

Hesselmann flounces out

Hamburg

Only a week after the latest boardroom row at Krupp comes another upheaval, this time at Reemtsma, Germany's biggest cigarette concern, with sales (in 1971) of nearly £4 billion. Herr Malte Hesselmann, virtually the crown prince of Reemtsma, has startled employees and competitors by handing in his notice. He will go at the end of next year.

A year after that the present managing director, Herr Rudolf Schlenker, will retire. Altogether 64 per cent of

the shares are controlled by the families of the three sons of Philipp Reemtsma, who founded the company in the 1920s and built it into the most powerful cigarette empire in Germany. But between them they have been unable to provide a successor to Herr Schlenker. So it was confidently expected that Herr Hesselmann, the 41-year-old nephew of the founder, would succeed.

He joined in 1964, and won his spurs in South America. Then he took charge of the company's diversification programme, pushing into the drink business, buying breweries and champagne cellars. But as the beer side developed the cigarette side declined. New brands failed to take off when one-time successes like Peter Stuyvesant had had their run. The women's cigarette Candida was launched after the leading competitor, British-American Tobacco, had conquered that particular market with its own brand, Kim.

The marketing department was weak. It had in fact been taken over by Herr Schlenker himself, who, however, had been generally regarded as indecisive. Family shareholders got restless, and so two years ago Herr Hesselmann himself was asked to take it over, making him the most powerful man in the company after Herr Schlenker, but in the process arousing envy elsewhere. The 37-year-old Herr Hermann Hinrich Reemtsma, an influential family shareholder and grandson of the founder, who retired to his farm in 1966 when it was made clear that he was not destined for a top job, opposed Herr Hesselmann's ambitions and clashed with him frequently. Domestic sales (the bulk of the total) failed to improve, and other family shareholders became critical too. Last weekend Herr Hesselmann had had enough.

His exit will remove the last of Philipp Reemtsma's descendants from the top management. The present spate of top boardroom rows in Germany (Flick, Krupp, Dornier, Reemtsma) is no coincidence. German industry has traditionally been a pretty feudal affair, with companies treated like pieces of family property. But companies are now too big to be run like this, even where the families can supply the talents. And family shareholders have become too numerous and mutually jealous to agree on key issues. Amid the thumping of tables and slamming of doors in many boardrooms, the age of the professional manager is dawning.

The growth tails off

Russia

No presents

Everything seemed ready this week for a splendid celebration of the 50th anniversary of the Soviet Union—except the economics.

The budgetary session of the Supreme Soviet produced a domestic bomb—a warning to the Russians that 1973 will be a pretty lean year. The message is concealed by the projected 6 per cent growth in national income, which assumes a spectacular recovery from this year's disastrous harvest. It is revealed, however, by the further slackening of the pace of industrial production; next year's target going down to 5.8 per cent. Moreover, whereas the output of heavy industry is expected to rise by 6.3 per cent, that of consumer goods should be up by only 4.5 per cent. This seems a sharp reversal of promises.

The current plan (1971-75) was heralded as the first to give priority to the consumer. Light industry was scheduled to go up at an annual rate of 7.9 per cent, compared with 7.4 per cent for heavy industry. The question arises whether, with things going wrong, the consumer industries are not being treated again as a cinderella by the

planners. (This feeling will be strengthened by the very low targeted rise in nominal wages—a mere 2.7 per cent for industrial and office workers.)

The new deal for the consumer was linked to the hope of an improvement in international relations which would not only reduce the burden of the arms race but also harness western capital for the Soviet economy. But the official figure for defence spending stays put, and defence's share, therefore, dips to only just below 10 per cent of total budgetary expenditure.

So the anniversary brings a puzzling rather than festive mood all around. East European visitors fear that their countries will be further squeezed. Overseas guests, like Dr Castro, wonder whether Soviet retrenchment will mean a cut in aid. Lastly, the Russian people are bound to ask themselves whether their country is just going through a bad patch or whether it is moving towards an economic crisis.

EEC lorries

Défense d'entrer

The French have got their own back on the British for winning the battle to postpone a decision on lorry weights. European transport ministers agreed to a wildly unfair system of community quotas for lorry permits on Tuesday. Most of the road haulage between European countries is handled bilaterally. Some countries, like Britain and Holland, favour unlimited access to anyone willing to offer reciprocal facilities; others, like the French, shelter domestic hauliers by rigid quotas. The community's aim is eventually to abolish quotas, but meanwhile it has a limited number of quotas that allow holders to roam throughout its territory.

On Tuesday it agreed to a 15 per cent increase in the number of permits next year, with countries of Britain's

Key indicators: world commodity prices

World shortages

World commodity prices have zoomed upwards over the past twelve months. All 27 items in The Economist index have increased. Russian shortages have helped to push wheat, sugar and soya bean prices up to record levels. Wool and hides increased by 50%, sugar and cocoa by 80%, lead, wheat and rubber by 40%, and bacon by 20%.

Barclays Bank International

Paid Up Capital £40,000,000 • Reserve Funds £167,603,000 • Loan Capital £34,914,000 • Resources £3,326,846,000

Extracts from the Statement by the Chairman Mr Anthony Favill Tuke, to be presented at the forty-seventh annual general meeting.

Lord Seebohm.

At the last annual general meeting Lord Seebohm retired from the chairmanship of the Bank. He held this position for seven years and controlled our affairs at a time of many changes and much progress in the countries where we are represented and, therefore, in the Bank itself. The most important aspect of these changes was the transformation of Barclays Bank DCO, as it then was, from what one might call an ex-colonial bank to an international bank, a process which brought with it a considerable number of problems.

Change and re-organisation were certainly part of our daily lives and Lord Seebohm was, and indeed still is, someone who is inclined to look forward to the future rather than over his shoulder to the past. The philosophy of "leave well alone", i.e. if this system has worked well for twenty years why change it, has never been part of his armoury and the Bank has benefited greatly from his outlook and his leadership.

Apart from presiding over our affairs he has found time to carry out a large number of important duties outside the Bank; perhaps the "Seebohm Report" will prove to be the most important and far reaching of all but it is only one of many. The life peerage which was conferred on him last March was indeed well deserved and must have pleased many of our former stockholders as much as it did his colleagues.

