PHILIPS: THE CATALYST OF GROWTH

Industrial growth. Growth dependent on technical knowhow and expertise, entrepreneurial skill, research and development. Philips have been quietly busy doing their bit to make the industrial revolution in India a reality.

New products, sophisticated techniques and innovation are only the visible part of Philips contributions. Over 2,000 small and medium scale units all over the country are sending steady streams of quality engineered components to Philips factories for such diverse products as lamps and lighting equipment, radios and sound equipment, professional electronic instruments and medical apparatus.

In the challenge posed by rising expectations, Philips response has been an ever widening industrial base imbued with technical competence.

PHILIPS

PHILIPS INDIA LIMITED

The evil of 'quid and quo'

making many promises to the public on behalf of the central government. It has been said that the government will hereafter work with greater dedication and increased efficiency in framing policies or executing programmes for improving the economic and social conditions of the people and, in particular, vulnerable or under-privileged sections of the community. There is a great deal of talk of employment-oriented development, while emphasis is being laid on social welfare and social justice. The Prime Minister and her colleagues are also pledging themselves to a new quality of planning which would encourage national self-reliance while discounting foreign aid. On another plane, assurances are being held out about the administration developing a new outlook or changing its ways of functioning so that bureaucratic inertia, negativism or obstructionism is eliminated from the implementation of the government's decisions or the discharge of the government's responsibilities for speeding up economic development.

There is, however, one promise which leaders in the ruling party or government have not made, one assurance which they have not held out. This is that they will endeavour to give the people a government cleaner than what the nation has been putting up with for several years now. There has been no undertaking on the part of the Prime Minister or other ministers in the central government to make an attempt to reduce the scale of corruption in politics or administration. The only assumption on which this silence can be justified is that this problem of corruption has not become a serious issue of good government. It is, however, widely recognised that there is or can be no place in our political syllogism or such a comforting premise. The politicians know only too well that the people now well enough that corruption has become the main fuel both for our politics and administration. The Election Commission has made no secret of its conclusion that the election practices of political parties or their candidates are chronically riddled with corrupt practices. There are several judgments of high courts or the Supreme Court in which references have been made to the poor state of morality among political parties or individuals as shown by their gross or consistent violation of election rules or regulations against corrupt practices. Recently, the government-appointed Direct Taxes Enquiry Committee had spoken in the most casual terms of black money being paid to and received by or on behalf of political parties. In addition, there is talk going on at all levels of the society of fund-collectors for political parties coaxing or coercing large cash payments from businessmen, often employing for the purpose the power or authority of their positions or offices in government. Significantly enough allegations of this kind have been seldom rebutted or even challenged.

Given the state of affairs at the political level, it is not surprising that the integrity and purity of the administration has also come to be widely suspected or arraigned. Once a minister's conduct ceases to be above board, he naturally becomes helpless or ineffective in dealing with corrupt practices in his ministry. Dishonest officials consequently become less and less inhibited in demanding or accepting bribes. Thus there often develop situations in which the bribed politician is unable to deliver the goods because files cannot be made to move unless the officials in their turn are also taken care of. In such a vicious context, clean government becomes an impossible idea and this is what is happening in our country at present.

It must be conceded, of course, that corruption in government is not a new development. But in the dimensions in which it now exists, it is certainly a phenomenon without precedent in the history of administration in our country. It is generally agreed that the root of this evil is to be found in the under-the-counter collection of cash payments from businessmen by politicians in office. It is also realised that the legal ban placed on open donations by public limited companies to political parties has had a great deal to do with the aggravation of this evil trade in black money. The Wanchoo Committee on Direct Taxes has suggested that the evil could be reduced if donations to political parties by public companies are made legal and given the benefit of tax exemption. Mr Palkhivala has also been advocating the removal of the legal ban on public limited companies making donations to political parties and has suggested that a law should be passed simultaneously making it compulsory for all political parties to make a public declaration periodically of all the donations they have received from various sources. There has also been a more far-reaching proposal that the state should finance with the tax-payers' money the legitimate election expenses of recognised political parties, thereby eliminating the role of black money as well as the need for political parties being beholden to individual or corporate donors. Whether the Prime Minister, her advisers and her colleagues are prepared to devote

some serious attention to this problem is not known, but it is clear enough that unless this basic evil of political corruption is dealt with, that other evil of corruption at the level of administration cannot be combated either.

Meanwhile could the community do anything at all even if the government or the political parties were to remain indifferent? The business community, at any rate, does bear a large responsibility for setting things right. This is for the simple reason that it is the most important 'other party' to corruption among politicians or officials. There was no doubt a time when businessmen could and did collect money openly and honourably for the benefit of political parties the economic policies or programmes of which they believed to be to the advantage of private enterprise and the good of the country. Today the climate for that kind of healthy and quite wholesome co-operation between political parties and the business community does not exist. On the contrary, financial support for politicians has become a black transaction in which undue personal favours are sought by businessmen and granted by the politicians in office or, equally often, politicians holding office have recourse to the tactics of blackmail to extract cash out of vulnerable businessmen. This being the pattern of political corruption, it follows that businessmen individually or the business community collectively ought to and can play an effective part in stopping this rot of corruption, in government or administration. This would no doubt mean for many businessmen a question of taking risks of a kind different from business risks but more often it would simply be a matter of their resolving, in the interest of the institution of private enterprise as well as in the national interest, not to seek undue advantages or favours from ministers or officials.

What is particularly unseemly in the anatomy of corruption in government or administration is the payment of money by businessmen to political parties or politicians as the *quid* for the *quo* of licences or quotas. There are certain business leaders who have lately taken up lecturing their fellow businessmen on the larger social ethics they must practise if private enterprise is to survive. It would certainly be useful if these prophets or preachers would also consider exhorting businessmen to turn their back on the monstrous institution of *quid pro quo* which has done so much to corrupt the administration, the government, politics and public life itself and imperil the democratic way of life.

This column has not

been planned as a regular weekly feature. It will appear whenever a fit subject presents itself. I have a suspicion that this will happen fairly frequently. As the caption warns, this column may extend charity to none: nor does it expect charity from any. It is and will be written, however, without malice towards the individuals whose views on issues of interest or whose sins of commission or omission in respect of their public responsibilities may be criticized or otherwise commented upon.

WITHOUT CHARITY

I am rather sorry

that my inaugural target happens to be the Minister for Tourism and Civil Aviation. Dr Karan Singh has qualities of head and heart which are deservedly and widely admired and respected. It is, however, not Dr Karan Singh, the individual, that I am concerned with here. I am writing about him only as Dr Karan Singh, the Minister for Tourism and Civil Aviation, especially Civil Aviation. I may be calling an axe a bloody shovel, but the plain fact is that Dr Karan Singh has been a dismal failure as Minister for Civil Aviation. The job has proved to be just too tough for this very soft man.

Nero was accused of

fiddling while Rome was burning. Dr Karan Singh, of course, is no Nero, but he is certainly interested in music. On March 31, a Friday, Dr Karan Singh was enjoying a music concert by Smt. M.S. Subbalakshmi from about 11 a.m. to 1 p.m. She was giving this performance for the delegates to the International Sanskrit Conference. In addition to being a lover of music, Dr Karan Singh is also a lover of Sanskrit.

There is of course,

nothing very wrong in a minister taking time off, even during the working hours of government, to pursue his interest in culture, literature, and the Fine Arts. Ministers, surely, do not have to sit glued to their chairs in their ministries or their seats in Parliament to show that they are not wasting taxpayers' money.

Nevertheless I feel

that I have just reason to pick up a quarrel with the Minister for Civil Aviation. For several weeks now the Indian Airlines schedules have

been in shambles. This may not have made a difference to the President or the Prime Minister both of whom have the IAF at their beck and call. It is also possible that other VIPs in government have not been seriously incommoded. They, after all, are in a position to throw their official weight about — and it has been remarked that one of the few IAF flights which managed to take off on time in the recent past was also the one which had the privilege of having the union Finance Minister listed among its passengers.

Lesser travellers,

however, have had to suffer varying degrees of discomfort or inconvenience so much so the weak of will or flesh among them have often been reduced to nervous wrecks. My charge against Dr Karan Singh is that he seems to be showing less interest in calling Indian Airlines to order than in Sanskrit conferences or music concerts. Seeing that he has not yet been moved to the Ministry of Education (including Cultural Affairs), this kind of behaviour on his part suggests dereliction of duty, gross or otherwise. The minister and the Indian Airlines management have charged the engineering staff with

staging an undeclared go-slow. The engineers on the other hand have claimed that they are simply working to rules. Additionally they have complained of lack of or ready access to spare parts, and this, they argue, is causing delays in maintenance operations being carried in accordance with the requirements of the safety of aircraft in flight. The public has a right to know where the truth lies and it should therefore have been one of the immediate acts of the minister to ask a competent expert or a small group of experts to go into the merits of the controversy and inform the public of the real state of affairs. If there is in fact a go-slow, the airline engineers could and should have been called to account. If, on the contrary, the management is in default with regard to spares or any other aspect of maintenance operations, the executives who are responsible for the lapse or lapses should have been brought to book. As it is, this hurling of charges and counter-charges, without any attempt being made by the minister to clear the air through a prompt and proper investigation of the truth, has only made it easy for irresponsible disputants on either side to carry on a battle of wills or war of nerves at the expense of air travellers who are the primary sufferers.

Incidentally, the

phrase "working to rules" seems to have been exploited once too often. If these rules would allow any section of airline operatives to knock down airline schedules, the sooner these rules are changed the better. The real problem, however, is that nobody is speaking the truth. It is clear that there is a wage dispute between the engineers and the airlines. To the extent that the demands of the former have substance, the management and the ministry have had enough time to make a 'take it or leave it' offer which is objectively reasonable and then proceed to deal sternly with the recalcitrants in case the offer is rejected. The trouble is that neither the Indian Airlines management nor the Civil Aviation ministry has yet been able to develop practices of tidy and firm administration. No wonder their record — and particularly the record of the present Minister for Civil Aviation — have been pock-marked by far too many surrenders

Mr Mishra's favourite child

IN his presidential address at the annual general meeting of the Indian Jute Mills Association held in Calcutta on March 30 1972, Mr S.L. Mehta referred to the keen and continuous interest that Mr L.N. Mishra, the Minister of Foreign Trade, was taking in the problems of the jute industry. "No wonder," he said, "if the industry claims the privilege of being your favourite child". But Mr Mehta's address showed how the industry has been receiving inadequate attention not only from the Ministry of Foreign Trade but also from other ministries. For example, Mr Mehta complained that the industry's efforts to maximise production by working extra hours including Sundays and by installing additional machinery and equipment were "greatly hampered by the inordinate delay which occurred in the necessary permission being accorded by government".

The delay in getting payments for the jute goods supplied to the government has resulted in blocking mills' working capital, thereby putting "a serious constraint on their working". Mr Mehta also remarked that the continuance of the export duties would

to aggressive trade unionism or simply unprincipled agitations.

Meanwhile air-

travellers are being repeatedly hit — and hit doubly every time. While the fares keep going up, the right to travel comfortably if possible — or peacefully at the very least — is becoming increasingly difficult to assert. The victims of Indian Airlines have in fact been reduced to such a helpless condition that the airline is even able to enforce and collect cancellation charges in spite of its being in no position to guarantee that its flights will take off according to schedule. A classic example of this a "pull devil pull baker" situation, which is being put up with only because the majority of air-travellers — perhaps the vast majority — has its fares paid by the government, directly or indirectly. There is here some poetic justice which both the aesthete and the moralist in Dr Karan Singh should be able to savour and relish.

TOUCHSTONE

ultimately prove detrimental to industry's export efforts.

The jute industry's export performance in 1971 can be considered as satisfactory only in a limited sense. Mr Mehta said that hessian exports increased from about 283,000 tonnes in 1970 to 309,000 tonnes, in 1971, carpet backing from 138,000 tonnes to 251,000 tonnes, and sacking from 79,000 tonnes to 1,15,000 tonnes, an increase of about 33 per cent. But Mr Mehta pointed out that the industry's improved performance in 1971 was much short of that of the sixties. For example, the industry's annual exports during 1963 to 1967 averaged about 850,000 tonnes which was 16.1 per cent more than what was exported last year. The better exports of last year were mainly due to the cessation of supplies from Pakistan.

Mr Mishra pointed out that the current prices were too high and that foreign countries were buying our jute goods mainly due to the "compulsion of circumstances". He added that jute could compete effectively only if its prices declined. But the industry's efforts were greatly handicapped by the frequent cuts in power supply, inadequacy of bank credit, high shipping freight and lack of co-operation from labour.

The power plants in West Bengal suffer from serious deficiencies arising from defective maintenance and strained management-labour relations. The plants of the State Electricity Board, the Durgapur Projects Ltd, and the DVC have been unable to produce according to capacity because of mechanical defects and lack of co-operation from labour. Though Mr Siddhartha Shanker Ray's ministry is now trying to improve the situation, it seems that it will take several weeks or months before industries in West Bengal can be assured of uninterrupted supply of power. It is doubtful if the jute industry's plea to exempt it from power shedding will be heeded by the state government. Frequent power shedding has also been affecting industrial relations in the jute industry. Mr Mehta complained that in spite of successive increases in wages and dearness allowance, there has been no improvement in production due to intense inter-union rivalries leading to various acts of indiscipline.

Mr Mehta highlighted the threat to the jute industry from synthetics. He said that the share of synthetics in the tufted carpet production in the

USA increased from 12.9 per cent in the first quarter of 1968 to 36 per cent in the third quarter of 1971 in the field of primary backing and from 8.8 per cent to 24.4 per cent in secondary backing. This resulted in an erosion in the share of jute primary backing from 83.5 per cent to 61.1 per cent and in jute secondary backing from 79.2 per cent to 66.9 per cent in this period. In 1971 the share of man-made fibre further increased from 32 per cent to 34.8 per cent in primary backing. In view of this increasing challenge from synthetics, both the government of India and the jute industry should intensify their efforts to improve the latter's competitive capacity. In this context, research activity assumes considerable importance.

Mr Mishra expressed satisfaction at the fact that the Indian Jute Industries Research Association had done useful work in the areas of jute spinning and fibre upgrading. But he regretted that quite a few mills had still not joined the Research Association and, more unfortunately, its subscription had run into large arrears, which showed "a lack of interest on the part of the members in the vital sector of research and development." While the minister is right in emphasising the role of research, he does not seem fair in attributing indifference on the part of mills. When the mills have not been able to operate profitably and even working capital has been hard to get, how can they be expected to show enthusiasm for research?

Mr Mishra exhorted the jute industry to devote proper attention to market studies. He said, "We should revitalise export marketing through proper planning and promotion and if necessary, market surveys and market orientation tours should be undertaken in the principal markets by experts in the industry and the government with a view to evolving suitable strategy for minimising loss in markets and deterring some new investment for production or use of synthetic substitutes". This is sound advice. But can Mr Mishra assure the industry of the adequate availability of foreign exchange to undertake market surveys? The industry had complained some time back that because of the niggardly allocations from the Market Development Fund, its efforts to intensify publicity in the USA for its non-traditional products like carpet backing and decorative fabrics had been

severely handicapped.

Referring to raw jute, Mr Mehta expressed satisfaction at the fact that as in the past, the industry was able to maintain the fibre price at Rs 42 per maund, basis Assam Bottoms. Mr Mishra pointed out that during the current season, the prices of raw jute in the mofussil markets dipped below the support level during the peak marketing period but he admitted that this was due largely to the floods and disruption in rail movement. Both Mr Mishra and Mr Mehta agreed on the need to provide the grower with a remunerative price. The Minister said that the government was considering fixing the minimum price of raw jute statutorily and strengthening the Jute Corporation. But these measures themselves would not benefit the cultivators unless they were also assured of the regular supply of

inputs and conditions are created for profitable working of the industry.

Now that West Bengal has a popular ministry and the centre is also keen to revive the state's economy, the jute industry should be able to look forward to better times. Mr Siddhartha Shankar Ray should impress on the centre, especially on the ministries of Finance and Foreign Trade, to deal with the jute industry with more realism and seriousness. At the same time the state government should do its best to help the industry particularly in such matters as supply of power and maintenance of discipline by labour. The IJMA also would do well to use the good offices of the state government in tackling some of its major problems. New Delhi perhaps may be in a better mood to listen to the voice of the jute industry when it is backed by the state government.

Our new trade partner

THE INDO-BANGLADESH trade agreement has been hailed in Parliament and outside as a sensible and realistic document. Mr L. N. Mishra, the Minister for Foreign Trade, has described the treaty as "historic" and as "a manifestation of our common will to discover and utilise the complementarities which exist between our two economies". To what extent the treaty will help to promote the welfare of the people in both countries, to whom it has been dedicated, will depend on how effectively it is implemented.

In West Bengal particularly, hopes have been raised that the treaty will substantially contribute to more employment, more supplies and lower prices of many essential commodities and will also give a stimulus to the rapid development of its agriculture and industry. To the people of Bangladesh the treaty is expected to augment the supplies of commodities which are required for the reconstruction of the economy and to create more jobs and better living standards. If these hopes are to be fulfilled, Delhi and Dacca should see to it that the terms of the treaty are carried out without an excessive emphasis on ideology.

The revival of the border trade is expected to provide immediate and substantial benefit to the people in both countries. The agreement provides that the facilities of border trade will be

available only to persons living in areas other than municipal areas within sixteen kilometres of the land customs frontiers and holding special permits. Those who hold such permits can carry across the border in each sector only the goods and quantities specified in the agreement and they may cross the border only once a day in each direction on any two specified days of a week only through the authorised routes. The movement of such goods will be free from customs duty and other formalities. Each person can carry in cash a sum not exceeding Rs 100 when crossing the border.

The quantities of goods to be permitted in this free trade are not the same across the entire border. The goods generally include such items as vegetables, chillies, fruits, milk products, firewood, fish, eggs, etc. These provisions in the agreement will help to provide employment to large numbers of people. But how far will they prevent smuggling? The border between India and Bangladesh runs into 1350 miles and some of the areas in the states of West Bengal, Assam, Tripura, Meghalaya and Mizoram are heavily populated. It remains to be seen to what extent the authorities on either side will be able to maintain eternal and effective vigilance and prevent unauthorised trading.

The agreement provides for a Rs 50-crore two-way trade in goods which are of special interest to the two countries. This trade is to be conducted on a balanced basis. The main goods to be bought by India are fish (Rs 9 crores),

raw jute (Rs 7.5 crores), newsprint (Rs 3 crores) and furnace oil and naphtha (Rs 1.5 crores). The exports from India will consist chiefly of tobacco (Rs 10 crores), cement (Rs 4.5 crores), coal (Rs 4 crores), cotton yarn (Rs 1.5 crores) and machinery, and spare parts for jute industry (Rs 50 lakhs). Transactions in this category will be made in rupees, similar to the arrangements in force with the countries of east Europe with the exception that the settlement of the balance, if any, will be in pounds. The agreement also provides for trade under free foreign exchange of goods not specifically mentioned.

Indian industries should be able to maintain their production at a high level if supplies to Bangladesh are to be assured without creating shortages at home and without affecting our exports to the other countries. In West Bengal particularly efforts must be made to enable industries to make better use of their capacity. The coal industry continues to be severely handicapped by the shortage of wagons. Production of coal in the country declined from 80 million tonnes in 1969-70 to 75.99 million tonnes in 1970-71 and 72.16 million tonnes in 1971-72 (estimated). In the Bengal and Bihar coal-fields, the output declined from 55.67 million tonnes to 52.21 million tonnes and 47.13 million tonnes, (estimated) respectively, in the last three years. This fall in production was caused almost wholly by the chronic shortage of wagons. This problem therefore needs prompt attention if we are to produce enough coal for our industries, for Bangladesh, and for other export.

The flow of fish from Bangladesh is expected to augment supplies and bring down prices in West Bengal. In the past, West Bengal used to import from East Pakistan about 6000 maunds of fish daily, estimated to cost over Rs 21 crores per year. It is not known to what extent Bangladesh will be able to meet the fish requirements of West Bengal. But it is important to ensure that because of the availability of fish from Bangladesh, West Bengal does not slacken its efforts to develop its own fish industry. Production of fish in West Bengal is estimated to have declined from 241,000 tonnes in 1969 to 235,000 tonnes in 1970 though the expenditure on the fishery schemes was much higher in the latter year.

Similarly, the prospects of supplies of raw jute from across the border should not create complacency in West Bengal and other jute-growing areas. In West Bengal the production of raw

jute has widely fluctuated in the recent years. It was 2.4 million bales in 1970-71 compared to 3.0 million bales in 1969-70, 1.1 million bales in 1968-69 and 2.5 million bales in 1966-67. West Bengal should intensify its efforts to produce more jute—and better jute. Though Bangladesh may be able to supply our requirements, she has also to export her jute to many countries of the world to augment her earnings of foreign exchange.

The trade agreement seems to rely too much on the state agencies for its implementation. So far as India is concerned, will the STC or any other official organisation that may be specially set up, be able to implement the agreement efficiently? The STC in the past has not been able to handle satisfactorily its responsibilities especially in regard to the procurement of raw materials whose imports have been canalised. Mere appointment of more staff to the STC or other official agencies will not be of much help so long as the procedures for state trading continue to be dilatory and complicated. In Bangladesh also, one wonders to what extent the state machinery has the necessary experience and expertise for the efficient handling of trade not only with India but with many other countries with which Dacca will conclude agreements in the near future.

Mr L.N. Mishra has said that if Dacca wishes to encourage the private trade in certain fields, the government of India will respect its wishes. But it appears unlikely that Dacca will allow the private trade any significant role in view of Sheikh Mujibur Rahman's anxiety to build up a socialist image of his country. Dacca seems to look up to Delhi for inspiration (and perhaps instruction as well) in policy matters. It looks therefore that state agencies will continue to dominate Indo-Bangladesh trade.

An unfortunate consequence of excessive reliance on state trading is to blunt private initiative in India in promoting trade and economic co-operation with Bangladesh. Take the jute industry, for example. Although it is more than four months now since Bangladesh was born, no dialogue seems to have taken place between the jute industries of the two countries to explore the scope for joint action. It is true that the jute industry of Bangladesh has yet to recover itself fully from the effects of the war. But what seems surprising is that not even a beginning has been made in this direction. Mr S.L. Mehta's presidential address at the annual meeting of the Indian Jute Mills Association held on March 30, gave no indication whatsoever as to whether there was any proposal for the jute industries of both the countries to initiate talks for a common policy in certain matters. Perhaps the Indian jute industry does not want to take any initiative in this regard unless Udyog Bhavan gives the green signal. Meanwhile, synthetics continue to make rapid headway in the USA and elsewhere, posing a threat to the jute industry both in India and Bangladesh.

The governments of India and Bangladesh have also agreed to make mutually beneficial arrangements for the use of their waterways, railways and roadways to facilitate movement of goods. Further, Nepal has been given access to Bangladesh via Radhikapur. There is thus considerable scope for India and Bangladesh to co-operate with each other in many fields. How far they will succeed in their efforts will depend mainly on to what extent Delhi is able to impart buoyancy to the economy and how soon Dacca is able to strengthen its machinery of government, re-build the infrastructure, and stimulate the growth of its economy.

Eastern Economist 25 Years Ago

APRIL 18, 1947

In view of the unexpected controversy over the Coinage Amendment Bill, the following details regarding the suitability of nickel for coinage purposes will be found interesting. The use of nickel has been traced by the Mond Nickel Co. Ltd. (who brought out a sumptuous volume on this subject in 1936), to Circa 235 B.C. — the first recorded use being in the reign of the Bactrian King Euthydemus II. The metal used was, however, only an alloy, the nickel content of which was only 20%. The first recorded use of pure nickel for coinage (this incidentally is the metal which

was mentioned in the statement of Objects and Reasons of the Indian Bill) was in 1881, when Switzerland experimented with the metal and found the results so satisfactory that the coin (of the same size and quality) was continued uninterruptedly. We have of course the English example also to guide us, as usual. But from a narrowly technical point of view the suitability of nickel has been established beyond dispute and this is the only consideration which is relevant. It is the only common metal which is magnetic and the fears about counterfeiting are baseless.

The UNRS installations for continuous casting of steel offered by the Soviet foreign trade organisation TYAZHPROMEXPORT:—

- ensure quality casting of billets,
- display high performance and service properties,
- have dependable units and assemblies,
- are highly mechanized and automated.

TYAZHPROMEXPORT delivers a number of UNRS makes and types, such as:—

- vertical-type,
- vertical-type, with billets bent into a horizontal position,
- radial-type,
- conveyor-type.

The installations for continuous casting of steel offered by TYAZHPROMEXPORT eliminate seven of the working cycle operations. Operating costs are reduced, metal waste is 4 to 15 per cent lower.

Furthermore, the process of continuous casting also offers other notable advantages:—

- fast metal setting in the crystallizer and repeat cooling area makes a billet of continuous casting acquire a better fine-grain structure, non-ferrous inclusions are fewer and more evenly spread, as compared to a common billet,
- a billet of continuous casting has better mechanical properties enabling reduce the extent of further thermal strain,
- the continuous casting technology makes production flexible since the installations can be quickly prepared for the next cast,
- continuous casting installations enable mechanization and automation of the steel casting line to be arranged on a large scale.

The plants are good for casting steel of various grades or conditions, such as rimming or killed carbon steel, electrical, low-alloy, or high-alloy steel. Billets of various cross-sections are obtained for lamination or section rolling.

High performance properties and top quality of product—this is what continuous casting means for you.

Please address enquiries on design, manufacture and operation of continuous casting installations to:

Chavan and the Wanchoo report

Sagittarius

POINTS OF VIEW

THE RECOMMENDATIONS of the Wanchoo Committee report on Direct Taxes, particularly those relating to taxation of corporate incomes, have not received the desired publicity or been critically examined. This is perhaps due to the fact that the full report has not been generally available or the reaction of operators and investors in the stock markets has not been unfavourable. It is wrong to arrive at definite conclusions about the usefulness or otherwise of the recommendations of the Wanchoo Committee after taking into account the rather inexplorable favourable reaction to the central budget proposals recently announced by the union Finance Minister, Mr Y.B. Chavan. The cheerful trend noticeable in stock markets in the past fortnight is due more to a feeling of relief over the absence of higher taxation on personal incomes and on corporate incomes generally.

It had been expected without any valid reasons that there would be a very big gap in the central budget in the revised estimates for the current year and the overall deficit for 1972-73 also would be such as to compel fresh taxation of at least Rs 250 crores. On account of the massive effort made in the past ten months to mobilise resources through fresh taxation and borrowing on an unprecedented scale, the deficit in respect of the revenue and capital accounts has been only Rs 385 crores and the actual deficit may be much less than this figure.

irresistible temptation

Mr Chavan could not have therefore thought of fresh punitive taxation though he could not resist the temptation of raising additional revenues through higher direct and indirect taxes of Rs 191 crores in a full year. When making this effort he has taken the opportunity to give effect to some recommendations which are advantageous from the point of view of the Exchequer. Even last year there was a whittling down of the concession given to industrial units in the priority sector. The deduction out of assessable

profits for payment of tax was reduced from 8 per cent to 5 per cent. Some industries like petrochemical and aluminium were excluded also from the priority list while some others were not eligible for a higher development rebate. In the latest budget the distinction between industries in the priority list and outside has been completely abolished and public limited companies whose shares are listed in the stock exchanges will have to pay a uniform rate of 55 per cent by way of taxation. The surcharge has also been increased to 5 per cent from 2½ per cent.

The changes in corporate taxation and the new levies relating to casual incomes from lotteries, winnings from races or other modes are in pursuance of the recommendations of the Committee on Direct Taxes but it has been overlooked that the burden of taxation on corporate incomes has been raised to the rather expropriatory level of 57.75 per cent inclusive of the surcharge and with the prospect of discontinuance of the development rebate the net burden will increase even more acutely after May 1974. Also it is not known in what manner the Finance Minister will decide to implement the remaining recommendations.

helpful proposals

Some proposals, if given effect to, will no doubt be helpful in mitigating the tax burden. But the whole philosophy of corporate taxation and ownership is undergoing a significant change and the government in its anxiety to protect its revenues has not been quite alive to the inflationary impact of high corporate taxation and also its disincentive effect on the promotion of savings and investment in the industrial sector. The committee has recommended the abolition of all distinction between publicly owned, closely held and private limited companies and recommended a uniform tax rate of 55 per cent.

It has also suggested exemption of that portion of profits distributed as

dividend up to 8 per cent in the case of small companies and a lower rate of tax on the dividend amount up to 8 per cent. There is also to be contribution to a Reconstruction and Stabilisation Reserve Fund the objectives of which seems to be only to create a pool of resources which are not immediately required by the contributors concerned to no great advantage. The proposal to abolish surtax will surely be welcomed if the government decides to do so. But one wonders what will happen if Mr Chavan eventually decided to impose a levy on the capital of industrial units in the crude and rigorous form recommended by the committee.

proper course

While it can be expected that the surcharge of five per cent will be abolished after some time it is too much to expect that the government will be agreeable to a uniform rate of taxation of 55 per cent for all companies. The proper course should have been to fix a rate of 50 per cent for companies whose shares are listed in the stock exchanges and of 55 per cent for other companies. The concessional rate of 30 per cent on distributed profits up to 8 per cent of disposable profits will be really an incentive if the government want faster development of industries. But there is no justification for excluding capital created out of the issue of bonus shares for computing the dividend amount eligible for concessional tax treatment.

The committee perhaps felt that the compulsion to distribute profits and raise capital later by issuing right equity shares will prevent tax avoidance now taking place by shareholders in the upper income brackets through the capitalisation of reserves. Since this will create needless difficulties it may be decided to include also bonus shares for computing the dividend amount and allow it to be taxed on a concessional basis.

There is, however, no justification at all for thinking in terms of a regular

levy on capital simply because there may be a decision in regard to the abolition of surtax. The latter tax is penalising efficiency and encouraging an unnecessary increase in working expenses because of higher profitability and fear of heavy incidence of taxation. There is perhaps objection to progression in corporate taxation but it would be far less inequitable to have one or two slab rates for taxing incomes which are in excess of 25 per cent of capital employed than a levy on capital which has been attempted in a different form and given up because of its anomalous incidence. The latest proposal is truly frightening because a levy of one per cent has been proposed on owned and borrowed funds, long-term and short-term.

The incidence of this levy will vary between old and new units in the same industry and between different industries. Also the incidence will be more keenly felt on earnings of industrial units which arise out of controlled prices and distribution. The committee

has observed that this levy has been proposed with a view to discouraging flabby development of industries and bring about a more judicious use of scarce capital resources. While there has certainly been excessive capitalisation in some directions because of the availability of development rebate and a bloating of working capital requirements due to the maintenance of high inventories, it can not be suggested by any stretch of imagination that it will be possible to effect a reduction in aggregate capital requirements by more than 10 per cent.

It has been conveniently overlooked that there can be an increase in the total of capital employed due to the higher cost of new machinery and rising prices for raw materials and components. It has also not been recognised that, notwithstanding the exemption of entirely new industrial undertakings from this levy for a period of 5 years, there will be needless disability arising out of differences in capitalisation simply because different units were promoted at

POINTS OF VIEW

different points of time. Above all the tax will bear heavily on industries which are highly capital-intensive in character and also on those which have to maintain a fairly large stock of raw materials and components. The seasonal industries also will be needlessly penalised.

Even if the suggestions made by Mr M.P. Chitale for reducing the rate of levy and excluding short-term credit in order to ensure that there is no net increase in the aggregate tax burden were implemented, the levy on capital will still be objectionable. There is no need to be unduly worried about the introduction of novel schemes. The ideal course would be to fix slightly different rates of tax for industrial units whose shares are listed in the stock exchanges and others which are closely held.

The incentive to distribute profits may be offered while the development rebate should be reintroduced in a different form. It may be made available

on a more selective basis. But there is no justification for the funny accusation that industrial units have been avoiding taxes by continuing to incur capital expenditure and taking advantage of the development rebate. It is overlooked that industrial units can expand only when it is profitable and there will be no desire to create new capacity if fresh investments is not worthwhile, even with the availability of development rebate, as is now happening in the cement and paper industries.

Unless the system of corporate tax-

ation is intelligently conceived and investment in industrial sector is reasonably attractive the desired progress cannot be made. Even if the proposals of the Wanchoo Committee are implemented on a package basis, there is bound to be an increase in the aggregate burden by more than 15 per cent and much more when the development rebate is discontinued. If it is the intention to discourage an undue build-up of reserves there can be a lower tax on distributed profits even up to 50 per cent of disposable incomes while there

POINTS OF VIEW

should be a good variant of the development rebate as in Britain and the advantage may become available to selected industries and to industries in selected places in a way without obliging the corporate assessee concerned to wait for the emergence of taxable profits as is now the case. It is only to be hoped that a pragmatic approach will be adopted when the Income Tax Amendment Bill is introduced in Parliament later in the year and a new incentive also is devised to replace the development rebate.

Productivity for progress

S. P. Chopra

THE CONCEPT of productivity has been popularised by the National Productivity Council (NPC) of India for nearly 14 years though it is hard to draw out a balance sheet of its achievements as well as failures. By and large, its activities have been centred in industry which provides sufficient evidence of advancement in this regard. Improved productivity is not the result of harder work by the working force alone. It is also a function of the optimum utilisation of capital and of the facilities available through science and technology. It is in this context that the two-day national seminar on productivity organised by the NPC in the Capital in the last week of March this year assumed importance. It provided an opportunity to the NPC to confer with leaders of the trade unions as well as business and industry so as to sort out the problems which have so far hampered the attainment of increased productivity in some sectors of the economy.

Mr Moinul Haque Chowdhury, the union Minister of Industrial Development who inaugurated the seminar, laid emphasis on the intensification of the productivity drive both at the macro and micro levels so as to utilise the available resources in the most profitable manner. Said the Minister: "We have to harness for our national growth the tremendous pro-

gress made the world over in the fields of science and technology. Technological progress is perhaps the most decisive stimulator in increasing productivity and, in turn, determining the rate of capital formation and economic progress. Development of independent technology from the very scratch in different sectors of the national economy is difficult and expensive". This is indeed a sensible approach to the problem of productivity and a number of papers presented and the contributions made by participants in the seminar endorsed this thesis of the union Minister of Industrial Development.

discordant note

Mr H.V. Narayana Murthy, President Salem Productivity Council, however, struck a discordant note when he put forward the view that automation should be resorted to rather slowly in this country. In his view until the population got stabilised and unemployment was substantially reduced, labour saving devices had little relevance in this country. He suggested that increase in the productivity of manual labour by utilisation of better organisation and the use of indigenous implements should be the aim. It may be stated here that the whole question of automation and the use of computers and other facilities in big organisations both in the public and the private sector is current-

ly being examined by a committee which has still to submit its report to the government even though it was appointed more than a year ago.

It is, however, undeniable that it is this basic conflict which has hampered the use of equipment for promoting increased productivity in many of our organisations. It is necessary that the government should give the country a very clear and unambiguous directive in this regard as the above-mentioned committee cannot be expected to produce a unanimous report in view of the variety of points of view represented on it.

The President, Mr V.V. Giri, and the Prime Minister, Mrs Indira Gandhi, have recently urged the workers as well as the industrialists to put a moratorium on strikes and lock-outs. It is expected that both the workers and the management will respond to the call of the leaders. But for a long time the workers have been demanding that they would like to have a good share of the productivity gains made by them. The share of labour in increased productivity needs to be defined in a clear-out manner and ways and means need to be determined whereby it would be easy to allocate the fruits of increasing productivity due to the hard work put in by labour. The NPC has circulated the draft of "Guidelines and Illustrative

Models on sharing the Gains of Productivity" which shows that despite various efforts made by the industry, the government and the NPC, it has not been possible to evolve an overall formula for sharing the gains of productivity.

Even if such a formula were evolved, "it would be difficult to make such a formula universally applicable in practical work situations." The nine points listed in the "Draft Guidelines" are however rather vague and urge sharing in gains of productivity through a national approach which is "flexible, equitable and simple to understand". Having failed to arrive at a workable formula, the NPC has thought it advisable to take shelter behind such generalised statements as "sharing the gains of productivity should be regarded a philosophy of industrial relations rather than a statistical technique of distributing the gain."

It is now clear that this is a question which will need to be settled by labour and industry through mutual negotiation in a spirit of give and take. While the major contestants in this tussle are the workers and the managements, any agreement between the two should ensure that the interests of the consumer as well as the society are not ignored.

research suffers

The organisations which have not been working well, are all under great pressure for increased wages and fringe benefits which might result in reducing the expenditure on research and development, marketing and other essential functions needed for increased growth. In this connection, it is worthwhile quoting the opinion of Mr S.M. Patil, Chairman and Managing Director of Hindustan Machine Tools Ltd — a public sector undertaking. Mr Patil said in his paper entitled 'New Directions and Dimensions for Productivity Movement' that "organisations which are not making sufficient profits are under intense pressure to cut expenditure on research and development, marketing and other essential functions without which the continued viability of the organisations would be impossible."

On the other hand, organisations

making good profits are also under heavy pressure to part with more and more of such surpluses on the plea that extra profits were earned by the efforts of workmen. In the ultimate analysis, such pressures would retard or stall economic growth and promote inflationary trends. Reinvestment of surpluses is vital for economic growth. It is because of this factor that Mr Patil put forward the view that "the cry for larger and larger compensations to industrial workers would not be in keeping with the socio-economic ideals of the Government."

multiplicity of unions

One of the elements which has hampered harmonious relationship between the managements and the workers is the multiplicity of unions in almost every establishment. Mr K.K. Birla opined that in a majority of industrial undertakings in our country, the principle of "one unit, one union" is yet to be given a fair trial. The central difficulty is that the trade unions do not act in a manner as would bring benefits to the working force. Many a time the decisions are taken not on merit but with a political objective. Therefore, Mr Birla concluded that unless it was realised both by the management and the workers that their interests were identical, there was no hope of success of the productivity movement in this country. While the trade unions in this country have been very active in organised clamour for increased wages, additional amenities etc. on behalf of the working force they have done little in educating the workers in regard to their responsibilities.

Powerful arguments were put forward by Mr K.K. Birla to rebut the statement in the working paper II circulated by the NPC that "plant capacities are not fully utilised with a view to restricting output for securing higher prices and profit margins". Mr Birla emphasised that under-utilisation of capacity had resulted in the case of many industries because of political idiosyncrasies which place artificial restraint on diversification and increased output. He went on to dilate upon the restrictions put on certain business houses which hindered in the attainment of economies of scale which in turn meant negation of the whole productivity movement in this country. While it is well-known

POINTS OF VIEW

that production in many industries has lagged behind because of the paucity of raw materials, bottlenecks in infrastructure facilities, labour troubles on trivial matters, shortage of working capital, difficulties in obtaining balancing equipment, spare parts etc, it would be unjust to blame the industry for under-utilisation of capacity. Unless the government takes a sympathetic and helpful attitude, it would not be possible for the units to fully utilise their capacities so as to enhance their production as well as productivity.

As stated earlier, the concept of productivity in our country has by and large remained restricted to industry and it was indeed refreshing to find Mr R. Niazmand, Managing Director, Industrial Development and Renovation Organisation of Iran draw the attention of the participants to the diet and food habits of workers which have a direct bearing on productivity. He cited the example of certain villages in Iran where laziness and lack of energy had characterised the population. The investigators found that their intake of iodine through water and food was next to nothing with the result that many of them were afflicted with goiter. The addition of iodine to the spring waters feeding these villages showed a marked degree of reduction in absentees to work and school and increased proficiency in learning among children. Thus he emphasised that it was necessary that the productivity science endeavoured to diligently examine food habits vs. productivity.

vast differences

In our country vast differences in productivity have been witnessed in the same kind of industrial units situated in different regions. Statistical analysis has shown that inter-regional differences emerged partly due to vague differences and partly because of the intensity of capital utilised and the strength of trade unions. The trade union movement in our country has assumed certain unhealthy trends which, if unchecked, could act as a blow to the productivity movement. If seminars of the type held in the capital help in putting the relationship between capital and labour on a healthy footing, they serve a useful purpose. But there are indications that such symposia remain as forums for letting off steam and no more.

Embarrassment of riches

R. V. Murthy

IT IS perhaps characteristic of all developing economies, particularly primary producers such as India, that they seem to face problems both when a given agricultural crop turns out to be good and also when it is bad. Presently the plentiful harvests of wheat and cotton are posing difficulties to the powers-that-be in India. As the economic law of supply and demand is inexorable, price of any commodity reacts to changes in volume of supply and demand in respect of that commodity. Quite often, a well-intended official intervention to prevent a fall in prices, whether by way of supporting the market by open market purchases or by way of credit relaxations, misfires because the action taken is invariably too inadequate or too late.

incomplete decision

Take, for example, the latest decision of the government of India informing the cotton mill industry and trade that, with immediate effect, the stock limits of Indian cotton allowed to be held by the mills, including the special limits allowed to exporting mills, have been increased by one month's average consumption. This decision is not only inadequate but incomplete. The press note dated March 23, 1972 issued by the Textile Commissioner, Bombay, for instance, made no reference to the relaxation of credit controls. It was relaxation of credit controls, only after the Millowners' Association, Bombay, (MOA) and the Indian Cotton Mills' Federation (ICMF) made representations to the government that "the regulations both as regards stocks as well as bank credit in respect of cotton (which had been imposed to deal with the situation arising out of acute shortage) needed to be changed (in view of the comfortable supply position) so as to enable further purchases of cotton and thereby stabilise the cotton prices" apparently that the authorities seemed to wake up.

It required Mr Babubai Chinai to raise a call attention debate in the Rajya Sabha on "the steep crash in cotton prices in various markets owing to lack of credit" for Mr A.C. George,

Deputy Minister for Foreign Trade, just to state that, to follow up the Textile Commissioner's notification, the government was examining (not decided, be it noted) the liberalisation of credit restrictions. (He also disclosed that the Textile Commissioner was due to meet the Reserve Bank officials on Friday, March 24, 1972. What transpired at this meeting is still not known, but, in view of the comfortable money conditions, the Reserve Bank could not have been averse to the suggestion. However, on an urgent issue such as this (vide Mr Chinai's warning to the government that "if action was not taken to stem the fall in prices, a very serious situation would arise"), it is not clear why the only admittedly effective decision, viz. to relax the margin against cotton stocks, should be delayed any further. On a matter such as this, the authorities would do well to take the concerned interests into confidence and act immediately.

restoring confidence

After all, the problem is not such as to warrant so much hush-hush deliberations and the consequent avoidable delay. What is needed immediately is to impart stability to cotton prices to restore confidence among cotton growers in the country, if only because, at this stage, the country cannot simply afford to allow any setback to the steady, albeit slow, increase in raw cotton output that has been taking place or to slacken the attempt at raising the cotton production potential already planned. (The cotton production potential in Maharashtra alone is expected to be stepped up from 10 lakh bales in the current year to 16.50 lakh bales by the end of 1972-73, according to the budget speech of Mr M.D. Chaudhuri, Finance Minister of the state).

Several remedial measures have been suggested, both in Parliament and by spokesmen of the cotton mill industry. Included among these are the suggestions made in the Rajya Sabha—Mr Chinai's suggestion that the Cotton Corporation should maintain its buffer

stocks, Dr Mathew Kurien's suggestion for setting up a permanent machinery to assess the production of cotton from time to time and take measures to boost production, Mr Sardesai's proposal for a remunerative fair price and monopoly purchase, and another proposal (by several members) for a minimum reasonable price for cotton. Of course Mr George dealt with some of these suggestions and, what he said is of considerable interest, particularly in the context of the decision of the government of Maharashtra to resort to monopoly procurement of cotton as from April 1, 1972.

While the union deputy Minister for Foreign Trade informed the Rajya Sabha that the government was examining the question of monopoly purchase of cotton by the Cotton Corporation, he also made a pointed reference to the huge investment involved and the need, therefore, to take a policy decision, that is, presumably to go slow. He asked the members to estimate what the investment would be if a mere 40,000 bales involved an investment of five crores of rupees. (The latest estimate of the total Indian cotton crop is 60 lakh bales which would entail an outlay of Rs 750 crores!).

brave words

Perhaps some of the brave ones may say: "What of that? Has not Maharashtra given the lead?" Those responsible for handling the finances of the country, however, may have a different view, to judge from the time being taken by the Reserve Bank even to relax the margin restrictions on cotton purchases. As regards a remunerative price or a minimum reasonable price for cotton, Mr George was even more non-committal. He merely said that the government would take a decision on this question when the report of the Agricultural Prices Commission was received. To say that this is only to gain time is not exactly to be cynical, because, as past experience has shown, the government decision is not based so much on the recommendations

of the APC as of the chief ministers of the concerned states.

Be that as it may, let us take stock of the present position. The textile mills, and or for that matter, the cotton trade, are not averse to purchasing more cotton. In fact, they have already purchased cotton to the fullest extent permitted under the stock and credit control regulations currently applicable to cotton. And these regulations, one must bear in mind, are woefully out of date. These, it will be recalled, were imposed to deal with a situation that arose out of acute shortage, and it is high time they were changed to meet an exactly opposite situation—a comfortable supply position. Hence the pressing plea of the Indian Cotton Mills' Federation and the Millowners' Association, Bombay,

to the government of India completely to suspend all restrictions on stocks of cotton to be kept by mills and to restore bank credits and margins to the levels that obtained in the crop year 1969-70.

The ICMF has also urged that the penal rate of interest on advances against cotton and *kapas* be done away with. (The MOA has asked for a reduction of the rate of interest from 12 per cent to the rate charged as in the case of finished goods). It has further pleaded (on behalf of the cotton trade) that the trade too should be allowed to operate under the normal margins and credit levels that obtained in 1969-70. In other words, as the MOA has urged, the heavy margins now required to be maintained by the traders against their cotton stocks

POINTS OF VIEW

require to be reduced. Not until and unless these measures are taken, and taken promptly, will the crisis in cotton be resolved.

It is no exaggeration to say, as the ICMF has, indeed, said, that 'there are serious apprehensions that, unless all possible steps (and these have been outlined above) are taken for a quick passage of cotton from the farms to the mills, a good portion of this year's cotton crop may not even be ginned by the beginning of the monsoon and will have to lie with the farmers in the form of *kapas*. It is needless to labour the point that this would cause deep distress to cotton growers and that, in turn, might mean a definite discouragement to them further to raise their cotton output. Surely that is not at all a pleasing prospect.

**Bankers! You'll love the rough, tough
Sergeant-Major Null Control headquartered
inside every ASCOTA Accounting Machine you buy!**

With Sergeant-Major Null Control on guard-duty in your Ascota, Corporal Wrong Posting doesn't have a chance to creep by. Which is just fine, making Ascota the most reliable accounting machine there is.

'NULL CONTROL' helps you in two ways:

- Warns you the moment an incorrect posting is made.
- Stops the machine instantly and returns the carriage to its starting position.

What more could you ask of such a lovable tyrant?

ASCOTA Accounting Machine comes to you with or without a typewriter, just as it suits you. It will suit you for other reasons too—each you can solidly bank on to render better service to increasing numbers of depositors.

Versatility With a choice of 5, 10, 15, 25, 35, 45 & 55 totalizers, ASCOTA can be custom-programmed to handle a variety of jobs in your bank. Current & Overdraft, Savings, Inward & Outward Clearing, Salary, Provident Fund, Branch Reconciliation, Supplementary.

Flexibility Simply by interchanging pre-programmed Control Panels, in just a matter of seconds, you can utilize the same ASCOTA machine for any number of different jobs.

Speed The blind-touch 10-key key-board and faster automatic totals speed up postings. Cut down operator fatigue. Shoot up productivity.

Service Prompt, expert service rendered by factory-trained technicians free for the first 12 months. Thereafter, under a fixed-price annual preventive maintenance contract.

For a demonstration, contact Blue Star today.

Available to actual users only, against Rupee-payment.

SAVE A LOT OF MONEY
AND A WHOLE LOAD
OF TROUBLE...

GET *Standard* ELECTRIC VEHICLES WORKING FOR YOU

Now available on
D.G.S. & D. Rate Contract—
'Standard' electric truck.

Why put up with the noise, the fumes, and all the nagging maintenance worries of petrol or diesel powered vehicles when you could be using STANDARD ELECTRIC VEHICLES?

Electric vehicles cost only 1/3 as much to run as other powered vehicles. They don't make a noise, fume or vibrate; their solid and simple design makes for easy maintenance and unrestricted manoeuvrability; and this means they last longer—you can reckon on 50% longer life expectancy.

And if your vehicle is in Bombay, you get a BONUS advantage with STANDARD—we'll service

your vehicles free for one year. But wherever you live, our factory trained and experienced personnel will service your vehicles and batteries at the same time, to save you the bother of two separate operations. So wake up from the vehicle nightmare with STANDARD's range of electric vehicles. They are made to cater for any load up to 3 tons and there is a whole range of trucks and tractors to choose from.

For further technical and engineering information, write to: The Commercial Manager, The Standard Batteries Limited, Vakola, Santa Cruz, Bombay 55 AS.

LINTAS-STB 25-200

FROM THE PRESS GALLERY

Our Parliamentary Correspondent

New Delhi, Saturday

SINCE WE reported last, the most important discussion that has taken place in the Lok Sabha has been the one on the mid-term appraisal of the fourth Plan. The union Minister for Planning, Science and Technology, Mr C. Subramaniam, seized the opportunity of this discussion to spell out the planning strategy of the government for the next few years. He indicated that the government intended to go in for restraints on conspicuous consumption, stand by its decision to lower land ceilings, check the uptrend in prices by stepping up production of items of mass consumption as well as by regulating their distribution, and bring about structural changes in administration and industrial relations. This strategy, Mr Subramaniam emphasised, flowed from the government's commitment to eradicate poverty in the country, usher in socialism and make the economy self-reliant. Fortunately, the socio-political climate in the country, he felt, was now much more favourable for undertaking the above task than had been the case hitherto.

resources mobilisation

Mr Subramaniam stated that the experience of the past two decades of planning had shown that a mere increase in the gross national product was not enough; the country had to make frontal attack on poverty. Poverty, he, however, opined, could not be removed unless more jobs were created and the basic necessities of life were ensured, if not to all, at least to most of the people. With a view to achieving these two ends, the development outlays, he stressed, had to be stepped up as also the production of those items which the masses needed the most. This called for greater resources mobilisation. The contemplated curbs on the consumption by higher income groups were designed to promote savings and investment.

Agriculture, Mr Subramaniam explained, would have to be accorded

again a pre-eminent position in the programmes of the fifth five-year Plan. This was imperative as nearly 70 per cent of the population lived in villages and was primarily dependent on agriculture. With a view to promoting agriculture, land reforms would have to be given a high priority. The ceiling on the holding of land would have to be brought down as the application of science and technology to farming had raised the productivity of land.

consumer good's production

Talking about industry, while Mr Subramaniam conceded that the performance of the public sector enterprises had to be improved a good deal, greater emphasis would have to be placed in future on the production of essential consumer goods. A very pertinent point that he made in this connection was that the present structure of industrial relations had to be radically changed to ensure industrial peace. He wanted the influence of political parties on trade unions to decrease. The co-operation of political parties in re-fashioning industrial relations was solicited by him.

The Minister of State for Planning, Mr Mohan Dharia, who also intervened in the debate on the mid-term appraisal of the fourth Plan, stressed the need for having a multi-level planning system with the district as the unit. He revealed that the Planning Commission had held discussions with the state chief ministers in this regard. It had been suggested that the states instead of having only a planning department, should have full-fledged planning bodies, consisting of the chief ministers, other ministers and economists. This would introduce decentralised planning.

The other important point that Mr Mohan Dharia made was that the lacuna in the present planning process of the Planning Commission not having the authority to monitor the progress and implementation of the Plan in the

states had to be filled in expeditiously. He indicated that talks would be held soon with the chief ministers of states in this respect.

During the debate, while most of the members desired decentralisation of the planning process, Dr V.K.R.V. Rao scathingly criticised the low rate of savings and investment. He pertinently pointed out that whereas the material targets set by the Planning Commission had not been achieved, the outlays on various development programmes had exceeded the planned estimates. He wanted the government to abandon the concept of per capita income and replace it by the concept of separate income rates for the different sections of society. Widespread concern was expressed over the deteriorating employment position and continuous rise in prices. Some members wanted the pace of industrial development to be accelerated. Several others urged for the devising of an effective machinery to implement Plan programmes at the state and district levels. Pleas were made for paying greater attention to the development of backward areas and for meeting the needs of the scheduled castes and tribes. Initiating this debate, Mr Subramaniam indicated that a beginning would be made this year for a massive and long-term effort for integrating the various river systems in the country from the Ganges to the Cauvery.

relations with Pakistan

In her reply to the Lok Sabha debate on President's inaugural address to the two Houses of Parliament, which had to be postponed for some time due to the presentation of the union budget for the next year and the general debate on that, the Prime Minister, Mrs Indira Gandhi, reiterated her offer of direct talks with Pakistan and disclosed that the government of India was in direct touch with the Pakistan government in this regard. Her government, Mrs Gandhi added, had consistently

wanted normalisation of relations with Pakistan and would continue its efforts towards this. The Prime Minister further stated: "We do not wish to humiliate anyone. We would like to discuss matters in a spirit of friendship and co-operation". She desired that Pakistan should turn her back on the era of confrontation with India. The two countries, she emphasised, should now live in peace and friendship. The Prime Minister denied that she was under any pressure from the Soviet Union in regard to talks with Pakistan. She assailed the Jana Sangh for resuming its "Soviet baiting." Mrs Gandhi also repudiated the insinuation that the unilateral cease-fire declaration by the government of India in December on the western front was done under pressure from the Soviet Union.

The Prime Minister took the opposition parties to task for their allegation that the recent state assembly elections had been rigged. She said she did not want to hit those who were down, but stated that the charge that elections were rigged was nothing but "fantastic nonsense". Mrs Gandhi expressed the view that much of the success of the Congress party in the state assembly elections was because of the mistakes of the opposition parties. She also did not think that the Congress had exploited the Bangla Desh issue for election purposes. The Congress party, she pointed out, had won the Lok Sabha election even last year when the Bangla Desh issue had not arisen.

heavy odds

Mrs Gandhi did not relish the criticism that the government had failed to check rise in prices. She conceded that prices had risen to some extent, but pointed out that the government should be given some credit for containing the prices spiral despite the heavy odds which it had to face last year—the massive influx of refugees from Bangladesh, the conflict with Pakistan into which the country had been forced, etc.

The Prime Minister agreed that the problem of unemployment had to be tackled expeditiously. She conceded that the last year's crash employment programme had not made much headway, but assured the House that this programme had of late gained momentum. She stressed that the employment programme had to yield results within three or four years if the political and economic stability of the country had to be maintained. A significant

point which Mrs Gandhi made in regard to employment was that those who were already employed in the organised sector should desist from raising demands that might cut into the resources for creating more jobs in the country. She underlined the need for a moratorium on strikes and lockouts.

Mrs Gandhi's speech reflected the air of confidence exuded in the President's address.

employment for engineers

Intervening in a discussion in the Rajya Sabha on a calling attention notice on the strike by petroleum and engineering student of the Indian School of Mines, Dhanbad, the Minister for State for Planning revealed that the government was formulating schemes to ensure full employment to the engineering and technical personnel within two years.

The Minister for Labour and Employment, Mr R.K. Khadilkar, pointed out during question hour in the Upper House that the interim report recently submitted by the Committee on Unemployment was being examined by a working group of the Planning Commission with a view to implementing its various recommendations for solving rural unemployment. No correct estimate of unemployment in the country, he said, was available, but the number of job-seekers on the live register of employment exchanges had shown an increase of 25.3 per cent during 1971, as against 18.8 per cent in 1970. According to an assessment made of the crash programme for employment in the rural areas, the estimated employment generated, he said, was about 344.09 lakh mandays.

The harassment and intimidation of Indian students in Detroit (United States) caused a good deal of concern in Parliament this week. This harassment and intimidation, it was alleged by several members, was a deliberate act on the part of the US and was in line with the anti-Indian attitude of the Nixon administration over the Bangladesh issue. The Deputy Minister for External Affairs, Mr Surendra Pal Singh, tried to assuage the feelings of members by stating that the government had already got an interim report from the Indian Consul who had visited Detroit and talked to students and the American immigration authorities. The government would think of the next

step when it received the full report from Washington.

The Public Accounts Committee has suggested that the evaluation of the work done by the University Grants Commission should be entrusted to an expert body appointed by the government instead of the Commission itself. In its 27th report presented to the Lok Sabha last week, the committee said such a body might comprise eminent educationists and reputed retired vice-chancellors. The report referred to an earlier note by the Ministry of Education and Youth Services which said the UGC had decided to set up a small group of science, arts and social science experts to study and evaluate the achievements of the Commission. It would be more appropriate, the report said, if the evaluation work was done by a government-appointed committee.

The Rajya Sabha has adopted a number of bills during the past two weeks. The more important among these are: (i) the Industrial Disputes (Second Amendment) Bill; (ii) Aircraft (Amendment) Bill; (iii) Prevention of Food Adulteration (Extension to Kohima and Mekong Districts) Bill; (iv) Newspapers (Price Control) Bill; (v) Hire-purchase Bill; and (vi) Maternity Benefits (Amendment) Bill. The Lok Sabha has adopted the Administrator-General (Amendment) Bill; the Indian Copper (Taking-over of Management) Bill and the Contingency Fund of India (Management) Bill.

hopes belied

The hopes of the Congress party to secure an absolute majority in the Rajya Sabha have been belied. In the biennial elections to this House held last week, it could win, despite its massive victories at the state assembly polls, only 49 of the 72 seats which fell vacant on April 2. The strength of the ruling party in the Rajya Sabha (118) now falls short of the absolute majority by four. The total strength of the House is 243 members. The 72 seats filled by the last week's elections were shared by the various parties as follows: Congress 49; Congress(O) 3; Jana Sangh 2; Swatantra party 1; CPI 3; Socialist party 1; DMK 5; BKD 1; Muslim League 1; Republican party 1; Utkal Congress 1; Manipur People's party 1; APHLC 1; Independents 2.

Europe's problem regions

Josselyn
Hennessy

London

Failure of National Policies

AS NATIONAL regional policies to deal with problem regions have been in force only since the 1950s in most countries (in the UK since the 1930s) it would not in any case be possible to point to many wide-ranging successes. But even allowing for the long gestation of the bigger new projects in development regions, it remains depressing that there is as yet no example of a reversal of the trend in any major problem region from progressive im-

Community-wide level to create appropriate small-scale and medium-scale industries in the Community's backward farming areas to provide jobs for farmers leaving the land. An allocation of funds amounting to \$100 million per year over the next five years is called for to get the project moving.

Other proposals by the Commission include: (a) the placing of limits on new official aids to new investment in congested fully-developed central areas; (b) the creation of a standing committee for regional development, composed of experts from the Com-

poorer regions should benefit from it to some extent, since a disincentive to locate in central areas in some cases implies an indirect incentive to locate in poorer regions.

Though the Council appeared to regard the Commission's other proposals favourably at its October, 1971, meeting, it had sufficient reservations to hold back from making any decisions until after further discussions—and there the matter rests at the time of writing.

A reshaped and enlarged European Social Fund became operative in January. Like its predecessor, it will use its resources mainly in the problem regions to alleviate unemployment and redundancy by retraining and redeployment. It is notable that the new fund

This is the second and final article of Europe's Problem Regions. The first article had appeared in our issue dated March 31, 1972

will play an active role in retraining workers threatened with redundancy before their existing jobs disappear. In 1972, it is estimated that \$50 million will be available for these purposes, increasing to \$250 to \$300 million annually by 1975.

II

Vast Scale of the Problem

As the Community still vacillates about implementing a supranational regional policy, it is important to look at some of the findings of a new study by the Commission's Directorate General for Regional Policy. Estimating the number of jobs that will need to be created in the problem regions over the period up to 1980, the Commission arrives at a total of 3.54 million, broken down by country and main type of problem region as shown in Table I (p. 764).

The cost of creating these new jobs will be enormous. The investment per new job will vary widely according to the type of industry but the Commission takes an optimistically low 25,000 unit of account (equal to the gold equivalent of \$1) per new job as a typical figure for the sort of labour intensive

poverishment to overall economic growth.

Clearly, a sweeping reappraisal of the whole issue is essential. And since in the new Community of Ten, the policy-makers may all too soon find themselves grappling with "problem countries" rather than "problem regions", any re-assessment would best be made at Community level.

Already the EEC Commission and the Council of Ministers have come out in favour of a co-ordinated regional policy. Albert Borschette, the Commission Member with special responsibility for regional policy and for competition policy, has repeatedly affirmed that the EEC, as well as member states, should be more active in regional problems of common interest.

As a limited, but nevertheless important, move forward, the Commission proposes the first regional policy at

mission and member governments; (c) the setting up of an interest rebate fund, initially of \$50 million per year, to subsidise, by up to three per cent points; loans from the European Investment Bank for projects in development regions; and (d) the allocation of \$50 million per year from the Agricultural Fund in order to offer premia of \$1,500 per new job created for ex-agricultural workers to firms setting up operations in development regions.

In the event the Council's first step towards a common regional policy was to curb national outbidding for new investment in central areas. From January 1, 1972, the Six have undertaken, for one experimental year, to limit aids to these areas to 20 per cent of the total investment cost of each project. The Six are also to rearrange their regional aid systems so that all the incentives offered are clearly assessable. Though it is ironic that the first full scale Community regional policy decision had to be negative, the

enterprises likely to be concerned. Applying this figure to the job vacancies specified in Table I yields a total requisite private investment of no less than a yearly average of 8,850 million u.a. per annum for the period 1971-80. This figure compares with total new private investment of 46,440,000 million u.a. in the Six in 1969, implying that around 20 per cent of total new private investment will need to go to new job creation in the underdeveloped regions each year — an ambitious target.

TABLE I

Job Vacancies Required in Problem Regions upto 1980

	Back-ward rural regions	Declining industrial areas	Total ('000)
W. Germany	—	—	464
France	550	150	700
Italy	2,000	100	2,100
Netherlands	60	80	140
Belgium	10	120	130
Luxembourg	—	—	6
Total	—	—	3,540

get. Table II brings together the data on a country-by-country basis; the 61.8 per cent of total new private investment in Italy implied as having to go to the poorer regions each year is as remarkable as it is unreasonable.

The Commission assumes that all this private capital spending in the problem regions will receive substantial official support (from national governments and from the Community). The Commission estimates that public aid for private sector investment will total 15,150 million u.a., with the greater part (10,500 million u.a.) going to Italy — the other national totals being: France 2,860 million u.a., West Germany 1,160 million, Netherlands 350 million, Belgium 325 million and Luxembourg 15 million (in each case for 1971-80).

Public investment (other than the above) in infrastructure is estimated at a surprisingly — and worryingly — low

60,500 million u.a. for the ten years (6,050 million per year).

The most striking feature of the study is that, if accepted at face value, it demonstrates that the problem cannot be dealt with by national governments acting alone. Only a Community wide approach is likely to be able to raise the large sums involved. The suggested programme also implies a substantial redistribution of resources from one country to another. The study is a dramatic and effective piece of advocacy for a thorough going Community regional policy. Its case would be even stronger if modified to include the four expected new members of the Community.

EFTA has at no time made any pretensions to implementing a common regional policy and, indeed, its constitution does not allow it. The issue has by no means been entirely neglected, however, though EFTA's work on regional development has been confined to the exchange of views and information between policy-makers from members countries.

The three main studies carried out by the Economic Development Committee, all of a high standard, bring together much valuable material. The study of growth centre policy published in July, 1968, and the examination of the character and use of industrial estates published in March, 1970, both influenced subsequent policy ideas in member countries. The committee's latest report on industrial mobility is also likely to influence much future thinking. But beyond this, EFTA has made no moves on regional policy and its associated problems.

Businessmen Sceptical

But however much national governments and supranational organisations may do to attract employment into the problem regions, in the final analysis what matters is how business reacts to the inducements offered.

At first sight the lists of incentives, concessions and other advantages available to industry locating new plant in development regions are impressive (see *Eastern Economist*, March 31, 1972). But clearly the number of firms availing themselves of these regional policy measures is almost invariably much smaller than the target number. The fact is that location decisions are made according to a set of hard economic and allied criteria,

only a relatively small proportion of which can be favourably influenced by incentives of the kind generally available. Indeed, a typical firm locating a typical type of operation in a typical development region will usually find that, in effect, a number of the incentives offered are mutually exclusive — for example, a company that rents a ready built government factory at a subsidised rent will obviously not qualify for a building grant.

Other incentives may in practice be worth less than a first sight suggests. Sometimes tax systems may take grants into account when assessing depreciation allowances. Tax holidays may be worth little in the crucial early years after starting operations, when taxable

TABLE II
New Private Investment in Problem Regions

(Million Units of Account at 1969 prices)

	Requirement for problem regions		Total* for whole country
	1971-80 total	Annual average	1969
W. Germany	11,608	1,161	15,836
France	17,500	1,750	16,224
Italy	52,500	5,250	8,490
Netherlands	3,500	350	2,570
Belgium	3,250	325	2,024
Luxembourg	150	15	300
Total	88,508	8,851	46,444

*Gross fixed capital formation less amortisation.

profits are likely to be low. In the labour intensive industries most attracted by the pool of workers in development regions, capital costs as a proportion of total costs are likely to be relatively small, and a 20 per cent official investment grant might well mean a marginal two per cent reduction in total production costs. Obviously, the precise worth of the available incentives depends on the nature and size of the individual operation, but it is apparent from the

above that regional development incentives will rarely in themselves be decisive in determining plant location.

In assessing the net cost of these incentives to national governments, and thus the net benefits to recipients, remember that in so far as official guarantees are not involved, loans are repaid, rents on government factories are later increased to market levels, etc., and the gross level of official outlays is reduced. And, of course, jobs created mean higher government tax: receipts and lower outpayments on unemployment benefits, etc.

It emerges that although regional policies have reached high levels of sophistication in some countries, they have as yet had relatively little impact on

what is after all a massive regional problem (or series of problems) in western Europe. Nevertheless, it is important to emphasise that progress is being made.

Part of the problem is that efforts to develop a body of systemised applied regional economies have to date been made in national contexts only. Co-ordination of efforts at supranational level would make for economy and provide the wider European setting within which regional development policies will eventually be conducted — this work could best be carried out under the aegis of the proposed Community standing committee for regional development.

But while the EEC Commission produces yet more proposals, the Council hesitates and national governments

press ahead on an *ad hoc* basis, and valuable assets in the problem regions stand idle or under-utilised. The tasks ahead are clear: 3.5 million new jobs need to be created in the Six alone by 1980; \$88,500 million of new private investment needs to be steered into the same area over the next ten years. The size of the solution will have to be geared to the size of the problem.

The poor get poorer

It is becoming clearer that, as west Europe's Common Market moves towards the logical outcomes of its policies life for the so-called independent small man and for the less skilled workers — the really poor of the middle and working classes — will become steadily more impossible. The most recent beam of light to be thrown on this melancholy fact was provided by the meetings of the Agricultural Ministers in Brussels who, after about 100 hours disagreement and bargaining in this most sensitive area of the Market's politics agreed on a new round of increases in the prices guaranteed to their farmers.

The purpose of the agreed price increases for cereals, milk and cattle is twofold—to make farming in west Europe more efficient by concentrating its activities and to align its production more closely to public requirements. The result of this and the inevitable future permitted price increases will be to make the better-off farmers richer, the poorer farmers either poorer or driven to other employment or suicide and a steadily rising cost of living for everyone else.

No one pretends that the Market's Common Agricultural Policy (conveniently known as CAP) will, for a long time, gain from its £1000 million annual bill more than marginal improvements or that it will do much to avoid the constantly recurring surpluses of pro-

ducts which have to be dumped on the world markets. Nor will it do anything much to improve the average European farmers' income from its present level of about one-third below the average industrial workers' income.

Those who know west Europe best from summer holiday tours, when the fields are turning golden and the sun shines on ripening fruit orchards, probably gain the impression of rural well-being and content: if they travelled a little later, in autumn, they would see French farmers angrily throwing away their tomato crop in protest against the insignificant price offered for it by the wholesale market. Unlike Britain, which, until it enters the Market, runs a policy of price support for farmers and cheap food for consumers, west Europe gives its small farmers — about 70 per cent of the total — little help.

How brutal is the effect of this may have been gathered from the reference earlier to suicide. This was no fanciful turn of phrase. The monetary poverty of the small French family farmer is crucial. Last year some three per cent of all French farmers — about 300,000 families — finally gave up the farming struggle and left beloved land to find work in industry. In France, the suicide rate is higher among farmers than in any other population group. Of French farmers between the ages of 36 and 45 one in nine dies a despairing suicide. He works some nine hours a day seven

days a week to earn, if he is lucky, about £550 a year or to earn nothing or actually spend more than he earns if the weather is bad or the market more glutted than usual. Many French and Italian small farming families never take a holiday — they can't afford it.

The high prices for cereals and milk (Common Market prices are about two-thirds above world prices for cereals and one-third higher for milk) are not sufficient to help the smaller farmers get a decent living; at best, they help him to hold on, inadvisedly, a little longer. For the bigger farmers, they are highly advantageous. The minority of farmers who own 300 acres or more can make an excellent living. The more intelligent of them are using their profits to turn from the relatively unprofitable grain and market foods production to animal production to gain the benefit of high prices for milk and meat. They will help to hold down cereal prices to make animal production even more profitable.

The future for farming in Europe lies everywhere in switching from small units to large. This does not imply anything so colossal as the state farms and collectives of eastern Europe since the average west European farm is small indeed and often in many pieces. Those who read of Poland's farm reforms, which began 14 years ago, regrouping small scattered farms into one unit, a process which was finally carried out

APRIL 14, 1972

in Britain 150 years ago by the Enclosure Act, may not realize that in parts of Holland this reform is only now being put in hand. Near Gouda, the home of famous cheeses, the Dutch government is carrying out a "reallocation" scheme which shares out anew the strips of land, some five miles apart, which farmers own, in order to concentrate them for more economic production.

The future for west European farming lies no more with the individual farming family but is beginning to turn, far profitable working on a sufficient capital basis, to the farming limited company. Holland and France will lead the way through sheer necessity and because they are more economically aware in agriculture. West Germany, many of whose small farmers do their farming as a part-time job, and domestically highly conservative Italy will follow later.

If the growing well-being of west Europe's Common Market area as a whole is causing some painful changes in living patterns to the small farmers it is beginning to take their better paid jobs in a foreign land away from many of south Europe's and north Africa's

emigrant workers. The German euphemism of "guest worker" has, as so often in these areas, thrown a pleasant cover over some rough facts. The welcome to these "guest workers" varies with the necessity for extra labour to help the host meet his marketing opportunities and earn handsome profits. The millions of dinars, lira, pesetas and drachmae sent home by south European mechanics and labourers to support their families and benefit national balances of payment have been a trivial reflection of the hundreds of millions of francs and marks their employers have been able to bank.

Now that trade recession is casting a sizeable shadow and now that unemployment is growing in the Market area the welcome to aliens is cooling rapidly. Their nastier habits have suddenly become more noticeable — the Dutch complain of Turks buying old houses and sleeping six to a room: in Austria, which still needs relatively cheap foreign labour, this Turkish habit has not yet attracted much attention.

There is yet no crisis: the "dirty jobs" are still fully available, particularly in more fastidious Britain, France and Germany. But France has informed em-

ployers that an effort must be made to fill a job with a Frenchman before a foreigner is hired. The Dutch government is preparing legislation to limit the entry of foreigners who seek to earn a living in Holland and Germany maintains a tight control over worker permits and foreign worker recruitment. In the last six months the number of foreign workers in Germany has been reduced by over five per cent. Switzerland, where about 30 per cent of the total labour force is foreign, is beginning to cut back.

When the Common Market enlarges next year the immigrant workers who have settled in Britain from India, Pakistan, the Caribbean area and from former British areas in Africa will find they are not able to migrate to the European mainland to work. They — and citizens from Commonwealth countries such as Australia and Canada — will face exclusion as not having "a permanent and irrevocable right to live in the United Kingdom". They will all need work permits and these, if unemployment still rises in west Europe, will be hard to obtain and will be revokable at the will of the Market government concerned.

Far too many people

in our country, I am afraid, have been afflicted with a mental condition which I may perhaps describe as "Bhutto-on-the-brain." It must be said to the credit of the Prime Minister that she has been valiantly resisting the efforts which are being made in some quarters, with great energy and determination, to infect her with this malady. Editorial writers in certain newspapers are particularly to be blamed. They seem to have concluded that Mr Bhutto is the best Indian we have in Islamabad and that our government, therefore, should not lose the opportunity of talking things over with him and reaching a peace settlement. Mr Bhutto himself seems to have a more accurate idea of where he stands in relation to India or India in relation to him. He is reported to have remarked some time ago that he owed his present job to the Prime Minister of India. He could also add now that if he continues to be the President of Pakistan it can also be only because of a helping hand from New Delhi. It is clear that Mr Bhutto needs India more than India or even Pakistan needs him.

The question that we may therefore ask ourselves is how important or relevant Mr Bhutto really is to our country. I have a feeling that the presidency of Mr Bhutto will turn out to be a nine-day wonder. The man is clearly too much of a demagogue to be able to lead his battered country through its present crisis to political stability or a democratic future. He is a wind-bag and a straw man by turns and is not only without principles or convictions but is also a stranger to the mental process of coherent thinking. His credibility is already less than nothing among other politicians or public figures in his country and this being so, it is extremely unlikely that he can hold together even the truncated state of Pakistan once other political leaders in that country, nearly all of whom are also his political opponents, have been able to collect their thoughts and think in a systematic way about the future of their

people. In these circumstances, I wonder whether Mr Bhutto has indeed anything worthwhile to offer to us at a negotiating table. The man's main concern seems to be to pull off one or more diplomatic face-savers and thereby enable himself to buy more time at Islamabad. That he apparently believes that he will be able to strike a useful deal with India without simultaneously coming to terms with Bangladesh only emphasises the shallowness of his political personality. It is quite possible that Mr Bhutto is not the best president that even Pakistan in its present plight can have. The mere fact that he is President should not therefore bamboozle us into believing that this country is obliged to do business with him; for as I had mentioned earlier, the question we must raise about Mr Bhutto is how long he can manage to be President. We may not have to wait long for an answer.

Mr Richard Nixon's

name must be the most hated name in all Vietnam, north or south. That it makes no music either in the ears of the people of Bangladesh may of course be readily assumed. If, with the 560 million or so of Indians (including, emphatically, Mr Frank Moraes), the US President is far from being most popular world personality at the moment, this, again, is entirely natural. What, I find rather difficult to make out is why tricky Dick Nixon, as he has come to be known in many lands including his own, should stand as low as he apparently does in the esteem of people in western Europe. In Amsterdam, for instance, he was recently voted to be the worst of all the sons of Adam down the ages. The poor man fared only slightly better across the Channel. Visitors to Madame Tussaud's Wax Works in London were asked to name the public figures whom they hated or feared most. Nixon got the third place in the list, yielding rank only to Hitler who topped the roll and Mao who stood second. The US President, incidentally, had scored comfortably over Jack the Ripper and Dracula.

Although quite a few

of my colleagues in the press have not been slow in giving three cheers to the current slogan about national self-reliance, some editors still seem to have a weakness for buying columns from foreign newspapers. *The Hindu* must serve up Art Buchwald hot from the pages of *Washington Post*, while *The Times of India* would attempt to draw even by doling out helpings of Russell Baker by arrangement with *The New York Times*. Even the Prime Minister's house journal, *National Herald*, must replenish its resources by reproducing material published in *The Guardian*. Years back, when Drew Pearson's "Washington Merry-go-round" was going through one of its periodic phases of extra-notoriety, the then Managing Editor of *The Hindustan Times* bought that syndicated column for his paper. The experiment did not prove a success, for Drew Pearson normally wrote about matters which were of little interest to the Indian public.

When Drew Pearson's heir and successor, Mr Jack Anderson, hit the headlines in the world's press some time ago and kept hitting them by making disclosures about the seamy side of current White House politics or policy-making, I naturally began to wonder which newspaper in this country would be seeking reproduction rights. *The Statesman* seems to have made a deal for publishing selected instalments of the Anderson column. Now that there is not much goodwill in this country for President Nixon or his administration, a large part of *The Statesman's* readership may take a lively interest in the spectacle of White House dirty linen being washed in this column. But this need not prevent some of us from asking whether *The Statesman* would not be using its resources more relevantly if it were to direct its attention to what may be going on behind the scenes in New Delhi than to what Mr Anderson says is going on in the murky corners of Washington politics. There is a saying in Tamil about people wanting to wipe the bottoms of others before or even instead of cleaning their own. It seems to me that it must matter more to our people to learn about corruption in their own government or administration than in the politics or public life of some other country. It follows that our newspapers have an obligation to try to do an Anderson themselves if they could, but then it seems to be a question with 'hem equally of "I would if I could" and "I could if I would".

MOVING FINGER

TRADE WINDS

Cotton Prices

THE DEPUTY Foreign Trade Minister, Mr A.C. George stated in the Rajya Sabha regarding the "reported steep crash in prices in various markets in the country and that cotton production during the current year has been very encouraging. Against the estimated production of only 5.3 million bales of the last year, the present estimates of the current year are around 6 million bales. The last year (1970-71) was an abnormal year for cotton, both in respect of production as well as price behaviour. The acute shortage of domestic cotton led to rise in prices to unprecedented levels. This affected the production in the textile industry, both for exports as well as internal purposes. Annual production of cloth and yarn was the lowest in 20 years. Since the current year's crop is higher than last year's production by about 700,000 bales, the prices have been moving downwards. The government is watching the situation closely, he said, some steps calculated to stabilise level of prices of cotton have already been taken. The programme for import of foreign cotton has been reviewed and the quantum of targetted imports has been curtailed by about 250,000 bales. The stock limits earlier imposed on mills have been uniformly increased by one month in respect of all the mills in the country. The Cotton Corporation of India has moved in the market in various states, opened a large number of purchase centres. The corporation had purchased to date more than 46,000 bales and was continuing its purchases in large volume.

The government has fur-

ther under consideration measures such as securing suitable relaxations in credit restrictions and extending the period of delivery in respect of non-transferable specific delivery contracts.

Kolar Gold Mines

Bharat Gold Mines, a public sector company, took over the Kolar Gold Mines on April 1. The new company, registered under the Companies Act 1956 as 'Bharat Gold Mines Private Ltd.' will be vested with all the assets and liabilities of Kolar Gold Mining Undertaking with effect from this date.

The entire gold production would continue to be made over to the union government by the company at the international parity price, as is being done at present. The company would take steps to increase the production of gold and reduce operating cost. With more flexibility of operations, than hitherto enjoyed by the Kolar Gold Mining Undertaking, the company will strengthen and widen its exploratory activities with a view to discovering new and promising reserves both within the present leasehold areas and outside. The quantum of assistance to the company from the government during the year 1972-73 would be Rs 4.25 crores and for 1973-74, Rs four crores. The company is expected to work well within the limits of assistance from government.

Cochin Shipyard

The Prime Minister, Mrs Indira Gandhi, will lay the foundation stone of the Cochin Shipyard on April 29. The Shipyard project is estimated to cost Rs 45.4

crores and is scheduled to be ready by the end of 1975. However, the keel of the first ship is likely to be laid in 1974 as soon as the essential facilities like building-docks and hull shops are ready.

Savings Scheme

The Prime Minister inaugurated on April 1, a new scheme of savings which is being introduced in 122 selected cities of India. Known as the Area Savings Leaders Authorised Agency Scheme, it is designed to provide an opportunity to educated women to go from house to house and from shop to shop to persuade people to save and collect their monthly savings. This will help them not only to add to their family incomes but also enlarge their social contacts and do a national service. The objectives of the scheme are: to educate housewives in family budgeting; to promote the habit of thrift among house-holds and self-employed people; to canvass for and secure from small savers investments in post office cumulative time deposit accounts and recurring deposit accounts; and to raise resources for development and defence. Besides women, social organisations are eligible to become agents under the scheme.

Izmir Fair

This country will participate in the International Fair to be held at Izmir (Turkey) from August 20 to September 20, 1972. The Ministry of Foreign Trade is organising India's participation in this Fair. This Fair has a special attraction, as Turkey negotiates a large percentage of her business and makes purchases during this period.

The Turkish government offers a considerable amount of Fair quota, both for traditional and non-traditional items, to all participating countries. This year the Fair quota allotted to India has been increased by about 56 per cent over the last year's quota. Another attraction of this Fair is that the participants are not required to contribute any space charges for the area allotted to them for display of their exhibits.

Shipping Targets

Shipping tonnage of this country will be about 2.9 million GRT by the end of fourth Plan. In addition, 1.72 million GRT will be either on firm order or would have been acquired. Thus, after scrapping the overaged ships the plan target of four million GRT is expected to be fully achieved. On March 1, 1972 the operative tonnage was 2.51 million GRT and 1.44 million GRT was on firm order.

ALUMINIUM IN CONSTRUCTION & STRUCTURAL USES

For Building & Construction, HINDALCO offers Semi-fabricated aluminium products (sheets and extruded shapes) in a wide range to suit diverse jobs. High strength-to-weight ratio and low maintenance costs make Aluminium the ideal choice of modern builders and architects. Besides, for making buildings cool in summer and warm in winter, aluminium panels are being increasingly used today in modern sky-scrapers. HINDALCO Semi-fabricated products are so versatile that they can be used in making almost anything, from landing mat for Aeroplanes in an emergency defence purpose to drainage culverts in farms for Agricultural purposes.

MODERN BUILDERS SPECIFY HINDALCO ALUMINIUM.

HINDUSTAN ALUMINIUM CORPORATION LTD.

P.O. RENUKOOT ■ DIST. MIRZAPUR ■ U.P.

making a total of 3.95 million GRT. It is estimated that overaged ships aggregating to 224,000 GRT will be scrapped during the remaining period of the Plan. Thus only 273,000 GRT has yet to be acquired or ordered to reach the fourth Plan target. It is hoped to place orders for the remaining tonnage of 273,000 GRT during the remaining two years of the Plan.

Loan for Irrigation

The union government has sanctioned special loans amounting to Rs four crores to 17 states for investigation of Irrigation, flood control and power projects during the current financial year. The loans are treated as non-Plan and are repayable in 15 annual equal instalments. The state-wise break-

up of loan assistance is: Andhra Pradesh Rs 25 lakhs, Assam Rs 5 lakhs, Bihar Rs 40 lakhs, Gujarat Rs 28 lakhs, Haryana Rs 12 lakhs, Jammu and Kashmir Rs 5 lakhs, Kerala Rs 12 lakhs, Madhya Pradesh Rs 40 lakhs, Maharashtra Rs 27 lakhs, Mysore Rs 25 lakhs, Orissa Rs 20 lakhs, Rajasthan Rs 25 lakhs, Tamil Nadu Rs 42 lakhs, Uttar Pradesh Rs 30 lakhs, West Bengal Rs 19 lakhs, Himachal Pradesh Rs 30 lakhs and, Punjab Rs 15 lakhs.

Airports Authority

The ownership of the four international airports at Delhi, Bombay, Calcutta and Madras, have been vested on April 1 in the International Airports Authority of India, constituted to manage these airports. The

assets of the four international airports which the Authority has taken over are worth about Rs 30 crores. These comprise mainly of terminal buildings, land making up the airports, runways, taxiways, aprons and hangers. The total revenue of these airports during the year 1970-71 was about Rs 520 lakhs. It was mainly derived from landing and housing fees from the international air carriers and airport fees. Bombay had earned the maximum revenue with about Rs 220 lakhs, followed by Delhi with Rs 161 lakhs. Calcutta had earned Rs 105 lakhs while Madras had earned approximately Rs 32 lakhs. The International Airports Authority constituted by a legislation for this purpose will be an autonomous statutory authority. It will own and manage the four

international airports which were previously under the Department of Civil Aviation. The Tata Committee report on International Airports in 1969 had recommended setting up of an autonomous body for the management of the international airports.

Plastics Exhibition

An exhibition entitled 'Plastic Today and Tomorrow' was inaugurated by Mr C. Subramaniam, Union Minister for Planning, Science and Technology recently in Delhi. The purpose of the exhibition was to highlight the technical needs of the plastic industry and to educate and attract new entrepreneurs to this field. The idea was also to promote the use of plastics for civilian, defence and industrial purposes.

COMPANY AFFAIRS

Hindalco

THE HINDUSTAN Aluminium Corporation Limited has proposed to maintain the dividend at Rs 1.25 per share for the year 1971. The company's sales were grossed Rs 37.28 crores and its gross profit was around Rs 8.22 crores. After providing Rs 3.79 crores for depreciation, Rs 9.50 lakhs for development rebate reserve and Rs 3.91 lakhs for contingencies reserve, the net profit is Rs 4.30 crores. Mr D.P. Mandelia pointed out that there was a substantial reduction in the selling prices and increased cost of raw materials with high cost of power. He stated that the profit would have reduced if the reduced selling prices had been applicable for the whole year. In spite of production being impaired to the extent of 25 per cent by a power cut during the months of January/June 1971, the company has been able to maintain production of primary metal almost at the level of last year, about 78,000 tonnes. But for the power cut, the company's production would have crossed 80,000 tonnes. The working during the first three months of the current year is almost the same as last year. The first phase of the company's expansion is already under way. It expects to commission the new smelter by the middle of this year and expects to increase its production capacity by 30,000 tonnes by the end of the year. The suspension of US aid has not deterred the company from advancing towards its goal. The company's application for expansion of fabricating capacity from 37,000 tonnes per annum is pending with the government. The company's application for an industrial licence for the production of caustic soda with a capacity of 100 tonnes

is also with the government. The company hopes to achieve its expansion to 100,000 tonnes capacity by the end of 1972 and to 120,000 tonnes by the end of 1973, when it will be the largest producer of aluminium in the country.

Century

The board of directors of the Century Spg. & Mfg. Co. Ltd met in Bombay recently and decided to review the application made to the Controller of Capital Issues some two years ago for the issue of one bonus share for every equity share held by capitalising Rs 3.55 crores from general reserve. The original application could not be favourably considered by the CCI in view of the government's policy not to allow more than two bonus issues in a period of five years. This time limit is, however, now over, and hence the board's recommendation.

Dunlop

The Directors of Dunlop India Limited have recommended a final dividend on the ordinary shares at the rate of Rs 1.25 per share, subject to tax, for the year ended December 31, 1971. Together with the interim dividend of 75 paise per share already paid, this makes a total ordinary dividend of Rs two per share for the year, the same as for 1970. Total preference and ordinary dividends paid and proposed absorb Rs 2.05 crores leaving retained profits of Rs 1.12 crores for transfer to general reserve. The total income for the year at Rs 98.90 crores exceeded that of the previous year (88.41 crores) by 12 per cent. This in part reflects the implementation of the automotive tyre and tube expansion at the Ambattur factory. Balance from trading, however,

has declined by 6.5 per cent compared to last year. The lower margins earned in 1971 were due to higher raw material prices, substantial increases in personnel costs and, the effects of power shortages and high absenteeism. With better power supplies and the improved law and order situation in the second half of the year, output at the Sahaganj factory increased and this, combined with the additional production from the Ambattur is responsible for the improved results in the period July-December, 1971.

Sylvania and Laxman

The Chairman of Sylvania & Laxman Limited, Mr Laxman S. Agarwal addressed the shareholders recently at the annual general meeting and informed them about increased turnover

of the company from Rs 2.62 crores to Rs 2.92 crores. The directors declared a dividend of 7½ per cent for the year ending September 30, 1971 against six per cent of the previous year. The company is making rapid progress for implementing a diversified expansion programme of lamp making viz. automobile lamps, GLS lamps, high wattage lamps, telephone switch board lamps, mercury vapour lamps etc. The company has agreed to give know-how to three other companies who are setting up factories at Chandigarh, Gwalior and Hyderabad for manufacture of GLS lamps. The company has also received letters of intent for the manufacture of industrial gases and for increasing glass shells production from 15 million to 30 million annually. It has also set up a research and development section in order to become more self-reliant.

Plan for 1972-73

The total Plan outlay of the centre, states and union territories for 1972-73 will be Rs 3,973.42 crores. This is about 25 per cent of the fourth Plan outlay in the public sector and represents a step-up of 25.8 per cent over the outlay of Rs 3158 crores for the year 1971-72.

The sectoral distribution of the outlay for 1972-73 is as follows (Rs crores): centre 2144.20; centrally-sponsored 162.97; union territories 64.50; and states 1601.75.

This information is contained in the document on the annual Plan for 1972-73 which was presented to both the Houses of Parliament on April 4, 1972 by Mr C. Subramaniam, Minister for Planning, Science and Technology.

Departing from the earlier practice of presenting the annual Plan towards the end of the financial year the annual Plan for 1972-73 has been released "as early as possible after the presentation of the union budget". This is intended to facilitate discussion in Parliament and to increase the operational utility of the document. Detailed provisions for Plan schemes included in the central budget are furnished in the budget document entitled "Plan—Budget Link". The annual plan document provides a brief outline of the Plan as a whole with special chapters devoted to the approach and reorientation, financing of the Plan and to the major schemes which have been included in the Plan to promote greater social justice as part of reorientation.

The significant increases to the Plan outlay in 1972-73 have been combined with

specific attention to correcting the shortfalls noticed in the Mid-term Appraisal and for promoting the main emphasis at the present juncture, namely, self-reliance and social justice. Special programmes have been included to achieve increased output from existing capacity in steel and fertilisers as also for expansion and new projects. The modernisation of export-oriented traditional industries like jute and cotton textiles will get special attention.

In formulating the annual Plan for 1972-73, the needs of the emerging situation have been kept in view. Special attention has been given to correcting the shortfalls and deficiencies brought to light in the Mid-term Appraisal of the Plan. A second major objective is a significantly enlarged provision for schemes promoting social justice.

High priority has been accorded in the annual Plan to firm commitments, spill-over expenditures from the previous years, completion of works in an advanced stage of construction, expeditious construction of other works on hand and fuller utilisation of capacities already created.

The outlay for 1972-73 for central schemes is higher by about Rs 585 crores as compared to the corresponding outlay for 1971-72. Last year an outlay of about Rs 105 crores was provided for certain non-Plan schemes, namely crash scheme for rural employment, schemes for drought-prone areas, schemes for educated unemployed, etc. These are now included in the Plan. In the case of centrally sponsored schemes, the outlay for 1972-73 is up by about Rs 21.5

crores as compared to the corresponding outlay for 1971-72. The outlay for union territories is higher by about Rs 11 crores on a comparable basis (i. e. including the outlay for Manipur and Tripura within union territories in 1972-73). In the case of the states, the outlay is higher by about Rs 198 crores (excluding outlay for Manipur and Tripura shown under states in 1972-73).

The distribution of Plan outlay by major heads of development is as follows (Rs crores): Agriculture and allied programmes 782.36; Irrigation and flood control 260.31; Power 602.26; Village & small industries 62.64; Industry and minerals 730.75; Transport & communications 728.36; Education 194.51; Scientific research 42.41; Health 87.26; Family planning 63.15; Water supply and sanitation 101.18; Housing, urban and regional development 61.93; Welfare of backward classes 42.14; Social welfare 153.84; Labour welfare and craftsmen training 8.03; Other programmes 52.29.

In the annual Plan, a large overall provision of Rs 125 crores has been made for special welfare schemes relating to the educated unemployed, expansion of elementary education, slum improvement in the major cities, rural water supply and rural home sites. This provision is in addition to a total provision of Rs 90 crores for rural employment etc.

The rationale of these schemes is directed to satisfying the basic minimum needs of the people. Assistance will be provided based on need and in a

manner that will correct regional imbalances. The schemes have been so designed as to secure adequate co-ordination so that the maximum impact can be had for a given level of expenditure. The assistance to be provided to states will be in the form of a 100 per cent grant. The additional resources will supplement outlays provided in the state Plans for similar purposes and will not be permitted to substitute for them. Depending on their needs and absorptive capacity, all the states will benefit from one or more of the new schemes. Wherever possible the state governments will also be expected to supplement these provisions with resources found from their own budget or from institutional sources so that there could be a multiplier effect.

The main emphasis in the complex of schemes relating to rural employment and development will be to get the maximum impact out of them by effective co-ordination. The special employment schemes will result not only in providing employment to the educated unemployed but will also promote the design of integrated rural surveys, the staffing of elementary schools, investigations for rural water supply and the setting up of self-employed entrepreneurs in rural areas. The scheme for elementary education, apart from providing employment to teachers will increase enrolment in the backward states with special emphasis on the schooling of girls and backward classes. It will also provide rural employment in the building of class rooms. The nutrition programmes will primarily benefit children in the tribal areas and in the urban slums. The slum improvement scheme will benefit the poorer sections of the urban population. It will supplement funds being provided for by the Housing

and Urban Development Corporation. The provision for rural water supply is a significant increase to the outlays the states are now providing for this purpose and will benefit the states where the needs are most in terms of villages which suffer chronic scarcity or health hazards such as cholera and guinea-worm infestation.

The individual provisions for the various schemes indicated in the Annual Plan are tentative. Reappropriation based on needs and performance capabilities will be possible either within the same scheme or within the overall provision. The reorientation of the Annual Plan for 1972-73, apart from making a qualitative change in the current Plan, will thus provide a sound basis of experience for making a much bigger effort for greater social justice in the fifth Plan.

With a view to initiating advance action in respect of projects and programmes to be taken up during the fifth Plan, it has been ensured that state governments and central ministries provide necessary resources for carrying out investigations and studies so that there are an adequate number of well-prepared projects available for the preparation of the fifth Plan.

In the agriculture sector apart from the ongoing agricultural programmes, certain schemes which are designed to overcome the main deficiencies and shortfalls that have been identified in the Mid-term Appraisal of the Fourth Plan will be taken up during 1972-73. In the field of agricultural research and education, special attention will be given to the development of agriculture in humid and high rainfall areas, temperate hilly zones etc. by taking up co-ordinated schemes for research on water management in these areas and for research on use of saline water in

agriculture. The research on post-harvest technology and allied matters will be intensified. For the development of dry areas, research on an integrated package of technology will be intensified. New programmes have also been included in the annual Plan for strengthening research on cotton and jute.

Special efforts will be made to boost the production of important commercial crops such as cotton, jute and oilseeds where production has fallen short of the Plan targets.

Priority has been given to the completion of the continuing schemes which are in an advanced stage of construction. Adequate provisions have also been made in respect of inter-state and multi-purpose projects. A number of new major and medium irrigation schemes will be launched. In addition, outlays will be provided for investigation of irrigation and power projects. In part these outlays will result in preparatory action for the fifth Plan; they will also create additional employment for engineers and technicians.

The total outlay provided in the Annual Plan for 1972-73 is Rs 793.39 crores. The bulk of the outlay is intended for basic industries like steel, fertilizers, petroleum, mineral development and non-ferrous metals. The steel projects account for about 30 per cent of the outlay envisaged for 1972-73. In non-ferrous metals, substantial additional provision has been made for the aluminium and copper projects as compared with the previous year. Increased provision has been made for oil exploration and the Haldia refinery; it is also envisaged that the construction of new refineries at Bongai-gaon and in the north-west region will be taken up during 1972-73. Another major

direction in which progress in implementation is expected is the construction of the naphtha cracker and associated facilities in the Gujarat petrochemical complex. In fertilisers, substantial additional provision has been made to proceed speedily with the expansions and new projects.

Particular attention will be given to fuller utilisation of existing capacity. Necessary provisions have been made for balancing or additional equipment that need to be set up and for technological improvements for achieving higher levels of output. As a result, better performance in industries like steel and fertilisers is envisaged in 1972-73.

The need for expanding activities in the production of consumer goods which are in short supply has also been taken into account. In particular, provision has been made for speeding up the scooter project, for the expansion of the production of drugs and speeding up the implementation of projects for the manufacture of cement and paper.

It is proposed to give particular attention to the industrial development of backward areas. Subsidy will be provided on the lines already announced to projects to be set up in the selected backward districts in different states. Apart from concessional finance, the Industrial Development Bank, in collaboration with other institutions and the state governments, will also carry out studies on the industrial potential of the backward districts.

Provision has also been made for new projects to be taken up by way of advance action for the fifth Plan, as for example, for the new steel plants to be put up at Hospet, Visakhapatnam and Salem. Particular emphasis has been placed on speeding up sur-

veys relating to natural resources in the mineral sector, as an essential prerequisite to the identification of project in the metallurgical, petroleum and allied sectors. In addition provision has also been made for investigations and preparation of feasibility studies for projects, to be got ready in time for consideration for the fifth Plan.

The installed generating capacity in the country at the beginning of 1971-72 was 16.5 MKW which is expected to increase to 17 MKW at the end of 1971-72. In 1972-73, 1.5 MKW are expected to be added which will step up the aggregate installed capacity in the country at the end of the financial year to about 18.5 MKW. The total sale of energy is expected to increase from about 54,000 million units in 1971-72 to about 59,000 million units in 1972-73.

The construction of transmission and distribution lines will be given priority. The progress of the transmission programme has suffered largely due to inadequate supply of steel for the fabrication of the towers. This position is expected to improve with the arrangements which have been made for the procurement of steel from abroad.

The rural electrification programme in the states has received increasing importance over the years. It is anticipated that about 3 lakhs additional pumpsets will be energised in 1972-73, bringing the total number of pumps in the country to about 22 to 23 lakhs as against 11 lakhs at the commencement of the fourth Plan.

Special efforts are proposed to be made during 1972-73 for accelerating the developments in the other sectors as well, including those in the transport, scientific research and social services sectors.

Import Policy: 1972-73

THE MAIN features of the 1972-73 import policy are:—

1. The role of the public sector agencies in imports has been further expanded.

2. A Steel bank will be set up by Hindustan Steel Limited to organise bulk imports of steel for sale to manufacturers.

3. The IRMAC set up by the State Trading Corporation for organising bulk imports of raw materials for sale to manufacturers, will further expand its activities.

4. The policy of need-based replenishment for licensing of raw materials imports will continue to be followed for meeting the requirements of priority industries.

5. Selected industries in the priority sector will be allowed additional imports of raw materials against a special allocation of foreign exchange set apart for the purpose.

6. Additional imports of raw materials will also be allowed to industrial units in the priority sector if they earn net foreign exchange by exporting their products or if their increased output results in a direct saving on present imports.

7. The concept pertaining to 'Export Houses' has been further enlarged.

Small-scale industries

8. Small-scale industries in the priority sector will be enabled to obtain their import requirements based on the assessment of their capacity.

9. Special facilities will be available for setting up small-scale industries in the

country by Indian nationals returning from abroad.

10. Special facilities will continue to be given for setting up small-scale industries in backward areas. Qualified engineers and ex-service personnel will also continue to have added opportunities to establish new industries.

Facilities for re-opening of closed units

11. Special assistance will continue to be given to the engineering industries for restarting production, particularly in the case of those in West Bengal which had to close down in the past for want of raw materials.

Facilities for educational and research institutions

12. More facilities have been provided for import of instruments, apparatus and appliances and books by educational research and technical institutions, research and analytical laboratories and universities.

Established importers

13. Quotas for established importers have been further reduced in respect of several items.

Canalisation of imports

56 additional items have been added to the list of imports canalised through public sector agencies. With the addition of these items, the list of canalised imports will now cover 168 items. On this basis, the public sector agencies will handle imports of about Rs 100 crores more in value during 1972-73 at the present level of imports.

Imports by STC/MMTC of raw materials licensable to

actual users and registered exporters

(i) State Trading Corporation will also be organising bulk imports of certain raw materials for sale to actual users and registered exporters. The Industrial Raw Materials Assistance Centre (IRMAC) set up by the State Trading Corporation will further expand its activities for supplying raw materials 'off-the-shelf'.

(ii) A "Steel Bank" will be set up by the Hindustan Steel Limited to organise bulk imports of steel for meeting the requirements of actual users.

(iii) Registered Exporters will continue to be allowed to transfer their import replenishment licences in favour of the STC/MMTC.

Pricing

Sale prices in respect of goods imported by the canalising agencies will continue to be determined by these agencies subject to the overall control of the Ministry of Foreign Trade. Preferential treatment will be accorded to exporting units in the matter of sale prices.

State Trading Corporation and Minerals and Metals Trading Corporation will further expand their developmental role to strengthen the export effort by providing assistance in finance, marketing and general services to exporters.

The scheme for the grant of facilities to Export Houses has been further enlarged.

Import facilities

(i) The exports of items covered by one additional produce group, namely, 'tobacco products' will also

be taken into account in determining the eligibility for an 'Export House', and for determining the value of the initial import licence to be given to an Export House.

(ii) Indirect exports made by Export Houses will also be taken into account for determining eligibility and for calculating the value of initial/supplementary initial import licences to be given to Export Houses, provided such indirect exports are not more than the value of exports made by the Export House in respect of products manufactured in the small-scale sector.

(iii) Export Houses having definite plans of increasing their exports of new products will be allowed the facilities of imports of raw materials over a wider range to meet the demands of their supporting manufacturers.

(iv) Eligible Export Houses will continue to have the existing import facilities to arrange for bulk imports on behalf of actual users, and also of operating the licences issued to actual users without obtaining letters of authority from the licensing office.

(i) In the case of registered exporters, the import content of the exported products will continue to be replenished from the most preferred sources of supply.

(ii) The policy for allowing nominations under the import policy for registered exporters has been streamlined, so that nominations are made in favour of manufacturers who hold Actual User licences relating to the end-products on the basis of which they are nominated. This policy will result in the nominations being made in favour of those manufacturers who require them for augmenting their production.

Facilities to exporters

(i) Industrial units in the priority sector exporting 10

per cent or more of their production will be eligible to preferred sources of supply and facilities for expansion of export production. Units which export 25 per cent or more of their production will receive substantially greater preference.

(ii) Units in the non-priority sector having similar export performance will be treated as priority units, given the same preference in regard to the sources of supply and for expansion of production, and receive all the facilities normally given to priority units.

(iii) In the case of selected priority industries, licences for raw materials and components for value higher than past consumption will, on merits, be issued if the industrial unit concerned earns net foreign exchange by exports of its products and the additional export earning is at least 50 per cent higher than the value for which additional raw materials may be allowed for import.

Compulsory exports for certain priority industries

A few industries have been selected from the priority list for their export potential. Units in these industries, failing to export 5 per cent of their production, will be liable to a cut in their import licences, apart from losing the facilities of preferred sources of supply and expansion of production capacity.

Need-based policy for priority industries

(i) The import requirements of 59 priority industries will be met as before, subject to availability of foreign exchange.

(ii) In the case of selected priority industries of special importance, both in large and small-scale sectors, import licences for raw materials and compo-

nents will be granted, on merits, for higher values against an additional foreign exchange allocation provided for the purpose.

(iii) In the case of priority industries, licences for raw materials and components for a value higher than past consumption will, on merits, be issued if the industrial unit concerned can prove that the increased output will directly save on present imports and the saving in foreign exchange is at least 50 per cent higher than the value for which additional raw materials may be allowed for import.

Special assistance to small scale industries

The requirements of small scale units set up in the priority sector for imported raw materials and components will be considered having regard to the assessment made by a team representing the Development Commissioner (small-scale industries) and the State Director of Industries, and after approval by a Special Committee set up under the Chief Controller of Imports and Exports.

Encouragement of industrial units in backward areas

(i) Preferential treatment will be accorded in the matter of import of machinery and raw materials to small-scale units proposed to be set up in backward areas.

(ii) Indian nationals returning from abroad and intending to set up small-scale industries in India will be allowed to import machinery, without indigenous clearance, of a value not exceeding Rs 5 lakhs and permissible raw materials upto Rs 1 lakh, purchased out of their funds abroad.

Special facilities to qualified engineers/ex-service personnel

Preferential treatment

will be accorded in the matter of import of machinery and raw materials to small scale units set up by qualified engineers and ex-service personnel.

Special facilities to closed engineering units

Units engaged in the engineering industry, particularly those located by West Bengal, which have closed down for want of raw materials, will be given special facilities to enable them to re-start their manufacturing activities. Advance allocation of imported raw materials will be made to such units to enable them to re-start their manufacturing activity.

Facilities for development and research activities

Import licences for raw materials and spare parts will be granted to the special research units recognised by the Department of Industrial Development.

Import of steel for export oriented production

Actual users requiring import of steel for export oriented production will be given priority and preference in the matter of allocation of foreign exchange and allotment through the canalising agency to enable them to execute export orders in time.

Import of spare parts against release orders

A facility has been provided to Actual Users to obtain import licences for permissible spare parts against release orders issued to them in respect of canalised items, upto 10 per cent of the value of the release order by a corresponding reduction to that extent in the value of the release order.

Conversion of licences into release order and vice versa

An actual user will have

the facility of converting an import licence for non-canalised items into a release order for canalised items and vice versa subject to certain conditions, to enable them to adjust their requirements of raw materials according to their programme of production.

Import of scientific instruments, apparatus and appliances

Technical and research institutions and government research and analytical laboratories will be allowed to import without licence scientific instruments, apparatus and appliances etc., of a value upto Rs 2,000 at any one time. If these institutions so desire, they can also avail of an alternative facility of importing these items, in one lot, once in the course of a year, without obtaining an import licence, if the value thereof does not exceed Rs 8,250.

Import of technical books

Educational, medical and research institutions and universities will be allowed to import without licence technical books upto Rs 10,000 in value in a year.

The import of certain essential raw materials required by industry, will continue to be on OGL.

More items banned for import

In view of the growing volume and quality of indigenous production, 160 items have been taken off the permissible list. These include certain types of ball bearings, taper roller bearings, machine tools, machinery and accessories, instruments, dyes and dyes intermediates and chemicals.

Items restricted for import

87 items which were hitherto allowed to Actual Users without restriction, will now be permitted only

on a restricted basis. These include certain types of ball bearings, drugs and medicines, chemicals, and dyes intermediates.

Established importers' quota reduced

In respect of 29 items, the quotas for established importers have been reduced. These include spare parts of various equipment, drugs and medicines, motor vehicle parts, garage tools and instruments.

Procedural simplifications

(i) The procedure for import of machinery by manufacturers against their export entitlements has been

rationalised by eliminating certain stages.

(ii) The procedure for the grant of replacement licences for machinery and spare parts against original defective imports has been simplified by dispensing with indigenous clearance.

(iii) The procedure for the grant of import licences for raw materials and components to new/proposed units in the small-scale sectors has been streamlined so that the unit may not suffer on account of administrative delays.

(iv) The procedures for granting import licences for prototypes upto Rs 12,000

in value has been simplified by delegating powers to regional licensing offices.

(v) The procedure for the grant of import licences for raw materials and components to certain industries has been streamlined by indicating industry-wise packet of raw materials and components permitted for imports.

(vi) Special case studies are being carried out to identify causes of delays in licensing and suitable remedial measures will be taken to cut down all avoidable delays.

Administrative changes

(i) The Iron and Steel

Control licensing offices at Bombay, Madras and Calcutta have been merged with the respective regional licensing offices.

(ii) The name of the office of the Assistant Iron and Steel Controller, Faridabad has been changed to that of Deputy Chief Controller of Imports and Exports (Iron and Steel), Faridabad.

(iii) Applications from small-scale units situated in Uttar Pradesh for import of iron and steel items will be dealt with by the Deputy Chief Controller of Imports and Exports, Kanpur.

Differential rates of interest

On March 25, the union Finance Minister, Mr Y. B. Chavan, made a statement in Parliament which outlined the policy of differential interest rates for bringing about changes in economic institutions in this country. The nationalised banks are expected to locate parties who deserve the differential rates of interest on borrowings among scheduled tribes, scheduled castes, processors of forest products, cottage and rural industries, students going abroad for higher studies, physically handicapped persons etc. The text of Mr Chavan's statement follows:-

Hon'ble Members will recall that in my budget speech I made a mention of the policy of differential interest rates as one of the steps recently taken to bring about basic changes in our

economic institutions and policies to supplement the central budget for furtherance of our social and economic objectives. I thought I should take an early opportunity to place before the House the essentials of the policy.

As the House is aware, the idea originated in the meeting I had with the chief executives of the public sector banks and senior officials of the Reserve Bank in July, 1970. I made the suggestion then that lower interest rates should be charged to carefully selected low-income groups, who deserve financial assistance for productive endeavours and higher interest rates to more affluent borrowers. In pursuance of this, a committee was appointed by the Reserve Bank to determine the criteria for identifying borrowers with-

in each sector in selected income groups who can be granted the benefit of lower interest rates without affecting the profitability of the banking institutions. The committee submitted the report in May, 1971, and it was made available to Members of Parliament. The subject also came up for discussion on more than one occasion in Parliament. The report has also attracted wide notice in newspapers and journals. I have taken careful note of the opinions expressed in Parliament and outside in giving shape to the contours of the policy.

The report of the committee was not unanimous. The majority report and the note of dissent have fundamental differences between them. The basic approach of the majority report is that the criterion for charging lower rate of

interest should be the size of the loan taken by a party and not the party's own financial position or economic status. They have in view a range between 8½ per cent to 10 per cent per annum on those borrowals which come within the cover of the of the guarantee schemes now in operation. On the question of charging higher rates to the more affluent borrowers, the majority take the view that the present normal rates are high enough and asking the banks to charge higher than normal rates to selected categories of the affluent people would be to invite legal complications and create distortions in the economy.

The dissenting note on the other hand does not agree that the size of the loan should be the principal determinant of eligibility for the benefit of an interest differential or that the selection of small borrowers should be linked with the existing credit guarantee schemes. It has stressed that differential lending rates including, in some instances, loans at even zero interest are an established feature of international lending and

it should be possible for banks to charge different rates of interest to different income groups, beginning with a very nominal rate of interest for the most needy and going up to 20 per cent for prosperous traders.

While it is difficult to reconcile the two points of view, I have no doubt about the basic soundness of the idea which led to the formation of the committee. I am aware that a wide ranging differential in interest rates is likely to pose practical policy and operational problems for the banking system, but in a country where a large segment of population is abjectly poor, social needs and expectations cannot be ignored and the public sector banking system will need to reorient its functioning in a way which makes it an effective instrument of service to the community. Interest rate mechanism should subserve our objective of social justice in the matter of distribution of credit but at the same time I am no less conscious that the banks should continue to retain their character as viable institutions.

I propose to make a start with the scheme of differential interest rate in favour of borrowers who answer to all of the following descriptions:

- (1) have really no tangible security of any worth to offer on their own;
- (2) cannot produce a security/guarantee of a well-to-do party;
- (3) are prepared to work hard;
- (4) can be helped to rise above their present economic levels in a productive endeavour with assistance from banks, the productive endeavour being such as would become economically viable within a period of, say 3 years;
- (5) do not incur liability to two sources of finance

at the same time.

The following are among the sectors within which the banks should be able to locate parties who deserve the differential rate:

(1) Scheduled Tribes, Scheduled Castes and others engaged, on a very modest scale, in agriculture.

(2) People who themselves collect, or do elementary processing of, forest products and people who themselves collect fodder in difficult areas and sell them to farmers or traders.

(3) People physically engaged on a modest scale in the fields of cottage and rural industries and vocations in urban areas. Illustrative examples are: cutting cloth and sewing garments, making reasonably cheap eatables, home delivery service of articles and commodities of daily use, running way-side tea stalls, plying of self-owned manual rickshaws and cycle-rickshaws, repairing of shoes/sandals mainly by hand, basket-making by hand etc.

(4) Indigent Students going in for higher education who do not get scholarships/maintenance grants from governmental or educational authorities.

(5) Physically handicapped persons pursuing a gainful occupation where some durable equipment and/or continuous supply of raw material is useful.

(6) Orphanages and Women Homes where saleable goods are made and for which no adequate and dependable source of finance, e.g., endowments or regular charities, exist.

The differential interest rate under the scheme is for the present to be uniformly fixed at 4 per cent i.e., 2 per cent below the current Bank Rate. The question of charging higher rates from the affluent borrowers is beset with operational difficulties. I am having the matter further

examined so that a rational structure of higher interest rates is devised.

The banks may give both working capital and term loan according to the facts of the situation. In addition to a differential rate, some initial moratorium in repayment may also be considered. Availability of tangible security will not be a pre-condition for the grant of a loan; when a surplus starts emerging and the borrower can, without real difficulty, offer some security, a margin of 15 or 20 per cent can be looked for. While loans to individuals are not barred, the banks may at the beginning look for groups in particular areas as groups lend themselves to easier handling. Each loan is to be covered by the existing credit guarantee schemes. The guarantee fee will be met by the banks and not charged to the borrowers.

For lending at the differential rate, each bank should select at least one branch in every 8 or 10 and in making such selection it should ensure that backward pockets in rural and semi-urban and urban areas of the country are well represented. The banks will have to maintain continuous touch with the borrowers to whom the benefit of the differential is extended and arrange for necessary guidance and help in a number of ways, i.e., provision of raw materials and processing and marketing etc. facilities. It is not visualised that bank offices, entirely on their own, will always be able to make these arrangements. When the banks themselves cannot make such arrangements they will have to link their operations with those of other recognised bodies, governmental and non-governmental, which function in that area.

The scheme which I have outlined above would operate for the present in districts which are not covered by SFDA/MFAL

scheme. In SFDA and MFAL districts, the central and state governments have accepted substantial financial responsibility over schemes intended to raise people through productive endeavours from below subsistence level or bare subsistence level to a higher level. The banks assisting borrowers in these districts through the differential rate of interest should get suitable financial reimbursement from the government concerned. Details will be worked out in consultation with the concerned ministries and the state governments.

The Scheme will for the present be confined to the public sector commercial banks. I have given careful consideration to the question as to whether the co-operative banking system should not also operate the differential interest rate scheme. It is not quite clear whether the co-operatives would be able to recoup consequential losses by charging higher interest rates from larger farmers. The extent of differential rates and the manner in which the co-operative institutions should be compensated for the loss involved are to be considered in detail by the government in consultation with the Reserve Bank of India.

I expect that each of the public sector banks will in the first year lend at the concessional rate at a minimum of 1 per cent of its aggregate lending of the previous year. This will come to about Rs 20 crores. This is a modest beginning, but I am confident that as we go along, the banks will use their ingenuity, imagination and resources to make the differential interest rate policy one of the important instruments for reducing disparities in income and wealth and for encouraging talent and enterprise that go waste for lack of support.

INITIATING SELF-RELIANCE IN HEAVY PLANT AND EQUIPMENT

Mukand now makes heavy steel castings upto 25 tonnes a piece which were, until recently, mainly imported. All types of these heavy steel castings are made to customers' requirements. Thirty years of steel foundry experience, as well as expertise, sophisticated and comprehensive testing facilities, and trained technical personnel, make it possible for Mukand to produce quality castings for the cement, metallurgical and other industries.

Mukand helps the drive towards self-sufficiency.

Pie in the sky

HARD ON the heels of reports in the press that the management of Indian Airlines is about to settle its dispute with its maintenance engineers, who have been adopting go-slow tactics for several weeks now, comes the news that the Air Corporation Employees Union, representing various categories of technical and non-technical employees, have given notice of a strike which may start on May 5, unless certain demands made by this union have been met in the meanwhile. The management of Indian Airlines and the Ministry of Civil Aviation have been displaying extraordinary patience in dealing with or rather putting up with periodical resort to pressure tactics on the part of its employees, from pilots down. There has been and there is nothing to be admired in this patience since, on every occasion, the management and the ministry have been irresponsibly surrendering the corporation's interest as well as the public interest while buying shortlived respites for the airlines. In the course of this process of systematic blackmail by one party and almost automatic submission by the other, Indian Airlines has come to be saddled with a structure of establishment costs which is not only grossly out of alignment with most of the categories of wages, salaries, or incomes in the country but is also thoroughly inconsistent with the earning capacity or potential of the airlines or indeed its basic economics.

It is possible that a false belief in the community at large that airline costs are the concern merely of the small, affluent section of the people who can afford air travel has perhaps been mainly responsible for permitting the government to indulge for some years now in a weak-kneed policy towards staff demands on this nationalised airlines. Actually, however, the public generally and the taxpayers in particular do have a direct and definite interest in the economics of air transport. Apart from the fact that a good deal of air travel is on government or private corporate account and is therefore paid for, in the last resort, by taxpayers or share-holders of public limited companies, the losses which Indian Airlines incur constitute a clear burden on public revenues, while the profitability of the airlines is a matter of legitimate concern to the body of citizens on whose behalf the state has invested capital in this business. It is, therefore, unacceptable as well as unfortunate that the government should continue to be free to buy peace from the employees of Indian Airlines at a steadily rising cost to the public or the public finances. Parliament, clearly has a responsibility in this matter, since it is through this institution, above all, that the discipline of public vigilance and public criticism can be brought to bear on the Ministry of Civil Aviation or the government as a whole. Some days ago an attempt was made in the Lok Sabha to discuss the disruption of the operation of the airlines by the go-slow tactics of the maintenance engineers, but there has been no evidence that this debate has been useful in stimulating the willingness or strengthening the ability of the Minister of Civil Aviation to present a front of legitimate firmness towards the agitating engineers and thereby defend the reasonable interests of the corporation or the public. On the contrary, the strike notice served by the Air Corporation Employees' Union is a fair indication that the management is about to settle its difficulties with the Maintenance Engineers' Association on terms which may place a premium on staff demands when backed by the willingness and ability of the trade unions concerned to defy successfully the normal machinery or procedures for settling trade disputes.

Finally, it is in the public interest to point out here that neither the management of Indian Airlines nor the Ministry of Civil Aviation has a good or clean record in protecting the interests of the corporation, the government, or the public while settling wage or other disputes with employees of the airlines. It is possible that the management itself is not so constituted as to enable it to discharge its responsibility properly in this field. For instance, recently, when the pilots demanded, among other things, a house rent allowance on the ground that the senior executives of the corporation were enjoying this emolument, the management saw nothing odd in asking some of these very executives to negotiate and settle with their pilots. Predictably the management's representatives ended up by accepting the pilots' claim to a house rent allowance. They could hardly have done otherwise, or even wanted to. Subsequently, the negotiations with the maintenance engineers have been reported to be proceeding along lines which do not seem to be taking into account the basic fact that Indian Airlines incurred substantial losses in 1970-71 and again in 1971-72. As things are, its estimate of a possible profit in 1972-73 is just so much pie in the sky. Would it be unfair, then, to suggest that the present is not serving the Corporation, the government or the Minister for Civil Aviation is not serving the country well? Perhaps Dr Karan Singh may be able to give a better account of himself in some other portfolio which calls for talents rather different from those which are needed in a minister dealing with the staff problems of Indian Airlines.

Money for planners

THE RESOURCES budget for the 1971-72 and 1972-73 annual plans recently presented to Parliament indicate that the central and state governments are now in a position to formulate their schemes boldly without worrying about the availability of funds. This may appear somewhat surprising when state governments had only in the past year resorted to heavy overdrafts from the central banking institution so much so that, during the week-ended March 31 this year, these overdrafts were over Rs 516 crores. The central government however would seem to be bothered about an abundance of resources and on present indications it looks as if there would be virtually no deficit financing on its account in 1972-73 even after raising Plan outlay in a massive way and providing also for sizable assistance to Bangladesh and a higher level of defence expenditure. The state governments too will receive a larger share of its tax revenues besides special accommodation for overcoming gaps in non-Plan expenditure in the case of some states, these gaps arising out of special factors.

Even in respect of the unauthorised overdrafts of the state governments it had been originally intended that the adjustments with the Reserve Bank should be completed before the end of 1971-72. It is however learnt that the central government subsequently changed its original plans for fear of presenting to Parliament a large overall gap in the revised estimates for 1971-72 and giving also an impression to the outside public that there had been resort to uncontrolled deficit financing and the centre was mainly culpable. Thanks however to the big tax effort in the past year and sizable foreign assistance for meeting refugee expenditure, the revised estimates anticipate only an overall deficit of Rs 385 crores. If there is a shortfall in Plan expenditure the actual deficit may be very much less. There are also some adjustments yet to be completed as a huge sum of over Rs 408 crores is being carried unadjusted in the returns of the Reserve Bank and the final position will become clear only when the state overdrafts are liquidated to the maximum extent possible in the last week of June and the centre also makes full use of committed aid for rehabilitating refugees and reduces its net assistance to Bangladesh on this account,

which has been assumed at Rs 82 crores even in 1971-72.

Whatever be the final shape of the resources budget of the central and state governments for 1971-72, and this is unlikely to be seriously distorted, the fact that the country is in a position to embark on a massive annual plan in 1972-73 and even think of exceeding the target of Rs 15,898 crores as indicated in the mid-term reappraisal is indeed a fitting tribute to its capabilities. Mr C. Subramaniam was naturally proud that he was in a position to plan for development expenditure of Rs 3,973 crores, Rs 2,371 crores on central account and Rs 1,602 crores on state account and he could rightly assert that the strains and stresses of the past year had not seriously embarrassed the progress of planning. The latest estimates compare with Rs 1,770 crores on central account and Rs 1,388 crores on states' account in 1971-72 making a total of Rs 3,158 crores. What exactly will be the actual outlay is not known but there may be a shortfall in outlay in the central sector and even with an exceeding of their targets by the states, the total outlay may not be more than Rs 3,000 crores.

It will thus be seen that the net increase in Plan expenditure in the current year may be even Rs 1,000 crores as compared to 1971-72 and the central and state governments have a challenging task to be discharged. The question is whether the allocations can be fully utilised and the assumptions regarding the availability of financial resources have been made on a realistic basis. It should be said that there would be no serious inadequacy of resources as the assumptions can go wrong, if at all, only in the case of the states. Against this, the availability of resources from the centre has been underestimated and the overall pool may not be different from the estimates though the contributions to this pool may be slightly different, with the centre's share being larger than the estimates as usual and the states again failing to achieve their targets.

Out of the total outlay of Rs 3,973 crores, there will be deficit financing of only Rs 175 crores against a revised estimate of Rs 385 crores for 1971-72 and net foreign assistance including PL 480 funds of only Rs 380 crores against Rs 447 crores in 1971-72. The higher level of expenditure is therefore being sustained with larger domestic resources. The

smaller proportion of foreign exchange expenditure and also a smaller quantum under this head underlines the determination of the central government to proceed with its schemes by utilising indigenous physical resources and also current foreign exchange earnings, obtained through a stepping up of exports and displacement of imports. Even in regard to the mobilisation of domestic resources the increase in outlay has been facilitated to a great extent by additional resource mobilisation through new taxes which are expected to fetch Rs 1,235 crores in 1972-73 against only Rs 725 crores in 1971-72 on the basis of the budget estimates.

This picture has of course subsequently changed because there were fresh taxes in November and December last year and there were also larger borrowings by the centre. But the increase in revenues through new taxes can still be over Rs 450 crores while net borrowing by the central and state governments can easily be in excess to the estimate of Rs 384 crores for 1972-73. The modest target for borrowing is perhaps due to the need for the Food Corporation to get credit of Rs 95 crores in order to maintain buffer stocks, as observed by the union Finance Minister, Mr Y.B. Chavan. Judging however by the growth in deposits in recent months net borrowing by the centre can easily be Rs 300 crores while the receipts through small savings may be higher by Rs 20 crores as compared to the budget estimates. With the likelihood of buoyancy in revenues due to a higher level of industrial production and vigorous collection of taxes, the overall deficit of Rs 175 crores may not materialise at all.

There will thus be no bottleneck on account of the lack of financial resources. Only it remains to be seen whether the centre will be able to step up expenditure on its account by Rs 601 crores when the states will be obliged to raise their outlay by Rs 214 crores. As the shortfall in Plan outlay in 1971-72 will be mainly on account of the centre, in actual practice it will have to increase its expenditure by over 45 per cent, which is indeed an impossible job. There is however confidence that the new rate of expenditure can be achieved as quicker progress has been recorded in recent months in the implementation of industrial projects particularly. Even if the government machinery can be geared to meet the needs of the new

situation fresh bottlenecks may arise in the form of shortages of physical resources. The success of the new efforts can be assured only if the anticipated increase in the output of steel by one million tonnes materialised and it was also possible to augment supplies of fertilisers from indigenous sources by 4.5 lakh tonnes of nitrogen. There will also have to be a larger output of heavy electrical equipment, petroleum products and agricultural raw materials.

Fortunately, a bumper cotton crop has made it possible to reduce appreciably the outlay on imports while it may not also be necessary to spend heavily on imports of edible oils in order to meet any deficit. It should certainly be possible to raise the output of fertilisers to over 1.4 million tonnes of nitrogen as considerable new capacity has been brought into being and the new units alone can account for an output of three lakh tonnes of nitrogen. If the existing units can raise their output by two lakh tonnes of nitrogen by operating more efficiently, the target of additional production of 4.5 lakh tonnes can be easily exceeded.

The same confident view cannot however be taken about the availability of an additional one million tonnes of steel from internal sources as everything de-

Status quo on wheat prices

THANKS TO the high-yielding varieties of seeds and the fixation of remunerative procurement prices for wheat, the output of this cereal in this country has continued to rise for the last four years. According to the latest estimates, the total production of wheat in the agricultural year 1971-72 (ending on June 30) is expected to be about 26 million tonnes registering an increase of nearly 2.5 million tonnes over the level attained in the preceding year. The production target of 24 million tonnes fixed in the fourth five-year Plan for 1973-74 has thus been surpassed.

In view of this continuous increase in the production of wheat, the supply position has eased to a considerable extent with the result that the demand for this cereal at current prices is significantly below the total availability. The almost simultaneous ban on the import of PL 480 wheat has in fact made no difference to the supply position. Consequently the stocks of wheat in this country, which were at a considerably high level in 1971, are likely to rise still

depends on the performance of the three units of Hindustan Steel. The two private sector units may acquit themselves more creditably if there are no bottlenecks in the movement of iron ore and other raw materials and there is also no shortage of coking coal. If the situation did not improve to the anticipated extent, there would probably have to be larger imports of steel and the government should not hesitate to utilise its foreign exchange reserves for permitting imports of raw materials and components in short supply in order to ensure continuity of implementation of Plan schemes.

For the first time in several years the planners are therefore free from the worry of inadequacy of financial resources and thanks to the fairly satisfactory level of foreign exchange reserves, about Rs 100 crores can be easily utilised if unexpected shortages arise in some directions. But a high level of Plan expenditure can be achieved only if there is a growth in industrial production by at least 10 per cent against the pitifully low rate of 3 per cent in 1971-72 and the government departments also spend wisely their allocations. What is done in the current year will determine the rate of progress in the coming years.

further this year. It may be stated that in 1971 the total quantity of wheat procured was of the order of 5.1 million tonnes. The volume of release through the public distribution system was lower at 4.5 million tonnes. This year, with a rise of 2.5 million tonnes in the production of wheat as stated above, its procurement is expected to increase by a further 1.5 million tonnes. The procurement of every additional million tonnes of wheat by the state purchasing agencies implies the locking up of about Rs 87 crores. Whereas last year more than Rs 400 crores of bank finance was locked up in wheat stocks, it is estimated that as much as Rs 550 crores would be needed to provide support to the surpluses flowing to the markets.

Besides this financial strain, the public distribution system involved a heavy loss of Rs 24 per quintal due to expenditure on procurement, distribution and carrying stocks. Hitherto some of the burden could be shared with cheaper imported wheat but that cushion is no longer available this year because of the stoppage of imports of PL 480 wheat. If procurement prices remain unchanged and about five million tonnes of wheat is distributed, the loss

to the exchequer would be of the order of Rs 120 crores. With the additional 1.5 million tonnes likely to be added to the wheat stocks this year, and likely increase in distribution to 5.5 million tonnes, the total subsidy might rise to Rs 132 crores this year. In view of these facts, the Agricultural Prices Commission (APC), in its report on price policy for Rabi foodgrains for the 1972-73 season, has suggested that the procurement price (which in fact is the support price) for wheat should be reduced from Rs 76 to Rs 72 per quintal for Mexican and common white indigenous varieties of wheat. In the case of the indigenous red varieties the recommended price for 1972-73 is Rs 66 per quintal as against Rs 71 to Rs 74 as fixed by the state governments last year.

There is considerable logic and sense in the recommendation of the APC for a reduction in the support prices of wheat. The wholesale issue price of wheat has increased by more than 100 per cent between 1964 and 1971. Whereas in 1964 the issue price of white imported wheat was Rs 37.51 per quintal, it has been as high as Rs 78 per quintal for three years i.e. from 1969 to 1971. The APC has come to the view that this recommended fall of about four rupees per quintal in the support purchases of wheat will not in any way hurt the volume of production in the coming years. In fact, the margin of profitability of this crop will remain comfortable even after the proposed reduction in support purchases.

The chief ministers of states, who met in the capital on April 13, recommended, as a body that no reduction in the procurement prices of wheat should be made this year, although voices of dissent were raised by the chief ministers of such states as Mysore, Orissa, West Bengal and Jammu and Kashmir. The central government has agreed to abide by the opinion of the majority of the states and its decision to maintain the *status quo* in regard to the procurement and issue prices for wheat during 1972-73 was announced in the Lok Sabha on April 17.

The APC based its recommendation for reduced procurement prices on cost data from the wheat-producing states; its case was strong but it suffered from some snags. First, the government had delayed inordinately its decision in this regard with the result that in some states such as Gujarat and Maharashtra where the current wheat crop has already been harvested, some purchases have been made by the official agencies at the prices prevailing last

year. The volume of purchases so made might be small but the wheat-producing states can legitimately cite that as a case of discrimination. Second, the wheat-producing states made the legitimate point that the procurement prices should be announced before the sowing of the Rabi crop. Third, some confusion prevails in regard to the cost of production of wheat. The APC, for reason best known to it, has not released the cost data on which it has based its recommendation. It is, however, reliably learnt that there is wide difference in the cost of wheat production between Punjab and the western districts of Uttar Pradesh, the latter having shown significantly lower costs than the former. Similarly no break-down is available in regard to the procurement charges fixed at Rs 11.02 per quintal, storage, movement and distribution charges at Rs 6.94 per quintal and carrying charges of buffer stocks at Rs 7.94 per quintal. The chief ministers opined that there was some room for reduction in these overhead costs and an effort should be made to bring

about economies in such expenditure. Because detailed break-down of these data have not been made available either by the APC or the Food Corporation of India or the states, it is hard to draw any conclusion. However, if there is any room for manoeuvrability, every effort should be made to locate, define and exploit it.

According to the latest directive of the government of India, a special committee will go into the cost data and submit a report within two months. The Agricultural Prices Commission, in turn, will examine it and submit its recommendations well in advance of the sowing of the Rabi crop. If it is found that the cost is not as high as is claimed by the wheat-producing states and that there is justification for some reduction in procurement prices so as to provide relief to the public exchequer as well as the consumer, the central government should not hesitate to come to its own decision and stick to it, the farm lobby notwithstanding.

exercised and one which formed the subject-matter of several discussions between the IBA and business interests, at a recent meeting at the Indian Merchants' Chamber, Bombay.

Outstation collections constitute a major area of public contact for the banks and, as the IBA plan released by Dr Hazari on the occasion of the silver jubilee notes, the quality and efficiency of banking services are in fact tested by the public by their experience of collections. That there has been considerable dissatisfaction about difficulties and delays in this regard is evident from the number of complaints that one hears from all sections of the public, in particular trade and industry. It is not the customers alone that suffer by this; banks and their staff also have to expend a lot of time both in dealing with complaint arising from outstation collections of cheques and bills and in straightening them out, which not only means additional costs but loss of public goodwill as well. Taking note of this, it may be noted here that the Banking Commission has made a pointed reference to this function of bankers and has recommended that, in order to avoid inconvenience to customers and as a measure of self-discipline, banks should either credit collection proceeds to their customers' accounts, or return the dishonoured instruments to them within a specified period.

The IBA also felt concerned about this and it is only after holding extensive discussions with representatives of banks and making a detailed analysis of all factors and areas responsible for delays in collections that it has now come out with a plan for ensuring speedy and efficient realisation of outstation collections. What is notable about the IBA plan is that it can be implemented by banks within their existing collection and staffing systems without making any basic changes in them. All that it suggests are certain immediate measures to cut down delays. Implied, therefore, is the fact that this is but an immediate remedy for a difficult situation, as also the indication that the IBA expects eventually to find a more enduring long-term solution involving systems, staffing pattern, productivity, etc. The IBA is indeed gearing itself for this and other tasks, to judge from the wholesale reorganisation of the Association with a view to functioning as an advisory service organisation, which is as it should be in the altered context of the Indian banking system today.

In the course of his address, Dr

Hazari no doubt took credit for the quantitative performance of the banking system but, at the same time, he conceded that a lot of new activities of banks had been taken up without much of an organisational support and sometimes "with more enthusiasm than preparation." Hence his emphasis on much greater attention than in the past "to build up banking on a sustained basis of modern systems and modern ways of organisation with greater attention to manpower planning and training." He also made a pointed reference to what he described as the "dark area" in banking, i.e. the utilisation of fairly well-paid manpower. In other words, he seemed to subscribe to the generally held public view that, though bank staff is better paid than other white-collared workers, it has not responded fully by giving of its best to bank customers. Although he did not say so in so many words, he was presumably referring to bank strikes on one count or other. "There is hardly an occasion," he said, "on which all banks are fully at work; hardly a day passes with all banks participating in all the clearings all over the country." This surely is a matter which will have to receive considerable attention, as he said, if only to give much greater importance to the demand of the public for good service than anything else.

The Reserve Bank Deputy Governor also alluded to the fact that the banking system was somewhat over-extended, because the pace of lending had outstripped the growth of resources. This, he went on to say, had since been corrected and so he expected it would be possible for the banking system to bring about a rationale consistent with national objective and profitable employment of resources. How this is going to be brought about is worth watching. For this is certainly no easy task. In the first place, as Dr Hazari himself noted, the priority sector financing is, and must be, really priority sector financing and, what is more, he felt certain that the pace of such lending could be stepped up further. Secondly, there are various other demands, such as food procurement and foodgrains storage (he might have added storage of other commodities also, such as sugar, fertiliser, cotton and what not) upon the banking system which are irresistible. Here, again, Dr Hazari felt very large amounts of bank funds would continue to be tied up this way. (About nine per cent of total public sector banks' credit is now deployed in food procurement. Besides, he recognised other demands arising from the fact

that the economy is poised not only for a recovery but a leap forward. And yet the Deputy Governor seemed more optimistic than ever before that the growth of credit would bring about a better balanced credit portfolio in the banking system. Evidently this "better balanced credit portfolio" applies only to credit to priority sector, for he did not seem much concerned, nor say anything about the credit needs of non-priority sectors or how these should be taken care of.

As for credit to the priority sector itself, it is noteworthy, Dr Hazari had some sensible points to make. Thus, while he agreed that aspirations should be high and that a lot more still needed to be done, he cautioned banks that even for this purpose resorting to the Reserve Bank must be regarded as only by way of a facility and not a resource and, for that reason, only temporary and not all along the year. Secondly, he made it clear that, so long as deficit financing of the government remained substantial, there was no alternative for the Reserve Bank of India but to follow a cautious monetary policy. As such the Reserve Bank must continue to advise banks to operate within the resources mobilised by them, those already mobilised and those to be mobilised in future.

That all is not that well with the internal working of the banks was clear from some of the exhortations made to bankers by Dr Hazari. For instance, he said there has to be some kind of quick attention to faster reconciliation of inter-branch accounts. Then, he wanted a constant review of the returns called for from the branches so as to cut down the number of returns. Thirdly, he stressed the need for co-ordination between bankers, State Bank of India, Reserve Bank and central go-

vernment (why not also state governments and other credit institutions?). But he took care to warn that co-ordination could not be made a convenient umbrella under which many things could be made to take shelter. And, while on this point, he made it clear — and this is the crux of his address — that "bankers are responsible for the money entrusted to them and whatever they might do of information and experience of anything else, the responsibility of money entrusted to them is of bankers and this is something which cannot be shared".

Another point, for clarifying which many bank customers would feel grateful to Dr Hazari, was that "as far as individual accounts are concerned, banks are responsible for the accounts of their individual clients." But, after saying that "the banker alone can be held responsible for individual accounts", he also added: "Furthermore, bankers are responsible to the duly constituted authorities inside and outside the bank." One other point of Dr Hazari, a point that required making and also one that requires to be more widely publicised than through an address to a closed-door meeting of bankers, was that "there cannot be any question of distribution of money on a *per capita* basis. Money has to be given for viable proposals for which the bankers have to take responsibility". This means that, even while conforming to the priority sector criteria and after all consultations, the banker has to take the ultimate responsibility both for deciding whether a given proposal is viable or not and for making the loan he finally decides to give. No banker worth his salt would shirk this responsibility, but he must have complete protection against political pressure to be able to discharge it to his satisfaction.

Dark areas in banking

THAT THE banking system in this country even after the nationalisation of 14 commercial banks needs to be reorganised so as to bring better life to its people is axiomatic, but, thanks to the Banking Commissioner's observation to this effect, this view has since received the stamp of authority. This, however, is not to say that, since nationalisation, banks have made no effort at all in this direction: only they have had no time to make the requisite effort, being preoccupied with adjusting themselves to their new and extended role. During the past few years they have been striving to achieve new goals, as Mr B.N. Adarkar, Chairman of the Indian Banks' Association (IBA), told the twenty-fifth annual general meeting of Association. To quote his own words, "since nationalisation, banks have been trying to extend their services to the poor and the underprivileged and to widen the range of their activities to productive endeavours everywhere." This process has not been easy, as witness the falling off in quality in bank service, which may be said to be more than proportionate to the sharp rise in the performance of our banks in quantitative terms. Is it any surprise, therefore, that this aspect of the matter has begun to attract the attention of all

bankers lately? The speeches of both the IBA chairman and Dr R.K. Hazari, Deputy Governor, Reserve Bank of India, chief guest at the IBA annual general meeting, fully bear out this concern.

After outlining what banks have done and endeavoured to do—increasing the number of bank offices, making innovations in lending and enlarging the range of banking services generally, as also equipping themselves with the requisite staff and simultaneously undertaking training programmes for this staff — Mr Adarkar pointed to a glaring lacuna, viz. absence of guidance in making lending innovations, so necessary at a time of transition such as this, "a transition from lending for ready-made viable schemes backed by talented entrepreneurs having a credit and business standing or proven integrity to preparing small people to launch pioneering schemes on a smaller scale by developing economic, technical and financial infrastructure and by placing a trust in their capacity and integrity". Realising the difficulties of mastering these new techniques and applying them, the IBA rightly hit upon the idea of disseminating information on successful attempts towards lending innovations and thereby expediting the process. The first such essay is a plan prepared by it for more efficient outstation collections, a matter on which customers of banks have been greatly

EASTERN ECONOMIST BUDGET NUMBER

As in previous years, the Special Budget Number presents an analysis of budget proposals and a study of the budget documents in their larger economic context as well as in their specific details. The Special Number includes all the relevant budget literature and statistical tables. It also carries a section of Special Articles covering fiscal and monetary issues. Priced at Rs 5 per copy (postage extra) copies of this number are on sale with leading booksellers or direct from:

New Delhi-1.**

Towards increased canalisation

THE IMPORT policy for 1972-73 has a number of depressing features, the most disconcerting being the pride of place given to the state trading agencies in regard to imports. No less than 56 new items have been added to the list of canalised commodities which will raise the imports of public sector by nearly Rs 100 crores this year. In overall terms, the share of the public sector in total imports is expected to rise from 70 to 75 per cent which is of course in keeping with the package of promises which the ruling party made in its election campaigns. In fact, the government is committed to the take-over of the entire import trade irrespective of its impact on the productive machinery and the prospects for enhanced exports.

The objection of the business community to canalisation of imports has been not on ideological basis but purely for pragmatic reasons. The chief fault with the public sector agencies is that, besides the monopoly position enjoyed by them, they are incompetent in more ways than one and this has an unfavourable effect on the working operations of the manufacturing and trading units which are mostly in the private sector. Failure to arrange timely imports, placing orders for wrong types of goods and charging high prices for basic raw materials are some of the evils which have haunted the operations of these agencies and which have very often hurt the working results of the industries dependent upon them. The statement for 1971-72 of Mr Prakash Tandon, Chairman of the State Trading Corporation, lists a number of accounting ratios to demonstrate its superior working results but has little to say about the above-mentioned complaints of its clients. Mr Tandon has refrained from discussing the basic questions i.e. pricing of imported goods, timeliness of imports and disturbance in the supply line because of the faulty or inadequate understanding of its officials in regard to the products needed by the consuming industries.

The suspension of US aid has been causing some anxiety to this country. This is evident from the frequency with which the word "self-reliance" is being used in official (and unofficial) pro-

nouncements. The import policy also extols this sentiment for "self-reliance" by adding as many as 160 items to the banned list, taking the total to 330. The imports of 87 items have been slashed; last year no less than 67 items had come under the axe. It is an easy exercise to ban or curtail the imports of commodities but this should not be undertaken absent-mindedly. The Ministry of Foreign Trade is well-known for this, the most recent incident being its decision to change in the middle of the year the procedure for recording exports in 1970-71 which gave a statistical boost of more than Rs 100 crores and provided some psychological satisfaction to the ministry. It could pat itself on the back for increase in exports which in fact had not taken place.

The ban on the imports of a large number of items coupled with sizeable reduction in the volume of imports of many others is likely to create shortages if simultaneous efforts are not made to increase the production of these items in the country. Shortages inevitably lead to rise in prices which in turn cause inflationary pressure. Consequently, export items are affected in the sense that they are priced out in highly competitive markets. Instead of gloating over its policy of curtailment in imports, the Ministry of Foreign Trade owes it to the people to see that unnecessary hardship is not caused due to a rise in prices and the volume of exports is not reduced because of the domestic prices having been put out of tune with international prices.

The policy in regard to priority industries has been couched in language which indicates as if the government has taken a liberal attitude but the use of the phrase "subject to availability of foreign exchange" tends to dampen the spirit in view of the uncertainties involved.

While it has assured that the import requirement of 59 priority industries would be met as before, in the case of "selected priority industries" a further concession has been promised in that import licences for raw materials and components would be granted, on merits, for increased values. What is more, in cases where increased output would directly save on present imports and the saving in foreign exchange would be at least 50 per cent higher than the value for which additional raw material imports would be allowed, an assurance

has been held out for imports of increased values. The small-sector has been given an assurance for liberal treatment in this regard.

The central point however remains how the government is likely to face the situation if the US attitude to aid to this country does not change. Granted that this country has a comfortable position in regard to reserves but once their level is reduced to meet current needs, the economy would be exposed to severe risks for facing unforeseen contingencies. The obvious solution lies in increased exports which do not seem to be doing as well as the pronouncements of the Ministry of Foreign Trade tend to show. It is however hoped that the incentives provided to exporters might result in some rise in exports. The eligibility for preferred sources of supply and facilities for expansion in export production have been indicated for industrial units in the priority sector exporting 10 per cent or more of their output. Even non-priority industries with similar export performance will be treated on a par with priority industries.

The constitution of a "Steel Bank" by Hindustan Steel Ltd for organising bulk imports of steel for sale to manufacturers is no doubt a welcome step. To the same category belongs the setting up of the IRMAC — a subsidiary of the STC — which is expected to undertake bulk imports of raw materials. How far both these undertakings will be able to buy goods at economic prices and hand them over to actual users without undue overhead charges remains to be seen. Past experience in this regard has not been a happy one as both the STC and the MMTC are known to have charged heavy overheads on certain items though the overall profitability of the state trading organisations may not work out to be exorbitant in view of losses incurred elsewhere. A suggestion has been made by some associations that a bank should also be set up for non-ferrous metals so as to feed the indigenous units but unless adequate experience has been gained by the public sector undertakings in the purchase and distribution of these metals, no hurried step need be taken in this regard. The extension of facilities to export houses, the small-scale industries in backward areas and the closed units (for restarting production) has been assured in the new import policy but it is feared that the gap between promise and performance may be very wide.

Let's get on with it

Robert S. McNamara

Brief and Candid

THIS is the first opportunity I have had since becoming President of the World Bank to attend a session of the United Nations Conference on Trade and Development, and I am very pleased to be here.

What I have to say will be brief and candid.

My view is this:

The state of development in most of the developing world today is unacceptable — and growing more so.

It is unacceptable, not because there hasn't been progress in the past 20 years — and particularly in the decade of the sixties — but because development programmes have been directed largely at gross economic goals, and have failed to insure that all nations, and all groups within nations, have shared equitably in the economic advance.

As the second Development Decade unfolds, the mistakes of the past have begun to be perceived, but neither the developing nor the developed nations have moved to deal with them effectively. Finally, if the state of development today is unacceptable — and it is — we must not waste time looking for villains in the piece, or even worse, waste energy in fruitless confrontation between rich nations and poor nations. Rather, the entire international development community — all of us — must promptly move forward with practical measures which are conceptually sound, financially feasible, and which can command the requisite public support. I hope to suggest some of these today.

I have said that I believe the state of development in most of the developing world today is unacceptable.

It is unacceptable, but not because there has not been progress. There has been. The total economic growth,

Address delivered by the President of the World Bank on April 14, at the United Nations Conference on Trade and Development held in Santiago, Chile.

measured in GNP terms, for the developing countries during the first Development Decade was impressive. For some of these countries it was the most successful decade — measured in these gross economic terms — in their history.

But such economic measurements, useful as they are, can be seriously inadequate.

II Inadequate, Unacceptable

What is inadequate about them is that they do not, in themselves, tell us much about what is happening to the individual lives of great masses of people in the developing countries.

But the improvement of the individual lives of the great masses of people is, in the end, what development is all about.

What are we to say of a world in which hundreds of millions of people are not only poor in statistical terms, but are faced with day-to-day deprivations that degrade human dignity to levels which no statistics can adequately describe?

A developing world in which children under age five account for only 20 per cent of the population, but for more than 60 per cent of the deaths.

A developing world in which two-thirds of the children who have escaped death will live on, restricted in their growth by malnutrition — a malnutrition that can stunt both bodies and minds alike.

A developing world in which there are 100 million more adult illiterates than there were 20 years ago.

A developing world, in short, in which death and disease are rampant,

education and employment scarce, squalor and stagnation common, and opportunity and the realisation of personal potential drastically limited.

This is the world of today for the two billion human beings who live in the more than 95 developing countries which are members of the World Bank. The personal catastrophe that affects the individual lives of hundreds of millions of these individuals is such that we can no longer take much satisfaction in the simple statistical achievement of the overall GNP growth goal of five per cent by the close of the first Development Decade.

To begin with, that average figure conceals the fact that the growth rate was very uneven among the developing countries; and that income grew the least where it was needed the most — in the poorest countries, with the largest aggregate population.

Based on a study of the individual countries, the picture that emerges demonstrates just how uneven that growth has been.

The major oil-exporting countries, with less than four per cent of the population, enjoyed a GNP growth rate not of five per cent, but of 8.4 per cent.

The developing countries with a per capita GNP exceeding \$500, with nine per cent of the population, had a growth rate of 6.2 per cent.

The countries with a per capita GNP between \$200 and \$500, with 20 per cent of the population, had a growth rate of 5.4 per cent.

And the poorest countries — those with a per capita GNP of less than \$200 — with an overwhelming 67 per cent of the population, had a growth rate of only 3.9 per cent.

So the first obvious conclusion is that by lumping all developing countries together, and measuring progress by an average GNP growth rate for the entire

group, we obscure the significant differences between these countries.

What is more, we obscure the even larger differences in their per capita income growth.

In the poorest countries, with 67 per cent of the population, per capita income during the first Development Decade grew at only 1.5 per cent annually.

In the two middle categories of countries, per capita income grew far faster than that — 2.4 per cent and 4.2 per cent respectively.

In the oil-exporting countries, it grew more than three times as fast: 5.2 per cent.

But what is most misleading of all is to assume that once we have calculated the GNP growth rate of a particular developing country, and then expressed it in per capita terms, we have arrived at a sound picture of the level of economic development in the country.

We have not.

For rates of growth of GNP, and of GNP per capita, tell us nothing about how income is actually distributed within a country.

III

Maldistribution of Income

Such evidence as is available suggests that even the developing countries which have registered significant gains in GNP growth rates are plagued with severely skewed income distribution patterns.

In the last decade Brazil's GNP per capita, in real terms, grew by 2.5 per cent per year, and yet the share of the national income received by the poorest 40 per cent of the population declined from 10 per cent in 1960 to eight per cent in 1970, whereas the share of the richest five per cent grew from 29 per cent to 38 per cent during the same period. In GNP terms, the country did well. The very rich did very well. But throughout the decade the poorest 40 per cent of the population benefited only marginally.

In Mexico the picture is similar. Over roughly the past 20 years, the average income per capita grew, in

real terms, at three per cent per year. The richest 10 per cent of the population received about half the total national income at the beginning of the period and an even larger share at the end of the period (49 per cent in 1950 and 51 per cent in 1969). But the share of the poorest 40 per cent of the people was only 14 per cent in 1950, and declined to 11 per cent in 1969. The share of the poorest 20 per cent during the same period sank from six to four per cent.

India's position

In India, there has been progress in overall GNP growth during the past decade. But, today, some 40 per cent of the entire population — 200 million people — live beneath a poverty line: a line defined as the point at which serious malnutrition begins. And the evidence is that the poorest 10 per cent of the nation — 50 million people — have not only not shared in the progress of the decade, but may even have grown poorer.

These examples are not atypical. A recent study of income distribution patterns in more than 40 developing countries estimates that at the beginning of the first Development Decade the average share in the national income of the richest 20 per cent of the people was 56 per cent — but the share of the poorest 60 per cent of the people was only 26 per cent. Although comparable data for the beginning of the second Development Decade are as yet too sketchy to draw detailed conclusions, preliminary indications are that this severely distorted income distribution is not only continuing, but in many countries may be growing worse. The poor are sharing only to a very limited extent in the benefits of growth.

Why is this the case?

The reasons, of course, are complex. We still have far more questions than answers, but I believe that certain points are clear.

To begin with, economic growth is a necessary condition of development in any poor country — but it is far from being a sufficient condition.

Without a climate of growth, the domestic savings and export earnings crucial for internal investment simply

POINTS OF VIEW

cannot be mobilised. That is obvious enough.

What is less obvious is that economic growth in a poor country, in its early stages, is likely to penalise the poorest segment of the society relative to the more affluent sectors unless specific action is taken to prevent such an effect.

This is particularly true of those subsistence agrarian economies in which economic growth began with a narrow but intense exploitation of rich natural resources. The historical experience of these situations is that unless the government takes steps to broaden the base of development by rapid reinvestment of the export revenues from such resources, the income share of the poorest 60 per cent of the population declines, and the income share of the richest five per cent increases.

Even the small middle-income group in such societies — the approximately 20 per cent of the population whose average share of the national income clusters near the median point — even this incipient middle class receives a declining share of the national income when growth is sudden and too confined to enclave types of activity.

Poor become poorer

As development in a poor country broadens its base, the middle-income group begins to benefit. This group prospers, largely as a function of its education and employment opportunities. But the 30 to 40 per cent of the total population, who range from the poor to the very poor, continue to receive a disproportionately small and frequently declining share of national income. Typically, it is these poorest 40 per cent who are most vulnerable to the economic hardships associated with high birth rates, poor educational opportunities, mounting inflation, the difficulty of obtaining credit for family farming or small-scale local enterprises, and the migration from a stagnant countryside to a jobless urban slum.

What this amounts to in most developing countries is a desperate and seemingly self-perpetuating situation.

What can be done about it?

What must be done about it is to reduce the crushing disparities of opportunity.

To begin with, there must be more equitable and comprehensive tax mea-

sures; land reform laws; tenancy security policies; and, above all, concrete programmes to increase the productivity of small farmers. And not just programme and measures languishing in legislative debate and delay, or lost in legal complexities so hedged about with exceptions that they end by being more rhetoric than reality. What is required are feasible fiscal, agrarian, and educational reform measures that can be fully and fairly enforced. What is needed most of all is a determination to move against the inequities of income distribution.

There is no need to point out that this is politically difficult. Without question it is. But when the distribution of land, income, and opportunity becomes distorted to the point of desperation, what political leaders must often weigh is the risk of unpopular but necessary social reform — against the risk of social rebellion.

"Too little too late" is history's most universal epitaph for political regimes which have lost their mandate to the demands of landless, jobless, disenfranchised and desperate men.

new thinking needed

What I am suggesting is that we should stop thinking of massive poverty in a developing country as simply a symptom of underdevelopment — and begin, rather, to think of it as a condition that must be attacked within the framework of the nation's overall development programme.

If developing countries themselves do not adopt the policies to deal with this problem, there is little that international institutions and other external sources of aid can do to help the poorest 40 per cent of their peoples — those 40 per cent who suffer the greatest deprivations, and who are in the most desperate need.

But if the developing countries do adopt policies to insure that the benefits of growth will be more equitably distributed among their own peoples, then these countries both need and deserve the assistance necessary to insure that a reasonable rate of overall growth can be achieved. That is why the second Development Decade's goal of six per cent growth in GNP per year was established. It is in my view a necessary and an attainable target. But it cannot be

met unless external assistance, in the form of both aid and trade, is made available in amounts larger than those which now appear likely.

IV

Need for Assistance

The developed countries in adopting the strategy for the second Development Decade, and in support of the growth target, stated that the level of external aid to be provided in the form of official development assistance should reach .7 per cent of their GNPs by 1975.

Where do we stand today in that effort?

A number of the developed countries have made significant progress towards the objective, as the table below indicates. However, on the basis of present indications, only two (Norway and

POINTS OF VIEW

Sweden) will reach or exceed the targets. Six more (Australia, Belgium, Canada, Denmark, France, and the Netherlands, will come close. Four other will substantially increase their percentage but still fall well below the target (Austria, Japan, Switzerland, and the United Kingdom). And the contribution from the United States which accounts for roughly half of the total GNP of such countries, continues to decline. It has already fallen from above .5 per cent of GNP in the early years of the last decade to .31 per cent in 1970. It is likely to fall further to around .24 per cent by 1975.

I feel obliged, therefore, to conclude that the total flows of ODA for the first half of the decade are likely to average out at approximately .35 per cent of GNP, only half of the second Development Decade target.

This is a most unwelcome conclusion. But we must face facts. Not only is there no evidence that ODA as a per-

Projected Flow of Official Development Assistance Measured as a per cent of Gross National Product*

*Countries included are members of OECD Development Assistance Committee, accounting for more than 95 per cent of total Official Development Assistance. Projections are based on World Bank estimates of growth of GNP, on information on budget appropriations for aid, and on aid policy statements made by governments. Because of the relatively long period of time required to change legislatively authorised levels of aid, and then to translate legislative authorisations first into commitments and later into disbursements, it is possible to project today, with reasonable accuracy, ODA flows (which by definition represent disbursements) for 1975.

centage of GNP will rise above one-half of the target rate by 1975, but unless there are prompt and marked changes in attitude, it is difficult to foresee any great improvement in the second half of the decade.

Was the .7 per cent target too ambitious? Are the difficulties within the domestic economies of the developed countries such that it is unrealistic to assume they can afford this degree of assistance to international development?

Certainly not.

I have pointed out the severe maldistribution of income and wealth which exists within the developing countries, and I have stressed that these nations must act to shape future economic growth in such a way as to redress that imbalance. But an analogous situation exists in the distribution of the world's wealth and income—there is severe maldistribution between the rich nations and the poor nations—and given that fact, one must face up to analogous conclusions.

During the first Development Decade, the total GNP of the world increased by \$1,100 billion. That is an increase in income almost beyond comprehension.

maldistribution of income

But how was that growth in income distributed throughout the world?

Eighty per cent of the increase went to countries where per capita incomes already average over \$1000—and they contain only one-quarter of the world's population.

Only six per cent of the increase went to countries where per capita incomes average \$200 or less—but they contain 60 per cent of the world's people.

Today the average per capita income in the developed countries is approximately \$2400. The comparable figure for the developing countries is \$180. By 1980, after the 25 per cent of the world's people who live in the developed countries once again receive 80 per cent of the total increase in the world's income, their per capita income will have risen by some \$1200. The comparable increase in the per capita income of the 75 per cent of the world's peo-

ple who live in the developing countries—even if the second Development Decade growth objective is achieved—will be less than \$100.

The collective GNP of the developed countries in 1970 totalled roughly \$2000 billion. In constant prices, it is projected to grow to at least \$3000 billion by 1980.

What this means is that in order to raise the current ODA flows of .35 per cent to the targeted .7 per cent, the developed countries would need to devote only about 1.5 per cent of the amount by which they themselves will grow richer during the decade.

The remaining 98.5 per cent of their incremental income will provide them with sufficient funds to meet their domestic priorities.

weak of will

Granted these facts, are we to say seriously that these wealthy countries cannot reach the ODA target of .7 per cent of their combined GNPs?

It is manifestly not a case of their being unable to afford it.

Nor, in my view, are the reasons for the serious shortfall in ODA the lack of generosity of the peoples of the developed world, or their indifference to justice.

It is much more a matter of ignorance: a failure to comprehend the inhuman conditions which characterise the lives of hundreds of millions of people in the developing countries; a failure to grasp how severe the maldistribution of income actually is between rich nations and poor nations; and a failure to understand how modest are the amounts of the wealthy nations' incremental income which, if made available to the developing countries, would make so great a difference in their ability to meet minimal growth objectives.

It is said that in wealthy countries the case for foreign assistance has no constituency. I do not believe that is true. What I do believe is that the constituency in most of the countries must be better informed, better mobilised, and better motivated. In the end, that is a matter of leadership.

But if that constituency in important parts of the developed world remains

POINTS OF VIEW

at its present level of concern—and governments continue to reflect this—then one is compelled to conclude that the flow of ODA will remain at its present wholly inadequate level throughout the decade.

In view of the degree of poverty that oppresses the human spirit in so much of the world, that would be tragic. Let me, for a moment, analyse what in fact that failure would mean.

The ODA deficit will penalise the poorest countries the most. It is unlikely that they will be able to reach the growth target. Their need for ODA is the greatest, and if it stagnates at its present level, they will feel the effects the most severely.

But for even those developing countries which are somewhat better off, a deficiency in ODA will force them to seek external finance from less desirable sources—particularly sources demanding high rates of interest or early repayment. The danger of over-reliance on such sources is well known: it adds significantly to short and medium-term debt burdens by mortgaging larger proportions of export earnings, and, in the event of an unexpected decline in those earnings, it can cause severe strains on the whole of the economy.

V

The Debt Problem

The truth is: if ODA flows level off at substantially less than the target for the decade, mounting debt problems for the developing world are inevitable.

Achievement of the six per cent GNP growth objective would require an increase in the volume of imports by over seven per cent a year. This increase would, in the main, have to be financed by a rapid growth in export earnings, as I will note in a moment. But even if these earnings increase at a rate greater than imports, the trade deficit, which would have to be financed by grants and external borrowings, would grow by approximately 7.5 per cent a year in current prices. In these circumstances, in the face of an ODA deficit, the developing countries would either have to reduce their rates of growth, or increase their debts above reasonable levels. Both are likely.

Since the mid-1950's, publicly guaranteed debt has been growing at about

14 per cent a year. At the end of 1971 it stood at over \$60 billion and annual debt service exceeded five billion dollars. Servicing of debt since the mid-1950's has been growing at the same average annual rate of about 14 per cent. This is about twice the rate at which the export earnings, from which the debt must be serviced, have been growing. Such a relationship cannot continue indefinitely.

With the prospect of a leveling off of ODA at far less than the targeted amount, and its partial replacement with financial assistance on harder terms, debt service ratios will inevitably rise. Debt financing has a continuing role in development. But it has its outer limits of prudence and these must be recognised by debtors and creditors alike.

VI

Expansion of Trade

If they are to offset shortfalls in ODA, and keep debt burdens within manageable proportions, it is clear that the developing countries' most imperative need is greatly to expand their export earnings.

How can this be done? Can it be done at all?

It can. But only by difficult economic adjustments, broad policy changes, and astute political leadership in the rich and poor countries alike.

The general outline of the problem is clear enough. From an export point of view, there are three broad categories of developing countries:

Those countries which export fuel. Fuel exports account for a third of all export earnings in the developing world, and are growing at an average rate of 10 per cent a year. But three-quarters of these substantial earnings go to only six countries, containing less than three per cent of the world's population.

Those countries, many of them with very low income, which remain highly dependent on exports of agricultural products.

Those countries, many of them in the middle-income group, which have

the possibility of increasing their earnings through exports of manufactures.

The relative inelasticity of demand for agricultural raw materials means that the growth of exports of primary commodities, excluding fuel and minerals, is not likely to exceed three or four per cent a year. However, even for countries dependent on the exports of such products, the developed countries can provide assistance.

They can negotiate stabilisation agreements—on the international coffee agreement model—for cocoa and other commodities. Such agreements might provide for multilateral financial assistance.

And the wealthier nations could well afford to leave more of their markets open to agricultural imports from developing countries. Agricultural protectionism, particularly in the climate of inflationary food prices in wealthy nations, makes neither domestic nor international sense. The sugar beet growers of the temperate countries, for example, have other ways of earning their living; the sugarcane growers of the Caribbean, Mauritius, and Fiji do not—and the same could be said for many other commodities.

growth target

For countries with greater capabilities for the export of manufactures—countries whose populations total over one billion—we have estimated that achievement of the six per cent growth target will require an increase in their export earnings, in current prices, of nearly 10 per cent a year. This, in turn, necessitates an annual increase of their manufactured exports of 15 per cent a year.

Can this rate of growth be achieved?

It is in the manufactured-products sector that world demand grows fastest, and the record of the developing countries in this sector during the sixties was impressive. Their manufactured exports did in fact grow at the rate of about 15 per cent a year.

What is needed in the seventies is that the momentum be maintained. The natural comparative advantage for developing countries lies clearly in those

manufactured products which have a high labour input, or which utilise abundant domestic materials. These include items such as textiles, garments, footwear, vegetable oils, processed foodstuffs, plywood, furniture, glassware, plastic and wooden products, and electronic and engineering sub-assemblies.

But though demand exists for these manufactures in the developed countries, the developing nations have in some cases clung too long to inward-looking, import-substitution policies—policies which may have been appropriate at earlier stages of their industrial growth, but which now unnecessarily hobble export promotion efforts.

specific actions

There are a number of specific actions which governments in these situations can take. They can reduce the heavy protectionist tariffs on necessary inputs; supply local credit on more reasonable terms for small, labour-intensive, export-oriented enterprises; and adopt and maintain realistic exchange rates.

But if the developing countries must realign their industrial policies to move from reliance on import substitution to greater efforts at export promotion, the developed countries must make just as great a shift from excessive protectionism to more equitable and less restricted import policies.

It is, for example, wholly illogical, after 20 years of development assistance to poorer countries, for the wealthy nations to negate that effort by maintaining higher tariffs on the manufactured goods these poorer countries export than on manufactures from their affluent counterparts. But that is precisely what the wealthy countries are doing. The levels of tariffs on imports of manufactured goods from rich and poor trading partners respectively average out in the United States to seven and 12 per cent, in the United Kingdom to nine and 14 per cent, and in the European Community to seven and nine per cent.

But it is not only the level of tariffs that is discriminatory against the developing countries. It is their structure. For tariffs rise with the degree of fabrication. In the United States, there is no customs duty on hides and skins, but tariffs on leather are five per cent, and on shoes 10 per cent. Similarly,

POINTS OF VIEW

in the European Community, cocoa beans from non-associated countries carry a three per cent duty, while processed cocoa products must bear an 18 per cent tariff. This manifestly means that processing — even simple processing — can by such tariffs be priced out of the developing country's most appropriate markets.

Even more repressive of the developing countries' export opportunities is whole series of restrictive non-tariff barriers which rich countries have erected over the years. These take the form of quotas, subsidies, and various preferential purchasing arrangements.

One of the most important elements in the strategy of the second Development Decade is that the wealthier countries should grant preferential treatment to the manufactured exports of the developing countries. Japan, the Nordic countries, and the European Community have adopted this proposal, with various limitations, and other developed countries are considering it.

essential requirement

It is essential that this plan be carried out in full, but much more is required. The proposed preference agreement would increase the developing countries' exports of manufactures by only about \$ one billion a year. And if these countries are to maintain the necessary momentum of a 15 per cent growth in manufactured exports, their annual volume—which rose from less than \$ two billion in 1960 to \$ seven billion in 1970—will have to quadruple to \$28 billion by 1980.

That is clearly going to be an enormous task. But one must not dismiss its feasibility, and certainly not on the grounds that it would impose an intolerable import burden on the wealthy countries. Should the \$28 billion in exports from developing countries be achieved, it would amount to only about seven per cent of the expected manufactured imports of the affluent countries, and would represent less than one per cent of their GNP.

The volume of trade in manufactured goods among the developed countries themselves is massive, and mutually beneficial. The rich nations accept huge quantities of manufactures from one another. There is no logical reason to suppose that it would not be equally beneficial — indeed, in terms of true

comparative advantage, even more beneficial — for these highly industrialized nations to open a greater share of their expanding market for manufactured goods to the developing nations.

The rich nations' absorptive capacity for such goods is immense, and by accepting the more labour-intensive manufactured items from the developing countries, they can turn their attention to where their own true comparative advantage lies: to the production of more sophisticated items, and those employing capital-intensive technology.

It is precisely these goods that the developing countries will increasingly require, and a vast potential market exists among them for such imports provided they can secure, in return, an adequate share of the market for their own manufactured goods.

But even those who accept the probability of long-term gains to the developed countries from opening their markets to the imports from the developing nations may point to the short-term pains of adjustment. Much of the rising tide of protectionism springs from the fears of those whose jobs and investments will be displaced.

It is a political fact of life that the developed countries must adopt realistic adjustment policies to cushion the impact of import competition by retraining, relocation, and refinancing. Few have done so to date. Until they do, labour and management opposition to trade liberalisation will be great — and justly so.

In sum, what we should all be seeking in development trade policies—both agricultural and industrial — is closer approximation to the principle of true comparative advantage. The basis for it exists in both the developed and the developing countries, but both must be prepared to modify inward-looking policies in order to achieve it. Only in an environment of more liberal international trade can the efforts of international and national aid agencies to improve the conditions of life in the developing world be fully effective.

VII

The World Bank

It is in this context that I would like to add a word about the World Bank.

Some four years ago, we set out in

POINTS OF VIEW

the Bank on a Five-year Programme. Our overall objective was that the Bank Group should lend roughly twice as much in the five years ending June 30, 1973, as it had in the previous five-year period; or to put it another way, that in the Five-year Programme period it should lend a total that would approach the entire amount lent in the first 23 years of the Bank's operations.

Taking into account the operating programme for the current fiscal year, and the prospects for the following and final year of the Five-year Programme, it now appears probable, assuming ratification of the Third Replenishment of IDA, that the total of new investments in the five-year period will in fact surpass the initial objective of \$11.6 billion, and the total cost of Bank-supported projects should exceed \$30 billion.

Our goals also included trebling lending in the field of education, and quadrupling it in the agricultural sector. These goals, too, are being met.

another objective

Still another objective we have pursued is to give greater emphasis to assisting the very poorest among our member countries — countries with per capita incomes of \$100 or less. Our estimate is that during the five-year period from 1969 to 1973 we will have assisted the poorest countries with a total of 215 separate projects. The comparable figure for the first 23 years of the Bank's activities — from 1946 to 1968—was 158.

Now that we are approaching the end of our Five-year Programme, we are giving concerted attention within the Bank to what we can most usefully do to assist our developing member countries in a second Five-year Programme from FY 1974 to 1978. These will be crucial years for the success of the second Development Decade, and we intend to play as productive a role as possible.

It is already clear that there will be a pressing need for an expansion of IBRD lending, and for a substantial increase in IDA assistance during the Fourth Replenishment Period. We are confident that the necessary increases in IDA assistance, and in other forms of ODA as well, can be achieved. These achievements would be facilitated if plans were made to link the financing

EASTERN ECONOMIST

APRIL 21, 1972

APRIL 21, 1972

of such aid, either directly or indirectly, to future issues of Special Drawing Rights.

I want to conclude by summarising the chief points I have put before you today:

There is an urgent need to relate the goals of national growth to realistic targets of more equitable income distribution. A climate of economic growth is necessary for the advancement of the developing peoples, but it does not in itself assure equitable participation in the fruits of that growth.

Unless this is done by the developing countries themselves, no amount of external assistance, whether in the form of aid or trade, will do much to improve the welfare of the lower 40 per cent of their populations which are living in conditions of the most abject poverty.

The six per cent growth goal established for the second Development Decade cannot be met without substantial flows of Official Development

Assistance. But current and projected flows of ODA—at less than half their stated target—are wholly inadequate. Unless ODA expands, the poorest countries will simply be unable to reach their objectives, and many of the others will face increasingly serious problems of debt.

Even with ODA flows at the targeted level of .7 per cent of GNP, achievement of the second Development Decade's growth goal would require substantial trade assistance to the developing countries by the wealthy nations. Action must be taken to help stabilise and expand the agricultural exports of those developing nations which are dependent on them. And for those countries with the potential for exports of manufactured goods, discriminatory barriers to markets must be removed and preferences made available.

Just as we must conclude that it is the responsibility of the political leaders of the developing nations to recognise the inequities that exist within their nations and to move to correct

POINTS OF VIEW

them, so we must likewise conclude that the wealthy nations of the world—possessing 25 per cent of its people, but 80 per cent of its wealth—should move now to provide the additional assistance, in the form of aid and trade, which the developing nations need to meet minimum national goals. That additional assistance can be financed by diverting but a tiny percentage of the incremental income which will accrue to the developed countries during the 1970's.

Our clear duty for the remainder of this decade is to face up to mass poverty for what it really is, determine its dimensions, locate it whereabouts, set a limit beneath which we will not accept its continuance, and make our first priority a threshold of human dignity and decency which is achievable within a generation.

That, ladies and gentlemen, is how I—for one—view the development task.

What we need most to do is to get on with it.

Enough to go round

Sagittarius

THE CURRENT busy season has ended for all practical purposes and the scheduled commercial banks did not have difficulty at any stage in meeting the requirements of industry and trade in spite of some complications arising out of a new pattern of trade being developed by us with Bangladesh and the compulsion to buy large quantities of raw cotton by official agencies for bolstering drooping prices. Even with a higher level of economic activity the increase in advances between October 29, 1971, and April 7, 1972 came down to the very low level of Rs 80.55 crores from Rs 207.45 crores. The comfortable position of the banking system will be evident from the fact that it has not been necessary for it to depend to any great extent on outside support. The borrow-

ings of the scheduled commercial banks have recorded a net decrease in a twelve month period ending April 7, 1972, by about Rs 190 crores.

The growth in advances would of course have been more pronounced but for the sharp decline in sugar production and the consequent absence of the usual seasonal increase in stocks. The Food Corporation of India also has not been obliged to effect procurement purchases out of kharif crop on the anticipated scale and some sales also have had to be effected out of stocks in order to bring down wheat prices in the open market as these were tending to rise awkwardly for some time. The supply of large quantities of foodgrains to Bangladesh could not, however, have

been responsible for a contraction of credit extended by the banking system as the central government would have been anxious to get some advantage for its budgetary position by utilising notionally stocks which had been paid for by it out of its own resources or which had been created out of concessional food imports.

There could not have been any large element of wheat imported under the PL 480 agreement as releases should have been effected for meeting commitments to the statutorily rationed areas and for sale through fair price shop in order to keep down the cost of subsidy as low as possible. But the volume of completely owned stock should have been about two million tonnes as pro-

curement credit at the end of January this year was around Rs 415 crores. The exact quantity supplied to Bangladesh so far is not known. Assuming however, that it would have been around six lakh tonnes, the government can still meet the needs of Bangladesh for three or four months without being obliged to draw on stocks which had been acquired to a great extent with the help of credit from banks.

There has of course been an offsetting effect in the shape of bumper cotton and oilseed crops. With an estimated increase in the yield of the 1971-72 cotton crop by even 12 lakh bales, the co-operative societies in Maharashtra and Gujarat have been busy for some time past effecting purchases for preventing distress sales by cotton growers. The Cotton Corporation of India also has been busy absorbing surpluses though it has not made much headway so far.

The developments in the money market in the first five months of the 1971-72 busy season have thus been rather tame. With a contraction in sugar stocks alone over a year by about 800,000 tonnes resulting in a release of funds for over Rs 80 crores the effect of a further expansion of procurement credit during the same period has been largely neutralised. As there has also been a big increase in deposits in a little over five months ending April 1972 by Rs 170 crores, the amounts borrowed from the central banking institutions could be easily returned even after increasing investments in approved securities.

borrowings wiped out

It is quite likely that by the end of April borrowings would have been virtually wiped out even though it had been expected earlier by the monetary authorities that banks might have to make a conscious effort to prune credit for keeping down borrowings.

For the first time in recent years there is thus the prospect of the banking system being completely free of any liability to the Reserve Bank against short-term refinance facilities at the end of a busy season. This is indeed a happy development and the monetary authorities should be feeling relieved over this situation in which it is possible to meet all needs with owned resources of banks and avoid an accentuation of inflationary pressures at a time when the overdrafts of the state governments

with the Reserve Bank has risen to the staggering total of Rs 666 crores on April 7, 1972.

It is likely, however, that there will be some new developments in May-July which may result in effect in an extension of the busy season in a different form. During this period there may have to be purchases of raw cotton by all agencies which could be responsible for a net increase in stocks by even 400,000 bales calling for an immobilisation of funds to the extent of Rs 80 crores. At the same time there may have to be heavy procurement purchases of wheat by the Food Corporation and other agencies. This is not an unusual feature as in the second quarter of every year since 1969-70 it has been necessary to expand credit for this purpose on a large scale.

record crop

On the present occasion, however, these purchases may have to be effected in larger quantities if the estimates of a record crop prove to be correct. It had been hoped that there would be important decisions relating to the lifting of statutory rationing in the few areas where it still remains in force. Also there should have been logically some understanding about the quantity that would have to be procured at the stipulated prices and the net additions to buffer stocks that would have to come about only in pursuance of support operations, the prices for wheat being fixed at lower levels for this purpose. In view of the successful opposition from the main producing states to a reduction in procurement prices and the compulsion to procure whatever surpluses that are offered by Punjab, Haryana and Uttar Pradesh in a short period there will have to be an increase in advances which may amount to even Rs 250 crores if there are heavy marketable surpluses. Thus between raw cotton and wheat alone credit may have to be expanded for Rs 330 crores.

Against this expansion there will of course be a reduction in sugar stocks by from 600,000 to 700,000 tonnes. If it can be assumed therefore that the increase in stocks of cotton may be offset by a reduction in sugar stocks and a drop in advances in other directions, the expansion of credit for procurement purposes may prevent an accumulation of resources with the banking system after the end of the official busy season. There is, however,

POINTS OF VIEW

usually a more pronounced growth in deposits with the commencement of the slack season and excepting for the bulges in credit that may be experienced with a bunching of purchases and imports of cotton and an intensification of procurement of foodgrains, it should be possible to avoid heavy borrowing from the central banking institutions. The scheduled commercial banks, however, may have to and like to, take advantage of refinance facilities available on a concessional basis against advances for priority purposes in order to meet statutory liquidity obligations. There may therefore, technically be an increase in borrowings from the existing low levels and banks may not be having that embarrassment of surplus resources which it was thought it would have at one stage. The borrowing programme of the central and state governments can, however, be completed satisfactorily and the targets even exceeded as there would be an assertion of slack season trends after July.

FROM THE PRESS GALLERY

Our Parliamentary Correspondent

New Delhi, Saturday

THE Lok Sabha debate on the next year's central budget entered its second phase this week when this House took up for deliberations ministry-wise demands for grants. The highlight of the proceedings of the Upper House was the discussion on the mid-term appraisal of the fourth Plan.

The demands for grants of three ministries — the Ministry of Irrigation and Power, the Ministry of Education, Social Welfare and Culture and the Ministry of Science and Technology — were adopted this week.

Although several members, both belonging to the treasury benches and the opposition, felt that the government had failed to accord high priority to irrigation and power in the development plans of the country, the criticism was by no means carping as could be expected in view of the clamour for more and more water to irrigate the agricultural fields and the growing shortages of power in various regions. The members generally remained content with asking for augmenting the power and irrigation facilities in their areas. Only some called for a national policy in these two vital sectors.

rural electrification

The tardy pace of rural electrification was adversely commented upon by some members. The recurrent floods in some parts of the country were a source of anxiety for several others, particularly those from Bihar. The inter-state differences over the development of water resources also figured prominently in the debate. Pertinent reference in this connection was made to the Narmada project which has been inordinately delayed because of lack of agreement on it between Gujarat, Madhya Pradesh, Maharashtra and Rajasthan states. It was suggested that the dispute over this project should be expeditiously resolved through the intervention of the central government—if need be, through the intervention of the Prime Minister herself.

The Minister for Irrigation and Power, Dr K.L. Rao, in his reply to

this debate, urged the members to have a national outlook in the matter of development of irrigation and power resources. He indicated that work on the linking of the Ganges with the Cauvery would be taken up soon. A UN team, he revealed, had already examined this scheme; its report was expected within a couple of months. Dr Rao significantly assured the House that the creation of the natural water grid would not deprive any area of its existing water resources; only surplus waters that caused floods would be allowed to flow into the areas which needed water.

new approach

In the field of power, Dr Rao indicated a new approach to the drawing up of the future development plans. The centre, he said, would henceforth like to have greater control over the generation and transmission of power. The role of the state governments would be restricted to the distribution of power in their areas.

Dr Rao felt confident that the government would be able to double power production in the country — from 20 million KWs to 40 million KWs per annum — by the end of the fifth Plan. By then, an additional 20 million acres of land would be brought under irrigation. He admitted that inter-state disputes like the one over the Narmada project had delayed the execution of several schemes, but hoped that the situation would improve soon. From Dr Rao's observations, it appeared that the government would concentrate more on completing the schemes and projects already in hand before embarking upon new jobs. A judicious policy indeed!

The debate on the demands for grants of the Ministry of Education, Social Welfare and Culture, however, was a very acrimonious affair. The government was taken to task for the falling educational standards, the slow progress in the imparting of primary education, the continued neglect of regional languages, and for not evolving an education system suited to the changed circumstances after the indepen-

dence of the country. It was argued that even though education was a state subject, the centre could not escape the blame for the failures on this front. Two or three members even suggested that education may be made centre's responsibility.

Some members called for an increase in the Plan outlays on education, particularly for technical education. It was pleaded that education should be made job-oriented. The institution of public schools came in for a good deal of criticism at the hands of the leftist members. A Congress member urged that the textbooks brought out by the National Council for Educational Research and Training should be adopted by all the states at least in science and mathematics. A Jana Sangh member desired that an institution should be set up in Delhi for the study of classics of Hinduism, Buddhism and Jainism. The cause of teachers was championed by several members who called for an improvement in their lot. The present examination system, it was urged by several members, ought to be changed.

lot of depressed

Some members pointed out that the lot of scheduled castes and tribes had not improved much during the past 25 years. Concerted efforts, therefore, needed to be made in this regard.

The Minister for Education, Mr S. Nurul Hasan, in his reply, dwelt at some length upon the limitations of the central government in the sphere of education — it being a state subject. But he refrained from expressing any opinion on whether education should be made centre's responsibility. He, of course, indicated that in consultation with the University Grants Commission, the central government was trying to evolve a new system of education. It was envisaged to set up a chain of model schools in different parts of the country which would impart education as well as become centres of youth activity and community life. Beyond this, he did not spell out the changes in the educa-

tional system which were contemplated.

Mr Hasan revealed that the government would soon bring before the House a bill to amend the charter of the Aligarh Muslim University. He, however, assured the Muslim League member, Mr Sulaiman Sait, that the proposed legislation would not seek to change the present minority character of this university. Referring to the lot of scheduled castes and tribes, Mr Hasan said that some fresh thinking would have to be done in the government in this regard.

The main highlight of the debate on the demands for grants of the Ministry of Science and Technology was the hope held out by the Minister for Planning, Science and Technology, Mr C. Subramaniam, that all graduate engineers and post-graduate scientists who did not have any gainful employment at present, would be given jobs within the next two years. This observation came from the Minister in reply to the scathing criticism voiced by several members about the growing unemployment of engineers in the country.

crash programme

Mr Subramaniam revealed that the National Committee on Science and Technology was working out a crash programme for providing employment to engineers and scientists. In drawing up this programme, care would be taken that the scientific effort was directed towards meeting the essential minimum needs of the people by the end of the fifth Plan. Another guideline for the NCST was that all research and development effort would have to be towards the achievement of self-reliance, which meant lessening dependence on foreign technology and the promotion of indigenous skills and know-how. The technology which had already been imported in the country would have to be improved by the Indian scientists. Only technology which was absolutely essential for the nation's development and which could not be evolved within the country would be allowed to be im-

ported from abroad in future.

Another important announcement which Mr Subramaniam made was that not a single worthwhile research project would be allowed to suffer for want of funds. He defended the government's decision to join the Ministry of Science and Technology with the Planning Commission which he was heading. The planners, he said, benefited from this arrangement. The programmes of science and technology, he added, could also be fully integrated with the development schemes through this arrangement.

Mr Subramaniam rejected the charge of some members that the government had delayed decision on the Sarkar Committee report on the Council of Scientific and Industrial Research. Decisions on all the recommendations of this committee regarding the structure and functioning of the CSIR, he assured, had been taken and implemented.

acrimonious debate

The Rajya Sabha debate on the mid-term appraisal of the fourth Plan was a much more acrimonious affair than the Lok Sabha deliberations on this issue last week. The sharpest attack on government's economic policies in this debate came from the Young Turk, Mr Chandra Shekhar. He took the government to task for not trying to curb monopoly and concentration of economic power and for wasting a lot of money on such things as the small car project. "In every sphere of social welfare", Mr Chandra Shekhar asserted, "we have lagged behind our targets".

Another notable speech was made by Mr T.A. Pai, former Chairman of the Life Insurance Corporation, who has been recently elected as a member of the Upper House. He stressed the need for raising production and thought that the attitude of the people in administration would have to be changed drastically if the problems of the country had to be solved. Mr Pai further suggested that we should switch over from the concept of gross national product to the idea of

gross national welfare. He emphasised the importance of housing as well as the development of dry farming.

The Jana Sangh spokesman, Dr Bhai Mahavir, felt that the mid-term appraisal was a disappointing and perplexing document because "it shows that we are in the soup but does not show the way of getting out of the soup". He emphasised the need for changing the basic strategy of planning. Greater stress, he opined, should be put on minor irrigation projects and fostering of small industries. Dr Mahavir also called for the containment of the non-developmental expenditure of the government and mobilisation of resources for development from the agricultural sector.

A good deal of concern was also voiced by members over the deteriorating unemployment situation and rise in prices. The need for accelerating the development of backward areas was stressed by many.

Winding up the debate, Mr C. Subramaniam assured the House that the government would make whatever structural changes were necessary in any sphere to achieve the fourth Plan targets. If it meant pulling down some structures, they would be pulled down. The Minister for Planning, Science and Technology reiterated government's resolve to eradicate poverty, reduce unemployment, remove economic disparities and inculcate further self-reliance. He urged members to suggest ways and means to achieve these ends. The situation in the country, he pointed out, was explosive. "If we don't move fast, we would be thrown out," he cautioned. Most of the other observations of Mr Subramaniam were on the lines of his address to the Lower House last week.

In a discussion in the Lok Sabha on the report of the Agricultural Prices Commission on rabi grains, most of the participants expressed themselves against reduction in procurement prices lest the "green revolution" should suffer a setback. They pointed out that agricultural costs were going up.

Nixonomics

Will Nixon Listen to Galbraith?

A CHALLENGING article, published in the latest issue of the National Westminster Bank's Quarterly Review (41 Lothbury, London E.C. 2.), by Professor O.J. Firestone of the University of Ottawa, gives a Canadian view of the economics of President Nixon.

In the course of his 17 page discussion, Professor Firestone argues that market forces alone cannot be relied

mand brought about by increased taxes and tight money does not alter the influence of large firms and unions on wages and prices, and these keep on rising. In this half of the economy, the market has been countered. Moreover, despite government intervention, private power reigns supreme and private planning sets the tone for the economy as a whole. As Galbraith says:

"With the rise of the big corporation and the strong union there was no longer any certainty that fiscal and monetary restraint, acting on aggregate

Josselyn Hennessy

London.

been re-adapted from that which is relevant to a market system to that which is relevant to an informal planning system centring on the large corporation — one that involves a good deal of management of the consumer, extends to the state and involves also the modern union. It is another and in some ways final step in the evolution of the advanced industrial sector of the modern economy from a market to a planning system."

Thus, Nixonomics recognises five facts that are stronger than political expediency:

(1) The USA cannot continue to bear as great a share of the international burden as it has during the last twenty-five years. Other well-to-do nations must play their part. (2) The USA must bring its economic relations with other countries into better balance, which means that the USA needs trade and monetary concessions as much as other less powerful economies. (3) The USA, without necessarily abandoning outward-looking orientation, must give greater priority to domestic requirements such as fighting inflation, raising levels of employment and increasing productivity. (4) The USA must demonstrate greater staying power in pursuing a steadfast course at home and abroad; this means tougher dealing with (a) domestic pressure groups and (b) concession-seeking foreign nations. (5) The USA needs increasingly to counteract private power exercised by large corporations and big unions over wages and prices. Whether this will mean permanent wage and price controls in key economic sectors, or in some other form, time will tell.

phase II policies

Following the 90-day wage-price-rent freeze, the US Administration embarked on Phase II of anti-inflationary policies, establishing a pay board with representatives of business, labour and the general public, to frame regulations setting up limits for increases in wages and salaries in conformity with the national objective of combating inflation. Companies with 5,000 employees or more must obtain prior approval of wage and salary increases; companies employing between 1,000 and 5,000 must report pay changes; the

rest need not report but are subject to spot checks.