We are all delighted that he is still with us as a deputy chairman of the Barclays Group and, equally important, that he is continuing as a director of our bank.

Expanding international interests.

This is the first year in which Barclays Bank International has been a wholly owned subsidiary of Barclays Bank Limited and, therefore, we no longer have any members of the public as ordinary stockholders. This change may bring with it a tinge of regret amongst those who were our older stockholders, and amongst our more senior staff, but in our view it is overshadowed by the enormous opportunities opened to the Barclays Group to be a really effective force throughout the world in the field of international banking. Our policy is to have some form of representation in all the major financial centres of the world, not so much with branch networks but rather dealing with what are called "wholesale" banking operations.

At home, by agreement with Tozer Kemsley &

Millbourn (Holdings) Limited, we have acquired a stake, at present 21 per cent which will reduce to 15 per cent in due course, in the equity of that company at a cost of approximately £7 million. We feel sure that our investment in this rapidly expanding international financing and investment house will bring benefits to both partners. Earlier in the year we, in company with BOAC, BEA and Grand Metropolitan Hotels, put in a bid to buy Thos. Cook & Son, Limited from the Transport Holding Company. We believed that substantial benefits could come from a joint acquisition of this well known firm but in the event, as you know, although the Barclays consortium and the Midland consortium put in bids well ahead of the others, our rival's bid was higher than ours and naturally we were unsuccessful.

Activities in the Far East.

Our main efforts this year, however, have been devoted to the Far East where, until recently, we had no banking presence. We have now received approval for the opening of branches in Tokyo, Hong Kong and Fiji while in the New Hebrides we have an interest in the Melanesia International Trust Company and also a small banking branch in Vila. In Australia, we reached agreement in August with a well known stockbroking and merchant banking group to form a new merchant bank, Barclays Australia Limited, with ourselves as the majority shareholder. In New Zealand, we have taken a 20 per cent interest in the New Zealand United Corporation, that country's leading merchant bank. We are also in the process of forming a new merchant bank, this time a triple alliance, with Merrill Lynch International and Nomura Securities of Tokyo. Our partners are both leaders in their own field and we look forward to the successful launching of this venture named Trident International Finance Limited. The intention is that it should have a head office in Hong Kong and open branches in other far eastern countries.

The bank and the EEC.

As this country will enter the Common Market on 1st January 1973 our other main area of expansion is naturally Europe. Barclays Bank Limited have, for some 50 years, had an important subsidiary in France, Barclays Bank S.A., with 21 branches; it continues to make progress and broaden its area of activity. In the Federal Republic of Germany, we have had a very successful branch in Hamburg for some 50 years and our more recently opened branch in Frankfurt has made most satisfactory progress. In Italy, Holland and Belgium, we were until very recently unable to give a full banking service but this has now been remedied. In Italy, we have acquired a 51 per cent interest in what was Banca Castellini, a small but well respected private bank which has been run by the Castellini family since its foundation in 1884; on 1st October it opened its doors as Banca Barclays Castellini S.p.A. In Holland, we have acquired 70 per cent of the private firm, Kol & Co, and th

has been reconstituted as Barclays Kol & Co N.V. equipped for international banking in addition to the traditional stockbroking business. In Belgium, we opened a branch of the Bank in Brussels on 1st December and look forward to making a real contribution in the field of wholesale banking.

Opportunities in the U.S.A.

Perhaps the most important development is in the U.S.A. where we have bid about \$60 million for the whole of the capital of the Long Island Trust Company, a well respected and growing bank which has 29 branches in the Suffolk and Nassau counties of New York State. In addition to this we propose to open a branch of the Bank in Boston early in 1973.

In South America, we have opened a representative's office at São Paulo, Brazil.

Integration of all foreign business and further local incorporations.

In this country, on 2nd October 1972 over 2,000 Barclays Bank International staff were joined by more than 2,000 Barclays Bank Limited foreign branches' staff, most of whom are working in London and the remainder in twelve branches in important cities throughout the country.

Elsewhere more and more of our branch network throughout the world has been and is being converted into subsidiary companies, sometimes with participation by the public, sometimes by the government, and occasionally, as will be the case in Nigeria, by a combination of the two. The latest addition was in Trinidad where Barclays Bank of Trinidad and Tobago Limited commenced operating in April of this year. It is hoped that our subsidiary company in Jamaica will take over our existing business there in the not too distant future.

Growth and future prospects.

Side by side with all the new activities to which I have referred our normal business has continued to progress satisfactorily. Deposits at the 30th September totalled some £3,079 million, an increase of approximately £660 million, but these figures include the business previously handled by Barclays Bank Limited foreign branches which was brought into our books just before the end of the year. Group profits before tax, excluding extraordinary items referred to in the accounts, reached £34.5 million, an increase of £4 million, and the net figure after tax of £20.3 million (1971 £16.1 million) represents an improvement of nearly 26 per cent. In a bank with a very wide geographical spread it is difficult to gaze far into the future but given political stability there is no reason to think that this progress will not be maintained though it has to be borne in mind that our plans for expansion require an allocation of capital resources on which we are unlikely for some years to earn an income commensurate with the return from the rest of our established business.

South Africa.

It is perhaps right that I should say something about our business in South Africa. We have been criticised by a very small minority of our parent company's stockholders on various grounds for continuing our presence there. Two

questions however are far more important than all the rest put together. Should those who dislike the philosophy and practice of apartheid—and we certainly do—continue to trade at all in a country where it is practised? And would it be to the benefit of the Africans in South Africa if we, and, one assumes, a large number of the other 500 or so British companies with investments there withdrew?

The answer to the first question might be regarded as purely a matter of conscience but it must be tied up with the answer to the second. I wonder if our critics ever pause to consider what the practical effect would be of Barclays withdrawing from South Africa. It would mean selling our business to a South African concern but, apart from this change in ownership, the local bank would remain exactly as it was and would carry on its operations just as it does now. All that would have happened would be that Barclays who are recognised as a liberal and international organisation would have given way to a South African owned company possibly with a narrower outlook. It is difficult to understand how such a change of ownership could be of advantage to the underprivileged in South Africa; in fact, there are clear indications that the view of the great majority of them is that such a step would be a retrograde one and I do know that among quite a number of leading figures in other African countries the news would be greeted with dismay. It is therefore right that the stockholders of Barclays Bank Limited should be aware that we do not propose to withdraw, that we believe our policy of maintaining, not burning, bridges is the right one and that we are confident that this policy has the support of the overwhelming majority of them.