A non-representative Price Commission has been set up to keep increases in prices and rents within bounds. Companies with sales of over \$100 million must obtain prior approval of price adjustments and report quarterly prices, costs and profits. The arrangements for companies with less than \$100 million in sales are more flexible, and reporting requirements for small businesses are minimum.

The Cost of Living Council continues as an umbrella policy organisation. For example, the council set a national target of price increases for 1972 at between two and three per cent.

The Internal Revenue Service has the task of surveying compliance with the Board and the Commission's regulations. Contravention, a criminal offence incurs fines of up to \$5,000, civil penalties of \$2,500, and restitution proceedings.

Several new committees seek to secure voluntary restraint of interest rates, dividends, and health costs, and offer advice on how to achieve greater stabilisation in matters concerning state and local government employees. The Construction Industries Stabilisation Committee was continued with its liaison with the Pay Board. Proposals were submitted to Congress for revision of the Economic Stabilisation Act of 1970, including strengthening of its constitutional base, authority for the President to control interest rates and dividends, expanded enforcement provisions, the establishment of a Temporary Emergency Court of Appeals, and an extension of the Act of 30 April 1973.

surtax raised

Meanwhile the Senate approved amendments to the Administration's tax bill which authorised the President to raise the surtax on all commodity imports by product or country to 15 per cent from 10 per cent imposed on August 15, and to establish quotas in the event of another balance-of-payments emergency. It included the Domestic International Sales Corporation proposal and empowered the President to reimpose an excise tax on foreign cars from countries discriminating against US cars. However, following the agreement on currency realignments in the Group of Ten, the 10 per cent surcharge on imports and the

"Buy American" aspects of the investment tax credit have been withdrawn, but the world has had warning of how readily the Senate and Congress accept protectionist measures.

II

A New-Look Incomes Policy?

In essence, the 90-day freeze and the Phase II programme is a new attempt at an incomes policy. Will it work? Professor Firestone answers: Over the short term — yes; over the long term — no. Some short-term improvements in the domestic economic situation, in part the result of the new economic policy, have occurred.

The real question is: Can an incomes policy be maintained over the longer term and can it control some of the basic economic problems facing the USA?

During the past twenty-five years, European countries have experimented with incomes policies — all the way from guidelines to complete wage-price freezes. Some policies failed; some achieved partial results; some were moderately successful, as was the wage-price freeze in the UK during the second half of 1966.

The USA tried wage-price guidelines in 1962, 1963 and 1964. Since then, US Administrations have tried to cope with concurrent problems, inflation either actual or threatened, rising unemployment, variations in the gap between actual and potential GNP, a deteriorating balance of payments and increasing pressures on the dollar.

Canada set up a Prices and Incomes Commission in June, 1969, to examine the causes of price pressures and to try to reach accord on price-wage restraints with business, the professions, and unions. The Commission was able to keep down price increases in some areas during 1970 but failed to obtain the co-operation of unions needed to achieve wage restraint. The Chairman of the Prices and Incomes Commission, John H. Young, said:

"... Unless increases in costs came under restraint as well, any effect of the price restraint programmes was likely to be limited. We were not able to obtain any effective support for wage and salary restraint from the unions and in the end we had to resort to a unilaterally suggested upper limit of six per cent. ... With the

termination of the price restraint programme at the end of 1970, the Commission stopped assessing price and income increases against specific criteria, although we have continued to issue fact-finding studies".

Two American economists, L. Ulman and R.J. Flanagan, who examined European experience with incomes policies including those of Britain, France, West Germany, Italy, Netherlands, Sweden and Denmark, concluded that there were two requirements for a successful incomes policy, which none of the countries could meet for the longer term: (1) co-operation from the unions and other sectors; and (2) toughness with those who exceeded the guidelines.

When income policies emphasized supply by restraining rising wages and other costs, workers went on strike, disrupting their economies. When incomes policies replied essentially on controlling prices, profits were squeezed, hitting enterprise and contributing to economic retrenchment. However, the main criticism of the two authors is that incomes policies in Europe and in North America were stop-go policies without long-term continuity and planning.

J.K. Galbraith expects that, before long, the President's advisers will start sprinkling his speeches with hints that controls are way-stations on the road back to the free market. Admitting the inadequacy of a control system, Galbraith argues that the USA faces a choice between imperfect control and the wholly uncontrolled wage and price spiral of recent years.

United States' problems

Canadian and western European experience suggests three reasons why the US government's incomes policies may not be as effective over the longer term as it hopes.

First, the Phase II measures are aimed at a transition from the temporary freeze to the "restoration of free market without inflation". They are to be removed as soon as "it is economically feasible to do so". While the controls are in force, the economy is being pressed into an inflexible structure, decided bureaucratically and not by market forces which respond to the demands of producers and consumers. As soon as firm controls are removed or watered down, the cost and price pressures that have been building up will start a new

WINDOW ON THE WORLD

on to achieve balanced and satisfactory economic growth *without* inflation — a point which J.K. Galbraith has been stressing for years and which most politicians and economists have rejected. But Nixonomics implies the validity of Galbraithian reasoning.

Galbraith says that about half of US private production comes from some 2,000 large companies and another half from some 12,000,000 farmers, small merchants, small manufacturers, independent enterprises, professionals and service enterprises. In this half the market still works and it is this half that feels most the impact of anti-inflationary action.

The big corporations together with the big unions set the wage-price pattern. Most of the time they resist government efforts by fiscal and monetary policies to reduce inflation. Unions keep asking for higher wages as unemployment rises. The big corporations pass on increased costs in higher prices, even in a recession. Reduction in de-

demand, would reduce prices or even keep them from increasing. The large corporations now set their prices. And unions now had the power to seek the wage increases and associated gains that it is the business of unions to obtain. And as unions became a commonplace of life, corporations no longer found it possible or wise to resist wage increases. ... The reduction in aggregate demand by which Keynesian policy expresses itself, unless applied with extreme severity, no longer affected the ability of the strong union to get wage increases or the strong corporation to pass them on in its price."

Galbraith asserts that, for the first time in US peacetime history, Nixonomics acknowledges the market's failure and puts forward a programme of public planning to counteract private planning. He says:

"The action of President Nixon is the culminating step in a long, though still only dimly perceived, process by which practical economic policy has

round of inflation—exactly the stop-go that has proved ineffective over the longer term in Europe. Neither are Canadians ready to accept Galbraith's proposals of continuing selective controls.

Secondly, business leaders and a large sector of the general public and members of both political parties support price and wage restraints, but the unions doubt its equitableness and effectiveness. Union leaders have agreed to serve on the Tripartite Pay Board: How long will they co-operate? Sooner or later a confrontation is likely to occur. The unions may find that they cannot support the Administration's objective of keeping wage increases in line with productivity increases, with differentiation between industries (i.e., wage increases above productivity growth in some industries and below in others, with the average approximating to national productivity increases). When this happens, the US incomes policy is likely to break down, as President Nixon recognised when he said: "The experience in other countries, which have tried wage-price restraints has been that, without the support and co-operation of organised labour, such programmes inevitably break down".

Thirdly, one of the major objectives of the anti-inflationary measures is to increase the competitiveness of US industry at home and abroad, and to increase employment. While there are some indications that over the short term the steps taken do induce growth, there is a possibility that wage and price restraints, if not fully supported by all sectors, will in fact be deflationary or anti-growth. This is particularly probable when the US economy is operating significantly below capacity (i.e., when the gap between potential GNP and actual GNP is substantial), a situation facing the US in 1972, and likely also in 1973. When businessmen find that the economy is not expanding as much as they were led to believe it would, they revise their expansion plans, and the rate of increase in the new jobs created slows down.

III

International Problems

When the US government introduced the 10 per cent surcharge on imports they made it clear that they meant this to help the balance of payments and would remove it if other countries re-

valued their currencies and ended "unfair" trade restrictions.

In response, some countries allowed their currencies to move upwards, particularly West Germany, Japan, and Switzerland; others, such as France, ignored the American request. The Canadian dollar, which earlier had moved close to par with the American, changed little in value after 15 August, 1971. Officially, all the major currencies were floating, though in fact they were not floating freely.

Although there was some response on the monetary side, the President's programme brought worldwide resentment and bewilderment. That economic growth was slowing down in most of western Europe and in Japan increased the possibility of damage and, consequently, the resentment.

Britain was facing an unemployment peak of about one million by the end of 1971, a 30-year high, and had the highest rate of inflation in Europe. West Germany expected that her exports to the USA might decline by as much as 30 per cent as a result of the 10 per cent surcharge and the revaluation of the mark. Unemployment, while still low, was on the rise. The motor, metal and steel industries were experiencing production cutbacks. Concern about a possible recession was spreading.

Italy's plight

Industrial production in Italy, plagued by strikes, absenteeism, uncertain export prospects, and business pessimism, fell by 3 per cent, while prices continued to rise. Unemployment and inflation were only too apparent. Switzerland faced a balance-of-payments deficit, the first in ten years. Sweden found herself in the worst slump since the 1930s, with high unemployment and inflationary pressures; Denmark faced foreign exchange problems and was forced to impose a temporary 10 per cent surcharge of her own. Only France, among the large European countries, seemed to be holding her own, with real economic growth expected to be about 5 per cent for the year. Japan's rate of economic growth, 12 per cent in 1969 and 11 per cent in 1970, was slowing in 1971, possibly to about one half the rate of 1970-71. This, considered to be a recession, prompted Japan to launch public capital spending and to reduce taxes to stimulate consumer buying.

The less-developed countries were

also concerned about the new US economic policies. While some 70 per cent of their exports to the USA were exempt from the 10 per cent surcharge, the remaining 30 per cent, consisting of manufactured products, were not. Further US economic policies created uncertainty among the trading nations and this meant possible cutbacks of purchases of raw materials and agricultural products from the less-developed countries, which were thus threatened directly through some loss of sales to the USA and indirectly through loss of sales to third countries. On top of this, they were about to suffer a cutback in external aid from the USA. The combination of these factors was ominous since the developing countries were facing rapidly rising unemployment, and this was coming to be recognised as even more serious than slow long-term economic development.

search for solutions

Attempts to find solutions were at three levels. First, internationally, Ministers of Finance and Governors of the Group of Ten met to try to find both short and long term solutions. Inconclusive, even acrimonious at first, these meetings resulted before the end of 1971 in an interim working agreement for the international monetary system. On a regional basis, EEC countries searched for common ground with the USA and, on a bilateral basis, discussions were held between the USA and their major trading partners.

The arguments centred on the restructuring of an international monetary system based on fixed exchange rates pegged to the US dollar, which in turn was tied to gold; and this led on to discussion of whether the USA should devalue or other countries revalue. This the USA at first refused. The Germans, Japanese and some others seemed willing to go even further in their currency revaluations if full accord could be reached. The French refused to revalue, although willing to accept a revaluation of the French franc to the extent that the USA increased the dollar price of gold. Apart from the French, most of the USA's trading partners feared that too great a revaluation would cause them balance-of-payments deficits and depressed economies. The Germans had (and perhaps still have) a particular bone of contention with the French.

The debate in the months after August is still important because, although an

interim settlement was reached and the immediate threat of a trade war was removed, the tensions implicit in the arguments are likely to recur. An adjustment of trade and payments of the magnitude required to bring the US balance-of-payments deficit to an acceptable level cannot take place without hurt to some countries. And when a country's industries are hurt it is tempted to retaliate. Thus, despite the enthusiasm which greeted the outcome of the Group of Ten meetings of 17-18 December, cause for concern remains.

The confrontation between the USA and their major trading partners took this form. The USA said that they would not drop the surcharge until they could see a clear possibility of eliminating their balance-of-payments deficit. They argued that the onus was on the rest of the world to put forward proposals for a solution of the USA's monetary and trading problems. Though opposed to bilateral or regional solutions, the USA's representatives threatened that they would make such arrangements on a country-by-country basis as they deemed necessary in the interests of the USA.

living beyond means

On the other hand, the USA's trading partners maintained that the USA had lived beyond its means, and had pursued neither effective anti-inflationary policies nor adequate efforts to increase domestic productivity. In effect, the USA was asking the world to pay for its failures and over-extension. The rest of the world were not prepared to accept the US proposal for a turn-round of \$13,000 million in their balance of payments and found it particularly irritating that the USA included in this figure a margin to allow continued capital outflow to enable US corporations to acquire control of overseas industries.

The case of Japan shows that the currency realignments agreed are no more than a halfway house. The Japanese have revalued the yen by 16.88 per cent against the dollar. Assuming that productivity continues to improve at the differential rate that has prevailed between these two countries in recent years (some 5 per cent), this would mean that within four years the USA would again be faced with exchange difficulties *vis-a-vis* Japan. Should the Japanese then be required to undertake a further revaluation to reflect the

underlying economic forces that determine the relative strength of one national currency *vis-a-vis* another?

Most nations have criticised the USA's New Economic Policy. They were unhappy because (1) it hurt their pocketbooks, (2) they claimed that the USA expected them to pay for US blunders, (3) some of them thought that, as friends, they should have received special consideration, and (4) at the protectionism of the 10 per cent surcharge, which was contrary to GATT and appeared to signal the end of trade liberalisation.

These criticisms reflected the genuine feelings of many of the USA's partners. But, in Professor Firestone's opinion, they overshadow the positive aspects of the New Economic Policy, which he thinks, opens up opportunities to come to grips with the new reality of international economic relations. To mention just four of these:

(1) The suspension of convertibility of US dollars into gold, and the freeing of the dollar to adjust its value, makes it imperative for the world's trading nations to improve the existing but outdated international monetary system. In the past it was easier to defer than to take action. This is no longer true.

(2) The 10 per cent import charge made it necessary for the industrialised

nations to recognise that they too have responsibilities (more than they have admitted in the past) and that currency values should reflect the basic underlying forces of national economic strength and trading advantages. The realignment of currency values and the further breaking down of trade barriers must encourage expansion and diversification of world trade.

(3) The Domestic International Sales Corporation arrangements will encourage some US firms to stay at home and build up the US economy instead of buying up foreign companies. Complaints about American economic domination have been persistent. Now complaining nations have the opportunity to show what they can do, drawing on their own resources, know-how and ingenuity.

(4) The USA's price and pay restraint measures are an attempt to tackle continuing inflationary pressures. If the USA is successful, two benefits will flow: (a) other nations will no longer be importing inflation from the United States; (b) US incomes policy is effective, the experience may help other countries to pursue more realistic policies themselves.

In other words, Professor Firestone seems to expect that President Nixon will make J.K. Galbraith's proposals for continuing price and wage controls part of Nixonomics. He is an optimist.

Eastern Economist 25 Years Ago

APRIL 25, 1947

The Report of the Select Committee on the Banking Companies Bill, 1946, was presented to the Legislative Assembly about the middle of February this year, but it was crowded out of consideration during the session by more urgent measures of legislation. Enactment thus stands postponed even at the end of three years. The Bill itself has been before the public for a long period and widely discussed. It is therefore on the several important new provisions and alterations made by the Select Committee that attention should centre. The definition of 'banking' has in no country been evolved in such manner as to secure general acceptance. The definition contained in section 277F of the Indian

Companies Act gives rise to administrative difficulties particularly in determining the 'principal business' of a company. In the 1939 draft prepared by the late Sir James Taylor, banking was defined as "the accepting of deposits on current account or otherwise subject to withdrawal by cheque. In the subsequent bills it was defined as "the accepting of deposits repayable on demand". The Select Committee considers this last definition to be too brief and unsatisfactory and replaces it by the one which reads: "the accepting for the purpose of lending or investment, of deposits of money from the public, repayable on demand or otherwise, and withdrawable by cheque, draft, order or otherwise".

In the Shadow of Dollar

E. B. Brook

Vienna.

ALTHOUGH most of the loudest noise in western Europe comes at present from West Germany where a crucial election is to be held on April 23 with heavy accents on conditions for east-west relaxations in Europe, the most significant fronts are building up not within Europe but between western Europe and the United States.

This is very much a year of developments. Having overcome the hesitation whether the Common Market was to be enlarged or not, Europe is now seeking to consolidate itself economically and politically not in the face of the eastern socialist states but in face of the United States.

The reason for this essentially is money and its worth; secondly, the obvious desire to counter the USA and the USSR with some form of western European confederation; thirdly, the world pattern of trade.

The basic position is that western Europe is full of US dollars, is increasing its tally of dollars involuntarily and unwillingly every day and that the near prospect is that the USA will lift its controls on US capital investment abroad rather than tighten them. In the matter of dollars, the west Europeans, including — now — the British, are a collection of very alarmed and most indignant men. But their indignation will do them no good because it is of the helpless type.

angry rebuttal

The Europeans insist angrily that some degree of "convertibility" must be restored, that this was the intention of the Washington currency agreement of December 18; but the USA has steadily remained in deficit, has paid out no gold or any other form of monetary assets. On the contrary, it is now insisting that Britain repays a larger part of its IMF loan in Special Drawing Rights than London is willing to undertake.

Bankers and finance ministers in Europe may fume against Washington's financial immorality (as they see it) but the USA is concerned more about other things than convertibility or even the success of the new exchange rate of structures.

The chief concern of the US President is to get himself re-elected to that office in November; the chief objective of the US administration is, partly for

this reason, full employment in the USA, secondly, international trade and only more remotely the structure of world currencies. Since the percentage of employment in the USA, as elsewhere, depends partly on trade (less than in many countries) the US Treasury led by the forceful Taxan of Irish origin, Mr Connally, is getting ready to use its strong position in international money matters in a resolute, if not tough, manner. The strength of the American position is that the US export industries would not be hurt much by another period of floating exchange rates while those of west Europe and Japan would be badly affected. The USA can well afford to wait a year or two before its balance of payments shows improvement—its contemporaries in west Europe and east Asia cannot.

clash of interests

It is essentially and acutely on this point where the interests of the USA and west Europe (and Japan) clash. Trade, to be profitable to the USA and useful in increasing its employment level, must be free; trade, to be profitable to the Common Market and Japan, must continue to be protected by policies discriminating effectively if not directly against the USA.

At the moment the USA is irritated by the complete lack of progress in negotiations between western Europe, the United States and Japan on trade liberalisation which is being handled with maximum diplomatic delay by a "high level group" in Paris. Established last autumn, the group is supposed to explore ways of liberalising trade over the next ten or twenty years but progress has come to a halt. There is also no move forward to a temporary arrangement for next year's trading. Some delegates, particularly the French, either remain silent at the sessions or fail to attend them. The British also have been almost completely negative.

The Americans are getting ready to bargain with west Europe on the basis of expressing willingness to negotiate on a new monetary system providing west Europe's Common Market will relax its defensive, protectionist trading attitudes. If pressed, the US Treasury might be willing to release some gold to the dollar-stuffed Europeans to obtain an easier trading market.

While Europe prepares also with

plans, led at present by France, for an economic and financial union aiming to free Europe from harmful US economic influences, it is alarmed by hints from Washington that it will lift controls on US capital investment abroad. This policy is almost certain to be adopted by the USA and phased to promote the maximum effect in Europe.

To European complaints about their huge dollar stocks the USA replies with a suggestion that if Europe does not like holding dollars it can run down its holdings out of a payments deficit with the USA, an idea that is absolutely unacceptable in a Europe whose export industries and structures of employment are geared to payments surpluses. Only one European voice, that of the Bank of Italy, has spoken in favour of the enlarged European Community floating in unison in relation to the US dollar and downwards if necessary.

The prospect at present is that western Europe will continue to hold more and more dollars and will be obliged to absorb more American investment. It will continue to remain in a weak bargaining position, whatever the size of the Market, so long as payments deficits are regarded as disastrous and not as a reasonable method of ridding itself of excess dollars.

the basic fact

This appears to be a basic fact which not all present plans, to be formalised when the ten Common Market heads of government meet in Paris next autumn, are likely to be sufficient to dissolve. The French President, M. Pompidou, will doubtless win a resounding majority in favour of the Market's expansion and a massive endorsement of his policy of a European confederation in the referendum to be held on April 23, the same day as Germany votes basically over its east European policy. The French vote may move the confederation forward from an idea towards becoming an accomplished fact; it may move France forward to a challenging position of leadership within the Common Market, but it will do little to increase the effectiveness of west Europe's self-protectiveness against American trading unless the fear of payments deficits and their inevitable result of economic internal reorganisation is overcome.

For several weekends

now quite a number of people of all kinds and descriptions have been saying that cabinet changes are only a matter of hours. It has been said of almost every Monday that its morning newspapers would carry the names of the 'ins' and the 'outs'. This speculation reached fever-heat the other day when it was announced that the Prime Minister would be taking a couple of days off for a holiday in Dehra Dun. It was promptly concluded that Mrs Gandhi was taking herself away from New Delhi in order to think quietly about the seeding or the weeding that she might do.

By now, however, it has become clear enough that cabinet carpentry is not among the Prime Minister's more urgent preoccupations. She probably attaches less importance to this matter than most others do. Mrs Gandhi of course has good reason for adopting such an attitude. In the last two years her council of ministers has come to mean little and count for even less as the governing factor in the administration. Mrs Gandhi has been making policy or functioning otherwise as Prime Minister without depending to any great extent or even drawing significantly on her ministerial colleagues. She has put together her own establishment of counsellors or executors and it is largely in discussion with them that the policy decisions are being taken and the processes for implementing those policies worked out. Like Mr Nixon in the White House, Mrs Gandhi at 1, Safdarjung Road has chosen and learnt to work through a personal secretariat which is outside and also above the regular structure of administration. Such system has its disadvantages as well as advantages, but right now I am not concerned with either. The point I am trying to make is the limited one that, given the situation I have just described, the Prime Minister would naturally attach less importance than many others may to the matter of cabinet changes, which may appear to her to be a minor exercise of power or patronage or even a digression, diverting

or otherwise, from the more rewarding pursuits of her office.

An autobiographical

sketch of Indian Airlines, circulated for the benefit of the press, quotes with pride, Mr Stephen Wheatcraft, an air transport economist, who has suggested in a study prepared for the World Bank that, had this airline not been there, the country would have needed at least 3,500 more top civil servants and 9,000 more top business executives of the same calibre as the existing ones to compensate for the time lost in travelling by the fastest alternative modes of transport so as to maintain the national economy at its present level. Whether we accept Mr Wheatcraft's assumption that all the air travel that is being done now by civil servants or even business executives is relevant to the functioning of the national economy or we do not, Indian Airlines evidently is only too willing to accept his arithmetic. In that case the management of the airline and the Civil Aviation Ministry must also agree that the disruption of

Indian Airlines flight schedules, which has lasted for many weeks now, must necessarily have done a great deal of harm to the national economy. If this be granted, the question would arise whether the Minister for Civil Aviation specifically and the government of India generally are justified in dealing with the go-slow tactics of the maintenance engineers in the leisurely and casual manner they seem to have adopted.

Here is a collector's

item about the Indian Posts and Telegraphs Department. On February 22, 1966, I wrote an inland letter to a New Delhi address. This came back to me last week, without any indication why the letter was not or could not be delivered to the addressee. To add spice to the incident, the postal department simultaneously demanded and obtained a payment of 20 paise on the ground that this inland letter (which, as I had mentioned earlier, had been posted in February 1966) bore only a ten-paise stamp (which, of course, was valid postage at that time) instead of a 15-paise postage stamp (which is the valid postage now) and also that it did not bear the five-paise refugee relief stamp (which, incidentally, could not even have been dreamt of in 1966). The postal marks reproduced elsewhere on this page may perhaps prompt some of us to speculate on what could have been happening to this letter during all those six years and more of its underground existence.

MOVING FINGER

TRADE WINDS

Export Priority

THE UNION government has formulated a scheme for making steel available either from indigenous sources or by imports, to the extent necessary, to meet the requirements for export production in respect of exports of engineering goods during 1972-73. In the case of imported steel, the supplies will be made by Hindustan Steel Limited against release orders issued by the licensing authorities. The supplies of imported steel will be at the Joint Plant Committee (JPC) price plus a small additional charge. The Chief Controller of Imports and Exports will be issuing the necessary public notice containing details of the scheme and the procedure to be followed by exporters. This scheme will also necessitate suitable adjustments in the entitlements of registered exporters who participate in the scheme in respect of the specific export contracts.

G.I.C.

Gujarat Industrial Investment Corporation Ltd recorded its maiden profit of Rs 1.94 lakhs during the period January, 1970 to March 31, 1971. During the period the Corporation gave assistance to the extent of Rs 5.44 crores spread over 211 units out of a cumulative assistance of Rs 11.53 crores to 303 units. The Corporation has broken new ground in sanctioning loans to competent technicians. The Corporation financed the projects of technicians to the extent of Rs two lakhs in case of an individual technician and Rs three lakhs in case of more than one technician in partnership. The corporation has

already assisted 585 projects under the Technicians' Scheme amounting to a total financial sanction of Rs 4.51 crores till the end of March, 1971. In order to see that the rural areas get servicing facilities, the Corporation started a Rural Workshop Scheme. For this purpose, a number of centres were selected in the state in consultation with the district authorities, and rural workshops were established—total 113 in number—throughout the state. Till the period ended March 1971, the Corporation had sanctioned financial assistance to the extent of Rs 26.16 lakhs to 113 units under this scheme.

In yet another dimension of its investment activity, the Corporation has entered the project field directly for launching industrial projects either by itself or in collaboration with other business houses. The Corporation has secured letters of intent for the manufacture of fuel injection equipment, fuel pump testing machines, automobile tyres and tubes and several chemicals. With these projects materialising, an investment of around Rs 40.00 crores is contemplated leading to a product pattern of over Rs 100.00 crores.

Newspaper Industry

The union government has decided to set up a fact-finding committee to go into the economics of newspaper industry. Dr. Babhtosh Dutta, Retd. Professor of Economics, Presidency College, Calcutta, is to be the chairman. Mr R. Rajagopalan, Chief Cost Accounts Officer, Ministry of Finance, Mr K.C. Raman, Retd. Production Manager, M/s Bennett Coleman & Co. Ltd and Mr I.P. Gupta, Officer on Special Duty, Central

Board of Direct Taxes are the members. Mr G. Govindan, Registrar of Newspapers for India, is the Member-Secretary. The Committee will ascertain all the elements of the cost of production of the daily newspapers; ascertain all the different elements of the total revenue earned by the newspapers; study these trends during the past few years and forecast, to the extent possible, the normal changes likely to occur in the next year or two; evolve norms for different elements of expenditure from the point of view of reasonableness combined with efficiency and record its findings in regard to the effect of restriction of newspaper supplies to different categories of newspapers.

The committee will consult newspaper managements and also working journalists, non-journalist workers and any other interested group that it may consider desirable to consult. The committee will report its findings not later than six months from the date of its constitution.

Railway Finances

A Parliamentary Committee known as the Railway Convention Committee has been appointed through a Resolution passed by both Houses of Parliament. The Committee will "review the rate of dividend at present payable by the Railway Undertaking to General Revenue as well as other ancillary matters in connection with the Railway Finance vis-a-vis the General Finance". Mr R.K. Sinha, MP, is the chairman of the committee. Public bodies, industrial, commercial and social welfare organisations, chambers of commerce and industry, institutes of management and other associations

and individuals having knowledge and experience of the working of Railways (including former Railway employees) who are desirous of submitting memoranda on the working of Indian Railways for consideration of the committee should send 40 copies of each memorandum to reach the Secretary, Lok Sabha, Parliament House, New Delhi on or before May 6, 1972. The committee would be particularly interested in suggestions to (i) improve the working of the Railways, (ii) step up the earnings, and (iii) reduce the working expenses.

India and E.E.C.

Mr L.N. Mishra, union Minister of Foreign Trade, who was in his way to Santiago, to lead Indian delegation to UNCTAD-III discussed recently with Mr H. Alphand, Secretary General of the French Ministry of Foreign Affairs the role France could play in persuading the EEC member countries to conclude at an early date the proposed Commercial Co-operation Agreement. This country had submitted to EEC an aide memoire in this connection some time ago.

The Commercial Co-operation Agreement is expected to provide a larger framework of co-operation covering different facets of economic relationship. Mr Mishra is understood to have asked Mr Alphand to use his good offices for EEC to find satisfactory solutions to offset the adverse effects on India's export trade consequent on the UK joining the EEC and the preferences becoming unavailable to this country. Only half of India's total exports to the UK are covered under the Generalised System of Preferences (GSP). Since a Commercial Co-operation Agreement was likely to take time it was suggested that the UK should accord a standstill arrangement in the present pattern of trade till 1975

like the one for Africans and Caribbeans.

Employment of Educated

The budget estimates of 1972-73 for the Ministry of Education and Social Welfare contain additional provision for employment of educated personnel, according to the annual report of the Ministry of Education and Social Welfare for 1971-72. As against the budget estimates for provision of general education, employment of educated personnel etc., of Rs 91.25 crores for 1971-72 for the Department of Education, the revised estimates for 1971-72 are Rs 91.42 crores and the budget estimates for 1972-73 are Rs 109.80 crores (provisional).

India-Ceylon Co-operation

At the recently held second meeting of the Indo-Ceylon Joint Committee for Economic Co-operation matters of mutual interest were discussed and it was agreed that economic co-operation between the two countries should be further strengthened. The Minister of Industrial Development offered the services of experts or technical assistance which might be needed in connection with Ceylon's schemes for industrialisation. Meetings of the Indo-Ceylon Joint Committee on Economic Co-operation were held between Mr Swaran Singh, Minister of External Affairs, and Mr C. Subramaniam, Minister of Planning, on the Indian side, and the Mr T.B. Illangaratne, Minister of Foreign and Internal Trade, on the Ceylon side. The Indian side confirmed that they would buy copra, graphite, arecanuts, cloves, chanks and cocoa in the quantities which had already been agreed to and would also examine the possibility of buying tyres and tubes. (A GOVT. OF INDIA UNDERTAKING)

davp 770(7)/71

Indian delegation offered assistance for the preparation of project reports in two hydro-electric schemes and suggested that the power grids of the two countries should be linked together in their mutual interest. The Ceylon delegation expressed appreciation of the feasibility reports prepared by Indian experts for the setting up of industries based on raw materials which were available in Ceylon, viz., glass, refractories, graphite, rubber goods, and mica.

Credit to Rice Mills

In view of the need to encourage use of modern equipment by rice mills and in accordance with the government's policy of encouraging the use of rice bran oil in the manufacture of vanaspati, the Reserve Bank of India has advised the scheduled commercial banks that they may grant, on merit in suitable cases, medium-term credit for, (i) the modernisation of the existing rice mills or installation of new units, and (ii) the establishment of rice bran solvent extraction plants which use pure rice bran for the extraction of rice bran oil. The restrictions imposed by the Reserve Bank on advances to rice mills against foodgrains would not be applicable to the extension of medium-term credit by banks to rice mills and rice bran solvent extraction plants.

Coal for Burma

The Minerals & Metals Trading Corporation will export a substantial quantity of steam coal along with a small quantity of hard coke to Burma during the current year. A high-power delegation led by Mr Thakin Sein Maung, member, Executive Committee, the Trade Council, government of the Union of Burma, visited this country on the

invitation of the MMTC and a contract was concluded, on April 1, 1972 by Mr C.R. Das, Director, MMTC and Mr Thakin Sein Maung of Burma. By exporting coal to Burma, MMTC will earn foreign exchange worth about Rs 1.4 crores.

Delegation to Cairo

A trade delegation, led by Mr S.J.S. Chhatwal, Director, Ministry of Foreign Trade, left for Cairo on April 16, 1972, for mid-term review of the working of the present trade plan. These talks were expected to last for a week. The delegation also proposed to explore further avenues for expansion of trade between the two countries.

Chemicals Export

With its latest consignment to the UK, Warner-Hindustan's exports of specialist basic organic chemicals (Alpha Picoline, Pyridine and bases) reached 203 tonnes. Warner-Hindustan took concrete steps towards gaining self-sufficiency in this field. The chemicals plant at Hyderabad, built at a cost of over Rs one crore has the distinction of being the only one of its kind in this country. This plant was designed to meet the entire home demand for these basic chemicals — imports of which used to cost the nation Rs 10 lakhs in foreign exchange every year.

Hanover Fair

The Hanover Fair, founded in 1947, with an area of 18,800 sq.m. in exhibition halls and 2,700 sq.m. open space, has now grounds of almost one square kilometre in size, and comprises an area of 470,000 sq.m. rented stand space, of which 295,000 sq. m. is in 22 exhibition halls. At the first

Fair in 1947, there were 1,300 exhibitors, whereas, today more than 6,500 firms are represented, of which almost one-quarter are foreign exhibitors from more than 30 nations. The ever-increasing number of visitors to the fair now come from more than 100 countries. Of great significance also are the trade conferences, which are held during the fair every year, representing an essential supplement to the range of exhibits in the individual branches. The 1972 Hanover Fair is being held from April 20 to April 28, 1972.

Rabi Procurement

The two-day Chief Ministers' Conference on Rabi Procurement and Prices and Land Reforms was held in New Delhi on April 13 and 14, 1972.

I.C.M.A.

A meeting of the members of the Indian Chemical Manufacturers Association in the Eastern Region held in Calcutta on Friday April 7, 1972, re-constituted the Eastern Regional Committee for the current year with Mr B. K. Ghose as Chairman and Mr A. K. Sen as Vice-Chairman. The other members of the committee are: Mr N. G. Bangur, Dr N. K. Bhattacharya, Dr B. N. Ghosh, Mr K. P. Ghosh, Mr B. Himatsingka, Mr A. L. Mudaliar, Mr A.N. Ray, Mr Kalyan Sen, Mr S. C. Sarkar, Mr S. N. Tandon and Mr Venkat ramanan. It was also decided to invite Mr. C. D. Thakkar and Mr A. Das Gupta to all meetings of the committee.

K.L.M.

KLM has sold its last two DC-8-33 jet aircraft. The new owner is the Venezuelan airlines VIASA, with

which KLM has been co-operating very closely for years now. The aircraft are the PH-DCB "Bali" and the PH-DCF "Java", both from the series of seven with which KLM entered the jet age in 60/61. The other five 33s had already been sold, so that the only DC-8s now owned by KLM are seven aircraft of the type 53, which have turbofan jet engines, a greater range and capacity; five DC-8Fs and eleven Super DC-8-63s.

The KLM fleet, which, not counting the "Bali" and the "Java", consists of 50 aircraft—including 7 Boeing 747Bs—will be joined in November of this year by the first of the six Douglas DC-10 wide bodies which have been ordered.

Names in the News

Mr S.P. Mandelia, President of Century Rayon, was unanimously elected President of the Bombay Management Association for the year 1972-73. Mr Mandelia is the Chairman of the Textile Council of the All India Manufacturers' Organisation.

Mrs Sumati Morarjee, Executive Director of the Scindia Steam Navigation Co. Ltd, has been elected Chairman of the Coastal Conference of Indian Ship-owners. Mr A. Ramaswami Mudaliar, one of the founders and chairman of the Conference since 1954, resigned due to his indifferent health.

Mr M.S. Oberoi has been elected a member of the Rajya Sabha. He controls nine luxury hotels in India and operates the prestigious 600-room Oberoi-Imperial in Singapore and the five-star Soaltee-Oberoi in Nepal. Construction on his hotel in Ceylon will also start soon.

COMPANY AFFAIRS

Madras Rubber

MADRAS RUBBER Factory Ltd has received a letter of intent to start a tyre unit in Goa with a capacity of three lakh tyres and tubes. With this new letter of intent the company will have the privilege of being the second largest licensee for manufacture of tyres in India. The company is maintaining its meritorious record in the field of exports and the government has recently announced its intention to award a Certificate of Merit for MRF's excellent export performance for the year 1968-69. Meanwhile the company is strengthening its export base and a number of steps have already been initiated in this direction including marketing surveys abroad and additions to the existing range of products. This was disclosed by the Chairman, Mr K.M. Cherian, while addressing the annual general meeting of the company held recently.

Continuous efforts are being made by the company to achieve self-reliance in the fields of raw materials, capital goods and tyre technology. For instance, for the new factory unit in Goa the company will be importing capital goods worth only Rs 1.15 crores. The remaining machinery will be fabricated locally by the company's engineering staff with technical assistance available from Mansfield.

The 96-day-old strike in the factory during 1970-71 resulted in a considerable loss of production. But the factory is now working satisfactorily. Sales in the first five months of the current year have exceeded the corresponding figures of last year by a significant margin

and if this uptrend is maintained the annual sales during this year are expected to surpass last year's sales by about 40 per cent. The company also hopes to complete the expansion of the Madras factory to 6.1 lakhs units from 3.6 lakhs as originally planned. Besides the management has entered into an agreement—effective from October 1, 1971 to September 30, 1975—with the labour regarding revision of wages, dearness allowance, incentive bonus and certain other benefits.

Philips

Philips India Ltd continues to maintain its proud record in the field of design and development of new articles, improvement of existing products and of production processes and towards import substitution and cost reduction. The company has submitted to the government a comprehensive plan indicating the areas that it proposes to enter in the next few years and the products involved. The plan envisages substantial new investments incorporating greater diversification, particularly in the area of professional electronics. Hence the growth of the company in the coming years will be more remarkable than that recorded so far.

While the approval of the government is awaited, the company is already turning out sizeable quantities of a wide range of electronic equipments and accessories. The telecommunication factory at Calcutta worked at its planned level of production of fully transistorised portable trans-receivers which are being supplied to the government and the order is expected to be completed in 1973. The produc-

tion of electronic instruments and public address systems continued at a high level at its unit in Bombay. Plans are afoot for the production of tape recorders for which the company holds a letter of intent. Another letter of intent has also been received by the company for the production of null indicators.

Production of radio sets was maintained at a satisfactory level during the year. The company's unit at Calcutta has commenced a fully integrated production of record players. Among the models introduced is a stereo-electrophone of a more indigenous design. The company also introduced fluorescent lamps with triple coil electrodes and anode rings to replace the double coil lamps.

The production of special fluorescent lamps with built-in reflector coating (TLF) was taken up. Plans have reached an advanced stage for production of high wattage incandescent lamps, mercury vapour lamps, halogen lamps, infra-red lamps, and krypton miners' safety lamps and to expand the production capacity for mercury discharge burners used in the production of mercury vapour lamps.

The company is issuing shortly 1,330,000 equity shares of Rs 10 each at a premium of Rs 15 per share. The foreign collaborators will take 294,000 shares in conversion of their loan; 420,000 shares will be issued for cash on a rights basis to the existing Indian shareholders; 92,400 shares will be issued for cash to the whole-time Indian directors and employees of the company and 523,600 shares will be offered for cash to the

Indian public. After the issue 40 per cent of the total issued and paid-up share capital will be held by the Indian public.

The working results of the company during the year ended December 31, 1971, are quite encouraging. The profit before tax after providing for depreciation was significantly higher at Rs 11.57 crores as against Rs 6.72 crores in 1970. The provision for depreciation was raised from Rs 1.10 crores to Rs 1.28 crores while taxation claimed Rs 7.70 crores as against Rs 4.27 crores in 1970. The profit after tax amounted to Rs 3.87 crores, which was higher than the preceding years' figure by Rs 1.40 crores. The directors have recommended a final dividend of Rs 1.40 per share which with the interim dividend brings the total distribution for 1971 to Rs 2.40 per share.

Kamani Engineering

Mr P.R. Kamani, Chairman, Kamani Engineering Corporation Ltd told the shareholders at the annual general meeting held recently that the turnover of the company increased to about Rs 15 crores during 1971 as against nearly Rs 14 crores in 1970 and the company was able to maintain production at the previous year's level. Profit during the year was recorded at around Rs 42.24 lakhs. Mr Kamani pointed out that the company had developed certain specialised items for rural electrification and had executed orders for these items to the extent of about Rs 40 lakhs. The company's rolling mills project was progressing satisfactorily and trial production was expected in April this year. The IDA, he said, had granted a substantial loan for transmission line projects in the country. The government too had detailed

plans for inter-linking various power systems in order to cope with shortage of power in several regions. Mr Kamani, therefore, expected appreciable improvement in the orders in regard to supply and construction of towers.

Mr Kamani mentioned the shortage of steel which affected the production of the company to a considerable extent. Some positive steps taken by the government, he added, had redeemed the situation only to a limited extent. The banning of the export of prime steel and import of steel in order to meet the export obligations had been steps in the right direction. Some other meaningful attempts to step up indigenous production had also been made, he stated.

Nevertheless the situation caused anxiety because there was the need to reduce the level of imports and the time lag between the efforts and results in the matter of raising domestic output was considerable. He pointed out that management of an organisation of this size and complexity, needed a high degree of sophistication.

As an integral part of their efforts to modernise their managerial systems and techniques, the company had computerised a number of its operations covering such areas as designing, planning and control, and financial accounts. Recently, in order to widen the area of application, the company decided to have its own in-house computer. Acquisition of this facility would help greatly in maintaining the technological parity with its competitors in other parts of the world, he added.

Aruna Sugars

Mr K. Palani, Chairman, Aruna Sugars Ltd. indicated recently that the company completed its expansion and

shortly the company's crushing capacity would increase to 2,000 tonnes of cane per day. The board of the company, he pointed out, was considering to increase the crushing capacity further to 3,000 tonnes of cane per day at a cost of Rs one crore. In that case the company would be in a position to crush nearly 400,000 tonnes cane against 280,000 tonnes during the current season. During the year 1970-71, he pointed out, the company worked for 209 days and crushed 247,036 tonnes of cane and produced 231,288 quintals of sugar with a recovery of 9.27 per cent, as compared to 555,543 tonnes of cane crushed and 214,474 quintals of sugar produced with a recovery of 8.24 per cent during the previous year.

Though the cane crushed was lower by 3.3 per cent the sugar produced went up by 7.8 per cent due to better quality of cane available for crushing, consequent on the various developments made in the cane area and efficient working of the factory. The profit and loss account disclosed a net profit of Rs 28.04 lakhs after providing Rs 17.44 lakhs towards depreciation against the net loss of Rs 7.42 lakhs during the last year. A sum of Rs eight lakhs was transferred to the development rebate reserve and Rs 20 lakhs to the general reserve. The general reserve stood at Rs 25 lakhs as on September 30, 1971, out of which payment towards dividend amounting to Rs 12.06 lakhs, if approved by the shareholders, would be made.

Mr Palani informed the shareholders at the annual general meeting that the company had become the holding company of Arvind Distillery (P) Ltd, a company incorporated for manufacturing arrack. The project was estimated to cost about Rs 30 lakhs. The

company had invested Rs five lakhs in the capital of that company and as per the present programme, the Arvind Distillery (P) Ltd was expected to go into production shortly.

Blue Star

Blue Star Limited recently signed a licencing agreement with Yusuf A. Alghanim & Sons, Kuwait, for the sale and technical know-how and patent right for the manufacture and sales of Blue Star water coolers in Kuwait. Blue Star have been in refrigeration and air conditioning for over 30 years. Blue Star was the first Indian manufacturer to export water coolers. Today, Blue Star water coolers are sold in 17 countries of the world.

Bayer

The directors of Bayer (India) Limited have decided to increase the authorised capital of the company from three crores to Rs five crores subject to approval of the shareholders. The directors have also decided to capitalise the sum of Rs 60 lakhs subject to the approval of the Controller of Capital Issues, the Reserve Bank of India and the shareholders, for distribution among the holders of three lakhs equity shares of Rs 100 each on such date as may be fixed by the board in that behalf as bonus shares in the proportion of one share for every five existing shares. Such bonus shares would rank pari passu in all respects with the existing shares and will be eligible for dividend that may be declared in respect of any financial year of the company commencing from and subsequent to January 1, 1972.

Canara Banking

The Canara Banking Corporation Ltd Mangalore, has made impressive progress in branch expansion,

deposit mobilisation, credit disbursement and advances to priority sectors during the year 1971. A record rise of 39.5 per cent in deposits was witnessed from Rs 22.41 crores on December 31, 1970 to Rs 31.27 crores a year later. The net profit of the bank after making the usual and necessary provisions including provision for taxation and payment of bonus to staff, is higher at Rs 6.22 lakhs out of which a sum of Rs 1.25 lakhs is transferred to statutory reserve fund. With the amount brought forward from the previous year's account, the total disposable surplus comes to Rs 5.10 lakhs. The directors have recommended dividends at 7.15 per cent p.a. and 6.43 per cent p.a. on five per cent first preference shares and 4½ per cent first preference shares respectively. Dividend at 10 per cent p.a. on equity shares will absorb Rs 2.50 lakhs.

The bank's 24 new branches were opened against two in the previous year, taking the total number of branches to 104 towards the end of 1971. Out of the 24 new branches opened as many as 19 branches are in unbanked centres. A classification of the branches on the basis of population indicates that 63 branches are in rural and semi-urban areas whereas the remaining 41 are in urban and metropolitan areas.

The bank is participating in the Lead Bank Programme in various districts under its area of operation. The bank has already opened a number of branches allotted to it under the Lead Bank Scheme. For the year 1972, the bank has drawn up a very ambitious branch expansion programme. The bank has already opened two branches since January 1972 and it has identified a number of growth centres with good potential.

Reviewed by ACADEMICUS

Management of Industry in India is based on the three lectures delivered by H.T. Parekh at the invitation of the University of Bombay under Prof. Vakil Endowment Lectures in Economics. In these lectures, the author has made an attempt to deal with the role of management at different stages of industrial growth in a country.

In developing countries where resources are scarce, the need for good and modern management has come to be recognised as an extremely pressing need. In India where the industrial structure has undergone substantial changes, there has been created new awareness of management problems. This being the situation, the reader takes up this book with great enthusiasm. It may be said at once that the reader is richly rewarded by its reading.

The first article deals with

the historical development of industries in India which commenced their operations about 115 years ago. The author has traced the development of Indian industries till the eve of independence as also the evolution of different forms of management — from family to the managing agency system. He has concluded that till 1947 management was still deemed to be "a matter of inheritance rather than acquired techniques." Trading rather than manufacturing operation was still the heart of the matter. With the growth of industrialisation, management groups had broadened, but almost entirely within the limitations of the family system. Naturally the system suffered from many limitations. "Close shareholder contracts insulated the managing group from outside shareholders. The choice before them, in case of dissatisfaction with management was

not the power to displace management, but to sell out their shares."

The second article is concerning 'Management under Planning'. Since 1951 substantial changes have taken place in the Indian industrial field. Rapid industrialisation in the country, passing of the Companies Act, the industrial policy statement of 1956 with subsequent amendments and foreign collaboration agreements characterise this period. Consequently the emphasis shifted to efficiency both because of the legal requirements and business environment. The result was increasing professionalisation of management where instead of family ties and linguistic loyalties possession of technical know-how and business efficiency have come to play an increasingly important role.

Parekh's third and final

article is on 'Management: Trends And Prospects.' Easily this is the best part of the book as the first two articles while full of information are of a rambling nature and lack proper co-ordination of ideas and logical presentation.

According to the author, in coming years industrial sphere is bound to expand along with the expanding public sector and increasing state intervention and regulation affecting, among other things, the ownership pattern of industry. Accordingly the Indian management will have to rise in coming years to the two-fold needs of professionalisation of its membership and qualitative changes that go with it and the vast increase in the supply of personnel needed in keeping with the expected growth of industries.

The author opines that the essence of professionalisation is the separation of management from ownership. Professionalisation of management which is already markedly evident in the private sector should in the nature of things also influence management patterns in the public sector. As a fact, professional management, whether in the public sector or in the private, will tend to be drawn from a single common national pool. According to the author, the distinction between the two sectors must gradually disappear, once professional management becomes the accepted pattern in industry. In view of the demand that may be made during the next twenty years which are likely to be exciting, the author wants that steps be taken to provide education in management at all levels, especially with a view to training local personnel.

Business management is in a sense one of the most im-

portant requirements of economic development of backward countries. It is only in recent years that its importance is being appreciated as its scarcity proved to be greater barrier to economic progress than other factors. H.T. Parekh has done well to deal with the various problems connected with business management. The presentation is direct, simple and lucid and therefore the articles are extremely readable.

Philippines, Taiwan

Both the Philippines and Taiwan suffered disruption to their economies in World War II. Since then both the countries have experienced rapid rates of growth of their national product. *The Philippines and Taiwan* contains separate studies of industrialisation policies pursued in these two countries.

It is found that in the Philippines the national product grew at an annual average rate of about 3.2 per cent between 1902 and 1961. This implies an annual per capita income growth rate of just under one per cent because the rate of population growth averaged a little more than 2.2 per cent. Of the major sectors, manufacturing led with 4.6 per cent annual growth rate, while agriculture and commerce grew at rates that approximated closely to the rate of population growth.

In the Philippines there appear to have been two periods of relatively rapid growth — between 1902 to 1918 and from 1952 to the present day. The two periods however present a fascinating contrast in patterns of growth.

The first period begins early in the era of American rule and closes at the end of World War I. This was a period of rapid growth in world output and trade and it must not seem surprising that the Philippines shared in it. What seems to have

been the most important influence during this period was not the war but the opening of the American market on a preferential basis to Philippines exports, mainly agricultural and agro-based products. This proceeded gradually with a 25 per cent preference until 1909, free trade with quotas until 1913 and fully free trade thereafter until the 1930s. This explains the rapid growth in this early period. Exports and agriculture both led with growth rates of about five per cent per annum. Manufacturing growth was only about four per cent. The picture is one of rapidly increasing agricultural production induced by export demand for raw and processed agricultural products. The case might seem to fit Myint's 'vent for surplus' theory of export-led growth. It is important to note however that it was the element of discrimination in the trading relationship between the Philippines and the USA that provided the principal inducement to agricultural exports. There were important repercussions of this agricultural growth on other sectors of the economy such as electric power, mining, forestry, transportation and communications.

As regards growth since 1952, the contrast with the earlier period is very striking. Growth was led this time by manufacturing output which rose rapidly across a broad front of import-substitution industries. The stimulus was import and exchange controls initiated at the end of 1949 as a consequence of balance-of-payments crisis. Since foreign exchange was in effect rationed on the criterion of 'essentiality', the new industrialisation of the 1950s favoured the finishing and assembling of imported semi-manufactured goods for sale in home market in contrast to the earlier period which was dominated by processing of domestic raw materials for export. It might be said that in the

earlier period manufacturing looked inward to supply and outward to demand while in the later period this trend was reversed. In each case however an artificial element of protection was present.

The structural changes that occurred over the entire six decades are generally in the direction one would expect. Agriculture's share of output and of the labour force declined while that of manufacturing increased. But what is disturbing is that the proportion of labour in agriculture declined very little — from 78 to 71 per cent. Coupling the high proportion of the labour force in agriculture with very low productivity gives the explanation of low per capita income in the Philippines today.

As regards Taiwan, in the first few years of the occupation in 1895, the Japanese authorities were highly sceptical about the value of this tropical land. The first step which the Japanese took was naturally to increase Taiwan's agricultural production by irrigation, flood-control, chemical fertilisers and farmers' co-operatives. Meanwhile sugar industry was built up and this may be taken as the beginning of Taiwan's industrialisation. After this emerged gradually food-processing industries and other light industries along with some infrastructure.

The late 1930s saw gradual changes in this policy as Japan waged a war against China. The outbreak of Pacific War in 1941 and the resulting difficulties in ocean shipping gave further impetus to industrialisation in Taiwan. During 1936 to 1942 there was an apparent industrial boom when some heavy industries such as machine-making, ship-building and petroleum refining were started. But although the total real national income continued to increase

on the whole during this period, real income per head ceased to do so after 1935 when it reached approximately US \$ 40 per annum. Also manufacturing contributed only about 18 per cent to total national income as compared with 40 per cent by agriculture.

The impact of the Pacific War on the Taiwan economy was disastrous. On VJ Day in 1945 when Taiwan was retroceded to the Republic of China, about three-fourths of the industrial productive capacity was destroyed, agricultural output dropping to 45 per cent and industrial output to less than one-third of their respective pre-war figures.

A painful process of rehabilitation and reconstruction began after the war. But Japan was no longer an assured market while trade between Taiwan and the Chinese mainland was completely cut off. Initially therefore recovery was naturally very slow. However, these difficulties were gradually overcome and normalcy restored by 1949. With the US aid soon flowing into Taiwan, the progress of the economy was speeded up and that progress continues to this day. Taiwan showed an annual average growth rate of more than nine per cent between 1961 and 1968.

On behalf of the Development Centre of the Organization for Economic Co-operation and Development, Oxford University Press has been bringing out a series of regional studies of which books on India and Pakistan have already been reviewed in these columns. This book on the Philippines and Taiwan belongs qualitatively to the same category. The treatment is authoritative. This book, compact and at the same time comprehensive, gives a fairly exhaustive picture of the economic developments which are taking place in these two countries. The

EASTERN ECONOMIST

APRIL 21, 1972

book would be welcomed by the students of regional economic development studies.

Corporate Law

It is common knowledge that at present business corporations play a very vital role in the economic development of a country and they have also great social and political impact. This being the case, it has become necessary to provide a satisfactory legal framework for the working of these business corporations so that misuse of power and money may be prevented or minimised. It is no wonder therefore that almost every country has enacted legislation regulating the management of business corporations.

Management of Corporations purports to provide a comprehensive study of corporate laws and management in England, the USA, Germany, France, Japan and India. The author has given, in brief, the origin and growth of companies and company legislation in each of the above countries with various suggestions regarding legislative measures and the machinery for implementing them.

So far as India is concerned, after dealing with the Companies Act of 1956, the author has dealt with the Monopolies and Restrictive Trade Practices Act, 1969, which is largely based on the Restrictive Trade Practices Acts of 1956 and 1968, the Resale Prices Act, 1964 and the Monopolies and Mergers Act, 1965 of the United Kingdom. The author however opines that 'it is too early to tell to what extent this Act will succeed in implementing the objectives it seeks to achieve.'

In the chapter on 'Labour Participation in Management', the author has made an attempt to show why there should be no legal compulsion to have employee representation at board level

in India until both labour and management are ready to accept this concept. According to the author, this is borne out by the serious problem confronting the 14 nationalised banks in naming their directors. Whether the basis of selection (of the representatives of employees on the reconstituted boards required to be done under the Banking Companies Act of 1970) of the two directors (one representing the junior officer cadre and the other representing the non-officer class) should be seniority and experience or representation to recognised unions is a tricky problem which the government is unable to solve.

Having gone through the book, the author's claim that it is 'a multi-national study of corporate law and management' and that 'there is no other book which has made a comparative study of the law and practice of corporate management in these countries' appears to be an extremely tall claim. Even if it is true, it is so only in the formal sense for this is essentially 'a work of sessions and paste'. Most of the pages are taken up by bare enumeration of clauses of acts and such other details. The author has hardly shown any penetrating analytical ability or understanding of the basic social attitudes and philosophies underlying such legislation. The book may give a smattering of knowledge about the vast subject, but it will certainly not satisfy the discerning readers.

Planning in India

There are many problems confronting Indian planners and *Dilemmas In Planning* is the compilation of speeches and articles of G.L. Mehta examining some of the crucial ones. He has made an attempt to examine some of the vital issues such as investment, allocation of resources, foreign aid, foreign collaboration, role of

private enterprise in planned economy, problems of technology and management and the impact of developmental measures on democratic values of our nation. Since the problems facing the planners and the country are crucial and since the author happens to be one who is intimately connected with our planning and development process, his ideas presented in this book should receive serious consideration.

At the very outset, the author is concerned with the problem of reconciling state action with individual freedom. According to him the problem is not one of choosing between an ideal conception of individual freedom and some kind of collectivism, but one of striking a proper balance between the two. The problem before us is how to use the necessary state guidance and regulations and at the same time personal initiative to get out of stagnation and effect a break-through. This is a big challenge and our statesmen will have to successfully face it, if the country is to prosper and become strong.

Writing about the pattern of India's economy, the author writes: "Those who seek the elimination of the private sector... do not fully appreciate the dynamics of growth in an economy like ours. On the other hand, those who advocate the abolition of the public sector do not understand the essentials of social and economic development in an emergent country like ours at the present." On technology and development, G.L. Mehta pleads that there should be selective approach in which "pace and degree of mechanisation should be determined in the light of our prevalent agricultural and industrial conditions." Developing countries, therefore, need technologies appropriate to their conditions, resources and needs,

instead of wholesale borrowing from the advanced countries.

According to the author, the important lessons which the second five-year Plan has taught us are greater emphasis on agriculture, greater encouragement to exports and appropriate foreign exchange budgeting, all of which were neglected in the second Plan with disastrous consequences. The lessons of the second Plan are still valid in 1972.

The article on 'Foreign Aid: Stimulus or Soporific' is very stimulating. It has examined critically the role of foreign aid to India which constituted five per cent, 19 per cent, 23 per cent and 17 per cent of the total outlay in our four five-year Plans, respectively, and according to the author, made possible 'an annual rise of one per cent national income in India. He has referred to the main recommendations in this field of the Pearson Commission and the Peterson Task Force Report. The recommendations contained in the above two reports that one per cent of GNP of developed countries should be given as aid, that the aid should be generally for priority sectors, that it should be internationalised and be given through institutions like the International Development Bank and that a committee should be appointed to direct aid policies and programmes should all be acceptable to governments and people in developing countries which have come to look upon foreign aid with a certain amount of suspicion due to its being used as an instrument of foreign policy by some of the donor countries.

As regards the role of private sector, the author is of the opinion that "while the broad structure of economic policy has remained unchanged, its implementation has become more flexi-

ble and in many ways more favourable to the exercise of the private sector, both indigenous and foreign." But the author has also warned that "private enterprise has, indeed, to play a role which has to be in consonance with the social philosophy of the times." He has pointed out that private enterprise cannot be a vested interest in itself, but feels sure that "it will not be found wanting in the challenge it faces in emergent economies." Writing on 'Beyond the Two Sectors' the author opines that "Nothing is more important... than to make the private sector institutional in character and professional in methods, while ways must be found whereby initiative, experiment and flexibility can be preserved within the public sector." People generally think only in terms of traditional values and institutions and emergent nations will have to give up old 19th century notions and frameworks and think and act along new lines to suit changing times, if they are to successfully solve their problems of poverty.

It is an excellent collection of articles and speeches, entertaining and instructive. The style is chatty and anecdotal and therefore the book is extremely readable. Though much of what G.L. Mehta has said in this book is now commonplace, there is no doubt that due to his long association with India's developmental efforts in the private and public sector, he has brought very keen insight and broad vision to his analysis of some of the most pressing problems before the country.

American Economy

Research in economic history 'has literally exploded in the past decade'. The Wiley Series aims at giving a breadth and depth to American economic history so far not found in a single con-

ventional textbook on the subject.

The Triumph of American Capitalism by Louis Hacker, published in 1940, presented a provocative and challenging view of America's past. *The Course of American Economic Growth and Development* by the same author presents to economic historians many unconventional hypotheses. The approach of the author makes the book extremely readable, challenging many of the views presented by a number of economic historians previously.

Part of the American heritage is, according to the author, the rejection and acceptance of certain European attitudes, commitments and institutions. Some of the important elements woven into the American mores and against which alone the development of American economic history can be properly understood and appreciated are: (i) the American climate and its way of life have always been capitalist; (ii) Americans have always regarded themselves as middle class; (iii) work to the Americans has always been invested with dignity; (iv) the American has always been a pragmatist; and (v) the Americans are committed to the rule of law.

There is the elaborate and critical analysis of the usual American developments such as the expanding colonial world during the early period of colonisation, the inadequacies of the article of confederation, the ante-bellum years and the structure of the American economy during those years, the process of industrialisation before the civil war of 1861-65, the southern plantation economy based on slave labour (which, it is now being asserted, was less efficient and therefore its employment less profitable implying the ultimate doom of the slave system),

the take-off in the post-civil war period and the part played therein by entrepreneurs, labour, money and banking, agriculture and government policies, achievements of Woodrow Wilson, the causes and consequences of the great depression, the reforms under the New Deal and the American economy during 1950s and 1960s.

Naturally the economic developments during the 1950s and 1960s attract our attention. We notice that during these years, the growth in real GNP had ups and downs and the employment rate too had its swings. We notice that inflation began to appear in the USA in the second half of 1950s and then accelerated in the 1960s. During 1950s and 1960s there was chronic deficit in the balance of payments of USA and a gold drain. Despite prosperity and high employment, depressed areas continue to exist, urban blight has become common and the unemployment rates of non-whites are notably high. And finally we notice that despite the validity of private enterprise, there has been more and more governmental direction and control which has come to be generally accepted as something necessary to sustain the delicate balances in the American economy.

While the students of economic history will find the entire book provocative, challenging and extremely readable, those not so much interested in the historical aspect will find chapters 15 and 16 dealing with the current economic problems of an affluent economy extremely stimulating and instructive. The approach of the author to the study of economic history which combines the conventional descriptive method with statistical and mathematical approaches makes the interpretation of the subject more exact. At present quantification of various

branches of economics is the general trend and economic history cannot for long remain an exception to the rule, though the application of statistical and mathematical methods to economic history has clear limitations.

Economics of Socialism

Human understanding, even his imagination, have their limits and we who are used to our own social and cultural environment, fail to comprehend fully an alien socio-economic system like communism, however sincerely we make an effort to understand its working. And yet we cannot afford to remain ignorant of the working of social systems other than our own. This explains the urgent need, for readers in capitalist countries and of countries like India with mixed economies of an excellent book on socialism viewing all the aspects of the system objectively and explaining them lucidly. No book does that in a better way than *The Economics of Socialism* by J. Wilczynski.

In the Marxian terminology, there are two stages of communism. The first state (the 'lower stage' of Marx) or 'socialism' is a transitional stage during which some elements of capitalism are retained and the second stage (Marx's 'higher stage') or 'communism' is the stage that is marked by the disappearance of the last vestiges of capitalism and the ultimate 'withering away' of the state.

The author classifies the models of the socialist economy into four categories: (1) the bureaucratic centralised model, (2) the planometric centralist model, (3) selectively decentralised model, and (4) supplemented market model. While most of the communist countries are undergoing gradual transformation since 1960s,

only Yugoslavia falls in the last category.

At present all the communist countries subscribing to Marxism-Leninism are characterised by (i) concentration of power in the communist party representing the working classes, (ii) social ownership of the means of production, (iii) central economic planning, and (iv) socially equitable distribution of national income.

Most communist countries are gradually being reformed since 1960. Some of the reforms introduced are: liberalisation of planning, greater independence to enterprises, introduction of the criterion of profit, strengthening of material incentives to labour, price reforms, greater role assigned to finance and credit, establishment of closer links between production and consumption and reorientation of foreign trade. In most communist countries (except Albania) the old dogmatic approach is giving place to new pragmatism and experimentation.

As is well-known the basic principles of socialist planning followed by the communist countries are: (i) determination of the criteria of economic calculation underlying planning decisions, (ii) determination and quantification of the targets to be reached in the planning period, (iii) co-ordination of the targets to ensure 'material balances' and internal consistency of the plan, (iv) determination of appropriate methods to ensure plan fulfilment, and (v) current revision of targets according to changing conditions. The author has shown lucidly, with the help of a simple model, how the communist countries try to seek overall balance among (a) production, consumption and accumulation, (b) primary, secondary and final distribution of national income, (c) personal money income and expenditure, (d)

fixed and circulating assets in productive and unproductive enterprises, and (e) utilisation of labour resources. Against this background, the author discusses 'optimal planning'. There may be a number of plans which are internally consistent and capable of fulfilment; but once a particular criterion is accepted, there can be only one 'optimal plan'. The practical effort so far has been limited to the application of the optimisation procedures only to selected sectors of the economy, such as investment, the location of specific industries, transport and foreign trade. The most advanced work in this field is done in Hungary.

As regards extension of the role of market mechanism to planned economy in socialist countries, it is being justified on three grounds: it is necessary to gain efficiency at micro-economic level which was neglected in the Marxian analysis which in its approach was essentially macro economic; it is necessary for the continuous verification of planned decisions; and finally, it provides a salutary discipline in the form of competition so that production and distribution are constantly being adapted to buyers' preferences.

Profit has come to be officially accepted in the USSR since 1965. But the role of profit under socialism differs significantly from that under capitalism. Briefly, under socialism, profit is not an objective but a means; it cannot be increased by restricting production; it cannot be owned by private persons (except in very minor cases and to an insignificant extent); profit is only one of the several driving forces behind socialist production; it is necessarily an objective measure of efficiency of business enterprise; differences in profit rates do not necessarily determine the distribution

of investment; and lastly, flows of capital to foreign countries are not determined by profit considerations.

After explaining the communist concept of national income (which includes only material products and not immaterial services which fact makes any rational comparison of GNP of capitalist and communist countries very difficult), the author has analysed the problems of accumulation which corresponds to the concept of investment in capitalist countries.

The planned accumulation is realised by direct and indirect measures restricting current consumption. At present there are three sources of providing finance to enterprises — the state budget, banks and enterprises' own resources, the last playing an increasingly important role in recent years. As regards the freedom of choice for consumers, attempts are being made in recent years to co-ordinate the production of consumer goods to the demands and preferences of consumers through devices such as survey of consumer responses and exhibitions. This ensures what the communist theorists call 'rationalised consumer sovereignty'. As regards wage structure though the Marxist theory speaks of 'to each according to his needs', in fact various incentives, moral and material, are provided in proportion to their efficiency measured by profit earned by their enterprises which retain a part of the profit for distribution as incentive bonus among the participating workers.

Price mechanism is being made use of to a greater extent than before. But the price mechanism in communist countries is not the same as in capitalist countries. Price mechanism in communist countries has to subserve the plan objectives in the sphere of produc-

tion as also in the sphere of consumption. This is achieved by having two-tier price system, one for the producers; and the other for consumers, the two sets of prices being determined by totally different considerations. The methods adopted for fixing prices show that prices in communist countries appear to have nothing to do with the labour theory of value which is the foundation of Marxist analysis.

Like pricing, money, banking and fiscal policy have been playing increasingly important role in communist countries with this difference that they are all properly co-ordinated and have to help achieve plan targets. The same is true of international trade which is being re-oriented. The communist countries have given up their former autarkic policies and have been entering the field of international trade both on bilateral and multilateral basis. This is to take advantage of higher technology in western countries, to secure raw materials from developing countries and to share the advantages of comparative costs. Since Stalin's death there has been considerable expansion in the international trade of the USSR. The chapter on 'International Economic Co-operation' which explains the economic co-operation of communist countries with capitalist countries and among themselves is very instructive. Thus communist countries are co-operating among themselves through Comecon for economic planning, to reap advantages of specialisation, for technological reasons, for standardisation and for transport and communication purposes.

Comparing the socialist system with capitalism, the author considers socialism superior to capitalism in regard to the mainspring of economic activity, the level of employment, rates of

growth, dignity of labour, distribution of national income, application of the principle of social cost-benefit principle and prevention of certain forms of wastes (such as product obsolescence, unnecessary product differentiation, unwanted fragmentation and duplication of equipment, excessive number of people working for sales promotion, misleading advertisement, etc., generally associated with capitalism), and dynamism.

On the other hand, the major weaknesses of socialism are the undue ideological and political dominance of the economic scene, bureaucracy and inflexibility, poor correspondence of decision-making between macro and micro levels, the system's liability to big errors, absence of rational and workable pricing system, insufficient effective competition and finally the system's tendency to produce what has come to be known as alienation. The overall effect of all the above weaknesses is reflected in limited personal freedom and low efficiency of labour in communist countries.

Are the two systems, namely socialism and capitalism, converging as Jan Tinbergen said in 1965? Many economists on both sides think so. Considering what is happening in both capitalist and socialist systems in the spheres of micro-macro analysis, economic planning, economic administration, money and banking, role of profits, property ownership, distribution of national income, social structure, prices and the role of consumer preferences, one is inclined to believe that socialism and capitalism are moving away from their classical models and are converging due to technological, political and such other pressures and compulsions.

This excellent book which contains lucid analysis of all

the above problems is a 'must' for the students of economics who want to know the essentials of socialism. And who does not? Socialism at present has prov-

ed to be as dynamic as capitalism and this single book teaches us more about socialism than what possibly a dozen sophisticated books on the subject can do.

Shri. K. M. Cherian

Text of the speech delivered by Padma Bhushan Shri. K. M. Cherian at the 11th Annual General Meeting of the Company, held on Wednesday, March 29, 1972.

Gentlemen,

I have great pleasure in welcoming you to the 11th Annual General Meeting of our Company.

TRIBUTE TO OUR PRIME MINISTER

When we met last year, the Parliamentary elections had just been held and the country's destiny had been confided to Mrs. Indira Gandhi. I had then offered our hearty congratulations to Mrs. Gandhi. Now, as we meet again, the Assembly elections have been held, and the results are an overwhelming endorsement of what happened last year. The past year's events have justified the country's instinctive choice of Mrs. Gandhi as leader of the nation; and it is fitting that we begin by paying tribute to our Prime Minister.

Last year, our country had to pass through a fiery ordeal. The Pakistani aggression and the flooding of our country with 10 million destitute refugees posed, for our country, problems of the greatest magnitude. How the war was won in 14 days and how the 10 million refugees were taken care of and finally led back to their homes are splendid feats that

have added lustre to the nation's record of achievements. I hope you will agree with me that this has been solely due to the great leadership of Mrs. Gandhi. Events that could have left our country in shambles have been turned into sagas of triumph and glory. Today India is greater than a year before, throbbing with inner vigour and with enhanced respect from other countries. Let us salute the Leader.

HIGHLIGHTS:

WAR EFFORT: The country rose as one man to the defence of the motherland in the year of crisis. The clarion call echoed through the length and breadth of the country. The call came to the Automobile Tyre Industry, too. The Industry responded to the call and in December gave a 15% production increase over November. The tyres were delivered at the places indicated and within the time desired by the Defence authorities. The Government has recorded its appreciation of the contribution of the Tyre Industry and we are legitimately proud of our performance.

SELF-RELIANCE: Likewise the country accepted the challenge of development through self-reliance. Whereas originally Automobile Tyres were fully imported, now India makes its own tyres. Its tyre production is adequate, not only to meet the country's needs, but also for exports that earn considerable foreign exchange. Initially, after commencing the manufacture of our own tyres, much of the raw material had to be imported. But today, except for few items, the required raw materials are procured in India.

In our Company, this quest for self-reliance commenced as early as 1963. In that year, Shri Jawaharlal Nehru inaugurated our in-plant research facility with the words, "Your record is good. Your future must surpass it." The success of our Company has been built on a tradition of self-reliance with no foreign technicians on the staff. The expertise

is home-grown. Trained by the Mansfield Tyre and Rubber Company, our American collaborators, our technicians have been wholly responsible for the development of tyre technology in our Company. I believe it is very relevant to mention here that we have achieved a significant breakthrough in rubber machinery technology. For our new Factory Unit in Goa with a rated capacity of 3 lakh tyres, we are importing capital goods valued at only Rs. 1.15 crores. The balance machinery will be fabricated locally by our engineering staff with the technical assistance available from Mansfield.

A Tyre Mould made by MRF

GOA UNIT: We have received a letter of intent to start a tyre unit in Goa with a capacity of 3 lakh tyres and tubes. Land has been purchased, civil works have commenced and it is our hope that production can begin here in 1973. With this new letter of intent for a unit in Goa, we are today the second largest licensee for manufacture of tyres in India.

PROGRESS OF TYRE INDUSTRY: Since 1960, production of tyres has increased three-fold. In 1971 there was a 15% production increase over 1970. In 10 years, India's exports have increased from about Rs. 160 lakhs to over Rs. 700 lakhs. The Government of India is sparing no effort to ensure that the country's tyre needs are fully met. As an urgent measure existing units, subject to certain stipulations, have been

permitted to double their production. As a long-term measure, letters of intent to start new units have been issued to 12 new entrepreneurs.

WORKING RESULTS: The Directors' Report and Audited Accounts for the year ended 30th September, 1971 have been in your hands for some time now, and, with your permission, I shall take them as read. There was a strike in the Company's Madras Factory for a period of 96 days. The loss in production has been considerable. In spite of this, it is gratifying to note that sales achieved for the year have only been 10% lower than that for the previous year. The General Reserve stands at Rs. 113.39 lakhs as on 30th September, 1971 as against Rs. 88.5 lakhs as on 30th September, 1970.

The Directors have pleasure in recommending a payment of 12% dividend on the paid-up capital of the Company as on 30th September, 1971.

EXPANSION: MADRAS UNIT: As I said last year, we hope to complete the expansion of our Madras capacity from 3,60,000 units to 6,10,000 units. Though the strike in the factory held up operations for a period, we still hope to achieve the expansion originally planned.

Continued

EXPORTS: Export was recognised by our Company from its early beginning as a vital factor towards achieving self-sufficiency. Towards this end, our Company has made significant contributions which have been duly recognised through export awards given to the Company. The Government has announced recently its intention to award MRF a Certificate of Merit for its meritorious export performance for the year 1968-69. The Company is meanwhile strengthening its export base and has taken a number of steps in this direction including market surveys abroad and additions to the existing range of products.

During the year under review, though there has been a further increase in the quantum of export orders received, actual exports dropped to Rs. 46,69,000 as against Rs. 58,39,000 for the previous year consequent to the stoppage of production for over three months.

LINTAS-MSF. 59C-192

RESEARCH AND DEVELOPMENT: Last year I stressed the need for a continuous flow of technical know-how from our collaborators. While it is true that we have been able to develop indigenous machinery and equipment for the manufacture of tyres, I must gratefully acknowledge the guidance, assistance, and encouragement given to us by our collaborators. We will continue to need this assistance as the Tyre Industry in our country cannot yet afford the colossal expenditure needed on original research. All along, our research has been confined to the field of import substitution. We have, no doubt, achieved some measure of success in this area, but we have to draw from abroad the great scientific advancements that are continuously taking place in tyre technology. Collaboration on a continuous basis is therefore the only means by which we participate in these advancements. I can confidently state that the unreserved flow of technical know-how from our collaborators, Messrs. Mansfield Tyre & Rubber Company, Ohio, U.S.A., has enabled us to keep pace with the

latest developments in tyre technology.

PROSPECTS: The working of our Company for the first five months of the current year has been quite satisfactory. Sales have improved substantially over the corresponding period of last year. It is hoped, that if the same trend continues, the annual sales this year would exceed last year's sales by 40%.

Mr. James H. Hoffman

COLLABORATORS: We are deeply indebted to our technical collaborators, the Mansfield Tyre & Rubber Company, Ohio, U.S.A., and their President, Mr. James H. Hoffman, for the continuous technical assistance and for help rendered in finding export markets. We are also

thankful to Mr. Hoffman for making it convenient to visit our country in February this year and for giving us valuable on-the-spot guidance in many matters relating to expansion projects on hand and the working of our Company.

CONCLUSION: A new agreement with the workers' Union entailing revision in wages, dearness allowance, incentive bonus and certain other benefits was signed on 18th November, 1971 with effect from 1st October, 1971 to 30th September, 1975.

Our Company has completed 25 years of work. All through these years, we have been driven by the desire to be self-dependent, and today, more than ever, we are aware of the demands the country has placed on us—the highest levels of self-reliance both in the fields of raw materials and capital goods. I take this opportunity to thank all our retreader friends, tyre dealers, consumers, banking and financial institutions and suppliers for their close co-operation. I also thank the workers, staff, management and my colleagues on the board for their contribution to the growth and development of our Company.

COMPANY NOTICE

Hindustan Aluminium Corporation Limited

Registered Office: 'CENTURY BHAVAN,' Dr Annie Besant Road, Bombay-25 DD

NOTICE is hereby given that the Thirteenth Annual General Meeting of the Shareholders of the Company will be held at Birla Matushri Sabhagar, 19, Marine Lines, Bombay-20 on Friday the 19th May, 1972 at 4-00 P.M. to transact with or without modifications as may be permissible, the following business:

1. To consider and adopt the Directors' Report, the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st December, 1971.

2. To sanction the declaration of dividend on Preference Shares for the year ended 31st December, 1971.

3. To sanction the declaration of dividend on Equity Shares for the year ended 31st December, 1971.

4. To appoint a Director in place of Shri G.D. Birla, who retires from office, by rotation, in accordance with Article 146 of the Articles of Association of the Company, and, being eligible, offers himself for re-election.

5. To appoint a Director in place of Mr. Edgar, F. Kaiser, who retires from office, by rotation, in accordance with Article 146 of the Articles of Association of the Company, and, being eligible, offers himself for re-election.

6. To appoint a Director in place of Shri G.D. Jhawar, who retires from office, by rotation, in accordance with Article 146 of the

Articles of Association of the Company, and, being eligible, offers himself for re-election.

7. To consider and, if thought fit, to pass the following Resolution which will be proposed as an Ordinary Resolution:

"RESOLVED that pursuant to the provisions of Section 258 and all other applicable provisions, if any, of the Companies Act, 1956, the number of the existing Directors of the Company be increased from 10 to 12".

8. To appoint Shri T.C. Saboo (who was appointed as an Additional Director by the Board under Article 141 of the Articles of Association of the Company and who holds office only up to the date of this meeting and in respect of whom the Company has received a notice in writing signifying the intention to propose him as a candidate for the office of Director) as a Director of the Company and to consider, and, if thought fit, to pass the following Resolution, which will be proposed as an Ordinary Resolution:

"RESOLVED that pursuant to the relevant provisions of the Companies Act, 1956, including Section 257, Shri T.C. Saboo be and is hereby elected and appointed a Director of the Company."

9. To appoint Shri Bhupendra Kumar Sethi (who was appointed as an Additional Director by the Board under Article 141 of the

Articles of Association of the Company and (who holds office only up to the date of this meeting and in respect of whom the Company has received a notice in writing signifying the intention to propose him as a candidate for the office of Director) as a Director of the Company and to consider, and, if thought fit, to pass the following Resolution, which will be proposed as an Ordinary Resolution:

"RESOLVED that pursuant to the relevant provisions of the Companies Act, 1956, including Section 257, Shri Bhupendra Kumar Sethi be and is hereby elected and appointed a Director of the Company."

10. To consider, and if thought fit, to pass the following Resolution, which will be proposed as an Ordinary Resolution:

"RESOLVED that pursuant to the provisions of Section 294 and other applicable provisions (if any) of the Companies Act, 1956, the Company hereby confirms and approves of the appointment of M/S Hindustan Sales Agencies, 6, Old Post Office Street, Calcutta, as the Sole Selling Agents of the Company for the States of Punjab, Haryana, Rajasthan, Jammu & Kashmir, Himachal Pradesh and Union Territory of Delhi for the sale of the Company's products comprising of Rolled Products and Extrusions for an initial period of one year commencing from 1st January, 1972, subject to renewals if so deemed fit

by the Board each year, but not beyond the maximum period of five years in all, on payment of commission at the rate of one per cent on the Company's ex-works price excluding excise duty, and on the other terms and conditions contained in the Agreement recorded in a letter dated 13th March, 1972 addressed by the Company to the said M/S Hindustan Sales Agencies, and confirmed by the latter, placed before this Meeting and hereby approved."

11. To appoint Auditors to hold office from the conclusion of this meeting until the conclusion of the next Annual General Meeting and to fix their remuneration.

NOTICE is also given that the Register of Members and Transfer Books of both Equity and Preference Shares of the Company will remain closed from 26th April, 1972 to 13th May, 1972, both days inclusive.

By Order of the Board of Directors
M.K. Jain
Dated the 15th Secretary
day of April, 1972.

N.B.: (1) A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

(2) The relative Explanatory Statements, pursuant to Section 173 of the Companies Act, 1956, in respect of the special business under items Nos. 7, 8, 9 and 10 set out above are being posted to the Shareholders along with the notice of the aforesaid Meeting.

(3) Dividends on Equity Shares and Preference Shares when sanctioned will be made payable on and after 25th May, 1972 to those shareholders whose names stand on the Register of the Company as on 13th May, 1972 to whom Dividend warrants will be posted.

Shareholders are requested to intimate to the Company change, if any, in their registered addresses.

RECORDS AND STATISTICS

Agriculture Ministry's Report: 1971-72

THERE WAS an all-round increase in the production of both foodgrains and commercial crops in 1971-72. According to the report of the union Ministry of Agriculture for the year 1971-72 the production of wheat in the current year might be about 26 million tonnes as compared to the last year's level of 23.2 million tonnes and the fourth Plan target of 24 million tonnes.

Among the commercial crops, production of cotton might be about 1.0 million bales higher than last year while that of jute might be higher by about 800,000 bales. The production of rapeseed and mustard is likely to reach a new record level while that of groundnut might be somewhat lower as also in the case of sugarcane.

high yielding varieties

The target for covering 18 million hectares under high yielding varieties of cereals in 1971-72 is expected to be achieved in full. In wheat production the high yielding varieties have brought about a revolution.

In the case of rice also, a breakthrough is in sight. High yielding varieties of rice have shown particularly impressive results during the summer season, which is a promising development. Hybrid bajra is also showing good progress, although during kharif 1971 incidence of one or two diseases was noticed in Haryana and Rajasthan.

In the case of hybrid jowar

and hybrid maize, there are some snags and research efforts are being intensified to evolve better varieties.

multiple cropping

Pilot projects for multiple cropping have been taken up from the current year under a centrally sponsored scheme. Under these projects special emphasis is being given to adaptive research trials, water use and management, scientific demonstrations, provision of credit, inputs and marketing facilities.

production of pulses

Research work has been intensified through All-India Coordinated Research Project on Pulses. Some high yielding and short duration varieties of arhar, urad, moong and lentils have been evolved by scientists and are being tested before their release. Three of these varieties have been released also. A centrally sponsored scheme for seed multiplication and demonstration of these newly released varieties has been formulated for implementation from 1972-73.

commercial crops

Under the Emergency Production Programme undertaken since December, 1971, plant protection measures were organised on a campaign basis to cover an area of 130,000 hectares under rapeseed and mustard crop. The production of this crop in the current year is expected to be substantially

higher than last year. In the case of groundnut, package programmes have been implemented, both under the state plans and under the centrally sponsored scheme.

Important initiatives have been taken for the cultivation of non-traditional oil-seeds, such as soyabean and sunflower seed. Soyabean cultivation has been taken up in Maharashtra, Gujarat, Madhya Pradesh and Uttar Pradesh. To provide incentive to the producers, the Food Corporation of India has been authorised to pay a premium of up to Rs 15 per quintal over and above the purchase price of Rs 85 per quintal. In the case of sunflower seed, demonstration programmes have been taken up to acquaint the farmers with the crop and the techniques of its cultivation.

A number of new programmes have been initiated during the year under report for the development of cotton. An Intensive Cotton District Programme has been taken up in 13 districts including six predominantly irrigated districts and 7 districts in the rain-fed cotton tracts. A new variety hybrid-4, has been found capable of yielding additional 1.5 to 2.0 bales per hectare. Another variety MCU-5 has also proved to be promising for cotton producing areas in the south. The coverage under both these varieties is being substantially stepped up. Development of

cotton in the newly irrigated areas in the command of Rajasthan Canal, Tungabhadra and Nagarjunasagar Projects is also being undertaken. All these measures are expected to lead to substantial rise in indigenous production and curtailment of imports of cotton in the next two or three years.

In the case of jute also, an Intensive Jute District Programme has been approved by the government of India for increasing the productivity and production of the crop in six selected districts in West Bengal, Bihar, Assam, Orissa and Andhra Pradesh.

In the sphere of horticulture, two centrally sponsored schemes, one for the development of bananas for exports and another for walnut cultivation, have been taken up for implementation during the year under report.

dry farming

Fifteen new pilot projects for integrated development of dry land agriculture were sanctioned during 1971-72, thus bringing the total number to the level of 24 projects, as envisaged under the fourth Plan. An outlay of Rs 4.44 crores was approved for the 24 projects for 1971-72.

minor irrigation

About Rs 105.24 crores of public sector outlay are expected to be incurred on development of minor irrigation during 1971-72. Apart from this, institutional investment on minor irrigation works from agencies such as land development banks, central co-operative banks, Agricultural Refinance Corporation and agro industries corporations, is expected to be about Rs 130 crores. The public sector outlay is being mainly utilised for public and community works which benefit small farmers and weaker sections and for

nature made him like other men.

we made him different

**GWALIOR
SUITING**

GOOD FOR WEAR ROUND THE YEAR

providing debenture support to the institutional agencies. The World Bank assistance for credit projects of various states ensures a significant support to the development of minor irrigation, which is an important item for provision of credit. Two projects, one each in Haryana and Tamil Nadu, with a minor irrigation component of Rs 2.7 crores and Rs 17.0 crores respectively were approved during 1971-72. These were in addition to the two projects, one for Gujarat with a minor irrigation component of Rs 20 crores and the other for Andhra Pradesh with a component of Rs 10.50 crores, which were approved earlier and were in operation during the year.

Negotiations have been completed for credit projects for Mysore and Maharashtra and they involve substantial components for the development of minor irrigation. About 1.58 million hectares of additional area are expected to be benefited through minor irrigation during 1971-72. The programmes of groundwater development are particularly making a significant progress.

During the year under report, about 300,000 pump-sets, 100,000 private tubewells and 100,000 state tubewells are expected to be installed. In addition, 170,000 surface wells are also expected to be constructed. The Central Groundwater Board is implementing projects for assessment of groundwater resources in hard rock areas, around Hyderabad, in the arid and semi-arid areas of Rajasthan, Gujarat and Haryana and in the alluvial areas of Narmada river basin in Gujarat and Madhya Pradesh.

water use and management

Three new projects for Water Use and Management have been sanctioned

in Tawa (MP), Pochampad (Andhra Pradesh) and Chambal command (Rajasthan) bringing the total number of such projects to 10.

command areas

During 1971-72, schemes have been sanctioned for the five command areas of Kangsabati (West Bengal), Tawa (MP), Kaveri (Tamil Nadu), Jayakwadi stage I (Maharashtra) and Pochampad (Andhra Pradesh). Including the five projects sanctioned in the previous two years, the number of such projects comes to 10, as envisaged under the fourth Plan.

soil conservation

An outlay of Rs 31.80 crores was provided during the year under report for soil conservation, to benefit an area of 1.37 million hectares. Six lakh hectares of non-agricultural land under afforestation and grass land development were also proposed to be covered. Under the centrally sponsored scheme for soil conservation in the catchments of major river valley projects, 108,000 hectares were proposed to be benefited at a cost of Rs 4.8 crores.

fertiliser use

The consumption of fertilisers has risen in 1971-72 by about 20 per cent to the level of 2.6 million tonnes of nutrients as compared to 2.2 million tonnes in the previous year. The consumption of N at 1.8 million tonnes has marked a rise of 18 per cent. P_2O_5 at 547,000 tonnes is higher by 18 per cent and K_2O at 295,000 tonnes by 29 per cent. Intensive publicity for balanced use of fertilisers was organised through audio-visual media, demonstrations and regional seminars. Measures were also taken to increase the flow of credit to the fertiliser distribution agencies and to farmers as also to strengthen

the arrangements for soil testing and construction of fertiliser godowns.

seeds

On account of large-scale shortage of rabi seeds following unseasonal rains at harvest time, central government coordinated arrangements for supply of quality seeds of wheat, gram and barley for use in Bihar, UP and West Bengal. An ad hoc Central Seeds Certification Board has been set up and it has drawn preliminary models for setting up state seed certification agencies. The National Seeds Corporation, a public sector organisation, continued its promotional and supply functions. During the year under report, its sales increased to Rs 4.61 crores. It has taken up seed multiplication for pulses to provide support to programmes for development of pulses. The Tarai Development Corporation also expanded its production and sales of seeds.

plant protection

A gross area of 58 million hectares is expected to be benefited by plant protection measures during 1971-72. The aerial spraying operations covered a million hectares as against 676,000 hectares in the previous year.

machinery

In the light of requirements for 1969-70, a decision had been taken for the import of 35,000 tractors. Against this, 25,390 tractors have been imported/shipped upto the end of October, 1971. These tractors had been allocated mostly through State Agro Industries Corporations. One hundred and thirteen Agricultural Machinery Hiring Centres have been already set up and measures are being taken to establish more such centres. Some

of the corporations are undertaking diverse activities connected with development of irrigation, fertiliser use, land development, fruit processing etc.

In order to provide self-employment opportunities to the agricultural engineers and graduates, a scheme for Agro Service Centres is also being implemented and 95 such centres have been set up.

special programmes

Consistent with the fourth Plan objectives of growth and social justice, special programmes for small farmers, marginal farmers and agricultural labourers, drought prone areas and crash scheme for rural employment and establishment of Agro Service Centres were initiated during the year under report. All the 46 SFDA projects have been approved. Over 1.2 million small farmers have been identified and assistance in the form of credit for development of minor irrigation, purchase of milch animals, poultry, etc. is being given to them.

All the 41 MFAL projects have also been registered and over 540,000 participants have been already identified for giving assistance for development of minor irrigation, purchase of milch cattle, poultry, etc.

The Drought Prone Areas Programme (formerly Rural Works Programme) has been sanctioned in all the 54 districts and an outlay of Rs 23.55 crores was sanctioned for them till the end of December, 1971. Schemes of minor irrigation, soil conservation afforestation and road works are being implemented under this programme. During 1971-72, this programme is expected to generate about 23.7 million mandays of employment. Under the Crash Programme for Rural Employment, about 87.5 mil-

lion mandays of employment are expected to be created during the full year through the implementation of schemes of land development, reclamation, drainage, minor irrigation, soil conservation, afforestation, road building, etc. The actual implementation of this scheme started in October 1971 and projects worth Rs 47 crores have been sanctioned. Under the scheme regarding Agro Service Centres, 2,500 centres are proposed to be set up with an outlay of Rs 386.97 lakhs.

agricultural research

A number of new varieties of crops are reported to have been evolved under the co-ordinated research projects for rice, wheat, other cereals, pulses, cotton, oil-seeds and jute. Research work in the spheres of soil science, agronomy, agricultural engineering, water management and dry farming has also been intensified. In the sphere of animal sciences, new projects for research in animal products technology and animal diseases were undertaken, in addition to the earlier ones on breeding, nutrition, animal health, etc. Research efforts for evolving better breeds of cattle, sheep and other animals through cross breeding were continued.

agricultural marketing

The compulsory grading and pre-shipment inspection, prior to export, now covers 38 commodities. The value of commodities graded before export during April to December, 1971 was Rs 58 crores. Market surveys were carried on in 242 markets between April, 1971 and February, 1972 so as to assess the additional facilities required for coping with increased arrivals of agricultural produce. As many as 211 markets and submarkets were brought under the purview of regulation during the period

April to September, 1971, raising the total number of regulated markets and market sub-yards to 2,356.

export promotion

Exports of agricultural commodities during the period April-June, 1971, totalled Rs 103 crores and were about 16 per cent higher than the exports during the corresponding period of the previous year.

economic policy

A comprehensive scheme for studying the cost of cultivation of principal crops has been sanctioned for implementation in 15 states. During 1971-72, the crops taken up for study under the scheme include wheat in Punjab, Haryana, Madhya Pradesh and UP, paddy in Orissa, Bihar, Andhra Pradesh, Tamil Nadu, Kerala and West Bengal, bajra in Rajasthan and Gujarat and jowar in Maharashtra and Mysore. Field work has already been taken up in 10 states.

animal husbandry

Six new Intensive Cattle

Development Projects were sanctioned during the year, in addition to the 46 projects already functioning. Eighteen new Key Village Blocks have also been set up. Two new Central Cattle Breeding Farms, one at Alamadi (Tamil Nadu) for Murrah buffaloes and another at Koraput (Orissa) for Jersey cattle have been sanctioned. 494 exotic cattle of Jersey, Friesian, Brown Swiss and Red Dane breeds were imported from Australia and Denmark for distribution to various states for intensification of cross breeding programme. Cattle breeding projects in collaboration with Denmark, Switzerland and West Germany are being implemented. In the context of feed and fodder development, in addition to three regional stations on forage demonstration, four more regional stations (in Andhra Pradesh, Rajasthan and Jammu & Kashmir) have been sanctioned. In the context of sheep development, sites for the establishment of three additional farms in UP, Rajasthan and Bihar have been finalised. 2,570 Rambouillet

sheep from USA and 3,019 Merino sheep from USSR were imported during the year to strengthen the programme of sheep improvement.

dairying

The average daily throughput of milk of all the dairy plants increased to the level of 2.40 million litres as against 2.25 lakh litres per day in the preceding year. Seventeen new dairy plants were set up during the year bringing the total number of dairy units to 123.

fisheries

The production of fish at 1.88 million tonnes marked an increase over the previous year's level of 1.76 million tonnes. The increase was shared by both marine fish and inland fish. The foreign exchange earnings from the exports of marine products in 1971-72 amounted to Rs 40 crores. 1,019 mechanised boats were added during the year, bringing the total to 10,762. Agricultural Refinance Corporation is giving credit support for fisheries projects.

The PM hopes and believes . . .

given to a Hungarian journalist some days ago, the Prime Minister said that "over the next few months we hope to consolidate self-reliance in agriculture, achieve greater industrial production and create vast new avenues of employment". This is as proper an appreciation of the tasks that lie ahead as can be expected of her. The word 'self-reliance' has become an ubiquitous one, but its application to agricultural goals is wholly appropriate. It is well to hear Mrs Gandhi talk of consolidating the nation's progress in farming since this indicates a healthy lack of smugness about the achievements of the green revolution. Although the country has succeeded in becoming self-sufficient in foodgrains in years of good rainfall, the trend in the growth of population does call for a further rise in the plateau of output so that the people may have less reason to worry about what may be in the nation's larder for them in the years when floods or drought or both happen to work havoc with crops in some part of the country or the other.

Self-reliance has ample scope too in the case of other important farm products, but, here, the Prime Minister, however, was not accurate in talking of 'consolidation' since there will have to be much greater progress in the cultivation of crops other than cereals before a stage is reached when there could be talk about consolidation. In the case of all the major commercial crops, viz., raw cotton, raw jute, sugarcane and especially oilseeds, production lags behind requirements, both quantity-wise and quality-wise, and there is therefore a clear and urgent need for crop development programmes in these areas to be intensified and speeded up. It would be interesting to know what or how much the Prime Minister believes the government can achieve in these directions "over the next few months" but there is no questioning the fact that an effort should get started right away.

It is interesting to note that the government, according to the Prime Minister, hopes to achieve greater industrial production over the next few months. To the extent that the availability of raw materials has improved or is likely to improve, there is a fair chance of this particular hope being realised to a considerable extent. So far as trends in current production are concerned, the deciding factor, however, would be the state or course of industrial relations. Mr Naval H. Tata, coining a neat phrase, has just pointed out that industry has entered a phase of 'production by consent'. The reference here is to disruption of production arising from various forms of non-cooperation practised by workers' organisations. There is of course nothing wrong in a situation in which the workers' positive participation is becoming more and more necessary for the free or full functioning of business enterprises. This, perhaps, is as it should be, but even as this development takes place, it is becoming all the more necessary for workers' 'consent' to increased production forthcoming in the normal course and on the right terms. Inaugurating the Asian Trade Union Seminar in New Delhi earlier this week, the Prime Minister, while giving an assurance to organised labour that the government was determined "that development should not be debased by any form of exploitation", firmly told trade union leaders that they too owed an obligation to help promote production and employment for the sake, particularly, of the poorer sections of the community. If the government, by its policies or administrative action, could make Mrs Gandhi's advice stick, it would have done a great deal indeed to improve the prospects for industrial production in the coming months.

Finally, as regards the Prime Minister's expectation that the government would be able to create "vast new avenues of employment" over the next few months, it is right to tell her that she is far from being realistic. Paper provisions for employment schemes, whether written into the annual plan or even incorporated in the central or state budgets, cannot produce an abundance of employment opportunities "over the next few months". There will have to be big advances in saving trends, investment patterns and the tempo of economic activity generally if there is to be a break-through on the employment front. Apart from the fact that even under the most favourable circumstances, all this cannot be accomplished "over the next few months", it is only too clear that the government has not even started thinking in terms of reorientation of its policies in the necessary directions. In the circumstances, this part of the Prime Minister's statement can have meaning only in the restricted sense that she at least realises that the government will have to act boldly and constructively in the immediate future if the nation is to be reassured that the outlook for its unemployed or under-employed millions will change for the better in the foreseeable future.

Home-truths for the protein club

THERE WAS nothing new on the presently controversial topic of protein strategy in what Dr P.V. Sukhatme told the thirty-first All-India Agricultural Economics Conference held at Varanasi recently. He has been saying the same thing since almost three years ago. But what he did say needed saying in the categorical terms he did if only to bring some sense of proportion to the astoundingly tall thesis of a few super-enthusiasts of the protein club. In their fervour, apparently, the zealous champions of a protein strategy tended to overlook the fact that, where under-nutrition is rampant, as, for instance, in our country, the first priority should be given to more food than to protein *per se*. Until recently, Dr Sukhatme's seemed to be a lone voice of dissent on the subject, but latterly the emphasis in international food circles also seems to be slowly shifting from protein-rich foods, as hitherto, to fully formulated foods which, in addition to protein, would also contain some concentrated sources of energy and vitamins and minerals. In the light of this latest trend, the eminent doctor would appear to be fully justified in asking our Planning Commission to review their plans for the so-called protein strategy, particularly their plans to fortify cereals with amino acid.

For some time past, the people of this country have been fed on and well-nigh sold to the idea that "the worst of the specific hungers that beset mankind today" is the protein hunger and that it is "the principal cause of malnutrition in infants and children". They have also been assured that protein need not all be drawn from land like other nutrients and that, therefore, it is no problem to satisfy the protein hunger. Implicit in these arguments is the assumption that protein deficiency can be overcome by increasing protein *per se* in the diet in much the same way as calorie deficiency can be overcome by increasing calorie intake in one's diet.

This, to Dr Sukhatme, is an oversimplified approach to a complex problem. According to him, what our diets lack is adequate energy food to help active utilisation of the protein that we eat and not just more protein as such. He is supported in this thesis of his—that protein malnutrition is the indirect result of inadequate energy intake—

by eminent scientists such as Miller and Payne in the UK and Gopalan in India. This, however, was not acceptable (at any rate at the time it was first made) to some people in India, including Mr Chandrasekhar, a former Union Health Minister. That not only marked the beginning of an avoidable controversy but also a studious scientific re-examination by Dr Sukhatme himself of all the relevant data and publications in a number of scientific journals of the results of such re-examination.

This explains his latest reversion to the

subject and his reiteration of the finding that "in the present state of our knowledge, available evidence for India does not support the thesis that diets as eaten by the people lack minimal quantity of protein; nor does it support the case for rushing into promotion and factory production of foods fortified with amino acids using modern technology".

In order to gain an insight into the nature of the problem facing us, Dr Sukhatme has suggested a reformulation of the problem (the outcome of a

Ricardo - A 200th Anniversary Tribute

April 19, 1972 marks the 200th birth-anniversary of the economist whom Lord Keynes termed 'as the most distinguished mind that found economics worthy of its pursuit'. The Department of Economics of Bombay University, which incidentally is celebrating its golden jubilee this year, had arranged a symposium on 'The Contemporary Significance of David Ricardo' on that day to commemorate the historic occasion. A number of facets of the contributions of Ricardo came up for discussion.

Dr. Ranganath Bharadwaj pointed out that Economics was privileged in having an unlitary man as the founder of its abstract tradition.

Professor P. R. Brahmananda, who was the main speaker of the day, referred to the contemporary significance of the numerous theorems of Ricardo. Ricardo's hunch that distribution and not wealth was the subject-matter of Ricardo has been vindicated by the absence of any firm conclusions from growth theory. Ricardo was the first to note that wage changes would not always lead price changes in a similar direction. A long line of evolution of the significance of thought has now led to a theory of value in which the components of capitals as inputs are deemed as fundamental in value-determination. Ricardo also destroyed the basis for the concept of equal values of capitals being equal in a physical respect. This has now led to the abandonment of the notion of capital-intensity in high theory. The speaker also referred to the admission by Samuelson and others that there is no necessarily inverse relation between interest and the measure of capital-intensity. The modern theory of value has discarded the marginal method and has returned to the Ricardian roots. The theorems relating to comparative costs, to the effects of the variations, in the quantity of money to the level of prices and to the absence of a permanent effect on the rate of interest of monetary changes have now been vindicated. Contemporary discussions on international liquidity have led us back to the proposition of Ricardo that a balance of payments disequilibrium of any one country is always the consequence of overexpansion of money supply. In fiscal matters, the emphasis on per capita surplus, rather than on increase, as a measure of the base for taxation has now come into vogue. The effects of a balanced budget would be negative upon savings and upon growth unlike as in Keynesian theory. Ricardo laid great emphasis upon the productivity in wage-goods as the key determinant of the rate of profits. Ricardo's position on machinery and its effects upon employment are of great relevance in India. The speaker said that definite quantitative evidence was now available that the Indian economy was heading towards a stationary state.

Other speakers referred to the contemporary significance of Ricardo's contributions to trade and capital theory. Miss Geeta Parthasarathy showed that, mathematically, the theory of factor-reversals cannot be vindicated. Her proof however was questioned by Mr. Nachane. Dr Lakdawala, in his concluding remarks, drew attention to the abiding significance of the Ricardian foundations.

mathematical model representing the relationship between calories and protein) in these words: "... it is not enough to know how frequently a diet is deficient in protein. It is essential that we also know the probability that a diet deficient in protein is also deficient in calories". "If a diet is protein-sufficient but does not have adequate calories to synthesise and retain protein, it would imply that man's primary need is for more food (energy) rather than protein *per se*". In the absence of such a reformulation, he believes, "the real nature of the problem of protein nutrition has tended to remain obscure" and has been allowed to acquire overtones, political, commercial and humanitarian far beyond the domain of nutrition". Hence his call to agricultural economists, statisticians and planners to take lead in sifting the available evidence and ascertaining the true situation. The urgency of the call lies in the fact that failure to do so might lead to our planners diverting an increasing part of the country's limited resources on projects which can contribute little to welfare and economic development.

What is precisely the stand of the protagonists of the protein problem? To quote Dr Sukhatme, "insufficiency of good quality protein in the diets of the people is at the heart of the protein problem. The problem is particularly serious in the case of children. So large are the inequalities in protein consumption among the different segments of the population that nearly one-third of the people are believed to have a protein intake less than what is needed for maintenance and growth, and this despite the fact that the average *per capita* consumption of protein for the developing countries as a whole is nearly 40 per cent in excess of the recommended needs based on the most recent recommendations made by FAO/WHO. With the current rate of population growth, the gap between nutritional requirement and actual consumption of protein by the greater part of the population is likely to widen rapidly and, if this situation should continue, "the physical, economic and social development of future generations may become completely arrested". (UN Report 1968).

Posed as stated above, the problem appears to be really urgent. In other words, it is imperative to raise the protein intake in the diets of the people without any delay. But the matter does not stop there. Taking all the prevailing factors into consideration, such as the slow pace of economic growth, the

limited possibilities of increasing production of good quality protein like animal protein, their high cost and so on, the UN experts went about urging production of semi-conventional cheap protein-rich foods using modern technology from materials locally available and distribution of such factory-made products (e.g. Modern bread fortified with lysine) through special feeding programmes. These experts also advocated the augmentation of protein supply from all sources (such as leaf protein, single cell protein, fish-protein concentrates, etc), but the main and noticeable stress was on recent developments of fortification with amino acids so as to produce low-cost protein-rich foods on a commercial scale for consumption by the undernourished and, of course, to set up an appropriate machinery to make this possible.

An interesting point that is worth noting here is that the UN experts based their recommendations on the estimate of the magnitude of the incidence of protein deficiency, as also the data for India from which this estimate was made, prepared by Dr Sukhatme himself. But, while doing so they missed the point revealed by a further analysis of the same data, viz that most of the protein-deficient diets are also inadequate in total energy content, and, in consequence, their implications, with the result that their protein strategy has turned out to be somewhat misconceived. Dr Sukhatme quoted an array of statistics to make his audience understand what man's needs for protein and energy are and how the adequacy or otherwise of dietary intake of

individuals in the light of the recommended needs had to be ascertained.

We may now sum up Dr Sukhatme's main findings. While agreeing that protein deficiency is widespread, he holds that diets which are protein deficient are almost always deficient in total energy and supplementing these diets with protein or amino acids is wasteful. Secondly, he contends that there is no evidence yet to establish that the quality and concentration of protein in the cereal/pulse based diet is inadequate to meet protein needs; on the contrary, according to him, what cereal/pulse based diets lack is energy foods like milk and eggs which enable active utilisation of the protein that people eat.

Thirdly—and this is important—the major factor responsible for protein deficiency is inadequate income. (This explains his stress on efforts to encourage pulse production and to involve the small farmer into the effort of food and milk production, as also the associated cottage and village industries, so as to increase his income and diet alike). Fourthly, Dr Sukhatme feels that a supplement of energy foods like milk which has half of its calories derived from fat, will greatly help in the transition from weaning to solid diets. Accordingly, he is for all-out efforts to expand the production of these foods. Finally, rather than provide lunch to school children, he thinks, more attention must be paid to the needs of pregnant and lactating mothers, as this is likely to have a direct impact on infant mortality and through it on improved levels of nutrition.

Eastern Economist 25 Years Ago

MAY 2, 1947

The Report of the Disposals Enquiry Committee is a rather unimpressive document and reads very much like a departmental memorandum. It will not be unfair to say that the enquiry has added very little to our knowledge of this vexed question about which the public has held firm views and entertained suspicions, which cannot altogether be dismissed as frivolous or malicious. Indeed the only new information made available by the Committee appears to be as regards the progress of disposals. The total volume of declarations of surpluses, excluding American surpluses made up to the end of 1946, amounted to Rs 152.1 crores in terms of book value, and sales Rs 70.5 crores, the balance being Rs 81.6 crores. But there

is a large volume of surpluses yet to be declared: further surpluses of engineering stores alone are expected to be of the order of 600,000 tons of the book value of Rs 70 crores, while vehicles are likely to be reported at the monthly rate of 5,000 till March 1948. The book value of all these will be well over Rs 100 crores, and the total left for disposal including the balance will thus be something like Rs 180 to 200 crores. Considerable delay in declaring surpluses occurs on account of the fact that the final responsibility therefor is vested with the War Office for several categories of stores. The Committee urges that this delay be cut and at least Indian surpluses declared at once.

ISI and the consumer

THE SILVER jubilee celebrations of Indian Standards Institution (ISI) last week in the capital were marked by all-round satisfaction with its achievements in the first quarter century of its existence. If the yardstick of ISI's success is taken merely as the total number of standards formulated by it, it can rightly feel proud as it had published as many as 6,720 standards till the end of February this year, the largest number (1,329) being in the chemical industry. All these standards have been evolved, according to Mr S.K. Sen, Director-General of ISI, "through a common consensus of different interests concerned". In other words, a standard is no more than a compromise of "what the manufacturer can make, what the user wants and what he is prepared to pay for the product". This applies particularly to consumer products. In the case of industrial products, however, the element of suitability predominates with an eye on saving both in materials and effort without in any way compromising with quality.

Under the ISI Certification Marks Scheme, nearly 3,000 licences have been issued for more than 500 industrial and consumer products. The value of annual production of ISI certified good has already crossed the mark of Rs 500 crores. But all this is a small portion of our total economy and in the words of Mr Moinul Haque Chowdhry, union Minister for Industrial Development and President of ISI "there is still a long way to go".

That formulation of standards has been instrumental in saving valuable raw materials and foreign exchange, there is no doubt. A number of studies have shown the benefits accruing to the economy through the adoption of standards. Some time back, the National Council of Applied Economic Research demonstrated in one of its studies that a saving of 23.6 per cent in structural steel could be effected by the new designs formulated in consultation with the Indian Standards Institution.

A research paper by Mr S. Rajamani and Mr G.R. Krishnamoorthy of Bharat Heavy Electricals Ltd., Trichy, submitted for discussion at the silver jubilee convention indicated that mere variety rationalisation brought about an increase in storage capacity by three

times in the case of plates and by 3.5 times in the case of structural in the manufacture of 60 MW and 110 MW high pressure boilers. This paper clearly established the utility of various techniques in standardization at different levels as well as their inter-dependence.

Another outstanding example of the use to which standardization has been put in a light engineering industry is given by Mr B.D. Kapur, President, Atlas Cycle Industries Ltd., Sonapat, in an article published in the souvenir of ISI jubilee convention. As the table below shows, variety reduction of the order of 40 per cent was attained through design standardization and as much as 50 per cent in product standardization (hardware only). This was an achievement of no mean order. Incidentally, it may be stated that this unit bagged a big export order recently — thanks to the imaginative materials management techniques, including standardization, adopted by the unit:

Results of standardization in Atlas

Activity	Variety reduction		Percentage reduction
	From	To	
Design	5,250	3,150	40
Standardization			
Product			
Standardization:			
Hardware	43	21	50
Washers	19	6	67
Bicycle components	254	212	18

Numerous similar examples can be cited demonstrating the usefulness of standards in industry.

In order to help the consumer in this country as well as the export industries, the ISI Certification Marks Scheme was started in 1956. The common understanding is that the ISI mark is an assurance against sub-standard product, the assumption being that the product has been manufactured under the quality control system approved by ISI. This naturally inspires confidence in the mind of the consumer who feels

that he is getting his money's worth if the product is certified by ISI. Already the certification scheme of ISI covers a large variety of industries such as pesticides, cables and conductors, steel and steel products, jute and jute products, liquefied petroleum gas cylinders and valves, diesel engines, food colours, etc.

The Certification Scheme of ISI is voluntary in nature, that is why only a small number of industries have gone in for it in the last 15 years. If the consumer insists on purchasing goods marked by ISI, it will result in increasing numbers of manufacturers turning to the facility provided by ISI. If a large number of manufacturers have not applied for the ISI Certificate Scheme so far, the apathy of the consumer alone is not responsible for it. A part of the blame rests with the inefficient handling of this scheme by ISI.

A typical example is provided by a consumer who wrote as follows to the *Times of India* on April 22, 1972: "Sometime ago I purchased an anodised aluminium lunch box bearing ISI mark number IS-21 on the assumption that the ISI mark guarantees quality. To my dismay, I found that any food material packed in this lunch box acquired the colour of the coating used. This was both unpleasant and dangerous. On complaining to ISI, New Delhi, I was informed that IS-21 certifies only the quality of the aluminium and nothing else. An average consumer does not know about these niceties. He assumes that the item has been checked and certified for use. For example, the ISI mark on a pressure cooker should ensure that it is made of the right material, that it will build up the necessary pressure and that it will not explode. It is little consolation to be told that the material used is of the right quality. Will ISI enlighten the public on the procedure it adopts to ensure that the ISI mark is used by manufacturers to serve society better and not to exploit the consumer?"

Obviously increased attention needs to be paid to the inspection of the manufacturing unit before awarding the ISI mark and the sampling checks carried out from time to time should be rigorous and not perfunctory. It might be argued that no amount of inspection can guarantee cent per cent perfection but an effort certainly should be made to minimise the percentage of errant cases.

Roads challenge railways

IN A recent publication, the Ministry of Railways has bemoaned the fact that a good proportion of the high-rated traffic has been creamed off by road transport. In *A review of the Performance of the Indian Railways*, issued while presenting the Railway Budget for 1972-73, the Ministry points out that the preponderance of low-rated commodities like coal, ores, stones, cement, fertilisers, fodder, foodgrains and salt in the traditional mix of the revenue-earning freight traffic of the railways has been getting accentuated over the years. In 1970-71 the low-rated group of commodities accounted for about 72 per cent of the total revenue-earning traffic but contributed only 52 per cent of the earnings from goods carried. Between 1960-61 and 1970-71, the originating tonnage of these commodities increased by about 54 per cent while, in the rest of the commodities consisting of a fair proportion of high-rated traffic, the increase was only by 14 per cent.

The Ministry of Railways has explained that an urgent demand has arisen for flexible road transport services because of the growth of secondary manufacturing industries especially in the small-scale and decentralised sectors. There has been a great increase in the demand for specialised transport services calling for safe, fast and reliable scheduled services including door-to-door delivery. The ministry points out that the road haulage, apart from certain inherent advantages like being able to pick up traffic and deliver it at different points, does not also have the legal liability which the railways have of being required to lift any traffic without showing undue preference either to any set of customers or to any type of traffic.

But road transport is becoming increasingly popular with industry and trade not merely because of its inherent advantages but because of the inability of the railways to provide satisfactory service. On the one hand, the freight rate on the railways has been going up sharply while, on the other hand, efficiency has been declining. The Operations Research Group of Baroda, in a recent study, revealed that about 77 per cent of the total of exporters who had the choice of road or rail transport preferred the former because of the

various deficiencies of the railways. According to the research group's findings, the following were the reasons for not using rail transport:

	Per cent
Long transit time	74.7
Uncertain transit time	58.3
Absence of ready availability	26.9
Fear of theft	20.7
Door-to-door delivery not being available	15.8
High freight	22.9

The railways have been attempting to meet the challenge from road transport by various measures like the running of super express goods trains, container services, freight-forwarder scheme, and special station-to-station rates for particular classes of traffic. The Marketing and Sales Organisation of the Railways is giving special attention to measures to divert more traffic to railways from road. But it can achieve success only if the railways tone up their efficiency considerably. The Minister for Railways said in his recent budget speech that in 1971-72 the railways had to pay compensation of over Rs 12 crores on account of theft, pilferage, and damage of booked consignments.

It is true that the railways are not to be solely blamed for their inability to serve industry and trade efficiently. The railways do not seem to be getting effective co-operation from the other ministries at the centre and from the state governments. Especially in the eastern region of India, the railways have suffered much from anti-social activities. For instance, in the eastern region the number of over-head electric traction wire thefts increased from 645 in 1970 to 699 in 1971, thefts of brass bearings from 26,388 to 28,366, thefts of brake bearings from 8821 to 19,377 and the number of victimisation of goods trains from 1079 to 1922. Mr Hanumanthaiya, the Railway Minister, said in his budget speech that he had given "serious thought" to this problem and that much improvement could be expected with the active and patriotic participation of railwaymen at all levels and with the co-operation of the state governments. It remains to be seen to what extent the minister's efforts in this regard will succeed.

Road transport has also suffered from anti-social activities though it has not received much publicity. In any case, the central and state governments should see to it that the railways are

able to perform their functions at the highest level of efficiency. At the same time, road transport should also be developed in a more serious and systematic manner.

India has been spending meagre amounts on the improvement of roads despite their immense importance to the economy. India's investment on roads as percentage of the gross national product was only 0.60 per cent in 1967 compared to 2.32 per cent in Japan. The government of India and the state governments have been deriving substantial sums of revenue from the road transport industry but spend only a negligible amount on the improvement of the roads. The Operation Research Group has estimated that while between 1960-61 and 1968-69, total revenues from the road transport industry increased at the compound rate of 16.1 per cent a year, the expenditure on road construction and maintenance increased at the rate of only 7.5 per cent a year. Consequently, the percentage ratio of expenditure to revenue declined at the average compound rate of 8 per cent a year. The efficiency of road transport is affected in many places due to narrow culverts, defective bridges and poor surface.

The government of India and the state governments should give greater attention to the vigorous development of road transport. This will help not only export promotion and employment but also improve the living standards of the people. In a vast and expanding economy like ours, there is clearly ample scope for the profitable co-existence of road and rail, each of which can effectively and substantially contribute to the country's rapid progress.

POINTS OF VIEW

The world of STC

R. V. Murthy

It is axiomatic that there is a direct relation in an organisation between its efficiency and the calibre of its men, but a lot also depends on the method of working that an organisation pursues. Of course, there are methods and methods, but it is the calibre of the men at the helm of an organisation that is decisive in the selection of the right method, that is a method that not only promises but produces the best results. When, three years ago, Mr Prakash Tandon, Chairman, State Trading Corporation (STC), introduced "performance budgeting," he claimed for it several virtues; among the more important was the inculcation of a sense of financial discipline in the STC's operations by making its management carefully to examine and quantify its intentions and, through follow-up actions, maximise output and minimise inputs. After looking at the STC's provisional results for the year ended March, 1972 announced on March 31, that is the last day of the year itself, it is difficult not to concede that the claim has been more than fulfilled.

main factors

Mr Tandon rightly attributed the gratifying progress of the STC during 1971-72 to two main factors: one, low capital employed ratio and low expenditure ratio. Thus, the saving in capital employed in 1971-72 was of the order of Rs 80 crores. In 1967-68, on a turnover of Rs 141 crores, the STC employed Rs 67 crores in stocks and debtors, but, in 1971-72, on a turnover of Rs 328 crores, only Rs 60 crores were employed thus, while in the current year 1972-73, the budget provides for an employment of a still lower amount, only Rs 47 crores, on an anticipated higher turnover of Rs 374 crores. Percentage-wise, the saving is a reduction in the ratio of expenditure on stocks and debtors to turnover from 46 per cent to below 19 per cent. At the former ratio (of 46 per cent), this would mean Rs 124 crores less by way of capital employed in 1972-73. Similarly, the ratio of expenditure to turnover, which was 2.65 per cent of the turnover in 1967-68, declined to 1.71

per cent of the turnover in 1971-72. The expenditure in 1967-68, it may be noted here, was Rs 3.8 crores and this used to rise at about 21 per cent; at this rate of rise, the expenditure would normally have risen to Rs 7.5 crores, but due to the new system introduced, the actual rise has been only Rs 5.1 crores, which means a saving of Rs 2.4 crores. In arriving at the savings effected, we must also add the savings on interest; calculated at 9.5 per cent per annum, this would work out to another Rs 7.6 crores, making a total saving of as much as Rs 10 crores in one year.

The total turnover of the STC group — Projects and Equipment Corporation (PEC), Cashew Corporation of India — (CCI), Handloom and Handicrafts Exports Corporation (HHEC) and Indian Motion Pictures Export Corporation (IMPEC) — crossed the Rs 300-crore level in 1971-72. Thus, exports rose from Rs 74.1 crores to Rs 96.8 crores (+30.6 per cent); imports increased from Rs 154.0 crores to Rs 220.7 crores

(+43.3 per cent); total sales rose from Rs 233.8 crores to Rs 328.6 crores (+40.5 per cent); and profit shot up from Rs 7.2 crores to Rs 16.1 crores (+123.6 per cent).

Lest this be adversely commented upon, Mr Tandon said in his statement: "STC lives in an interesting world: when it makes good profits, some object to it; equally, when it makes less profits, some say it is sliding down. STC took this to heart and this year made an all-out effort to improve its profits and more than doubled it". But he did not stop at that. He went on, perhaps to be seen to be in tune with the prevalent trend, "Our management is now fully cost and profit conscious, consistent of course, with its social obligations".

Even so, he did not mind adding, perhaps as an after-thought, "Actually, by the standards of industry's profits in India of nearly 10 per cent on turnover, and private trade's even higher our profits of 4.9 per cent is quite modest. A profit of 4.9 per cent is certainly

TABLE I
Performance of STC

	Last year 1970-71 Actual	This year 1971-72 Provisional	Next year 1972-73 Budget
Export sales	74.1	96.8	127.5
Import sales	154.0	220.7	236.9
Domestic sales	5.7	11.1	10.1
Total sales	233.8	328.6	374.5

1.4.1971		7.1	1.4
1.4.1972			4.1

*Excluding interest, depreciation and provisions.

modest, although it must be borne in mind at the same time, that not all the dealings of the STC are decided solely by the STC; oftentimes, it is required by the authorities to enter the market to stabilise prices as, for instance, in respect of rubber and tobacco, or to do some buffer stock operations as, for example, for fats and oils and rubber as in 1971-72. Nevertheless, Mr Tandon would do well to strive and achieve a profit rate of 10 per cent so that there may not be a shortfall in contribution to Plan resources from public sector undertakings for which credit is taken meticulously by the Planning Commission.

A noteworthy feature of the STC's 1972-73 budget is that, for the first time, it covers the entire group. The highlights of the budget are an all round increase in total sales (exports, imports and domestic sales) and a reduction in stocks, debtors and expenditure as a ratio to sales, as the table on page 838 shows.

On one achievement of the STC, namely cash management, no one can withhold credit to Mr Tandon. Despite some buffer stock operations which involved an avoidable use of its resources, the STC managed not only to have cash surplus but invested it suitably and also usefully. The Corporations lending to its export associates in the small-scale sector and the switching of its surplus funds for use by any member of the group are at once imaginative and prudent, in that these not only make for the maximum utilisation

of the available resources but the minimisation of interest payments as well. To judge from the chairman's statement, the small-scale industries stand to gain many other benefits. Other beneficiaries of the STC's new schemes are its own employees (management trainee scheme) and young talent from men and women drawn from scheduled castes and scheduled tribes apart from the Administrative Staff College, Hyderabad and the Indian Institute of Management, Ahmedabad, which have both received endowments for the purpose of encouraging management education (e.g. Industrial Relations in Hyderabad and International Marketing in Ahmedabad).

What role does the STC play in stabilising prices? This is a matter of opinion, depending upon the angle from which one looks at it as a producer, as a trader or as a consumer. But, by and large, the STC must be said to have exercised a healthy restraint on wild fluctuations in prices, especially in the field of fats and oils. But for the STC's sales of soyabean oil and tallow (the issue prices of both, by the way, are fixed by the concerned union ministries), prices in the field would have witnessed gyrations galore. The STC's effective role in the field is necessarily circumscribed by the findings of a committee set up by the Ministry of Foreign Trade (on which the STC is also represented) which decides the prices of a wide range of commodities to be actually charged by the STC. This explains the multi-tier system of prices

followed by the STC, the prices varying with the margin of the profits charged, these being the lowest in the case of items supplied as replenishment against exports of certain products.

While on the subject of prices Mr Tandon was also thinking aloud on the problem of price support operations for agricultural products. According to him, an import-export bank for agricultural commodities would be a worthwhile experiment. Such a bank, he said, could export an agricultural commodity whenever it was in surplus and import raw materials needed by industry out of the foreign exchange so earned whenever necessary. As we achieve agricultural improvement, he opined, we must think in terms of such and other agricultural services.

Mr Tandon also made a reference to the number of advisory committees set up by the STC to ascertain from the industrial interests concerned their requirements of various items so as to enable them to plan their export programmes more systematically. More than in the field of exports, where individual exporters would still be relatively more effective, the STC, he thought, could play a really decisive and useful role in imports, even as combines of import interests, official or non-official, in other countries were doing by reason of their being in a commanding position to dictate terms. This, however, has not prevented him from planning for an increase in STC's exports in 1972-73 to Rs 127.5 crores as against less than Rs 100 crores in 1971-72.

Let's be reasonable

Sagittarius

WITH BUMPER food crops continuing to be harvested, the suspension of concessional food imports, the establishment of a new record in respect of the output of raw cotton and the emergence of a new threat of sugar shortage, the policies of the central and state governments and the Reserve Bank of India will have to be suitably revised. In regard to food procurement and distribution particularly, it has become necessary to have clear ideas as the cost to the exchequer on account of the maintenance of buffer stocks and the commitments to meet the requirements

of the statutorily rationed areas and for effecting sales through fair price shops is tending to become prohibitive.

One would have thought that the central government would not be obliged to incur heavy expenditure on food subsidies after the country had attained near self-sufficiency in food and it became possible to dispense with concessional imports of wheat and other cereals under the PL 480 agreement. Indeed, it can even be said that surpluses of foodgrains are emerging in some directions and it should not be

difficult to overcome deficits in some cereals by paying for their imports with exports of others in excess of our requirements.

The actual developments, however, are coming about in a different way. With a record output of 26 million tonnes of wheat in 1971-72 and the prospect of heavy arrivals of this cereal, into the marketing centres in Punjab Haryana and UP particularly, there is even talk of buffer stocks of foodgrains increasing by 1.5 million tonnes to around 10 million tonnes by the end

of this year. In the budget estimates for 1972-73 it has been indicated that there will have to be a provision of Rs 25 crores for maintaining buffer stocks though the aggregate amount involved would be Rs 120 crores. The balance of Rs 95 crores will be found out of the resources of the banking system and this is stated to be one of the main reasons for fixing a modest target of Rs 215 crores for net borrowing through open market loans. While the government may still succeed in raising a larger net amount of more than Rs 300 crores by the issue of new loans, what is more important from the point of view of the present discussion is the additional burden cast on the exchequer in the form of higher interest charges, losses on sales, increased expenditure on storage, loss on account of waste and deterioration and so on.

unprecedented procurement

As there will be an expansion of credit for procurement operations on a scale hitherto unprecedented in the 1972-73 marketing season and there is likely to be a net increase in procurement credit by over Rs 100 crore, by the end of March 1973, aggregate advances against food-grains to the Food Corporation of India and other agencies may easily cross the Rs 500-crore mark. This figure should not be considered forbidding as the go-downs of the Food Corporation of India would be bursting at their sides and the value of 10 million tonnes of foodgrains could be easily in excess of Rs 850 crores. This roughly gives a measure of the indirect investment out of budgetary resources of nearly Rs 350 crores in food stocks. The question is up to what level buffer stocks should be allowed to increase, what should be the procurement prices and how sales should be effected out of buffer stocks through fair price shops and to consumers in the statutorily rationed area. A decision on these vital questions will have to be taken at an early date as any effort to maintain buffer stocks in excess of even the existing level of 8.5 million tonnes will cost the exchequer dearly besides leading to wasteful use of transport facilities deterioration in storage and the immobilisation of large funds, which can be utilised for other purposes.

The central government has to bear

the interest charges payable by the Food Corporation to the banking system for maintaining minimum buffer stocks. Even assuming that about Rs 500 crores will continue to be immobilised in these stocks, the cost will be a minimum of Rs 50 crores. It has been suggested by those in charge of procurement operations that it should be the objective to mobilise minimum resources at an interest rate of six per cent for creating a revolving fund and reducing interest charges.

interest charges

This will no doubt result in a reduction in interest charges alone by Rs 20 crores annually. This suggestion is eminently acceptable though it will be difficult to find the required resources in a short period in view of the pressure on available resources from many directions. It should not be difficult however to carry out this operation on a staggered basis and complete it in a period of five years. In that case, there will be no question of earmarking definite amounts out of budgetary resources or continuing to immobilise large amounts of the banking system in the shape of advances against foodgrains.

The Food Corporation may attempt to raise its own funds through the issue of bonds or if it is not immediately practicable, the government may allocate about Rs 100 crores every year out of its own resources for this purpose and lend the amount to the Food Corporation in the same way as it is doing to the Railways by charging an average rate of interest. A continuance of this procedure for four or five years will enable the corporation to have a pool of resources which will help it to be independent of either the government or the banking system for carrying out its operations. What is however more important is how it conducts these operations. They are likely to result in heavy losses as stated earlier if there is a net increase in buffer stocks and purchases and sales have to be carried out of about 3.5 million tonnes in order to meet the needs of fair price shops and the statutorily rationed areas.

The Agricultural Prices Commission has drawn forceful attention of the government to the need for reducing procurement prices and increasing issue prices in order to eliminate the losses

POINTS OF VIEW

sustained on procurement and sales. The subsidy on this account in 1972-73 is estimated at Rs 120 crores while a provision of only Rs 100 crores has been made in the budget estimates. The provision in the budget for 1971-72 was originally Rs 30 crores and it has risen to Rs 50 crores in the revised estimate, on account of a fall in the content of imported foodgrains and an increase in the volume of buffer stocks. The actual losses may be very much more since the state food ministers at their recent conference did not agree to an increase in issue prices immediately or a staggered reduction in procurement prices. Since they have not had the courage to arrive at workable decisions, there should at least be a change in the policy in regard to procurement and distribution. There is no point in penalising the tax-payer for feeding a section of consumers in a period of plenty through the pursuance of policies which were thought of in times of scarcity.

costly operation

The grower has to be assured a fair price for his produce. But the manner in which procurement and distribution policies are being implemented is proving to be costly for the community as excessive procurement has been responsible for high prices in the open markets in the lean months. Also in the deficit areas traders are helped to exploit consumers partly because of the inability of the Food Corporation to carry out intelligent open market operations. The anomalies in this regard can be expected to be rectified naturally if in 1972-73 there is a further increase in the output of foodgrains to 112 million tonnes. But there is no reason why a decision should not be taken regarding the limiting of the subsidy that will have to be incurred by the central government to Rs 50 crores and restricting procurement operations to a limited quantity. After this quota had been completed, additional quantities should be acquired only in the nature of support operations at prices which are much lower than procurement prices.

This kind of approach to the problems confronting the central government and the Food Corporation is inevitable. Otherwise, apart from interest charges of over Rs 50 crores, there will be the loss arising out of the actual

POINTS OF VIEW

difference between issue and procurement prices which are now about Rs 50 per tonne. There will also be the additional expenditure on transport, storage costs, loss in storage and deterioration, administrative expenditure and so on. Even assuming that about Rs 50 per tonne will be the minimum expenditure on account of these factors, the total loss involved will be easily Rs 100 per tonne. If the quantities procured exceed six million tonnes, the aggregate cost will be over Rs 100 crores including interest charges and even Rs 120 crores as estimated by the Agricultural Prices Commission. The adjustments in issue and procurement

prices should thus be effected for absorbing at least handling and other charges. The burden of interest charges may for the time being be borne by the government, though even here there will have to be an upper limit in regard to the size of the buffer stocks and a definite plan for creating a revolving fund. Only after pragmatic decisions have been taken on these issues, it will be possible to evolve correct policies in regard to the maintenance of buffer stocks for raw cotton or raw jute.

It will also be necessary to have clear thinking in respect of minimum prices

for sugarcane and availability of credit for effecting payments against cane purchases and maintenance of sugar stocks. It is the failure to think clearly on vital questions that has been responsible for the present confusion in the formulation of farm policies. The emphasis has necessarily to be on boosting production at any cost in the earlier stages of development. But once a breakthrough has been achieved in some directions the new problems have to be handled properly and sentiment should not result in the undue penalisation of the tax-payers or those consumers who do not benefit from subsidised sales.

Coin shortage— a danger signal

M. R. Pai

FROM ABOUT the end of 1970, an acute coin shortage has been felt all over the country. This has seriously inconvenienced people in their day-to-day economic activities. In big cities like Bombay, quarrels with bus conductors, vegetable vendors and restaurant owners have become a routine for the public.

Similar reports are heard from cities as far removed in distance as Cochin and Delhi, and other towns of India.

A brief study of our mints and coinage system is interesting. Three mints at Bombay, Madras and Calcutta were set up in 1823. The Madras mint was closed down in 1859 though there is still a Mint Street to remind people of it. The Calcutta mint was shifted to Alipore in 1951. The Hyderabad mint was acquired in 1950.

The three mints at Bombay, Alipore and Hyderabad are under the charge of the union Finance Ministry. But the Reserve Bank is responsible for coin supply to the public.

When public criticism of Reserve Bank started, an impression was sought to be created by the Reserve Bank spokesmen that the Bank had nothing

to do with the present coin shortage as the mints were owned by the government. The actual position is different.

The programme of production of coins is determined by mints "on the basis of advices received from the Chief Accountant, Reserve Bank of India." (Estimates Committee of Second Lok Sabha in its 48th Report).

The reasons for present acute coin shortage are two: First, failure of the Reserve Bank to anticipate coinage requirements of the economy. Second, the failure of government economic policy over the years.

In March 1956, the coin supply was Rs 66 crores. It had increased to Rs 134 crores in January 1972. However, the increase is not to be measured in terms of these figures. A meaningful interpretation of these figures is to see the coin supply as a percentage of the total stock of currency. Only then one gets a proper appreciation of the supply position.

In 1956, coin supply was 3.9 per cent of the total stock of currency which was Rs 1,684 crores. In 1971, it had come down to three per cent while the

total stock of currency was Rs 4,708 crores. Considering the increase in money supply, and growing economic activities, there was need to increase the coin supply. Because most transactions in our country take place in retail trade, even if coin supply had been maintained at 1956 level, the requirement would have been about Rs 183 crores and not Rs 134 crores in January 1972. Therefore, there is a serious shortfall of about Rs 50 crores owing to the failure of the Reserve Bank to anticipate the need for small coins.

An explanation is sometimes given that owing to export orders to Thailand and Greece, our mints were busy. This is not correct. In the first place, export orders are nothing new. One of the functions of the mints is to execute export orders. For instance, the "Currency and Finance", Report of the Reserve Bank for 1956-57, clearly states: "As in the previous years, the India government mints continued to undertake coinage for foreign countries". The Parliamentary Estimates Committee also points out that mints "take up foreign coinage".

Second, the recent report of the union Finance Ministry had disclosed that

in the last two years, the Reserve Bank had drastically cut down orders for coins. The result is a countrywide shortage of coins.

The Reserve Bank in a letter to the Bombay branch of the All-India Bank Depositors' Association has contended that this was a shortage only in Greater Bombay, and elsewhere conditions were better.

Once again, this explanation is incorrect. If it had been true, then coins would have been attracted to Bombay from the rest of the country because they command a premium of Rs 10 to Rs 12 per coins worth Rs 100. Coin shortage is universal in the country, but it is felt more acutely in Bombay which is India's premier commercial centre. Bombay's faster pace of economic activities require more coins than other parts of the country.

The second main reason for coin shortage is the failure of government's economic policy. Over the years, because of government's faulty policies, prices have gone up steadily. The increase has been so big that the metallic content of many coins today is much more than their face value. In such a situation, unscrupulous persons have

started cornering and melting coins for sale of metal.

It is interesting to note in this context that many countries use light metals in coins just to forestall this possibility. In fact, our Parliamentary Estimates Committee had recommended in 1959 that use of cheaper substances in our coins should be considered. Unfortunately, this recommendation does not seem to have been acted upon by the authorities. Only now that the coin crisis has come upon the public, new coins are being minted in light aluminium magnesia alloy. Had this been done earlier, the present crisis would not have been so acute.

From time to time, there are suggestions that paper coins or plastic coins should be issued. As coins change hands frequently, "paper coins" would be soiled and damaged beyond recognition in a few days. As it is, the one-rupee notes have a short life. Moreover, counterfeiting such paper or plastic coins would become easy and detection very difficult.

Some organisations like the BEST Undertaking of the Bombay Municipal Corporation have issued coupons to cope with the requirements of their bus services. Some restaurants have also "coupons" or "tokens" currency. This

is permitted as the authorities seem to be helpless in enforcing the laws. In reality, such coupons and tokens are a parallel currency and illegal.

The present coin shortage cannot be allowed to continue because it hampers economic growth. In addition, its burden is mainly borne by small people who can least afford it. While on the one hand there is loud talk of "social justice" and the need to help small people, on the other we have the ironical spectacle of gross social injustice and losses for the small people as a result of coin shortage!

Shortage of coins in our present inflationary situation can be compared to a fat man gasping for breath. It shows that ours is not a healthy economy if people have to pay more money to buy money! Money itself is a measure of economic value and when that measure becomes distorted economic activities also get distorted.

The coin shortage is, therefore, a danger signal to the economy. It points out the need for (a) realistic economic policies which promote greater production of wealth and a stable rupee, and (b) managerial efficiency on the part of the governmental authorities in handling the economic problems of the country.

RECORDS AND STATISTICS

Editor: R. V. MURTHY

A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement

The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.

Man-power is as man-power does

M. K. Raju

THE ALL India Management Association, in collaboration with the Madras Management Association, had conducted a survey last year on "The Managerial Profile in Madras". The survey was confined to 120 member organisations, who are enlightened enough to become members of the Management Association. Only 29 important organisations representing 30,658 employees, 1,484 managers and 3,095 supervisors have responded. This is a 24 per cent response, which I understand, is one of the highest responses for such a survey. The findings are most revealing:

27.6 per cent of managers surveyed do not possess a university degree.

54 per cent of supervisory staff are non-graduates.

Inexperienced supervisors

More than 62 per cent of supervisors have less than 10 years of experience. This would imply that they have another 25 years productive run and will be a drag, without an opportunity for training or continuing education, more so, as many of them may move to management levels.

The total training effort covers only 20 per cent of the sample, a substantial portion of which is due to the impact of only two highly training oriented companies.

Amongst the supervision, the total trained, excluding one major company, is only 17 per cent.

A survey conducted by *Economic Times* in 1969 and reported in the MMA Executive Compensation Survey, reveals that 46 out of the 75 managing directors do not have any qualifications worth mentioning. The position, I understand, shows some improvement now.

If we take the criterion for eligibility

Extracts from an address by Mr M.K. Raju President, All India Management Association, at the Third Annual Convention of the Indian Society for Training and Development, held in Madras earlier this month.

of a professional manager as possessing good education, an opportunity and a desire for continuing education, well developed ethical and moral values and a certain experience in managing, 54 per cent of our existing managers do not meet these standards.

This is indeed a depressing picture. Planning of training is not widely practised—activity-wise and budget-wise—even in the relatively well-known and large companies in an industrial metropolitan city like Madras. On the national scene, organised training efforts are more scarce. An area as important as training is taken for granted. We only have lip service, with too little commitment in the country for training and development.

Human resource development is so critical a factor in the economic growth of the nation, that it can no longer be left to chance, or 'corporate conscience' in a few companies. There is an urgent need for a national policy on training and human resource development.

Current scene

That explains the reason why so many countries have developed national policies with respect to training. Let us look at the scene in some of these countries:—

Britain has introduced an industrial training legislation on the basis of a levy and grant system varying from industry to industry (the levy in engineering industry is 2½ per cent of salaries and wages). Two million people are being trained systematically each year by the employers.

In France, every employer of more

POINTS OF VIEW

than 10 workers is obliged to pay a uniform training levy going up to two per cent on his total wage bill. Under the scheme, total number trained has risen from 190,000 in 1969 to 371,000 last year. It is the legal right of every French worker to get periods of leave to attend approved training courses.

French managers believe that training must become a permanent process throughout their professional life.

Sweden has implemented a man-power and economic policy.

Japan's miracle

Japan's economic miracle is the success story of their man-power policy, where thousands of supervisors and technicians were trained in a very short time.

Canada has a new man-power training programme.

USA spends 12 per cent of GNP for education and training in industry, government and defence. It is reported that 42 per cent of growth rate per product per person is due to education during the fifty years 1910-1960.

Israel has introduced education and job training measures worthy of mention.

In Finland, it is reported that top and middle executives go to school to study professional management, probably more than those in any other country.

In Singapore, with no more than 50,000 management personnel, 100,000 man-hours of management training were imparted in less than four years.

In Poland, in one year itself, in

1963, 100,000 personnel took part in courses dealing with management and related subjects.

All this reveals a national concern for human resource development. This covers as much the existing stock of human resources, as well as the development of new resources. Formal management education and training is becoming an integral part of corporate man-power policy and it includes top management at the board levels, as well.

While the experience in all these countries, demonstrates so clearly the relationship between investment on training and economic growth, in our country, there is a glaring contrast—a gap between 'blissful ignorance and unconcern for management on the one hand, and appreciation of the significance and role of management for the efficient and effective functioning of all social units on the other'. In my opinion, this is the crux of our problem. Unless we bridge this gap, we cannot ensure any sustained progress.

magnitude of task

Let us presume that we accept in principle that this gap must be bridged and we as a country accept training and development, as a part and parcel of our man-power policy. Then, what is the magnitude of our task?

Efforts were made from time to time to project our future demands of managerial personnel in the country.

The latest estimate from the Institute of Applied Man-power Research projects our demands for the decade 1966-76 at 250,000 managers, of which promotions from within cover at least 100,000. What is conspicuous is that the data is so much at variance from one estimate to the other, that it needs to be reconciled. What is even more conspicuous is that no data, not even a rough estimate, is available on the existing management and supervisory personnel in the country. This is so serious, as they form the baseline for our training needs, make the climate for receptivity to training and form at least 80 per cent potential for promotion of supervisory and managerial personnel from within.

These estimates of managerial re-

quirements do not include the 8.5 million and odd government employees from the state and central governments and the corresponding managerial needs. Put together, industry, government and agriculture, call for an intensive training activity, on a gigantic scale, in our country.

large demand

Whatever be the criterion we adopt, the estimated demand for new managers is large—anywhere from 25,000 to 50,000 annually. Against this requirement, we turn out about 650 graduates in management education annually from our business schools and universities. Amongst the existing management personnel, it is estimated that about 10,000 managers get exposed to some training or the other annually through all existing training agencies, associations, universities and business schools. This is from the existing base of about a million management and supervisory personnel.

Thus, our efforts in the direction of training are glaringly inadequate and this, to a large extent, is retarding the tempo of our economic development, regardless of our other investments. This constitutes a colossal task and our policy must be to allocate our resources judiciously prioritising our national requirements.

High rate of economic growth is not possible without the better utilisation of existing facilities. Our industrial sectors must, therefore, increase their efforts in a relentless campaign, to make present workers, supervisors and managers more effective and to ensure an adequate supply of well qualified personnel for the future, if our country has to maintain rapid growth.

With the present industrial base and existing technologies, machines and materials and with only one more input, namely, improved management and massive training at all levels, we should be in a position to restore full utilisation of existing capacities, which will be the equivalent of 3500 million rupees of additional output. Similarly, an efficient inventory management should result in substantial savings in the country. It is, therefore, clear in the present stage of our development, that training of existing personnel to improve the

POINTS OF VIEW

efficiency becomes even more important than even training of new managers.

Then, what is the role of the Indian Society for Training and Development (ISTD) and industry?

As I visualise it, ISTD must be a catalyst to close the gap between ignorance and appreciation for training and development, the gap between appreciation and acquisition of knowledge and finally, the gap between the acquisition of knowledge and its application.

As a first step, it must take the responsibility to collect facts about existing management and supervisory personnel in the country, both in the government and industry and our projected demands for the future, for a predetermined economic growth. I recommend a national committee for this project, a time schedule to correlate the existing data, for collection of new data and to make available authentic statistics on existing management and supervisory personnel. This must cover

Agents:
THE ORIENTAL MERCANTILE CO., LTD.
Calcutta - Bombay - Delhi
Kanpur - Madras

age, educational qualifications, experience and area of specialisation. This is the most urgent task we have, if we want to make any progress in our training activity. This will be a starting point for a National Plan on Training. When once the project proposal is ready, I am sure, we can find enough financial resources from enlightened industrialists and the government to conduct such a survey.

Secondly, a strategy must be evolved by ISTD to close the gap between ignorance and unconcern for training and its application. Whether the approach will be enterprise-wise, or at the dual level; whether it should be through appreciation seminars or through films or through case studies of successes and failures, it is for ISTD to decide. I recommend that you honour at each annual convention two or three organisations in our country, which are training oriented, which have shown creativity and innovation in training and which have contributed to our national progress. They deserve such recognition.

industry's role

Thirdly, I strongly believe that industry can and must take all necessary steps to do everything in its power including investment of large sums to supply qualified man-power. No doubt, we require the assistance of the government. But, installation of recruiting, training and selecting centres within the companies on their own initiative will pay high dividends and contribute not only to their own prosperity, but also the country at large.

Fourthly, I recommend, we set up national training centres in Bombay, Calcutta, Delhi and Madras with facilities such as audio-visual aids, auditoriums, libraries and films. ISTD can take a lead in setting up such centres, and co-ordinate its efforts in training with other management associations. Physical facilities will make training more effective, reduce costs and increase the frequency of use. ISTD could take the lead in drawing a Master Plan. Ultimately, such facilities may be extended to at least one centre in each state for mass exposure of supervisors and managers to training in every sphere of economic activity.

Fifthly, this intense training activity pre-supposes an adequate number of

competent trainers. It will be worthwhile for the ISTD to study the profile of a trainer, as it exists today and develop a profile for the future, to undertake the tasks ahead. This is so important that it will be worthwhile for you to consider "Profile of a Trainer" as one of the themes for your next convention. I hope, by that time, you will be in a position to bridge the gap between ignorance and appreciation of the role of training and move to the acquisition of knowledge and its application. The trainer will have to play an important role in this transition.

Sixthly, as you will, no doubt, discuss during your deliberations at this convention, you must prepare yourself as how to meet the challenges of training of a large number of personnel in the country; how to make organisations more effective; how to initiate, set up and organise training in an organisation; how to provide enough trainers in quality and quantity and also what approaches to take — the behavioural and the systems — that ideally suit our environment and culture. This includes the training design, training evaluation, both qualitative and quantitative and research into different types and methods. This must become a part of the integrated plan for training in the country.

Lastly, our training goal must match the needs of our national goals of an annual growth rate in industrial production of 10 per cent, agricultural output of six per cent, national income of five per cent, labour productivity of seven per cent and more than all, real per capita income of five per cent.

baseline for plan

This should form the baseline for developing a National Plan for Training. Some of the major elements of this plan would be:

Establishing priorities between orientation and functional programmes, executive development programmes, postgraduate development programmes, as well as derive cost-benefit equations for each one of them.

Developing sectorial and managerial level priorities for training in industry.

Establishing the education and training linkages, through constant dia-

POINTS OF VIEW

logue between the industry and the academics.

The plan calls for mobilisation of resources in a big way. While we need the assistance of the government, industry cannot shy away from its own responsibility. With the creation of physical facilities for training in national centres all over the country, industry groups could consider voluntary efforts to launch a crash programme for training, as you have done so in one of your chapters, where 40 companies, 300 participants and 78 faculty members have participated in a co-operative supervisory training programme during the last two years. This is the best way. However, there is one harm independent India has done to industry—it has made it cease to think for itself and look to the government to do the thinking for them. On the training front, if we wish to keep to this trend, we may have no alternative but to look to the government for a compulsory levy on training, as in France and Britain. The choice is entirely left to the enlightened leadership in the country. To conclude:

crucial factor

Human resource development is the critical factor for economic growth. It can no longer be left to chance or corporate conscience.

The efforts in developing this resource, in India, have, so far, been grossly inadequate.

The crux of our problem is the gap between ignorance and appreciation of human resources development.

Priority is for improvement of the calibre of existing management and supervisory personnel.

ISTD can play a strategic role in bridging the gap between ignorance and appreciation of the role of training, in collecting authentic data on existing management and supervisory personnel and future demands, creating physical facilities for training and developing strategies to meet the existing and new demands.

ISTD can assist in drawing up a National Plan for training.

Human resources form the key to our progress. If properly harnessed, there is no reason, why we cannot altogether banish poverty and ill-health from the face of India.

FROM THE PRESS GALLERY

Our Parliamentary Correspondent

New Delhi, Saturday

THE DEMANDS for grants of two more ministries — (i) the Ministry of Agriculture, and (ii) the Ministry of Communications — were adopted by the Lok Sabha this week and those of the Ministry of Home Affairs were inconclusively debated. Another highlight of the proceedings of this House was a discussion on the large-scale closure of textile mills in Ahmedabad due to power shortage. Before the Rajya Sabha went into recess on Saturday last to re-assemble on May 8, it deliberated upon the arrangement with the Soviet Union for the import of raw cotton from there for processing in this country and re-export of cloth in the form of garments back to that country.

raw cotton prices

With plenty of foodgrains in stock and the current rabi crop expected to be again a bumper one, the members participating in the debate on the demands for grants of the Ministry of Agriculture, were much less critical of the government's agricultural strategy than they had been till last year. They however, expressed a good deal of concern over the recent sharp fall in the prices of raw cotton, particularly in Gujarat, the up-trend in sugar prices as a result of production this year going down to 31 lakh tonnes, the slow progress in the implementation of land reforms and the growing unemployment in the countryside. In respect of foodgrains, some critical references, of course, were made to the lack of adequate progress on the pulses and oilseeds fronts.

In his reply to this debate, the Minister of Agriculture, Mr Fakhruddin Ali Ahmed, took pride in the government having redeemed its pledge to stop all concessional imports of foodgrains. We are on the threshold of even exporting some foodgrains, he pointed out. The wheat target of the fourth Plan, Mr Ahmed said, was likely to be exceeded this year when the output would be more than 26 million tonnes. On the rice front also, he assured the House, the picture was now much

more encouraging as a good deal of rice was being produced even in the hitherto wheat-growing states like Haryana, Punjab and Uttar Pradesh. The massive summer rice crop programme, which was envisaged to be launched in the north-eastern part of India this year, would further substantially improve rice production in the country. This type of rice cultivation in West Bengal, Mr Ahmed said, had already yielded very good results.

concerted effort

Mr Ahmed agreed that concerted efforts had yet to be made for stepping up the production of oilseeds and pulses, but assured members that the various schemes which the government had prepared to raise the output of these two farm products — extension of cultivation of soyabean and sunflower in the case of oilseeds and popularisation of the new varieties which have been developed in the recent past in the case of pulses — would help in easing the position in the near future. Steps, he further stated, are being taken to check the diversion of area under cultivation of pulses and oilseeds to growing of foodgrains. Mr Ahmed assured the House that land reforms would now be more effectively brought about. He mentioned in this regard the steps being taken by the state governments to reduce the ceiling on land holdings.

Earlier intervening in the debate, the Minister of State, Mr A.P. Shinde, dealt with the problem of cotton, the other Minister of State in this Ministry, Prof. Sher Singh dwelt upon the sugar issue and the Deputy Minister, Mr Jagannath Pahadia, dealt with the problems connected with community development and co-operation. Mr Shinde announced that the government had decided to buy cotton at fixed prices to build up a buffer stock — the purchase prices, however, were announced later: about 10 per cent increase over the minimum prices reached in 1969. The purchase operations would be undertaken by the Cotton Corporation of India. These support prices, Mr Shinde hoped,

would make the country self-sufficient in cotton in the next three years. Mr Shinde also revealed that the total production of foodgrains in the country this year was estimated around 112 million tonnes, as against 107 million tonnes last year.

sugar estimate

Prof. Sher Singh expressed the hope that as a result of increase in the acreage under sugarcane, sugar output next year would go up to about 40 lakh tonnes, as against nearly 31 lakh tonnes this year. About the problem of payment of arrears to sugarcane growers, which had been adversely commented upon by some members, he stated, that the concerned state governments had been requested to take up steps to ensure expeditious payment to growers by mills. A large part of the outstanding arrears, he revealed, had already been cleared. Another point that was made by Prof. Sher Singh was that the rural works programme, which was launched by the union government last year to create employment in the countryside, was now making steady progress. The target of creating 554 lakhs man-hour jobs through this programme had already been exceeded. Of the 50 crores outlay earmarked for it, sanctions had been accorded for schemes involving an outlay of Rs 47 crores. The disbursement till now was of the order of Rs 34 crores.

Mr Pahadia assured the critics of his department that serious efforts were being made to strengthen the co-operative institutions which provided credit facilities to small and medium farmers.

The debate on the demands for grants of the Ministry of Communications was marked by the stout defence of the Minister for Communications, Mr H.N. Bhuguna, of the working of the Posts & Telegraphs Department in the face of heavy odds and the clamour of members for extending postal facilities in the rural areas. Mr Bhuguna admitted that the P&T Department con-

tinued to incur losses and had not lived up to the expectations of members. But he attributed this to the many problems faced by the department. One of these problems, he pointed out, was that out of social considerations, the department had to provide certain services at heavily subsidised rates. Whereas the cost of handling a postcard, for instance, he said, came to 18 paise, the department charged for it only 10 paise. The cost of handling newspapers, similarly, was as much as 25 paise, while the P&T Department's charges were 3.5 paise. The Minister did not agree with the suggestion of members that the P&T Department should be replaced by an autonomous corporation. Such a step, he felt, would amount to total commercialisation of the department which was also expected to be a public utility service. The other major problem, Mr Bahuguna pointed out, was that of human element. There being nearly one lakh post offices for about seven lakh villages, more than 51 per cent of the mail in 1972 was delivered by foot-runners. Moreover, mail sorters had to sort out letters written in 14 languages, if not more.

service in rural areas

In respect of extending postal facilities in the rural areas, Mr Bahuguna observed that the major constraint was shortage of funds. As additional funds became available, more and more post offices, he assured, would be opened in the rural areas. Mr Bahuguna also dwelt upon some of the economy measures his Ministry was taking. The plethora of forms, he said, was being reduced. The government had also decided to levy a small charge for VPP and acknowledgement receipts for registered letters as was being done in the case of money orders. To the complaint of a long waiting list for telephone connections, Mr Bahuguna's reply was that the production of indigenous equipment was being stepped up. He, however, regretted that the productivity of the Indian Telephone Industries, Bangalore, was much lower than that of the highly mechanised plants in Japan. Several members suggested that the state capitals should be linked with New Delhi by STD. The Minister assured them that that was his Ministry's aim also. Some members stressed the need for a concerted drive for stepping up small savings in rural areas through post offices.

During the debate on the Home Ministry's demands for grants, the CPM and Congress-O spokesmen

assailed the union government for using police and intelligence agencies for consolidating the rule of a small coterie in the ruling party. The DMK spokesman expressed concern over the increasing central control over states. Charges were again hurled at the central government for rigging up the recent state elections in some parts of the country. It was also alleged that the office of the state Governors had been reduced to the position of the chief election agents of the ruling party. The delay in the union government taking action on the memoranda submitted by the opposition parties against the Haryana Chief Minister, Mr Bansi Lal, which contained charges of corruption and nepotism against him, came in for scathing criticism at the hands of several members. A CPI member vehemently criticised the "failure" of the union government to curb corruption and black marketing.

state of emergency

The Jana Sangh leader, Mr A.B. Vajpayee, criticised the Prime Minister for concentrating too much power in her hands. The continuance of the state of emergency was also adversely commented upon by many opposition members. The Congress spokesmen, however, made valiant attempts to defend the government against the charges of the opposition, particularly in regard to the use of police and intelligence agencies for perpetuating the rule of a small coterie in the ruling party. They scathingly criticised the CPM for resorting to murder politics in West Bengal and expressed the hope that the law and order situation in that state would be improved in a concerted manner. Mr N.E. Horo (Ind) demanded the creation of a Jharkhand state, comprising the Chota Nagpur division of Bihar, two districts each of Madhya Pradesh and West Bengal and four districts of Orissa. This demand however, was strongly opposed by a Congress member, Mr Shankar Dayal Singh.

Intervening in this debate, the Minister for Home Affairs, Mr K.C. Pant, pointed out that time was not yet ripe for dispensing with the powers acquired by the union government through the declaration of emergency in the wake of war with Pakistan, as the Indian forces were still on the western borders keeping a constant vigil. He castigated the opposition members for raising the bogie of rigging up the recent state elections and advised them that they should take their defeat at the polls in a sporting manner. He, however, assured the House that the

government was prepared to legislate to tackle violence at the polls. Mr Pant hit back at Mr Jyotirmoy Bosu, the CPM spokesman, and pointed out that his party had suffered setback at the polls because the people in West Bengal had now turned against the CPM due to the violence let loose by it when it was a partner in the United Front government there. The Minister doubted whether the CPM at all believed in democracy. He felt that the Naxalite problem had been contained, thanks to official measures. The government, he added, was keeping constantly in mind the socio-economic aspects of the problem. Mr Pant also indicated that the union government would soon bring forth legislation to deal with the activities of communal organisations in the country.

power shortage

A strong demand was made in the Lok Sabha for the nationalisation of the Ahmedabad Electric Company during the discussion on the power crisis in Gujarat which had led to the closure of many textile mills in that state recently. The company was charged of not having informed the state government in time about the shortage of coal. It was also suggested that the company was grossly mismanaged. The Deputy Minister for Foreign Trade, Mr A.C. George, revealed in his reply to the discussion that the union government had taken a very serious note of the closure of textile mills in Gujarat due to power shortage, but pointed out that it had no authority to take over the Ahmedabad Electric Company. He advised members to approach the state government for this purpose. Mr George assured the House that the union government had taken prompt action as soon as it came to their notice that the shortage of coal had caused power crisis in Gujarat. The recurrence of such happenings in the country, he stressed, had to be avoided.

The cotton agreement with the Soviet Union came in for sharp criticism in the Rajya Sabha at the hands of the Swatantra members who expressed fears that it was detrimental to textile exports. Mr A.C. George agreed that the arrangement was not as advantageous now as it was last year when it helped in providing work for textile mills which were starved of raw cotton, but hastened to add that it was in the "national interest". The deal with the Soviet Union, he pointed out, had enabled the country to earn Rs 16.5 crores as conversion charges, besides assisting in making use of the idle loomage.

Evolution of sterling area

Josselyn
Hennessy

London.

Sterling Yesterday

DURING THE postwar period sterling and the sterling area have declined in importance but, in periods of strain, international monetary support has been given in the interests of stability. Now that Britain is about to join the European Economic Community, and now that changes in the basis of international liquidity are being discussed, sterling enters a new phase. Both the sterling area and sterling as a reserve currency will continue to diminish, although

ing the second half of the nineteenth century and up to 1931, the trade of overseas sterling area countries was predominantly with Britain, so that it was natural that it was carried out in sterling.

Each of the overseas sterling area countries had its own local currency. Some, notably the self-governing dominions, had their own central banks, which kept their assets almost entirely in sterling. For the rest, the pattern which developed early in the twentieth century was for their currencies to be issued by local currency boards, which

and both private and public borrowers had ready access to the London capital market. Governments and public bodies, in particular, raised funds by issuing stocks on the new issue market.

Two consequences flowed from these arrangements. To the extent that foreign currencies were earned, they were sold, through the banks, on the London market in exchange for sterling. Secondly, local currencies were maintained at a fixed rate of exchange against sterling.

The countries involved in these arrangements were mainly those which constituted the British Empire, with the exception of Canada which, largely for geographical reasons, became more closely linked with the USA and the dollar. But a number of countries outside the empire also participated in the arrangements to a greater or lesser extent, particularly by borrowing on the London capital market and by holding part of their reserves in sterling. With all major currencies convertible into one another and into gold, and the stability of sterling unquestioned, sterling was widely held, both as a trading and a reserve currency. It supplemented gold as an international reserve medium.

II

The Departure From Gold

The international trading world awoke to the significance of these long-standing arrangements in 1931 when sterling ceased to be exchangeable for gold at a fixed parity, which had been the implicit basis of the arrangements up to then. Other major countries left the gold standard at about the same time. With exchange rates liable to fluctuate in the market more freely than before, most countries decided to stabilise their exchange rates in relation either to the US dollar or the pound sterling. For the sterling area countries which were members of the British Empire, whether self-governing or not, there was virtually no choice; they linked their exchange rates to sterling. So, too, did several others, notably Eire, Egypt, Iraq, Portugal, Siam and the Baltic and Scandinavian states most of which had close political and economic ties with the UK. This group of

sterling will remain an important trading currency.

The position of the sterling area, and the role of sterling in international monetary arrangements are likely to change considerably in the near future in the natural course of evolution and also, and more particularly, as a consequence of Britain's expected entry into the European Economic Community. Looking even further ahead, fundamental changes in the status of reserve currencies are possible. In any event, in recent years it has become clear that the sterling area neither works as it used to nor in the straightforward way suggested by the more simplified descriptions of it.

The origins of the sterling area go back a century and more; its development ran parallel with the history of British imperial commercial and political relationships, into which it fitted so naturally that few people were aware of sterling's significance until the ending of the gold standard revealed it. Dur-

held corresponding assets denominated in sterling. Both boards and central banks would buy and sell their local currency against sterling, without restriction, at fixed rates. There was no need to hold reserves in other forms, as sterling was freely convertible into gold or foreign currency.

Similarly, all other parts of their financial systems were closely linked to Britain and to sterling. The banks were mainly British undertakings with head offices in London, or indigenous banks with an office in London. They took deposits locally, and lent part of their resources locally, but the bulk of their other assets were held in sterling in London where they were deployed in the large and efficient money and capital markets which were not available elsewhere.

Again, the overseas sterling area countries looked to Britain to provide capital for financing local developments. Private capital flowed largely through British companies operating overseas,

countries, then, comprised the sterling area.

The link between most of the sterling area countries was strengthened in 1932, when Britain, which up to then had by and large pursued a policy of free trade, introduced a general protective tariff. Arrangements were made under which almost all goods from Empire countries entered Britain free of duty, and the countries concerned extended reciprocal preference to British goods, although by no means so completely. This was the system known as Imperial Preference, which still continues under the name of Commonwealth Preference. Otherwise, membership of the sterling area implied no discriminatory treatment. In particular, until the war, no restrictions were placed upon either current or capital payments between the sterling area and the rest of the world, although some watch was kept over new capital issues on the London market.

In 1939, however, the sterling area became legally recognised as the basis of the system of exchange control then introduced. A few of the non-British members left the area at this time. The essence of the arrangements was that both current and capital payments within the sterling area, which naturally continued to be made in sterling, remained free of restriction. Payments between the sterling area and any part of the rest of the world, however, became subject to exchange control permission, because in the circumstances such payments had to be made in gold or foreign currency, of which supplies and current earnings were limited. The introduction of exchange control involved the setting up of similar procedures by all members of the sterling area. At this time, too, the arrangements became formalised whereby any foreign currency earnings by sterling area countries were sold for sterling in London, and all foreign currency resources were gathered into the Exchange Equilisation Account, run by the Bank of England; this became popularly known as the sterling area dollar pool.

III

Postwar Arrangements

After the war — indeed before it ended — Britain and other countries sought to establish an international monetary system in which all currencies would be freely convertible into one another at least for current transactions.

The basic purpose of the International Monetary Fund launched in 1946 was to achieve this under a system of fixed parities with exchange rates fluctuating within narrow margins either side of parity.

Pressure on the UK to restore full convertibility — prematurely as it turned out — and aimed specifically at the sterling area arrangements came from the USA with the agreement reached in December 1945 to provide a large line of credit to the UK. Owing to the shortage of dollars at that time exchange control permission for the use of dollars even for current payments, was severely enforced. Britain undertook within one year from the coming into force of the agreement, to make "sterling receipts from current transactions of all sterling area countries... freely available for current transactions in any currency area without discrimination, with the result that any discrimination arising from the so called sterling area dollar pool will be entirely removed and that each member of the sterling area will have its current sterling and dollar receipts at its free disposition for current transactions anywhere". When this undertaking was met in 1947, heavy outflows of dollars began and convertibility had to be suspended.

anaemic position

At that time Britain's current trade position was still anaemic from her war effort. In addition, mainly because of the way in which overseas military operations had been financed, Britain had emerged from the war with external sterling liabilities several times greater than the size of the gold and dollar reserve, approaching £4,000 million as against under £1,000 million. A large part of these balances, even those of sterling area countries, which held the bulk of them, was blocked by British exchange control. The US loan agreement provided for part of these balances to be released by instalments and for part by agreement with the holders, to be "adjusted", by which was meant written down. Although unblocking was gradually achieved no progress was made with the intention to write down.

That — whatever the eventual objectives agreed at the Bretton Woods conference in 1944 — exchange control would be likely to continue for a substantial period was recognised in the Exchange Control Act of 1947, which provided, and still provides, the statu-

tory authority for exchange control. The countries of the sterling area were listed in a schedule to the Act and so became known as the "scheduled territories".

Another aftermath of the war was the devaluation of sterling in September, 1949, from \$4.03 to \$2.80. Although many non-sterling countries also devalued at that time in a widespread realignment of parities, sterling area countries (except Pakistan and British Honduras) changed their gold parities by the same amount as the pound. Devaluation thus demonstrated the continued cohesion of the sterling area, but it also suggested a fundamental weakness.

dubious assumption

The area had functioned on the implicit assumption that sterling was at least as strong as any other currency, and so was at least as satisfactory as any alternative asset to hold as a reserve. Devaluation showed this assumption to be false, at least in the circumstances of those early post-war years. Some of the sterling area countries were substantial earners of dollars, e.g. Malaya from sales of rubber and tin. Had such countries continued to hold these earnings themselves instead of converting them into sterling, they would not have incurred loss through the devaluation. For the system to survive, it was necessary to demonstrate once again the fundamental strength of sterling.

For some years after devaluation, it seemed that confidence was being restored. Despite occasional strains and crises, the UK balance of payments was becoming stronger, and Britain had assumed her traditional role as a substantial provider of capital, particularly to overseas sterling area countries. Indeed, in due course she became once again a net creditor country, but the increase in external assets was on a longer-term basis; no inroads were made upon the wide discrepancy between short-term liabilities and assets, and the chronic illiquidity of Britain, in her role as "banker" to the sterling area, persisted.

The sterling area remained the basis of UK exchange control. As applied to sterling holdings of countries outside the area, it went through various changes until a major simplification was made in December, 1958. Current sterling was then divided into two categories only, "resident" sterling held by residents of any sterling area country,

and "external" sterling, held by residents of any other country. External sterling was fully convertible for current purposes, i.e. it could be used for payment to any other other external sterling account or to a resident sterling account. Resident sterling was freely transferable to other residents sterling accounts, but exchange control permission was needed before it could be moved to an external account or used to buy non-sterling area currencies. This was usually given for approved trade transactions, but import censoring controls were nominally retained until substantially abolished in November, 1959.

IV

Loosening of the Bonds

The granting of convertibility to external sterling was the most noteworthy overt event affecting the position of the sterling area between the evaluations of 1949 and 1967. There were, however, other developments during his period, the full significance of which was often not appreciated at the time, which gradually weakened most of the numerous real — as distinct from legal — links of the area.

At various postwar dates, South Africa left the Commonwealth (though remaining in the sterling area), Egypt and Iraq left the sterling area, and Burma left both. Most of the dependent Commonwealth territories achieved political independence. A common and parallel development was the setting up of indigenous central banks in place of the old currency boards which had been substantially under British control. In any case, the functions of the new banks went much wider, and decisions had to be taken about the form in which reserves should be held. The longer-established central banks, too, similarly reconsidered their policies. The net outcome was a considerable diversification of the reserves of overseas sterling area countries, generally because additions were in the form of non-sterling rather than sterling assets. Over the nine years to 1970 their combined sterling assets rose on balance by £792 million. Table I gives the year-by-year movements.

Although the amount of sterling held in official reserves has not changed greatly since 1950, that of dollars has risen sharply because of the successive and large deficits on the US balance of payments. As a result, between 1948

and 1971 sterling fell as a proportion of total world reserves of gold and convertible currencies from 23.6 per cent to 7.4 per cent, whereas US dollars rose from 6.0 to 37.3 per cent.

TABLE I
Changes in Reserves of Overseas Sterling Countries

	£m.		
	Sterling assets	Non-sterling assets*	Total
1962	+64	+131	+195
1963	+131	+97	+228
1964	—37	+77	+40
1965	—67	+58	—9
1966	+53	+343	+396
1967	—108	+264	+156
1968	+98	+687	+785
1969	+360	+230	+590
1970	+235	+591	+826
1970 first half	+367	+506	+873
1971 first half	+459	+590	+1,049

*Gold, non-sterling currencies and SDRs

This relative switch out of sterling both reflected, and was made possible by, the increasing diversification of

trade between the various countries of the sterling area. Intra-sterling area trade continued to grow, but has declined as a proportion of total trade from around one half in the early fifties to under one third by 1970. For trade between Britain and the rest of the area the fall has been somewhat similar.

Note some specific influences on sterling area trade patterns: The Commonwealth preference system has remained in operation, but has become less important. The preferences, many of which were specific rather than *ad valorem*, have been reduced both by inflation, and by the general lowering of duties through GATT and UNCTAD. Britain has also extended preferential arrangements to other members of the European Free Trade Association. All these developments have whittled the value to other Commonwealth countries of the preferences extended to them in the UK market. When the UK enters the EEC the preferences themselves will be withdrawn over a period.

More important, perhaps, especially from the mid-1950s, in respect of diversification of reserves was the mounting evidence that sterling was becoming overvalued at the 1949 par-

TABLE II
Sterling Area Trade

	Total exports of sterling area countries £m.	Intra-sterling area exports as % of total	Total imports of sterling area countries £m.	Intra-sterling area imports as % of total
1950	5,349	48.9	5,591	48.2
1955	6,664	51.3	8,119	47.1
1960	7,965	43.6	10,062	38.7
1965	10,729	38.6	13,155	34.7
1970	18,464	30.6	20,565	30.2

United Kingdom Trade

	Total exports £m.	Exports to sterling area as % of total	Total imports £m.	Imports from sterling area as % of total
1950	2,243	46.1	2,598	37.8
1955	2,993	47.6	3,861	40.1
1960	3,789	38.3	4,655	33.8
1965	4,901	34.1	5,751	31.3
1970	8,063	27.5	9,051	27.2

ty, and a series necessitated international assistance while remedial measures took effect. When the UK balance of payments went into deficit again in 1964, however, this time there was no swift response to the action taken. In 1966 a new form of international aid was agreed, the so-called "Basle arrangements". Assistance under these was intended to provide resources to meet drains on Britain's reserves from any running-down of official sterling balances, but not those due to the balance of payments itself. A facility of \$1,000 million was arranged and made available to Britain by a number of central banks and by the Bank for International Settlements. Originally for only a short period, it was renewed in March, 1967 and 1968.

Not all the developments of this

period were determined by pressures on sterling. Any remaining discrimination in respect of current sterling was virtually eliminated by administrative action. Exchange control permission continued to be required for resident sterling to be transferred to an external account, to buy non-sterling currencies. However, the granting of such permission—in practice delegated to banks—became almost automatic in the UK, so that sterling held by residents could be freely used to import any goods from anywhere in the world, or for any other *bona fide* current transaction, with the exemption of tourist expenditure, on which no restrictions were applied in the sterling area, but limits were imposed for other countries. The allowance has varied from time to time, being reduced to £50 per head per

annum between November, 1966, and January, 1970, since when it has been large enough to involve virtually no effective discrimination. Thus current account discrimination was largely eliminated.

Sources and acknowledgments: This is the first of two articles summarising a nine-page report in the latest issue of the Midland Bank Review (Poultry, London E.C. 2P: 2BX), but the bank is responsible neither for the emphasis of my summary, nor for my interspersed comments, based on a variety of sources.

Next week's concluding article will survey the differing treatment of capital movements, the working of the sterling area today, the implications of the UK's entry into the EEC and sterling's future role.

Between Prague & Moscow Michal Kelem

THE ECONOMIES of the socialist countries develop on the basis of plans which determine the perspective as well as the yearly main trends of development. The past and present development of the economic plans shows that this principle is objectively valid—as an axiom.

True, some "theoreticians" consider any broader plans than inner-enterprise relations an "instrument of bureaucracy", but the economic results achieved in the socialist countries prove them to be wrong, or that they want to be wrong.

An example of this is Czechoslovakia, whose economy, and in this connection also other spheres of activity and life of her inhabitants, is developing uniformly and at a comparatively high speed. During the last twenty-five years, industrial production rose 7.2 times (in Slovakia 22 times,) agricultural production rose by 26 per cent—which is about the same level achieved in France—the national income rose 3.7 times, personal consumption 2.5 times, real wages more than doubled and so on.

Although the initial state was different in the other socialist countries, their economies developed at about the same pace, which was largely aided by mutual economic co-operation. The complex character of the Soviet economy holds a major position in this co-operation and mutual assistance,

Czechoslovakia's national-economic plans are analysed here in terms of the high degree of linkage and co-operation which exists between Czechoslovakia and the Soviet Union within the respective five-year plans and the principles determined for the economic development of countries of the Council for Mutual Economic Assistance. Czechoslovakia will be celebrating its National Day on May 9.

which gives wide scope for socialist production relations.

For instance, it is impossible to overlook the fact that the Soviet Union supplies up to 65 per cent of the raw materials required for production and life in the socialist countries. In many instances this concerns irreplaceable raw materials, such as iron ore, non-ferrous metals, crude oil, natural gas, cotton, grain and so on. A more detailed analysis shows that development of these economic relations was dependent upon the expansion and intensification of the economies of the member states of the Council for Mutual Economic Assistance (Comecon.)

Czechoslovakia, is known to be one of the industrially advanced countries—with a strong processing and mainly engineering industry. On the other hand, her raw material base provides minimum possibilities of development.

It is therefore only logical that a

country of this character will find of greater advantage such economic co-operation which enables it to export the products of its advanced processing industry and to purchase the required raw materials in exchange. This is why economic co-operation between Czechoslovakia and the Soviet Union has been expanding year after year.

The Soviet Union accounts for almost one-third (32.4 per cent) of Czechoslovakia's foreign trade turnover, while the exchange of goods between the two countries almost doubled during the last ten years.

In certain raw materials imported by Czechoslovakia in 1970, the Soviet Union accounted for 85 per cent (10,840,000 tons) of iron ore, 96 per cent (9,400,000 tons) of crude oil, 66 per cent of manganese ore, 91 per cent (150,000 cubic metres) of timber, 64 per cent (73,000 tons) of cotton, 100 per cent (one million tons) of grain—together with the other Comecon countries, 50 per cent (121,000 tons) of meat and so on.

Czechoslovakia is a country in which engineering is the most advanced branch of industry, accounting for 23.8 per cent of total industrial production and 53 per cent of all exports. It is therefore of extraordinary importance for the structure of Czechoslovakia's economy that 60 per cent of Czechoslovak

exports to the Soviet Union are made up of machines and equipment. The rest comprises 16 per cent of various materials and raw materials and about one-fifth products of the consumer goods industry.

The Soviet Union is Czechoslovakia's most important customer for electrical locomotives, trolleybuses, trams, river craft and ships, equipment for rolling mills and the chemical industry, as well as consumer goods such as the world famous Czechoslovak footwear, clothing, textiles, furniture, leather accessories and artificial jewellery.

Many large Soviet metallurgical and engineering plants—e.g. in Cherepov, Orsk-Khalim, Novolubitsk, Zlatousk and so on—are completely equipped with machines made in Czechoslovakia.

beneficial co-operation

This economic co-operation, which has proved its worth during the years of its development, is economically beneficial to both countries. It is one of the most important principles upon which co-operation between the Comecon member countries is based.

This is also why their economic advance could achieve a level which provides possibilities for higher forms of economic co-operation. Part of this is specialisation which enables the production of larger series and provides scope for even broader co-operation. The aim is to jointly develop industrial branches which are beneficial to all concerned, to build common enterprises and to gradually integrate the economies of these countries.

True, the term economic integration is nothing new. Integration processes are objectively called for by the development of the production forces within the stage of scientific-technical revolution. However in the world division of labour, the conception of socialist integration is something quite new, which has within itself a feature of proletarian internationalism, that means not only economic co-operation as such but also mutual assistance. Socialist economic integration is not taking place at the cost of the working people, it is a planned process which makes way for the development of the production forces and thus of socialism as a whole.

The "complex programme" for the further intensification and improving of co-operation and development of socialist economic integration

among the COMECON member countries", approved by the 25th session of the Council for Mutual Economic Assistance at the end of July this year, is not intended to deepen existing differences in the stage of development in various socialist countries, but to bring about an economic equalisation and a rapprochement of the socialist economies and nations.

The complex programme, accepted for a period of 15 to 20 years, is in itself a co-ordinated plan for the near distant future in these countries.

Whereas, in the past, there was economic co-operation between the Comecon member-countries only on the basis of agreements concluded mostly for a period of five years and supplemented by annual contracts, and concerning mainly the exchange of goods, the co-ordination of plans within the complex programme is intended to jointly develop all spheres of the economy.

This comprises branches and kinds of industrial production which tend to form the basis of common development: raw materials, power engineering, ferrous and non-ferrous metallurgy, petrochemicals and production lines connected with them, the systems of machines and instruments which determine the development of scientific-technical revolution, e.g. electronic, systems of automation, control and measuring instruments. They provide the indices for the dynamics of economic growth, the trends in world trade, the trend of prices on the world market, preparation and raising the qualification of personnel and so on.

support to technology

This form of integrated co-operation, which takes place on the basis of mutual consultations, is in no way intended to infringe the independence of planning activity of national bodies, but, on the contrary, will support it. However it is certainly intended to give support to the most progressive production methods and technologies and thus to ensure the competitiveness of the whole socialist economic system on the world markets.

This all comprises a complex of measures amounting to a qualitative revolution in the economic processes of the socialist states. It took two years to prepare this very intensive work. Around 300 experts and specialists from the Czechoslovak Socialist Republic—which is supremely interested in the development of economic integration

within the Council for Mutual Economic Assistance (Comecon) in view of her standard and economic position in the world—took part in elaborating the Complex Programme in the controlling body and the Comecon commissions. The first stage of coordinating the plans of economic development of bilateral and multilateral bases took place at the same time.

In the co-ordination of plans between Czechoslovakia and the other member countries of the Council for Mutual Economic Assistance (Comecon) priority is given to economic co-operation with the Soviet Union, which the 14th Congress of the Communist Party of Czechoslovakia, in May 1971, designated as one of the main factors for the development of Czechoslovakia's economy.

increased turnover

The turnover of Czechoslovak foreign trade with the Soviet Union is to increase by 40 per cent in the next five years. This increment is to guarantee the expansion of a number of processing branches, which is documented by the following data: (during the five-year Plan period ending 1975,) Czechoslovak deliveries to the Soviet Union will include 4,500 machine tools of various types and parameters, 75 gas turbines, rolling mill equipment weighing 110,000 tons, 38 complete breweries, telephone exchanges for 905,000 line connections, 1,125 diesel locomotives, 2,700 trams, 60 river craft and so on.

Consumer goods will also hold an important place in Czechoslovakia's exports to the Soviet Union: 35 million pairs of shoes per year in 1975, furniture to the value of 128 million rubles, tricot for 56 million rubles, ready-made clothing for 165 million rubles, glass-ware for 26 million rubles, artificial jewellery for 25 million rubles and so on.

Czechoslovak imports from the Soviet Union will be concentrated mainly in raw materials: the amount of imported crude oil and natural gas will especially be raised. Other import commodities include machine tools, cutter loaders for mines, excavators, bulldozers, tractors, harvesters, diesel locomotives, planes. Czechoslovak motorists are particularly looking forward to Soviet cars of which 215,000 are to be imported.

Integration progresses in all spheres of production and between various enterprises. Let us give a few examples:

The Vítkovice steelworks is to deliver

a 3.6 four-high rolling mill train to the value of 2,100 million Czechoslovak crowns for the Azovstal metallurgical plant in Zhdanov (USSR) by 1973. The order, which is unparalleled in the history of this metallurgical-engineering complex, is called the "order of the century". Enterprises from the German Democratic Republic, Poland and Hungary are participating in the production of this equipment.

The underground railway in Prague is one of the large construction works of Czechoslovakia's five-year Plan. The Soviet trade partner is taking part in its construction not only by passing on its own wealth of experience, and with its experts, but also with equipment supplied. Around 10,000 million Czechoslovak crowns are to be spent on this capital construction, the like of which cannot be found in the republic. Co-operation in the building of Prague's underground will not only cut down costs but will also speed up construction work; the first line, 7.1 kilometres long, will be put into service by July 1973.

nuclear power

Another basis for integrated production will gradually emerge in nuclear power engineering. By the end of 1980 ten nuclear-power plants, of the Vornesh type, will be erected in the Czechoslovak Socialist Republic. The Soviet Union will supply the core circuit for the first two of them, while Czechoslovak enterprises will supply the pumps, turbines and condensers for the secondary circuit.

The production of computers, which Czechoslovakia has been helping to develop, for many years, is also going beyond the possibilities of a single country. Division of production programmes and joint research between both countries is being prepared in the sphere of electrical engineering, electronics, in the production of numerically controlled machines, textile machinery, petrochemistry, the production of cellulose and in metallurgy.

In many capital constructions which require extensive investment costs Czechoslovakia has been participating with credits, and will continue to do so. During the present five-year Plan period these are repaid by raw materials or finished products.

These investment credits enable Czechoslovakia to import from the Soviet Union part of her supplies of crude oil, natural gas, iron ore, aluminium, copper, zinc, lead and so on.

In 1971, these supplies will account for one third of the total deliveries of raw materials from the Soviet Union.

During the fifth five-year Plan, Czechoslovakia takes part in the construction of the transit gas pipeline, which is to carry natural gas from the Soviet Union across Czechoslovak territory to Austria, Italy, the German De-

mocratic Republic and the Federal Republic of Germany.

Economic integration will also be promoted by the International Investments Bank of the Comecon member-countries, which has large funds at its disposal for developing progressive industrial branches and for the construction of joint enterprises.

UCOBANK AT THE SERVICE OF EXPORTERS

Exports are a national priority—Exporters need credit facilities over a wide range—Availability of credit at the right time, in adequate measure and at reasonable cost is essential for development and expansion of overseas trade.

By means of our various Schemes of Export Finance and through our foreign branches, agents and correspondents throughout the world, we can offer every assistance you need in your export business.

HEAD OFFICE: CALCUTTA

UCO-3/72

I wonder how many

of us have noticed how peaceful our country is these days. Firm administration in West Bengal has contributed not a little to the making of this healthy situation, but the main reason, of course, is that the Left extremists have managed to alienate the sympathy of the man-in-the-street by their suicidal tactics of gangsterism. In Andhra, too, another red trouble spot, the politics of violence seems to have gone into cold storage. In Bombay, where the Shiv Sena has had its ego repeatedly knocked about, political goondaism is now at a considerable discount. In Tamil Nadu, the DMK's attempt to muscle in on the trade union movement had recently been creating ugly situations, but Mr Karunanidhi seems to have learnt a few lessons in time. In Madhya Pradesh, dacoit gangs have been surrendering arms and promising to turn over a new leaf. In view of all these, the idolaters around Mrs Gandhi may well be tempted to hail her as the greatest Home Minister India has ever had.

Whether Mrs Gandhi deserves this particular tribute or not, her reply to the debate in the Lok Sabha on the Home Ministry's Demands for Grants was certainly noteworthy for some of its pronouncements. She expressed a personal preference for the abolition of capital punishment and while it is true that she may not have received enough help in this matter from state governments or even the Law Commission, she nevertheless has sufficient authority in state capitals as well as over public opinion to be able to initiate effective steps for the early passage of necessary legislation. Although she has based her arguments in favour of the abolition of the death penalty mainly on the grounds that (a) the deterrent effect attributed to capital punishment has not been firmly established, while (b) there have been cases of miscarriage of justice resulting in innocent men being convicted and made to suffer the extreme penalty, the most valid argument against men being

put to death through judicial processes is that this practice dilutes the quality of civilisation to which the community concerned may lay claim. In other words, even if it could be shown that the death penalty is effective in keeping down the murder rate or that the judicial machinery for the trial and conviction of accused persons could be perfected so as to eliminate all risks of the innocent being punished, it would still be barbarous for any society to resort to the savage ritual of executions carried out in its collective name and on its collective behalf.

The Prime Minister

said that the government intended to enact a law requiring political defectors to resign their seats in legislatures and seek re-election. That a politician who has been characterised in some quarters as the Grand Defector should now be thinking in these terms is no doubt amusing, but the country would surely be willing to forget the notorious episode of the 'conscience vote' since a certain degree of disciplinary functioning by political parties has now been seen to be a basic requirement of political stability or orderly administration in the country and the people are therefore inclined to be grateful to whoever it may be who is now proposing to penalise defection, without caring to scrutinise this person's own record or motives too closely. At the same time as a corollary to this decision of the government to bring forward a law discouraging defectors in legislatures, the ruling party is morally bound to bind itself forthwith by a self-denying rule against admitting into its ranks floor-crossers from other parties between now and the passing of the proposed law.

The Chief Minister

of Tamil Nadu, who was in the capital a few days ago and had a meeting with the Prime Minister, is evidently very keen on persuading her of the virtue of coexistence between her party and his in the political life in that southern state. This is not

because Mr Karunanidhi believes that the Indira Gandhi congress constitutes a serious threat to the DMK government. On the contrary, he is aware of the fact that, in comparison to himself, Mr C. Subramaniam is a very poor strategist and an even poorer tactician. More important still, he also knows only too well that, although Mrs Gandhi is as popular with the people of Tamil Nadu as she is with people in other parts of the country, her popularity has not been able to encroach on the grass-root support which he personally and the DMK as a party do command in the state. If, nevertheless, he is anxious to avoid a confrontation, it is largely because the Indira Gandhi congress has a certain nuisance value as an opposition party, especially as the DMK's demagoguery, combined with the widespread suspicion that its leaders are not only corrupt, but are avariciously so, has led to the party and its government being regarded with growing contempt among various sections of the people who, although in a numerical minority even in the aggregate, are nevertheless qualitatively and, perhaps, strategically important in the public life of the state. Mr Karunanidhi certainly can carry on without the political support of these people, but it would be so much nicer for him if he could rule without a nagging feeling that his administration is not being respected in these quarters.

I greatly enjoyed

reading the following Letter to the Editor which appeared in the Delhi edition of the *Sunday Statesman* dated April 23:

"Sir, —The evening flight from Calcutta to Delhi was so delayed that I knew I would reach my destination after midnight. To avoid annoyance to my Delhi host, the PRO at Dum Dum obliged by sending a telex message: 'Flight delayed. Please leave the front-door key in the top drawer of the hat-stand.'

"A few days later, I was flying to Delhi again and the flight was once again late. Unfortunately, no message could be sent to Delhi as the telex machine at Dum Dum was out of commission. However, when I landed at Delhi airport after midnight, the announcer had a message for me: 'The front-door key is in the top drawer of the hat-stand.' Since then, this is a standing arrangement between me and my host at Delhi whenever I fly Indian Airlines—Yours, etc. K.C.K., Calcutta."

APRIL 28, 1972

MOVING FINGER

EASTERN ECONOMIST

TRADE WINDS

Cotton Prices

THE UNION government has fixed prices for certain varieties of cotton and has asked the Cotton Corporation of India to make bulk purchase of those varieties. The centres of purchase, varieties and prices per quintal are: Punjab, Bhatinda: 320F Rs 195; Abohar: 320F Malout, Kotapura and Kukfar Rs 200, Fazika 320F Rs 210. Madhya Pradesh: A-51/9 certified cotton Rs 220 and uncertified cotton Rs 210. Gujarat: Kalyan Rs 180, Wagad equivalent to Rs 1,300 per candy for cotton lint, V-797 Rs 190, Co2 (Cambodia C) Rs 235 and Cambodia B Rs 260, Digvijay Rs 240-245, Gujarat 67 Rs 305, Hybrid-4 Rs 320.