Special tributes to staff.

I would like to pay a special tribute to the vital contribution made by our staff all over the world. The Bank now employs over 30,000 staff in more than 50 different countries; over 4,000 of these work in this country. There are also 480 British Covenanted staff serving abroad, mainly in Africa and the Caribbean. This is to be compared with 680 in 1969 and we do feel some satisfaction with this evidence that our training policy has borne fruit and that we are increasingly able to promote our local staff to positions of responsibility.

I know that all my colleagues in every country would like me to say how much we have been concerned about the very difficult conditions in which our staff in Uganda have worked during the latter part of the year. The unusual situation in that country has put great pressure on all our staff, British, African and Asian. Under Mr. Macdougall's wise leadership the Bank has carried on offering the same service to its customers as before and we all look forward to a return to normal conditions.

Although Uganda has had very special problems to face this year that does not mean it has been plain sailing elsewhere. All of us recognise the part played by all our staff throughout the world. I expect most of them will say, and this would certainly include the general management in London, that they cannot remember a busier or more eventful year.

Copies of the full statement and the report of the directors can be obtained from the Secretary, Barclays Bank International Limited, 54 Lombard Street, London EC3P 3AH.

BARCLAYS International

...a world of banking

size getting over 300 each. The commission proposed that new members should be given the number they would have received when the system first began, with 99 for Britain, or twice Luxemburg's quota. The newcomers naturally protested, but the French insisted that, until they were willing to co-operate over standards for weights and dimensions, they should not expect to benefit from a common transport policy.

The French argument is ridiculous. The agreement on maximum weights and dimensions for lorries is not intended to come into force until 1980, while the new quotas apply from Monday week. France was keen to show that Britain cannot refuse to co-operate in forming European policies without expecting retaliatory measures.

Venezuela's oil Running dry

Caracas

A cold New England winter, threatening a fuel shortage, has brought glum tidings to Venezuela and Christmas cheer to the Arab states. It led the United States last week to suspend the preferences it gives to the oil exporters of the western hemisphere. America's massive east coast fuel market, previously earmarked for Venezuela, by far the largest western hemisphere exporter, will now be open to competition from Middle East producers. For Venezuela, which earns over 80 per cent of its foreign currency from oil, the sudden, if temporary, suspension is a setback after years of fighting for special access to the American fuel markets. But Venezuela has been unable to keep up the oil flow that the east coast requires. This year demand there is up about 8 per cent, while Venezuela's ageing oil wells are producing only 3.2m barrels a day—12 per cent down from their 1970 peak and at a price that is not competitive with the Middle East.

Since all oil concessions return to the Venezuelan government in 1983, the oil companies have been hesitant about opening new wells. Venezuela, waiting to see how far Opec's demand for greater producer participation would be met, has also been in no hurry to grant further licences. As a result, there has been little exploration in Venezuela for the past 10 years. But there has always been a blind faith in the country that the existing wells in Maracaibo Bay were only the first taps on Venezuela's huge reserves. This faith

is now rapidly wilting; eight recent drillings in the south of the bay have all proved embarrassingly dry. Early drawings from the Orinoco oil belt, which had been advertised as one of the largest reserves in the Americas, have shown that the oil is contaminated and far too heavy to be efficiently refined. The oil companies are gloomy about the future. The Nixon Administration is anxious that new fields should be opened in Venezuela to offset America's increasing dependence on the Middle East; but—especially after last week's collapse of the international coffee agreement—Mr Nixon is not popular in Latin America right now.

With Venezuelan elections only a year away, the usual attacks on the United States have been mounting. This summer the Venezuelan government broke a 32-year-old trade agreement with America. It is negotiating for entry into the free trade area of the Andean Pact, and Venezuelans say that the United States' abrupt ending of oil preferences for this winter will teach them to rely more on trade with their southern neighbours and friends. But with 65 per cent of Venezuela's oil exports going to North America, there is likely to be more of a show of independence than a reality.

France

Red run to Napoleon

Paris

With the public opinion polls showing 45 per cent popular support for the Communist-Socialist alliance, in advance of Wednesday's announcement that France's parliamentary elections are to be held on March 4th and 11th the price of gold napoleons went up to Fr82, yet another new record, before coming back to under Fr78.

Gold Napoleons

The napoleon, which is roughly the size of a 5p piece, weighs only 5.806 grams—so its gold content is worth Fr36 at the official price or Fr62 at the current free market price. It has been minted occasionally since the time of Napoleon I. Some coins show the heads of rulers—Napoleon I, Louis XVIII, Charles X, Louis Philippe, Napoleon III: others the traditional French feminine head of Marianne or a rooster. Except for a small minting in the early 1950s, the last issue was in 1914. No estimate exists of the number in circulation, but in some years as many as 10m were minted. The Banque de France plays no role in trading, so that the price of the napoleon is free to soar wildly.

The programme put forward by the leftist parties strikes the average holder of a gold napoleon, after 14 years of gaullist rule, as too radical by far. The left says it wants to nationalise private banks and insurance companies and such key industrial companies as Dassault (aircraft), Roussel-Uclaf-SIFA (drugs), Saint-Gobain-Pont-à-Mousson (glass, iron and steel), Pechiney-Ugine Kuhlmann (aluminium), and ITT-France; it advocates majority state control in all steel and oil companies. It wants to tighten foreign exchange controls, reform the social security system and drop the value-added tax on some consumer products. It calls for a reduction in the work-week to 40 hours without any drop in pay (a charge that would fall heavily on companies), a programme of building 700,000 units of low-rent housing a year, a minimum wage of not less than Fr1,000 (£85) a month, and a lowering of the retirement age to 60 years for men and 55 for women.

The cost of these left-wing measures has been estimated at Fr100 billion (£8½ billion) a year, which would cause a real humdinger of an inflation, and necessitate much heavier taxation on all the upper middle classes as well as the rich (who would take their money out of the country in a rush). In practice, President Pompidou would not allow parliament to enact these horrors, even if the Communist-Socialist alliance became the majority group there. The gaullists have not been too sorry at the financial mini-panic of the past week, since it might help to drive voters back into the fold in March. But it is understandable that those with the means and the knowhow have been switching from the Paris bourse to Wall Street. Those with less of either are having to make do with the napoleon.