New Sugar Policy

The union cabinet has set up a sub-committee to formulate a new sugar policy for the 1971-72 season. Besides considering anew the ratio between "levy" and "free" sugar, the sub-committee will try to determine the cost of production of sugar. In view of the high prices of sugar in the open market and the widening gap between demand and supply of this essential consumer item, it was felt that the percentage of "levy" to "free" sugar should be raised from 60 to 70.

Industries in U. P.

Mr K.N. Modi, President, Western Uttar Pradesh Chamber of Commerce & Industries felicitated Mr B.B. Lal, Secretary, Ministry of Development and Internal Trade at Meerut on April 22. Mr Modi referred to the backwardness of Uttar Pradesh despite the policy of the government, both at the centre and in the

state, to accelerate its industrialisation. In his review of the problems facing industries in Uttar Pradesh in particular and the country in general, Mr Modi urged administrators to give clear-cut direction to the socio-economic policy of the government designed to promote growth with social justice. He made a pointed reference to the reduction in savings in the economy, which, in his view, was due to confiscatory rates of taxation. Till the time savings picked up, Mr Modi urged that financial institutions should be more liberal and should accept 3: debt equity ratio as against 2:1 allowed as at present. Mr Lal's diagnosis of the ills of UP was the absence of initiative among industrialists and businessmen. The state government also was partly responsible for slow growth of this most populous state in the country, said Mr Lal.

Trade with Bangladesh

In a public notice issued on April 20, the government of India has laid down the rules and regulations regarding trade with Bangladesh. Most of the trade between the two countries will be handled by state agencies; only a few items have been left out for the private sector. In the list of India's exports to Bangladesh, stone boulders, hard wood, soft wood, barytes, lime and lime-stone, dolomite, gypsum, unslaked lime, books, periodicals, gramophone records, ayurvedic and unani medicines, infant milk food, and machinery and spare parts have been reserved for eligible exporters. The exports of cement and unmanufactured tobacco will be handled by the State Trading Corporation, asphalt by the Indian Oil Corporation, coal by

the Minerals and Metals Trading Corporation and cotton textiles by the Cotton Textile Export Promotion Council. Similarly, the bulk of the imports from Bangladesh will be handled by the state agencies; only ayurvedic and unani medicines, books, periodicals, gramophone records and semul cotton will be imported by eligible importers.

Ceiling on Urban Property

A bill providing for a three-tier scheme of ceiling on urban property was recently adopted by the Madhya Pradesh assembly. The measure [The Madhya Pradesh Urban Property (Ceiling) Bill] fixed ceiling on urban property for the three slabs at Rs 3 lakhs, Rs 4 lakhs and Rs 5 lakhs. The ceiling would be enforced in towns having a population of 10,000 and above. The draft Bill contained only two slabs of ceiling — Rs 4 lakhs and Rs 5 lakhs — but an official amendment provided for yet another category ceiling, Rs 3 lakhs, which was accepted by the House. The amended Bill stipulated that a family comprising a single person would not be permitted to possess property worth more than Rs 3 lakhs. A family of up to five members could, however, be allowed to have property worth Rs 4 lakhs. A family of more than five members will be able to acquire property of up to Rs 5 lakhs. Each member of a family of more than five members can possess property worth Rs 25,000 but the value of total property should not exceed Rs 5 lakhs. The government has been given two years' time to take over the excess property. Any "gift, sale or transfer" during the period will not

be permitted. The bill also provided for a member of exemptions. Public sector undertakings, and public, religious and charitable trusts will not be covered by the measure. All private and public companies registered under MP Societies Act and the Co-operative Societies Act have been granted exemptions. Similar exemptions have been granted to traders and industrialists who use the property for "trade, industry and commercial purposes". Educational institutions, libraries, non-profit making clubs and housing schemes for weaker sections of society have also been exempted.

Petroleum Products

Last year a high-level committee was set up under the chairmanship of Mr N.N. Kashyap (Chairman, Indian Oil Co.) for suggesting measures to curb the consumption of petroleum products in this country as the continuously rising prices of crude oil had increased the burden of foreign exchange expenditure. The committee submitted its unanimous report within three weeks. Most of its recommendations were carefully examined by the government and some of them have already been implemented.

Regarding the suggestion of the committee that the production of liquefied petroleum gas (LPG) should be maximised, the government has requested Engineers India Limited (EIL) to appoint experts for conducting techno-economic feasibility studies for producing LPG where it is not being produced and for maximising its production where it is already being produced. The government has appointed an expert group to assist EIL's experts and to generally co-ordinate action in this regard. The IOC is also making a complete review of the existing market-

ing and distribution facilities for LPG to identify the bottlenecks, if any.

The committee had recommended that there should be a sharp increase in the price of motor gasoline to curb its consumption which suggestion has already been accepted and implemented by the government. The committee had also suggested that the techno-economic feasibility of producing 83 ON motor gasoline instead of 79 ON motor gasoline should be examined. The committee was of the view that this might result in a reduction of five per cent in the consumption of motor gasoline. The government has accepted this suggestion and the techno-economic feasibility study has already been completed. The government is making efforts to bring about a change-over in the octane rating as early as possible.

In order to prevent the misuse of solvents, the committee had suggested that the ceiling selling prices of motor gasoline and solvents should be equated. The government has accepted as well as implemented this recommendation. In regard to kerosene, the committee had recommended that intensive studies should be made to determine how best its misuse as automotive fuel could be prevented. This question is currently being considered by the government in all its aspects. Also, the NCAER and the IIP have been asked to undertake studies to determine the extent of kerosene consumption in rural areas for lighting purposes.

In regard to the price of high speed diesel (HSD) oil, the government has noted the recommendation of the committee not to increase it, as it would accentuate inflationary trends. A study in depth of the railways programme for diesel-

isation has been recommended; the Planning Commission and the railway board are at present studying it jointly. The Ministry of Shipping and Transport and the CSIR have been requested to undertake research for improving the efficiency of the diesel engines which would reduce the consumption of HSD.

The committee had recommended that the production of larger capacity of road trucks should be progressively increased. It had also suggested that the roads should be widened and strengthened to carry heavy duty road trucks and truck-trailor combinations. This recommendation of the committee has been accepted by the government and the Ministry of Shipping and Transport is taking suitable action in this regard.

The recommendation of the committee that the rural electrification programme should be intensified in those states where the demand for light diesel oil (LDO) for lift irrigation is very high, such as in Gujarat, has been accepted by the government. Regarding investigation of the problem if the present price of LDO gives any inducement for its use in lieu of electricity, the government has asked the Ministry of Irrigation and Power to pursue this matter.

In order to eliminate the misuse of mineral turpentine oil, the committee has suggested that the prices of kerosene and mineral turpentine oil should be equated. The government has accepted this recommendation and the Fuel Policy Committee has been requested to specifically analyse this problem.

Regarding the recommendation of the committee that the consumption of furnace oil by the textile industry should be reduced to the barest minimum after

reviewing the requirements of individual customers, the government has decided to refer this matter to a special standing committee with representatives of the Ministry of P & C, DGTD, Ministry of Finance and the IOC. The suggestion regarding the desirability of setting up secondary processing facilities to convert the heavy residue into middle distillates has been referred to an expert group.

Jehangir Ghandy

Sir Jehangir Ghandy, technocrat, administrator and pioneer in management and technical education, passed away in Delhi on April 17. He was 76. In 1921, at the age of 25, he joined the Tata Steel Works at Jamshedpur as metallurgical engineer.

In 1945, he was appointed a Director of Tata Industries and in April, 1954, Director-in-Charge of Tata Steel. A more significant recognition of his outstanding ability as one of the foremost administrators in the country came in August, 1959 when he was appointed a Director of Tata Sons, the parent firm then controlling the Tata Group of companies. He was Chairman of Indian Tube Co. Ltd, Belpahar Refractories Ltd, and a Director of the Tinplate Company of India Ltd.

He was a member of the Executive Committee of the National Metallurgical Laboratory; Chairman, the Metals Committee of CSIR; Executive Council of the Central Fuel Research Institute; Eastern Regional Committee of the All-India Council for Technical Education, and the All-India Board of Technical Studies in Management. He was a member, among others, of the governing body of CSIR, Council of the Indian Institutes of Technology, the Court of the Governors of the Administrative Staff

College, Hyderabad, the Board of Governors of the Indian Institute of Management, Calcutta, the Indian Advisory Committee of the Nuffield Foundation, and the Indian Committee of Lloyd's Register of Shipping.

Humphreys & Glassgow

Humphreys and Glassgow Consultants Private Limited, which has secured from Messrs New Central Jute Mills Limited the solvay process of making soda ash and ammonium chloride, developed by the latter at their Varanasi works, is reported to have modified this process. It is now offering the modified process to soda ash and ammonium chloride manufacturers solely against rupee payment of engineering and know-how fees, although a certain amount of foreign exchange is required for importing some equipment. Humphreys and Glassgow Consultants also intend to make available the service of the Indian engineers in its employment to its sister concerns in the United Kingdom and Australia for setting up fertilizer and chemical plants in the Persian Gulf and south-east Asian countries.

Indo-Nepal Collaboration

The Nepalese Prime Minister, Mr Kirtinidhi Bista, revealed at a press conference here recently that his government had approached the government of India for collaboration in the setting up of the Karnali hydro-electric project in his country. This project is envisaged to produce two million KWs of electricity per annum. A sizable quantity out of this output could be made available to India at a negotiated price. Although the scheme has already been investigated by a Japanese team and an Australian company, as also by the World Bank, Nepal, Mr

Bista said, would like India as well to investigate it and then help in its execution and supply of such equipment for it as was possible. The World Bank has shown interest in financing a part of the cost of this project, which is estimated around Rs 210 crores.

During his visit to Delhi, Mr Bista had talks with the representatives of Indian Chambers of Commerce and Industry to interest Indian entrepreneurs in the establishment of industries in Nepal, notably paper and cement. He expressed disappointment at the response of the Indian entrepreneurs for setting up industries in his country. Nepal he said, was prepared to give them as adequate concessions as they are getting in west Asia, Africa and south-east Asia.

Aluminium Foils

The change of definition of aluminium foils from "a product of thickness (excluding any backing) not exceeding 0.15 millimetres" to "foils (whether or not embossed, cut to shape, perforated, coated, printed or backed with paper or other reinforcing material) of a thickness (excluding any backing) not exceeding 0.15 millimetres" in the 1972 Finance Bill is said to have created a very anomalous position for the small and medium-scale printers and converters of these foils. Through this change in definition, the levy of 23 per cent ad valorem is said to have been made applicable to the overall sale price of all packaging materials in which aluminium foils are used even if the percentage of the foil in them is as low as two to five per cent. The new levy procedure, it is feared, will throw the small man in the foil printing and conversion trade out of the business as his operative costs are already much higher than those of the integrated, big foil-making concerns.

The big units by virtue of their integrated operations, are able to economise a good deal in their costs as they have not to incur such expenses as transportation charges, octroi duties, sales-tax, etc., on primary foils which the non-integrated printers and converters have to incur.

According to the All-India Paper and Allied Products Manufacturers' Association, whereas the cost of laminated and printed foils produced by the non-integrated units to the consuming industries comes to as much as nearly Rs 72,100 per tonne, the cost of the products of the integrated concerns approximates only about Rs 58,460 per tonne. Deducting the excise levy on primary foils from the cost of laminated and printed foils, the customers have to pay nearly Rs 67,600 per tonne of finished foils in the case of non-integrated producers, as against Rs 58,460 per tonne in the case of integrated producers. The table alongside gives the approximate cost of production of the non-integrated and integrated units,

The non-integrated units, which at present meet only about 15 per cent of the total demand for laminated and printed aluminium foils in the country, cannot be expected to realise any premium from the customers over the sale prices of the integrated units, which supply 85 per cent of the total requirement. In fact, they are reported to be obliged to sell their products at a small discount so that they can compete with the integrated units. The All-India Paper and Allied Products Manufacturers' Association has, therefore, suggested that the excise duty on aluminium foils ought to be levied only at the primary state. At this level, the duty may be imposed even at 40 per cent, instead of 32 per cent, so that the net receipts of the central ex-

chequer from this source do not suffer. This suggestion apparently merits consideration by the union Ministry of Finance.

Names in the News

Brig. B.S. Bharat, Director-in-charge of the pharmaceutical division of Rallis India Limited, has been unanimously re-elected President of the Organisation of Pharmaceutical Producers of India (OPPI), Bombay, for 1972. Mr S.V. Pillai, Managing Director, Pfizer Limited, and Mr D.J.R. Farrant, Managing Director, Glaxo Laboratories (India)

Limited, have been re-elected Vice-presidents.

Mr. M. R. Shervani, former member of Parliament and renowned industrialist of Uttar Pradesh, has been appointed by the government of India as a director of Indian Telephone Industries, Bangalore — a public sector undertaking.

Mr M.M. Muthiah, Managing Director, M/s Carborundum Universal Ltd. was elected Chairman of the Employers' Federation of Southern India for 1972-73, at the annual general meeting held on March 29, 1972.

COMPANY AFFAIRS

Gwalior Rayon

THE RAYON grade pulp factory of Gwalior Rayon's new division, Harihar Poly-fibres, situated at Harihar, Mysore state, has commenced its trial run. The factory is expected to produce 300 tonnes of rayon grade pulp in April and 1500 tonnes per month by the end of July. The full production of 100 tonnes per day or 3000 tonnes per month is likely to be reached by the end of this year. The raw material, eucalyptus, is being obtained from the nearby forests in Mysore state. The know-how for the manufacture of rayon grade pulp from wood has been developed by Gwalior Rayon in its pilot plant and research division at Nagda and in this respect the company has the most advanced experience in the world.

A sizeable part of the machinery and equipment has been fabricated by the company while the plant has been designed by Birla Consultants Pvt Ltd, a leading consultancy firm in the country specialising in the techno-economic evaluation, factory layout, plant and machine design, management studies, training of personnel and research and development planning right from erection to commissioning of the plant. This exemplary collaboration between Gwalior Rayons and Birla Consultants is yielding rich dividends, as for instance, in the bagging of a Rs 5-crore turnkey assignment from South India Viscose. The project includes erection, start-up and test performance of viscose preparation plant, spinning machine, after-treatment machine, dryer baling press, carbondisulphide plant and sulphuric acid plant besides guaranteeing of production with minimum raw material

consumption. South India Viscose which is setting up a 20-tonne per day staple fibre plant has awarded the turnkey contract jointly to Gwalior Rayons and Birla Consultants.

Century

The directors of Century Spinning and Manufacturing Company Ltd, have proposed to maintain the final equity dividend at Rs 29 per share, making a total distribution of Rs 45 a share for 1971, the same as paid in 1970. Although the company's sales have gone up by 5.5 per cent from Rs 52.62 crores to Rs 55.52 crores, the gross profit has declined by Rs 1.75 crores to Rs 13.10 crores. The fall in profits is attributed to the all-round increase in the cost of raw materials on the one hand and lower realisation on rayon yarn on the other.

Out of the gross profit, the directors have allocated Rs 250.37 lakhs to depreciation as against Rs 288.61 lakhs in 1970 while the appropriation to development rebate reserve was stepped by Rs 10 lakhs to Rs 26 lakhs. Taxation claimed Rs 580 lakhs as compared to Rs 706 lakhs. This leaves a net profit of Rs 453.25 lakhs as compared to Rs 474.51 lakhs in the preceding year. The interim dividend absorbed Rs 56.78 lakhs the same as in 1970. After adjustments a sum of Rs 200 lakhs was transferred to general reserve and Rs 148.85 lakhs to dividend equalisation reserve as against Rs 307.73 lakhs and Rs 110 lakhs provided respectively in the previous year. The proposed final dividend will claim Rs 102.92 lakhs, the same as in 1970 and it will be paid out of the dividend equalisation reserve.

The company's Rs 13-crore cement plant is expected to go into production by the end of 1973. The company is presently finalising orders for plant and equipment for the cement project. The capacity of the plant will be six lakh tonnes a year. The company has not yet received a licence for the setting up of seamless steel pipes plant.

Telefunken

Telefunken India Ltd has reported remarkable improvement in its performance during the year ended December 31, 1971, with significant increase in output, record rise in exports, and encouraging improvements in its working results. This is indeed a magnificent record for a company which has completed a run of only four years in the manufacture of radio sets. During the year under review the output of radio sets shot up by more than 82 per cent as compared to that of 1970. At the same time the product range was further increased with the addition of new models of radio sets and diversified by the introduction of tape recorders which have been well received by the market. Steps are now being taken for undertaking the expansion of the manufacture of radio receivers — the licensed capacity having been increased from 120,000 sets to 300,000 sets — and for the implementation of the industrial licence for the manufacture of 40,000 record players. Efforts are now being made to obtain a licence for the manufacture of TV sets.

It is gratifying to note that the company was able to make deep inroads in the domestic and overseas markets. While its domestic sales of radio receivers went up by over 62 per cent as

compared to 1970, exports increased by more than three times in 1971 as compared to the preceding year.

During the year under review the company earned, after providing for depreciation, a profit of Rs 31,076 as against a loss of Rs 56.49 lakhs in the previous period of eighteen months. An amount of Rs 9.00 lakhs was provided for depreciation in 1971 as compared to Rs 13.71 lakhs in the preceding period of eighteen months.

With stability and economic level of production and with rising demand for the company's products in internal and external markets the company is well poised for a major thrust forward in all spheres of its activities in the coming years.

Dunlop India

Mr R.G.S. Nairn, Chairman of Dunlop India Ltd, while addressing the annual general meeting of the company said that even with a sizeable increase in the output of tyres there would be an unsatisfied demand particularly for truck tyres. He has indicated that the gap between demand and supply for automotive tyres in 1973-74 will be of the order of one million tyres even after taking into consideration the capacities involved in the various letters of intent. As considerable foreign exchange had to be incurred for the import of tyres it is desired that fresh expansions should be allowed in the case of existing units especially to growth companies such as Dunlop India which are making significant contributions in the vital sectors of the national economy such as road transport, agriculture, industry, defence and exports. Dunlop India has already approached the government with a fresh proposal for increasing the capacity of the Ambattur factory by two lakh tyres

and tubes. Meanwhile the company has fully implemented the expansion programme for 250,000 automotive tyres and tubes at Ambattur for which it received an industrial licence in December 1969. Further, it has appointed an export team to study the future development of the factory at Sahaganj, West Bengal, so that it can satisfy fully the changing future market requirements.

In keeping with its policy to develop new and improved products of advanced design, the company introduced a number of products such as a new rayon truck tyre (Dunlop Highway 105) Dunlop Super Taxi tyre, the PG 6 suitable for very rough off the road conditions and new types of tyres for IAF and Boeing 737. One of the most recent projects is the development of the main wheel tyre for the Boeing 747 jumbo jet.

Every effort was made by the company to maximise the use of indigenous raw materials. As a result the company's dependence on imported raw materials was reduced from 11.3 per cent in 1966 to 6.2 per cent in 1971. The company continued to maintain its record in the field of exports. In 1971 the company exported to 71 countries earning Rs 3.34 crores, an increase of about 10 per cent over 1970. It is heartening to note that the company's exports accounted for 47 per cent of the total tyre industry's exports.

Unit Trust

Sales of units by the Unit Trust of India during January-March 1972 were higher than those in the corresponding period of last year. The Trust sold units of the face value of Rs 1.77 crores to 4,586 new investors during January-March 1972, third quarter of its current year, against Rs 1.22 crores to 2,570 applicants in the

In his Statement to the Shareholders of National and Grindlays Bank Limited the Chairman, Lord Aldington, said:

Progress in 1971

The principal reason for the sharp increase in the trading profit between the two years was the steady improvement in management efficiency.

Asia

The Bank's business in India and with India has been well maintained and well run; and the Bank's deposits inside India have continued to rise. We have considered a number of useful additional sterling loan proposals to assist in Indian industrial or commercial development, but for a variety of reasons none reached full completion in 1971. The Merchant Banking Division in India are concerned in advising a large number of top class industrial customers, but market and other conditions make most of their work a lengthy process. They have, however, completed several useful export finance arrangements and are considering others.

Middle East

1971 was a year of considerable consolidation within our organisation throughout the Gulf. Our associate, the Bank of Bahrain, had a satisfactory year and another associate, the National Bank of Dubai, is building up a strong banking position. Our associated bank in the Lebanon, the Société Nouvelle de la Banque de Syrie et du Liban, continues to occupy a predominant place in a very large banking community.

The Far East

Dao Heng Bank, in Hong Kong, has had a

corresponding quarter of last year. During the quarter, a sum of Rs 5.88 lakhs was invested by 60 non-residents. The Trust repurchased units of the face value of Rs 67.99 lakhs during the quarter, against Rs 89 lakhs in the corresponding quarter of last year. The number of unit holders, registered with the Trust totalled 4,12,056 at the end of March 1972, with the amount invested totalling Rs 102 crores. Under the Unit-linked Insurance Plan, the total business written during the quarter amounted to

Rs 10.19 lakhs under 128 applications.

Interim Dividends

The directors of *Dharan-gadhra Chemical Works Ltd* have maintained the interim equity dividend at five per cent for the year ended March 31, 1972.

Chowgule Steamships Ltd has proposed a tax-free interim equity dividend of Rs 20 per share for the year ended March 31, 1972 as against Rs 15 for the previous year.

New Issues

Modi Industries Ltd is offering for public subscription 5,000 (8 per cent) registered debentures of Rs 1,000 each at par for cash payable in full on application. The subscription list opened on 25th April and will close on April 29 or earlier but not before April 28, 1972. The entire public issue is underwritten. The company proposes to install three ten-tonnes electric arc furnaces (two already installed) and twin strand radial types continuous casting plant complete with auxiliary equipment for casting billets of carbon, spring and low alloy steels of 100x 100 mm section and a rolling mill.

Rathi Alloys and Steel Ltd will be issuing to the public for subscription shortly 2,70,000 equity shares of Rs 10 each and 10,000 redeemable cumulative preference shares (9.5 per cent) of Rs 100 each. This is the first mini-steel plant out of the six sanctioned by the governments. Its first furnace was commissioned in September last and the second one, forming part of the expansion, was put in operation last month.

Regal Papers (Pvt) Ltd is setting up a high glass cast-coated paper plant, at Ghaziabad with an installed capacity of 1500 tonnes per annum without any foreign know-how. It will be entering the capital market sometime in June or July to raise Rs 17.5 lakhs — Rs 10.5 lakhs in equity shares of Rs 10 each and Rs 7 lakhs in preference shares of Rs 100 each to meet a part of the capital cost of the project.

Alfred Herbert (India) Ltd, Calcutta, proposes to raise fresh capital by issuing two lakh equity shares of Rs 10 each at a premium of Rs 5 per share. A part of this issue will be reserved for subscription by the com-

pany's employees. The company proposes to undertake the manufacture of rubber machinery including intermixes, shear strip tyre presses and tube presses. Technical collaboration will be provided by Messrs. Francis Shaw and Co. (Manchester) Ltd.

East Coast Breweries and Distilleries Ltd will be entering the capital market soon with a public issue of Rs 29.5 lakhs in ordinary shares of Rs 10 each at par. The entire issue is underwritten. Considering the vast potential of Paradeep the government has issued a letter of intent to the company for setting up a new undertaking for the manufacture of 5,000 hectolitres of beer. The technical know-how has been offered by Desmet (India) (P.) Ltd based on the latest development in processing equipment and technique of pressure fermentation developed by Dr Wellhoener, Pressure fermentation Institute of West Germany and being exploited by Steineckers.

Eurokote (India) will be approaching the capital market shortly to raise capital worth Rs 55 lakhs — 3,50,000 equity shares of Rs 10 each and 20,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each. The entire issue is underwritten. The company has received an industrial licence for the manufacture of 3,000 tonnes of high glass cast coated paper and board per annum. The factory will be located in the industrial area of Vapi, Gujarat state.

COMPANY MEETING

DUNLOP INDIA LIMITED

Chairman, Mr. R.G.S. Nairn's Review

The following is the address by the Chairman, Mr. R.G.S. Nairn, at the 46th Annual General Meeting held on April 21, 1972, at Calcutta.

I have pleasure in welcoming you to the 46th Annual General Meeting of the Company.

As the Directors' Report and Accounts for the year ended 31st December, 1971, have been in your hands for some time, I should like, with your permission, to take them as read.

THE YEAR'S TRADING

Sales of Dunlop automotive tyres and tubes were higher than in 1970, mainly due to the implementation of the expansion at our Ambattur factory. However, the demand for our products continued to be in excess of manufacturing capacity. Your Company took special steps to ensure equitable distribution of tyres and tubes at the recommended retail prices, and maximised supplies for Defence, State Transport undertakings, and to border areas.

Sales of our industrial products also exceeded those of last year, but, here again, the demand, particularly for conveyor belting, could not be fully met due to limitations in capacity.

INDUSTRY CAPACITY

Production by the Automotive Tyre Industry increased substantially to 4.6 million tyres in 1971 as compared to 4.0 million in 1970, an increase of 14%, but in the important product groups of truck, rear tractor and large earthmover tyres, demand exceeded availability. This was in spite of the implementation of expansions granted by Government to existing manufacturers, including your Company. The position was further aggravated when additional tyres had to be diverted towards the end of the year for Defence needs. During 1972-73 shortages will continue,

particularly in the main truck tyre size 9.00-20.

In order to ensure sufficient availability of a vital product, which is essential for the economic development of the country, additional automotive tyre manufacturing capacity should be installed within the next two years. The available capacity of the existing manufacturers, including Letters of Intent, is 5.5 million automotive tyres whereas the total demand in 1973-74 is estimated to be 6.5 million. This gap cannot be filled by the various new tyre projects to whom Letters of Intent have been issued as they do not appear to have made significant progress.

In anticipation of the growing shortage, your Company submitted early last year applications to Government for a composite factory at Goa for the manufacture of automotive tyres and tubes, and industrial products. Government has recently rejected the automotive tyres and tubes application as a licence for a tyre factory at Goa has been given to another existing manufacturer. In view of the immediate need to create additional capacity and the national policy for conserving foreign exchange, we have submitted a new proposal to Government to increase capacity at our Ambattur factory by 200,000 tyres and tubes with the addition of balancing equipment only. It will be possible to implement this expansion within the short period of one year from receipt of the capital goods licence, thus enabling us to meet a part of the shortage in the immediate future. I hope that Government will consider our latest proposals favourably and speedily in order to minimise the need for imports at a substantial foreign exchange cost. The foreign exchange required to import 100,000 truck tyres is approximately Rs 3 crores.

I mentioned earlier that the demand for Dunlop industrial products could not be fully met. In the case of conveyor belting in particular, the market potential has increased well beyond the manufacturing capacity in the country and our capacity is booked for 42 months. Major consumers, mostly Public Sector projects, are therefore having to import their requirements and the position will become progressively worse until additional capacity.

is installed. Our application for the factory at Goa includes a composite scheme for the manufacture of steel cord and textile reinforced conveyor belting, which is still being considered by Government.

DEFENCE SUPPLIES

Your Company fully played its part in meeting the country's Defence requirements, during the year and the output of products such as tyres for army vehicles, including tanks, and for Indian Air Force aircraft, was increased substantially.

Dunlop India is the only manufacturer in the country of aircraft tyres and military tank tyres. During 1971, we commenced production of a special purpose truck tyre for sand operations to meet Defence needs. Our future plans include a scheme for retreading aircraft tyres.

Following the declaration of the national emergency, the employees at the Company's factories worked on Sundays and holidays to maximise production for Defence needs. We had the honour of a visit by Lt. Gen. I.S. Aurora, GOC-in-C. Eastern Command, to our Sahaganj factory on 21st December, when he expressed his appreciation to your Company and its employees for the important contribution which they had made to the war effort.

EXPORTS

Our consistently good export performance was maintained and another new export record was set in 1971 in the face of severe international competition. Your Company exported to 71 countries earning a total of Rs. 3.34 crores, an increase of almost 10% over 1970. This was achieved through well planned export promotion, effective visits by Dunlop export executives to as many as 36 countries to expand existing markets and develop new ones, and the invaluable support from our U.K. Associates with their international distribution and service organisation. Dunlop India's exports in 1971 were 47% of the total Tyre Industry exports.

A notable achievement of Dunlop India Export House was the development of overseas markets for a wide variety of goods

made by indigenous small scale manufacturers.

International trade today is complex, highly competitive and subject to sudden shifts and in order to be successful in this field, comprehensive and consistent Government policies are needed. Unfortunately this is not always so. For example duty drawback rates for automotive tyres and tubes were reduced drastically with very little prior notice in December 1971 with no increase in export cash assistance to compensate for the high raw material prices in India. Consequently, exports can now only be made at an even more substantial loss than previously. If we are to win and hold export markets on a long term basis, it is essential to have reasonable stability in the net cost of products for export.

PRODUCTION

Higher production was achieved during 1971 despite production losses at the Sahaganj factory, mainly because of power cuts and high absenteeism, particularly in the first half of the year.

The expansion programme for 250,000 automotive tyres and tubes at Ambattur, for which an industrial licence was received in December, 1969, was completed by the end of the year. The Ambattur factory also started production of bicycle rims, for which a capital goods licence for 1.5 million pieces per annum was received in July, 1969.

An expert team was appointed to investigate the future development of our larger factory at Sahaganj, West Bengal. Plans are being finalised to ensure that Sahaganj continues to operate efficiently, and plant and equipment are modernised to cater to changing future market requirements.

The range of Metalastik rubber-to-metal bonded products at Sahaganj was enlarged during the year with the introduction of draft gear pads required for the centre buffer couplers of railway wagons.

PRODUCT DEVELOPMENT

In keeping with the Company's policy to develop new and improved products of advanced technical design, a new rayon truck tyre, the Dunlop Highway 105, was introduced in the market after being tested over 80 million kilometres on all kinds of roads throughout India. No other tyre developed in this country has ever been so extensively tested before commercial introduction. Your Company also developed and marketed the Dunlop Super Taxi tyre. This is the first tyre produced in India specially designed for the needs of the taxi operator. Another addi-

tion to our tyre range was the PG. 6 which has been developed for use under very rough "off-the-road" conditions. User reaction to these tyres has been most favourable.

In pursuance of our policy to make the country self-sufficient in aircraft tyres, we have continued to develop new sizes. During 1971 we added to our range three new sizes for the Indian Air Force and tyres for the Boeing 737 aircraft. One of the most recent projects is the development of the main wheel tyre for the Boeing 747 Jumbo jet.

RESEARCH AND DEVELOPMENT

Research and development are of the highest importance in a technology-based industry like ours, and backed by the supply of technology from our U.K. Associates, your Company's technical development departments enable us to introduce new and better products, and to improve on our already excellent achievements in the field of import substitution and exports.

The know-how from our U.K. Associates is provided under a Technical Aid Agreement. At the end of 1969, this Agreement was terminated by Government who requested us to renegotiate a new Agreement. We submitted our proposals for the new Agreement and Government approval is awaited.

It will interest you to know that Dunlop U.K.'s expenditure on research and development exceeds the equivalent of Rs. 15 crores per annum, and their recent union with Pirelli, Italy, permits Dunlop India, at no extra cost, to avail of the added benefits of research and development by Pirelli, whose expenditure is also in the region of Rs. 15 crores per annum. To remain competitive by international standards, research and development on this huge scale have become essential and, needless to say, a company of the size of Dunlop India cannot possibly afford expenditure of this magnitude. It is not only economical but essential for your Company to continue to purchase technical know-how to ensure that we do not fall behind international standards which I, would submit, is a matter of national interest. The advantages are not only in terms of product quality and performance, which are vital to maintain exports, but just as important to ensure that there is the most economic use of scarce raw materials.

However, your Company is keenly aware of the need to reduce reliance on external technical assistance, and, in fact, spent

approximately Rs. 30 lakhs on local development activities in 1971. The new proposed Technical Aid Agreement reduces the number of products for which technical assistance needs to be continued, thereby minimising foreign exchange outgoings.

The most important products now excluded are cycle tyres and tubes, for which we are establishing a Research and Development Centre at our Ambattur factory. This Centre will not only assume responsibility for exporting know-how to Dunlop Companies all over the world but will also enable us to sell know-how to other manufacturers overseas. Your Company will thus earn additional foreign exchange.

We continue to make every effort to maximise the use of indigenous raw materials and provide all possible assistance to local manufacturers for the development of new indigenous sources of supply. As a result of these efforts, our imported raw materials have been reduced from 11.3% of total requirements in 1966 to 6.2% in 1971.

A similar effort has been made by us in persuading the major international equipment manufacturers to commence operations in India and in encouraging the development of indigenous tyre manufacturing equipment. For example we have played a large part in persuading McNeill's of USA to manufacture Bag-o-Matic tyre moulding presses in India. Production is expected to commence in the next year or two and another major step will then have been taken towards self-reliance.

COSTS

The inflationary trend in prices of indigenous raw materials continued during 1971. Apart from

higher excise duties price increases were particularly high in the case of synthetic rubber, cotton textiles, and steel. Prices of imported raw materials have also increased following the imposition of higher import duties in December 1971 and March 1972 and the realignment of exchange parities.

The cost of wages, salaries and dearness allowance has also increased considerably over the previous year.

To compensate for the direct cost increases incurred since November 1968, when automotive tyre selling prices were last increased, the Tyre Industry approached Government for an increase in automotive tyre prices early in 1971. This request has now been referred to the Bureau of Industrial Costs and Prices for investigation. In the meantime, we are compelled to absorb these and any further cost increases.

Taxation

The full impact of the reduced rates of development rebate was felt from 1971. The 1971 Budget introduced further increases in the incidence of taxation, the most important being the withdrawal of relief on profits of a number of priority industries, of which your company was one. In December 1971, a surcharge of 2½% on corporation tax was levied as an emergency measure and this has been increased in the 1972 Budget to 5%. These changes will result in a steep increase in the burden of your company's taxation.

Furthermore, the announcement of the proposed total withdrawal of development rebate from May, 1974 is likely to become a disincentive to industrial investment, particularly in the case of capital intensive projects, unless relief in an alternative form

is granted to offset the increase in the tax burden.

PROFIT & LOSS ACCOUNT AND BALANCE SHEET

The main features of the financial results for 1971 have been covered in the Annual Report, but there are several points that I would like to make.

We have always maintained that an important yardstick in considering profits is the percentage of profit, before interest and tax charges, to sales. Since 1969, this ratio has been declining in spite of a steady increase in sales volume, and in 1971 the ratio was 7.4% compared with 9.1% in the previous year. The major reason for this is that selling prices for automotive tyres and tubes have not been increased since November, 1968, although prices of major raw materials, services and also employee costs have risen substantially during this period. The result of these cost increases is that whilst the Company's total income has increased in 1971 by approximately Rs. 10 crores, profit before tax has reduced by approximately Rs. 1 crore.

Although much has been achieved by way of cost economy, improved operating efficiency and reduced working capital tie-up, a fairly rapid growth in production volume and turnover is essential if selling prices are to be contained and a reasonable level of profit earned.

As you will see from the accounts, profit before tax amounted to Rs. 6.04 crores compared with Rs. 7.04 crores in 1970. After providing for taxation and Development Rebate Reserve, the balance of profit amounted to Rs. 3.17 crores. The taxation charge for 1971 is actually lower than it was in 1970, due to the commissioning of the new

plant and buildings at the Ambattur factory. Preference Share dividends absorbed Rs. 4.6 lakhs and your Directors propose to maintain the Ordinary dividend at Rs. 2 per share absorbing Rs. 2 crores, the same as for 1970, retaining the balance amounting to Rs. 1,12,48,000 by transferring this to General Reserve.

Capital expenditure for the year was Rs. 6.03 crores compared with Rs. 3.20 crores in 1970. The expenditure during the year includes the implementation of the expansions at the Ambattur factory.

A reappraisal of the effective working life of your Company's fixed assets was carried out during the year. Based on this study, the rates of depreciation applicable to various categories of assets were revised on 1st January, 1971, with retrospective effect. The cumulative adjustment arising out of this revision amounted to Rs. 65.95 lakhs and this amount has been transferred from depreciation account to Capital Reserves.

In order to finance the sterling requirements and also the balance of the rupee cost of the company's recent expansion, it was decided with your approval at the last Annual General Meeting, to raise approximately Rs. 2 crores by way of an issue of 15,00,000 Ordinary Shares at a premium of Rs. 4 per share to members in the ratio of three new Ordinary Shares for every 20 Ordinary Shares held. The proceeds of the proposed issue will be Rs. 2.1 crores. The amount payable by Dunlop Holdings Limited, U. K. is approximately Rs. 1.08

crores of which Rs. 1.04 crores will be met by set off against the sterling loan made available by them. Government approval to this issue is awaited.

PERSONNEL

It has always been your Company's firm belief that a properly trained and contented labour force is its biggest asset. We have therefore adopted progressive labour relations policies and continuously worked towards improving the conditions of service of all employees.

Consistent with this policy, it has been your Company's practice to negotiate long term agreements, which help to ensure uninterrupted production and industrial peace during the operational period of the agreements. In 1971, we concluded negotiations and signed a new four year agreement covering the personnel at the Head Office as well as the District and Sub-District Offices throughout the country.

Negotiations for a new agreement for the production operatives and staff at the Sahaganj factory are still continuing in an environment of industrial peace.

The agreement covering our employees at the Ambattur factory expired at the end of 1971 and negotiations for a new agreement were started. However, I am sorry to have report that while negotiations were still continuing at tripartite level, the Union at the Ambattur factory disregarding the advice of the Government Labour Department, took the law into their own hands thereby disrupting production and creating

indiscipline. As a consequence of this, in the interests of security of personnel and plant, the Management was compelled to declare a lock-out until normal working conditions are assured. We are keeping the door open for negotiations and it is to be hoped that the appropriate climate for the resumption of full production will soon be restored.

Your Company's programmes for training and development of personnel at all levels continued to make good progress during 1971. A large number of employees attended Company courses as well as courses organised by outside professional bodies.

FUTURE PROSPECTS

I have already referred to your Company's plans for expansion and diversification of its manufacturing activities. However, a point that disturbs me is that we continue to be regarded as a dominant undertaking under the Monopolies & Restrictive Trade Practices Act. As you know, a company is deemed to be dominant in any product if its average production of that item over the last three years was one third or more of the total industry production. Although your Company's share of the total automotive tyre industry output in the last three years has been somewhat in excess of one-third, this is so only because we have implemented licenced expansions quickly and because during this period, our factories have worked peacefully. In fact, your Company's share of total licenced capacity is only 25% which reduces to 16% if all Letters of Intent that are presently valid

are included. Your Company which has produced to full licenced capacity because it has taken energetic steps to implement its expansions quickly, would not be considered dominant if the future position rather than past production were taken into account.

I would like to cite a specific case, directly affecting your Company, where the Monopolies & Restrictive Trade Practices Act could operate against the national interest. Dunlop India is the sole producer in India of aircraft tyres and tubes. Consequently, under the Act, it could be said that your Company is monopolistic for these products. It would be unfortunate if this were the case as our pioneering efforts have resulted in self-sufficiency for these vital products for the country's military and civil aircraft.

I have every confidence that Government will increasingly take a more realistic view of issues such as "dominance" when considering expansion applications and will allow growth to companies such as Dunlop India, which are making significant contributions in vital sectors of the national economy, such as road transport, agriculture, industry, Defence and exports.

In conclusion, I should like to thank all our employees for the efforts they made during 1971 and particularly for the special endeavour during the national emergency.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

PUBLIC NOTICE

This is for public information that M/s Modi Spinning & Weaving Mills Co. Ltd., Modinagar has made an application on 13th March, 1972, under Section 23 (4) of the Monopolies & Restrictive Trade Practices Act, 1969 to the Department of Company Law Affairs, Government of India for making an investment upto Rs 65 lacs (Rupees sixty five lacs) in the equity capital of the Modi Rubber Ltd., Modinagar.

Any person interested in this, may make representation to the Secretary, Department of Company Law Affairs, Government of India within a fortnight of this publication.

DIRECTOR

RECORDS AND STATISTICS

Wholesale Prices

THE WHOLESALE prices as measured by the official index (with the year ended March, 1962=100) rose by 2.2 per cent to 190.0 in January, 1972 as against 186.0 for December, 1971. The index for January, 1972 was higher by 3.7 per cent when compared to 183.3 for January, 1971. The rise in the All Commodities index during January 1972 was shown by an advance in almost all the constituent groups except 'Chemicals' which declined by 1.0 per cent to 199.5. The rise in the other groups was of the following order:

'Food Articles' (+2.8 per cent to 210.1), 'Liquor & Tobacco' (+1.6 per cent to 201.8) Fuel, Power, Light & Lubricants (+0.1 per cent to 174.7), Industrial Raw Materials' (+3.1 per cent to 190.5), Machinery & Transport Equipment (+0.2 per cent to 162.0) and Manufactures (+1.8 per cent to 171.1).

food articles

The index for 'Cereals' Sub-group moved up by 2.6 per cent to 204.7 due to a rise in the prices of all the cereals except jowar which remained unchanged. Enhanced prices of all the pulses (except arhar which fell), pushed up the index for the sub-group by 3.0 per cent to 294.5. The index for 'Food grains' rose by 2.6 per cent to 221.0. At this level the index for 'Food grains' was also higher by 9.0 per cent when compared to that of a year ago. The index for 'Fruits & Vegetables' advanced by 3.6 per cent to 184.7 due to a rise in the prices of oranges and bana-

nas. Owing to a rise in the prices of milk, the sub-group index for 'Milk & Milk Products' went up by 1.8 per cent to 214.8. Higher prices of groundnut oil, gingelly oil and vanaspati raised the sub-group index for 'Edible Oils' by 2.5 per cent to 201.1. The prices of coconut oil, however, declined. The sub-group index for 'Fish, Eggs & Meat' declined sharply by 18.0 per cent to 202.8 due to a fall in the prices of eggs and fish. The index for 'Sugar & Allied Products' recorded a rise of 11.9 per cent to 231.7 due to a rise in the prices of sugar, gur and kandsari. A rise of 3.3 per cent to 161.3 in the sub-group index for 'Other Food Articles' was caused by higher prices of all the commodities.

liquor & tobacco

The index for 'Liquor & Tobacco' group moved up by 1.6 per cent to 201.8 due to a rise in the prices of tobacco raw.

fuel, power, light, lubricants

The index for this group stood at 174.7 as against 174.6 for the previous month. The prices of coke moved upwards during the month.

industrial raw materials

Higher prices of all the fibres (except coir fibre which stood stationary) pushed up the index for 'Fibres' sub-group by 5.8 per cent to 180.9. In the case of the Oilseeds sub-group, the prices of groundnuts, linseed, gingelly seed, rapeseed and cottonseed moved up

Source: Office of the Economic Adviser, Ministry of Industrial Development.

while those of castorseed and copra declined consequently the index for this sub-group recorded a rise of 2.6 per cent to 208.7. The sub-group index for Minerals rose by 0.3 per cent to 141.5. The sub-group index for 'Other Industrial Raw Materials' advanced by 0.3 per cent to 174.5.

chemicals

The index for 'Chemicals' group declined by 1.0 per cent to 199.5 due to a fall in the prices of sodium-hydrosulphite and copper sulphite.

machinery and transport equipment

The sub-group index for 'Electrical Machinery' remained unchanged at its earlier month's level of 162.8. The sub-group index for 'Non-electrical Machinery' however advanced by 0.5 per cent to 170.5. The index for 'Transport Equipment' stood at 146.2 as against 146.1 due to a rise in the prices of cycles.

intermediate products

The index for 'Intermediate Products' moved up by 4.3 per cent to 204.1 owing to an increase in the prices of cotton yarn, rayon yarn, leather, semis (billets), zinc, bran sheets, copper sheets, lead and linseed oil. The prices of tin block however declined.

finished products

Higher prices of Jute Manufactures (+4.0 per cent to 202.0) and Silk & Rayon Manufactures (+0.4 per cent to 129.0) raised the sub-group index for 'Textiles' by 1.0 per cent to 169.6. The index for 'Metal Products' sub-group advanced by 2.6 per cent to 182.7 due to an increase in the prices of all the items under this sub-group. The

sub-group index for 'Non-Metallic Products' moved up by 0.5 per cent to 152.8 on account of a rise in the prices of cement and pottery goods, although the prices of bricks, tiles and glass manufactures declined. The sub-group index for 'Chemicals Products' went up by

0.3 per cent to 150.5 due to higher prices of dying materials and essential oils. The indices for Leather Products, Rubber Products and Paper Products stood stationary at their last month's levels of 98.0, 157.3 and 135.7 respectively. The sub-group index for 'Oil

Cakes' advanced by 0.4 per cent to 185.9. The index for 'Miscellaneous Products' moved up slightly from 123.8 in the outgoing month to 123.9. On the whole the index for 'Finished Products' moved up by 1.0 per cent to 163.1 during the month under review.

PERFORMANCE:

**PRODUCTION IN
1971-72 STEPPED UP TO
RS. 32.76 CRORES**

**An increase of more than RS. 5 CRORES
over 1970-71 output**

**PRODUCTION SINCE INCEPTION
RS. 158 CRORES**

Major Accomplishments Include:

- Completely equipped & Commissioned
- Three Hydro power stations
- Two Thermal power stations
- Over 230 diesel electric locomotives
- Three out of every four suburban trains operating in Calcutta area
- One out of every four suburban trains operating in Bombay area.

And supply of

- Main Steam Turbines for propelling Indian Navy Warships
- 1,20,000 KW Steam Turbine Generator.

**HEAVY ELECTRICALS (INDIA) LIMITED
BHOPAL**
(A Govt. of India Undertaking)

INITIATING SELF-RELIANCE IN HEAVY PLANT AND EQUIPMENT

Mukand now makes heavy steel castings upto 25 tonnes a piece which were, until recently, mainly imported. All types of these heavy steel castings are made to customers' requirements. Thirty years of steel foundry experience, as well as expertise, sophisticated and comprehensive testing facilities, and trained technical personnel, make it possible for Mukand to produce quality castings for the cement, metallurgical and other industries.

Mukand helps the drive towards self-sufficiency.

Tumbril, not band-wagon

It is unfortunately only too true that much of the business community has let itself be demoralised and devitalised by the unprincipled political persecution to which it has been subjected. Indeed many business leaders seem to have got themselves brain-washed to an extent where they seem to have more or less happily reconciled themselves to being talked to or otherwise treated as second-class citizens who must justify their existence from day to day by proving their *bona fides* to the satisfaction of the current vendors of ideological claptrap. So much so we have now reached a situation in which the future of free enterprise, with all that it means for the defence of our democratic values, has become too serious a matter to be left to certain leaders or spokesmen of the business community. This is all the greater reason for our congratulating Mr Devarajulu, who delivered a brave and frank speech to the annual session of the All India Organisation of Employers held in New Delhi last week.

Mr Devarajulu, disdaining to be hypocritical or opportunist, suggested that it might "be wrong to look upon industry as a provider of massive direct employment, at any rate in the short run." He also expressed the hope that the Bonus Review Committee would ensure that "the basis for payment is such that it would not place an undue burden on industry or lead to litigation and worse." By uttering these views he managed to rouse the ire of the Labour Minister, Mr R.K. Khadilkar, who promptly charged him with having a closed mind. It is difficult to see what was so outrageous in Mr Devarajulu's observations. It is after all the bare truth that jobs in millions cannot be created directly in organised industry in the short run, especially in view of the fact that industrial growth is itself being depressed partly by the government's own politically oriented economic policies. As a matter of fact, Mr Devarajulu's statement only strengthens the government's approach to the issue of employment which is presumably to create additional employment opportunities mainly in the agricultural, transport, construction and service sectors. There is, thus, no question of Mr Devarajulu having sinned even against the Holy Ghost of the "politics of commitment" of which Mr Khadilkar is so doughty a champion.

In any case, is there any justification at all for the kind of verbal assault launched by the state-owned All India Radio on Mr Devarajulu through the medium of a script broadcast in its "Spotlight" programme on April 29? Mr N. Gopinathan Nair, who is the author of this script, (which is reproduced elsewhere in this issue) was described by the announcer as a political commentator. It might perhaps have been more appropriate had AIR mentioned that Mr Gopinathan Nair was attached to the newsweekly *New Wave*. This would have helped the listeners to relate Mr Nair's script to his political faith or associations and thereby guided the listeners to evaluate his views properly. Mr Nair has used strong language. This journal, of course, does not and cannot object to strong language as such since it too believes in and practises hard-hitting journalism. But, then, Mr Gopinathan Nair's polemical style would have been quite in order had it been exhibited in the *New Wave*. The point is whether AIR was within its rights in inviting him to launch a deliberately misleading verbal tirade of this kind on a private individual when it is a well-known fact that AIR certainly does not allow similar latitude to those who write or broadcast for it when the latter have things to say in criticism of individual ministers or the government. Our short question is will AIR pass for broadcasting a script which may comment, for instance, on Mr Khadilkar's rejoinder to Mr Devarajulu in a language similar to that which Mr Gopinathan Nair felt so free to revel in?

But, then, AIR only knows too well on which side its bread is buttered. The misfortune of some of Mr Devarajulu's colleagues in the business community is that they are far less shrewd or practical. They naively believe that they are jumping on a band-wagon whereas the fact is that they are being pushed into a tumbril.

For the rest of us, the wonder must be for how much longer businessmen of independent views will at all be able to continue to speak out their mind from positions of authority or influence in the business community. It is clear that, if the ruling party considers the people as so much fodder for the ballot box, it looks upon the business community merely as a pliable provider of the cash to buy this fodder with. The pity is that so many businessmen seem to have reconciled themselves not only to play the game as they are expected to play it, but also to play into the hands of a tribe of politicians which is clearly set on destroying every possible area of influence in our national life which may possibly put up obstacles in the way of the absolutist principle in government. Mr Frank Moraes, writing in *The Indian Express* has mourned the decline of parliament. Much else that must be valuable to a democratic community is decaying too.

Problems of plenty

THE YEAR 1971-72 will stand out as a major landmark in the history of the country's agricultural development as, for the first time in the post-Independence period, it was possible to dispense fully with imported foodgrains. With an all-time record output of 107.8 million tonnes in 1970-71 against 99.5 million tonnes in the previous year, there was no need to use imported supplies of wheat or other cereals.

Indeed, anticipating an increase in internal availability, it was possible for the union Ministry of Agriculture to reduce imports in 1971 to 2.1 million tonnes from 3.6 million tonnes in 1970. It has since been decided to stop altogether concessional or commercial imports of wheat. Also, there will henceforth be only commercial imports of rice under barter trade agreements and these imports too may become surplus to the requirements of the country as a break-through on the rice front is also being established.

The food situation has become so comfortable that the government has started thinking of exporting wheat products like suji and maida. It may also be necessary to export even limited quantities of fine cereals apart from effecting a change in the crop pattern in order to bring about an increase in the proportion of fine cereals to total production. A tantalizing situation may develop in the 1972-73 marketing season if the union Minister for Agriculture, Mr Fakhruddin Ali Ahmed's estimate of 112 million tonnes of output of foodgrains proves correct.

The government will have to be alert in the coming months in order to be in a position to manage any situation if the peculiar predicament experienced, when there was a glut of raw cotton, is to be avoided in the case of foodgrains. This view is taken on the basis of the data given in the latest annual report of the union Ministry of Agriculture. Out of the output of 107.8 million tonnes the quantity procured increased by 2.2 million tonnes to 8.8 million tonnes.

There was a marked increase in market arrivals and the procurement of wheat had to be raised substantially to 5.1 million tonnes from 3.2 million tonnes. As the output of wheat increased to 23.2 million tonnes from 20.1 million tonnes in 1969-70 it will be found that more than 60 per cent of the additional production of this cereal had to be purchased by the Food Corporation of India and other agencies. In respect of rice,

When the Sun King

of France arrogantly asserted centuries ago that "I am the state", it was probably thought that he had stated for all time the absolutist principle in politics. We, in the India of today, know better. Speaking in Hyderabad the other day the Prime Minister said that if her party failed in making good the slogans of its election manifesto, that would be the end of the democratic political system in our country. Although Mrs Gandhi spoke of "her party", all of us know that the "party" means Mrs Gandhi and Mrs Gandhi alone. There is after all the big hoarding put up in Connaught Place in New Delhi by the municipal committee, which proclaims in big, brazen letters day in and day out the finality of the leadership principle in our current politics. Louis XI only went so far as to exalt the divine right of his kingship to the level of the state, but we have the

taking over this firm, he could have easily done so. That he has not troubled to do so is clearly significant in terms of the authoritarian spirit which the Prime Minister is building up in her personal government.

Mr Kumaramangalam, again, is equally arbitrary about his proposal to set up a holding company for the steel industry. The minister himself has been saying that the major problems confronting the state steel plants are the poor quality of maintenance and the sorry state of industrial relations. Mr Kumaramangalam, however, has yet to explain how the setting up of a holding company is going to raise the efficiency of the Steel Minister or his ministry in dealing with these difficulties or otherwise improve matters in this respect. Again, with a grand unconcern for the legalities or even the minimum decencies of government-people relations, Mr Kumaramangalam is saying that

WITHOUT CHARITY

Prime Minister of India, functioning presumably under a Republican constitution, suggesting that the future of democracy in our country begins and would end with her being able or allowed to fulfil the electioneering commitments of her party, i.e., herself.

No wonder that the ruling hierarchy in New Delhi is now permeated through and through with the spirit of authoritarianism. Thus we have the Minister for Steel and Mines unhesitatingly saying over and over again, in explanation of the government's recent decision to take over the Indian Copper Corporation Ltd, that his purpose was to "grab" the experienced and skilled technical personnel of the company. Mr Mohan Kumaramangalam is a person who, by professional training and political choice, is accustomed to make the worse look the better cause. If, therefore, he had wanted to make out a plausible case for

the proposed holding company will appoint directors to the boards of the private sector steel plants on behalf of the shareholders of the public sector institutions, such as the LIC and the Unit Trust, in these firms. Although public memory is proverbially short, people still recall what pains the government of the day took in the wake of the Mundra scandal to reassure public opinion that there would be no government interference in or with the discharge by the LIC of its investment functions and responsibilities. It is, therefore, most surprising that it has now become possible for a minister of the central government to declare publicly that certain vital duties relating to the investment portfolios of public finance institutions including the LIC may hereafter be transferred to a new government agency even the constitution of which is yet to be sufficiently described. The nation once nearly went into hysterics about a single, pri-

vate Mundra operating in Calcutta and here we are with a minister of the central government holding out the possibility of a nationalised Mundra functioning with the sovereign authority of New Delhi.

Considering the level of management in the public sector in steel, any minister for steel should normally speak from a position of humility. Mr Kumaramangalam, however, accepts no such obligations. He has in fact his own view of managerial values in the state steel plants. Not long ago, even as the nation was suffering an enormous economic loss through the dislocation of steel production at Rourkela, Mr Kumaramangalam had the effrontery to suggest that the country should admire the efficiency and speed with which the public sector steel engineers had been able to carry out repairs to the roof of the steel melting shop. Indeed, at the time, it sounded almost as if Mr Kumaramangalam was positively pleased that the roof had collapsed and thereby given an opportunity to his bright boys to show what they could do by way of a quick repair job. More recently, he gave another fine display of logic being stood on its head when he once again attempted to make light of operational lapses by unduly emphasising the diversionary aspect that "corrective action has been promptly taken by the plant management and there is now no escape of gases."

Any objective comparison of managerial performance in the two sectors of the steel industry is highly likely to indicate that the case for converting the public sector into a joint sector by providing for private participation in the ownership and management of the state steel plants is much greater than any case that there may be for the backdoor nationalisation of the private steel companies through Mr Kumaramangalam's projected holding company. This, however, does not come in the way of the minister blandly declaring that his holding company would be revolutionising the steel industry in this country particularly by a break-through in steel technology by putting big money into research and development which would benefit both sectors, public and private. The fact that Hindustan Steel has been eating into its capital base through continuous operational losses has obviously not found mention in Mr Kumaramangalam's brief.

TOUCHSTONE

however, the quantity procured rose only marginally to 3.19 million tonnes from 2.94 million tonnes while there was an increase in output by two million tonnes. In regard to other cereals also there has been good absorption as the quantity procured rose only slightly to 4.92 lakh tonnes from 2.74 lakh tonnes. It will therefore be clear that a surplus has arisen in wheat while current production of rice and other cereals is being easily absorbed.

The whole quantity of wheat procured could not be sold in the lean months by the Food Corporation and other agencies as imports were arriving. There was therefore an increase in buffer stocks of foodgrains to 7.9 million tonnes by the end of 1971 from 5.3 million tonnes at the end of the previous year. Allowing for imported supplies of 2.1 million tonnes, it can therefore be stated that there was a net addition to government stocks by five lakh tonnes out of indigenously procured foodgrains. The addition would have been more but for the fact that sizable quantities had to be utilised for feeding refugees from Bangladesh. The annual report thus proudly draws attention to the fact that for the first time in recent history the offtake through the public distribution system was less than the quantity procured, the actual offtake being 7.7 million tonnes against the quantity procured of 8.8 million tonnes.

In view of the expectations of bumper harvests of foodcrops aggregating to 112 million tonnes in 1971-72, in spite of adverse weather conditions in Orissa, parts of Bihar and Andhra Pradesh, the question is what will be the quantity procured in 1972-73 and to what extent there will be an increase in buffer stocks. It is generally expected that the output of wheat will constitute a new record at 26 million tonnes or 2.8 million tonnes more than in 1970-71. If the experience of 1971-72 is any guide, it may not be surprising if nearly 80 per cent of additional production is to be procured and even stored. This would mean that the total quantity procured may be even in excess of 7.3 million tonnes.

Assuming that the increase in buffer stocks in 1971 was mainly on account of wheat and allowing for imports of 2.1 million tonnes, it can be reasonably presumed that self-sufficiency had been reached out of the 1970-71 crops and gross consumption was of the order of 22.7 million tonnes. There will necessarily be a growth in consumption in the current year by about five per cent. In that case in the absence of imports of wheat, there will be need for providing about 24 million tonnes out of indigenous produc-

tion for meeting the requirements of the home market.

There will thus be statistically a surplus of two million tonnes of wheat. In respect of rice and other cereals total consumption in 1972-73 may be 75.0 million tonnes against the production of 74.5 million tonnes. With marginal imports of rice there is the prospect of buffer stocks increasing by nearly two million tonnes. The needs of Bangladesh can be easily met out of the country's production though with the continuance of imports against earlier indents, the shipments to Bangladesh may not make any big difference to stocks.

It will be clear from the foregoing that food self-sufficiency had been reached in 1971-72 even after meeting the needs of Bangladesh and providing for unknown leakages across the frontiers. This is indeed a great achievement as it has become possible to avoid heavy expenditure in foreign exchange on food imports. From self-sufficiency to marginal surplus will be another great step forward when the bumper harvests make themselves felt in the coming months.

It may not be a difficult proposition to hold stocks of foodgrains to the extent of two million tonnes additionally by the end of this year taking the total to 10 million tonnes. The finance involved also may not be difficult to be located as the total of about Rs 160 crores in a year can be easily provided by the banking system as its net commitment will be only Rs 135 crores. There is a budgetary provision of Rs 25 crores in 1972-73 against an estimated increase in the value of stocks by Rs 120 crores. In the light of the latest developments the aggregate increase may be Rs 160 crores, as stated above. With rising deposits of the scheduled commercial banks and the absence of any keen demand for funds, the commercial banks may even welcome the opportunity to expand credit against foodgrains of Rs 135 crores and even more.

The problem, however, is not so simple as it looks. The quantities procured will have to be 12 million tonnes in 1972-73 against 8.8 million tonnes in 1971-72 and there will be considerable strain on storage and transport facilities when arrivals out of rabi crops prove to be heavy in the next three months. Even last year the procurement and storing of wheat particularly caused great concern and the Food Corporation had to wage virtually a battle in order to move huge quantities of foodgrains to places of safe storage before the onset of the monsoon.

With a greater demand on the facilities

of the railways by the defence services the accordance of high priority to the needs of Bangladesh and a higher level of activity in other directions, the Railways may find it difficult to provide the required number of wagons for moving foodgrains. How this ticklish problem will be solved in the coming months remains to be seen. The whole argument is of course based on the assumption that total production will be 112 million tonnes.

There is another point which has to be borne in mind in the context of emerging plenty. If for any reasons bumper harvests were again realised in the next kharif season, market arrivals may be heavy later in the year and with a disgoring of stocks by traders and hoarders, the offtake through the public distribution system may not be even of the dimensions of 1971-72.

The union Ministry of Agriculture has therefore to be fully prepared for meeting any eventuality and the lessons of 1972-73

New industries for West Bengal

THE GOVERNMENT of West Bengal claims that the climate for industrial development in the state has distinctly improved recently and that, in the coming months, a large number of new industries will come up while many of the existing industries are likely to undertake substantial expansion. It is, of course, true that Mr Siddhartha Shankar Ray's ministry has helped to revive the people's confidence, especially of the business community, in the economic future of West Bengal. But it seems unlikely that the state's economic recovery will come about so quickly as expected by the government.

The lack of electricity continues to be the biggest hurdle to the rapid revival of industrial activity. Most of the industrial units are severely handicapped by frequent and prolonged load sheddings; and if all, or even many, of the closed units immediately reopen, they will not be able to work due to the acute power shortage. Moreover, the administrative machinery is yet to be geared to the task of industrial development. The West Bengal Industrial Development Corporation which was set up in 1967 was reorganised recently. But it has not yet been able to find suitable personnel for its technical and financial divisions. The corporation has also not been provided with sufficient funds

will clearly indicate what are exactly the beneficial effects of self-sufficiency in food production and to what extent there will have to be changes in procurement and distribution policies in order to avoid an undue increase in buffer stocks and in expenditure on account of higher interest charges, storage facilities, supervisory personnel and the like. Only if the new problems are successfully tackled, it can be expected that the upward trend in food production will be sustained and a healthy crop pattern evolved.

The current year will therefore stand out as another landmark with the complete elimination of imports and even the emergence of a small surplus. Only the apple-cart should not be upset by Nature in 1972-73 though there is reason to believe that the agricultural economy has gained considerably in strength and with the adoption of new techniques of cultivation and the creation of lift irrigation facilities there may not be a repetition of the disastrous happenings of 1965-67.

for the efficient discharge of its functions. Mr Ray and his ministerial colleagues therefore should take prompt and positive measures to invigorate the state's economy by enabling the existing industries to make better use of their capacity and by facilitating new industries to come into existence in various parts of West Bengal.

About ten years ago, the National Council of Applied Economic Research, New Delhi, conducted a techno-economic survey of West Bengal, in which it clearly indicated the great scope that existed for the growth of new industries in the state. Unfortunately, this competent and comprehensive survey did not receive any attention either from the political parties or the administration or even from the industrial organisations. This was a pity because the survey had analysed the state's economic potential in great depth and had made many specific suggestions for setting up new industrial units. Now the Indian Investment Centre, New Delhi, has issued a brochure on the scope for industrial development of West Bengal. The centre has opened an Entrepreneurial Guidance Bureau in Calcutta to assist businessmen in taking investment decisions. The 35-page brochure provides basic data on West Bengal, its natural resources, and the incentives and facilities available for development.

The brochure has analysed the scope for industries broadly under two categories — engineering and non-engineering. In the former group, great scope is seen

for automobile ancillaries, electronics, industrial valves, paper and pulp making equipment, and various types of industrial machinery. The prospects for electronics seem to be particularly encouraging in view of the availability of labour at relatively low wages. The brochure says that it is possible to develop an electronic complex consisting of a large number of units, each specialising in the production of components. In addition, the manufacture can be taken up of electronic equipment like calculators, mini-computer unit and electromedical unit. In the non-engineering sector, considerable scope is seen for forest-based industries, rubber-based industries, ceramics, synthetic fibres, fruit processing, and petrochemicals. The outlook for petrochemicals seems to be quite promising. The brochure says that the setting up of the proposed refinery and the fertiliser complex in Haldia will provide the nucleus for a new pattern of development in the fast-growing fields of fertilizers and petrochemicals. The fertiliser complex will make available many intermediates and by-products like methanol, phosphoric acid, ammonia, and urea, which will facilitate the establishment of numerous industries based on them.

The scope for small industries is also highlighted in the brochure. In 1966, there were in West Bengal about 495,000 small-scale units, employing about 1.3 million workers and the net value added by them was Rs 728 million. But no official survey has been made about the small-scale sector since 1966. The brochure envisages vast scope for the growth of small-scale units as ancillary and subcontracting industries especially in the manufacture of automobile components, electronic components, electric fittings, castings, forgings, machined components, sheet metal components, and so on.

The brochure has merely listed the industries which have growth potential in West Bengal. It would have been better if it had also indicated, at least broadly, the areas which offered scope for such industries. For example, what kind of industries are suitable for Darjeeling? A district-wise analysis would have been of more practical use to entrepreneurs.

The chapter in the brochure on infrastructure is not only sketchy but even misleading. It says that West Bengal has "a well-developed infrastructure." But the fact is that the infrastructure facilities in this state are grossly inadequate and this is one of the main reasons why except Calcutta, the 24 Parganas and Howrah, the rest of West Bengal has had very little of industrialisation. The brochure says

that West Bengal occupies the third place in the per capita consumption of power. This makes little sense in the context of the serious power shortage that has been prevailing in the last two years.

It is pointed out that as in March 1969, the number of villages electrified in the state was 2433. But nothing is said of the fact that West Bengal has the least number of electrified villages in the whole country. Less than ten per cent of the villages have been electrified so far compared to 80 to 90 per cent in many other states. The brochure refers to the increase in the length of extra municipal roads from 12,721 kilometres in 1966 to 14,138 kilometres in 1967. But the condition of most roads in Calcutta and the districts continues to be scandalous. In many places, the roads are not suited to carry heavy vehicles. Attempts are now being made to improve the roads by the Calcutta Metropolitan Development Authority but the progress is very slow because of the shortage of steel, cement and other materials, and the lack of effective co-ordination among the various implementing agencies.

The brochure says that West Bengal has the highest railway mileage of about 21,000, about 65 per cent of which is broad gauge, 20 per cent metre gauge, and 15 per cent narrow gauge. But there are vast areas in the state which are not linked to the railway network. It is estimated that about 25 per cent of the state's total area lies over ten miles away from the nearest railway track. The brochure should have given a correct picture of the infrastructure facilities on West Bengal and explained how their expansion would contribute to the growth of various industries.

There is no dearth of organisations, official and non-official, in West Bengal to provide advice and assistance to entrepreneurs. For instance, there are the West Bengal Financial Corporation, Industrial Development Corporation, and the Board of Industries. In addition, there are institutions which operate at the all-India level such as the Industrial Finance Corporation, National Small Industries Corporation, Industrial Development Bank, and Industrial Reconstruction Corporation. The nationalised banks also are expected to assist new entrepreneurs in various ways.

The Bureau of Entrepreneurial Guidance, sponsored by the Indian Investment Centre, is the latest addition to the list of institutions which have been set up to assist the growth of new industries. The Bureau's functions are to offer advice on the need for fresh capacity, the size of

the economic unit and the corresponding investment involved, methods of production, availability of raw materials, demand forecast, export prospects, and official policies regarding industrial licensing and foreign collaboration. The bureau has made a good beginning by drawing attention to the enormous scope for industrial expansion of the state. But

Sugar, a captive of politics

THE ESTIMATES Committee of Parliament, in its 15th report on the Ministry of Agriculture, has castigated the government for its *ad hocism* in regard to sugar policy. It has recommended the formulation of a long-range sugar policy keeping in view the future domestic demand and export commitments. What needs to be underlined is that this is not the first time that the government has been criticised for following an *ad hoc* policy in regard to this industry. Nearly seven years ago, the Sen Committee had suggested that the government should lay down a long-term plan for this industry which has been dogged by wide fluctuations in production from year to year. The Sen Committee had also recommended the setting up of a buffer stock of 500,000 tonnes of sugar in order to smoothen the supply to consumers which tends to become erratic due to yearly oscillations in production.

This industry has struck the headlines in recent weeks because of the increase in the free market prices of sugar. The consumer, who had been paying around two rupees per kg, has now been forced to pay more than three rupees per kg. The harassed consumer blames the industry which in turn blames the government for its faulty policies. The Estimates Committee has indicated that the government is largely responsible for the present mess in this industry.

The production of sugar started rising in 1968-69 after a bad spell of two years. The highest output was recorded in 1969-70 at 4.26 million tonnes. This was the period when partial decontrol (60 per cent levy and 40 per cent free) had turned out to be a blessing in disguise. The closing stocks of that year were as high as 2.1 million tonnes — almost half the total production of the year. Consequently, there was not much difference between the sugar prices in the free market and the fair price shops. The diversion in demand from fair price shops to the open market caused

so long as the existing industries in West Bengal continue to work with large idle capacity and face serious difficulties in regard to the availability of electricity and transport, one wonders whether new entrepreneurs will come forward in sufficient numbers to take advantage of the various facilities and concessions offered by the government.

hardship to the sugar factories because of the accumulation of stocks. Unfortunately, at this stage the government adopted the obstinate policy of not revising the sale price of levy sugar in keeping with the rising trend in costs. The sugar factories had no option but to take recourse to high courts which passed interim orders permitting the factories to charge increased prices for levy sugar. The government hurriedly withdrew all controls on price, distribution and movement of sugar with effect from May 25, 1971.

The prolonged stalemate has resulted in reducing acreage under sugarcane by more than three per cent in 1970-71 and further by three per cent in 1971-72, according to official sources. The industry's estimate is that the area under sugarcane has dropped by 10 to 15 per cent in these two years. Consequently, production dropped to 3.74 million tonnes in 1970-71 and to 3.10 million tonnes in 1971-72 (estimated). The declining trend in output has been accompanied by a reduction in stocks causing a bullish trend in prices. With anticipated demand at 4.0 million tonnes in 1971-72 (year ending in October 1972) and availability at 4.5 million tonnes, the closing stocks at the end of 1971-72 would be around 0.5 million tonnes if no exports are made. But the Ministry of Agriculture in its report for 1971-72 has stated that "efforts would be made to maintain the export level at 0.35 million tonnes as admissible under the International Sugar Agreements, if the internal supply position later permitted." It means that the closing stocks after exports would be significantly lower than the stocks at the end of the earlier two years. Despite these bleak prospects, at the time of the outbreak of Indo-Pakistan hostilities in December last year when there was a sudden rise in sugar prices, the industry agreed to make available 60 per cent of the monthly releases to the government for distribution through fair price shops at a fixed ex-factory price of Rs 150 a quintal. This was a goodwill gesture on the part of the industry.

It may be stated here that besides the sugar factories, gur and khandasari pro-

ducers also are competitors in the purchasing of sugarcane. Whereas the statutory minimum prices are fixed by the government in regard to the purchases of sugarcane by the factories, no such limitation is imposed on gur and khandsari producers. What is more, gur and khandsari producers have to bear no burden by way of excise duty. In a good year, gur and khandsari producers are under no obligation to consume all the cane while the sugar factories are forced to crush all the cane available. Consequently, in such years crushing of sugarcane extends even beyond June and July when recovery from sugarcane is extremely low. On the other hand, when the crop is lean, gur and khandsari producers are able to divert substantial quantities of sugarcane meant for the factories by offering higher prices. Here lies much of the dilemma of the sugar factories.

Again, the financial operations of sugar factories have been put under great pressure by a number of statutory obligations. The excise duty is a first charge and is immediately provided for; this applies to the purchase tax as well. Recently, the payments to sugarcane growers have also been put in the same category as instructions in this regard have recently been sent to the banks by the Reserve Bank of India so that the manoeuvrability of financial operations of the sugar factories is severely restricted. Despite these limitations, the sugar factories have attempted to maintain their production and allied activities. In northern India particularly, the sugar units are honouring the obligation of providing levy sugar at controlled prices despite the fact that they are forced to pay exorbitant prices for sugarcane which in some cases is as high as Rs 13 per quintal against the statutory minimum price of Rs 7.37 per quintal. The burden of this increased incidence is naturally passed on to the 40 per cent quota of free sugar.

In Tamil Nadu, factories are paying cane price around eight rupees a quintal. Recovery of sugar in Tamil Nadu is higher than in northern India. Thus, the cost of sugar production in Tamil Nadu is lower than in Uttar Pradesh and Bihar—and this applies to other southern states as well with slight variations—

while the tax on industry is uniform irrespective of location. This has put the north Indian factories at a serious disadvantage.

A part of the blame for stagnation in yield from land under sugarcane in northern India particularly must be shared by state governments which have collected large sums of cess from sugar factories for improving sugarcane cultivation but have done precious little in this regard. The states, in turn, have passed on the responsibility of cane development to the cane development councils. The development councils on their part plead their inability to service the sugarcane growers because they have to cater for a large number of growers with very small holdings each. The factories are unable to assist the growers because they have no direct contact with them. Even if they assist the sugarcane growers, there is no assurance that the sugarcane that they assist in development will not be diverted to gur or khandsari manufacturers.

In his recent statement in Parliament, Mr Fakhruddin Ali Ahmed, the union Minister for Agriculture, indicated that the government was committed to the nationalisation of the sugar industry as promised to the electorate in the election manifesto of the ruling Congress party. He, however, stated that the government would take a decision in this regard only

after the report of the Commission of Enquiry to examine the working of the sugar industry appointed in November, 1970, was received. It may be recalled that the centre had made it clear to the government of Uttar Pradesh some time back that the latter was competent to nationalise the sugar industry in the state if it so desired. In Uttar Pradesh, the government took over — not nationalized — 12 sugar factories under the Uttar Pradesh Sugar Undertakings (Acquisition) Act, 1971. Out of these 12 sugar factories, only five are under the control of the state government while the remaining seven have been able to regain control through the intervention of the courts. With the threat of nationalization facing them and the availability of sugarcane on the decline—apart from the rising price of cane and the compulsion of surrendering 60 per cent levy sugar to the government—the sugar factories find themselves in a difficult position. This is hardly a situation which would encourage sugar units to modernise or renovate their plants. They are today in the same position as the coking coal mines were before their take-over by the government. So long as the government does not take a long-term view of the issues of sugar development or assure the industry that it is willing to adopt a consistent policy designed to promote cane development and increase sugar production year after year, the industry cannot be blamed for the messy state of our sugar economy.

Eastern Economist 25 Years Ago

MAY 9, 1947

What has been described as a deftly executed social stratagem has been necessary in order to induce Mr. Jinnah to receive Gandhiji. Discreet officials of the Viceroy's House, who apparently spent considerable time and planned elaborately to arrange a meeting between the two leaders, where presumably gratified when Gandhiji proposed and Mr. Jinnah agreed that a further meeting should be arranged at latter's residence. Nobody certainly expected any immediate or spectacular results; and nobody was therefore disappointed. One of the subjects discussed was the response to the joint peace appeal—probably the only point on which agreement could have been predicted. But the somewhat colourless statement "that we must do our best in

our respective spheres to see that that appeal of ours is carried out" (to which Mr. Jinnah was willing to subscribe) was followed almost immediately by another proclaiming overtly, if not clearly, that neither the appeal nor the further communique reiterating it was intended to apply to the N.W.F.P. On the major question namely Pakistan, no real discussion was obviously possible. Gandhiji met the Quaid-e-Azam on the Congress. The very question of partition was itself thus open for discussion, and the problems which agitate Sikhs and Hindus of Eastern and Central Punjab, could hardly have been discussed.

POINTS OF VIEW

We are all our brother's keeper

Pierre-Paul Schweitzer

I WELCOME this opportunity to address the Third United Nations Conference on Trade and Development. The UNCTAD and the Fund share a common concern about the trade and development problems of the developing countries and in the past we have closely collaborated on many levels. I look forward to continued fruitful co-operation in promoting the economic development of our members.

A few days ago, Mr McNamara, President of our sister institution, the World Bank, spoke to you about the unacceptable state of development in most of the developing world and the urgency of moving forward with practical measures. I agree with his emphasis on the need for a reappraisal of some of the policies in developing countries and for an improvement in the external climate for development. Much of what I have to say on this occasion will bear on this latter aspect, especially the international monetary situation. But before I turn to this main subject of my talk, I would like to refer briefly to our own experience in developing countries.

Fund's concern

The Fund has been deeply concerned with problems of development over the last two decades, and much of its work, in annual consultations and in connection with provision of resources has been to discuss and review financial policies and programmes of its members. In the last ten years of the Fund's operations, developing members had no fewer than 206 stand-by arrangements for a total of more than SDR five billion, each arrangement designed to support a programme to foster economic development in conditions of reasonable financial stability. The resources that the Fund committed were substantial, but no less important was the encouragement that the Fund's support and continuing collaboration gave to the authorities in carrying out their programmes. The Fund's approach has been that of a partner in a common en-

Address delivered by the Managing Director of the International Monetary Fund on April 25 at UNCTAD III in Santiago, Chile.

deavour, based on the conviction that only through sound financial policies and management can a country generate the savings which are essential to economic development. Not infrequently the Fund and the member have persevered through many years of effort until the aim of restoring vigour to the economy has been realised.

unsatisfactory progress

None of us can take satisfaction from the course of economic development over past years. Progress needs to be much faster and better balanced; there must, in particular, be substantially more opportunities for productive employment of the growing labour force. The Fund's experience testifies to the increasing realism that the developing countries have shown in their policies and priorities in recent years. In improving and strengthening their efforts, they must and should have much greater external support.

In the monetary field the period since UNCTAD II has seen many important changes. This was the period when, after prolonged discussions within the Fund and elsewhere in which UNCTAD itself played a very constructive role, the special drawing rights scheme was created and activated. The experience of the first basic period, which draws to a close at the end of this year, clearly shows that the SDR has become established as a reserve asset. SDRs are allocated to each Fund member in proportion to its share in total quotas; the almost two and a half billion in SDRs which our less developed members received represent about 15 per cent of the total reserves of these countries.

During the same period a substantial

increase was made in the quotas of members in the Fund, thus enlarging the pool of resources available to finance payments deficits. The Fund also established a new facility, which stands alongside the widely used compensatory financing facility, to assist members in connection with the financing of international buffer stocks. Unfortunately, even with the availability of this facility, negotiations of commodity agreements are very difficult to conclude. There is at the present time only one agreement under which the facility is used, the Fourth International Tin Agreement of July 1970. But I hope that in coming years there will be greater success in concluding such agreements, and I am sure that our facility will play an increasingly useful role.

turbulent phase

The period since UNCTAD II has also coincided with a difficult and turbulent phase in international monetary relations, with recurring disturbances of growing magnitude. Last year, in particular, was in every sense a year of crisis, in which fundamental disequilibria in payments that had gradually been building up culminated in the United States' decision of August 15 to suspend the convertibility of the dollar into gold and other reserve assets. Shortly after this, at our Annual Meeting in Washington, the Governors of the Fund passed a unanimous resolution calling upon members to establish, as a first step, a satisfactory structure of exchange rates. As you know, this was accomplished towards the end of the year. It was also agreed, and reflected in decisions taken by the Fund last December that, as a temporary measure, countries might permit their exchange rates to fluctuate within wider margins.

You will recall that the resolution of the Governors also requested the Executive Directors to make reports to them on the measures that are necessary or desirable for the improvement or reform of the international monetary system. Seve-

ral studies have since been prepared on this question and the Executive Directors of the Fund have given much thought to it. I would like to direct my remarks to some of the more important aspects of the reform as we see them now.

As members of UNCTAD are aware, the search for improvements in the international monetary system did not begin with the resolution that I mentioned; it has been one of our main preoccupations for some years. Two broad elements in the functioning of the system gave us the greatest concern. First, the mechanism for reserve creation that had served the world well until the early sixties was no longer viewed as adequate or desirable. A system based largely on gold and reserve currencies tends to be increasingly subject to strain as currency holdings become the dynamic element in reserve creation through continuing deficits of the major reserve centre. Second, there was much ground for dissatisfaction with the process of balance of payments adjustment and the role of the exchange rate mechanism in this adjustment. It was in response to these concerns that special drawing rights were created as a supplement to reserve assets, and a re-examination was undertaken of the par value system and the mechanism of adjustment of payments imbalances. This re-examination led to an interim report submitted by the Executive Directors to the Governors at the Fund's Annual Meeting in Copenhagen in 1970.

three conclusions

In this report there were three main conclusions: first, the par value system, under which exchange rates should be held stable so long as they are at a realistic level, is sound and it is neither feasible nor desirable to construct an international monetary system based on floating rates. Second, stability of exchange rates does not and should not imply rigidity, and there would be advantages in smaller and prompter changes in parities. Third, there should be a further study of appropriate ways of introducing flexibility into the system while preserving the basic reliance on par values.

More recent events, and especially those since August 1971, have given new urgency to the efforts to improve and strengthen the international monetary system. It has also become increasingly evident that if we are to avoid a repetition of crises in the future, we should not be

content with technical improvements of the present regime but should seriously re-examine the system as a whole. While many of its features should no doubt be preserved, new mechanisms and rules may be needed so that the system will be fully adequate to the future requirements of world trade and development.

main objective

As you know, the main objective of SDR allocation was to bring about a growing degree of collective and deliberate control of international reserves, with the expectation that reserve assets in the form of gold and currencies would over the years decline in relative importance. The SDR facility has been successful, and has provided an important addition to the reserves of Fund members—developed and less-developed alike. But the aim of providing an orderly process of reserve creation was overwhelmed by the explosive growth of official US dollar balances, resulting from a large basic deficit in the US balance of payments and massive outflows of speculative capital. We are therefore confronted with the necessity of finding ways of avoiding in the future the instabilities inherent in an undue growth of holdings of reserve currencies. In my view, this points to an emerging central role for SDRs in the international monetary system, and to a restructuring of the SDR scheme so as to make this possible.

It scarcely needs to be stressed that the international monetary system cannot function smoothly and efficiently unless all countries adopt appropriate policies, particularly with respect to balance of payments adjustment. No system can survive if it must labour under the burden of persistent payments imbalances and long-continuing overvaluation or undervaluation of major currencies. If we are to avoid this danger in the future, we must devise policies and techniques which will lead to more effective exchange rate flexibility than has existed in the past. Nor can appropriate freedom to adjust parities be denied to the reserve centres, if they are to undertake the same commitment for financing their imbalances as other countries. There continues to be wide agreement that the par value system should remain the basis of the future exchange rate mechanism. But there must be assurance that changes in parities will be made promptly, before payments imbalances build up to unmanageable proportions. This, perhaps together with

POINTS OF VIEW

access to widened exchange margins under appropriate safeguards, should go far to curb disruptive speculation. One of our principal tasks will be to clarify the role of international consultation and initiative to ensure a satisfactory structure of exchange rates.

The reform and strengthening of the international monetary system to serve the needs of all countries is a complex and challenging task, and we cannot expect to complete it overnight. But we must seize this opportunity to build an enduring system, not least because of the benefits that developing nations will derive from a smoothly functioning system less prone to crises and more capable of helping to maintain the growth in world trade on which all countries heavily depend. The attitudes and uncertainties bred by frequent monetary crises cannot but affect adversely the external climate in which economic development of countries has to proceed. Recent experience has given ample demonstration of the impediments that developing countries encounter in their efforts to make orderly progress when the world economy remains vulnerable to disturbances.

notable achievement

A notable achievement in relations between nations since the middle fifties was the growing acceptance by industrial countries of the need to share responsibility for assisting economic development. In recent years, unfortunately, that spirit has weakened and the actions of developed countries—despite their growing affluence—have not measured up to their responsibilities. Development assistance, in particular, has faltered badly, and improvements in the terms of assistance, such as aid untying, have dropped into the background. The scheme of preference for exports from developing countries has been accomplished only in part. A great deal remains to be done in broadening the access to the developed markets of both primary and manufactured products of developing countries. This calls for difficult adjustments in the developed countries, and they may well be reluctant to act as long as the overall international monetary situation remains uncertain. We are unlikely to achieve the structural changes in world trade and capital flows that will most benefit the developing countries unless the international monetary system functions efficiently.

Developing countries have an impor-

ant stake in the preservation of an orderly system of trade and payments. It is sometimes argued that the rules of conduct in currency and payments relations that are suitable for developed countries are not appropriate for developing countries. I do not agree with this view, for I have no doubt that the interests of the two groups of countries coincide on most matters concerning economic growth and stability. Each has problems that are unique to its economic situation, but this only means that the code of conduct that should govern the system should be capable of flexible application so as to accommodate these special problems and needs. Within the framework of the present Articles, the Fund has evolved policies and practices which have proved responsive to the interests of all groups and indeed to the circumstances of each particular member. The Fund's attitude toward exchange practices and restrictions and its policies on the use of its resources, including the compensatory and buffer stock financing facilities, are examples of the way in which it has been able to meet the needs of developing and developed countries equally well. I strongly believe that we should continue to preserve a universal code applying to all countries in a manner that takes full cognisance of their special circumstances.

Such a universal system in no way precludes a useful role for regional groups designed to promote closer monetary and trade relations. These arrangements can be of particular advantage to small countries by providing access to a larger market, thus facilitating a more productive use of resources. The Fund co-operates closely with regional organisations and will continue to support efforts to establish regional co-operative arrangements.

SDR facility

Earlier I emphasised that, in connection with our forthcoming consideration of the restructuring of the international monetary system, much thought has to be given to the further development of the SDR facility. An aspect of SDRs that will certainly be examined is that of a link between SDRs and development financing. The Fund has been studying this question in response to the desires of many Governors at the last two Annual Meetings. This study will now have to be set in the context of the larger role that SDRs may play as the growing element in international reserves and the

principal source of international liquidity in years to come. The report by the UNCTAD Secretariat on the international monetary situation has set forth arguments in favour of the link. The Fund's study will take that report into account as well as the many suggestions that have been made on the subject at this conference and at the recent meeting in Caracas. What we must consider is how best to evolve this new instrument so as to ensure its position as a major—and ultimately the major—reserve asset. This means that we must carefully consider what collateral uses of SDRs can be compatible with the efficient functioning of the international monetary system. The various forms of link between SDRs and development finance that have been suggested need to be examined from the point of view of their effect on the quantity and quality of development aid, and on the working of the SDR mechanism. I should also add that some of the proposals now being made for the reform of the international monetary system may give rise to still other possibilities of transferring resources for development, all of which will receive our full attention.

important subjects

The UNCTAD Secretariat report that I just mentioned also touches on two other important subjects on which I would like to comment briefly. One is the size of the quotas of developing countries in the Fund. I agree that developing countries have a particular need to rely on the resources of the Fund in view of the variability in their trade, and their difficult access to alternative sources of international finance. Indeed, in view of these considerations, special upward adjustments have been made in the past in the quotas of developing countries. Countries that are in the lower range of development ("hard core" least developed countries) have a share in total Fund quotas well over three times greater than their share in world exports. But our work in this area has not stopped. The Fund is now engaged in a review of the methods by which quotas have been computed in the past to ensure that in future quotas of members adequately reflect their economic circumstances. An increase in the share of developing countries in total Fund quotas would, of course, not only broaden their access to conditional liquidity by the Fund but also increase their share in SDR allocation, as long as the latter continues to be based on Fund

quotas as required by the Articles of Agreement.

The other subject noted in the UNCTAD report is the important one of decision making. It is clearly appropriate, as was emphasised in the Governors' resolution at the Annual Meeting that the examination and reform of the international monetary system should be carried out in the Fund. While the Articles provide that decisions of the Executive Directors can be taken by weighted voting, in practice the Fund operates by consensus and its decisions reflect the views of Executive Directors representing all 120 members of the Fund. However, reform of the monetary system entails so many complex policy problems that from time to time it may be desirable that major issues be discussed at the highest financial and political levels. It is this consideration that has led the Fund to give active thought to the creation of a Committee of the Board of Governors, selected on a basis comparable to that of the Executive Board. Clearly, its size would have to be a compromise between the widest possible membership and the compactness necessary for fruitful negotiations. This and many other questions are yet to be settled. But if an agreement on the creation of such a committee can be reached, it would, in my view, greatly facilitate the negotiations of major issues that may arise in connection with the reform as it would give full weight to the interests of all members of the Fund. I am gratified by the strong and unanimous support that this idea received at the meeting of the Group of 24 at Caracas earlier this month.

task unfulfilled

Mr chairman, the problems of trade and development with which this conference is concerned are urgent. Despite two decades of effort and achievement, the task of developing the greater part of the world, and improving the standard of living of most of its population, remains unfulfilled. There is need for more intensive effort on the part of developing countries and more substantial collaboration on the part of others. This conference will undoubtedly point to many constructive ideas and suggestions. The principal task for us in the Fund will be to strengthen the international monetary system so that these ideas and suggestions can be effectively carried out and yield that all of us hope for.

POINTS OF VIEW

POINTS OF VIEW

When production is by consent

R. V. Murthy

IN HIS presidential address to the 39th annual general meeting of the Employers' Federation of India (EFI) held in Bombay a few days ago, Mr Naval H. Tata dealt incisively with such issues as bonus, strikes and productivity. He also subjected to a searching analysis the concept of "Garibi Hatao", a slogan which has now attained a truly international status.

To quote Mr Tata, "while 'Garibi Hatao' is meant for the entire nation, somehow our trade union leaders, in their dramatised self-pity, have led the workers in organised industries and services to believe that, in this grand plan for relief of poverty, they are the primary beneficiaries. They seem to ignore conveniently the ocean of humanity far less fortunate than themselves". In other words, they have failed to keep in view the larger picture of Indian poverty as Prime Minister Indira Gandhi wanted them to when, in May last year, she made an appeal to the country's trade union leaders. She had then said: "The employed, particularly in the organised sector, who enjoy a measure of social security should recognise that, in our country, to be employed is in itself a privilege."

glaring disparity

Our organised industrial workers who are most vocal and vociferous, although small in number — only a fraction of the massive working population of the country — thanks to their mainly urban-based trade union leaders, have brought about such a glaring disparity in the ranks of our working population that Mr Tata felt like saying: "Before we talk endlessly of the widening gap between the rich and poor nations and between the rich and the poor of the nation, let us spare some moments in rectifying a grievous social injustice within the working classes."

Considering the fact that, as against the average *per capita* annual earnings of Rs 2,473 of our organised industrial workers, the income of a whole rural labour

household was only Rs 955 in 1967-68, and also the fact that as many as 20 million of our country's unemployed have no income whatsoever, it is but right that the call for "Garibi Hatao" should accord greater priority to this large segment of non-industrial workers rather than to organised industrial workers, as Mr Tata suggested.

specific issues

To turn now to the specific issues that EFI president touched upon, he pointed out that since the enactment of the Bonus Act, on a rough estimate, "no less than 10 per cent of all industrial strikes have had their origin in the issue of bonus and the country has lost thousands of mandays in strikes, go-slows and lock-outs, after endless litigation." It is unnecessary to go into all the circumstances and the factors that have led to this sorry state of affairs — Mr Tata has put down everyone of these step by step — but we may ask with him the question: "Can we not devise other ways of dealing with this vexed question?" Here are the two alternatives that Mr Tata has put forward:

(1) Any other practical alternative than the Bonus Act formula whereby the government itself would disburse bonus directly without involving the management, say by levying a surcharge related to production and disbursing it as a national dividend of labour.

(2) A direct increase in wages.

Obviously neither of these suggestions seems to have been fully thought out by Mr Tata. For, as he himself noted, both suffer from the same defect as the present provision of minimum bonus, in that they too are neither related to productivity nor to profit. They are probably his loud thoughts on the admittedly frustrating problem of bonus. It is significant that, in stressing the need for another look at the issues, he wanted to make bonus "an instrument of not only higher productivity,

but something which would promote cordial industrial relations". Note that he did not even so much as make a passing mention of profits here. All that he seems concerned with is cordial industrial relations.

As in the case of bonus, the attitude of most of our industrial workers and trade union leaders towards strikes and lock-outs is short-sighted and selfish rather than national good-oriented. This has become particularly conspicuous since the recent reference to a moratorium on strikes and lock-outs, made by our President and the Prime Minister. Instead of reacting to the appeal in a constructive manner, our members of Parliament and trade union leaders straightaway sought to denounce it as an attempt to abridge the fundamental right to strike.

voluntary gesture

Mr Tata, on the other hand, pointed out, that the right to strike for the worker and the right to lock-out for the employer are not fundamental rights, nor are they enshrined in ILO conventions. And, accordingly, he interpreted the appeal from the two topmost dignitaries of the country not as a plea for a ban on strikes but as a call for a voluntary gesture on the part of both workers and employers not to invoke it for a specified period in the national interest. He further wanted to drive home this point: "Strikes and lock-outs are reciprocal rights to counteract the threat from each other, in the process of collective bargaining; one cannot exist without the other". In this connection, he urged the government to impress upon trade union leaders how they have conveniently overlooked this fact by a reference to the position prevailing in all essential services where it is not possible for the government to exercise its right to lock-out for reasons of national defence or for maintaining essential services for the public.

To the extent that the government does this, it can be held that the government has voluntarily renounced its right to lock-

An Air Conditioning or Refrigeration Plant that repeatedly stalls due to poor system-engineering just doesn't make a pretty picture.

Neither does your face.

Our system-engineering is so sound, you'll end up camera-happy!

No fooling. Happens all the time. With all our customers. Those who've never turned to anyone else. And also those who've switched to us.

Your experience too will prove

this. We do a better job simply because we engineer and build a system that delivers climate conditions exactly matched to your needs. At an economic, sensible price. With no compromise on quality, or performance.

Yes. Whether you need a packaged

climate system or a central plant, if you want a job done really well from system-engineering through installation to maintenance after commissioning — come to us. The doers.

The pretty picture will be a natural outcome.

POINTS OF VIEW

out. But no trade union leader or labour minister has cared to tell the workers, on grounds of reciprocity, voluntarily to forgo their right to strike in these essential services.

Talking of lock-outs, I may draw attention to Mr Tata's remarks on the latest legislation regarding closures of industries. As per this legislation, a prior notice of 60 days is required before any industry decides to close or face severe penalties including imprisonment. This surely is extremely one-sided and stems from the supposition that businessmen close down their shutters deliberately to cause avoidable unemployment. As the EFI president observed, "No businessman in his senses, invariably involved as he is in having borrowings against his personal securities and guarantees, will expose himself to an action for take-over or liquidation by the bank by deliberately closing the doors of his units".

Moreover, "in these days of uncertain finance, dubious supply of raw materials and frequent and unpredictable industrial disputes involving law and order, can any employer by any stretch of imagination foretell 60 days in advance that he would be compelled to close down on a certain prespecified date?". Mr Tata was, therefore, perfectly justified in asking the Labour Minister whether he would be willing to enact a similar legislation compelling workers to give to government 60 days' clear notice for an indefinite total strike.

As for productivity, Mr Tata can certainly be excused for holding the view that whatever modest increases in productivity the country has witnessed so far can truthfully be said to have been achieved in spite of trade union indifference, if not opposition. It is excusable because, by and large, our trade unions make a point of opposing all forms of rationalisation, modernisation, innovation and, in fact, any measure direct or indirect, to improve productivity. Why this is so was also brought out by him. He gave as many as seven reasons — fear of higher share of the additional profit to the employer; apprehension of an erosion of potential employment; possibility of greater strain on workers; disinclination to exert more; the inherent disincentive of our wage pattern; lack of relation between profit-sharing and productivity, albeit up to a point, and workers' reluctance to concede any credit to labour-saving equipment for higher production.

These reasons ought to make our labour leaders as well as our labour ministers

do some hard thinking with a view to educating our workers and dispelling their doubts on this vital question. At the same time, as Mr Tata exhorted employers, in this age of "production by consent", it is difficult to expect any breakthrough in higher productivity without the co-operation of both trade unions and workers. The

sooner this co-operation is sought and got, the better it would be for our country. Unless this is done, our goods will be priced out of all our export markets, a contingency that we shudder even to contemplate when export earnings bid to become practically the sole reliable source of foreign exchange earnings for the country.

Thinking of buying a TV Set ?

Save for it under our CUMULATIVE DEPOSIT SCHEME

This Scheme brings you the highest returns, higher than even Fixed Deposits.

Save for that new TV Set under this Scheme. Buying it will not be a burden at all.

Study this chart. It shows how this Scheme can be real boon:

Deposit.	Months.	Amount. Repayable.
Rs. 1000/-	18	Rs. 1100/-
Rs. 1000/-	33	Rs. 1200/-
Rs. 1000/-	46	Rs. 1300/-
Rs. 1000/-	60	Rs. 1400/-
Rs. 1000/-	69	Rs. 1500/-

Deposits are accepted even in the multiples of Rs. 100/- under this Scheme.

POINTS OF VIEW

Private Employer and Social Accountability

N. Gopinathan Nair

DIVINE RIGHTS have become a thing of the past: kings and queens have long reconciled themselves to this fact. But not some of the so-called princes of private industry in the country.

Mr G.K. Devarajulu's presidential address at the thirtieth annual session of the All India Organization of Employers was replete with peevish assertions of this anachronistic right. No wonder that the union Labour Minister, Mr R.K. Khadilkar, was compelled to give the assembled employers a sharp lesson on social accountability.

It is a pity that a powerful section of the employers in India is still living in the mid-nineteenth century. They have no compunction in asserting their right to hire or fire labour. The employers seemed to be rattled at the government's new policy to give priority to employment rather than GNP promotion. The presidential address darkly warns the government that it will be wrong to look upon industry as a provider of massive direct employment. "Shorn of the qualifying words, this means that the private sector cares two hoots about massive employment, but is more concerned about its rate of profit."

making merry

During the last four Plan periods, the private sector was making merry under the slogan of production for growth. The effect of hitching the Plans to the lodestar of GNP promotion has led to serious distortions in the economy. While encouraging the rapid growth of monopoly and making the rich richer, it has resulted in massive unemployment and impoverishment of the masses. The real wages of the very workers who raised production to new heights have remained static during the last two decades. The government has at last woken up to the mischief caused by the slogan "production for growth" and has decided to reverse it with the slogan "growth for social justice." One of the key elements of this slogan is the stress on priority to employment. But if Mr Devarajulu's address is an indication of

This is the text of the AIR broadcast which has been referred to editorially in this issue (cf page 877)

the mind of the private sector in the country, it is opposed to this policy.

The employers do not consider it their responsibility in helping liquidate unemployment in the country. They have also revealed their vested interest in its continuance. A cheap labour market is the dream of every profit-obsessed capitalist.

Another passage in the president's address also reveals the working of the minds of the leaders of the private sector. The address has strongly opposed the demand for a decent bonus. According to Mr Devarajulu "the bonus sum represents no more or no less than the capacity to mulct the industry to the maximum at any given time." To make such a statement after the bonus law has been in operation for so many years is, to say the least, Rip Van Winklish.

imposing discipline

The attitude of the employers as crystallized in the President's address does not augur well for smooth industrial relations in the country. As usual, the employers allege that labour is the villain in deteriorating industrial relationships. They want the government to impose so-called "discipline" on the workers. This means, while the employers will be at liberty to flout accepted obligations, the government should rush to their aid to put down the workers who will naturally resist and struggle against such doings.

The employers plead that the management and workers should be inspired by an identity of purpose. But one fails to understand, how there could be any identity of purpose between employers who are not prepared to accept the social implications implicit in the government's employment-oriented policy of development, and workers who have a vital stake in making this policy successful. Con-

licts are bound to arise, unless the employers are prepared to change their present high and mighty attitude.

Mr Khadilkar should be congratulated for his blunt speaking. He asked the employers to free themselves from their fixations. Instead of exhorting the government and labour to practise self-discipline, it would pay dividends if the employers' organizations, for a change, took up "the task of educating and disciplining their constituents in accepting the obligations that flow from the very fact of their having the citizens of this country in their employment," he pointed out.

current fashion

It has become a fashion these days to compare the relatively high income level of industrial workers to the low per capita income of the population in general. The implication is that the workers were taking an anti-social stance by demanding higher wages and better conditions of work. The presidential address had also raised this bogey. But Mr Khadilkar gave it a hard knock. There has to be a great deal of levelling up, he said. But equally a considerable amount of levelling down has also to be done. The tallest poppies have to be cut. Mr Khadilkar gave the employers another piece of advice. If they want to stay in business, it will be wise of them to exercise more self-discipline, recognize the source of their power and above all its limitations.

New Delhi, Saturday

THE DEMANDS for grants of four more ministries — (i) the Ministry of Home Affairs, (ii) the Ministry of Industrial Development, (iii) the Ministry of External Affairs, and (iv) the Ministry of Information and Broadcasting—were adopted by the Lok Sabha this week. Those of the Ministry of Defence were inconclusively debated. The Minister for Agriculture, Mr Fakhruddin Ali Ahmed, clarified the thinking of the union government on the issue of farm land ceilings. Another highlight of the proceedings of the House was the introduction of the Constitution (29th Amendment) Bill.

Widespread concern over the fall in the growth rate of industrial production last year was the main feature of the debate on the demands for grants of the Ministry of Industrial Development. It was strongly urged by almost all the participants in this debate that the government should go into the causes of the slow progress on the industrial front and expeditiously take steps to reverse the declining trend. Several members complained that licensing procedures were still very complicated, red-tape ridden and time-consuming. Quite often, it was alleged, entrepreneurs got frustrated with these procedures and gave up the very idea of starting industry. The leftist members of the House accused the government of becoming soft towards monopoly houses as well as foreign concerns in complete disregard of its declared policy of curbing monopolies. They also felt that not enough was being done to foster self-reliance. Some others, however, pointed out that restrictions on the growth of monopoly houses was one of the primary reasons for the slow pace of industrial progress during the past three years.

sick mills

The steady increase in the number of sick industrial units in the country was also adversely commented upon. Pleas were made for a revision of the Industrial Policy Resolution with a view to accelerating growth. The cause of backward areas for industrialisation was championed by many. Some members argued for rapid expansion of agro-based industries. The need for stepping up the produc-

tion of essential consumer goods was also stressed.

In his reply to the debate, the Minister for Industrial Development, Mr Moinul Haque Choudhury, denied the charge that the government had become soft towards monopoly houses. Since he assumed the charge of this Ministry, the share of larger houses in the industrial licences issued, he pointed out, had gone down from 17.19 per cent to 3.7 per cent. He agreed with members that industrial growth last year had left much to be desired. But one of the main causes of this, he said, was a sharp decline in the production of sugar, cotton yarn and steel. These three industries alone, he stressed, had depressed the industrial growth rate by about 3.5 per cent. Mr Choudhury denied the allegation that the government had taken a decision to allow foreign subsidiaries to set up units in export-oriented and labour-intensive industries.

new licences

The Minister for Industrial Development expressed the hope that as a result of the speeding up of the clearance of applications for industrial licences, the rate of industrial growth would start improving soon; the full impact of this, he pointed out, would, however, be known in about three years' time. The number of industrial licences and letters of intent issued last year, Mr Choudhury said, was nearly three times of the figure for 1969. A close watch, he added, would be kept on the implementation of the new licences. The necessary assistance would be given to entrepreneurs wherever needed, but the licences would be revoked if not implemented according to the specified schedules.

Referring to the development of backward areas, the Minister indicated that some more concessions for setting up industries in these areas might be announced soon; the matter, he disclosed, was under the consideration of the Planning Commission and his Ministry. Mr Choudhury also revealed that the government was thinking of establishing a corporation to run "sick" industrial units. On the question of the nationalisation of

industries, he recalled the Prime Minister's recent observation that while the government was not averse to this step, it wanted its approach towards this problem to be pragmatic.

Mr Choudhury announced that an agreement for the proposed joint sector scooter project to be located at Lucknow would be signed soon with an Italian firm and production would start within a year. The ministerial examination of the public sector project for the manufacture of dry batteries, he further revealed, had also been completed. Another announcement made by the Minister was that the government had taken the decision to establish a holding company for machine tools.

Indo-Pak talks

The current emissary-level talks with Pakistan at Murree to prepare ground for a summit meeting between Prime Minister, Mrs Indira Gandhi, and Pakistan President, Mr Z.A. Bhutto, dominated the debate on the demands for grants of the Ministry of External Affairs, although the other aspects of our foreign policy too came in for a good deal of discussion. There was a general consensus that the main stress in the talks with Pakistan should be on an overall settlement of the issues of dispute with that country in the interest of a durable peace on the sub-continent and not only on the settling of the controversy over the prisoners taken by the two countries during the last conflict.

Several members desired that the Sino-Indian relations should also be normalised but some others doubted whether the time was ripe for parleys with China. Some Congress members advocated continued support by the government of India to the Arab cause in west Asia. Some others pleaded for a rapprochement between our country and the United States. The Vietnam issue too figured prominently in this debate and a good deal of resentment was expressed over the renewed mass scale fighting in this strife-torn country. While Indo-USSR friendship was generally appreciated, the spokesmen of the Jan Sangh and the Socialist parties were critical of the concept of Asian security unde-

Soviet auspices. The usual plea for the recognition of the German Democratic Republic and the Provisional Government of South Vietnam, which has its seat of operation in North Vietnam, were also made by the leftist members of the House. A former minister of the union government, Mr B.R. Bhagat, desired that one per cent of India's GNP should be set apart for giving assistance to developing nations.

hand of friendship

In his reply to this debate, the Minister for External Affairs, Mr Swaran Singh, expressed the hope that the proposed Indo-Pakistan talks would pave the way for a lasting peace on the sub-continent. He urged Pakistan to grasp the hand of friendship extended by India. The External Affairs Minister assured the House that Bangladesh would necessarily be a party to any settlement of the outstanding issues between India and Pakistan.

Referring to Vietnam, Mr Swaran Singh felt that the prospects of the resumption of Paris talks on the issue had brightened. He hoped that these talks would lead to a settlement not only of the Vietnam conflict but also of the difficulties of all the three Indo-China states within the framework of the Geneva agreement. On Sino-Indian relations, he said, that India would take the necessary steps for a detente whenever an opportunity came up for some concrete action. He regretted that as yet there had been no positive indication from Washington to improve Indo-US relations. The Indo-Soviet relations, he added, were very cordial and the government of India was grateful to Moscow for its support in times of need and difficulty when "others wavered, hesitated and even worked against us". Mr Swaran Singh thought that the fears of some members that India was becoming a satellite for the Soviet Union were unwarranted. There was no question of this country becoming a client state of any other nation, he stressed. On West Asia, he said, India continued to support the Arab cause.

Mr Swaran Singh welcomed the idea of collective security in south-east Asia and pointed out that it should not be viewed as an extension of the Brezhnev doctrine. He revealed that Malaysia had shown interest in this concept and even Australia had made some queries. The External Affairs Minister wanted the Indian Ocean to be declared a peace zone in which ships carrying nuclear weapons should not be allowed.

Earlier intervening this debate, the Deputy Minister for External Affairs, Mr

Surrindra Pal Singh dealt with our relations with the neighbouring countries like Ceylon, Nepal, Bhutan and Burma. The relations with these countries, he observed, were friendly. He deprecated the allegation in some quarters that we had designs on Ceylon.

As could be expected, the controversy over the recent order of the government restricting the pages of newspapers to ten dominated the debate on the demands for grants of the Ministry of Information and Broadcasting. While the Congress and CPI members supported the step, the spokesmen of the Swatantra, Congress(O) and Utkal Congress parties assailed it. The Swatantra spokesmen accused the ruling party of using newsprint as an instrument for curbing the freedom of the press; the government, he observed, was not at all worried about the havoc which the above order was likely to play with newspapers. A similar view was expressed by the Congress-O spokesmen in this debate. The Utkal Congress spokesman, however, wondered why the simpler method of price-page schedule was not resorted to by the government, instead of imposing the ceiling of 10 pages. Some of the Congress and other members with leftist leanings wanted the government to introduce without delay legislation to secure diffusion of newspaper ownership. The affairs of the Children's Film Society also came in for scathing criticism. So also the role of All India Radio (AIR) and other information media. It was alleged that AIR and other information media, were being used to help the ruling party. The oft-repeated plea for converting AIR into a statutory corporation was reiterated. Some members wanted the Press Trust of India as well to be converted into a corporation.

no ulterior motive

The Minister of State for Information and Broadcasting, Mrs Nandini Satpathy, stoutly refuted the allegation that there was any ulterior motive for restricting the size of newspapers. The only reason for this, she pointed out, was the necessity to contain foreign exchange outgo on the import of newsprint in the present tight foreign exchange situation. She stressed that the government believed in the freedom of the press and that it must be accepted as a basic principle of democracy. The government, therefore, would like to see opinions expressed freely, subject only to the limits of national security, not only by the persons who had means and resources to do so but also by those who wished and were capable of doing so. The newsprint policy, she assured the House, would be reviewed as soon as the

report of the fact finding committee was available. Referring to films, Mrs Satpathy disclosed that her Ministry and the Ministry of Foreign Trade were jointly considering the setting up of a composite public sector undertaking to look after the exports of Indian films, imports of foreign films, loans for the production of "deserving" films and the creation of distribution and exhibition facilities directly under this undertaking. She did not agree to the suggestion for converting AIR into an autonomous corporation. The TV network in the country, she said, was being expanded.

major announcements

In her reply to the discussion on the demands for grants of the Ministry of Home Affairs (the highlights of this debate were reported in this column last week), the Prime Minister, Mrs Indira Gandhi, made two important announcements. The first was that the government would soon bring forward legislation to severely cut the role of foreign money in the country's public life. The intention is to completely prohibit the receipt of foreign money by candidates standing for elections, political parties, employees of the government, public sector undertakings and newspapers. Associations, trusts and foundations would require prior sanction for receiving funds from abroad. In the case of individuals, information would have to be given to the government by the recipients on a prescribed form.

The second announcement concerned defection by legislators. The Prime Minister indicated that a bill was being considered by the government in this regard which would make it necessary for the defecting legislators to resign and seek fresh mandate. Mrs Gandhi denied the charge of the opposition members that this legislation had been deliberately delayed by the government. The cause of delay, she added, was the failure of the opposition parties to respond promptly to the government's communication to them in this connection.

The Prime Minister virtually ruled out the consideration of the demand for greater autonomy for states. The central government, she stressed, had been extending full co-operation to state governments regardless of which party was in power. The chief ministers of all the states, including those ruled by the opposition parties, were also always willing to co-operate with the centre. She thought that the centre-state relationship as envisaged in the Constitution was basically sound.

Mrs Gandhi castigated the opposition

members who had alleged that elections had been rigged. She characterised this charge as fantastic. She was particularly severe in her references to the CPM, which party, she said, was not even willing to concede that democracy could deliver the goods. The CPM, she pointed out, had always talked of negation of democracy and emergence of one party rule in the country. It had at no time understood democracy as it was commonly understood.

The Prime Minister also informed the House that the government had accepted the plea for ending discrimination against married woman in the matter of seeking or retaining employment in government services. She expressed her preference for the abolition of capital punishment.

The highlight of the inconclusive debate on the demands of the Ministry of Defence was the strong plea made by several members, belonging both to the treasury and the opposition benches, for the country going nuclear. They maintained that the high cost involved should be no argument against our doing so; no price was too high when it came to guarding the freedom of the nation. The performance of the defence forces during the last December's conflict with Pakistan was highly praised by all the sections of the House. The need to strengthen the defences of the country was reiterated. Hopes were expressed that the welfare programmes for ex-servicemen and the dependents of those who were killed or injured in the Indo-Pakistan conflict would be implemented expeditiously.

ceiling on land holding

The Minister for Agriculture, in a statement, clarified that the ceiling of 10 to 18 acres on land holding by a family of five, consisting of husband, wife and three minor children, was envisaged in the case of lands which were prennially irrigated from government sources. The lands irrigated by private tubewells, therefore, would be outside the purview of the above ceiling. He quoted in this regard the enactment by Parliament itself for West Bengal. Most of the other states, he said, were following this principle.

The Constitution (29th Amendment) Bill, which seeks to amend Article 31-A of the Constitution to enable the government to pay compensation for acquisition of land at a price to be fixed by it which may not be the market value of the acquired land, was introduced in Lok Sabha this week. The provisions of the Bill are proposed to be given retrospective effect from June 20, 1964.

In a report submitted to the Lok Sabha on April 27, the Estimates Committee of Parliament expressed deep concern over the paucity of raw materials for industries. It suggested that instead of a number of ministries and government departments being responsible for meeting the needs of industrial raw materials, a central planning agency should be set up to keep a constant and strict watch over the supply position so that remedial steps could be taken expeditiously. The Committee also referred to the "lack of proper planning" in developing the requisite capacities for the production of basic raw materials.

economic production

An important guideline for the processing of applications for industrial licences, it opined, ought to be whether the capacity to be licensed offered scope for economic production. The development of backward areas and a rational distribution of industries in the various parts of the country were stressed by the committee. In regard to foreign collaborations, it said that a close watch should be kept on the results of these collaborations. Care should be taken that the efforts at self-reliance were not marred by undue imports of foreign know-how.

The committee recommended that a perspective plan for the next 10 to 15 years should be prepared for all the key industries, so that the five-year requirements and year-to-year achievements could be properly adjudged in this wider perspective. All possible encouragement, the committee stressed, should be given to entrepreneurs who wanted to set up labour-intensive industries.

In its 44th report, the Public Accounts Committee of Parliament has expressed the view that it is not worthwhile to tax commodities in the case of which the annual yield from taxes is less than Rs 50 lakhs. The committee has mentioned specifically in this regard the products manufactured by small industrial units dispersed throughout the country. The levies on these goods or commodities, the committee feels, would involve disproportionately large cost of collection. It is of the opinion that it is necessary to develop a fully integrated system of costing to find out the cost of collecting taxes commodity-wise.

In its 20th report on the working of the Shipping Corporation of India, the Parliamentary Committee on Public Undertakings has recommended the drawing up of a need-based shipping programme integ-

rated with the capacity of indigenous shipyards. The committee has pointed out that the country would have a total tonnage of only 33.77 lakh GRT at the end of the fourth Plan, on the basis of the existing tonnage and orders placed by March 31, 1972. There will, thus, be a sizeable shortfall in the achievement of the fourth Plan target of raising the shipping tonnage in the country to 40 lakh GRT.

The Shipping Corporation of India, the committee has suggested, should gear up its machinery suitably and take proper action to achieve the target assigned to it of raising its tonnage to 15.47 lakh GRT by 1975. A high-powered committee, consisting of the representatives of the corporation, other shipping interests, Hindustan Shipyard and Mazagaon Docks, might be set up to provide guidance and to resolve all problems of the corporation.

The committee is of the view that development of ports and ordering of ships should go hand in hand so that valuable funds are not locked up in ships which the ports are not able to handle and which, therefore, have to be chartered out.

Alone and honourable

IT CAN scarcely have been a surprise to any of the 141 countries which have been discussing international trade and financial strategy at the third UNCTAD conference that it has so far provided little tangible in the way of assistance to the developing countries. From west Europe only one voice, that of Federal Germany, has offered the developing countries easier loan terms at a time when the general trend is the other way. From west Europe, also, only one voice, that of Dr Mansholt, the new President of its Commission, has expressed regret that no comprehensive and coherent policy on development aid was offered by the Common Market at the Santiago meeting.

These niggardly facts are scarcely surprising partly because it is doubtful how

per cent of the amount by which the Atlantic countries will grow richer during this decade.

There is little support either in western Europe or the USA for a significantly increased allocation to the industrially developing area of Special Drawing Rights. The United States, itself one of the largest users of SDRs, is unenthusiastic. Western Europe dislikes the idea of increasing international liquidity because it considers the SDR system to be a factor in preserving American domination of the international money markets. They fear also that more liquidity would bring on more inflation.

The extent to which the United States and western Europe are preparing for sharper economic contest is revealed by

in another. A mere synchronisation of Common Market currencies will not suffice as long as some member countries continue to pursue a policy of growth rather than of stability.

The Common Market, as it moves towards expansion, faces this and many other problems, not all of which are likely even to begin to be solved by the Market summit meeting in Paris next autumn. Its institutions need to be more flexible and more democratic. The status of the little-publicised European Parliament in Strasbourg — whose members are elec-

The first part of the article on the "Evolution of Sterling Area" by Josselyn Hennessey had appeared in our issue dated April 28. The second part will appear later—Ed.

WINDOW ON THE WORLD

far west Europe and north America have genuine interest in sharing effectively and steadily in the industrially developing nations' progress. West Europe and the USA are getting set for battle with one another, for internal economic squabbles and have not much time for others.

The Common Market's proposal at Santiago to raise official development assistance from the current 0.35 per cent of industrialised countries' gross national product to the 0.7 per cent recommended by the United Nations for 1975 shows how very far the Atlantic states are from making the proposal at the second UNCTAD conference in New Delhi four years ago — that there should be a net transfer of resources amounting to one per cent of gross national product. Many of the current transfers, also, carry a high interest rate — this despite the fact that even the increased assistance proposed by the Market would use up only 1.5

anxiety in both areas over a possible further growth of inflation and by their measures either to ensure raw material supplies or to buy them more cheaply.

The anxiety about inflation was expressed by the President of the West-Deutsche Landesbank Girocentrale. He foresees a growth of inflation throughout the Common Market because the monetary exchange margins between the Market's currencies have been narrowed without accompanying firm agreements on joint Market economic and monetary policies. The factors influencing west European monetary stability are no longer controllable at the same time as the USA continues its over-production of dollars.

If, in this German banker's opinion, the Market continues its failure to arrive at an agreed economic and monetary policy, an inflationary policy in one country could reduce the stability of the currency

ted by their governments, not by popular franchise — needs to be raised and the basis of its membership made far more popularly representative. There is increasing risk of clash also between Market authority and national sovereignties. There is some danger, especially in this period of expansion, that the euphoria of apparent solidarity may lead to an overriding of justified national interests.

The nations' intention to secure for themselves supplies of industrial raw materials has been revealed recently both by France and the United States. The French government is about to detail an ambitious plan to diversify its sources of basic raw materials through intensified worldwide exploration by French firms and backed by a stockpiling policy. The stockpiling plan will concern itself largely with assembling and maintaining a sufficient supply of copper and nickel for all French industrial purposes. This may eventually damage the interests of such non-French copper exporters as Poland and South Africa since the aim is for French firms to be capable of directly controlling supplies amounting to between one-quarter and one-third of overall French requirements within five years. Through direct and indirect aid French firms will be encouraged to expand their exploration activities, especially in Canada, Australia and New Caledonia. Investment risks against war and political take-overs abroad will be covered by a government guarantee. Timber and rare

metals as well as copper, nickel and industrial ores are included in the plan.

The USA, somewhat similarly, is to give government support to private corporations and firms in their dealings with foreign governments owning or controlling mineral or other natural resources vital to US industry. The USA is, with Japan, the world's largest consumer of raw materials most of which it does not possess.

Both the USA and France have recently

learnt the hard way in their dealings with the OPEC and the Algerian government that possession remains nine points of the law. As a result, France will mine and bore farther afield and the US government back and lead its large corporations in negotiations with foreign enterprises and foreign governments.

The USA, to west Europe's concern, is also preparing a tougher foreign trade policy, including new criticisms of foreign trade practices and restrictions. The anti-

dumping law will also be tightened and its administration made still more rigorous. French and Belgian firms have recently suffered from this increased strictness over practices of "selling goods at less than fair value" in order to effect a sale. Customs procedures are also to be tightened in the USA and there is a hint that US capital may be restrained in creating jobs abroad if domestic US manufactures are prevented by discriminating barriers from selling in those foreign markets on equal terms.

It is now generally accepted that Indian agriculture which contributes about 48 per cent of the national income is relatively lightly taxed and for rapid economic development, the agricultural sector will have to play a more significant role and therefore a larger amount of resources will have to be mobilised from this sector. The emphasis on increasing mobilisation in the agricultural sector has become all the greater because of the 'green revolution' that has already made its appearance in the country. *Direct Taxation of Agriculture* by Dr A.C. Angrish tries to analyse the various aspects of direct agricultural taxes in the light of modern principles of taxation and requirements of economic development of the country and attempts to put forward "a rationalised scheme of direct agricultural taxes for the country."

revenue significance

The author, having traced the evolution of agricultural taxes, has analysed the revenue significance of land revenue and agricultural income-tax, with a view to ascertaining their productivity and elasticity. After calculating the burden of land revenue and agricultural income-tax, the author has come to the conclusion that the agricultural sector is undertaxed, especially in terms of the absolute taxable capacity that it possesses. The analysis also reveals inter-sectoral and interclass inequity. The author has appraised the agricultural tax structure in the light of the principles of taxation and has brought to the forefront the existing defects of land revenue and agricultural income tax. In this connection he has also discussed

the pros and cons of the current controversy regarding the abolition of land revenue especially on lands below some minimum size and has made out a strong case not only for the retention of land revenue but its enhancement, both on theoretical and practical grounds. The author has critically examined the possible alternatives to the existing system of land revenue and agricultural income tax and has come to the conclusion that on economic grounds there is no satisfactory alternative system.

taxation reform

Chapter 8 and 9 which deal with the reforms of agricultural taxation are the most significant part of the book. The author is of the opinion that agricultural income-tax may not be a good substitute for land revenue from the point of view of productivity and administrative feasibility. Having examined the pros and cons of the proposal to merge agricultural income-tax with the general income-tax, the author has concluded that this proposal, though theoretically sound, is practically impossible in view of some economic and political difficulties. In view of many difficulties in imposing agricultural income tax, the author is inclined to retain land revenue, after rationalising the existing system. In the author's proposal for reform of land revenue system, the basis of 'potential net income' would be more or less a crude form of agricultural income tax. Land revenue in that rationalised system would not be based on acreage of land but on the potential income from land. The author has also put forward a detailed

scheme for the collection of land revenue in kind and proposals to make it administratively feasible and fiscally sound. The author however favours continuation of agricultural income tax on large tea estates and other plantations as a long-term measure.

The author has confined his analysis only to land revenue and agricultural income tax — the two important direct agricultural taxes. This means that he has not taken into account other direct agricultural taxes such as water rates, betterment levies and local taxes on agriculture. But unless all these taxes are taken together, we are not likely to get an idea of the full contribution which agriculture is making at present to mobilisation of resources and this means that the author's recommendations made only on the basis of his study of land revenue and agricultural income tax will have only limited practical value, both from the point of view of theoretical analysis and for policy-formulation purposes.

So much has been written these days on contribution of agriculture to economic development and on agricultural taxation that it is not at all surprising that there is hardly anything new in what Dr Angrish has said. One is left with the impression that that problem of agricultural taxation is not economic or even administrative but has become essentially a political problem in which sphere economist has hardly any say.

WAGE DETERMINATION

Wages and wage rates are one of the most important bones of contention between employers and employees and account for an overwhelming percentage of industrial disputes both in developed and developing countries. A developing economy like India embarking on a comprehensive programme of planned economic development will have to certainly concern itself with the avoidance of industrial disputes and maintenance of industrial peace in order to register satisfactory progress on the industrial front. Naturally this explains the anxiety on the part of the state and every one interested in the economic progress of the country

to find out methods of peacefully resolving issues concerning wages and determination of wage rates.

In his *Wage Determination*, P.R.N. Sinha has made an attempt to analyse the various issues pertaining to determination of wages by wage boards in India. He has tried to emphasise the principles and procedures adopted by wage boards in the fixation of minimum wages and reckoning of wage differentials. Also an attempt has been made to analyse the working of wage board system, its impact on industrial relations and some economic implications of the recommendations.

frequency of disputes

Analysing the factors that led to the formation of non-statutory wage boards in India, the author has pointed out that prior to the advent of the wage board system, state regulation of wages in organised industries in India came essentially as a by-product of settlement of industrial disputes by conciliation and adjudication machineries. During the course of the working of the tribunals, it was experienced that they failed to provide an effective solution to constantly increasing unrest over the question of wages. It was increasingly realised that the number and frequency of wage disputes in organised industries would not be reduced unless the parties themselves had the ultimate say in reaching the decisions. It was due to this that the second Plan recommended the establishment of wage boards on industrywise basis. The result was that a number of central wage boards came to be established in different industries.

Each wage board consists of an impartial chairman, two other independent members and two or three representatives of employers and workers each. The central wage boards are purely recommendatory bodies, the ultimate decisions regarding the acceptance of the recommendations lying with the government of India, which requests the parties concerned to implement them, if the government accepts those recommendations.

It is noticed that in determining the wage-structure, the wage boards are required to follow the principle of 'fair wage' as set forth in the Report of the Committee on Fair Wages. In addition, the wage boards are also required to consider (a) needs of the industry in a developing economy, (b) requirements of social justice, (c) need for adjusting wage differentials in such a manner as to provide incentives to workers for acquiring more skills and (d) desirability of extend-

ing the system of payment by results.

In chapter III the author has sought to analyse the various issues connected with 'need-based minimum wage' as viewed by the wage boards. It is found that the wage boards' estimates of need-based wage were at sharp variance with those worked out by employers and trade unions. In spite of various limitations, the need-based minimum wage was finally recommended by the wage boards for the cement and iron and steel industries, the quantum of need-based minimum wage recommended by the wage boards lying somewhere between the estimates made by employers and trade unions when making their submissions before the wage boards. It is interesting to note that other wage boards did not think it possible to recommend need-based wage on the ground of inability of industries to bear the financial burden involved and that such a recommendation cannot be made without considering the capacity of industries to pay. The author rightly feels that the task of calculating a need-based wage, instead of being left as at present to individual wage boards set up differently for different industries, should be entrusted to a single national tripartite body, the different wage boards on their part concentrating only on examining the capacity of an industry to pay such a wage, reckoning of differentials, and resolving other issues of wage determination.

various issues

The author discusses the various issues pertaining to the application of 'the capacity to pay' criterion. In this regard the main problems facing the wage boards related to determination of a fair cross-section of the industry and secondly the measurement of capacity to pay. In both cases the approaches of different wage boards differed considerably. As regards the first, we notice that some wage boards selected only a certain number of units to represent a fair cross-section of the industry, while some others made an attempt to ascertain the capacity of each unit separately. As regards the measurement of capacity of an industry to pay, different wage boards adopted different approaches. While some depended on balance-sheets furnished by the employers, others placed their reliance on the findings of the Tariff Commission and profitability studies made by the Reserve Bank of India. The yard-sticks adopted for measuring the financial health of an industry were various, covering items such as capital formation, percentage of bonus issues to the total paid-up capital, net worth, reserves and uses of funds and percentage of dividend declared on equity

shares and so on. However the wage boards in general failed to demonstrate as to how the consideration of the above factors was brought to bear on the fixation of wages.

The author has also analysed certain other principles considered by wage boards, i.e. productivity of labour, prevailing rates of wage levels, national income and its distribution, place of industry in the economy of the country, needs of the industry in a developing economy and requirements of social justice. Though productivity of labour was considered by wage boards, they could not specifically measure the proportionate contribution of labour to this increase in productivity. Only the wage boards for sugar and jute industries gave some definite weight to 'prevailing rates of wages'. 'Level of national income and its distribution' was given consideration by some wage boards, though nothing definite was said about correlating wages to national income. Certain wage boards, according to the author 'laid undue emphasis on the needs for accelerating capital formation, building of reserves for promoting modernisation and rationalisation and promoting exports'. The term 'requirements of social justice' was interpreted differently by different wage boards and the author feels that 'consideration of this factor did not have any direct bearing on the fixation of wages.

As regards various types of wage differentials, the wage boards were concerned more predominantly with the fixation of differentials based on differences in occupations and various degrees of skill. In general they did not disturb the existing differentials, except for removing anomalies from the existing wage-structure. However we find that most of the wage boards reduced the number of existing grades which were reported to have been numerous and widely diverse.

declining ratio

As regards some of the economic implications of the wage boards' recommendations and the impact of the wage board system on industrial relations, the author has stated that the level of money wages in all the industries in question has considerably increased, the most notable increase taking place in cement and sugar industries. He has also pointed out that the percentage of both workers' money wages and total wage cost to total cost of production declined or remained more or less unchanged after the wage boards recommendations came into force. It is significant that the percentage nowhere increased. Also it is proved that produc-

tivity per worker in value terms after implementation of the wage board's recommendations has generally been higher than for the period preceding the recommendations.

As regards the share of labour in the national output, according to the author, a mixed picture has emerged. In some cases, the share of value added going to wages has gone up and in some others it has gone down.

Wage problems in a country assume socio-political colouring and are often sought to be resolved on grounds other than economic. This is bound to create problems for industries in the private sector. If the emphasis is shifted to economic considerations based on adequate empirical data, different parties to industrial disputes are likely to evolve more satisfactory solutions. It is therefore extremely heartening to note that considerable amount of research is being made in the field of labour economics and some excellent books on the subject are being published. This book on *Wage Determination* by P.R.N. Sinha is certainly one of them.

EFFICIENCY IN INDUSTRY

The subject-matter of *Managing for Profit* is the meaning and measurement of efficiency in an enterprise. In the manufacture of its products, an enterprise makes use of various resources such as raw materials, power, labour and machines and it is the output achieved from these resources that determines the efficiency and, therefore the profitability of the enterprise.

The purpose of industry is the fulfilment of human needs. If an enterprise can find customers for its product, sell this product at a profit and operate within limits set by its social and legal obligations, the enterprise can justly claim that it has fulfilled these human needs.

But it is also equally true that in its quest to meet these social needs, the enterprise must make profits without which the enterprise cannot survive. Profit is the ultimate measure of effectiveness. It is only a concern that makes reasonable profits that is likely to offer security of employment, promotion prospects, job opportunities and income and personal motivation that comes from being associated with the enterprise and its success. Thus, without doubt, the final result must be profit and a business can only earn profit if it is able to utilise its resources effectively, harness the skills and abilities of its employees, innovate, exploit new

markets and locate and develop new opportunities.

It is obvious that the true income of an enterprise is obtained by deducting, from value of sales, the value of all raw materials and other bought-out purchases. It is this income which represents the fund from which all wages, salaries and profits must be paid as well as other items of operating expenses such as rent, rates and depreciation. According to the author the name given to this fund is 'Added Value'.

Though economists have been using the concept of 'Added Value' to measure national income, it is surprising that it is only comparatively recently that companies have become aware of the significance of this concept as a tool of management. As a result, it is the creation of 'Added Value' that has become the primary objective of an enterprise. Whatever the decisions to be taken, the acid test of their effectiveness will be whether they will result in an improvement in the 'Added Value' per unit of resource input.

It is stated that a company has many responsibilities: responsibilities to the employees (fair wages, security, status, comradeship, scope for self-development and fulfilment, good and safe working conditions and sense of belonging); to the shareholder (fair and reasonable return on invested capital); to the local community (to be a good neighbour, taking constructive interest in local affairs); to the consumer (good quality at a fair price); and to the nation (proper and productive use and development of national resources, both human and material). According to the author all this a company can do or fulfil only if it makes reasonable profits which in the final analysis depends on the 'Added Value'.

interesting and readable

This is all that R.R. Gilchrist has to say, though he has said that in an interesting and readable way. But reading the book, one is aghast that even the chief executives of companies know so little about the principles of economics. Some of the topics analysed, namely pricing, incomes and employment, incentives for profit, costing, budgeting, and even the concept of 'Added Value' bear out this statement. The economic phenomena are influenced at present by so many factors including monetary and fiscal policies of the government that it would be impossible for modern executives to conduct their business satisfactorily without having a firm grasp of elementary economics. He might have succeeded in the last century without this knowledge, but

he has little chance in the present. Looking to the courses of study of commerce faculties in Indian universities, and reading some of the books on commercial subjects written by Indian authors, one is confirmed in one's opinion that all these people concerned with modern business need a sound foundation of economics which most of them seem to lack at present.

MARKET RESEARCH

In *Industrial Management and Market Research* S. Ranganandha has attempted to bring into sharp focus the main issues in marketing and industrial management. In most of the developing economies which have adopted the technique of planned economic development with its various restraints on free economic forces, there is perceptible decline in the guiding influence of the market and market forces. And yet the importance of marketing, according to the author, "as a creative management function which promotes trade and employment cannot be over-emphasised". Moreover in India where nearly four-fifths of its population is dependent on agriculture which contributes nearly half of its national income, the crucial role of rural marketing is not widely recognised. There is however a marked change in the outlook as regards rural marketing which has undoubtedly vast potential, thanks to the record agricultural production and impending 'green revolution'.

Though India has yet to become a leading industrial country, the phenomenal expansion of Indian industry in recent times has accentuated the need for increasing the number and improving the quality of the personnel required to meet the demands of industrial management in the country. It has now been realised that industrial management has become so complex at present that the industrial manager is required to function as a 'coordinator-general', which is possible only if he has acquired inter-disciplinary skills. The author has rightly emphasised that what is needed in India is "a changed attitude to the role of the manager in an industrial undertaking which accords with the increasing complexity of the structure of modern industry". This study aims at highlighting some of the issues in marketing and industrial management that have to be faced in India in the present context of its development.

The author begins by emphasising the importance of work study. According to him, in a wider perspective, industrial research and market research are the two familiar techniques of enhancing producti-

vity. The former depends upon science, technology and innovation, while the latter is concerned with the study of consumer needs. In fact 'work study' may be defined as "the systematic objective and critical examination of all the factors governing the operational efficiency on any specified activity in order to effect improvement". The author has discussed various aspects such as managerial audit, productivity analysis, wage-setting, product-diversification, product research analysis, brand-preference study analysis, marketing research analysis, sales organisation analysis, sales forecasting and dozens of other allied topics.

When one completes the reading of the book, one is left completely frustrated. The common feature of most of the books, on industrial management and marketing is that the analysis hardly seems to have any strong theoretical foundations, making the analysis highly superficial and shallow. Though the author has something useful to say, one notices that there is hardly any co-ordination and integration among scores of topics which the author attempts to analyse. What he has done is to present a few pieces and bits based more on common sense than on any formal theoretical analysis. Indian publications on commercial subjects will have to raise their plane of analysis, if they are to command respect of their readers.

INDIAN PRESS

The Indian Press Profession to Industry has its origin in individual surveys conducted by Arun Bhattacharjee since 1969. Since the Press in India has earned the sobriquet of "Jute Press", "Monopoly Press" and the like, one is interested to know about the real state of affairs about the Indian Press.

The book is divided into three major sections. The first section is concerned with the 'Freedom of the Press'. This section discusses such important topics as 'Pressures on Mass Media', "Is State Finance to Newspapers Compatible with the Freedom Concept?" and "Newsprint Crisis and Growth of the Press."

Under freedom of the press, the author has analysed pressures of law, such as common law restrictions, professional secrecy, incitement to disorder, obscenity and so on. The author has also referred briefly to prevailing conditions in this respect in some other countries such as UK, USSR, China, East Germany and Yugoslavia. The author then proceeds to analyse "Economic and Political Pressures" such as subsidies, graft, allocation of

newsprint, government advertisement, price-page schedule, finance corporation, trade unions, political pressures, violence and some other direct pressures by the government. And there are pressures on news agencies.

The consequence is that freedom of the press is constantly faced with the possibility of intervention by the state. By claiming that it is necessary to prevent the diffusion of false or distorted news, to prohibit propaganda subversive of public order or the existing system of government to protect and maintain high moral standards, to uphold religion and punish blasphemy and so on, the state can and often does intervene and impede publication of information and opinions. It only means that no constitutional or legal provisions as such can guarantee freedom of the press and information, unless society recognises that the best government is that which allows citizens to form and express their own opinions on all matters, including the government.

anti-trust laws

Is state finance to newspapers compatible with the freedom of the Press? The author asks why the growing monopoly of the press should not be controlled by direct anti-trust or anti-monopoly laws instead of by indirect method of financing small papers which would support the party in power? And it is doubtful, according to the author, if it could check the growth of monopoly. Again, if the purpose is to create a small but powerful voice in the semi-urban and rural areas in support of government by such governmental financial assistance, then also it is rather "an unwise attempt as only two per cent of newspapers reach the villages." The author opines that the scheme of government's financial assistance to newspapers, taking all factors into consideration, is hardly commendable.

As regards production handicaps, with general literacy reaching 30 per cent mark which should lead to a greater demand for newspapers and consequently newsprint, the situation in India in regard to newsprint is more dismal than before. India continues to import a substantial part of newsprint and there has been hardly any planning in this vital sector during the last twenty years, various attempts made being either half-hearted or thoroughly inadequate.

The second section analyses various issues regarding "News Agencies". The author is of the opinion that "a co-operative, non-profit-making agency subscribed

D. R. GADGIL

The Industrial Evolution of India in Recent Times 1860-1939

Fifth edition

The fifth edition of D. R. Gadgil's well-known book carries the history of India's industrialization up to the beginning of the second world war. The revision has taken the form of rewriting the account of the entire period after 1914.

and supported by the press in any country is usually the best form." In India most of the news agencies are afraid that government may force them into corporations to make them answerable to the government and Parliament. The author has analysed the organisation and functions of some important news agencies such as Press Trust of India, United News of India, Samachar Bharati and Hindustan Samachar in India and some foreign news agencies such as Associated Press, United Press International and Reuters Ltd. He opines that it is most unfortunate that "during the last hundred years, despite the tremendous development of the Press throughout the world, the number of world news agencies remained almost the same." There are just five world news agencies which are controlling or supplying news to the mass media.

The final section analyses "Progress Towards self-sufficiency". We note here that during the last ten years considerable development has taken place in the country in the fabrication of plant and equipment for pulp and paper machinery. At present, almost the entire pulp plant, recovery system, boilers, turbines, water supply, most of the electric equipment, pumps and instruments can be fabricated in the country, whereas before the third Plan almost all these had to be imported. However in the case of paper machinery, the position is not equally good. There will have to be more planning to fill some of the gaps that still remain in this sphere.

Though free press is an important and vital aspect of democracy, an average citizen knows very little about its organisation and functioning. This book by Arun Bhattacharjee giving all the essential details of the industry not only in India but to some extent in other countries also, is therefore, extremely welcome by all those who value Freedom of the Press.

PROFILE OF SALE

The volume of retail trade is vast, ranging generally between 30 per cent and 50 per cent of the gross national product of a country. Any one entering retail trading should therefore have an eye on the volume to be covered not only for the purpose of economic viability under business considerations but also to cause the needed demonstration effect with a view to rationalising the retail trade as a whole. Unless accompanied by a clear-cut and well defined objective with the necessary wherewithal, know-how and capital, a retail shop may remain a backward, unpro-

gressive and little known business entity.

In *Sale — A Profile* the authors, besides dealing with the aspects of location, assortment, pricing, selling systems, layout, location of goods, display, and salesmanship which are all basic to a retail establishment, deals with more important though less practised aspects of a retail trading such as conducting a feasibility study, sales promotion through sales budgeting and sales planning. The authors have dealt in a lucid manner with various selling techniques like silent selling (by window display), clearance sales etc. The authors have also discussed the problems of staff training, customer relations and shop hygiene.

Retail trading which occupies an extremely important place in the nation's economy and in the lives of millions of people remains one of the most neglected subjects in all countries and has received hardly any attention from analysts. Even big departmental stores and

cooperative retail establishments have hardly looked at these various aspects of retail trading in a scientific way. Though in this book the authors have analysed the various issues mainly having co-operative retail trading in view, their analysis will be found useful by all retail traders, big and small, in developed and developing countries. Without bringing in irrelevant theoretical sophistication which is the practice of many authors dealing with such subjects the authors have dealt with the various issues relating to retail trading in a lucid and lively style so as to be easily understood and appreciated by most of the retail traders who often do not possess high theoretical knowledge and analytical ability. Though some aspects of retail trading lend themselves to theoretical analysis and generalisations, it is essentially an art and the authors have done well to treat it as such and without high theoretical pretensions, with the consequence that the book has become extremely readable and useful to retail traders as also purchasers.

TRADE WINDS

UNCTAD III

THE SIX-WEEK session of UNCTAD III started in Santiago (Chile) on April 13. Earlier two meetings of this UN organisation were held in Geneva (1964) and New Delhi (1968). The basic aim of the organisation is to ensure an equitable system of international trade so as promote the economic development of poor countries.

High hopes were generated when UNCTAD came into being but the developments in the past eight years have caused widespread disappointment among the developing countries. Mr L.N. Mishra, India's Foreign Trade Minister gave expression to the frustration prevailing among backward countries of the world because of the rigid attitudes of the advanced countries. He urged that the existing system should be so re-fashioned that "international economic co-operation becomes binding and that assistance to developing countries is not based on an appeal to the charity of richer nations."

After about two weeks of discussions at Santiago, it appeared that the Third World countries were joining hands to press the adoption of a resolution to bridge swiftly the economic gap between the world's 25 poorest countries and the rest of the developing nations. Included in the list of these countries are: Upper Volta, Botswana, Burundi, Chad, Dahomey, Ethiopia, Guinea, Lesotho, Malawi, Mali, Niger, Tanzania, Rwanda, Somalia, Sudan, Uganda, Afghanistan, Bhutan, Laos, Maldives, Nepal, Western Samoa, Sikkim, Yemen and Haiti. They are selected on the basis of, (a) having per capita income of less than \$100, (b) illiteracy rate at 20 per cent and (c) 10 per cent or less manufacturing rate in the gross domestic product.

Mr Raoul Prebisch, former

UNCTAD Secretary-General, addressed the conference in his personal capacity. He said that it was impossible to "leave the necessities of international commerce to the vicissitudes of gold or dollar production". He appealed to the developing nations to remain united as that was the only means they had of fighting "geocentrism" of the industrial powers.

The European Common Market came in for severe criticism at the conference. The developing countries received considerable support in their fight against the developed countries, from Dr Sicco Mansholt, President of the Executive Commission of the European Common Market. Dr Mansholt said that the terms of trade were becoming unreasonably unfavourable to the poor countries, whose debts—currently around \$60,000 million—were increasing twice as fast as their export earnings. He urged UNCTAD III to produce a resolution setting out the "minimum volume of aid necessary and the limits of aid conditions acceptable to all concerned". Dr Mansholt also called for more international commodity agreements to provide more stable markets and fair prices for producers.

According to Mr Adede Boerma, FAO Director-General, "if richer countries decided to become only two per cent less self-sufficient in agricultural products, poorer countries could gain \$4,000 million worth of exports a year." The market sharing, according to him, did not in any way imply that rich countries would be tied to buying commodities, the demand for which was declining. "If a part of the money now being spent in richer countries on research into substitutes were spent on agriculture in developing countries, results for the latter could be spectacular" he added.

As was expected Mr Chou Huaming, Vice-Minister of

Foreign Trade and head of the Chinese delegation, accused the USA of pursuing a policy of "economic expansion, plunder and profiteering". He said: "they force down prices of raw materials, occupy commodity markets, monopolise monetary affairs, expand the export of capital and plunder the resources and wealth of other countries". Mr Huang set his country firmly behind the demands of the so-called Group of 77 whose members now total 96.

The Soviet delegation did not relish its being clubbed with other non-socialist rich countries in the exploitation of the poor countries of the world. Mr N.S. Patolichev, the Soviet Minister for Foreign Trade, criticised those members of the "Group of 77" who did not differentiate between socialist and developed capitalist countries and referred to them as "one general group of the rich north". Mr Patolichev said, that the USSR had co-operated in building 490 industrial projects and that 500 more would be constructed during the years of the current five-year plan ending in 1975. He further said that the Soviet Union would furnish to the developing countries long-term credits at a low interest rate, with the settlement of these credits being done as a rule through the deliveries of traditional export products of developing countries.

UNCTAD has not been a total failure as alleged by some critics. In regard to tariff preferences some progress has been made. The establishment of a Generalised System of Tariff Preferences in the rich countries for the manufactured goods of developing countries is no small achievement. The scheme differs from country to country. The USA and Canada have still to finalise their schemes but others have certainly gone ahead with it. The countries which have already derived benefits from these schemes are Hong Kong, Yugoslavia, South

Korea, Singapore, Brazil, Mexico and to a certain extent India. After tariff preferences, the developing countries anticipate concessions in regard to shipping and freight rates and in the transfer of technology.

A challenging speech was made by Mr Robert S. McNamara who asked the developed countries to take steps for the reduction of inequalities which existed between the rich and the poor countries. He said: "Our clear duty for the remainder of this decade is to face up to mass poverty for what it really is, determine its dimensions, locate its whereabouts, set a limit beneath which we will not accept its continuance, and make our first priority a threshold of human dignity and decency which is achievable within a generation."

Included in the Indian delegation as a member is Mr C.P. Srivastava, Chairman of the Shipping Corporation of India who earned the honour of presiding over a session of the UNCTAD committee on shipping and other invisibles after his election as president of the committee at the current session of UNCTAD.

Asian Development Bank

The report of the Asian Development Bank for 1971 states that loan approvals during the year rose to \$ 254 million, about 40 per cent of loan approvals since the first loan was made in January 1968. For the bank itself, the outstanding event of the year was the decision by the Board of Governors to increase the authorised capital stock by 150 per cent from \$ 1,100 million to \$ 2,750 million. The addition in capital will permit the bank's lending operations to grow by more than 10 per cent per annum over the next four years without damage to its liquidity position or over dependence on borrowing.

The loans approved during the year were spread over 13 countries including the territory of Papua and New Guinea which received its first loan

from the bank. Electric power development absorbed the largest portion of the bank's lending during the year, followed by industry, including indirect lending through industrial development banks; transport and communications; water supply; and agriculture in that order.

A feature of importance in the context of the difficult debt-servicing problem of many regional developing member countries was the growing share of concessional lending from special funds resources in the bank's operations. Special operations in 1971 accounted for 12 out of the total 28 loans approved compared with 10 out of the total of 32 loans in 1970. Of the 13 countries which were active borrowers in 1971, eight received concessional loans totalling \$51.5 million. These eight countries were Ceylon, Indonesia, Laos, Nepal, the Philippines, territory of Papua and New Guinea, Republic of Vietnam and Western Samoa. In the case of one project—for a fisheries port in the Philippines—ordinary and special funds loans were blended.

Cumulative loan approvals at the end of 1971 stood at 85 loans totalling \$638.5 million, comprising 57 loans for \$531.3 million from ordinary capital resources and 28 loans for \$107.2 million from special funds resources. Loans to industry, both direct and through industrial development banks, had the largest share with 32 per cent; electric power accounted for 23.7 per cent; transport and communications 21.4 per cent; agriculture 14.4 per cent; water supply 8 per cent; and education—less than one per cent.

As the bank's lending covers only the foreign exchange cost of the various projects, the total development effort assisted by the bank far exceeds the amount of bank financing. It is estimated that the total cost of projects directly financed by the bank in 1971 was \$514 million, the bank's loans representing about 41 per cent.

Apart from its primary task of providing loan funds for

development, the bank continued to provide technical assistance for project preparation and implementation, sectoral studies, policy formulation and institution building. Excluding regional activities, 15 technical assistance projects totalling \$ 1.5 million were approved during 1971. These covered such economic activities as rural development, irrigation, crop plantation, timber marketing, a fisheries port, chemicals, power supply and road work, bridge and port studies. About 80 per cent of the technical assistance commitments entered into in 1971 was for project preparation. Such technical assistance normally leads to "bankable" projects and constitutes an important source of projects in the pipeline.

The year 1971 also saw a welcome number of additional contributions to the Technical Assistance Special Fund. Four countries—Austria, Ceylon, the Republic of China and the Republic of Korea—contributed for the first time to the Fund and another five countries—India, Japan, the Netherlands, the Federal Republic of Germany and the United Kingdom—made additional contributions or extended arrangements for contributions made in previous years.

During the year, the bank raised the equivalent of \$121.7 million by means of public issues in Austria, Belgium, Japan, Switzerland and the United States, and a private issue placed in 12 regional member countries. Aggregate borrowings reached the equivalent of \$ 160 million at the end of 1971. At the end of 1971 total subscriptions to the authorised capital stock of the bank stood at \$ 1005.38 million. The territory of Papua and New Guinea became the thirty-sixth member of the bank on April 8, 1971, subscribing \$ 1.38 million to the bank's capital.

Total subscription in convertible currencies paid amounted to the equivalent of \$246.7 million. Total subscription in members' own currencies, or in the form of promissory notes,

amounted to the equivalent of \$246.7 million of the amount of subscription paid in the members' own currencies, convertible currency funds amounted to the equivalent of \$169.1 million. At the end of the year the bank's investments of convertible currency funds held were invested in 18 currencies and amounted to the equivalent of \$363 million, of which 24 per cent was held in government securities or government-guaranteed obligations of member countries and 76 per cent in time deposits or certificates of deposit of banks in member countries and with the Bank for International Settlements.

ADB and Soft Loans

Addressing the fifth annual meeting of the Board of Governors of the Asian Development Bank at Vienna on April 21, the Finance Minister, Mr Y. B. Chavan, welcomed the opportunity for the bank to hold its annual meeting outside the Asian region. Mr Chavan advocated that the level of ordinary lending of the bank should be maintained and not increased significantly during the next few years as it would not be advisable to add to the debt burden of Asian countries with a large volume of loans on commercial terms. It would also be damaging for the image of the bank if its activities continued to get concentrated in a few countries whose needs were by no means the most pressing. If the Asian Bank developed primarily as a sort of middle-man to mobilise the resources of the capital markets of the world for the benefit, primarily of those Asian countries which could afford to borrow on commercial terms, there would be little justification for so many of the Asian countries' representatives to gather annually to discuss its affairs.

The major task for all those who are associated with the bank should be to increase the proportion of the soft loans, said Mr Chavan. He further said that when soft loan resources were scarce and indeed

meagre, they should not be used for countries which were relatively better-off. The only criterion for eligibility for soft loans was the economic condition of the country concerned, he added.

Last year, India had contributed Rs 300,000 to the Technical Assistance Fund. The contribution has been substantially utilised and India is now prepared to offer a further contribution of Rs 400,000 to the same fund. Like the earlier contribution, this sum can also be utilised for expenditure on Indian personnel and services, irrespective of whether such expenditure was in rupees or other currencies.

The developed countries had declared in the DAC meeting in Tokyo in September 1970 and the OECD ministerial meeting in June 1971 that they would untie their future contributions to multilateral financial institutions. The contributions to multilateral financial institutions had always been taken to cover both general funds, including soft funds, as well as those for technical assistance. Apparently, suggestions were now being made that the declarations did not cover the field of technical assistance. "This is very disappointing; and I hope such distinctions will not be pressed", added Mr Chavan.

Referring to the long-term monetary reforms, Mr Chavan urged the ADB to raise its voice where the vital interests of the members were concerned. In matters like the link between the SDRs and development finance or the safeguarding of the value of the reserves of the developing member countries, the ADB should be more vigilant. Mr Chavan urged economy in the administration of the ADB. He said that more effort had to be made to ensure economies bearing in mind the particular context of the Asian region.

Rajasthan Budget

Rajasthan's budget for 1972-73 presented to the state Legislative Assembly on April 26, by the Finance Minis-

ter, Mr Chandannal Baid, showed an overall deficit of Rs 27.94 crores. Tax proposals would yield Rs 4 crores. Mr Baid announced an increase in sales tax on gems and stones, country liquor, beer and other intoxicants, cereals and pulses and chemical fertilisers and withdrawal of concessions on central sales tax on hand-made soaps. This was expected to yield Rs 2.43 crores.

Increases in motor vehicles tax and irrigation rates were expected to yield Rs 75 lakhs and Rs 80 lakhs respectively. The increase in excise duty on methanol would yield Rs 2 lakhs. Mr Baid hoped that the deficit would be covered through special accommodation from the centre and also by the state's share in the centre's efforts for additional resources mobilisation for the current year. The Finance Minister proposed reduction in sales tax on barley from two per cent to one per cent.

Mr Baid said revenue receipts are estimated at Rs 211.51 crores and expenditure at Rs 228.33 crores leaving a deficit of Rs 16.82 crores on revenue account. Capital receipts are estimated at Rs 84.62 crores and capital expenditure at Rs 99.04 crores leaving a deficit of Rs 14.42 crores. The minister announced additional Plan expenditure for opening 1,000 new schools and upgrading another 1,000 schools, provision of drinking water faucets in backward areas and supply of medicines totalling Rs 70 lakhs.

The increase in levies would reduce the overall deficit from Rs 31.24 crores to Rs 27.24 crores. Taking into account the additional Plan expenditure of Rs 70 lakhs the net overall deficit comes to Rs 27.94 crores.

Mr Baid declared that the state government intended to introduce a bill in the current session to bring the ceiling on agricultural land to the level recommended by the Central Land Reforms Committee. Another bill, imposing a ceiling on urban property would

also be introduced in the current session.

Speaking about the difficult financial position of the state, the Finance Minister said that there was an overall overdraft of Rs 89.82 crores. To this must be added the adjustments yet to be carried out relating to previous years' accounts. Over and above the carry-over deficits of previous years and an anticipated deficit of Rs 31.24 crores is to be taken into consideration. He said that these chronic budgetary deficits must be viewed in the background of the total debt burden of the state, which stood at Rs 643.16 crores on March 31, 1972. A provision had been made in the budget estimates for liquidating 15 per cent of the assessed overdraft.

The problem in the state was really acute and staggering compared with other states. "Our debt burden is considerably higher in relation to our population and resources which will be evident from the fact that debt servicing liability alone would amount to Rs 95.96 crores, of which Rs 41.90 crores would be by way of payment of interest alone". He, therefore, demanded that the centre should appoint a national debt commission without delay to study the problem of indebtedness of states and suggest ways for scaling down this burden.

Export Output Plan

According to Mr A. C. George, Deputy Minister for Foreign Trade, 12 inter-ministerial groups have been set up to draw up concrete export production plans in respect of some specific commodity groups and to implement those plans. The terms of reference of all the working groups are: (1) Pinpoint specific products with export potential within the group; (2) review existing capacity and production including export production; (3) build export elements; (4) identify gaps in existing capacity in regard to ranges, specifications, quality and deficiency in quantity; (5) plan at the micro

level for diversification, expansion and creation of capacity with export component; (6) overseas provision of production inputs and piloting of individual cases through a production control system (industrial licensing, capital goods licensing and foreign collaboration) both for generating new production and for continuing existing production; (7) develop information, reporting and reviewing systems for discharging the above functions. The groups which are being studied are as follows: Group A: Pig iron, mild steel tools, alloy and special steel; Group B: electronic equipment and components; Group C: (i) aluminium metal, (ii) petrochemicals and derivatives thereof, integrated petrochemical complexes, dyes and intermediates, drugs and pharmaceuticals, (iii) plastic resins and manufactures. Group D: metallurgical equipment, small and cutting tools, hand tools, metal cutting machines, metal forming machines, chemical and fertiliser plants; Group E: automobile ancillaries; Group F: (i) ferrous castings and forgings, structural steel fabrications, (ii) aluminium metal manufactures; Group G: sewing machines and bicycle components; Group H: processed foods, marine products, canned fruits and vegetables; Group I: leather and leather products, rubber manufactures including tyres and tubes; Group J: other selected products in the small sector.

M RTP Commission

Under the provisions of the MRT P Act, the number of members of the Commission should be not less than three and not more than nine. On the initial constitution of the commission, a start was made with the statutory minimum of three, comprising the chairman and two members.

As in the case of judicial pronouncements, where there are differences of view among members of the Commission, the opinion of the majority is taken as the Commission's opinion. That is why the MRT P

Act provides for an odd number of members in the minimum and maximum strength prescribed for the Commission. With only three members now, even if one of them were to be absent, owing to illness or leave or for other reasons, the progress of work of the Commission will be affected.

So far, the government has sought the opinion of the Commission on a few cases relating to substantial expansion, setting up of new undertakings, mergers, amalgamations or take-over, under Sections 21, 22 and 23 of the MRT P Act, which were considered by it to be important or significant. In view of the present limited strength and detailed procedures involved in the inquiries, the Commission has not been able to dispose of all of them or to set up benches as provided for in the Act. Unless its strength is increased, the Commission may find it difficult to cope with the work when more references are made not only under these sections but also under Section 31 relating to monopolistic trade practices. That is why the government is examining the question of increasing the number of members of the Commission.

Licensing Policy Criticised

The Estimates Committee of Parliament has suggested that the industrial licensing policy and procedures should be "clear and unambiguous" and should generally hold good for a reasonably long time. It has recommended that the policy should be for a minimum duration of five years, coinciding with the five-year Plan, "so that industry can have a span of assured development along predetermined lines for sustained growth of production."

In its 19th report, submitted to the Lok Sabha recently by its Chairman, Mr Kamal Nath Tewari, the committee noted that the industrial licensing policy had in the past been changing rather frequently and

this "has had an unsettling effect on industry". The committee has recommended that the government should formulate and announce the licensing policy for the fifth Plan period well before the Plan begins so as to attract the most competitive applications for the issue of industrial licences on merit.

The committee has been critical of the licensing policy and procedures on several accounts. It has stated, for instance, that if the government had taken corrective steps in good time in respect of under-utilisation of industrial capacity, the country might have been saved the recent decline in the growth rate of production in the organised sector and shortages developing in certain categories of goods. It regrets that the government should have waited for corrective action until the growth rate declined to a "distressingly low level" even though the fact of considerable under-utilisation of industrial capacity at the beginning of the fourth Plan was pointed out in the Plan itself.

Referring to the policy of capacity restraints, the committee expressed the view that the new policy of freeing industrial licensing from the limitations of assessed demand and indicative production targets given in the Plan might be justified as a short-term measure to tide over current shortages of goods but in the long run, this policy is fraught with danger in as much as it would generate undue pressure on scarce resources and may well lead to excess capacity.

Bonus Act to be Reviewed

The government recently announced the appointment of an eight-member committee, including representatives of employers and major trade unions, to recommend, among other things, the level of minimum bonus. The committee, headed by Dr. B. K. Madan, will review the operation of the Payment of Bonus Act and suggest suitable modifications to the

scheme outlined in it. Besides the chairman, the committee includes Mr N. S. Bhat, Mr Harish Mahindra, Mr R. P. Billimoria, Mr G. R. Ramanujam (INTUC), Mr Satish Loomba (AITUC), Mr Mahesh Desai (HMS) and Mr S. D. Punekar.

The committee will recommend whether establishments (other than factories employing less than 20 workers) may be covered by the Bonus Act and if so, up to what limit of employment. Further, it will suggest whether there should be any separate formula for payment of bonus in small establishments, whether the ceiling on payment of bonus requires any alterations and whether the bonus should be linked with production or productivity. The committee will also make a careful assessment of the impact of its recommendations on the national economy before finalising them. Its headquarters will be in Bombay in the Department of Industries and Labour of the government of Maharashtra.

Punj Delegation

The Engineering Export Promotion Council's delegation under the leadership of Mr V. P. Punj, which returned to New Delhi, a few days ago, after a fortnight's tour of Malaysia, Indonesia and Thailand, told newsmen recently that Malaysia offered great opportunities for the supply from India of sugar mill machinery, power station equipment including structural fabrications, instrumentation, transmission line towers, cables, etc. In the field of power station equipment, including boilers and transformers, the quality of Indian products has been found to be comparable to the equipment exported by Japan and other developed countries. Some of the public undertakings in Malaysia have expressed their full satisfaction not only with the quality and performance of Indian equipment but also with the business dealings of Indian suppliers. The thermal power station at Port Dickson which took boilers from

Bharat Heavy Electricals Ltd, Trichi, has placed orders for complete structurals on Texmaco, Calcutta, and for complete instrumentation on Instrumentation Ltd, Kota. Malaysia is also expected to place sizeable orders for machinery, structurals, etc., on Indian suppliers for the setting up of a 2,500 tonnes crushing capacity per day sugar mill. It has as well, shown interest in India collaborating with Malaysian nationals in setting up such small-scale ventures as agricultural implements, farm tools and bicycles, at an industrial estate set up in one of the Malaysian states.

In Indonesia, the delegation discovered promising scope for the supply of sugar mill machinery and stores. Most of the sugar mills there need rehabilitation and modernisation. The Indian sugar mill technology is considered at a par and in some cases even better than that of the developed countries. The modernisation of sugar mills in Indonesia, estimated to cost \$ 100 million, is to be assisted by world financial institutions and the United States. India can well participate in modernisation programme of the Indonesian sugar industry. The delegation feels that there is good scope for India collaborating with the foundry, bicycles and airconditioning industries in Indonesia.

Thailand, the delegation said, was already importing a wide range of engineering goods from India, valued at roughly Rs 3 crores. Contacts were established by the delegation with the public undertakings in Thailand, which were buying equipment for power generation, irrigation etc., and organisations interested in industrial development. Thailand, the delegation feels, also offers sizeable scope for the expansion of our engineering goods export.

The markets of Malaysia, Indonesia and Thailand being highly competitive, they are very quality conscious. The delegation stressed the need for discipline in our manufacturing industries and the introduc-

tion of stage-to-stage inspection system, besides the final stage inspection.

ADB's Bond Issue in Japan

The Asian Development Bank announced on April 19, its third Japanese yen bond issue in the aggregate amount of Yen 10 billion (equivalent at current rates to approximately US \$32.5 million). The bonds known as Japanese Yen Bonds bearing 7.3 per cent interest and having ten-year maturity period, will be issued at par. The bonds are redeemable at par in four annual instalments of Japanese Yen 600 million each, payable on May 6 in each of the years 1978 through 1981, and the final instalment of Japanese Yen 7,600 million is payable on May 6, 1982. This brings the average life of the bonds to 9.4 years.

Names in the News

Mr R. Doraiswamy, Director General of Shipping, has retired from the office. He has handed over charge to Mr Y.S. Kasbekar, Deputy Director General of Shipping. Mr Doraiswamy who was to retire in March 1972, was asked by the union government to continue in office for some time more. He was the secretary of the Reconstruction Policy Subcommittee on Shipping constituted at the dawn of Independence.

The following were elected the office bearers of the Public Relations Society of India, Delhi Chapter, at its annual meeting:

1. Chairman: Mr K. R. Singh (IBM); 2. Vice-chairman: Mr Baldeo Sahai (Fertilizer Corporation of India); 3. Secretary: Mr R. P. Agarwala (Eastern Economist); 4. Treasurer: Mr J.S. Jogi (Deccan Herald).

Mr S. P. Mukherjee, Jute Commissioner relinquished his office on April 19 to take up his new assignment as Lt. Governor of Mizoram. The successor to Mr Mukherjee has not yet been named.

COMPANY AFFAIRS

Vijaya Bank

IN HIS annual address to the shareholders of Vijaya Bank Ltd the Chairman Mr Mulki Sunder Ram Shetty presented a graphic picture of the phenomenal progress made by the bank during 1971 and the energetic steps that are being taken to streamline the administration to cope with the changing needs, conditions and requirements. The bank is planning to start a department for management development, the purpose being to fill managerial, executive and other responsible posts with well-trained staff.

The year 1971 was a year of formidable challenges and creditable achievements for the bank. Deposits in 1971 for instance shot up to Rs 43.64 crores registering an impressive increase of 58 per cent over 1970, probably the highest among banks in the country. It is gratifying to hear from the chairman that this momentum has been maintained for three successive years, a record performance indeed of which any bank can boast of. Gross earnings, on the other hand, jumped by about 53 per cent and net profit by nearly 75 per cent while advances leaped by 47 per cent to Rs 25.84 crores with the average credit-deposit ratio in 1971 standing as high as 63.35 per cent. The bank at present is having a network of 150 branches all over the country as against just 21 branches in 1961.

The target for the current year is pitched high at 200 branches. It is encouraging to find that 75 per cent of the bank's branches are functioning in rural and semi-urban areas while 25 per cent of them are in urban and metropolitan areas. The bank has recently opened a foreign exchange department to deal on all foreign currencies and is at present conducting foreign exchange operations from seven

centres viz. Bangalore, Mangalore, Bombay, Madras, Cochin, Delhi and Hyderabad.

Bank of Baroda

Bank of Baroda's multi-service agency branch, providing a range of services to a spectrum of self-employed small borrowers was inaugurated recently in Bombay. The agency, described as the first of its kind in India, will provide integrated financial assistance as well as package of technical services such as procurement of raw materials, management of business and marketing of products. Finance is to be provided at a concessional rate of four per cent—two per cent below the Bank Rate—to certain "approved" categories of small borrowers. Apart from the concessional rate of interest easy repayment schedule will be worked out with due regard to the specific needs of various kinds of borrowers. The maximum loan to be disbursed under the scheme is fixed at Rs 50,000 while the minimum could be as low as Rs 150, depending upon the requirements of the borrowers and the nature of their problems.

To start with, the activities of the multi-service agency will be restricted to Bombay City and will gradually be extended to other centres such as Delhi, Kanpur, Ahmedabad and districts where the Bank of Baroda has been assigned the 'Lead Bank' role. Currently the bank had prepared schemes for 19 categories of self-employed borrowers.

National & Grindlays

In his annual statement Lord Aldington, Chairman of National and Grindlays Bank Ltd, has made a synoptic and an illuminating survey of the group's world-wide business activities. Adverting to India the chairman was happy to report that the bank's business

in India and with India during 1971 was not only well run but maintained as well. The Bank's deposits continued to maintain its rising trend. During the year a good number of additional sterling loan proposals to assist industrial development and commercial operations were considered but the schemes could not be finalised for a variety of reasons. The Merchant Banking Division is playing its useful role in advising a large number of top class industrial concerns and it has completed during the year several export finance arrangements while many others are under active consideration.

The year 1971, according to the chairman, proved to be a year of considerable consolidation within the Organisation throughout the gulf. In Far East the Dao Heng Bank in Hong Kong had a splendid year while in Europe, Banque Grindlay Ottomane S.A., reported marked expansion in its business. The sterling lending business of the bank in UK recorded satisfactory growth while its Eurocurrency operations continued at a high level.

The bank has reported encouraging working results during 1971. Its capital and reserves, including loan stock, was higher at £53 m. as against £50 m. in 1970 while shareholders' funds increased by £0.5 m to £38.6 m. Deposits stood at £884 m. and advances at £ 476 m. — the amounts being at the 1970 rate of exchange—as against £817 m. and £478 m. respectively in 1970. The consolidated profit after tax before exceptional items in 1971 moved up to £4,161,000 recording a handsome rise of £1,213,000 over the preceding year.

Blue Star

The directors of Blue Star Ltd have proposed to maintain the equity dividend for 1971

at 12 per cent on a higher capital resulting from the one-for-four rights issue.

With a smart rise in sales by about 15 per cent from Rs 8.39 crores to Rs 9.68 crores, the gross profit has advanced significantly by about 40 per cent from Rs 30.22 lakhs to Rs 42.42 lakhs. Out of the gross profit a sum of Rs 4.78 lakhs was appropriated to depreciation reserve as against Rs 3.88 lakhs in 1970 while the amount set aside to development rebate reserve was reduced by Rs 13,654 to Rs 64,511. Taxation claimed Rs 23.30 lakhs in 1971 as against Rs 14.94 lakhs in the preceding year. After adjustments a sum of Rs 13.93 lakhs was transferred to general reserve as compared to Rs 10.80 lakhs in the previous year. The proposed dividend will be paid out of the general reserve and it will absorb Rs 9.23 lakhs, Rs 1.70 lakhs more than in 1970.

News and Notes

Expansion and Diversification :

Estrela Batteries Ltd—the second largest manufacturer of dry batteries in the country—plans to expand its activities in a big way. Apart from its existing factory at Bombay the company intends to set up a new unit in Gujarat at a cost of Rs 4 crores. When in full production, the factory will be producing 125 million cells and the turnover is expected to be of the order of Rs 10 crores. The plant will be on stream by 1975.

The company which started manufacturing batteries in 1939 is now producing batteries worth Rs 7 crores annually. For the past 10 years it had technical collaboration with France's foremost battery maker, La Pile Leclanche, which ends in 1973.

Motor Industries Co Ltd—MICO—is embarking upon an ambitious expansion programme. While a part of the expansion will be carried out

in Bangalore, a new factory will be set up at Nasik to implement its other manufacturing schemes. The capacity for the production of all items except nozzles and nozzle-holders will be substantially increased in Bangalore, while the production of nozzles and nozzle-holders will be taken up at Nasik in order to achieve economies of scale in operations both at Bangalore and Nasik. The additional machinery and equipment required for expansion will cost about Rs 13.8 crores. The new investment in Bangalore will be about Rs 2.9 crores.

Baroda Rayon Corporation has received a letter of intent for increasing the rayon production capacity from 3000 tonnes to 6380 tonnes per annum. It has submitted the necessary collaboration proposals for consideration and approval of the government and the government's reply is awaited. The company has also received a letter of intent for putting up a soda ash plant with a capacity of 1.44 lakh tonnes per annum. It is also expecting to receive letters of intent for setting up a cellophane paper plant as well as for nylon tyre cord plant.

Ceat Tyres of India Ltd has completed substantial expansion of its tyre plant and it is operating at full capacity since the last quarter of 1971. It is now going ahead with the project for the setting up of a bicycle tyre plant at Nasik. The plant is expected to be commissioned by the last quarter of 1972. Meanwhile the company has applied to the government for an industrial licence for a tyre and tubes plant to be located in an underdeveloped area. The capacity of the plant will be four lakh automotive tyres and tubes a year. The application is under the consideration of the government.

Aruna Sugars Ltd has embarked on an expansion scheme for increasing the crushing capacity to 3000 tonnes daily from the existing level of 2000 tonnes per day. The expansion scheme is expected to cost

about Rs 97 lakhs and it will be financed by raising loans to the tune of Rs 80 lakhs from financial institutions, while about Rs 17 lakhs will be made available from internal sources. When the expansion is completed the factory will be able to crush about 4.5 lakh tonnes of sugarcane as against 2.7 lakh tonnes expected to be crushed this year. The current year's working results are so far satisfactory due to higher rate of crushing and with better recovery. It is hoped that with the increased crushing rate of 3000 tonnes per day and with a total crush of about 4.5 lakh tonnes the company's prospects next year are expected to be quite encouraging. With 3000 tonnes crushing capacity Aruna sugars—it is claimed—will be the factory having the highest crushing capacity in Tamil Nadu.

New Ventures

Manubhai Sons & Co is entering the field of printing machinery manufacture to produce offset rotaries, letter press rotaries and other types of machinery. It has signed a collaboration agreement with Veb Polygraph Leipzig of GDR to manufacture these types of machinery. A new company styled Maschinenfabrik Polygraph (India) Ltd has been formed and the factory will be located at Kolhapur. Production is expected to commence in 1974.

Jesons Electronics a new company incorporated in Delhi, is setting up a project at Ghaziabad, UP, to manufacture 60 million dry batteries annually. Financial and technical collaboration will be provided by Yai Dry Battery Company of Japan. The capital outlay on the project is estimated at Rs 185 lakhs including the foreign exchange component of Rs 44.25 lakhs.

National Machinery Manufacturers is embarking on a new venture for manufacture of machinery for synthetic fibres. Ready-made plant has been acquired from Hindustan Glass Works and Navin Glass Works. Machinery has started arriv-

ing at the factory site at Baroda and production is expected to commence by June this year. On achieving full production, the turnover is expected to be of the order of Rs 5.5 crores. The company also proposes to manufacture at this plant hydraulic infinitely variable motors and gear boxes. At its existing factory at Thana it has spent in 1971 Rs 18 lakhs in replacement and renovation and proposes to spend a crore of rupees in the next few years. It has plans to manufacture machinery for jute industry, for heavy duty canvass and for weaving cordroys. The turnover by 1975 is expected to rise to about Rs 18 crores, including about Rs 6 crores at Baroda.

Joint Ventures

Tabaldi, a government-owned engineering corporation in Sudan has approached Standard Batteries for its assistance for putting up a battery manufacturing unit in that country. Till the time the unit is set up in Sudan, battery components like plates, separators, hard rubber containers and other equipment for assembling 50,000 batteries per year will be exported by Standard Batteries to Sudan. The order valued at Rs 45 lakhs was recently secured by the company. Standard Batteries have also bagged an export order from Poland for the supply of 12,000 automotive batteries for 1972.

Mukand Iron has made considerable progress in the implementation of its first joint venture in Malaysia for setting up a steel foundry with a production capacity of 3,000 tonnes per year. While the government's formal sanction is awaited, the company is going ahead full steam with preparations to start production by the end of the current year or in early 1973. Mukand will own 35 to 40 per cent of the capital by supplying the necessary equipment.

New Issues

Atlas Copco (India), a wholly-owned subsidiary of Atlas Copco Aktiebolag, Sweden, will

be offering to the public shortly for subscription 2,89,000 equity shares of Rs 10 each at a premium of Rs 7.50 per share. In addition 32,090 equity shares of Rs 10 each at a premium of Rs 7.50 per share have been reserved for subscription by directors, employees and business associates who are Indian nationals. The issue, which is fully underwritten, is offered to the Indian public with a view to reduce the foreign share-holding to 60 per cent. The proceeds of the issue amounting to Rs 56.23 lakhs will be utilised for financing the future expansion programmes.

The company is manufacturing at its factory near Poona air compressors, rock drillers, pushers, lubrications, grinders and couplings. The company is doing reasonably well and the directors hope that the company will be in a position to declare a dividend of not less than 15 per cent on the increased capital during the current year, the proposed new shares being entitled to a 'pro rata' dividend for the year.

Chemopulp Tissues Ltd, promoted by Electrosteel Castings Ltd, will be offering shortly for public subscription 75,000 equity shares of Rs 10 each and 5,000 (9.5 per cent) redeemable cumulative preference shares of Rs 100 each at par. The entire public issue is underwritten. The company has an authorised capital of Rs 25 lakhs and an issued, subscribed and paid-up capital of Rs 1.51 lakhs. The present issue is for Rs 18.49 lakhs of which equity shares of Rs 5.99 lakhs have been reserved for allotment to directors, their friends and associates.

The company is setting up a project for the manufacture of paper at Ghaziabad, UP, with installed capacity of 4.5 tonnes of MG paper per day. As per the present plans the company intends to produce 1,750 tonnes of tissue paper in different colours for which there is a large unsatisfied demand in the country. It is also esta-

blishing a separate unit for a rag pulp plant to meet a part of the pulp requirements.

Capital and Bonus Issues

Consent has been accorded to six companies to raise capital amounting to over Rs 14.98 crores. Following are the details.

Morris Electronics Private Ltd., Poona, has been given consent, valid for three months, to capitalise Rs 10 lakhs out of its general reserve and issue fully paid equity shares of Rs 100 each as bonus share in the ratio of five bonus shares for every three equity shares held.

The Ahmedabad Mfg. & Calico Printing Co. Ltd., Ahmedabad, is granted consent to capitalise Rs 1202.85 lakhs; Rs 60,75,000 in ordinary shares, Rs 202.50 lakhs in eight per cent convertible bonds of Rs 100 each and Rs 939.60 lakhs in eight per cent redeemable bonds of Rs 116 each to be issued as credited fully paid-up to the shareholders of Bank of India Limited pursuant to the scheme of amalgamation approved by the high courts of Maharashtra and Gujarat. The order is valid for 12 months.

Shri Vasavi Parameswari Permanent Fund Ltd., Karur, has been given permission, valid for three months, to capitalise Rs 39,750 out of its general reserves and issue fully paid equity shares of Rs 25 each as bonus shares in the ratio of one bonus share for every equity share held.

The Standard Mills Co. Ltd., Bombay, is granted consent to capitalise Rs 200 lakhs in the form of 40,000 convertible bonds of Rs 500 each carrying interest at the rate of eight per cent per annum to be offered to the public through a prospectus for cash at par. The bonds will have certain rights attached to them for conver-

sion into equity shares of the company. The proceeds will be utilised for financing a part of the cost of expansion of the company's caustic soda production. The consent is valid for 12 months.

Larsen & Toubro Ltd., Bombay, has been accorded consent valid for 12 months to issue capital of Rs 50 lakhs in the form of equity shares of Rs 100 each to be subscribed privately for cash at par. The proceeds of the issue will be utilised for the promotion of a new company under the name of L. & T. Mcneil Ltd for the manufacture of tyre curing presses and other rubber processing machinery.

Alfred Herbert (India) Private Ltd., Calcutta, has been given consent valid for three months to capitalise Rs 15 lakhs out of its general reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one bonus share for every one equity share held and thereafter to issue further capital of Rs 20 lakhs in equity shares of Rs 10 each for cash at a premium of Rs five per share through prospectus within a period of 12 months. The proceeds of the cash issue will be utilised for providing part finance for a new project at Bangalore for the manufacture of rubber machinery.

Company Meetings

National Rayon Corporation Ltd.; Birla Matushri Sabhagar, 19, Marine Lines, Bombay-20; May 3; 3.30 PM.

Mysore Paper Mills Ltd.; New Hall, Nandi Hotels (P) Ltd, Bangalore-25; May 4; 4 PM.

Killick Nixon Ltd.; Killick House, Home Street, Fort, Bombay-1; May 5; 4 PM.

Gokak Mills Ltd.; Tata Auditorium, Bombay House, 24, Bruce Street, Bombay-1; May 5; 4 PM.

Interim Dividend

Glaxo Laboratories (India) Ltd, has maintained the gross interim dividend at 60P per share for the year ending June 30, 1972.

COMPANY MEETING

The Vijaya Bank Ltd.

Regd. Office: Light House Hill Road, Mangalore-3.
Admn. Office: Race Course Road, Bangalore-1.

Statement by the Chairman Shri Mulki Sunder Ram Shetty

at the 40th Annual General Meeting of the Shareholders
of the Bank held at Mangalore on April 28, 1972

Ladies & Gentlemen,

It is my privilege today to welcome you to the 40th Annual General Meeting of the Bank. Our performance in the period under review has been creditable as will be seen from the figures before you. I take it that you have already read the Balance Sheet and Profit

Early in the year the setting up of a stable government at the centre, with a thumping majority for the ruling group in the general elections to Parliament was the big event in our political scene. Soon started the refugee problem by the influx of evacuees from East Pakistan culminating in a fourteen day war at the end of the

Sri Mulki Sunder Ram Shetty

and Loss Account for the year 1971.

The Economic Scene in 1971

In the year left behind, the political arena in the country was dominant, and replete with events, some of which led the country to the crest of history.

While the war with Pakistan left some small dents in our economy it also built up an image for us in the world of nations, created greater confidence in us and a new spirit to meet the emerging challenges. It must also be said to the glory of the nation that all political parties stood solidly behind the

government throughout this period of crisis.

There were natural calamities like floods and droughts in different states, including a devastating cyclone. The familiar features of inflation, rising costs, labour unrest and unemployment did however have their natural repercussions. The financial burden on our economy increased so heavily that additional taxation had to be resorted to by the government in the middle of the year. The dollar crisis and the consequent stir in the exchange market were dealt with by our government with an alert awareness of the international monetary situation. Exports were kept up and the foreign exchange reserve was satisfactory during the year. As the year progressed the economy showed distinct signs of slackening, with a pronounced slowdown in industrial production, but as a redeeming feature, the production of foodgrains was maintained.

It is against this background that we examine the performance of our Bank, a bank in the private sector working in close competition with the other larger banks spread all over the country.

The Banking System

The year 1971 was a fairly successful year of steady growth for all the banks. The average growth of deposits for all the banks in India together was 20.6% as against 16.4% in 1970. The number of branches increased to 12,985 from 11,184 in the last year. On an average 150 new bank offices per month were opened in 1971. The average population served by a branch of the bank declined to 42,000 in December 1971 from 52,000 in December 1970, and 65,000 in June 1969. The banks met their challenge of deposit mobilisation with added vigour to take the total deposits to Rs. 6,856 crores at the end of the year 1971. The credit needs of the priority sectors continued to get support from all the banks. The total advances of all banks

stood at Rs. 4,966 crores at the end of the year. The credit expansion in the banking system was only 11.5% in 1971 as against 23.1% in 1970. Unlike in 1970, deposits did not lag behind credit in 1971. The average credit deposit ratio was as high as 77.4% in 1971 but the bank borrowings from the Reserve Bank to meet credit needs were less than in the previous year.

The report of the Banking Commission set up in 1969 has already been presented to the Parliament. Further developments in the structure and organisation of banking in the country are awaited, depending on the extent of the government's acceptance of the Commission's recommendations.

Our Bank

The deposits of our Bank stood at Rs. 43.64 crores on December 31, 1971. The increase in deposits was 58% as against the average growth of 20.6% of all the banks. For us three successive years have been record years. To keep up the momentum was a big challenge. To have kept it was a proud achievement.

It is no small pride for us to give you a flash back. Ten years ago in 1961 our deposits stood at only Rs. 1.44 crores. In May 1962 your present Chairman took over as the Honorary Chairman of the Bank. Seven years later, in May 1969 when the Honorary Chairman was appointed as the full-time Chairman and Chief Executive of the Bank, the deposits were below Rs. 15 crores. In a few months, by 1969 December, it was Rs. 18.71 crores, an increase of 42% over 1968. In 1970 it was Rs. 27.52 crores, an increase of 47% over 1969. In 1971, it was Rs. 43.64 crores, an increase of over 58% over 1970, probably the highest among banks in the country. I repeat, it was a record for us. Our advances increased by 47% in 1971 and stood at Rs. 25.84 crores with the average credit deposit ratio in 1971 at 63.35%. As you will see from the

Balance Sheet, our working results were encouraging. Our gross earnings rose by nearly 53% and our net profit by about 75% to enable us to step up our rate of dividend this year to 12%.

We have opened 15 branches in the year 1971, taking the total number of branches to 141 at the end of the year. 75% of our branches are in the rural and semi-urban areas and 25% in urban and metropolitan areas. Today, we have over 150 branches. Our target for the year is 200 branches. Against 21 branches in 1961, you can imagine the long way that we have travelled these 10 years.

Current Year

The potential for further deposit growth through branch expansion still exists. But banks have now to go slow and be more selective in their approach to branch expansion. Unless a village or a town is a really potential centre, the banks should not venture into such places. Wastage of manpower and other resources has to be eliminated. Nevertheless, the Reserve Bank of India has programmed the opening of 5,000 branches, in the next 3 years which should work out at about 140 branches a month. In the face of this proposed massive expansion, to what extent an individual bank in the private sector can grow in the years ahead is a matter of guess. But from the growth achieved in the last few years I am as optimistic as ever. Let us hope for the best. It was not a mere expansion for us in 1971 but more a consolidation of our position, in centres where we had established earlier.

We obtained in the year under report a licence to deal in foreign exchange. We have opened a Foreign Exchange Department in our Bank to deal in all foreign currencies. Your Chairman went abroad to establish contacts with some of the foreign banks in the month of October 1971. The Bank has now account and agency arrangements with many of the leading banks in

other countries. The Bank is at present conducting foreign exchange operations from seven centres—Bangalore, Mangalore, Bombay, Madras, Cochin, Delhi and Hyderabad. More centres will be covered as and when it is deemed necessary.

Personnel

At the end of 1970 we had on our staff 1,462 persons of all categories. At the end of 1971 the strength was just 1,896, an increase of 30%. Our staff deposit ratio stood at 52 per crore of deposits at the beginning of the year. It has declined to 43 per crore at the end of 1971. Our working ratio of salaries and allowances to gross earnings declined from 33½% in 1970 to 29% in 1971.

Our growth is fast and the need for training our staff is engaging our attention. In addition to training them in our own Training Institute, we send some of our officers to courses conducted by the Reserve Bank of India and other training establishments in the country. Our Chief Accountant was at the Administrative Staff College, Hyderabad, for a short course on financial administration. We had sent one of the officers in our agricultural advance cell for a course on Farm Credit Management conducted by the Indian Education Committee, New Delhi. The 23-day course included 18 days tour of Thailand, Philippines, Japan, South Korea and Hong Kong. We propose to depute one of our senior managers to attend the International Banking Summer School in the United States and another offi-

cer to Germany for training in foreign exchange. We have plans to train more of them both in and outside India. On the initiative taken by the Reserve Bank of India, a combined staff training college is soon to be set up at Coimbatore for the non-nationalised banks in South India. It will interest you to know that your Chairman has been elected as the first Chairman of the governing body of the combined staff college.

In a developing institution, no single individual at any level is expected to shoulder the increasing demand for technical competence. What we have yet to do therefore is a further stream-lining of our administration in keeping with current management thinking. The pattern of banking has changed. As I said a year or two ago, the old concepts in the management of men, money and material are being pushed out of vogue by the rising tide of social and scientific forces.

What is demanded of banks is a high degree of resilience in set up, staff and structure to meet the changing concepts and conditions. The new trends and techniques call for enterprise and expertise at every level. We have to grow our own executive timber. We hope to start a department for management development to develop our own personnel to occupy managerial and executive posts. The purpose behind is to keep well trained men readily available to fill up posts. We must have the right men at the right time in the right place, individuals developed by us with a sense of pride in the

organisation and a feeling of growing participation in the progress. We are a bank predominantly youthful in its staff structure with a good spicing of age and maturity at the superstructure. It is only natural for us to grow and grow we must.

Our Thanks

Now let me pay my tributes to our esteemed members of the Board of Directors. My colleagues on the Board gave me their unstinted co-operation. Very sincerely I thank all of them and also the members of the Local Advisory Committees for their unfailing support.

My thanks are due to the Secretary, other Executives, officers and the staff at the Administrative Office of the Bank for their devotion to duty throughout the year. The untiring efforts of group managers, branch managers, other officers and the staff have contributed greatly to our deposit growth. I am deeply appreciative of their dedicated efforts and enthusiasm. I do thank one and all of them.

I take this opportunity to express my gratitude to the Bank's customers and well-wishers for their valuable help, co-operation and understanding at all times.

To you, our shareholders, I am extremely grateful for the confidence reposed in me and my colleagues on the Board.