BUSINESS

Investment

Nixon zapps Wall Street

New York

Only Neville Chamberlain could have done it better. Last Saturday's grim and measured reassessment by Mr Henry Kissinger of the prospects for peace in Vietnam was a body blow for a stock market already winded by a week's vacillation. With the Dow almost 10 points down from its all-time peak of 1,036.3 investors were in no mood for stoicism over the weekend. They piled up the sell orders, and on Monday morning the Dow average dropped a dismal 17 points in the first half-hour. Since then the market has continued to sell off on a broad front to the point where the 1,000 threatens to be history in every sense of the word, the close on Wednesday being 1,004.8.

This year produced a creed on Wall Street that whatever the outlook for, and achievements of, the American economy, investors would continue to view them through a veil of tears so long as the war continued. This belief became so widespread as to be self-fulfilling. At the end of October Mr Kissinger pulled away the sackcloth and ashes and the market went into a 100 point ascent that brought smiles of smugness to the faces of those fore-

casters who had assured their clients that all would indeed be all right in the end. And now the smiles have gone, and the Street is back to penance.

The new concussion in the outskirts of Hanoi has its gloomy reverberations here. To judge where the market will now go you must look at good things through miserable eyes. The good things do not need repeating: continued growth in profits next year, no real scares at the moment that inflation will once again rip into the indices, rising real incomes, unemployment going down, and the economy apparently on track for a rather remarkable third year of economic recovery. Judging by what has happened so far this year the indices will probably amble along at current levels until Mr Kissinger or his successor comes up with some more good news.

One chink, or potential chink, has opened up in this assessment. Barrons, the business magazine, pointed out this week that 70% of advisory services were bullish (before Saturday) and cynically remarked that this might be a bad thing. As a generalisation the bullishness takes the following form: "The

fundamentals dictate that the market must tend upwards. The ending of the war will remove the most important block to this. How far the market goes up will depend on the return of the small investor." But the small investors are running a mile. They are the chink. Mutual fund shareholders sold out to the tune of a net \$258m in November—an all-time record figure.

That little guy, on whom the professionals' hopes are pinned, is doing the dirty. He's not playing the game. He's dropping his stocks like hot potatoes when the market gives him half a chance. And he is putting the spuds into investments that are at a distance from the stock market. This leaves a market of professionals, very rich, getting richer—but dismayed and alone. So, back to game theory. There will be nervous reactions to the news, migrations from one stock group to another, fruitless in their overall effect, and a narrowing in market breadth. But underneath, the comfortable hibernatory feeling that the all-important peace, of which Wall Street has experienced such a strong and tantalising whiff, must inevitably return.

International Computers

Wait and see

Whenever the profits of a major company fall dramatically, the kind men in the City reckon it drops into the recovery stock category. Everyone wants to be kind to International Computers because it is a British company fighting the International Business Machines giant in the tricky field of advanced technology. That kindness should not extend to recommending the shares. The survival of the company rests in the hands of the Government and of its major shareholders, General Electric and Plessey, which own about 40% between them. They are the ones who should take the risks, not the other shareholders.

Although the trading profits are about even, at £15.5m, there are some hefty write-offs of £7.4m which reduce the pre-tax to £8m. Interest on loans

chops that to £3.3m, as against £8.7m, and a high rate of tax, thanks to the overseas operations, leaves only £1m at the attributable level. On a turnover of £154m, and before excuses, the net profit is £1m. Add back the naked depreciation, and the cash flow comes to roughly £20m. There's the rub.

To produce the next generation of computers is going to need, at a reasonable guess, another £100m over the next few years. From where? The Government has promised some—will the shareholders have to put up any more? If not, the cash flow will have to provide the bulk of the finance, as the company—which is paying no dividends—could only borrow at high interest rates.

The bull argument is that the worst is now over—there is another dose of rationalisation costs of £7.5m which was lifted out of the profit and loss account and charged to reserves—and that sales and orders are picking up. As further evidence of new grit and determination, there is the fresh management, and a reduction in the number of employees by 5,000 (nearly half of which is accounted for by the sale of the Belfast factory). But, even at 91p, compared with a high of 158p for the year, the risks are large.

Australian takeovers

Towards an SEC

Sydney

An Australian court has ruled that the duties of directors towards their shareholders are more important than attempts to ward off unwelcome takeover bids. The ruling has come in Australia's cause celebre of the ethics of takeover bids, the R. W. Miller Holdings case. In July, a company called Ampol Petroleum, which had bought 30% of Miller shares in

privately negotiated sales, made a formal bid for the remaining 6m. It then joined with another major shareholder, Bulkships, and between them they thought that they owned more than half of the capital of Miller, whose operations in tankers are complementary to those of Ampol. Miller then blithely issued 4.5m shares to a more friendly bidding company, Howard Smith, and barred the takeover by Ampol. So Ampol sued Miller and the New South Wales supreme court ruled that the issue of shares to Howard Smith was invalid. The company is appealing against the decision to the privy council, so the matter is not finally settled, but Ampol shares rose on the verdict.

Miller broke the rules of the Sydney stock exchange, and had its quotation suspended from July 6th until this week, when it was lifted. The rules require shareholder approval of significant increases in issued capital (which is more than London does), and ban the issue of shares within three months of receiving a takeover offer. It is comforting that the court has backed up the stock exchange rules, which have not got the force of law, but the situation is still unclear enough to require either an established code of conduct, as in Britain, or a body of rules monitored by an American-style securities and exchange commission—which the new Labor government might well copy.

Toys

The zoomy balloonie

What's that incredibly strange model, making all the noise? It's Terrible Toad, one of the twelve way-out models from

the Matchbox zoomy balloonie range—each one more weird than the next. Blow them up and hear them go!

This advertising blurb in Lesney Products' catalogue might be a description of Mr John Bentley, who has now decided to quit big-time toymaking less than a year after becoming the largest toymaker in Europe. Barclay Securities hopes to sell what remains of the Tri-ang empire it acquired last March, probably to an American bidder. The trade would like the sale to be to an asset-stripper, thus removing a competitor, but it would strip a thousand jobs in South Wales.