Thank you.

Note: This does not purport to be the record of the proceedings of the Annual General Meeting.

EASTERN ECONOMIST BUDGET NUMBER

As in previous years, the Special Budget Number presents an analysis of budget proposals and a study of the budget documents in their larger economic context as well as in their specific details. The Special Number includes all the relevant budget literature and statistical tables. It also carries a section of Special Articles covering fiscal and monetary issues. Priced at Rs 5 per copy (postage extra) copies of this number are on sale with leading booksellers or direct from:

**The Manager,
The Eastern Economist Ltd.,
UCO Bank Building,
Parliament Street, New Delhi-1.**

RECORDS AND STATISTICS

The World's Workers in 1971

FOR THE world's workers, the economic slowdown of 1971 meant spreading unemployment and an increase in consumer prices, says Rosalie Ducommun of the International Labour Office.

The trend was noted in varying degrees both in the industrialised countries (though their real wages rose generally) and in the developing regions, which were already suffering from unemployment and underemployment of a chronic type.

The 1971 employment curve in the industrialised countries tended to flatten out: in some countries it stopped rising altogether, or took a downward turn. Unemployment rates and consumer prices sometimes rose to a marked degree. However, wage increases exceeded consumer price rises almost everywhere.

Little information was available on employment and wages in most developing countries. But their unemployment and consumer prices, of which somewhat more is known, both rose faster in 1971 than in the preceding year. Unemployment and underemployment, affecting a large part of the working-age population, remain among the gravest problems in the developing countries.

These are some of the main trends emerging from statistics collated by the International Labour Office, which has recently published its 1971 Year Book of Labour Statistics.

general situation

Employment continued to increase in 1971 in most of the countries for which information was available, though at an even more sluggish pace than in 1970, when a slowdown had already been noted. In one country in four, overall employment actually fell. One country in three had a drop in the number of employees in manufacturing.

Unemployment was on the increase in two out of every three of the 50 or so countries for which statistics were available. It grew in practically all the industrial

countries, where it often reached the highest level for years — and in some cases the highest since the end of the Second World War.

Decelerating growth of industrial production often led to dismissals affecting primarily foreign workers, women and older wage-earners; young people about to take up work faced shrinking prospects. Moreover, social problems arising from the regroupment of enterprises often affected the whole of the local population and not simply those dismissed.

Consumer price increases in 1971 were often much greater than those observed in preceding years. The rate of increase slowed down a little in the second half of the year in several countries, however.

Money wages in manufacturing increased in all the countries for which data were available. Although consumer price increases were accelerating, money wages went up still farther in most cases. Thus real wages improved almost everywhere and, in about two countries out of three, workers in manufacturing benefited from an increase of 5 per cent or more.

increased employment

Employment continued to increase in 1971 in the great majority of countries which supplied data to the International Labour Office, but generally at a slower rate than in 1970.

The general level of employment rose in 12 of the 17 countries for which information was available. Only in Israel, Malawi and Yugoslavia, however, did the number of working people increase by more than 4 per cent during the latest 12-month period.

In four countries (Austria, Canada, Norway and Poland), the rate of increase was between 2 and 4 per cent. In the United States the general level of employment, which had risen little since the second quarter of 1970, went up in the second half of 1971; in November 1971 it exceeded by 1.9 per cent the level of

November 1970. The increase consisted mainly of service and professional workers, while the number of blue-collar workers fell by some 350,000 between October 1970 and October 1971. In Australia and Japan the general level of employment rose by about one per cent, and in the Federal Republic of Germany it went up by less than 0.5 per cent.

Slight reductions in the total number of employed persons were noted in Italy and Sweden from the summer or autumn of 1971. In the United Kingdom, where the total number of employed persons had been falling since 1966, there was a reduction from March 1970 to March 1971 of 1.8 per cent — the greatest annual fall of the past 20 years.

fall in farm labour

In the countries under review, slower growth or reduction of the general level of employment was mostly due to a fall in the number of workers engaged in agriculture, often of those in mines, sometimes of those in construction, and occasionally those in manufacturing. The fall in employment in agriculture was particularly sharp in Japan where, in July 1971, the number of persons engaged was 1,260,000 fewer than in July 1970. Some 960,000 of those who left agriculture had been unpaid family workers, and 170,000 had been self-employed peasants; two-thirds of the leavers went over to the service sector. However, in some industrialised countries including Canada, Italy and the United States, the number of persons occupied in agriculture stopped falling, or increased, over the latest 12-month period for which figures were available. This change in a basic trend was probably a temporary one and can be attributed chiefly to the deteriorating employment situation in other sectors.

Information was available on employment in manufacturing in 29 countries and territories. It showed that the increase over the latest 12-month period exceeded 5 per cent in Greece, Hong Kong, Malawi and Rumania. The increase ranged from 3 to 5 per cent in Austria, Israel, Republic of Korea, Norway, Republic of South Africa and Yugoslavia, while it amounted to between 1 and 3 per cent in Australia, Bulgaria, India and Poland. The smallest increases, of less than one per cent, were noted in Ireland, Italy and Puerto Rico as well as in France and the United States, two countries where a year-end increase compensated for a decline at the end of 1970 and the beginning of 1971.

There were reductions in employment in manufacturing over the latest 12-month period in 10 countries (Canada, Denmark, Federal Republic of Germany, Hungary,

Japan, Philippines, Sierra Leone, Sweden, Switzerland and the United Kingdom). In Canada and Hungary the reduction was of less than 1 per cent; the same applied to Japan in October 1971 compared with October 1970, despite an average increase of 2 per cent during the first nine months of 1971. There was a 1 per cent decline in the Federal Republic of Germany, Philippines and Switzerland (Swiss manufacturing industries showed a fall in employment for the seventh year running). Reductions of 2 to 4 per cent were noted in Denmark, Sierra Leone and Sweden. In the United Kingdom the number of workers engaged in manufacturing fell by 5.3 per cent from October 1970 to October 1971. The number of employees involuntarily working reduced hours increased considerably, since the hours not worked for this reason (1,250,000) were three times greater in September 1971 than in September 1970; more than 300,000 workers were no longer doing overtime.

unemployment spreading

As employment growth was slowing down, unemployment was spreading, particularly in the second half of 1971. It had already been on the increase in some 20 countries toward the end of 1970. Among the 50 countries for which figures were available, 32 recorded an increase in unemployment for the latest 12-month period. It rose in practically all the industrialised countries, sometimes sharply. As in 1967, the rise in unemployment was delayed or diminished in several countries by the halting of immigration or even the sending home of foreign workers.

In several European industrial countries and in the United States, unemployment rose faster among women than among men.

The greatest increases in unemployment were recorded in Guatemala, New Zealand and Sweden, where the number of unemployed roughly doubled; and in Denmark, Finland, Federal Republic of Germany, Mauritius, Netherlands and the United Kingdom, all of which had an increase in unemployment of more than 40 per cent during the last 12-month period for which figures were available. There were noticeable increases in a dozen other countries, including Australia, Chile, France, Ghana, India, Poland and Spain. Smaller increases were observed in about 10 countries, including Austria, Belgium, Ceylon, Japan and the United States.

However, unemployment level data showed that those out of work represented less than 2 per cent of the total labour force in about half of the countries

which supplied information on this subject, and that the rate of unemployment exceeded 5 per cent in only six countries (Canada, Chile, Ireland, Puerto Rico, United States and Yugoslavia).

In the Federal Republic of Germany the number of unemployed rose from 129,000 in November 1970 to 208,000 in November 1971. The United States, with an average of 5.9 per cent, had the highest unemployment rate observed for 10 years. In France, the number of registered unemployed reached 395,000 at the end of November—the highest level recorded since the forties. In the United Kingdom the increase in unemployment which started in July 1969 was intensified towards the end of 1970 and at the beginning of 1971; the number of workless had almost reached 1,000,000 in December 1971.

Available figures indicate a fall in unemployment in 15 countries, six of them in Asia. Among the 15, the reduction was large in Greece, Guyana, Iceland, Pakistan and Yugoslavia. In Canada the number of unemployed in December 1971 was slightly below that of December 1970; but for 1971 as a whole, unemployment averaged 6 per cent, a rate not observed since 1961. In Italy, the figure for July was less than 600,000, the lowest rate for this month since 1967, but partial unemployment increased.

consumer prices

Data from 117 countries and territories show that the rise in consumer prices continued in 1971 in all parts of the world, and that two countries in three had a faster rate of increase than in 1969 or 1970. Eleven industrialised European countries recorded consumer price increase of more than 5 per cent in the latest 12-month period, compared with six countries in 1970 and with only three countries in 1969.

The increase exceeded 10 per cent in 21 countries and territories, including Brazil, Chile, Republic of Korea, Uruguay and Republic of Viet-Nam — and in these five countries, increases of more than 10 per cent were observed for the eighth year running.

The greatest increase was recorded in the Khmer Republic, where prices almost doubled between September 1970 and September 1971. In Argentina, where the rate of increase averaged 10 per cent in 1969-70, consumer prices started to rise more rapidly from October 1970; they were 30 per cent up for each month from May 1971 on their level 12 months previously. In Chile and Republic of Viet-Nam, however, consumer price rises for the last 12 months for which details were

available were less than 20 per cent, compared with more than 30 per cent in 1970.

Increases of between 5 and 10 per cent were recorded in 32 countries and territories, including seven in Africa, six in America, four in Asia, 12 in Europe and three in Oceania; among them were Australia, Finland, France, Federal Republic of Germany, Japan, Netherlands, Peru, Republic of South Africa, Spain, Switzerland and United Kingdom. Prices went up by 3 to 5 per cent in 32 countries, including Bolivia, Canada, People's Republic of the Congo, Greece, India, Indonesia, Italy, Morocco, Syria and the United States. Seventeen developing countries and Hungary had consumer price increases of 1 to 3 per cent, and the increase was less than 1 per cent in five countries and territories (Iceland, Hong Kong, Lebanon, Mexico, Upper Volta).

Lower consumer prices were noted in nine countries. During the latest 12-month period the reduction was of less than 1 per cent in Czechoslovakia, Malta and Poland; of about 1 per cent in Ivory Coast, Liberia and Somalia; of more than 2 per cent in Libya; and of more than 5 per cent in Ethiopia and Sierra Leone.

money wages and real wages

Regular series of statistics on wages are available from only about 30 countries, and in a number of these cases the information is limited to the processing industries and to the first half of the year.

Money wages rose in the latest 12-month period in all the countries for which figures are available, and the rate of increase was generally faster than in 1970. In most countries the rate of increase was higher in manufacturing than in the non-agricultural sectors as a whole, and almost everywhere women's average wages rose proportionately more than those of men.

The greatest increases were noted in the countries where consumer prices also advanced rapidly. Despite the price increases, real wages (or money wages corrected for price variations) in manufacturing rose in 24 of the 27 countries for which information was available. The rate of increase was more often higher in the first half of 1971 than in the second half.

The largest rise in real wages was observed in New Zealand, the only country to achieve an increase of more than 10 per cent. In 16 countries (Australia, Canada, Japan, Mexico and 12 European countries) average real wage increases in the processing industries ranged between 5 and 10 per cent. Increases of from 2 to 5 per cent were recorded in seven countries, including Czechoslovakia, Netherlands, Sweden and United States.

HINDALCO HELPS TO BUILD NATION'S ECONOMY...

In May, 1962 Hindalco started production of aluminium with a smelter capacity of 20,000 tonnes a year. The capacity was raised to 40,000 tonnes in November, 1965, 60,000 tonnes in August, 1967 and to 80,000 tonnes in May, 1969. Plans are in hand to expand the plant further to 120,000 tonnes by end-1973.

Between May, 1962 and December, 1970 Hindalco, now India's largest producer of aluminium, has produced 372,903 tonnes of aluminium, which has saved for the nation nearly Rs. 180 crores of precious foreign exchange.

As a substitute for imported copper in the electrical industries, the above output represents a much larger foreign exchange saving, since one tonne of aluminium is replacing two tonnes of copper and as imported copper is several times costlier than indigenous aluminium.

As a vital raw material for Electrical Conductors & Cables, Telecommunications, Electric Capacitors, Condensers and Motors, Transportation (by road, rail, air and

water), Containers & Packaging (in both rigid & flexible forms), Building & Construction, Furniture, Paints, Surface Coatings, Explosives and Rocket Fuels, Industrial Castings, Steel Deoxidizing, Coinage, Missiles, Rockets, Satellites, Sophisticated Consumer Durables (like air-conditioners, refrigerators, electric fans), Business Machines (computers, typewriters, etc), Irrigation Piping, Grain

Sewer, Drainage Culverts, Water Mains and countless other applications. HINDALCO aluminium is helping to build a new India. With its almost limitless variety of forms and shapes and its versatile properties, HINDALCO aluminium is sure to play a crucial role in meeting Industrial India's challenge today and tomorrow...

Not even a quorum

EVER SINCE the last general election, when the ruling party was returned to the Lok Sabha with a massive majority, the quality of parliamentary activity has kept deteriorating at a frightening pace. This, however, cannot be attributed wholly to the fact that the governing party so decisively dominates the legislature in the numerical sense. Quite some years after Independence, the Congress party used to enjoy an overwhelming superiority of numbers in Parliament. Nevertheless the proceedings of Parliament had a certain vitality which is now lacking. What has made for this disagreeable difference is not the small size of the opposition parties but the fact that these parties are in a demoralised condition.

In the earlier years, the opposition parties had a certain self-confidence and some of them even had the exhilarating feeling that the future belonged to them. Today the opposition groups are not only an uncertain or anxious lot but are also a frustrated crowd. They have become so diffident that they seem to have given up all hopes of being able to exploit their presence or opportunities in Parliament to the advantage of their respective parties. All this appears to be particularly true of the other Congress. But the Swatantra party too is in the throes of emotional disintegration. As for the Jana Sangh, Mr Atal Behari Vajpayee strives hard to be politically alive but even he is heard or heard more from outside Parliament than inside. As for the parties of the Left, the CPI has the advantage of being in an unwritten coalition with the ruling party at the centre and is therefore in a position to bide its time, while the other wing of the communist movement is still picking up the pieces after the shattering blow it had received from the electorate in West Bengal.

Perhaps the most disquieting aspect of the political prostration of the democratic parties in the opposition is that they feel themselves driven to steal the ideological or tactical clothes of the ruling party. The other Congress for instance has lost the respect of the people as a result of the opportunist compromises it has been permitting itself on the issue of amendments to the Constitution. The Jana Sangh, for its part, is forfeiting the trust of the public because of its clumsy efforts to outbid the ruling party in the matter of socialist reforms relating to property rights. The Swatantra party has no doubt managed by and large to stick to its principles, but even in this case its Grand Old Man, Rajaji, almost gave the show away when, recently, in a moment of anguish, he suggested that the party might perhaps give itself a new name in the hope of winning a new lease of life. It follows that Parliament will never again begin to function as it should unless and until the opposition parties are able at least to take up the task of re-establishing their respective political identities.

All this, however, cannot absolve the ruling party of the responsibility it too has for the dispirited functioning of Parliament. The Prime Minister, on a recent occasion, claimed that she was under no obligation to ensure that the opposition was in sufficient strength in the Lok Sabha. Mrs Gandhi was clearly side-tracking the issue. The precise charge against her style of government is that, through the procedures and manner of her functioning as the head of the administration, she is fast turning the parliamentary form of government into a presidential type. It has now become very obvious indeed that the Council of Ministers, which is collectively responsible to Parliament, is no longer the *de facto* policy-making or decision-making authority in the government. The policy options are discussed and lines of action mapped out by the Prime Minister in consultation with her advisors outside the regular proceedings of the Council of Ministers. If one or more of the ministers happen to be among these advisors, it is not because they are ministers but because they happen to enjoy the confidence of the Prime Minister in a special sense. This explains why Mrs Gandhi has been so casual about the quality of individual ministers or indifferent about filling vacancies in the Council of

Ministers. Once this body has become an institution of secondary importance in the Prime Minister's scheme of things, the spirit of collective responsibility of the cabinet to Parliament necessarily gets enfeebled. From this it is an easy transition to the proceedings in Parliament or Parliament itself coming to be taken not too seriously in New Delhi and consequently the country at large. That this is not an uncharitable analysis is indicated by the fact that the Minister for Parliamentary Affairs found it possible to declare in the Lok Sabha the other day that it was no special responsibility of the ruling party, however big its majority might be, to maintain a quorum in the House. Mr Raj Bahadur was no doubt well within his rights to ask that the opposition parties too should co-operate, but he certainly was not justified in suggesting that the ruling party, which had 362 members in the Lok Sabha, could not be held to account when it had repeatedly failed to ensure the attendance of even as few as 52 members, the minimum required for a quorum, so that Parliament could transact the business on its agenda. This minister has certainly not enhanced the dignity of his office in the eyes of the public by taking up the position he did.

Eastern Economist 25 Years Ago MAY 16, 1947

The United States Government under pressure adopted an early removal of several controls on the internal economy of the country. It was hoped that freedom from the shackles imposed during the war would be a great impetus for increased production and reaching higher levels of production than ever before. This complacent attitude has been so much belied, prices shooting up further and further, that it is already being argued if recession, which is generally taken for granted is inevitable, may not come upon the country sooner rather than later, and with a steeper fall in prices than was at one time expected. American price level has after the World War I been of immense importance to the world economy as a whole, but has never been so much important and determining as now and will certainly be in the future.

LOKANATHAN

DR P. S. Lokanathan passed away on May 5 in Madras. He died in the fullness of years—he was 78—and also in the fullness of achievement. Lokanathan was the founder-editor of *Eastern Economist*. Indeed he had sown the seeds and nursed the growth of many institutions, national or international. He was the first Executive Secretary of the Economic Commission for Asia and the Far East (ECAFE), and he was also the founder Director-General of the National Council for Applied Economic Research in New Delhi. Many other organisations—the Indian Council of World Affairs, the Indian School of International Studies and the National Productivity Council, to mention a few — owe much to his solid participation. His were thus a creative temperament and talent.

It would be true to say that *Eastern Economist* made him nearly as much as he made, *Eastern Economist*. He no doubt already had a distinguished academic past when he undertook to launch *Eastern Economist* early in 1943. His definitive study of the managing agency system in his best known work, *Industrial Organisation in India*, again, had won him considerable reputation both at home and abroad as a serious investigator of the economic processes and institutions of industrialization. All the same, it was his editorship of *Eastern Economist* which first gave him those significant opportunities that helped him to become a vital personality in national and international discussions of the economic issues which India faced in the years that were crowded into the eve of its independence.

The first issue of *Eastern Economist* was brought out on May 21, 1943. Lokanathan and his original editorial team had little or no experience of active journalism. Their greatest collective asset was a shared enthusiasm and a common faith in the national impor-

ance of their task. His colleagues drew their inspiration and sense of confidence from him, while he himself had been similarly motivated by the great trust which Mr G.D. Birla had placed in him and the tremendous freedom of editorial judgment and discretion which Mr Birla gave him in the conduct of this journal. From 1943 to 1947, when he left the editorship of *Eastern Economist* to become Executive Secretary of the newly constituted ECAFE, Lokanathan enjoyed this great advantage of being

trusted and respected by the man who had chosen him to pioneer a new quality of economic journalism which would integrate the political aspirations of our people for freedom from foreign rule with their economic aspirations for the industrialization of the country.

Lokanathan had given generously to the national and international community in many fields of endeavour. His contributions were wide-ranging and many close colleagues or other co-workers must be able to discuss various aspects of his personality or work. Here it is about Lokanathan as the first editor of *Eastern Economist*, which was fortunate enough to have him lead and guide it in its formative years, that I may write with some appropriate-

ness. Lokanathan was not a natural journalist, financial or other. He was not a particularly elegant writer. He had no penchant for the phrase that tells and, having told, lingers in the memory. He was, however, a writer who communicated always easily and often forcefully because what he had to say was almost always so important that how he said it became a matter of secondary interest. If his style had any distinction it was the sincerity that he breathed into it, a sincerity which was often underlined by an outburst of genuine emotion or even sentiment. Lokanathan was a liberal economist who had as little use for the ideological excesses of the Left as he had for the narrow capitalism of a rentier economy. Indeed he was passionate about a grand design of development for the people of India in all the diversities of their social and economic conditions or problems.

For our editorial team, he was a teacher only for part of the time, but he was a leader all the time. We learnt from him day after day and what was really important in this was that we learnt how to think, not what to think. The daily editorial conferences in those days of *Eastern Economist* were exciting intellectual exercises. There was always a free exchange of views and a truly co-operative effort to plan each issue in such a way that the journal carried a step forward its purpose of promoting consciousness and spreading interest among the people in the development of India at a time when the nation's first priority was necessarily independence but whose basic necessity was to prepare itself for the economic challenges and opportunities that independence would bring.

It was a great experience indeed to have worked with him on this journal and it is a privilege to carry on, however inadequately, a tradition which has now become immortal with his passing away.

V. BALASUBRAMANIAN

Houses for millions

THE SHORTAGE of houses in the country, both in the urban and rural areas — particularly of those required by the less affluent and weaker sections of society in the urban areas — has assumed alarming proportions. Conservative estimates put the backlog of housing construction at as much as 80 million units. Another two million dwelling have to be put up every year for meeting the needs of our growing population. Against this backdrop, the recent official seminar held in the capital on evolving a national policy on urbanisation and housing cannot be said to have been held a day too soon.

State activity in the housing sphere till lately had been confined, by and large, to the building of tenements for its staff, though for a few years soon after Independence, a sizeable number of dwellings had been built by the governmental agencies in several parts of the country to provide for the refugees who poured into the country after partition. Some housing construction in the governmental sector has also been undertaken at places where giant public sector undertakings have been set up and under the slum clearance schemes. Otherwise, the emphasis has been on private initiative to tackle the problem. During the sixties, whenever the necessity arose to prune planned programmes — after the conflicts with China and Pakistan — the axe fell heavily on such schemes as construction of houses. This curtailed the building activity of the state.

Efforts, of course, have been made by the state to assist house-building operations in the private sector through such measures as making loans available to the lower middle and middle income groups and provision of subsidy as well as loans to public limited companies for the houses to be built for their labour force. The progress of these schemes, however, as is well known, has left much to be desired. The continued stringency of building materials has been a big const-

straint on construction activity in the private sector. The rent control legislation has led to a deterioration in the structures to which it has been applicable. So, while on the one hand the construction of new houses has very much lagged behind the growing requirements, the life of the existing dwellings, on the other hand, has been shortened.

Further, no concerted attempts have been made at research to evolve expeditious methods of construction and to develop low-cost building materials. Barring some work having been done in the field of prefabricated houses, conventional methods of construction still continue to be followed by and large. The materials used too are mostly conventional. Not much publicity has also been given to the results of research and development. The successive imposts on building materials and the general inflationary tendencies in the economy have raised their prices to prohibitive levels. The municipal taxes have multiplied fast. The result is that private housing activity is now mostly confined to such houses which are expected to yield adequate return on investment. The rentals of these houses obviously cannot be within the reach of the less affluent and weaker sections of society.

With the view to tackling the problems in an organised way, the seminar made a large number of suggestions and called for a high priority to be given to house-building activity not only as a vital social overhead for growth and stability but also as a source of widely dispersed development. Some of the suggestions of the seminar apparently are wholesome. For instance, it has been rightly pointed out that the mere making available of developed land for building houses is not enough. This programme has to be supported by augmenting the supply of building materials at reasonable prices. The financial assistance programmes will also have to be strengthened along with the streamlining of the procedures for providing this assistance. The research and development effort, similarly, has to be intensified to find out new low-cost building materials. The rent control legisla-

tion has to be drastically modified so that the maintenance of existing houses can be properly looked after. Positive fiscal incentives are required to encourage private house-building activity.

The solution of the housing problem in the urban areas, especially in the metropolitan cities, however, requires another set of remedies, besides the above measures to encourage construction of houses in general. The seminar appropriately emphasised in this connection the need for spatial and regional planning. This should curb migration to cities. The dispersal of industrial projects away from the congested towns and cities could also be helpful; so also the identification and development of other growth points such as those in the irrigation command areas. These points can be developed as new urban centres as they can attract agro-based industries. The development of small townships in the vicinity of metropolitan cities has been suggested as another important step to solve the urban housing problem. A highly relevant point made in this connection was that, along with the development of these townships, cheap and expeditious transport facilities should be planned so that people can commute to their places of work without any difficulty.

Two other major recommendations of the seminar, adopted presumably at the suggestion of the government representatives participating in the seminar, however, can be expected to raise a good deal of controversy. These are: (i) the socialisation of all lands which in the foreseeable future are likely to be urbanised, and (ii) the abolition of free-hold ownership of all dwelling sites to be developed in the future.

In principle, there is a sound case for mopping up by the state of unearned gains from any source, including land, for the benefit of the entire community. But the trouble arises when the quantum of unearned gains is determined. The governmental calculations invariably are based on age-old concepts and formulae. They do not take into account the normal appreciation in assets because of the in-

flationary tendencies in the economy. Instances are not wanting of how, not to speak of the original land-owners, even the members of the co-operative societies whose lands were acquired by the Delhi Development Authority in the mid-fifties, did not get even the normal interest which could have accrued on their investments in the housing plots in these societies. The gross under-valuation by the governmental agencies of the crops to be shared by the land-owners and tenants in cases of dispute between the two is another classical example and these valuations are taken into account while determining the value of land acquired by the state.

The Constitution (29th Amendment) Bill currently before Parliament, which seeks to do away with the concept of market value for properties to be acquired is bound to make matters worse. It may be argued that the government will show due consideration to the small and less affluent land-owners while fixing the quantum of compensation. But can it be denied that governmental powers are misused under some pressure or the other? Pious intentions can never be a substitute for legal sanctions.

Further, there has to be a time-limit for the payment of compensation to the owners of acquired properties from the day the notification of the intention of the government to acquire the said properties is issued. The extent of land to be acquired too has to bear some relationship with the state plans for making use of the land. Otherwise, the sad experience of the capital city is bound to be repeated. The wholesale acquisition of land in Delhi in the late fifties was one of the main reasons for land values skyrocketing here.

Coming to the issue of free-hold ownership of dwelling sites, the substitution of this pattern of ownership by the system of leasing out of land will make the state a co-sharer in the appreciation in land values. But experience shows that this power is always used for the benefit of the state. The lease money is never decreased even if the expectations on which it is determined originally do not materialise

or the lessee suffers because of some subsequent decision of the government.

The municipal taxes too are an important component of a national housing policy. No doubt the municipal costs have gone up, thereby justifying an increase in the taxes on property. But should there not be a relation between the taxes realised by local bodies and the services rendered by them? There is a good case for a review of the entire tax burden on house-owners.

Some participants suggested at the seminar that public limited companies should be made interested in housing construction, especially for the weaker sections of society. In view of the present political atmosphere in the country, it is extremely doubtful that this proposal will be of much help in solving the acute housing shortage in the country. Admittedly, public limited companies are presently being kept outside the scope of urban property ceilings. But the way mechanised farms, orchards, plantations, etc., are being now treated despite the earlier assurances, can hardly encourage the formation of public limited companies for house-building purposes.

The way legislation on urban property ceilings is being proposed by some states is in itself likely to affect adversely housing construction for rental purposes. This will enhance the burden of housing construction on the state; every family cannot be expected to own its own house, especially in the big cities to which people throng for employment purposes. There is obviously a case for a thorough assessment of the impact of the legislation on urban property ceilings on housing development.

The call by the seminar for the preparation of a model municipal act for adoption by states, prescribing financial sources and executive powers, and the resort to the national building code evolved by the Indian Standards Institution, of course need to be endorsed. The ISI code, it claimed, can reduce construction costs substantially. Its large-scale adoption requires modification of municipal housing

specifications. This modification task needs to be completed expeditiously.

The present practice of the Delhi Development Authority of auctioning dwelling sites for the more affluent sections of society is a judicious one. This helps in generating resources for financing housing operations for the less affluent and

weaker sections. Here is an instance of the savings of the people being mobilised effectively for an important socio-economic purpose — an objective which is also successfully pursued by the Delhi Development Authority's scheme of inviting interest-bearing deposits from applicants for houses and flats built and sold by this organization.

hand, if the industrial policy is kept uncertain, it will give opportunity to the government to adjust it from time to time according to political (and personal) whims and fancies. So, though from the country's point of view, the Estimates' Committee's plea seems sensible, the Prime Minister may hesitate to accept it for political reasons.

The Estimates Committee has argued the case for continuity only in industrial licensing policy. But there is, surely, need for stability in other economic policies as well. Economic planning has little meaning if major policies are to be changed suddenly and drastically. There is no reason why the tax policies at least in regard to income-tax and corporation tax cannot be laid down for a five-year period, to be changed only when it becomes unavoidable due to unforeseen circumstances. As Mr N.A. Palkhiwala has observed in his book, *The Highest Taxed Nation*, "The rates and even varieties of our direct levies are nowadays like railway tickets, — good only for one journey in time, from the 1st April of one year to the 31st March of the next, and sometimes not even for the whole journey. Benjamin Franklin's observation that in this world there is nothing certain except death and taxes has passed into a byword. India has sought to match the inevitable certainty of the existence of taxes by incredible uncertainty as to their incidence and by kaleidoscopic changes in the legal provisions under which the levies are imposed".

Foreign trade is another major field where frequent changes in policy have been crippling the country's economic growth. There is no reasonable stability either in export policy or in import policy. The announcement of an export policy resolution has not been of much help to our businessmen to enter into long-term

export commitments. Apart from the uncertainties of the incentive schemes, there have been constant talks and threats of nationalising the export industries. Even major industries like jute and tea have to face continued uncertainty about their future role in the country's economy and export trade. In the import trade, canalisation has created almost chaos over a wide area, resulting in irregular and inadequate supply of raw materials which in many cases have also been much costlier than direct imports. Yet, year after year, more items are canalised in complete disregard of its impact on industrial production and foreign trade.

The Prime Minister has been recently stressing strongly the need for self-reliance. If this is to become a reality, economic policies ought to have some measure of stability. Industries cannot grow on the scale and the speed necessary so long as entrepreneurs are unsure of what is going to happen to them in the next few months, not to speak of years. Mrs Gandhi has been saying that she does not believe in nationalising industries indiscriminately. But such casual statements hardly carry conviction when the government has not hesitated even to amend the country's constitution as often as it wants to suit its political needs. It is bad enough that industries should be confronted with uncertainties in regard to the availability of railway wagons, electricity, and essential raw materials; and the situation becomes much worse when government creates confusion by constantly changing policies in regard to industrial licensing, taxation, foreign trade and also in other fields like labour legislation. If the government is really earnest in its intention to tackle grave problems like poverty and unemployment, it can no longer afford to go slow with industrial development. The Estimates' Committee's plea for stability needs to be considered seriously both by government and Parliament. But stability in economic policies will benefit the country only if they are soundly conceived and are not excessively influenced by ideology and subjected to political pressures as it has been unfortunately happening too often in the recent months.

Stable government, unstable policies

THE ESTIMATES Committee of the Lok Sabha, in its 19th report submitted on April 26, has criticised the frequent changes in the government's industrial licensing policy and has stressed the need for some stability in this matter. The committee has suggested that the policy should be for a minimum duration of five years, coinciding with the Plan, so that industry can have a span of assured development along pre-determined lines for sustained growth and production. It has recommended that the government should formulate and announce the licensing policy for the fifth Plan well before its commencement to attract most competitive applications for the issue of licences on merit.

The committee has cogently argued the case for ensuring stability in industrial policy. But it seems unlikely that the government will accept this sensible recommendation. The Economic Survey for 1970-71 said that "there has been throughout the year deeply felt concern over the pace of industrial growth". But there is little evidence yet of the government's determination to impart dynamism to industrial development. Mrs Indira Gandhi, in her speeches during the election campaigns, eloquently emphasised the need for stable governments at the centre and in the states. But the Prime Minister does not seem to appreciate the importance of ensuring some stability in industrial policies. She appears to think that though stability is essential, politically it is neither desirable nor practicable. To announce the industrial policy for as long as a five-year period will deprive the Prime Minister and her government of a powerful means of exercising patronage for political purposes. On the other

We respect money.

That's why a Blue Star Air Conditioning or Refrigeration system doesn't cost you the earth.

Whether its a Blue Star packaged climate system or a central plant, you pay a fair, economic price.

That's because we execute your job the same way we run our organisation.

By making optimum use of our resources: men, machines, materials, money

That's why there are no high costs of organisational inefficiencies to be covered in our price to you.

V. Balasubramanian

Not to be left out

WHILE ADDRESSING the fifth annual meeting of the Board of Governors of the Asian Development Bank in Vienna on April 21, India's Finance Minister, Mr Y.B. Chavan, made a reference to the need for the developing countries being enabled to protect their interests effectively whenever monetary and financial problems were internationally discussed and settled. His observation is rooted in the tragic experience of the countries of the Third World last year when the affluent nations got together and struck bargains about currency parities without caring in the slightest degree for the problems and difficulties of the economically weaker countries.

purchasing power reduced

As a result of the appreciation of the currencies of western Europe and Japan in terms of the US dollar, the poor countries found the purchasing power of their reserves reduced by more than US \$500 million. Again, while the affluent countries, with large stocks of gold held in their official reserves, were in a position to benefit substantially from the devaluation of the US dollar in terms of gold, the poor countries, since they do not hold much gold in their reserves, have not been able to secure any great relief in this manner. There is, moreover, the fact that the international monetary crisis of last year and the way in which the affluent countries got together to cope with this crisis to their own advantage have resulted in a worsening of the terms of trade of the poor countries most of which export primary commodities or semi-manufactured goods as a high percentage of their total commerce with the rest of the world. Above all, the poor countries, who have in no way contributed to the payment problem of the United States, have rightly resented the sweeping decision of the US government to make its import surcharge universally applicable during the period when negotiations were going on among the affluent countries to find ways and means of resolving the monetary crisis.

It is against this background that India's Finance Minister has asserted that it is in the interests of the poor and de-

This is the text of a talk broadcast on the External Services of AIR and is reproduced here by courtesy External Services Division, AIR.

veloping countries of the Third World, to demand and secure an effective voice in international discussions or settlements of monetary and trade issues. This, indeed, has become particularly important and pressing because the affluent countries are tending increasingly to negotiate international monetary issues among themselves and outside the forum of world organisations such as the International Monetary Fund.

Fortunately, even in the affluent countries, there are powerful currents of liberal opinion which are now coursing in favour of the poor or developing countries being given their legitimate share in shaping international monetary and trade policies. Speaking at a symposium on International Economic and Business Cooperation in Tokyo on April 14, Mr Olivier Long, the Director General of GATT, dwelt with understanding on the desire of the developing countries to have a clearer view of their own role and expectations before committing themselves to an opinion on current moves for a new round of negotiations for the reduction of tariff barriers across the world.

important stake

The Managing Director of the International Monetary Fund, Mr Schweitzer, addressing the United Nations Conference on Trade and Development now in session in Santiago, has acknowledged the important stake which developing countries have in the preservation of an orderly system of trade and payments. He also commented, on the whole favourably, on the point made in the report of the UNCTAD Secretariat to the present conference that a suitable machinery should be created for the developing countries being represented effectively in the processes of decision-making. Earlier, also at Santiago, Dr Mansholt, President of

the EEC Committee, was refreshingly outspoken about the raw deal which the developing countries had received as a result not only of the international monetary crisis of last year but also of the manner in which that crisis was settled by the affluent countries. He, in fact, suggested on behalf of the EEC Commission that, at the next allocation of the Special Drawing Rights in the IMF, a special allocation might be made for the developing countries for the specific purpose of compensating them for the loss in the purchasing powers of their reserves.

united effort

It is possible that before UNCTAD III winds up, the developing countries will have succeeded in committing the industrially advanced countries to the principle that the Third World must be duly represented in decision-making processes relating to international monetary and trade problems. Mr Chavan's statement in Vienna is indication enough that the government of India is fully co-operating with other developing countries in Asia, Africa or Latin America towards the achievement of this purpose. That this united effort will succeed need not be unduly doubted. The international community is not lacking in leaders who now recognise that world economics is too serious a matter to be left wholly to a trade union of rich nations.

UTI comes of age

R.V. Murthy

HAS THE Unit Trust of India (UTI) come into its own? Is there scope for further growth of the UTI in particular and of the Unit movement generally? Whether strictly appropriate or not, these two questions were raised at a function, held in Bombay recently, to bid farewell to Mr R. S. Bhatt, the first chairman of the UTI who has just retired. In view of this, it is perhaps as well to take stock of the origin and growth, as also the present position of the UTI, if only to appreciate what has been handed to Mr James Raj, who will henceforth control the destinies of this twin-baby of Mr P. C. Bhattacharyya's financial statesmanship (the other being the Industrial Development Bank of India—IDBI). Incidentally, by some curious concatenation of circumstances, both Mr Bhatt and Mr Raj happen to have graduated from the same private sector financial institution—Industrial Investment Trust—to take over as chiefs of the UTI.

confusion persists

According to "the worm's eye-view" of Mr S. D. Deshmukh, Executive Trustee of the UTI, "there is still a great deal of scepticism and some confusion about our operations.... In certain quarters the confusion still persists. Our country is a vast one and, despite the able direction Mr Bhatt was able to give and the gigantic efforts he has put in, one cannot claim that units have become a household word". Laudable though such a claim may be as healthy ambitions go, one must wait a long long while for its fulfilment, that is until investors in India generally become sophisticated enough to assess the superior worth of units *vis-a-vis* other forms of investment. But the process has definitely begun and Mr Bhatt has indeed blazed the trail.

Whilst paying tributes on behalf of the trustees of the UTI to Mr Bhatt, Mr H.T. Parekh, Chairman of the Industrial Credit and Investment Corporation of India (ICICI), recalled how the UTI came into being. The country's economy, he said, had shown clear signs of fumbling towards the early sixties and a push was needed if it was to move forward. It is in this context, he added, that the setting up of the UTI was conceived, and we owe it to Mr P.C. Bhattacharyya, then Governor of

the Reserve Bank of India, for promoting this as well as the IDBI. The creation of these twin institutions is certainly "an example of financial statesmanship of a high order".

Although simultaneously conceived, the chances of success of the two were not identical. For, while the success of the IDBI seemed more or less evident, the future of the UTI, at any rate at that point of time, was far from clear. For one thing, it depended upon public response for its success; secondly, it was a new type of Unit Trust, and that too one that was being set up in the public sector. Furthermore, the experiment was surrounded with various uncertainties associated with the prevailing economic situation. Notwithstanding these initial handicaps—doubts, confusion and uncertainties—as Mr Parekh put it "the UTI has been a great success, far beyond my expectations—as is evidenced by the fact that it has collected about Rs 100 crores as private savings from over 300,000 unit-holders during the brief period of its existence of eight years".

The following table shows the annual sales and repurchases of the UTI units since July, 1964 :

Sales and Repurchase by UTI

(In crores of rupees)

Year	Sales	Repurchases
July-June		
1964-65	19.14	0.40
1965-66	2.15	1.09
1966-67	9.24	1.99
1967-68	15.34	1.22
1968-69	17.16	1.67
1969-70	22.83	2.03
1970-71	17.99	3.19
1971-72	12.62	2.11
(upto 31-3-72)		
TOTAL	116.47	13.70

(The net sales upto March 31, 1972, thus aggregated Rs 102.77 crores).

The first dividend distribution by the UTI was in 1964-65, when it was 6.1 per

POINTS OF VIEW

cent and this was raised to 8.0 per cent in 1970-71.

It is easy to point to the declining sales and rising repurchases over the past three years, that one notices in the aforesaid table, but, as Mr Bhatt pointed out to newsmen on the eve of his retirement, this was but a reflection of the state of the stock markets in India. He, however, hoped, on the basis of the conditions obtaining today, that there would be soon a reversal of the trend.

Whether this is a great success story or not is a matter of opinion, but there is no gainsaying the fact that the UTI has come to stay. Thanks to his accumulated experience in different but, in a sense, allied lines, Mr Bhatt has found no difficulty either in convincing unit-holders about the safety and integrity of the funds or in bringing home to industrialists that the co-operation of the Unit Trust would strengthen the financial basis of the country. Even more than this, he knew how to invest wisely, especially in these lean years which would have tried the talent of anyone not so fully conversant with the stock markets as Mr Bhatt. As Mr Parekh recalled, the UTI then "lent a major support to the investment market without which it is difficult to see how the stock market could have survived".

Indian model

The unit trust concept, as everyone knows, is not indigenous; it has been copied from the UK, but, like the ingenious Japanese, Mr Bhatt has transformed his exotic model into something wholly Indian. Mr Deshmukh instanced the face value of units, pricing policy and income-distribution policy of the UTI to highlight the special contribution of Mr Bhatt. He thus pointed out how, unlike what we have in India, units in the UK or other foreign countries do not have a face value. Under Indian conditions, Mr Bhatt rightly felt, having an instrument without face value would be regarded as too sophisticated. Again, whereas the price of units goes up and down in accordance with the changes in the market value of securities in other countries, Mr Bhatt managed to prevent the value of the UTI units from falling below their face

The world's latest can making technology now comes to India You can enjoy all its benefits

American Can Company, the world's leading can manufacturer and Poysha, India's most enterprising can maker, enter into technical collaboration to elevate packaging technology in India. American Can Company, whose annual sales now exceed Rs. 1325 crores

- established the metal container industry's first research laboratory
- developed the pull-tab, easy-open can

CMPI-53-243

- invented the novel Mira-seam process for tin-free steel and aluminium cans
 - developed the all-tin easy open can
 - developed the drawn and ironed tin can to name a few.
- These advanced can making techniques are the result of Rs. 18 crores spent annually on research and development which

are made available to each of the American Can's 25 subsidiaries and 25 associates operating in 33 countries all over the world.

Poysha will assist canners and consumers in India and abroad through improved technology, new materials and new processes. For India, this promises real progress and sophistication in the packaging field.

POINTS OF VIEW

value. And this was achieved too by taking steps to ensure that security prices did not dip below the face value subject to limitations imposed by the Unit Trust of India Act. Thirdly, whereas, in the west, Unit Trust operations involve very considerable turnover of the portfolio evidently with a view to achieving capital appreciation, Mr Bhatt ruled out either the possibility or the desirability of placing similar accent on capital appreciation under Indian conditions. Surely these are among some noteworthy refinements.

Has the initial charm of units spent itself out? Is there scope for further growth of the unit movement in India? The answer to the former is in the negative, while

that to the latter is in the positive. Mr Parekh was positive that the Unit movement in India must continue to grow in the coming years. For with the Life Insurance Corporation (LIC) devoting an increasing proportion of its resources to economic welfare investments—"social infrastructure"—he felt, the growing corporate sector must needs look to individual savings for increasing support. One obvious form of these savings is purchase of units, and the UTI is a means by which the public can participate indirectly in industrial investment. Talking of the potentiality of the UTI, Mr Parekh pertinently drew attention to the comparative rates of growth of bank deposits, LIC's investible funds and of the UTI. He noted

how, while deposits with commercial banks have been increasing at the annual rate of over Rs 1,000 crores and the LIC's investible funds have been growing at the rate of over Rs 250 crores a year, annual collections of savings by way of unit have yet to exceed Rs 25 crores. Fortunately, the mantle has fallen on the capable and competent shoulders of Mr Jame Raj. As a former Deputy General Manager of the ICICI, a former Vice-President of the International Finance Corporation, a former Chairman of Glaxo Laboratories Ltd. and erstwhile Chairman of the Industrial Investment Trust, he brings to his new office a rich and varied background of investment, industrial and financial experience.

LIC : from strength to strength

Sagittarius

THE LIFE Insurance Corporation has made such impressive progress in the past two years that it has been possible to achieve an increase of nearly 60 per cent in respect of new business to Rs 1,651 crores in 1971-72, a growth rate which has not been achieved in any earlier period since the corporation came into being. This performance should be considered significant as it not only testifies to the success attending the efforts of the management to underwrite a larger volume of business but also underlines the vast potentialities that exist in the rural and urban areas for further growth.

heady growth

In former years, either the management could not successfully tackle the outstanding problems or the situation was unyielding as even a target of Rs 1,000 crores was difficult of attainment in the stipulated year and was reached only some years later, in 1969-70. Thereafter, heady growth has been recorded and the new chairman, Mr K.R. Puri, must be feeling happy that he is in a position to fix an ambitious target of Rs 2,150 crores for 1972-73.

It has been explained that this rate of growth is aimed at in order to bring about a doubling of new business to Rs 4,300

crores and make available the benefits of insurance to a large number of policy-holders. Towards this end, it is gratifying to note that the rate of increase in the number of policies to 19 lakhs from 16.16 lakhs in 1970-71 is more than the increase in the volume of business. This is not exactly a favourable development immediately from the point of view of the corporation as a larger volume of work will be involved in servicing policies which have a lower average value than in the previous year.

benefits appreciated

It must be pointed out, however, that, from the angle of promoting new business in the future, the large base now being created will be very helpful. No details are available about the number of policies relating to entirely newcomers or whether larger business was secured from the rural areas. But the data that may be made available after some time should clearly indicate that the bulk of new business was on account of newcomers and the benefits of insurance are being appreciated even in new areas.

While the western region has again accounted for the largest volume of business, the largest number of policies is claimed by the southern region. What is,

however, more important from the point of view of the corporation is the emergence of some encouraging trends in the central region. With the special emphasis on promoting business in the rural areas and the strengthening of the field staff in backward regions, the increase in new business in the coming years can be easily of the order visualised.

group insurance

While much hard work will be involved in issuing new policies to those in the low income or the lower middle income group, the corporation has been specialising in group insurance. This form of risk cover does not involve any additional commitment for the participants concerned but helps them to derive greater advantage out of social welfare schemes like gratuity and superannuation. This way funds are utilised for providing sizable cover with only a slight decline in the rate of return on investment that would otherwise have accrued. It is also learnt that some state governments are inclined to extend the benefits of insurance to weavers and others in the decentralised sector by subsidising to a certain extent the premium that would have to be paid in respect of members of co-operative societies. These new experiments linking savings in unit and bank deposits with insurance should

also open up new fields for insurance though the schemes have not yet gained the necessary popularity.

The spread of the insurance habit among new sections of the population will certainly bring to the families concerned a greater sense of security. So long as the insurance cover is not on a large scale and the risk provided is considered valuable by the dependents of the insured, the cost of protection, which is heavy now, may not be a great deterrent to the further expansion of business. The Life Insurance Corporation, however, should not exploit its monopolistic position and refuse to heed the suggestions made by policy-holders and others for making insurance more attractive than it is now.

In view of the spread of risk over a large body of policy-holders, the improvement in the mortality rate and also the opportunity for securing a higher yield on freshly invested funds, the management should make a sincere effort to reduce substantially the overall and renewal expense ratios and augment net and gross incomes. Even a half per cent saving in the renewal expense ratio can add significantly to valuation surpluses.

real satisfaction

There will also have to be streamlining of the methods of servicing policies as in the context of new developments without complete mechanisation and computerisation, the desired level of efficiency and reduction in expenditure cannot be achieved. Only if the general impression gains ground that insurance is worthwhile also as an investment, the full potentialities for mobilising resources for Plan purposes cannot be exploited. The policy-holders will feel really satisfied only if there are larger bonuses and reduced premiums. Even if the latter were not possible there should immediately be an increase in the bonuses on all classes of policies.

The scope for adding substantially to the

assets of the LIC has already vastly improved. Even in the past few years assets have more than doubled and these grew in 1971-72 by Rs 299 crores to perhaps around Rs 2,300 crores. It is quite probable that the growth in assets in 1972-73 will be easily Rs 350 crores. This assured availability of funds will encourage the central and state governments and the public bodies, to draw up their borrowing programmes in a bold manner. Fresh investments in government securities in the past year were Rs 136 crores and in bonds of state electricity board Rs 11 crores. The corporation alone could thus make available to the different classes of borrowers more than 25 per cent of the net amount borrowed through loans and bonds in 1971-72. The state electricity boards and the municipalities have also benefited immensely through direct loans. Liberal encouragement has besides been given to housing schemes.

huge increase

It will be interesting at this stage to speculate on what the extent of additions to the assets of the corporation will be after the target of Rs 4,300 crores in respect of new business had been reached. The annual increase in assets by 1974-75 can easily be Rs 600 crores which, with the possibility of additions to deposits of scheduled commercial banks being of the order of Rs 2,000 crores by that time, will enable the public sector to proceed on the basis of an availability of fresh resources of over Rs 1,200 crores annually. There is also bound to be a big increase in the amounts to the credit of provident fund accounts. This clearly underlines the fact that institutional savings and the monetisation of incomes can be useful in formulating bigger plans. Actually, in respect of the current year the central government need not worry at all about the availability of financial resources for stepping up its Plan outlay by Rs 601 crores. The target for net borrowing of Rs 215 crores for the centre and of Rs 109 crores for the states in 1972-73 can be easily exceeded and the total borrowing

POINTS OF VIEW

effort in 1971-72 which was considered exceptional on account of the emergency, can be easily surpassed.

The special significance of the record volume of business written by the corporation and the spectacular growth in bank deposits should not, therefore, be missed. The co-operative sector also can be expected to make its own contribution with a continuing improvement in agricultural production. So far no special effort has been made to examine critically the progress of co-operative credit societies and land mortgage banks. If the activities of all these agencies can be closely co-ordinated and novel schemes are formulated, the process of institutionalisation of savings may be hastened with far-reaching consequences.

FROM THE PRESS GALLERY

Our Parliamentary Correspondent

New Delhi, Saturday.

THE LOK Sabha this week raced through budgetary demands of three more ministries — (i) the Ministry of Defence, (ii) the Ministry of Labour and Rehabilitation, and (iii) the Ministry of Steel and Mines. The demands for grants of the Ministry of Petroleum and Chemicals were also deliberated upon, but these could not be adopted as the minister looking after this portfolio could not complete his reply.

The main highlights of the debate on the demands for grants of the Ministry of Steel and Mines were (i) the widespread deep concern over the continued losses in the public sector steelworks, (ii) the need for augmenting the supply of steel in the country not only by improving the utilisation of the existing capacity but also through augmenting the capacity by setting up new plants as well as by expeditiously expanding the existing ones, and (iii) the trenchant criticism of the highly unsatisfactory performance of such projects as the heavy engineering complex at Ranchi. Some leftist members called for the nationalisation of the entire steel and the coal industries. They also assailed the steel distribution policy. The proposal to form a holding company for steel plants came in for criticism by some others. The likely delay in the commissioning of Bokaro steel works was also adversely commented upon. Fears were expressed that the government might further raise steel prices.

not up to mark

In his reply to this debate, the Minister for Steel and Mines, Mr Mohan Kumaramangalam, conceded that the performance of the public sector steel plants had not come up to the promises he had made last year and that these steelworks would again be incurring a sizeable loss (about Rs 20 crores) for 1971-72, but expressed the hope that the situation would improve substantially this year as a result of the measures initiated recently. He attributed the last year's loss to the roof collapse at Rourkela (which resulted in a loss of production of about 350,000 tonnes), the rampant labour indiscipline at Durgapur

(which caused the plant to lose one million man-hours) and the serious trouble in coke ovens at Bhilai.

Mr Kumaramangalam appealed to all concerned to help in improving industrial relations at Durgapur in particular and at the other steelworks in general. A Soviet expert, he disclosed, had been invited to suggest measures to improve the performance of coke ovens at Bhilai. As a long-term measure, additional coke oven batteries, he further revealed, had been planned at Rourkela and Bhilai. About Bokaro, he said that a set group of workers was constantly engaged in twisting the arm of the management and the government at crucial junctions.

co-ordinating activities

The minister expressed the hope that the proposed holding company for steel plants would help in raising production by co-ordinating the activities of all connected with steel-making in the country. All that the government sought to achieve through this holding company was the introduction of better methods of production and ensuring of proper functioning of the steel industry. The company he stressed, would not interfere in the day-to-day functioning of the steel plants.

In an attempt to allay the fears about rise in steel prices, Mr Kumaramangalam said that there was no such proposal under the consideration of the government at present. The prices of steel in the country, he added, compared favourably with the international prices. If the steel plants' capacity utilisation could be raised to 85/86 per cent, the cost of production could be brought down substantially. This could help in lowering steel prices.

The minister informed the House that the performance of the other public sector units under the charge of his ministry, including the Ranchi Heavy Engineering complex, was showing improvement. He ruled out the nationalisation of all coal mines. The Deputy Minister for Steel, Mr Shah Nawaz Khan, revealed that it had been established that some 50 coking

coal mines abandoned by the original owners still had about 350 million tonnes of this type of coal.

The labour policies of the government came under scathing attack during the debate on the demands for grants of the Ministry of Labour and Rehabilitation. While the rightist members of the House felt that not much was being done to curb labour indiscipline, the trade unionists who participated in this debate accused the government of being soft towards employers. The present policy of the union government, they alleged, was "anti-labour", "pro-capitalists" and "bankrupt". The public sector enterprises, they further pointed out, were outpacing the private sector in flouting labour laws. Pleas were made for workers' participation in management and for expeditious implementation of the recommendations of various wage boards. The recommendations of these wage boards, it was stressed, should not be tampered with under pressure from employers.

moratorium on strikes

There was no unanimity among labour leaders on the call of the President and the Prime Minister for a moratorium on strikes and lockouts. It was emphasised that only fundamental changes in labour laws and uniform legislation for the whole country could usher in industrial peace. A good deal of concern was expressed over the growing unemployment in the country as well as the expanding prices spiral. The Bombay labour leader, Raja Kulkarni, outlined his concept of "industrial self-government" under which elected representatives of workers and other concerned groups would be given decision-making powers on issues like production and distribution of profits. The defaults in the depositing of employers' contribution to the provident funds of the employees too came in for a good deal of criticism. The cause of women workers was championed by several members.

Replying to this debate, the Minister for Labour and Rehabilitation, Mr R.K. Khadilkar, indicated that the government

proposed to stiffen the law against defaults of payment by employers of their contributions to the employees' provident funds. He also announced that the Industrial Disputes Act would soon be extended to the employees in hospitals and universities. The government, he further stated, proposed to bring forth in the near future a comprehensive bill on industrial relations to cover all the crucial labour issues that had defied solution over the years. He expressed satisfaction at the three important trade union centres in the country having covered a good deal of ground in regard to the above comprehensive bill. Some issues, however, still remained to be sorted out, he added.

centre's difficulties

Mr Khadihar pointed out that the centre's difficulty in handling labour problems was that under the Constitution labour was a concurrent subject and states shared the responsibility of implementing the labour laws. The general economic situation in the country, which was beyond the control of the Labour Ministry, also had its impact on industrial relations. The government, Mr Khadihar added, had yet to take a final decision on the wage board system.

Vociferous pleas were made by the leftist members of the House during the discussion on the budgetary demands of the Ministry of Petroleum and Chemicals for the takeover by the government of the three private oil companies operating in the country. They alleged that these companies were charging too high a price for crude supplies and were repatriating huge funds out of their earnings in this country. It was suggested by these members that we should enter into direct negotiations with the oil producing companies for the import of crude oil. That these comments were politically motivated should be evident from the fact that the crude oil prices charged by these companies are much lower than what the Madras refinery has to pay for its crude supplies to the Natural Iranian Oil Company and its collaborators. If the legitimate profits earned over the years by these companies are being repatriated, there cannot be any objection to it as the future growth of these companies has been stalled with the result that they cannot plough back their profits into their operations. The efforts of the union government to have direct contracts for crude supplies with the oil producing countries, it may also be pointed out, have not yet succeeded.

Many members expressed dissatisfaction over the pace of oil exploration in the country. Some expressed the view that

the working of the Ministry had suffered in the recent past because of too frequent changes of ministers. The controversy over the supply of official files to the Takru Commission, which is looking into the pipelines "scandal" of the Indian Oil Corporation, figured prominently in this debate. The high prices of drugs came in for sharp criticism. The slow pace of growth in the fertilizer industry's output too was adversely commented upon.

The most important point made by the Minister in charge of the portfolio of Petroleum and Chemicals, Mr H.R. Gokhale, in his reply to this debate was that a scheme had been finalised recently for raising the production of crude oil by the Oil and Natural Gas Commission to eight million tonnes per annum by 1978 and further to 13 million tonnes a year by 1983. The present known reserves of the ONGC, it is thought, would yield these quantities.

Earlier, replying to the debate on the demands for grants of the Ministry of Defence (reported briefly in this column last week), the Defence Minister, Mr Jagjivan Ram, reiterated that "the developments in the international situation do not warrant any change in our present (nuclear) policy, which is to utilise nuclear energy for peaceful purposes only". He, however, indicated that the Atomic Energy Commission, which had drawn up proposals for a programme that included the development of 2,700 MWs of nuclear power by 1980, was studying the technology to conduct underground nuclear explosions for peaceful purposes.

close watch on Pakistan

Mr Jagjivan Ram assured the House that a close watch was being kept on the acquisition of arms and equipment by Pakistan as well as on the training and deployment of its forces. Beyond this, he preferred not to say anything on Indo-Pakistan relations in view of the proposed summit talks between Prime Minister Indira Gandhi and the Pakistan President, Z.A. Bhutto. He made several pertinent observations about the attitude of certain great powers which, he thought, were interested in maintaining tension on the subcontinent. The extension of the operations of the US Seventh Fleet to the Indian Ocean, he added, was a matter of great concern to us.

Within the constraints imposed by technology and finances and the imperative need of a frontal attack on poverty, the Defence Minister stated, the three defence services would be strengthened and their tactical power improved. The role-on five-year Plan for defence production, he

said, was being up-dated in the light of the changes in strategy and technological environments. The emphasis of this Plan was on making the country self-reliant in defence production at the earliest. The first indigenously made Leander class frigate, INS Nilgiri, Mr Jagjivan Ram disclosed, would join the Western Fleet before the monsoons. Steps were also being taken to increase the ocean surveillance capacity. In regard to the Air Force, the ground observation system, he said, was being strengthened in the light of the lessons of the last Indo-Pakistan conflict. Efforts were also being made to remedy the deficiency of deep penetration air strike capability.

better service conditions

Referring to the service conditions of defence personnel, Mr Jagjivan Ram revealed that the government was reviewing the terms of engagement and retirement of these personnel in view of the improvement in public health, higher expectancy of life and the longer period and enhanced cost of training. The pay and allowances of the defence personnel had been raised. The recommendations of the Pay Commission, he hoped, would provide for a reasonable basis for the future pay and pension structure of defence personnel. Mr Jagjivan Ram also disclosed that plans were being drawn up to settle ex-servicemen in Arunachal and the Andaman and Nicobar islands. He further dwelt at some length on the steps being taken for the placement of those disabled in the last war with Pakistan as well for the welfare of the families of those who laid down their lives in the defence of the country. Referring to the prisoners of war issue, he regretted that while Pakistan prisoners of war in India were being treated fully according to the Geneva Convention, the Indian prisoners in Pakistani hands were not being looked after equally well.

Earlier intervening in the debate, the Minister of Defence Production, Mr V.C. Shukla, revealed that the government had decided to enter the export market in respect of defence items in a big way. Already some defence products, he said, were being exported to friendly countries in consultation with the Ministry of External Affairs (last year these exports aggregated to about Rs 2.70 crores). A public sector organisation was now proposed to be set up for accelerating the exports of defence items. This, along with the production of some items for civilian use, whenever possible, he felt, would enable full utilisation of the defence production capacity which in times of peace had otherwise to remain idle to an appreciable extent.

Will rich uncle Rip van Winkle wake up?

WHAT PRICE THE DOLLAR?

BAD TIMES are more often associated with good in short than in profuse supply. So what about dollars of which the supply exceeds the demand? This is a state of affairs almost incomprehensible to the man in the street. For example, despite the UK's readiness to do so, she cannot repay her debts to the International Monetary Fund right now simply because the Fund shies away from more dollars! It is already stuffed with more non-convertible dollars than its rules permit.

What is sauce for the monetary goose could be sauce for those central bank

accepted as the strongest of all industrial countries.

rich uncle short of cash

In terms of its international balance-sheet, it is true, the USA is insolvent; the cash that it holds covers scarcely a fifth of the corresponding short-term liabilities to foreign central banks, but when, however, the long-term foreign credit balances of the American economy are included, the picture changes radically: the USA then appears as a rich uncle who just happens to have run short of small change. West Germany by comparison is like a less affluent nephew who, thanks to a favourable jackpot, has his pocket stuffed with cash, both his

will make themselves felt in due course, although it is likely to take more than twelve months for these efforts to be reflected as visible and sustained successes in the US balance of foreign trade. For the UK the consequence of, what even Left-wing economists now admit to have been, the Labour government's clumsily forced devaluation of the pound in 1967 only became apparent two years later. Moreover, a glance at the statistics shows, that the USA can point to far more stable price levels in the postwar years than many industrial countries.

an invitation to learned readers

The Intelligence Department of the Berliner Handels-Gesellschaft Frankfurter Bank takes the view that the USA owes the loss of its position in the ranks of countries geared to stability (a) to the protagonists of the new school of economics who moved into the White House under President Kennedy and who, despite their claims, did not know how to control the boom that they had unleashed, and (b) to the financial burdens of the Viet Nam war which simultaneously began to escalate at a rate as unforeseen as it has proved economically and psychologically disastrous. I should be interested if some of our learned readers would take advantage of our correspondence columns to air their views on point (a) above, about which there seems to me much to be said for and against.

Even at the present time, wages and prices are rising more slowly in the USA than in most other industrial countries, despite the very easy money policy of recent months. After long stagnation the economy has begun to pulsate once more. Existing capacities should ensure appreciable improvement in profit margins without serious new price increases. The comparatively high stocks of goods particularly dependent on imports are hardly likely to lead to prematurely fast rise in imports, and the export incentives should ensure at least some recovery in exports. But in order to ensure a return of confidence in the dollar I don't see how the USA can avoid taking steps to restore its balance of payments by acting on capital transactions. In this sector, rapid and convincing successes are both important and

WINDOW ON THE WORLD

ganders who, since August 15, 1971, have to decide whether to continue to buy dollar. At that time President Nixon had suspended not only the gold exchange obligation but also the convertibility of the dollar into any other currency. Since then the *de jure* convertibility of the erstwhile Almighty Dollar has been limited to the possibility of changing a ten-dollar note into two five-dollar bills. The US dollar, however, remains the most important international means of payment for two reasons. The first is that there is no equivalent major substitute currency which could take over the job that the dollar still does. To abandon the dollar as a trading currency is conceivable only over a longer period. Although the second reason has been pushed into the background at times during the last few months of crisis it is there just the same: the American economic potential is still

own and borrowed, and is leading an unearned gay life on the strength of it.

It is clear that, in terms of foreign trade, rich Uncle Sam has lived far beyond his means during the postwar years. His foreign investments in trade and industry were glaringly disproportionate to his overall economic savings, yet—and this is frequently overlooked today—all the time our over-confident Uncle has been drawing returns worth \$11,000 million a year from these foreign investments.

It is relevant to recall that the United States is making consistent efforts to reduce, step by step, the financial burden of its overstrained political influence throughout the world. At the same time it is working to improve its foreign trade position. Apart from a number of measures to promote exports, the effects of the monetary realignment in December

possible without endangering the economic revival. The raising of the rate on treasury bills and the increase in prime rates by leading banks are the first steps towards this.

"benevolent indifference" ?

Yet the dollar still remains vulnerable. What is needed is an additional (administrative) corset. The US government must declare its readiness to restore as soon as possible the dollar's full convertibility. America's "benevolent indifference" towards the monetary worries of its partners has devastating repercussions and any change which showed that the USA takes the needs of others into consideration would also be in her own interests. To continue the present policy would force America's partners, particularly the Europeans, purely for reasons of self-preservation to find a monetary solution which would necessarily be inimical to the dollar, harmful to world trade and therefore disadvantageous to all internationally trading countries.

The USA must know that the Europeans will not help it out by an indefinite period of floating, or by further revaluations of their currencies. Early in March the French Minister of Finance, Giscard d'Estaing, spoke for Europe when he uttered a warning to a meeting of American businessmen about this, but at the same time he added a conciliatory note by saying that the Americans could not by themselves bear the cost of a return to partial convertibility of the dollar. The Europeans would shoulder part of this burden.

The French Minister's offer is perhaps the last chance to avoid worldwide disintegration. Now it's Washington's move! Wake up Rip van Winkle!

II

Dollar Convertibility

The latest issue of the Economic Bulletin (which the authoritative Deutsches Institut für Wirtschaftsforschung, 5 Koenigin Luise Str. West Berlin 33, so kindly sends me for your benefit) offers (1) a thoughtful round-up of the historical background leading to much the same conclusions reached above by the Berliner Handelsgesellschaft Frankfurter Bank (which I have paraphrased in my own language) and (2) a complementary analysis of future possibilities.

The balance of payments of individual countries and country-groups reveal the extent of disequilibrium in 1971, a year

that saw the most serious international monetary crisis since World War II.

The USA's balance of monetary movements presumably closed the year with a deficit of around \$30,000 million. Official results were, at the time of writing, available only for the first three quarters. The broadly dispersed accumulation of foreign exchange in the rest of the world was almost exclusively in dollars. The dollar purchases of these countries' central banks in 1971 amounted to \$28,000 million (1970: \$7,300 million). The flow of dollars continued even subsequent to the US government's currency measures of August, 1971.

causes for purchases

A number of causes were behind the jump in dollar purchases by the central banks in 1971. For the first time in the twentieth century there was a deficit in America's balance of trade, which slipped \$5,000 million in one year. The invisible balance, on the strength of sharply increased return on capital, presumably showed a higher surplus than in 1970. This, however, was far from compensating a \$4,500 million deterioration in the visible balance. The deficit in the goods and services balance was furthermore accompanied by a sharp increase in the export of long-term capital in rising direct and portfolio investment. The deficit in the basic balance, in 1970 only \$3,000 million, rose to around \$12,000 million in 1971. Augmenting the basic deficit, investment in short-term debt also rose sharply. This mostly involved dollars which commercial banks and firms cashed in at central banks. This and, to a certain extent, the export of long-term capital arose from speculation against the dollar inevitable in such circumstances.

The other industrialised countries attempted gradually to lessen the influx of dollars, primarily by floating their currencies. Anxious, however not to see their exports of goods and services constricted to the degree necessary to eliminate the US balance of payments deficit and, for this reason, only gradually permitting a revaluation of their currencies, these countries, with few exceptions, had no choice but to continue buying dollars.

The devaluation of the dollar finally achieved with the realignment in December, 1971, when compared to other industrial countries, was approximately 11 per cent (in terms of all currencies there was only an 8 to 9 per cent depreciation as many developing countries chose to retain the old dollar parity). Decisive here was the US government's willingness after long reluctance to lower the dollar's

gold value by 8.6 per cent.

Despite this dollar devaluation, which largely corresponded to general expectations, speculation against the dollar has not ceased for two reasons. First, the US balance of goods and services closed 1971 worse than expected, causing doubts as to whether the negotiated parity change can effect a sufficient improvement. These doubts are strengthened by the comparative business cycle conditions between the US and western Europe which, at present, cast a shadow over US foreign trade prospects. While real GNP in the USA has risen to 6.5 per cent (current annual rate), a rate of about 3.5 per cent prevails in the other industrialised nations. There will, therefore, be no rapid expansion of imports by these countries over the short term, and this will prevent an expansion of US exports to the extent hoped. US imports, on the other hand, will rise above desired levels. (On this point the DIW differs from the Frankfurter Bank).

III

Was the Re-alignment Sufficient?

A change in this unfavourable business cycle will occur only when an upswing begins in western Europe and Japan, but the Deutsches Institut thinks that this is hardly to be expected before the second half of 1972. Only then does the Institut believe that it can be seen whether the realignment was sufficient to solve the US balance of payments problem. Assuming about \$3,000 million per year to be a "normal" level for US transfer payments and adding another \$4,000 to \$5,000 million for the export of long-term capital, a surplus of from \$7,000 to \$8,000 million would have to be achieved to avoid further outflow of dollars. The realignment thus can be regarded as a success only if the American balance of goods and services is improved by about \$8,000 million. If the considerable dollar liabilities are to be gradually reduced, an even greater surplus must be achieved.

Another cause of continuing speculation against the dollar is the failure to deal with problems pertaining to the restoration of the dollar's gold convertibility at the monetary conference in Washington. Private propensity to accumulate dollars is therefore diminished, but the dollar flow will increase as long as the US balance of payments is in deficit. It is thus obvious that without a solution of convertibility in the near future, speculation about the dollar's future must continue. This is particularly true in view of the interest rate gap between the USA and Europe, which reinforces the flight from the dollar. Not

only would this gap have to be eliminated, but tipped significantly in the opposite direction, before private persons would be sufficiently attracted to dollar investment in the absence of dollar convertibility.

Dollar convertibility, however, will hardly be possible before a reserve medium is available against which dollars can be traded. Present US holdings of gold and foreign exchange are not sufficient, even at the new exchange rates, to underwrite dollar convertibility as long as the dollar itself must perform the functions of reserve currency. Were dollar convertibility to be reintroduced under present conditions, enormous dollar holdings by foreigners, which have arisen through US payments deficits in the postwar years, would force the US to a devaluation. Exchange-rate revisions would then again be necessary. The problem of providing the world economy with a stable reserve medium would remain.

An expansion of Special Drawing Rights at the International Monetary Fund as an artificial reserve currency can be carried out only by international agreement. A reform along these lines is still opposed by

some countries, which view the transformation of dollar holdings into SDRs as simply pouring the international liquidity created with the dollar glut from an old bottle into a new one. In addition they fear that SDRs could provide an added impulse to future international inflation.

It seems that these countries favour a solution which would once more increase the importance of gold. But, argues the DIW, the gold supply and annual production of gold even after the realignment and resultant higher price of gold, are insufficient to cover international requirements for reserve currency. The price of gold — in terms of all currencies — would have to be raised drastically in terms of the dollar; to free the USA of dollar liabilities, the price of gold would have to be increased many times over. Only then could all dollars presented to US central bank be converted into gold instead of SDRs.

Subsequent to a monetary reform giving a larger role to SDRs, the other industrialised countries could co-operate on a consolidation of US dollar liabilities in order to prevent excessive conversion of the

foreign dollar holdings into SDRs. A portion of their short-term dollar credit might be converted into long-term credit with the stipulation that amortisation of this consolidated debt would be gradual and dependent on the balance of payments situation.

In the absence of either such a consolidation of dollar liabilities, or a broadening of SDRs, or — in the final analysis — a sharp increase in the price of gold, the non-American industrialised countries will have to learn to live with sharply increased dollar reserve at their central banks.

Non-American central banks must furthermore be prepared to absorb additional dollars or to provide some other form of standby credits in order that the USA should not be forced back on damping measures at a time when the degree of capacity utilisation of labour is still too low. Support for the dollar through a hard-currency loan, similar to that extended to Britain in past years, would be preferable to a further inflation of the dollar supply. The USA could then wait until economic conditions are such as to reinforce rather than counteract the improved competitive-

LAGAN LEADS

ness gained with the realignment.

Such, stop-gap assistance should not, however, divert attention from the overdue basic reform of the international monetary system. The decisive task is the replacement of the dollar, and eventually gold as well, with a stable medium for international payment which would provide an accounting unit against which all na-

tional currencies would be measured. Once the dollar is relieved of its reserve function, the USA would be forced, like other countries, to set the dollar exchange rate in keeping with balance-of-payments requirements. The expectable changes in the dollar rate then would not disturb the entire monetary system.

Sources and acknowledgements: The fore-

going summarises views recently set forth in the Berliner Handels-Gesellschaft Frankfurter Bank's fortnightly letter and the Deutsches Institut für Wirtschaftsforschung's Monthly Economic Bulletin. These institutions can, however, hardly be held responsible for the translation of their economic jargon into what I guess it to mean, nor for my interspersed comments, based on a variety of sources.

SAVE A LOT OF MONEY
AND A WHOLE LOAD
OF TROUBLE...

GET **Standard**
ELECTRIC VEHICLES
WORKING FOR YOU

Now available on
D.G.S. & D. Rate Contract—
'Standard' electric truck.

Why put up with the noise, the fumes, and all the nagging maintenance worries of petrol or diesel powered vehicles when you could be using STANDARD ELECTRIC VEHICLES?

Electric vehicles cost only 1/3 as much to run as other powered vehicles. They don't make a noise, fume or vibrate; their solid and simple design makes for easy maintenance and unrestricted manoeuvrability; and this means they last longer—you can reckon on 50% longer life expectancy.

And if your vehicle is in Bombay, you get a BONUS advantage with STANDARD—we'll service

your vehicles free for one year. But wherever you live, our factory trained and experienced personnel will service your vehicles and batteries at the same time, to save you the bother of two separate operations. □ So wake up from the vehicle nightmare with STANDARD's range of electric vehicles. They are made to cater for any load up to 3 tons and there is a whole range of trucks and tractors to choose from.

For further technical and engineering information, write to: The Commercial Manager, The Standard Batteries Limited, Vakola, Santa Cruz, Bombay 55 AS.

UNTAS-STA. 15-200

It is a curious fact of

Indo-American relations that, barring the short period when Lal Bahadur Shastri was at the helm of affairs in New Delhi, the political understanding or even the personal respect between President and Prime Minister had always been less than perfect. That, presently, there is no love lost between the White House and I, Safdarjung Road is known widely enough. Nevertheless there is surely a close resemblance between Mr Nixon's style of government and Mrs Gandhi's. Both draw heavily on personal advisors not merely for advice or information but also for planning strategy or making decisions. If Mr Nixon has Dr Kissinger, Mrs Gandhi currently has Mr D.P. Dhar. If Dr Kissinger is a scholar by profession, Mr Dhar is a scholar by preference and it is certainly no accident that the scribes in the press have lately been working over-time to publicize Mr Dhar's love of literature, particularly Urdu poetry.

Dr Kissinger is reputed to be very much a ladies' man and this aspect of his personality has been lavishly detailed and discussed in the American Press. The newspapers and periodicals in our own country have so far not deployed their investigative resources or gifts, such as they are, in this area of reporting. Whether Mr Dhar feels or has reason to feel thankful for this small mercy I do not profess to know. "Ariel", in his column in *The Sunday Standard*, however, recently made a casual reference to Mr Dhar's love of the good things of life. This cryptic observation, coming as it does from Mr Frank Moraes, may perhaps be readily taken to imply that Mr Dhar is a connoisseur of a certain famous product of Scotland for which there is a very strong global market. But, then, Mr Dhar may be a teetotaler for aught I know, in which case Mr Frank Moraes may perhaps be a little more explicit when he next does his stint for *The Sunday Standard*.

The politics of West

Bengal may become stabilised sooner than the politics of some of its public men. Take, for instance, Mr Siddhartha Shankar Ray. It is possible that he has to live down some of his professional past for the sake of much of his political

present. Even so he could surely have been less exhibitionistic in going through such purification ceremonies as he may consider necessary or rewarding. As it is, the ostentatious way in which he has gone about convening a meeting of his cabinet to discuss the all-important question of his and his colleagues' social relations with the so-called monopoly houses and the flamboyant manner in which he has been proclaiming for the benefit of all and sundry the earth-shaking event that his cabinet, in its virtuous wisdom, has decided that the Chief Minister and other ministers of the West Bengal government should not have any social relations with the businessmen in question is a very sad instance of the collapse that is taking place in the standards of our public life thanks to the politics of commitment. Mr Ray ought to be a man of some intelligence; otherwise, he could not have been making big money in the legal profession, although it is true that he had immense inherited advantages. Being a reasonably intelligent man, then, Mr Siddhartha Shankar Ray should certainly have known that the Buddha-like pose that he is now striking is more a reflection on him than on the monopoly houses against whom he has announced his social boycott. There is the story, for instance, of a certain lady of pleasure, who suddenly saw Light. When, one fine morning, she stood up and declared that she had decided to be a woman of virtue, even those who had not heard about her before naturally began speculating about what she had been up to all along.

Our national genius is a great one for creating one class of sinners after another. Now the high priestess of our national destiny and the numerous pujaris of varying ranks who trail after her seem to have decided to create yet another class of sinners or social outcasts. There is no doubt an act on the statute book about monopolies and restrictive trade practices but even this act has not declared that the so-called monopoly houses as such constitute a criminal tribe. Why then should the Chief Minister of West Bengal take it upon himself to offer gratuitous insult to some of the citizens of this country who are in no way inferior in civic status to Mr Ray or his fellow politicians. Surely no one of any sensibility could have been so

wanton in his indulgence in unwarranted offensiveness.

If Mr Ray or his fellow ministers, for reasons of their own, do not want to be seen in the company of this business man or that on social occasions, he or they are certainly free to please themselves. But, even then, is it absolutely necessary that they should play so openly to the gallery? There could be, of course, a section of the public which may be taken in since it is certainly possible for politicians to fool some people for some time. But there is surely a much larger section of the public in West Bengal and outside which must think only poorly of ministers who consider their reputations to be so brittle that they must be protected from temptations or suspicions in as ostensible manner as possible. Not long ago, there were regal men in this country who were not afraid to insist on the world judging them on their own terms. They could afford to do so, because they were no small men. They too had heard that Caesar's wife must be above suspicion. But they also knew that this did not mean that Caesar's wife should stand in the market square wearing a chastity belt and little else.

The way the tragic inci-

dent in which a schoolboy died in the capital after eating opium preparation was reported in some of the local newspapers raises the question whether the press is far too liable to yield to the temptation to suppress some of the relevant particular or even the main facts for reasons which have nothing to do with sound professional reporting. *The Indian Express*, *The Times of India* and *The Hindustan Times* duly informed their reader that the boy was suspected to have died after taking some drug or "trip pill". But, while *The Indian Express* and *The Times of India* also said that the boy was studying at Modern School, *The Hindustan Times* spoke only vaguely of "a local boarding school". As for *The Statesman* it not only did not identify the school but it also had its staff reporter narrating a meandering tale about the boy having eaten somewhere and about "symptom indicating food poisoning". The Delhi edition of *The Statesman* has a much smaller circulation than the Delhi edition of *The Hindustan Times* or *The India Express* which means that *The Statesman* could (and does) put this edition "to bed" somewhat later than the other papers. Its staff had therefore that much more time at its disposal to do this story. I cannot therefore be pleaded that the incompleteness or the misleading nature of the report was due to the pressure of the press deadline.

BOMBAY, 20th April, 1972.

Schedule to the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that—

(a) In our opinion and to the best of our information and the explanation given to us and as shown by the books of the Bank:—

(i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1971, and

(ii) the profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;

(b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;

(d) The returns except for Pakistan Branches—See Note (2) received from the branches of the Bank have been found adequate for the purposes of our audit.

PRESENTING THE LIGHT FANTASTIC!

The PHILIPS *TLE* Reflectalite a tubelight with a built-in reflector.

A brilliant new concept.
The TLE Reflectalite is a tubelight which has an inner reflector coating. This reflector coating may well be the greatest invention in fluorescent lighting. Because of its many benefits, the whole of the West has switched over to it.

It gives more light where you want it.
The TLE Reflectalite's coating prevents light from escaping upwards. It reflects the light downwards. So you get more light where you want it.

It is India's first dust-proof lamp.
When dust falls on an ordinary lamp, its light level goes down. Not so in the Philips TLE Reflectalite. Dust has no effect on it. Because of this you save a lot on maintenance.

It outshines all other tubelights.
Tests prove that the Reflectalite maintains lumen output twice as long as that of any other tubelight.

Better value for your money. Philips TLE Reflectalite is the ideal tubelight for your factory, office, shop or home. It will give you better light. And it will save a lot of money for you.

**PHILIPS

UNCTAD III

THE DISCUSSIONS at Santiago moved at a slow pace in the third week of deliberations. The suggestion by the United Nations that the industrialised countries should step up the volume of their assistance and should ease the debt-servicing burden came in for severe criticism by the UK. The British delegate Mr D. Williams expressed doubts regarding the ability of the donor countries to increase their assistance to developing countries. In the case of Britain, he was not sure if official assistance could be raised to 0.7 per cent of its Gross National Product in 1975. If the developing countries were in poor condition in regard to servicing their debts, they themselves had to blame for it, according to the British delegate. Mr Williams was of the view that the progressive softening of loan terms was becoming the most positive aspect of loan-granting.

The Chinese delegate Mr Yen Chia-Hua said that his government was opposed to the political pressure that the lender states exert over the borrowers which, in turn, tended to increase the earnings of the developed countries. When economic aid was given, the sovereignty of the country that received benefits should be respected without seeking any privileges of any kind, added Mr Yen Chia-Hua. China's Deputy Foreign Minister, Mr Chou-Hua-min, criticised both the USSR and the USA. He said that China was opposed to "the one or two super-powers that subject the countries of Asia, Africa and Latin America, as well as other regions of the world, to aggression, subversion, expropriation, intervention and vexations."

Mr H. Lal, India's Foreign Trade Secretary, urged the international community and financial institutions to help the land-locked countries to create an infrastructure and adequate systems of transport and communications to solve the problems faced by them. He said

that India had provided resources to assist the development of its land-locked neighbours and that it would offer its fullest co-operation to any project framed in that direction.

As the third week of the discussions at Santiago was approaching its close, signs of a split in the group of "77" was witnessed in regard to the list of the 25 less developed nations. The list drafted earlier had been termed as "unjust" by Latin American representatives. It was suggested that the criteria should be altered so as to include the Central American Republics, Ecuador and Bolivia.

A Canadian proposal to enhance the volume of multilateral aid was described as the most enlightened measure on development aid suggested so far at the Conference. Canada had proposed that the annual flow of total multilateral aid should be increased from the current level of \$1,500 million to \$2,000 million.

Power Development

The Ministry of Irrigation and Power has appointed a 28-Member Working Group for formulating proposals for the power development programme for the fifth Plan period. Headed by the secretary to the Ministry of Irrigation and Power, Mr B.P. Patel, the Working Group will include senior officials of the Central Water and Power Commission and concerned central ministries and departments, chairmen of the five regional electricity boards and the Director General of Technical Development. After assessing the future

power demand in the five regions in the light of industrial and other targets, the Group will suggest tentative power targets for 1983-84 as well as the most economical combination of hydro, thermal and nuclear generation programmes.

Five Study Groups have been formed for assisting the Working Group. They will carry out studies in depth on (i) load demand; (ii) planning power generation; (iii) system planning; (iv) rural electrification; and (v) management in regard to equipment, materials and personnel.

Sugar

New Tariff Value : The government of India revised the tariff value of crystal sugar produced in vacuum pan factories from Rs 190 to Rs 200 per quintal with effect from the midnight of April 30/May 1, 1972. The new tariff value will apply only to sugar which is sold in the free market. The sugar delivered to and lifted by the government for distribution to domestic consumers at fair prices or for meeting other emergent needs will continue to be assessed on the basis of a value of Rs 135 per quintal.

Fall in Production : Large-scale diversion of sugar-cane and a bad crop in the northern belt brought down production in sugar mills in the season that ended with March, according to the Indian Sugar Mills Association.

Though the mills offered Rs 10.13 a quintal, sugar cane growers were attracted by the gur and khandasari manufac-

turers who offered more in western Uttar Pradesh.

The total sugar production in the six months of October-March was 2,807,000 tonnes against 3,085,000 tonnes produced in the same period last season. The mills produced 492,000 tonnes in March this year against 682,000 tonnes in March last year.

Exports were also less this season because of the lower international quota. They totalled 63,000 tonnes this season which was less than the exports of last year by 94,000 tonnes. Despatches for domestic consumption rose slightly from 1,880,000 tonnes to 1,991,000 tonnes.

The factories held a stock of 2,158,000 tonnes on March 31, 1972 whereas their stock on the same day last year was 3,132,000 tonnes.

Companies Act

The central government has, by three notifications published in the Gazette of India Extraordinary dated April 24, 1972, amended the schedule of fees payable under the Companies Act, 1956, for filing returns/documents, etc., with the Registrar of Companies for making applications for obtaining the approval, sanction, condonation of the central government and for filing appeals before the central government under Section 111(4A) of the Companies Act, 1956.

The new rates of fees took effect from May 1, 1972 and all returns, documents, etc., filed with the Registrar of Companies or applications, appeals, etc., preferred before the central government on and after that date should be accompanied with the fees as are payable as per the new rates.

Summary Assessments

The Finance Minister, Mr Y.B. Chavan, told Income-Tax Commissioners, gathered in the capital for their annual conference, that they should take vigorous and effective

steps to combat tax evasion. The conference discussed the entire gamut of tax administration. The topics for discussion included the Wanchoo Committee's report, steps for combating tax evasion and strengthening the enforcement machinery, building up proper expertise on prosecution, introduction of permanent account numbers to each tax-payer and reduction of tax arrears.

Referring to the problem of tax arrears, the Finance Minister said it was gratifying that the arrears brought forward on April 1, 1971, had been reduced by about Rs 250 crores during 1971-72. The department should, however, take timely steps to enforce the collectible demands. Coercive steps should be taken, if necessary, to collect taxes from affluent defaulters like film artists.

The conference decided that the bulk of the tax returns should be brought within the scheme of summary assessments. These assessments are completed on the basis of the returns filed by the tax-payers without requiring them to appear before Income-Tax Officers. The conference also noted that the scheme of summary assessments could be effective only if it was accompanied by the full vigour of penal provisions in cases of tax frauds. It was decided to pick up a small percentage of cases for detailed scrutiny; if any fraud was detected, the tax-payers would be prosecuted. The powers of search and seizure under the tax laws will also be increasingly used to unearth concealment of income and wealth.

The allotment of a permanent account number to each tax-payer throughout the country will be completed by the beginning of next month. This will help link up all papers relating to a particular tax-payer and thus ensure proper maintenance of records.

Cases of foreigners, foreign enterprises and Indian enterprises having foreign collabora-

tion will be centralised with selected income tax officers in Commissioners' charge. These cases involve fairly complicated issues and are important from the revenue point of view. The conference decided to increase the strength of tax recovery officers in order to tackle the problem of tax arrears more effectively.

Sillimanite

In pursuance of the declared policy of the government to extend the role of the public sector in the export trade of the country, it has been decided to canalise the export of sillimanite of all grades and varieties through the Minerals and Metals Trading Corporation of India Ltd, New Delhi, with effect from April 29, 1972. Sillimanite is an important mineral used in the production of special purpose refractories.

White Oils

A process for the manufacture of white oils has been developed at Indian Institute of Petroleum, Dehradun. The process is available with the National Research Development Corporation for marketing.

Improvement of Slums

The Ministry of Works & Housing has sanctioned Rs 17.63 lakhs to Bombay and Hyderabad under the newly introduced central scheme for environmental improvement in slum areas. Bombay will get Rs eight lakhs to carry out improvements in 31 slums in the city, the total cost of which is expected to be Rs 31.04 lakhs. Hyderabad will receive Rs 9.63 lakhs out of Rs 38.42 lakhs for three schemes in Hyderabad/Secunderabad.

Environmental improvements to slums normally consist of providing water supply including drinking water taps, sewers, storm water drains, community baths and latrines, widening and paving of existing lanes and street lighting. Only such slum areas will be selected where water, electricity and

sewer mains are available on their periphery. Initially 11 cities having population of over eight lakhs have been selected. They are Calcutta, Greater Bombay, Delhi, Madras, Hyderabad, Ahmedabad, Bangalore, Kanpur, Poona, Nagpur and Lucknow.

Escorts Tractors

Escorts Tractors Ltd is the recipient of a loan of Rs 90 lakhs from the USA. The loan agreement was signed in the capital on May 4, by Mr Howard E. Houston, Minister-Director, United States Agency for International Development (USAID), and Messrs Rajan Nanda, Managing Director, and C. K. Hazari, Director, of Escorts Tractors Ltd.

Escorts Tractors Ltd is an affiliate of the Ford Motor Company of the United States. Its Rs 10-crore tractor plant, located at Faridabad in Haryana, will be completed in three 12-month phases by 1973. With the completion of the first stage last year, the first Ford tractors rolled off the assembly line.

As much as 50 per cent of the value of the tractor is now accounted for by parts produced in India. Eventually, almost all tractor components will be made in India. Only a few sophisticated components not produced in the country will be imported.

The Escorts tractor project which will be capable of producing 6,000 units a year, will ultimately help this country save as much as Rs 15 crores in foreign exchange every year.

The loan has been received from the sales proceeds of agricultural commodities supplied to India under the US Public Law 480 (Food for Peace) Programme.

TV Stations

Information and Broadcasting Minister Mrs Nandini Satpathy stated in the Parliament recently that the government had planned to set up television stations in all the

state capitals in the next few years. She said the Bombay television station was expected to be commissioned in October, 1972, and the Calcutta TV station in March 1974. She further said that the coverage of the Bombay station, including that of the relay station at Poona, would be 36,500 square kilometres. The Calcutta station would serve people in 18,000 square-kilometre area.

India-USSR Air Services

Talks between India and USSR on civil aviation matters concluded in the capital on April 26, with the signing of protocol on development of air services between the two countries. The national air carrier of the USSR, Aeroflot, is at present operating three flights a week via Delhi and one via Calcutta with traffic rights and one transit service. Air India operates two flights per week via Moscow. Air India and Aeroflot are operating flights under a revenue pooling agreement, whereby all revenues earned by the two airlines from the carriage of direct passengers, cargo and excess baggage between India and USSR are pooled in accordance with average tariffs agreed between the airlines.

Indo-Soviet Trade

India's demands for increased supplies of fertilizers, non-ferrous metals and newsprints have been met in the Indo-Soviet trade protocol for 1972. The Foreign Trade Ministers of the two countries, Mr L.N. Mishra and Mr Nikolai Patolich, signed the document in Moscow on May 5. The protocol envisages sale of up to Rs five crores worth of Soviet tractors to India as a prelude to co-operation in building Indian capacities in tractor manufacture.

Both countries have agreed to set up a joint committee of the two ministers and officials to further expand trade. This year's target is Rs 500 crores with the turnover expected to exceed the 1970 volume by 30 per cent. Zinc and copper are

among items India will get in large quantities this year. The copper quota has been increased nearly four-fold—from 400 to 1,500 tons. The newsprint quota exceeds 50,000 tons. The Soviet Union will also supply over 200,000 tons of fertilizers. Yet another item included in the protocol is kerosene, of which the Soviet Union will supply 500,000 tons.

India will increase consumer items in its exports to the Soviet Union, including garments, hosiery and cosmetics. The value of cosmetics alone is to be over Rs eight crores. Industrial items in the list include garage equipment, accumulators, power cables, wire ropes, chemicals and paints.

Gold-Dollar Parity

The US Treasury has officially notified the International Monetary Fund regarding the new parity of \$38 an ounce. The new parity which is higher by three dollars was rectified by Congress in March this year following December's international monetary agreement. The new rate came into force on May 8, 1972.

Vanaspati Prices

Prices of vanaspati have been reduced by 10 paise per kg. in all the zones in view of the fall in the prices of groundnut oil in recent weeks. These reductions have been effected after adjusting the increase in packing costs. The revised prices will take effect from May 8.

According to a press note the maximum retail prices of vanaspati will be as follows:

Zone	16.5 Kg Rs	4.0 kg Rs	2.0 kg Rs	Loose per kg Rs
North	80.96	21.64	11.34	4.91
South	79.90	21.38	11.21	4.84
East	81.35	21.74	11.38	4.93
West	79.78	21.35	11.19	4.84

EASTERN ECONOMIST

SISMA Opposes Price Control

The Vice-President of South Indian Sugar Mills Association, Mr P. Maruthai Pillai, told newsmen here recently that his association was strongly opposed to the demand of some sections of the sugar industry in UP and Bihar for the control of sugar prices in the southern region, including Maharashtra, and lifting of the control on north Indian mills. No doubt, the north Indian sugar industry's cost of production, he said, had been adversely affected by the short duration of the season and the competition for cane supplies from gur and khandasari manufacturers. The correct way of alleviating its distress was to provide some concession in excise duty. The imposition of price control on the production of a section of the industry, he pointed out, would not only be discriminatory but would also lead to a setback to this section's production. He wanted a uniform policy for the entire industry. He, however, did not have any objection to fiscal relief being provided to those units which suffered from special disadvantages.

Quality Control

Over 100 new items were brought under the Compulsory Quality Control and Pre-shipment Inspection Scheme during 1971-72. These items include: transmission line towers, aluminium chloride, barium chloride, calcium carbonate, potassium permanganate, zinc sulphate, a number of jute products, coriander, frozen lobster tails etc. More than 570 items have been brought under this scheme since the incep-

tion of the Export Inspection Council, some eight years back.

The Council, which met in the capital on May 5, under the chairmanship of Mr V. Shankar, reviewed various schemes of Compulsory Quality Control and Pre-shipment Inspection under operation. It was disclosed that the government of India has approved a scheme, recommended by the Council, for assaying of articles and jewellery made of gold. This scheme, which is likely to come into force from July 1, 1972, contemplates hall-marking of gold articles indicating the purity of gold on the pattern being followed in the UK.