Mr Bentley has decided to beat a retreat while the rest of the toy trade is enjoying a record year. Brokers Beamish and O'Kelly reckon there will have been a 15% growth in toy sales in 1972, and the growth rate should be maintained for 1973. The drop in Britain's birth rate casts only long shadows before.

There are not many new toys in the shops this Christmas. The makers prefer teddy bears and trains that sell predictably, rather than gimmicky toys for which demand is erratic. Lesney is one of the few innovators. It has diversified, and Matchbox cars now account for only half its sales. Lesney (see *The Economist* portfolio, page 75) has had a 29% rise over the year. It should earn £2m in the current year, putting the shares at 55p on a p/e ratio of about 14. It has bought out its German importers and sales are already booming, despite a 27% tariff barrier. Lesney stands to gain strongly from the tariff cuts as Britain joins the EEC. It looks a good share to hold, although investors will take a lot of convincing that it deserves a high rating after the collapse of 1969-70.

Few toy shares look dear, except

Key indicators: world bourses

Wall Street in retreat as the bombs fall again on North Vietnam. But it did not take Canadian markets with it. London had been standing up well until depressed on Thursday by the Bank of England's call for further special deposits.	Stock price indices			Percentage change on

Indian Engineering makes its mark

Establishes India as the 8th largest industrialized country

Suddenly in a few dramatic years, India has caused a stir in the international engineering scene and has emerged as a major industrialized nation with a 274.42% rise in engineering exports in the last five years.

New landmarks

Industrialized India is creating its own landmarks. Joint venture offers in Asia, Africa, Latin America. Advisory ser-

This sophisticated, permanently pressurized TMG Air Blast Circuit Breaker is manufactured in India

Off to the Middle East—this city type bus

vice to the UN on a ferro-alloy facility in Iran. Turnkey projects in Nigeria, Kuwait, Sudan. An ever widening range of industries and products.

In good company

You'll be in the good company of the U.K. the U.S.A., France, Japan, the U.S.S.R., and others, if you decide to do business with India. These nations are finding it profi-

table to buy Indian machine tools, castings, automobile spares and ancillaries, heavy machinery, wagons, engine components and many, many more items. You'll find it profitable too, to do business with India.

A suggestion

India is as interested in maintaining quality as you are in demanding quality. Therefore it will be to your advantage to get in touch with

Famates Sienter, Famates India Pvt. Ltd., Thana, Maharashtra

India's Engineering Export Promotion Council who have the facts about Indian manufacturers that will suit you best. Please put a call through to your nearest EEPCC office.

perhaps Mettoy, which is making toy-town profits. Cowan de Groot at 120p, Airfix at 113p and J. & L. Randall at 54p are all on prospective p/e ratios of 12 or under. Spears, famous for its games, is on a prospective p/e of only 8, and now people are playing more games than ever. However there is only a tiny market for the shares, which means a vast spread between buy and sell prices. Dunbee-Combex-Marx at 236p is an enigma. It bought Rovex, another division of the defunct Lines empire, which could be as much of an albatross as Tri-ang has been for Mr Bentley.

SECTOR ANALYSIS

Television buys

The Granada Group's 54% jump in pre-tax profits to £11.4m in the year to last September rounds off a spectacular 1972 for the Independent television companies. The shares, at 252p, are now selling at 17 times earnings, a well-justified premium over the p/e ratio of 15 that is fair for network television companies. These companies tend to have wide diversifications to offset the danger of losing their franchises in 1976; Granada's main diversification is Robinson Rentals, which now contributes more to trading profit than television contracting does.

Big profits ring the bell for increases in the advertising levy; the companies' fear is that it might even go back to what it was before being halved in 1971, after the industry fell on hard times. This would cost the industry £15m a year. So the Christmas spirit has been surging through television veins, with a £2m spending spree on the networks alone—just the thing to keep the money from being printed too fast. Light entertainment and films are the staple diet, with an all-star comedy carnival as Christmas Day climax. Poor old Verdi's Macbeth has been put off to the Wednesday.

Another reason for heavy spending is the end of the franchise in 1976. Applications for the new franchise will be made in 1974, so now is the time to accumulate brownie points. Not that the Christmas programmes are well suited to that, but there are other cards in the pack. Thames Television is planning to spend over £500,000 on a 26-episode documentary on the second world war, to be shown next year—the biggest series ever undertaken by

Macbeth must wait

an Independent television company.

Associated Television has made some programmes with a deliberately mid-Atlantic flavour. The Strauss family is not meant to be one of these but has nevertheless earned nearly \$1m. ATV is now preparing a series on Edward VII. Its results for the half year showed a pre-tax increase of 14% to £2.5m, almost all from the television network side, which provides half the profit. The shares, at 131p, are on a p/e of 15, and seem over-priced. Part of ATV's diversification is out of the television frying pan into the fire of the film industry.

Television's heavy spending, and cost increases, should offset the buoyancy of advertising revenue in 1973—up 20% this year—and limit profit rises. But Scottish Television is particularly attractive: 1972 earnings should drop the p/e to about 6 at 78p. A reasonable p/e for an undiversified regional company is about 7½-8.

On this basis HTV (formerly Harlech Television) is attractive at 104p. The historic p/e is 7.4 and earnings should improve slightly in the current year to July, 1973; last year earnings were up despite the prospectus forecast (when HTV went public in October, 1971) of a decline and programme expenditure £400,000 larger than forecast. Trident Television is a cut above the other regional companies, combining the old Yorkshire and Tyne-Tees Television, and it has £1m of spare cash. The problem is what to buy, but it deserves the premium p/e of 11 at 62p. Grampian Television seems reasonably priced at 39p, with an historic p/e of 10½; earnings grew by 70% in the half-year to August, 1972, although such growth will not be

repeated in the second half. Ulster Television is probably over-priced at 66p, on a historic p/e of 8.2. Advertising in the province cannot be relied on indefinitely.

Portfolios

1972: bridge of Tsais

Now we know how Mr Gerry Tsai must feel about the disappointing performance of his Manhattan Fund which he launched so triumphantly on the fantastic reputation he had built up as a fund manager. (It attracted just under \$250m, the largest mutual fund underwriting in history.) Our 1971 portfolio beat all the others in the game with a super rise of 60.7%, against the market's 40.2%. But our 1972 portfolio only went up 6.7% against the market's 17.1% (as measured by the Financial Times Actuaries all-share index) if one includes the stock we would rather forget about, Metal Traders, that went bust; if we do forget about it, the portfolio's rise was 18.5%. Sorry, fans.

Every cloud has a silver-tinsel lining, and the lesson from the 1972 portfolio was the wisdom of having a portfolio—though no one would, as we did, have the unwisdom to leave the portfolio unmanaged throughout the year. However, suppose the investor had fecklessly put £100 in each of the 10 shares we recommended and left the money there, the gain, plus dividends, would have protected his capital even though one of the shares was a 100% dud.

Still, we could have done without the Metal Traders thrill. We did say that we were going out on a limb—and they sawed it off. Readers may recall that there were several scientific criteria for choosing last year's portfolio. One of them was to find the companies that were least dependent on fixed assets for earning profits and thus most resilient to the ravages of inflation. Metal Traders had practically no assets and depended on the trading skill of its metal buyers and sellers. The market was as surprised as we were when it announced that it was to cease trading in March; the price was then 32p, down only 5p since we popped it in the portfolio. However, the inflation warning steered us—and you—out of British Leyland (down 18p), Vickers (up a mere 9p), Dunlop (down 68p). We wrongly warned against Ocean Steamship and P&O; no one could have foreseen the

epic battle for the big shipper and its effect on the others.

Crane Fruehauf, York Trailer and Richard Costain were selected because their high dividend cover might, as the market began to think about the implications of imputation, make them attractive. The market has not yet thought about imputation. And we also thought that lorry companies would be a good bet as industry got moving; industry is only just getting on the move and the lorries are only just following on; their time might come this year. Costain shot up because of the attempted Hanson Trust takeover, but retained the glamorous rating builders won this year.

The Vokes Group came in the category of dividend payers with lowly cover; it also had a useful 8% yield. High yielders are takeover targets, and so Vokes proved to Thomas Tilling in October. The price was reasonable—but the directors would no doubt have got a better one had they decided to fight. Unfashionably, they agreed to the bid. As an investment trust, Tobacco Securities, with three-quarters of its investment in tobacco shares, also had low cover and looked an interesting bet in view of the stability of cigarette sales and earnings; however, although assets per share have gone up by around a third, the discount has widened by 60%, putting this trust on an unusually high discount of around 40%.

Star (GB) was selected on the basis of its past performance record in terms of earnings and assets per share; it paid off. Court Line, selected on the same basis, was doing reasonably well until it made the bid for Doxford and Sunderland at what the market rated a very fancy prize. Of the two recovery situations, Lesney Products did—but Aberdare Holdings did not.

1973: attack and defence

What guesses about next year's winners? After a 95% rise in the market since May, 1970, there is a need for shares with strong defensive qualities. But the macro-economic forecasters are expecting something like a rise of 15% in company profits in 1973, so there could be a good rise in the market before the bear turn comes. We have therefore chosen a quiver of 10 shares which have good defensive qualities and yet are poised for the attack. We have, on the whole, gone for the smaller companies this time—though each has a market capitalisation over £10m. Also, we feel that the financial and property sectors are attracting too much attention, and too much money. Bet on industrial Britain, therefore.

Rexmore, which manufactures and distributes fabrics for the bedding, upholstery and furnishing trades, seems an overlooked textile share. Its profits have grown over fourfold in the past five years. On an estimated p/e of around 10½, the shares look cheap in their own right; and next year should be a better one for the furnishing business. Another company to benefit from this should be Gomme Holdings, makers of G-plan furniture, which also has a steady record of rising profits and a prospective p/e of around 12.

The interim results from Magnet Joinery, whose pre-tax profits are up 112%, reflect the startling success of a new distribution policy, whose benefits should continue for at least the next year. Despite the substantial rise in the share price over the past year, this is also one to be aboard. Dimplex, makers of central heating radiators, also has an impressive record—profits up by nearly four times over the past five years—and it specialises in the faster growing areas of the British heating market, such as night storage heaters.

The recent "better order figures" for the machine tool sector were misleading because they included £16m of orders stimulated by a government incentive. Without that the figures would have shown a worse order position than for the equivalent first nine months of 1971. Nonetheless, the situation must improve some time. As a bit of a spec in one of last year's lame ducks, we include Alfred Herbert in this year's list—although in terms of profits 1974

will probably be a better year than 1972. If it achieved its earnings of 1966 during the next investment recovery, the p/e would be under 3.

Average economic growth of around 5% in the western world is expected in 1973. Raw materials' prices have risen sharply, but sales of them should continue high; hence Rio Tinto-Zinc, which should be a major beneficiary of an upswing in copper consumption through the Bougainville mine. In an indirect way, Swan Hunter should also benefit from the same trend; raw materials need ships to be transported in. Swan Hunter's profit trend—more than doubled in the half-year to June—is expected to continue. Despite a very healthy rise in the share price over the past year, a further increase looks likely in 1973. The p/e of 6.8, and yield of 7.2%, is behind events.

Whessoe, the plant fabricator, is getting a boost from the North Sea oil boom; it has the contract to build the plant connected with British Petroleum's Forties field. It has a good geographical spread, is now financially quite secure and on a prospective p/e of around 8.

Manbre and Garton should benefit immensely over the next four years from common market entry. Its sales of starch (40% of profits) may provide most of the fun; if margins here go up to continental levels, the p/e at the current price could be about 5 on 1976 earnings.

The Brocks Group has been a weak market of late, because of rather disappointing interim results, but a prospective p/e of 11 looks too cheap for this burglar alarm and navigational aid business; it has produced a compound growth rate of 50% in profits over the past four years.

CHAIRMAN'S STATEMENT

J. BROCKHOUSE & CO. LTD.

"Current orders show healthy increase"

The following are extracts from the circulated statement of the Chairman, Mr. Arthur Chamberlain, M.C., T.D., in respect of the year ended 30th September, 1972.

I gave a warning a year ago on three vital points—inflation, confidence amongst industrialists and wage demands. I now report our experience of a deterioration during the last twelve months on all these points. The slump which began for us about October, 1971, exceeded our gloomiest expectations.

The second half of the year was more profitable, if only just, producing final annual sales of £31,355,000, up 4% on last year. Profits before tax of £1,282,000 (£1,958,000) show a sickening drop, proof of the difficult times we have been through. After taking this year's prospects into account, your Directors recommend a final dividend of 11% making a total of 15% for the year (same).

The main lesson learnt during this year of difficult trading is our orientation towards the supply of components for heavy engineering. Your Board will be exploring every opportunity to widen the base of your Company's activities in the months to come.

I am glad to report a healthy increase in our current order books. All factories are back to a five day working week and a feeling of optimism is held by your Board of Directors.

COMPANY STATEMENTS

The London, Australian and General Exploration Company, Limited

"I view the future of your company with great confidence" reports Oliver Jessel, Chairman.

Profits

Profits attributable to members for the year to 30th June 1972 were £312,692 against a forecast of £260,000.

Acquisitions

Land Investment and Development Corporation Limited (Lidcor) and Wit Industrials Limited (Wits) have been acquired since the year end. Lidcor is a South African property company with a portfolio consisting mostly of residential townships, industrial and city centre sites and development property. Wits is an investment holding company owning major holdings in six companies quoted on the Johannesburg Stock Exchange.

Assets

Net tangible assets of the enlarged group now exceed £17 million.

Activities

LAGS is now a powerful group engaged in property, investment, the leisure industry, mining, finance, trading and manufacturing, with most of its assets in South Africa.

Copies of the Report & Accounts may be obtained from the Secretaries, Stevenson, Hardy & Co., 155 Fenchurch Street, London, EC3.

NORTH ATLANTIC SECURITIES CORPORATION LTD.

The Eighteenth Annual General Meeting of the Corporation was held on 14th December 1972 in London. The following is an extract from the Report of the Directors:

Gross revenue for the year was £522,410 which was virtually unchanged from the previous year. Net revenue available for distribution to Ordinary Shareholders increased from £394,087 to £404,043 which is equivalent to earnings of 2.31p per Ordinary share compared with 2.25p per Ordinary share last year.

A final dividend of 1.325p per share is recommended making a total dividend of 2.2p for the year. Last year a total dividend equivalent to 2.125p per share was paid.

The valuation of our investments at 30th September, 1972 reached just over £20 million. This gave an asset value to the ordinary capital of £18,540,936 (106p per share) which is an increase of 14.7% over the net asset value of £16,164,826 (92p per share) at 30th September, 1971.

Our provisional estimate leads us to hope that it will be possible to pay a net dividend on the Ordinary capital equivalent to the net amount of the recommended dividend for the year ended 30th September, 1972.

TENDERS

CONTRACT TENDERS

APPOINTMENTS

North East London Polytechnic

Due to the impending retirement of Mr H. K. Hickling, BSc(Econ), applications are invited for the post of:

Dean of the Faculty of Business and Head of the Department of Business Studies Grade VI

Salary scale: £4579-£5051 inclusive (plus Dean's allowance of £375)

The successful candidate will be expected to take up appointment on 1 May, 1973.

Departments within the Faculty, in addition to Business Studies, are Applied Economic Studies, Systems and Computing Studies, Accounting and Finance, and Law. There is a wide range of academic work including degree courses of the CNA and Higher National Diploma courses.

Further details and application forms may be obtained from:

The Academic Staffing Officer, Ref S/DJ104, North East London Polytechnic, Forest Road, London, E17 4JB. Tel: 01-527 2272.

Wellcome

MARKETING DIRECTOR Nigeria

This is a new appointment to our Nigerian Company in Lagos which manufactures and markets consumer and ethical pharmaceutical products. The Company employs 160 staff and is poised for rapid development.

The key objective of the position is to achieve an accelerated growth in the profitable sales of the Company's products. To meet this objective, essential experience will include consumer marketing and the management of a field sales force in some part of Africa, preferably West Africa. Preference will be given to a man aged between 35 and 45 educated to degree standard, but the most important criterion will be a proven record of success.

A substantial salary and generous fringe benefits will be paid to the appointed candidate.

Please write, in confidence, to:

The Personnel Manager, International Services, THE WELLCOME FOUNDATION LTD, 183 Euston Road, London NW1 2BP.

The University of Manchester

Chair of Economic History

Applications are invited for the Chair of Economic History which will become vacant on October 1, 1973, upon the retirement of Professor T. B. Willan. The salary will be within the normal professorial range with F.S.S.U. benefits. Applications (one copy suitable for photocopying), giving full details of qualifications and experience and the names and addresses of three persons to whom reference may be made, should be sent to the Registrar, The University, Manchester, M13 9PL, and received by him not later than January 26, 1973. Particulars of the appointment may be obtained on request from the Registrar. Please quote ref: 189/72/R.

University of Glasgow

DEPARTMENT OF SOCIAL AND ECONOMIC RESEARCH Senior Lectureship or Lectureship in Applied Economics

Applications for the above post, tenable for three years in the first instance, are invited from persons with a good Honours degree in Economics. Preference will be given to applicants with research and teaching experience in LABOUR ECONOMICS. The salary will be on the scale - for Senior Lecturers £4143 to £5241 per annum and for Lecturers £1764 to £4143 per annum. Placement will be according to qualifications and experience. F.S.S.U. The successful applicant will have considerable opportunities for research but will be expected to contribute to the teaching work of the University. Applications (eight copies) should be lodged, not later than 1st January, 1973, with the undersigned, from whom further particulars may be obtained. In reply please quote Ref. No. 3243 (U). ROBT. T. HUTCHESON Secretary of the University Court.

Tayside Development Authority

Research Manager

A Research Manager is to be appointed by the Tayside Development Authority, which promotes the economic welfare of the City of Dundee, the Counties of Angus and Perth and Kinross and the Burghs of Perth and Arbroath.

The Research Manager, who will report to the Development Officer, will be responsible for providing a continuous analysis of the region's potential and requirements in terms of industrial development. He will link those with the requirements of possible industrial investors at home and abroad and study the effects on Tayside development of British and EEC regional policies. He should be a University Graduate, probably an economist and have a knowledge of international business. Knowledge of foreign languages useful. Preferred age 28-40. Salary range: £3,528/£4,056. Location: Dundee.

The post is superannuable, subject to medical examination. Five day week. Removal allowance payable to a maximum of £100. Assistance with housing may be provided.

Forms of application may be obtained from the Subscriber, to whom they should be returned not later than 15th January, 1973.

GORDON S. WATSON,
Clerk, Tayside Development Authority,
City Chambers, DUNDEE, DD1 3BY

APPOINTMENTS

The Royal Institute of International Affairs (Chatham House)

Research Specialists in International Economics

Applications are invited from economists with particular interests in European affairs for the post of Research Specialist in International Economics. The person appointed will be expected to contribute to the Institute's programme of studies on the internal and external affairs of the European Community, and to conduct economic research of his own in this field. The appointment, for a period of 3-5 years, will be made on a salary scale corresponding to that of university lecturer in the medium range, up to £3,400 per annum, but the ceiling is subject to negotiation. Appropriate provision will be made for superannuation. Further details may be obtained from the Administrative Director, 10 St James's Square, London, SW1Y 4LE.

Institute of Development Studies at the University of Sussex

Fellowships and Research Appointments

The Institute, an autonomous national centre now seven years old is continuing to expand its work, focusing especially on problems of employment and income distribution. Applications are invited from those with overseas experience, who accept the desirability of an interdisciplinary approach to the problems of the less developed countries and have professional expertise in one of the following areas:

FELLOWS (with responsibilities for developing new work in the areas specified).

Economist with interests in international trade and its implications for Third World development.

Economist/political scientist interested in national planning and budgeting with particular reference to problems of poverty and income distribution.

RESEARCH APPOINTMENTS (to work with ongoing interdisciplinary projects).

A social psychologist interested in the motives behind choices by small farmers under conditions of risk, and/or by actual and potential educators and their parents.

A political scientist/sociologist interested in the political factors underlying distribution of costs and benefits from rural institutions and innovations.

A demographer interested in the growth and structure of the rural population, especially as they affect income and resource distribution, labour utilisation, nutrition and/or the role of women.

A political scientist/sociologist interested in the forces moulding policy in the metropolitan counties towards 'developing' countries.

A sociologist/economist interested in the intellectual and cultural influences on development originating in metropolitan countries, via textbooks, mass media, education abroad, etc., especially in as far as they affect transfers of technology and standards.

Appointments are on contract with terms and conditions similar to University appointments. If necessary to secure an outstanding candidate the Institute is prepared to consider holding an appointment until 1974. Work includes research, post-graduate teaching and consultancy.

Further particulars are available from the Administrative Secretary, Institute of Development Studies at the University of Sussex, Falmer, Brighton BN1 9RE, Sussex. Applications by 26th January, 1973.

Portsmouth Polytechnic

Department of Economics and Economic History

Applications are invited for the post of Lecturer Grade I or Grade II in Economics.

Candidates must be well qualified, preference being given to those having qualifications in mathematical economics and/or econometrics. Assistance will be required in the teaching of quantitative methods for economists and economics mainly at degree level. Candidates should state their special interest in economics.

The vacancy will occur by the end of February but an alternative starting date can be arranged.

Salary scale: Lecturer Grade I £1,500 to £2,687 per annum. Lecturer Grade II £2,355 to £3,083 per annum.

Application forms and further particulars may be obtained from the Staff Officer, Portsmouth Polytechnic, Ravelin House, Alexandra Road, Portsmouth PO1 2QQ, to whom completed applications should be returned by January 8, 1973, quoting Ref. G17.

For further announcements see pages 5, 7, 76 to 79

The University of Manchester Institute of Science and Technology

DEPARTMENT OF MANAGEMENT SCIENCES

The U.M.I.S.T. Department of Management Sciences is one of the oldest and largest centres of Management education in the United Kingdom, embracing a substantial research school engaged upon a variety of industry sponsored research projects.

SPECIAL RESEARCH ASSISTANT (REF. MS/219/AD)

Applications are invited from suitably qualified mature graduates in Marketing Science, Economics, Statistics and Operational Research, preferably with some research experience, for appointment as the Research Assistant to Professor Roland Smith, Carrington Villa Professor of Marketing and Chairman of the Management Sciences Department.

The successful candidate will be required to work closely with Professor Smith on a variety of projects and will also be expected to pursue his own research interests for submission to a higher degree.

The appointment will be for three years at a salary of £1,326 per annum rising to £1,392 after one year. F.S.S.U.

Requests for application forms quoting Reference number, should be made to the Registrar, The University of Manchester Institute of Science and Technology, Backville Street, Manchester M60 1QD, to whom completed forms should be returned by 8th January, 1973.

Fight cancer with a will

When drawing up your will, please remember the vital work being done by the Imperial Cancer Research Fund which is fighting all forms of cancer, including leukaemia, in its own laboratories. It has no official grants and is entirely supported by voluntary contributions.

Form of Bequest

I hereby bequeath the sum of pounds free of duty to the Imperial Cancer Research Fund, Lincoln's Inn Fields, London, WC2A 3PX for the purpose of scientific research, and I direct that the receipt of the Honorary Treasurer or Secretary shall be a good discharge for such legacy.

Please write for further information to: The Secretary Imperial Cancer Research Fund (Dept 202) P.O. Box 123, Lincoln's Inn Fields, London, WC2A 3PX

Patron: H.M. THE QUEEN. President: The Honourable Angus Ogilvy

IMPERIAL CANCER RESEARCH FUND

Bookings for the past season were very satisfactory and preliminary figures indicate that the profits of the year ending 30th April 1973 should show a satisfactory increase.

Yesterday

Today

Tomorrow

Ever since the day we began making autos 40 years ago Toyota has faced the fact we can never get around. Our home country is one of the most densely populated in the world. So right from the start we've had to meet the consumers' demand for a good small car.

Our philosophy has remained the same to the present day. Everything we have goes into satisfying the world's need for a safe, reliable, well built small car. And the way we've been accepted in over a hundred and twenty countries tells us we've been on the right track all along.

In the days to come Toyota plans to concentrate its extensive research and development facilities on solving the problems we are all aware of. Because if we don't use yesterday's experience to overcome today's difficulties no one can have a decent tomorrow.