The Members of the Council were informed that arrangements have already been initiated by the Council to enable the fish exporters to meet the requirements laid down under the proposed US Fish Inspection Bill. This envisages strict bacteriological standards and sanitary and hygienic conditions in fish processing units.

Gratuity Law

A higher ceiling on the amount of gratuity payable to industrial employees and more stringent penalties for employers who fail to pay gratuities are among the major recommendations of the Lok Sabha Select Committee on the Payment of Gratuity Bill. The committee has, however, suggested that an opportunity should be given to the employer to prove before a court that the gratuity rule was contravened without his knowledge, consent or connivance, and that he "used due diligence on his part to enforce the Act." The bill provides for a gratuity payment system for employees of factories, mines, plantations, oil-fields, ports, shops and other establishments.

To provide an incentive to employees to work beyond 30 years of service, the committee has urged that the ceiling on the amount of gratuity payable to an employee should be raised from 15 months' wages to 20 months' wages.

The committee has held that gratuity should be forfeited if an employee is dismissed for an offence involving moral turpitude, provided that the act constituting such an offence is committed in the course of his employment.

While ruling that periods of illegal strikes should not count as part of continuous service, the committee has held that "lay off" periods should be considered as part of continuous service. For persons employed in seasonal work, the committee has suggested that employment for 75 per cent of the working days at an establishment during a season should be deemed equivalent to continuous service. The qualifying period of five years' service has been endorsed as minimum for gratuity payment. But the committee has held that there should be no minimum qualifying period in cases where an employees' service is terminated by death or any disablement because of an accident or disease, as against the limitation of the proviso to 'total disablement' in the original bill.

Names in the News

Air Marshal Y V. Malse, Air Officer-in-charge of Maintenance at Air Headquarters, has been appointed Deputy Chief of the Air Staff in place of Air Marshal H.N. Chatterjee who retired in March. Air Marshal Yeshwant Vinayak Malse (50) will be in charge of Air Force operations. He joined the Air Force in 1940 and saw action during the Second World War in Burma. He was a member of the high-powered joint planning committee set up to draw a blueprint for the country's defence requirements after the Chinese operations in 1962. In 1964 he took over as Air Officer Commanding-in-Chief, Eastern Command. He was made Air Marshal in August, 1969. He is a winner of the Param Vishisht Seva Medal.

The International Development Research Centre, Ottawa, has announced the award of

MAY 12, 1972

Research Fellowship to Professor M.L. Dantwala, chairman of the Department of Economics at the University of Bombay. Professor Dantwala will spend his tenure as research fellow, which begins in July this year, in undertaking a study "In Search of a Better Understanding of the Problems of Poverty in Rural India". Together with one or two other senior scholars, Mr Dantwala plans to study at all levels from the Secretariat in New Delhi to the villagers who are supposed to have benefited.

Mr Kisan Mehta, 45, who heads the Indian business of Coca-Cola has been appointed Vice President and Area Manager. Mr Mehta is the first Asian to be named Vice President of this global company.

Mr James Samuel Raj took over the chairmanship of Unit Trust of India (UTI) from Mr R.S. Bhatt on May 2, 1972. Mr Raj, who has been the Managing Director of the Industrial Investment Trust Ltd, will be full time chairman of UTI.

With effect from May 1, 1972, four new Trustees have been appointed by the Reserve Bank of India on the Board of Trustees of the UTI under Section 10 (b) of the Unit Trust of India Act, 1963. Their names are: Dr V.V. Bhatt General Manager, Industrial Development Bank of India; Mr V.G. Rajadhyaksha, Chairman, Hindustan Lever Ltd; Mr M.V. Arunachalam, Managing Director, Carborandum Universal Ltd; and Mr C.P. Mukherjee, Senior Partner, P.K. Mitra & Co.

The following were elected office bearers of the Public Relations Society of India (National Council) at the Annual General Meeting held recently at Bangalore: President — Mr Gyan Haksar (Easun); Vice-President — Mr Sanat Labiri (Dunlop).

Mr Kamalnayan Bajaj, Congress leader and industrialist, died in Ahmedabad on May 1, after a heart attack. He was 60. He was son of Mr Jamnalal Bajaj, an associate of Mahatma Gandhi. He was associated with the Bajaj Electricals, Bajaj Auto, Mukand Iron and Steel Works and Batala Engineering Works.

The Congress president, Mr D. Sanjivayya, died on May 7, at his residence in the capital, following a heart attack. He was 51. In 1953, he became Minister for Planning, Labour

and Public Health in the Andhra Cabinet under Mr T. Prakasam. Later he was Minister for Transport, Taxes, Law and Co-operation under Dr B. Gopala Reddy. From 1956 to 1960 he was Minister for Co-operation, Social Welfare and Religious Endowments under Mr N. Sanjiva Reddy. He became the Chief Minister of Andhra Pradesh and continued in that post till March 12, 1962. He was Congress President from June 6, 1963 to January 6, 1964. On January 24, 1964, he was sworn in as the youngest member in the central Cabinet incharge of Labour and Employment. He was Minister for Industry in Mrs Indira Gandhi's Cabinet in January 1966. On Feb., 18, 1970, he was sworn in as Minister for Labour and Rehabilitation. After the mid-term poll to the Lok Sabha last year, he succeeded Mr Jagjivan Ram as Congress President.

COMPANY AFFAIRS

Bharat Commerce

BHARAT COMMERCE and Industries Ltd has suffered a slight setback in its working during the year ended December 31, 1971, with sales declining from Rs 19.17 crores to Rs 18.50 crores and gross profit moving down to Rs 69.75 lakhs from Rs 155.35 lakhs in 1970. Acute shortage of raw materials, staple fibre in particular, has hampered the operations of the company during the year. The situation became almost critical when the supply was completely stopped due to the closure of the wood pulp plant of the largest manufacturer of staple fibre in the country. This led naturally to under-utilisation of capacity in all the four plants. Apart from dearth of essential raw materials, other factors such as sluggishness in the off-take of blended fabrics and escalation in costs of production and wages over which the company had no control have also affected adversely the working of the company during the year. However with the easier availability of staple fibre and polyester fibre and diversion of part of the plant capacity on cotton spinning and a slightly encouraging trend in the off-take of products, a distinct improvement in sales and profits is expected during the current year.

Despite the steep fall in profits the directors have maintained the equity dividend at 12 per cent. Out of the gross profit, a sum of Rs 53.29 lakhs was set apart to depreciation reserve as against Rs 54.03 lakhs in 1970 while the allocation to development rebate reserve was enhanced by Rs 0.73 lakh to Rs 4.73 lakhs. An amount of Rs 4.99 lakhs was provided for gratuity as against Rs 26.74 lakhs in 1970 while directors'

remuneration absorbed Rs 80,731 as compared to Rs 1.39 lakhs in the preceding year. No allocation has been made for taxation as against Rs 37.00 lakhs earmarked in 1970. This leaves a profit of Rs 5.94 lakhs as compared to Rs 32.19 lakhs in the previous year. With the addition to excess provision for taxation written back of Rs 1.43 lakhs, the amount available for appropriation comes to Rs 7.37 lakhs which has been transferred to general reserve out of which dividends—equity and preference—amounting Rs 22.56 lakhs will be paid.

Hindalco

Aluminium as a power-intensive industry is heavily dependent on an uninterrupted supply of power for its successful operations. Hindustan Aluminium Corporation's production, for instance, would have easily crossed the 80,000-tonne mark but for the 25 per cent power cut enforced by the UP State Electricity Board (UPSEB) during Jan.-June 1971. The uncertain power supply position, aggravated by and on by the arbitrary power cuts imposed by the UPSEB under the pretext of inadequate rainfall and the consequent imposition of exorbitant tariffs for the reduced power supplied, is causing very much embarrassment to the company as disruption in power supply is leading to dislocation of production schedules and consequent loss of revenue. The management, the directors stress in their annual report, is contesting such unjustifiable and wayward actions of the UPSEB as being against the specific provisions of the long-term agreement entered into by the two parties. Though it was

mutually agreed upon to refer the matter to arbitration the UPSEB, strange to say, has issued a notice threatening to cut the power supply. The unreasonable attitude and militant posture of the UPSEB has compelled the management to move a writ petition in the high court and obtained a court order staying such action by the UPSEB. The matter, according to the directors' report, is pending before the Allahabad High Court. The UPSEB has also refused to renew the agreement which provides for the supply of additional power in the case of an emergency and shutdown of any of the Renuagar thermal units for repairs. In this case too the management had to move the matter to the court to obtain an interim order to the continuance of power supply. As aluminium industry has gained national importance, it is desirable that an amicable settlement is reached between the UPSEB and the company in the absence of an assured supply of power the vastly expanded capacity built up at a great cost cannot be effectively utilised.

Escorts

Impressive rise in sales, handsome increase in reserves, and further diversification in production range are some of the creditable achievements of Escorts Ltd during the year ended December 31, 1971. Sales continued to advance at an accelerated pace and a new record was set up during the year with the crossing of Rs 40-crore mark thereby excelling its performance in the previous year by as much as Rs 1.12 crores. The contribution of tractors towards sales volume was quite significant. Although

the company succeeded in selling 8994 units, tractor sales would have been appreciably higher but for the imports of fully built-up tractors authorised by the government which forced the company to curtail production. However with the price increase on tractors allowed by the government in February 1972, the company was able to effect marked improvements in product range and launch a new tractor — Escort 3036 — with water-cooled engine and with the addition of several new features. It is heartening to note that the company's all other product lines too have maintained their uninterrupted record in progress both in sales and profitability. Further with the introduction in the near future of a new sports model of Rajdoot motorcycle, a significant step up in production of scooters and with the rising demand for yellow-line industrial equipment, loaders and tuggers in particular, an encouraging rise in turnover and profits is expected during the current year. The company has earned a profit of Rs 70.97 lakhs as compared to Rs 101.75 lakhs in 1970. The profit has been arrived at after providing Rs 90.42 lakhs to depreciation, Rs 66 lakhs to taxation and Rs 120.01 lakhs towards interest charges as against Rs 92.10 lakhs, Rs 77 lakhs and Rs 73.96 lakhs provided respectively in the preceding year. The directors have recommended a dividend of 11 per cent on equity shares. It is expected that a part of the dividend will be free of tax under Section 80 of the Income-Tax Act. This will absorb Rs 45.69 lakhs. After payment of this dividend the general reserves would stand at Rs 173.01 lakhs.

Hindustan Lever

The directors of Hindustan Lever Ltd have proposed a higher final equity dividend of nine per cent for the year ended December 31, 1971 as against eight per cent paid for 1970. With the interim dividend the total distribution for 1971 comes to 15 per cent as against 14 per cent declared for the previous year. The company's

MY PRODUCTS ARE OFF ON A WORLD TOUR...

THANKS TO THE CHARTERED BANK

...and the Bank has been helping them on their way for quite some time now. They are thoroughly conversant with all aspects of the complex business of exporting. Add to that their efficient handling of export documents, and you can imagine how much help they have been to me since my first ventures into world markets. These services are available in more than thirty major centres all over the world.

The Chartered Bank

AMRITSAR, BOMBAY, CALCUTTA, CALCUTTA COCHIN, DELHI, KANPUR, MADRAS, NEW DELHI, SAMBAHALI.

net profit, which suffered a sharp setback in 1970 owing to substantial increase in raw material costs, has recovered to Rs 2.75 crores from Rs 2.39 crores in 1970. The profit is arrived at after making provisions for capital expenditure on scientific research, transfer to development rebate reserve and taxation. The company's sales soared to Rs 134 crores from Rs 119 crores in 1970, while its earnings from exports improved by Rs 74 lakhs to Rs 5.52 crores. The results for the current year will depend significantly upon the outcome of discussion with the government in regard to prices of products which are subject to price control.

Enfield India

Enfield India Ltd has reported significant improvements in sales and profits during the year ended December 31, 1971. With a good demand for motorcycles and a pick-up in the offtake of agro-industrial engines, there was a smart rise in turnover to Rs 7.29 crores from Rs 6.41 crores in 1970. The output of motorcycles was higher at 10,954 units as against 10,408 and the turnover of this division increased to Rs 5.27 crores from Rs 4.93 crores. A further increase in production and turnover is expected during the year. Encouraged by the working results directors have recommended a higher equity dividend of 12 per cent as against 10 per cent paid in the previous year.

Out of the gross profit a sum of Rs 20.91 lakhs was set aside for depreciation and Rs 3.65 lakhs for development rebate reserve as against Rs 20.26 lakhs and Rs 3.10 lakhs provided respectively in 1970. There is no liability towards taxation as before while general reserve was allotted with Rs 8.50 lakhs as compared to Rs nine lakhs in the preceding year. A sum of Rs 3.45 lakhs has been earmarked for payment of bonus relating to previous years as against no provision in 1970.

The company is launching

on a ambitious expansion programme and it has already received the government's sanction for enhancing the capacity from the existing level of 11,000 vehicles to 30,000 vehicles. It is proposed to expand the capacity of the Tiruvottiyur factory, near Madras, to 16,000 units from 11,000 units by installing balancing equipment. A loan of Rs 30 lakhs has been obtained from the Industrial Finance Corporation. The remaining capacity of 14,000 motorcycles will be taken up at the new factory under construction at Anaikaripatki in Ramanathapuram district, Tamil Nadu. This site has been selected in order to take advantage of the concessions granted by central and state governments for starting the venture in a backward area. It is expected that the Ramanathapuram unit alone will be able to increase the turnover up to Rs four crores when in full production. Financial arrangements for implementing these schemes have been successfully completed.

News and Notes

Expansion and Diversifications

Kothari Sugars and Chemicals Ltd has received a licence for setting up a new sugar factory in Siruguppa, Bellary district, Mysore state, with a crushing capacity of 1500 to 2000 tons per day. Contract for purchase of land, machinery and erection of building have been placed and the factory is expected to go into production in October-November 1973. The cost of the project is in the region of Rs 3.6 crores and it will be financed through the share capital Rs 80 lakhs while the balance of Rs 280 lakhs will be raised from internal sources and by way of borrowings from banks and financial institutions. The directors have decided to issue right equity shares at par to the existing shareholders in the ratio of one share for every equity share held and such of those shares as are not taken by the existing shareholders will be offered to others. As a majority of the new licences are given to the

co-operative sector, only very few factories are currently being established in the corporate sector. Hence such of those factories as Kothari which have been able to get licence should have very good prospects. The company has also other plans for putting up a distillery and other chemical manufactures, in course of time which should add to the diversification of production and increase the profitability of the company.

Polson Ltd is planning to diversify its lines of manufacture. A beginning has already been made with the acquisition of controlling interest in Amba Tannin and Pharmaceuticals Ltd of Kolhapur. The company, which has become a subsidiary of Polson from January 1972, is engaged in the manufacture of tannin powder from myrobalam fruit which is used for curing and preserving leather and as an anti-corrosive to prevent the formation of scales in boiler tubes. This factory which was set up in 1950 at Amba is one of the three units manufacturing tannin in the country. The three units are unable to meet the country's needs and hence about Rs 4.5 crores are spent on importing this commodity. Polson expects that Amba Tannin will now be able to expand its operations on a fairly large scale so as to meet the local demand.

New Ventures

Kothari (Madras) Ltd which has been formed by the merger of three plantation companies, namely Blue Mountain Estate and Industries Ltd, Waterfall Estate Ltd and Balmadies Plantations Ltd and two textile units namely Kothari Textiles Ltd (Mills Nos I and II) and Adoni Spinning & Weaving Company Ltd, is now venturing into new fields of manufacture. The company has already received a licence for manufacturing a wide range of electronic components and it has also plans to set up a unit for the manufacture of automobile batteries including industrial train lighting cells and nickel-

cadmium batteries in collaboration with a German firm for which it has received a letter of intent. There is also a proposal to go in for the manufacture of various plastic items such as rigid PVC pipes, films, containers and heavy duty bags of various specifications as also calendered plastic materials and printed plastic materials. Besides, the company has plans to promote a project jointly with the Gujarat Industrial Investment Corporation Ltd (GIIC) which holds a letter of intent for the manufacture of truck and automobile tyres. All the four projects will be located at Baroda. The cost of electronics project is estimated at Rs 50 to 100 lakhs and that of the battery undertaking at about Rs two crores and plastics venture at Rs two to three crores. The capital outlay on the tyre project is placed around Rs 14 crores.

The total turnover of the company is of the order of Rs 16 crores and the profit is about 90 lakhs. An interim dividend of 10 per cent has been declared for the current year and the directors hope to pay a final dividend of 10 per cent for the year ending August 31, 1972. The management hopes to pay a dividend of 10 per cent on the increased capital in the immediate future.

Graphite India Limited is setting up a factory at Bangalore at a cost of Rs four crores for the manufacture of graphite electrodes, anodes and other graphite products. To finance this project it is proposed to issue new equity shares at par for Rs 25.84 lakhs. Convertible debentures for Rs 1.20 crores carrying an interest of 8.5 per cent will also be offered for being taken up by institutional investors. The terms of the issue of debentures include an option to convert 20 per cent of the face value of each debenture into equity shares. A loan of Rs 88.70 lakhs also will be obtained from ICICI to meet the cost of imported equipment.

S.R.P. Tools Ltd has entered a new era with the signing of a

collaboration agreement with Mitsubishi Heavy Industries Ltd. Under this collaboration, technical know-how from Mitsubishi Industries will be available for manufacturing solid hobs pinion type gear shaper cutters, broaches and shaving cutters of all dimensions. Mitsubishi is a pioneer in this field and S.R.P. Tools will have the proud privilege of being the first unit to undertake the manufacture of these tools in the country.

Joint Venture

The Textile Machinery Corporation (Texmaco) has bagged an order worth Rs 2.5 crores against global competition for the fabrication, supply, and erection of steel works and cladding to Malaysia. Texmaco, it is significant to note, had quoted four per cent lower than Hitachi of Japan and two per cent lower than a Malaysian firm.

New Issues

Punjab Tractors Ltd, a new venture in the joint sector, will soon be approaching the capital market with an issue of Rs 93.50 lakhs consisting of 6,35,000 equity shares of Rs 10 each and 30,000 cumulative redeemable preference shares of Rs 100 each. The company, which has been promoted by the Punjab State Industrial Development Corporation, is setting up a project for the manufacture of 'Swaraj' 20 and 30 HP tractors at Mohali, near Chandigarh. The 'Swaraj' it is claimed will be the first tractor to be made with entirely indigenous technology developed by the Central Mechanical Engineering Research Institute to meet local farming conditions. The installed capacity in the first phase will be 5000 tractors and it will be raised subsequently to 12,000 tractors. Construction work has already commenced and the first tractor will be rolled out of the assembly lines in the first quarter of 1973. The cost of the project is estimated at Rs 3.70 crores.

Jotindra Steel and Tubes will soon be in the market to raise

about Rs 40 lakhs in equity and preference shares to meet a part of the cost of its Rs one-crore project for the manufacture of steel tubes and pipes. The company has set up a most modern tube mill at Faridabad with an annual capacity of 46,000 tonnes and it has built-in capacity for further expansion. The first stage of the factory has been completed and the company has already commenced production of tubes and pipes of sizes ranging from 1.25 to 6 inches. In order to complete the range of all sizes, the company is putting up another mill for the manufacture of tubes and pipes ranging from 0.5 to 2.5 inches. The cost of the project is proposed to be met by the share capital of Rs 50 lakhs made up of Rs 37.5 lakhs in equity shares of Rs 10 each and Rs 12.5 lakhs in 9.5 per cent cumulative redeemable preference shares of Rs 100 each, a long-term loan of Rs 48 lakhs from IFC and Rs two lakhs from internal sources.

Rathi Ispat is offering 200,000 equity shares of Rs 10 each and 5,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each at par to the public for subscription. The proceeds of the issue will provide a part of the finance required for installing a second ten-tonne steel melting electric arc furnace at its factory at Ghaziabad, the first ten-tonne electric arc furnace being commissioned in September 1971. The delivery of the second furnace has started and it is expected to be on stream some time next month. The cost of the project is estimated at about Rs 130 lakhs. The results of operation of the plant since September 1971 are quite encouraging and the directors are hopeful that the company will be in a position to declare a dividend from the very first year of its operations.

Jay Electric Wire Corporation, is setting up a tungsten and wire project at Bangalore in technical collaboration with Westinghouse Electric Corporation of the USA. The plant will have an annual capacity

of 60 million metres of tungsten wire and 30 million pieces of tungsten coiled coil filaments. To raise resources for financing a part of this Rs 85-lakh project the company will soon be in the market with a public issue of Rs 35 lakhs in equity shares of Rs 10 each. If all goes well the plant is expected to be on stream within six to eight months.

In Brief

Volta Ltd has received the consent of the Controller of Capital Issues for the issue of rights shares in the ratio of one new share for every five shares held at a premium of Rs 50 a share.

Tube Investments of India propose to issue debentures of Rs 1,000 each carrying an interest of 8.5 per cent for a total amount of Rs one crore. These

debentures will be placed privately with the institutional investors. The company has under active consideration the installation of a third tube mill at its factory at Avadi. With this, the factory would be reaching the licensed capacity

Company Meeting

The annual general meeting of the Ahmedabad Advance Mills Ltd, originally scheduled to be held on May 16, 1972, will now be held on May 31, 1972 at 4.00 P.M. in the Bombay House Auditorium, Bruce Street, Bombay-1.

Interim Dividend

After a lapse of three years Kothari Sugars and Chemicals Ltd has returned to the dividend list with the announcement of an interim equity dividend of six per cent for the year ending August 31, 1972.

GUEST KEEN WILLIAMS LIMITED

Statement by the Chairman, Mr. K. C. Maitra, on the occasion of the Forty-second Annual General Meeting held in Calcutta on the 5th May 1972.

It is my pleasant task to welcome you to this 42nd Annual General Meeting of your Company. The Annual Accounts and Directors' Report have been circulated and with your permission I shall take them as read.

Board of Directors

Mr. A. H. Sethna who joined the Board on 12th June, 1964 has resigned from it on 30th December, 1971 on his retirement. I must add, however, that this association with the Sankey Electrical Stampings part of the Company is longer, going back to April 1961. Throughout this time, his knowledge and experience of the Steel Industry were of great assistance to the Board, and on your behalf and mine I would like to place on record our great appreciation of the services rendered by him during his long association with us.

I have also to report to you the resignation of Sir Henry Wilson Smith, KCB, KBE, Deputy Chairman of our associated company in U.K.—Guest Keen & Nettlefolds Ltd. Although Sir Henry only joined our Board in June 1970, his interest in our affairs has been continuous throughout his service with GKN, and we have greatly benefited from his mature counsel and experience. Again on your behalf and mine I would like to place on record our great appreciation.

It gives me pleasure to wel-

come to our Board Mr. S. K. Nanavati, whose appointment as a Director from 4th February, 1972 is noted in the Directors' Report. I am also glad to tell you that Mr. H. S. Killick, M.C., TD., one of the Executive Vice-Chairmen of Guest Keen & Nettlefolds Ltd., joined the Board of Directors from 30th March, 1972. Your Company is indeed fortunate in obtaining the services of men of this calibre and distinction.

Operations During 1971

The Directors' Report circulated to you has already covered the salient features of the 1971 results, and I need not repeat them here. But I cannot let the achievement, for the first time, of Rs. 50 crores turnover pass without a special mention. I shall at the end of my statement, as is customary, thank the members of the GKW team at all levels for its contribution during the year; but I think you would wish me to make special reference to this landmark—such figures are only achieved when the whole of our strength is pulling in the same direction. As it happens, achievement of Rs. 50 crores comes almost exactly 50 years after Henry Williams (India) Ltd. set up its first manufacturing activity in Calcutta in 1922. This Private Company later grew and became associated with Guest Keen & Nettlefolds Ltd., U.K. in 1934 leading eventually to the public company of Guest Keen Williams Ltd., in 1956.

The contribution to the Indian economy, to employment, and to indigenous availability of needed materials and products, brought about by this combination of private enterprise and association with one of the world's great international companies, is obvious. It is our earnest hope that it can long continue to thrive and to grow.

The area where we are most disappointed with our performance is export. I am glad to be able to tell you that we have booked some good orders already in 1972, although price competition in export markets is, if anything, fiercer than last year. We should be able to hold our position, but we have much further work to do in order to get our exports back on to a growth track.

I would also like to comment on the apparently high liquid resources we are maintaining. I do not think it is sufficiently realised how the combination of inflation, high tax rates, and growing volume of business, place heavy demands on resources. For example, the book value of our stocks at 1st January, 1972 was Rs. 14.26 crores. If this year we hold merely unchanged volume, but suffer 5% inflation, the value of stocks will rise by Rs. 71 lakhs. To finance this from internally-generated resources requires a pre-tax profit of about Rs. 2.1 crores. If one couples this purely inflationary impact, with the need to achieve expansion in real volume and re-equipment of

our fixed capital base, the pressure on funds is obvious.

Bonus Issue

Before I begin to speak on 1972 and the future, I must give the shareholders a piece of disconcerting news. You will recall that, at an Extraordinary General Meeting held in November 1971, it was decided that an application should be made to Government to permit a 1 for 2 issue of Bonus Shares by capitalising the entire amount standing to the credit of the Share Premium Account, and some of the General Reserve. By an order received shortly after the Directors had signed their Report, the Government has turned down the request for bonus issue on the ground that Rs. 1.11 crores of the total Share Premium Account was "created by consideration other than cash," which they do not permit to be capitalised. This policy of Government raises important points which affect both our Company and yourselves as shareholders, for it effectively freezes a part of our Share Premium Account for many years to come. We are carefully examining the matter and, for the moment, I would request you to bear with us till we come to some definite conclusions. I couple this with an assurance that it is still our wish to effect a bonus issue on the best basis we can devise consistent with Government policy.

Current Prospects

Looking back, the recession

of 1966-67 affected all industry. Your Company had to go out of the dividend lists in respect of its operations in 1967 and 1968: although we traded at a profit, it was all wiped out by the heavy interest charges on borrowings at that time. In 1969 and 1970 we came back into profitability, coupled with rigid control on assets to restore the healthy liquid position I have already referred to. Last year we moved forward again and we were able to support the higher activity levels with internally-generated funds.

In 1972, we expect further turnover increase (and indeed, sales in the first four months are ahead of the equivalent period of last year although not as much as we would have liked). But costs are also rising; in particular, in the Emergency Budget last December increases in excise duties and regulatory duties were announced. In view of the general economic situation, and the Government's wish to maintain the price line, we decided to absorb these extra costs at that time. The main budget in March further increased the same duties, and whilst on certain products we have been obliged to raise our prices, we are still absorbing a substantial portion of the combined impact.

Meanwhile, it is common knowledge that the rate of growth in industrial production has markedly slowed down over the last 12 months, although one must hope that the increased Plan expenditure also included in the Central Budget will help to stimulate a faster rate. If we are to make a contribution to holding the price line against inflationary cost pressures, an expanding economy is vital—particularly in a company like ours, supplying materials and components to the manufacturing industry. Equally vital is the need to ensure that expansion is not disrupted by industrial strife—certain of our major customers are currently suffering from this canker, and it has materially affected our sales to date.

Against this background, the

problem of 1972 may be summarised by saying that we have to run quite fast just to stay where we are, and maintain the 1971 profit figures. I believe this to be possible; but to achieve further profit improvement we need very substantial increase in our turnover, and that in turn would require a marked surge forward in the economy as a whole.

The Economic Climate

At this point, I would like to make some of the more general observations which Chairmen are customarily permitted on these occasions. They tend to display a certain sameness, one to another, and to repeat the words of leaders, politicians, and other pundits. This year, more than ever, it is difficult to avoid this repetition. National events in the last twelve months have been so total in their impact upon the life of the country, so demanding of effort from its people and its institutions, and have wrought such a drastic change both in our present situation and our possible future, that comment on other matters runs the risk of triviality by comparison.

When I last addressed you, the most massive popular vote in a free democracy had installed a Central Government with overwhelming strength in the Lok Sabha. Within days of its installation it was faced with a crisis on our Eastern border which, although external in its source, was immediately internal in its impact through one of the greatest refugee movements ever seen. For nearly nine months we vainly sought the peaceful solution we would have so much preferred; but circumstances imposed on us military action, carried out by our armed forces with surgical precision. A new nation was born, essentially out of its own strength—particularly strength of national purpose, and therefore looking to us not as a parent but more as a godfather. We gladly accept the role, cherishing and supporting the independence of Bangladesh by giving political, moral and

economic support insofar as that country itself determines what it would wish to have. Finally, in March the electorate gave a further mandate in the States to the leadership which has seen us through such a difficult year.

These are great events in the life of a nation. They have given rise to a sense of unity and purpose which, if constructively put to work in the national interest, can yield a rich harvest within the framework of a stable Government. The ways in which we seek to use this new-found strength in pursuit of our national objectives, are commonly expressed in certain slogans which, by constant repetition, attain the status of inviolable truth. But the danger of adopting a slogan as an inviolable truth is that we cease to think. It is always easier to repeat a cliché, parrot fashion, than it is to think about problems more fundamentally; this easy road is a luxury which no nation, and particularly its leaders, can afford. As Bernard Shaw said "The golden rule is that there are no golden rules". Moreover, there is also a tendency that, where a rule has been devised in pursuance of a particular policy objective, it becomes sacred even though in a particular application the rule may achieve results quite opposite to the policy it was intended to support. This is a characteristic of bureaucracy everywhere—it "works to rule" in a quite literal sense, for this is the way the elected political authority seeks to exercise its political will through the administrative machine.

Let us examine for a moment one of the most popular ideas of the day, namely the need for self-reliance. As a target to be set in front of the country, it is in many ways eminently desirable. There is no reason why we should depend on others for what can be achieved by our own material and human resources. We must resist the tendency to rush for outside help at the slightest provocation and to ignore or condemn whatever can be done indigenously. However, it

would be wise to remember that in this century technological developments have been taking place (and still continue to take place) at such a rapid pace that no country, however advanced, is or will ever be completely self-reliant in the absolute sense. Even countries like America, Great Britain and France have all in the last five years had balance of payments crises leading to devaluation: in our struggle to raise our exports and control our imports, we keep company with the most developed of countries.

Thus self-reliance is not an absolute goal, it is relative to the standards of living which we wish to secure for our people. We could be self-reliant today: there is no absolutely essential requirement—essential, that is, for supporting life for our people—which is not either already indigenously produced or obtainable within the limits of our existing foreign exchange earnings. But a self-reliant India on this basis would also be a poorer India—self-reliance under these terms means quite simply "cutting our coat according to our cloth". Surely, we should aim higher than this!

I believe it would be particularly misleading to take self-reliance as an overriding objective in the sphere of fixed capital formation. The capital needs of India are probably greater than those of any other nation in the world. It has been said that if we achieve 6% per annum compound economic growth rate, allowing for the expected growth in population, it will take us 20 years to double the per capita income of our people. Twenty years from now, that will still condemn many to grinding poverty by any standards, and many more to poverty by the standards which will then exist in most of the rest of the world.

The cure does not lie wholly within our borders. To what extent can we honestly ask millions of people, who have so little, nevertheless to save—to forego marginal improvement

in their current condition in return for future benefit? Yet if the State generates revenue surplus to fund State Capital Investment, this is financed by savings of the people: even if private industry generates its own surplus, it comes ultimately from the prices paid for its products, paid by the people's ultimate users of the goods they make. India currently has a low rate of capital formation as a percentage of Gross National Product, and although politicians and economists are fond of saying it should be raised they rarely draw attention to the consequence of such a policy—that we should spend less on current consumption!

This is indeed a cruel dilemma—more investment we must have to achieve 'Garibi Hatao' in the future, but if the cost is less consumption now, that is 'Garibi Bachao'. Surely, the solution—in this context, a good socialist solution—would be to attract to this country capital from those people and nations that have far higher margins between current wealth and current need; who have, therefore, both a greater propensity and a greater ability to save and invest. The rich nations of the world have a huge capital market, India has a huge capital need. Surely our policy should be such as to encourage world capital to invest in India.

Assistance from the outside world can take two forms. The first is official aid from Governments and from institutions such as the World Bank. Here, the cliché is "aid without strings", which carries the implicit assumption that no aid carries no strings. In practice, no aid would carry the string of unabated poverty. By all means we should reject strings which defeat our national objectives, debilitate our attitude to hard work, or violate our international conscience; on the other hand why should not we continue to welcome, as we have done in the past, development assistance the fruits of which have been so obviously not to our detriment.

The aid contribution from

official sources is comparatively well known. It is perhaps less well known that the flow of funds from private sources in the developed countries to the developing is almost as great as the total official aid. In 1970, according to provisional World Bank figures, the net flow of private funds was \$ 6.4 bn compared to the official flow of \$ 8.3 bn. This huge source of wealth is one from which India should seek at least her fair share. It is sad that by a combination of tax structure, specific restrictions, and interminable procedures making a mountain of every molehill, India presents to the world capital market one of the least attractive investment propositions.

Finally, let me make one comment on the ideal of distributive justice. I use the word ideal deliberately, because I genuinely believe that we must aim for it. It is taken to mean *inter alia* that the proportion of total production resources held in the State Sector, or in the Small Scale Sector, should grow as compared to the proportion held by established companies like ourselves. If we are allowed to grow at the maximum rate which we can achieve, in support of the objectives of increased employment and attack on poverty, and if the State Sector and the Small Scale Sectors grow faster, we would wholeheartedly

applaud. But if the rate of growth in the State and Small Scale Sectors is inadequate, and re-distribution is achieved by holding down companies like us to a still more inadequate rate of growth, this will merely re-distribute stagnation! The percentages may look better on paper, but will the people really benefit?

All our social objectives, however well meant they may be and however appalling are the problems they are designed to cure, fail if there are not economic resources to carry them out. I am well aware that there are problems and difficulties in the course I have been advocating, particularly the need to ensure that we do not leave to future generations a burden of debts which they cannot support. But I believe most sincerely that alternative policies to those currently in favour must be constantly reviewed, otherwise they go by default. More than anything else, what I am pleading for is a result-oriented pragmatic approach to our economy, and a rejection of unthinking adherence to clichés or slogans. In such a result-oriented pragmatic approach, we would eagerly wish to join; for we believe that in the future, as in the past, we can echo the proud words of Othello—"We have done the State some service, and they know it".

Our Associates

A highlight of the year to date has been the visit in February of Sir Raymond P. Brookes, Group Chairman, and Mr. J. F. Insch, Deputy Chairman of Guest Keen & Nettlefolds Ltd., U.K. This visit gave concrete evidence of the importance which our associates attach to our affairs, and their presence with their charming ladies was a great pleasure to us. We are currently fortunate in having in our midst Mr. H. S. Killick, whose appointment to our Board I have already referred to. In the opposite direction, GKN continue to receive our people for training in their Works in U.K., as well as rendering valuable technological assistance.

Conclusion

It remains for me to thank our employees for their continued cooperation. All of them have had to work under somewhat difficult conditions, particularly during the last war with Pakistan. It is to their efforts that we owe the improved working of the company already achieved, and I am quite sure we will not be lacking in their support for our plans to move ahead in the years to come.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

EASTERN ECONOMIST BUDGET NUMBER

As in previous years, the Special Budget Number presents an analysis of budget proposals and a study of the budget documents in their larger economic context as well as in their specific details. The Special Number includes all the relevant budget literature and statistical tables. It also carries a section of Special Articles covering fiscal and monetary issues. Priced at Rs 5 per copy (postage extra) copies of this number are on sale with leading booksellers or direct from:

The Manager,
The Eastern Economist Ltd.,
UCO Bank Building,
Parliament Street, New Delhi-1.

RECORDS AND STATISTICS

Industrial Production in 1971

INDUSTRIAL production which recorded an annual rate of growth of 7.1 per cent in 1969 showed signs of deceleration in 1970. The rate of growth during that year was only 4.8 per cent. This trend became more pronounced during 1971 and, on the basis of the index for the first nine months of 1971, the growth rate was 2.2 per cent only.

An analysis by major industrial groups reveals that there was a marked decline in cotton textiles (-7.9 per cent), leather and fur products (-15.2 per

cent) and transport equipment (-11.9 per cent). The decline in non-electrical machinery was nominal. On the other hand, there was a marked improvement in several groups of industries such as wood and cork manufactures (+29.4 per cent), electrical machinery (+13.4 per cent), metal products (+10.3 per cent), rubber products (9.3 per cent), petroleum refinery products (+7.2 per cent), non-metallic minerals (+7.9 per cent), chemical products (+7.1 per cent), electricity generated (+7.0 per cent) and beverage and tobacco

(6.2 per cent). In some other groups of industries also there was a marginal increase below five per cent.

Although the official index is not available for the period after September, 1971, provisional output data in respect of a number of industries are available for the full year 1971. Industries that have recorded creditable increases in production include machine tools, diesel engines (stationary), scooters, three-wheelers, moped, typewriters, flour milling, bleaching powder, automobile

tyres and tubes, tractor tyres and tubes, blasting explosive, T.V. sets, vanaspathi, soap, jute manufactures, aluminium ingots, aluminium conductors, phosphatic fertilizers, nitrogenous fertilizers and liquid chlorine.

Industries that have maintained a fair rate of production include newsprint, rubber chemicals, polyester fibre, nylon filament yarn, soda ash, caustic soda, petroleum refinery products, electrical, steel sheets and automobiles.

Production of Industries in 1970 and 1971

Towards Stagnation?

THE INTOXICATING victory of the Congress Party under the leadership of Mrs Indira Gandhi, first in the Lok Sabha election and then in the recent state assembly elections, has caused a certain rigidity in the attitude of the ruling group which is likely to do considerable harm to our economy in the coming years. The result of the ban on the expansion of the activities of big business houses has already been witnessed in the stagnation of industrial growth. Alas! this has not caused as much concern at the centre as it would have in earlier times.

The sharp increase in foodgrains production and the recent upturn in cotton output have created conditions which have generated momentum for growth despite the failure on the industrial front. However, it seems that the current thinking in the Congress on land ceilings is likely to cause stagnation in agriculture also. Already reports have been received that in some areas the landlords are dismantling their tubewells in order to be able to retain larger land holdings when the proposed laws in this regard come into force. The loose talk regarding ceilings on land holdings has naturally caused panic among farmers having large holdings. The current year is proposed to be celebrated as the silver jubilee year of independence, but the new trends in economic thinking in the country are hardly conducive to faster growth. In fact, the measures already taken or proposed to be taken in the name of eradication of poverty are likely to undo a part of the gains which have already been achieved.

The foodgrains surplus which this country has been able to generate during the past four years is due by and large to the efforts of farmers who have relatively bigger farms and also the resources to make use of the inputs such as improved seeds, fertilizers, pesticides and improved agricultural implements. Once this class is eliminated after the implementation of the proposed land reforms and the agricultural economy passes through a lean year, the cushion which has been available to us through the labours of this class of farmers will be denied to us. Consequently, the crisis in a lean year would tend to accentuate.

Not that this argument has not been presented to the Congress leaders; in fact, all these facts were put before the nine-member high level committee appointed by the Congress leaders' conference and this committee is reported to have agreed to make a marginal distinction between the land assured of perennial irrigation from government sources and the land irrigated from private sources. The committee has also expressed concern at the reported dismantling of tubewells by some farmers. But it seems that this committee also is in favour of only making a small distinction between the two types of land and the land reforms revolving around the formula of 10 to 18 acres of irrigated land per family of five are likely to be pushed through in one form or the other.

The redistribution of surplus land in this way is likely to hurt the current onward march of the agricultural economy. With slowdown in industrial expansion and application of brakes on agricultural growth, the economy might come to a halt within a couple of years.

The expansion in the tertiary sector, especially in the urban areas, is proposed to be curbed by the ceiling on urban property. Current thinking in different Congress-ruled states is in favour of imposing a ceiling of Rs two lakhs per head or Rs five lakhs per family on urban properties. Such a ceiling is bound to cause an upheaval in urban land and property values. This again is bound to give a shock to the urban economy which might disrupt regular channels of business and trade for some time. It is hard to believe that the persons at the helm of affairs in the country do not understand the implications of the various measures under consideration. The marked accent on distribution tends to show as if this country has made tremendous progress and that the era of distribution must start here and now. During the past two-and-half decades all that we have been able to achieve is to increase our gross national product by a little more than 100 per cent, which, on the average, has given a rate of rise of about one per cent per annum on per capita basis. This is not a rate of progress in which one can take pride. There was need for laying stronger foundations for economic growth before we started applying the brakes through our socialistic zeal. Will the new power elite be willing to ponder over the consequences of the prevalent ultra-socialistic thinking?

Doubling steel production : how?

THE FAILURE of the Planning Commission and the central government to formulate in time a correct policy for developing the steel industry is bound to cost the country dearly in terms of a huge avoidable drain of foreign exchange resources and a serious holdup of the implementation of Plan schemes if the requisite supplies of steel are not available. Even now, the lessons of 1971-72 have not been properly understood and there is as yet no clear comprehension of the serious situation that will arise in the early years of the fifth Plan in regard to the availability of steel if immediate measures are not adopted to increase steel output regularly on a defined basis.

It is true that there were exceptional developments in the past year and it was not possible to raise output substantially because of the loss of one million man-days in Durgapur on account of labour trouble, the difficulties experienced in Bhilai due to the shortage of coke oven gas and the roof collapse in Rourkela. Even so, with a slight improvement in operating efficiency in the latter half of 1971-72 and the fairly good performance of the two units in the private sector, steel output was marginally higher at 6.3 million tonnes of ingots against 6.17 million tonnes in 1970-71.

As there was a sharp increase in the demand for steel and exports of engineering goods also had to be increased, it became necessary to incur heavy expenditure on imports of steel of different categories which are roughly estimated to have cost Rs 243 crores. In the absence of details relating to categorywise imports it is difficult to say what exactly the quantum of imports of mild steel is. It can however be roughly estimated that these imports were 1.1 million tonnes, the imports in April-September 1971 being 5.5 lakh tonnes. The actual quantum may be even higher at 1.2 million tonnes if it is remembered that there were larger imports in the closing months of the last financial year.

Allowing for exports of about two lakh tonnes and assuming that total availability was 5.8 million tonnes, actual consumption of mild steel in different forms was probably 5.6 million tonnes. The question is what should be the assumptions regarding growth in consumption in the coming years with an acceleration of Plan outlays? It will be justifiable to presume that this growth will be at least 20 per cent annually till 1978-79. This will

require an output of at least 15 million tonnes of finished steel by that year calling for the creation of an installed capacity of at least 23 million tonnes of ingots against the goal of 19 million tonnes now proposed. What is even more important is the availability of new capacity for commercial production regularly in order to bring about a sustained growth in indigenous production of steel.

This aspect of the problem has not however been correctly understood and it is only now dawning on the minds of the planners and the union Minister for Steel and Mines that greater priority will have to be accorded to the implementation of expansion schemes of the existing units in order to make scarce financial resources go a longer way and achieve also a quicker increase in steel production.

As matters stand, in 1972-73, the output of finished steel may not increase to more than 5.4 million tonnes while consumption would have risen to 6.7 million tonnes. This would mean that imports will have to be on an even larger scale in the current year especially as it is proposed to step up exports of engineering goods by 50 per cent in order to achieve the target of Rs 200 crores. It will be wrong therefore to expect that there can be a cut in imports of steel with an increase in indigenous production by 7.5 lakh tonnes of finished steel. These imports would have to be much higher at two million tonnes if there was a static level of production. It is hoped to achieve an output of 7.2 million tonnes of ingots by helping all the steel plants to operate at an average of 80 per cent of rated capacity. The additional output however will have to be accounted for mainly by the three public sector plants though the Asansol plant of Indian Iron and Steel Co. Ltd. also will have to make its own contribution.

While the situation may be managed in the current year with better operating efficiency and a higher level of imports, serious difficulties will be experienced in raising output further through higher efficiency and after overcoming teething troubles of newly installed plant and machinery at Bokaro. On the basis of existing plans, an installed capacity of 10.7 million tonnes of ingots may become available in 1973-74, 12 million tonnes in 1974-75 and 13.1 million tonnes in 1975-76.

It is not possible to anticipate at this stage what the growth in installed capacity will be after 1975-76 as even without unexpected delays in constructing the Visakhapatnam and Vijayanagar steel plants fresh capacity may not be available earlier than 1979-80. It can therefore at best be expected that only the increase in

consumption will be taken care of by rise in level of internal production and imports cannot be displaced significantly with a better use of existing and new capacities. An import bill of over Rs 200 crores annually in respect of steel promises therefore to be a regular feature. Indeed, there will be a compulsion to double these imports in the last three years of the fifth Plan if immediate steps are not taken to implement expansion schemes.

Mr Mohan Kumaramangalam has stated the obvious by pointing out that it is advantageous to implement expansion schemes instead of concentrating attention on the construction of new plants other than those proposed in Andhra Pradesh and Mysore. There is a compulsion to implement the expansion schemes of Bokaro and Bhilai because of the heavy expenditure already incurred on the creation of many facilities. The availability of the capacity of four million tonnes at Bhilai has been already taken into account.

However if the expansion of capacity of Bokaro to 5.5 million tonnes of ingots in three stages is taken into account, the whole work should be completed in a five-year period. There will still be a gap of seven million tonnes of ingots which can be filled only if there is a doubling of the capacity of Tata Iron and Steel Co. Ltd to four million tonnes and of that of Indian Iron and Steel Co. Ltd to two million tonnes. There will also have to be a doubling of the capacity of the Durgapur and Rourkela units to yield another 3.5 million tonnes. At present only the first stage expansion of the Asansol plant is under consideration.

It will therefore be clear that the requirements of the fifth Plan can be ensured only if the capacities of all the major units in the public and private sectors are increased on an emergency basis and the construction of steel plants also is taken up at regular intervals. A decision in regard to the location of new units in Orissa and Madhya Pradesh may have to be taken up after two or three years as perspective planning would compel advance action in regard to the creation of new capacity by entirely new units early in the fifth Plan in order to ensure continuity of production on a growing basis in the sixth Plan.

It will also have to be examined how the construction period of expansion and new schemes on hand can be shortened by laying emphasis on import substitution in respect of steel making machinery on a pragmatic basis. Since heavy expenditure will have to be borne on imports of steel all the time, there is considerable force in the argument of the Mysore government for speeding up the implementation of new

schemes with the use of imported machinery where it is clear that through such a procedure it would be possible to shorten the period of construction and displace its imports of steel significantly. Major

decisions have therefore to be taken without delay and on the basis of scientific estimates a suitable pattern of production should be evolved for more than doubling capacity in the fifth Plan period.

Jute under pressure

SOON AFTER signing the tripartite agreement between employers in the jute industry, the central trade unions, and the government of West Bengal on May 7, at Calcutta, Mr Siddhartha Shanker Ray, the Chief Minister, said that the government had not let down the workers or the industry and that they wanted it to survive and flourish. The next few months would reveal to what extent the new wage burden, amounting to Rs 20 crores per year, would affect the competitive capacity of the jute industry. Two days prior to the signing of the agreement, the Indian Jute Mills Association issued a statement, pointing out that an increase in the wage bill by as much as 25 per cent at one stroke would cause "an irreparable long-term damage to the industry's export prospects by crippling its competitive strength vis-a-vis synthetics and the Bangladesh jute industry". The Association expressed the hope that the government and the workers would weigh all aspects of the wage question and would not blunder into placing on the industry a permanent cost burden, misled by a single year's profits which were purely temporary and adventitious.

But the industry's arguments did not seem to make any impression on the trade union leaders or on the government. They had already made up their mind that the jute industry must be compelled to pay substantially higher wages, irrespective of its present financial position and future prospects. And, frankly, the industry had no other option but to yield. Mr Siddhartha Shanker Ray revealed that on the morning of May 7, he telephoned a solicitor and asked him to persuade his clients—the jute magnates—to agree to the payment of a basic minimum wage of Rs 235 per month; and he thanked the solicitor (whom he did not name) for his part in the negotiations. By making this disclosure Mr Ray perhaps wanted to tell the public that the credit for this agreement should go to him also and not merely to his Labour Minister and the labour leaders!

The jute industry has been highly labour-intensive, the labour cost being about 26 per cent compared to five to

ten per cent in engineering. In the last three years, the costs of production have sharply increased on account of stores, electricity, raw jute, and the payment of higher wages, dearness allowance and bonus. In 1971 the dearness allowance was increased on two occasions, once by Rs 12 and again by Rs 4.80 per month. But when a decline in the cost of living index called for a reduction in the dearness allowance by Rs 9.20 per month in the middle of 1971, the industry agreed, at the request of the union Labour Minister, not to cut the DA. Now with the powerful backing of government, the industry has been compelled to increase its annual wage bill by Rs 20 crores from the present level of Rs 90 crores.

The agreement, indeed, represents a big triumph for the workers. The Indian Jute Mills Association has explained that the average monthly wage in the industry will now be about Rs 275 per worker. But with the payment of gratuity at four per cent, bonus at seven per cent, contribution to the provident fund at eight per cent and other fringe benefits, the cost per worker to the company will go up by another Rs 80 a month, making a total of Rs 355. Some workers will now have to pay income-tax. It is estimated that the average cost of converting raw jute into fabric will increase by about Rs 170 a tonne. The Indian Jute Mills Association has expressed the hope that the workers will exert themselves to increase production to the rated capacity of every machine. How far will this hope be realised? A similar sentiment was expressed in August 1969 when the jute industry conceded an increase of Rs nine crores in the wages after a prolonged strike. But in April 1971 at the annual meeting of the IJMA, the president complained that since January 1970 while the cost of conversion of raw jute into jute goods had increased by Rs 173 per tonne, in the same period labour productivity had declined by 10 to 15 per cent due to a steady fall in efficiency. In April this year, the IJMA bemoaned the continued decline in productivity and referred to the "intense inter-union rivalries leading to various acts of indiscipline and a large number of general strikes". In this background, it remains to be seen to what extent the workers will respond by improving efficiency and discipline.

The jute industry has been saddled with fresh and heavy burdens at a time when

the competition from Bangladesh has been resumed and the threat from synthetics has been intensified. It is true that our total jute exports in 1971 increased to a little over 732,000 tonnes from 549,000 tonnes in the preceding year. But it is worth recalling that between 1963 and 1967, our annual exports averaged about 850,000 tonnes which was 16.1 per cent more than that was exported in the last year. It is also pertinent to remember that between 1968 and 1971, the share of jute in the total primary backings in the USA declined from 81 per cent to 63 per cent while the share in the secondary backings fell from 71 per cent to 66 per cent. Already, non-jute backings account for about 35 per cent of the market. The government, industry and workers therefore can no longer afford to ignore these realities.

One of the immediate tasks before the government should be to provide the jute mills with electricity adequately and without interruption. For more than two years now, the industry has been plagued by frequent and drastic cuts in power supply, resulting in huge loss of production, estimated at 20,000 tonnes valued at Rs seven crores in 1971. In the current year also, the industry continues to suffer from prolonged load sheddings. If the West Bengal government cannot provide power to all industries, it should at least exempt the jute industry from the cuts in view of its unique role in the country's economy and export trade. Apart from power, attention has to be given to other urgent problems like the provision of sufficient bank credit, finance for expediting the schemes of modernisation and availability of raw jute at economic prices.

The government of West Bengal and Mr Siddhartha Shanker Ray in particular may feel gratified at the fact that soon after coming into power, they have been able to win the goodwill and gratitude of the workers in the jute industry. It will be hardly surprising if workers in other industries also start asking and agitating for higher wages. (The workers in the jute mills situated in Andhra Pradesh, Bihar, Uttar Pradesh and Madhya Pradesh have already demanded the extension of the Calcutta agreement to them). In the negotiations between the jute mills and the trade unions, the industry's capacity to pay did not seem to figure at all. In the last few years, most industries in West Bengal especially in the engineering group have been passing through a critical phase due to the scarcity of raw materials and bank credit and other causes. About 300 units still remain closed while many are in the sick category. In this background, will not an indiscriminate increase in wages serious-

ly affect industrial growth of West Bengal? The per capita annual earnings of persons employed in factories and earning less than Rs 400 per month in West Bengal were Rs 2245 in 1968 compared to Rs 1180 in 1958, an increase of ninety per cent in ten years. Few will grudge the payment of higher wages and amenities to workers so long as the industries concerned are in a position to bear the financial bur-

HEC : A sorry tale

THE 18TH report of the Committee on Public Undertakings (CPU) relating to the affairs of Heavy Engineering Corporation Ltd (HEC) makes sad reading. It shows that large sums of public funds have been unnecessarily wasted because of bad—nay, callous—management.

On March 31, 1971, the paid-up capital of HEC was Rs 100 crores and loans to the extent of Rs 61.22 crores had been contracted. Against the total capital of the order of Rs 161 crores the losses incurred by the end of 1970-71 had risen to Rs 73 crores which were nearly three and a half times more than what had been expected by HEC and the Ministry of Steel and Mines. The process of incurring losses has, however, not ended. A forecast prepared by the management of HEC indicates that further losses of the order of Rs 23.5 crores are likely to be incurred during 1971-72 and 1972-73. If past estimates are any guide in this regard, it is safe to presume that the volume of actual losses would be much higher. It follows that by the end of the current financial year, the whole of the paid-up capital of this public sector undertaking would be completely wiped out. On top of that there does not seem to be any possibility of reaching a breakeven point at an early date. The Ministry of Steel and Mines has estimated that income and expenditure of HEC might balance in 1974-75.

Many are the causes which have brought HEC to its present pitiable condition. The most important in the opinion of the CPU is the absence of an organizational set-up. Also, no firm market surveys were undertaken in order to determine possible trends in demand. Consequently, even now HEC has not received any firm orders on long-term basis with the result that production plans on an assured and rational bases cannot be chalked out.

The HEC exhibited undue haste in taking on the manufacturing operations without acquiring worthwhile machinery for costing its operations. In a majority of cases, its cost of production exceeded the

den involved. But if it is the stand of the West Bengal government (as reported to have been stated by its Labour Minister, Dr Gopal Das Nag) that the minimum wage in the organised sector should be the same, irrespective of the nature of the industry or the capacity to pay, it is doubtful if the economic revival of West Bengal can gather any momentum in the near future.

sale price making the accumulation of losses inevitable. The CPU has pointed out that "low productivity, high cost of materials and wage rise without commensurate rise in productivity" are some of the reasons which resulted in inflated costs. This state of affairs had continued year after year because the corporation had not followed any proved costing system. It had not prepared any accounting manual and had no detailed cost estimates before undertaking a job. Moreover, no job analysis had been undertaken to fix the "norms for labour requirement". No wonder that HEC landed itself in a financial mess.

It seems that the HEC project was conceived by absent-minded bureaucrats in the Ministry of Steel and Mines; that is why it took the corporation and the steel ministry about ten years "to finalise the capital estimates of the various projects of HEC." Amazingly the estimates for township of HEC and "common charges have not as yet been finalised. The CPU is, therefore, justified in expressing resentment at this inept handling of the affairs of a public sector undertaking costing the exchequer crores of rupees. The committee has rightly stated that, "it is unfair to the Parliament and to the country to make them commit to a project on a piecemeal basis from year to year without giving a true and realistic picture of the final cost of the project". A similar warning was given by the Estimates Committee in 1963-64 in its 51st report when it emphasised that "total commitments on such projects should be prepared as realistically as possible in the beginning and should be available to government and Parliament before a project is approved so that there is proper and effective control on the finances of the company". The manner in which HEC has been run clearly shows that this public sector undertaking and the Ministry of Steel and Mines have scant respect for the opinion of the parliamentary committees.

The cost of construction of the project increased mostly due to delays in its erection and commissioning. The gestation period proved to be unusually long. On top of that, HEC continued to revise its built-up capacity from year to year because the project report had not given any indi-

cation in this regard. The CPU has now suggested that "the project reports for plants to be set up in future should indicate the gradual build-up of the capacity from year to year." It is high time that the corporation makes up its mind about the eventual sizes of its various divisions. If it continues to be indeterminate in its approach to this question even after 13 years of its inception, then the prospects of its ever becoming a viable unit are remote.

The most scandalous element in the working of HEC is the extremely low capacity which has been used so far. Only 10 to 25 per cent of the capacity of the plant has so far been utilised. Organizational failures necessitated the "off-loading" of some orders for heavy structurals, castings and forgings to ancillary industries and sub-contractors. In other words, the mismanagement of the affairs of HEC has gone to such pathetic limits that the corporation finds it difficult to execute even the limited volume of orders received by it. The HEC is also responsible for holding up the progress of the Bokaro Steel Plant as it was not able to meet in full the orders for equipment and machinery required for it. Even the recommendations of technical experts to improve the working of the Foundry Forge Plant have not, according to the CPU, brought about any worthwhile improvement in working.

A peculiar feature of the working of HEC has been its amateurish handling of the manpower problem. In some vital sections, there is dearth of workers while in others—especially at the headquarters—there is a glut. The CPU rightly saw little justification for 385 officers and nearly 3,000 supporting staff for the headquarters' organisation while the design section—a key part of the Heavy Machine Building Plant—had only 191 officers as against the sanctioned strength of 555. Again, in the Foundry Forge Project, as many as 653 officers have been employed against the requirement of 545. Also, in the Heavy Machine Building Project, there is an excess of 42 officers. Obviously, there is sufficient room for cutting out dead wood in most of these divisions so as to bring about economy in expenditure.

The absence of co-ordination which has been witnessed in the affairs of HEC is indeed alarming. Sadly the CPU has noted that "spares worth more than two crores of rupees were received much before the receipt of plant and equipment for which the spares were required". The spares were allowed to rust in the stores till the plant and equipment arrived. It meant unnecessary blocking of capital and consequential financial loss. In short, HEC seems to be dogged by a number of deficiencies whose list is long. It is perhaps competing with some others in the public sector to be declared as the worst public sector undertaking!

Foreign aid and economic development

R. L. Pitale

THE IMPORTANCE of foreign aid as a factor in economic development has been increasingly recognised. However, there are extreme differences of views about the role or importance of foreign aid in economic development. Attempts have been made to explore the possibility of economic development without foreign aid such as the Svadeshi Plan enunciated as an alternative course of economic development. At the same time, there are others who advocate free flow of foreign aid to bring about early take-off of the developing economy.

Hence a quantitative analysis, free from any political consideration, is needed to arrive at the proper appreciation of the role of foreign aid in economic development.

The objective of this article is to present such a quantitative analysis with reference to India. Many empirical investigations have been carried out by the economists to find out the effect of foreign aid on economic development. One of the studies points out that "significant increase in per capita income depends largely upon availability of external resources." However, OECD Development Review (1968) states that "there is no significant correlation between GDP growth and official per capita aid receipt." The World Bank Report also testifies that the relationship between foreign exchange availability and economic growth appears to be weaker than between exports and growth.

In the quantitative analysis relating to India, only government to government aid has been taken into account excluding food aid and private business investment. Moreover, the structure of foreign aid is not dealt with, though ultimately the effectiveness of foreign aid in the long run depends upon its structure.

In finding out the relationship between

The author, who is in the Indian Economic Service, desires that it should be clearly understood that the views expressed in this article are his personal views.

foreign aid and economic development, it is not logical to relate foreign aid to national income directly. Foreign aid gets integrated in the growth process of an economy through its effect upon investment. Foreign aid is used in the first instance to import capital goods, raw materials and services. This adds to investment in the economy and through investment it helps in raising national income. Thus it is through investment that foreign aid affects national income.

In arriving at the quantitative analysis some assumptions have been made.

Assumptions

1. $S = I$: Saving equals investment. S =Saving, I =Investment,
2. $I = f(M, R, P_n)$, M =Imports, R =Rate of Interest, P_n =Net Profit.

Investment is the function to imports, rate of interest and net profit. R and P_n are assumed to be constant.

3. $M = f(E, F)$ E =Export, F =Foreign Aid

Import is the function of export earnings and foreign aid.

$$4. Y = f[I(M)]$$

As exports depend on various factors, E is excluded and imports getting into investment financed by foreign aid are taken into account. We can write:

$$5. Y = f[I(F)]$$

6. Foreign exchange rate is given and is constant.

7. Availability of domestic goods is constant.

Quantitative Analysis

In the quantitative analysis presented here, the data relates to the period 1955-56 to 1964-65.

POINTS OF VIEW

TABLE I

Net Domestic Product, Net investment and Foreign Aid

(Rs crores)			
Year	Net Domestic Product (1960-61 prices)	Net Investment (1960-61 prices)	Foreign Aid
1955-56	11096	1161	35.31
1956-57	11672	1809	67.12
1957-58	11388	1217	155.07
1958-59	12285	1442	248.68
1959-60	12533	1428	197.20
1960-61	13380	1733	217.32
1961-62	13891	1868	250.60
1962-63	14177	1940	321.58
1963-64	15000	2198	404.91
1964-65	16090	2504	505.50

4. Finance Ministry, Govt. of India; Economic Survey: 1967-68 Table 7.1 P. A65.

In this analysis, one-year time lag has been assumed between investment and national income. It differs between different sectors and within a sector from industry to industry. Therefore, for the sake of simplification, time lag of one year is assumed. Similarly, time lag between foreign aid and investment is also taken as one year.

The results of the quantitative analysis in terms of absolute figures and in terms

of log-linear method of regression are as follows:

1. Absolute figures: (Rs crores)

$$(a) Y = 7793.57 + 3.397 I_{-1} \quad (1.099) \quad r = 0.75 \quad \text{St. T.} = 3.070$$

$$(b) I = 1787.66 + F_{-1} 3.658 \quad (0.99) \quad r = 0.81 \quad \text{St. T.} = 3.695$$

II. Log-linear Method:

$$(a) \log Y = 2.53 + 0.439 \log I_{-1} \quad (0.040) \quad r = 0.978 \quad \text{St. T.} = 1.458$$

$$(b) \log I = 3.035 + 0.163 \log F_{-1} \quad (0.076) \quad r = 0.63 \quad \text{St. T.} = 2.151$$

$$\text{Thus } Y = f(I_{-1}) \dots (1)$$

$$I = f(F_{-1}) \dots (2)$$

Explicit form of the function (1) can be written as:

$$\log Y = \alpha + \beta \log I_{-1} \dots (1a)$$

$$\text{Similarly } \log I = a + b \log (F_{-1}) \dots (3)$$

From these equations, brief explanation of the model can be given as:

Differentiating log Y with respect to

Log I_{-1} we get:

$$\frac{d \log Y}{d \log I_{-1}} = \frac{I_{-1}}{Y} \dots (4)$$

$$\text{or } \frac{dY}{dI_{-1}} = \beta \left(\frac{Y}{I_{-1}} \right) \dots (5)$$

In order to get a trend figure, we can take arithmetic mean of Y and I denoting the same as $\bar{Y}$ and $\bar{I}$ and replace them in place of Y and I_{-1} respectively.

$$\frac{dY}{dI} = \beta \left(\frac{\bar{Y}}{\bar{I}} \right) \dots (6)$$

Similarly

$$\frac{d \log I}{d \log F_{-1}} = \frac{F}{I} \cdot \frac{dI}{dF_{-1}} \dots (7)$$

$$\text{or } \frac{dI}{dF} = \left(b \frac{I}{F} \right) \dots (8)$$

$\bar{F}$ Arithmetic mean of foreign aid received during this period.

Therefore, adding the above two equations (i.e. 6 and 8) we can write:

$$\frac{dY}{dF} = \frac{dY}{dI} \cdot \frac{dI}{dF} = f \dots (9)$$

f = denoting change in Y for a unit change in F.

The results of the quantitative analysis in terms of linear analysis give the coefficient (or elasticity) for investment and foreign aid. Using above equations, we get the following results:

cient (or elasticity) for investment and foreign aid. Using above equations, we get the following results:

$$\frac{dY}{dI} = \beta \left(\frac{Y}{I} \right) = 0.439 \left(\frac{14145.5}{2362.7} \right)$$

$$= 0.439 (6)$$

$$= 2.634$$

$$\frac{dI}{dF} = b \left(\frac{I}{F} \right) = 0.163 \left(\frac{2362.77}{210.88} \right)$$

$$= 0.163 (11.2)$$

$$= 1.82$$

$$\frac{dY}{dF} = \frac{dY}{dI} \cdot \frac{dI}{dF} = f = 2.634 \times 1.82 = 4.795$$

Thus we can say that on an average a unit increase in foreign aid leads via investment to an increase in national income by 4.8 units. Of course, this relationship is based on the assumptions mentioned already.

The foreign aid as percentage of national income on an average during these years was 1.4% $\left(\frac{210.88}{14145.5} = 1.4\% \right)$.

Given this proportion of foreign aid in

POINTS OF VIEW

national income, 1.4% of foreign aid will bring about $(1.4 \times 4.8) = 6.72\%$ increase in national income. However, a certain percentage of national income is required for debt repayment and debt-servicing. In India, considering this to be nearly one per cent of the national income, we find that, with foreign aid as 1.4% of the national income, the increase in national income will be 5.72% $(6.72 - 1)$.

The quantitative analysis detailed above has its own limitations but it tries to show that, given the assumptions, foreign aid helps in raising national income. If its proportion in national income is less, its impact on national income is bound to be less significant. In the countries where foreign aid formed a large and substantial proportion of investment and imports, it has affected the national income significantly. Take, for instance, the case of Greece. "In Greece, import surplus (financed by foreign aid) was 24% of GNP, 78% of imports and nearly 100% of investment".³ Thus much depends upon the volume of foreign aid and its proportion in national income, imports and investments.

The above analysis also depends upon the implicit assumption that contribution of the agricultural sector to the national income is constant or that it does not drastically change. In a developing country like India, agricultural sector still contributes a substantial proportion (nearly 40 to 45%) to national income. Thus if due to droughts or floods agricultural sector fails to contribute to national income, the national income will decline in spite of the increase in foreign aid. Hence, the structure of national income and contribution of each sector to it is of great significance and cannot be overlooked in any study of the relationship between foreign aid and its contribution to national income. However, in this analysis it is implicitly assumed that the proportion of contribution of agricultural sector to national income remains constant and hence a normal period free from drought and recession (1955-56 to 1964-65) was chosen.

Thus, foreign aid not only supplements domestic savings but also helps in bridging the trade gap which helps in realising the productive capacity of the economy. In India foreign aid will play an important role because even if a saving-investment gap may not exist, a trade gap will continue because of the increased requirement of maintenance and raw material imports. The recent ECAFE Report on trade gap analysis regarding India, points out that

"the functional* relationship between income and consumption indicates that the potential for mobilising domestic resources is increasing in India with rising net domestic product. . . . At a uniform growth rate India will always start with a deficit in savings to be met by foreign savings, and end up with a non-utilisation of potential domestic resources because of the dominance of trade gap. . . . As income and saving potential grows, it is no longer needed to meet savings gap. . . . The major obstacle to growth is the essen-

*Log $C = 0.19195 + 0.89377 \log X_n$ $r = 0.9957$
C = Consumption.
 X_n = Net domestic product.

tial capital goods and raw materials needed from foreign countries. The situation then calls for increased foreign aid, as also fresh efforts to expand exports and for increased import substitution."⁴

In view of this, foreign aid has a effective role to play in the overall process of economic development and its importance cannot be minimised by emphasising non-economic considerations.

Towards greater economic independence

S. P. Mandelia

THE YEAR 1971 proved to be a very significant one in the history of our country and in fact, in the annals of democracy in the world. The year proved to be unique, because it saw the principles of human dignity, liberty and democracy more firmly established and courageously upheld in India. What was supposed to be a poor and helpless country of 560 million people, emerged as a strong nation, ready and willing to sacrifice everything for its beliefs and lofty principles. This phenomenon gave a jolt to those nations who had hoped to dictate the "Do's" & "Don't's" to this country on the strength of the economic aid they gave. Their experience had all along shown that economic aid could be used as a very convenient and effective political tool to bring 'erring' poor countries down on their knees. But to their great disappointment, nothing like that happened in the case of India and it is determined to achieve greater economic independence.

The rich nations have grossly underestimated the resilience and the will of the Indian people to make the necessary sacrifices for achieving the goal of economic independence, for we realise that our political freedom is not safe as long as economic independence is not achieved. Only if the militarily powerful nations leave the Indian sub-continent alone and do not foment trouble to grind their own axe, India can peacefully settle down to achieve this task in a few years' time. There is no

doubt left about its capacity to do so but it needs to be left alone with its neighbours to work out a plan of lasting peace and faster economic progress for all.

1971 was the year of destiny for India. Besides the emergence of a strong government at the centre, the military victory over Pakistan and the liberation of Bangladesh, the year 1971 was also marked by our decision to stop the imports of foodgrains. For the first time since independence, the country became self-sufficient in food. This also helped to improve the balance of payments. Unfortunately, the year was also marked by a very great increase in unemployment — over 22 per cent, and a very low rate of growth in the industrial sector — less than 1.5 per cent in the first five months of 1971-72. New capital issues in 1971 were the lowest in the last six years and only 50 per cent of that in 1967. The number of new enterprises floated in 1971 was also very small. The rate of savings was lower last year at 8.6 per cent as against 11.15 per cent in 1965-66. Although the country did well on the export front, imports for development have been rising. The adverse gap in trade balance, which was reduced to Rs 90 crores in 1970-71, has again gone up to Rs 200 crores.

The protectionist attitude of some countries and the enlargement of the EEC are also causing some concern to developing countries such as India. It is in this con-

text that the Prime Minister has called for greater regional co-operation among Asian countries. A time has come when these countries should help each other develop so that their exploitation by the rich countries is brought to an end and a relationship of partners in development is fostered. Imports will also have to be reduced to the bare minimum and exports as well as import substitution will have to be boosted.

But these are stupendous tasks. If India is to play an important role in the sub-continent and in Asia, it will have to tackle these problems fast and effectively. Any delay or indecision can only harm our national interests. Co-operation and help from all the sections of the society will have to be enlisted, if progress in the true sense is to be achieved. The twin tasks of helping Bangladesh rebuild its economy and continuously reducing our own economic dependence on others, must be achieved simultaneously and at the earliest.

Foreign aid is mainly in the form of long-term loans which are to be repaid with substantial interest. Most of this aid is tied and we are obliged to buy our requirements from the creditor country at its own quoted prices, which are invariably higher by 25 to 50 per cent compared to these for purchases against free foreign exchange. Other terms and conditions—like compulsory shipping of more than 50 per cent of the exported goods in

POINTS OF VIEW

the creditor country's ships—are also quite pressing for the debtor country.

A study of the inflow of foreign aid during the last four years gives us the picture in the table below :

Since food imports have now been stopped, stoppage of foreign aid would mean a net loss of about Rs 235 crores per year in foreign exchange. It is in this context and the need for additional foreign exchange for strengthening our defence and for rebuilding Bangladesh, that an all round effort is to be made to reduce our dependence on foreign aid.

The shortfall in foreign exchange could be made up partly from the country's foreign exchange reserves, partly from higher exports and partly from reducing imports. Quite a sizeable part of raw material imports goes into the production of luxury or semi-luxury goods. The present pattern of consumption will, therefore, have to change if more savings and investment are to be generated. It has been found that there has been a definite co-relation between an increase in aid and a decline in domestic savings. In fact, foreign aid is being increasingly used for covering the gap in domestic savings.

breaking the circle

The government is now determined to make genuine self-reliance a reality. For this the production pattern would be restructured with the greatest emphasis on essential consumer goods and investment goods, which are necessary for generating employment and for defence. But the country will have to break the circle of low savings, low rate of growth in industrial production, high unemployment and widening trade deficit. The time to attempt a positive and massive thrust to break this circle was never so appropriate as now. The new mood of the nation to go to any extent to ensure greater economic independence and self-reliance for the country's economy should be constructively canalised. There is hardly any

doubt in the minds of the people today that the country can live without foreign aid. Bold statesmanship on the economic plane could definitely bring about results as spectacular as it did on the political plane.

challenging task

The business community will have to be prepared to face and overcome the difficulties which may come in its way as a result of such a bold policy. This would be a small price to pay for the economic independence the country would enjoy in the end. Some dependence on imports may be unavoidable but over-dependence on external aid is degrading and dangerous. It breeds complacency, and saps the will to work hard for cost reduction. Our cost of production is consequently higher and the exports suffer. Besides, dependence on aid for import of raw materials and/or spares also accounts for higher inventories and higher costs. In fact, if India could bid freely in the world market for the goods obtained with this aid, the actual outlay of foreign exchange might only be half of the net external aid. The Prime Minister has, therefore, rightly called upon the nation to make a Silver Jubilee Year of our political emancipation as the year of self-reliance in the economic field.

Positive steps are now being taken to see that industrial production increases at a much faster rate. A growth rate of 10 per cent per year is thought to be quite feasible and within our capacity. Such a tempo would generate more resources for further growth. The recent decision of the government to allow expansion in 54 selected industries is a step in the right direction. The Prime Minister has also asked all the concerned ministers to speed up the growth of the industrial sector by utilising idle capacity in key industries like steel, fertilisers and engineering industries and by creating additional capacities in these and others. It is now realised that the general slack in industry is not due to the unrealistic weights used in the official index, but due to the shortage of raw cotton, declining steel production, capacity constraints in

some industries and demand constraints in some others, and of course, labour unrest. In fact the mid-term appraisal of the fourth Plan admits that "the poor record of overall industrial growth is largely the result of stagnation or even decline in the output of a few major industries, especially textiles, steel and transport equipment". With this realisation and with a more bold and realistic policy, industrial growth will no doubt be hastened. However, the speed of action is extremely important here as time is the essence of the whole process. The legitimate demand for greater social justice must be met without undue delay and for this the process of industrial development must be accelerated. It is a matter of great satisfaction that the Prime Minister is reported to have asked her colleagues in the ministry that "delays and procedural wrangles should not be permitted to affect the country's development".

boosting savings & investment

Besides the twin tasks of import substitution and export promotion, all possible steps must be taken to boost the rate of savings which is at a very low level at present. The Finance Minister has recently said that the low rate of industrial growth was mainly due to low investments. The general level of savings must be raised if our efforts towards economic independence are to succeed. The Finance Minister also admitted that it was difficult to inject buoyancy in the private sector unless public investments surged forward. By way of generating more resources the country will have to tap those sources of revenue which have remained untapped so far. Besides, industrial units in the public sector will have to yield more returns by increasing managerial efficiency and reducing costs. The question of cost reduction is extremely important if we wish to compete successfully in world markets.

It is feared that some steps taken by the government towards liberalisation of industrial policy may not make such impact on the industrial scene. The most crucial question which must be asked in this context is whether a given measure would really push up investment and result in larger output at the fastest possible speed. The present policy of fragmentation of capacities in various industries, therefore, needs to be closely re-examined. Similarly investments in research and development (R & D) must be encouraged for making them more attractive to the private sector. Only with increased R & D and development of indigenous techniques with high labour content, can we hope to

achieve self-reliance and increased employment.

The real test of self-reliance is not only import substitution but rising exports of those finished products and raw materials which we have been importing so far. The reduction of cost and promotion of greater managerial efficiency, therefore, become two extremely important tasks.

It is now being realised that although foreign aid has enabled us to undertake various projects and programmes, it unfortunately also bred a tendency to depend upon foreign technology for everything and thus created a sense of complacency in the Indian farmers as well as entrepreneurs. India would have become more self-reliant

and definitely more self-respecting, had foreign aid not been so eagerly sought. It is true that at the time of a very critical food supply position in the country, food imports under foreign aid programmes helped us to tide over the difficulty. But it also remains a fact that scarcity arose in the first place only because we had neglected our agriculture and agricultural pricing policy. If we had taken care of these, we would not have been forced to import foodgrains.

However, the nation has now awakened to a new sense of self-respect and self-reliance and is willing to make the necessary sacrifice. This does not mean discarding all foreign aid. We shall accept aid from friendly countries, aid without strings and after ensuring that it would not

POINTS OF VIEW

be used as a political leverage. But the true strength to face great challenges can come only from our resilience and willingness to change our strategies of economic growth in general and export promotion in particular, to suit the new national requirements. Changes are called for in industrial development policy, research and development promotion measures and export strategy to cultivate new markets, for both traditional and non-traditional products.

Furtherance of the goals of social justice are not incompatible with a pragmatic policy of faster industrial growth. But the correct mix must be found soon. At this juncture of our national economy, we can hardly afford to lose another day.

Ceiling on land holding

M. L. Singh

THE PROGRAMME of imposing a ceiling on land a family or a person can hold and the distribution of the excess land among the landless and small landholders is acclaimed as the most appropriate fiscal measure for reducing intra-farm income inequality and attaining the long cherished goal of social justice. The programme figured in the election manifesto of ruling Congress party in the last parliamentary and recent assembly elections and received wide support. In the past, the ceiling measure gave rise to more serious debate than any other measure, as it was concerned with the question of right of private property. The programme was never taken in right earnest because of the stiff opposition from the big farmers who commanded rural votes. The government never wanted to incur the displeasure of this class and ceiling acts were made deliberately evasive to suit their convenience. The delaying and avoiding tactics were followed to allow them enough time to make the transfer of their lands in the names of their kith and kin. After the passing of the 25th Amendment to the Constitution, which makes it free from legal complications and the formation of favourable ministries in the states for which the central government was anxiously waiting, the decks have now been cleared for the speediest and smooth implementation.

The ceiling programme has been justified from the point of social justice as well as growth. The rural income is more unevenly distributed, as it is evident from the data on income distribution

and personal consumption expenditure. Thus, weighted average income per capita per day in 1960-61 turned out to be 35 paise for 87 per cent of rural population, while it stood at 233 paise for the rest of the population¹. Similarly, while 42 per cent of rural population, with their per capita monthly expenditure of Rs 15 at 1960-61 prices, lived in abject poverty and were not able to meet consumption at minimum caloric requirement, 6.4 per cent of rural population had a per capita monthly expenditure of more than Rs 43.²

Inequality is simply a matter not of income but of the means of production. The genesis of the rural income inequality lies in the uneven distribution of land which is the main source generating rural income. While 73.76 per cent of rural households having their operational holdings below five acres account for 19.82 per cent of total cultivable land, 4.46 per cent of them with holdings above 20 acres account for 35.35 per cent of the cultivable area.³ It is this great inequality of land ownership which year after year has created the gap between the rich and the poor. It lies at the root of the rural inequality and political power, as the rural society develops on the ground of feudal society. It has created the differential capacity of the big and the small farmers to make investment and benefit from the new farm practices. While the big farmers because of their greater resource base and access to the institutional facilities have reaped greater fruits of the HYV programme, the small farmers have

lagged behind due to the lack of the necessary resources. This has all the more accentuated the rural income inequality in the recent years. The income of the big farmers has increased considerably because of their disproportionately larger share in the total marketable surplus of agriculture and rising terms of trade for agriculture in recent years.⁴ The big farmers have accumulated more and more investible surplus and in turn have been able to adopt more HYV programme. On the other hand, the resource constraints have prevented the small farmers from taking advantage of the new farm technology. The production on the small farms is not enough to meet farm family consumption, which means that majority of the small farmers are indebted⁵ and a considerable part of their income every year goes to the repayment of loans.

The small farmers also lose to the big farmers in two ways. Firstly, majority of the small farmers are the net buyers of foodgrains and as the prices of foodgrains are rising, the earnings of these farmers pass to the big farmers who have large marketable surplus. Secondly, as the small farmers are indebted, in case of their inability to repay the loans, they sell their lands. In Punjab it has been seen that big farmers with 100-150 acres of land increased the size of their farms by 40 per cent between 1960-61 and 1967-68. Most of the addition took place through purchase.⁶

The welfare of the agricultural labourers has remained static in spite of the

Inflow of foreign aid

Item	(Rs crores)			
	1967-68	1968-69	1969-70	1970-71
I. Gross aid (excluding food aid)	866	717	711	670
II. Total debt servicing	333	375	412	435
III. Net aid inflow (exclusive of food aid)	533	342	299	235

POINTS OF VIEW

rise in agricultural production. The wage rate for the labouring class in most states has remained constant and the share of the wage in agricultural produce has declined.⁷ The reduction of income inequality has been one of the basic objectives of the Plans, but inequality has got accentuated and more and more benefits of development has accrued to a small number of the rich class. Thus P. Bardhan⁸ estimates that between 1960-61 and 1967-68, the percentage of rural population below poverty line increased from 37 to 73. It is now strongly believed that so long the means of production i.e. land is not properly distributed, it is difficult to achieve social justice in rural areas by any other fiscal discipline. Thus, there is a justification for the ceiling measure from the point of view of social justice.

justification of programme

But can we justify this programme from the point of view of growth also? Below are some arguments on the basis of the farm management studies:

- (1) The productivity per acre is greater on the small than on the large farms.
- (2) The employment per acre is a decreasing function of the size of farm.
- (3) The intensity of cropping decreases as the size of farm increases.
- (4) The proportion of area irrigated and the investment per acre is greater on the small than on the large farms.

One is, therefore, apt to conclude that the ceiling measure is desirable from the growth point of view, as it will lead to a more intensification of land, create more production and labour employment and solve the problem of rural unemployment. These points, however, need not overlook certain facts which are concealed in the farm management studies and are very useful in judging the relative efficiency of the small and large farms. The efficiency of the farm can be judged on the basis of the following criteria.

(a) Output per unit area (O/A), (b) Employment per acre (E/A), (c) Output per unit labour applied (O/L) and (d) Output per unit of input used (O/I).

From the points of view of O/A and E/A ratios, the small farms, no doubt, can be called more efficient, but this refers to the static efficiency on the basis of given resource allocation. From the point of view of dynamic efficiency and future growth rate of output, the O/I and O/L ratios must be taken into account. The O/A and E/A ratios are greater on the small farms, because these farms use more

farm resources per acre including family labour—a paid out factor—and carry production upto the point where the marginal productivity of paid out resources is less than acquisition cost of factor or even zero. Such a situation can be justified in a backward agrarian economy, on the assumption of zero opportunity earning of the farm fixed factors. Some economists justify the static efficiency of the small farms on this assumption. They take into account only the cash expenses on the farms and exclude the value of the paid out factors. In their opinion, the quantum of outturn is vital in an over-populated country where the resources may not have their opportunity costs. Thus, A. K. Sen⁹ justified small farms on the ground that gross output is greater that way. It is, however, an error to assume zero opportunity cost of the fixed factors including labour. The family farm labour may not have private cost, but it involves cost from the point of view of the society. The family labour has its own cost of consumption, so that the opportunity cost of this factor is the cost of consumption. The return of this factor must equal at least this cost.

incurring loss

But, if we take all the inputs which go in production, family labour evaluated at the ruling wage rate, the majority of the small farms will be found to incur loss. The surplus on these farms turns out to be negative. On the other hand, profit per acre on the large farms is positive and it increases with increase in the size of farm. The O/I and O/L ratios on these farms are greater. Table I shows that small farms do not produce sufficient to meet their family consumption requirement. This signifies that the return per family labour has been forced lower than the acquisition cost of family labour. Small farms apply excess of family labour in the quest for maximisation of production which is possible if marginal productivity of labour is zero or less than the acquisition cost. Productivity per unit labour applied is much less on small than on the large farms. The farm management studies of UP show that the return per day of family labour on the farms of less than five acres turned out to be lower than the wage rates for casual and permanent farm labourers.

The existence of a phenomenon of marginal productivity less than the ruling wage rate is a form of disguised unemployment and the lack of gainful employment opportunity for farm labour. The ceiling measure will provide such employment of labour. The real solution of rural un-

employment must lie in the provision of employment of labour at marginal productivity not less than the acquisition cost or the ruling wage rate.

The efficiency of a farm should be judged not by the possession of the farm resources but by their efficient utilisation. The small farms are not viable units to give a better utilisation of available resources, particularly of the fixed factors, such as family labour, bullock power and the capital assets, which are the major constituents of the farm inputs in a traditional agriculture. There exists a considerable degree of under-utilisation of these resources on small farms. Large farms, on the other hand, have the economies of scale and give a better utilisation of their fixed factors. There is a significant reduction in bullock and labour charge per acre on these farms. Thus the farm management studies of West Bengal¹⁰ reveal that an acre of cultivated land is looked after by 2.21 earners on the smaller farms as against 0.21 earners on larger farms. This signifies an excess dependence of family labour and under-utilisation of this factor on the small farms. According to the farm management studies of UP, the number of draught cattle per acre farms of less than 2.5 acres was 0.75 as against 0.18 on the farms above 25 acres. A pair of bullock commanded 2.8 acres on smaller farms as against 11.8 acres on larger farms. This shows the under-utilisation of bullock labour and higher cost per acre of bullock on the small farms. According to the same source, the cost per working day of bullock labour turned out to be Rs 6.51 on smaller farms as against Rs 2.61

TABLE I

Farm Business Income and Family Consumption by Size of Holding

Size (acres)	Farm business income	Family consumption	Surplus or deficit
Below 5	365	654	-289
5-10	868	960	-92
10-15	1111	1080	+31
15-20	1684	1364	+320
20-above	3290	1974	+1316

on larger farms. Table II shows that bullock charge is the single most important factor for the much higher cost on small farms and large farms have lower cost because of the economies of scale.

Thus the scope for fuller utilisation of fixed resources is greater only when the farm is fairly large.

An argument often advanced in favour of small farms is that investment per acre is relatively much greater on these farms. Thus the farm management studies of UP show that fixed investment (other than land) per acre on small farms was twice the investment per acre on large farms. But this is a misleading argument. The per acre investment on bullock on small farms is twice as high and investment per acre on farm building is thrice as high as on large farms. This difference is mainly on account of the economies of scale. A greater investment per acre on these items do not help raise productivity on small farms. If anything, it represents the greater under-utilisation and wastage of resources on these farms.

Large farms make investments more on the key inputs, such as tubewells, pumpsets, improved implements, fertiliser and HYV seeds which have greater potential to raise agricultural productivity than the traditional inputs. Investment on these items raise the O/I ratio and lowers cost on the large farms. Small farms, on the other hand, make investment mostly on the traditional inputs whose marginal productivities have been reduced so low that farmers have little capacity and incentive to invest. It is under the new technology that the importance of key inputs has very much increased, but even in the pre-HYV period to which most of the farm management studies are related, it was found that big farmers spent more than small farmers

on the key inputs. Thus according to the farm management studies of West Bengal, although investment per acre on improved implements was poor in whole of the area under study, small farms used less costly implements and were not capable of increasing farm efficiency.¹² Similarly, the farm management studies of UP conclude that small farms were poorly equipped with modern implements, so that the desired level of efficiency could hardly be reached on these farms.¹³

A study¹⁴ in the context of HYV shows that 70 per cent of small farms invested on the traditional inputs like construction and repair of wells, livestock and farm building. On the other hand, big farms spent 67 per cent of their investment amount on the acquisition of modern implements. The livestock happened to be the most important and improved implements the least important item of investment on small farms, although investment per acre on these farms turned to be relatively greater. By investing more on modern inputs, large farms have been able to generate more income and investible surplus. On the other hand, small farmers are forced into the vicious circle of poverty, indebtedness and generate negative surplus. Thus, according to NCAER,¹⁵ 62.62 per cent of the rural households in the lower income groups had negative saving in the mid-sixties. The statistics collected by a team of economists in collaboration with the Economics and Statistical Department of the Haryana government¹⁶ reveal that in a progressive state like Haryana, 27.8 per cent of the cultivating households who had their holdings of less than five acres were constantly under debt and their annual deficit was Rs 669. Another 29.1 per cent of the cultivating households with their holdings between 5 and 10 acres had annual deficit of Rs 485. On the other hand, big farmers with their holdings above 30 acres had large annual savings

TABLE II

Distribution of Cost Per Acre on Input Factors—Survey Sample 1955-57.

Inputs	(Amount in Rs)					
	Below 5	5-10	10-15	15-20	20 & above	Average
Total inputs	175.3	216.4	194.3	190.1	155.4	201.6
Bullock labour	140.0	96.3	81.7	80.4	62.9	88.7
Unkeep of implements	20.0	13.4	11.8	10.4	8.5	12.3
Human labour	55.3	51.8	48.1	48.6	41.4	48.7

to make investment. A study by Francine Frankel¹⁷ shows that small farmers are handicapped in respect of essential factors and that they have no necessary resources to invest in indivisible inputs for profitable adoption of new technology. An overwhelming majority of the cultivators having uneconomic holdings of two to three acres have been able to increase per acre yield from application of small doses of fertilisers, but aggregate gains in production have been insufficient to create capital surplus for investment. Only a small percentage of cultivating households above 10 acres have been able to mobilise surplus capital for investment. Farmers with 20 acres and more have made the greatest investment by mechanising farm operations to take up double or multiple cropping.

As the small farmers are deficit producers, the marginal propensity to invest on small farms must naturally be lower than that on the large farms. The average cash expenditure per acre of HYV paddy is Rs 390 as against Rs 52 only of ordinary paddy.¹⁸ Even if the HYV technology has been adopted on small farms, the per acre cash expenditure on these farms has been much less than that on the large farms.¹⁹ Moreover, the percentage of self-financed cash expenditure varies from 10 on the farms below 2.5 acres to 92 on the farms above 25 acres.²⁰ This shows that small farmers cannot take up HYV, unless they are provided with a large amount of credit.

For the adoption of HYV technology, the provision of assured irrigation is essential. But the percentage of assured irrigated area to total area is relatively much less on the small than on the large farms. The small farms rely more on well irrigation, whereas large farms get irrigation more from tubewells. A study is Nainital shows that small farms did not have assured irrigation, whereas large farms has assured irrigation through tubewells and pumping sets.²¹ Tubewells irrigation is 1/3 less costlier than well irrigation,²² besides it provides assured irrigational facilities. The cost of irrigation through bullock driven buckets is so high that growing HYV is not profitable.²³

Thus, it is obvious that ceiling on land holding will depress the rate of investment by redistributing land from those who have better capacity to invest to those who lack necessary resources. The measure will be detrimental, unless small farmers are provided with large credit.

Those who justify small farms base their argument on the farm management stu-

POINTS OF VIEW

dies which say that productivity per acre is relatively greater on these farms. We must, however, note that most of the farm management studies relate to the old technology under which small farms give higher return per acre by making greater use of the traditional inputs, such as human labour and bullock power. Under the new farm technology, the importance of these inputs as output-raising factors has very much dwindled. More outturn is now obtained by greater use of the key inputs, such as HYV seeds, fertiliser, tubewell irrigation, improved implements etc. which have much greater yield-raising potential than the traditional inputs. Since large farms use more of these inputs, they have been able to give higher outturn per acre in spite of less inputs per acre than the small farms.

Several studies reveal that the percentage of area under HYV is relatively much greater on large than on small farms. Thus, in Nainital district, the proportion of area under HYV paddy was 50 per cent on the large farms as against 28 per cent on the small farms.²⁴ A study in two blocks of Saran district (Bihar)²⁵ shows that the participation in the HYV programme was 26 per cent among the farmers in the lowest size group as against 60 per cent among the farmers in the highest size group. The adoption of the recommended level of technology was the lowest among the small farmers. Only 32 per cent of farmers with their holdings less than five acres used recommended doses of fertiliser as against 100 per cent on large farms. Working in the six villages in Raipur, an IADP district from 1964-65 to 1968-69, it was found that the rate of participation in HYV increased from 15 per cent to 43 per cent on small farms, from 33 per cent to 87 per cent on medium sized farms but from 33 per cent to 96 per cent on large farms.²⁶

yield differential

The Programme Evaluation Organisation (PEO) and the Agro Economic Research Centre (AERC) data confirm that there is a positive relationship between the proportion of the area under HYV programme and the size of the farm. In 17 out of 20 studies by AERC, the relationship between the percentage of area under HYV and the farm size was found to be significant.²⁷ Such a trend has reversed the yield differential between small and large farms from what the farm management studies report and the percentage of area under HYV was much higher on larger farms.

A study by P.K. Bhanja²⁸ shows that

gross output per acre of HYV paddy varied from 47 maunds on the larger farms to 23 maunds on smaller farms in Nainital district. Data collected by A.S. Kahlon of Ludhiana University²⁹ show that there is a positive relationship between the productivity per acre and the size of the farm, but negative relationship between cost per acre and per unit produce and the size of the farm. The production per acre of wheat varied from 20 quintals on small farms to 27 quintals on large farms. On the other hand, the cost per quintal wheat production turned out to be Rs 79 on small farms as against Rs 53 on large farms.

conflict of objectives

The analysis presented so far shows that there is a sound justification for the ceiling programme from the point of view of social justice. But there may be conflict between the objectives of growth and social justice. While we have reached the point in the country that we cannot now deny or delay social justice, the measures have to be taken to guard off the economic ills of the measure. The ceiling measure should not lead to creation of more un-economic holdings, as it will nullify the major impetus for technological advance and reduce capital accumulation and development. In the existing ceiling legislation, there is no provision for the floor or the minimum size of holding which can give efficient utilisation of resources, create productive employment, invest on modern inputs and raise production.

An alternative can be the management of the distributable surplus land through the co-operative organisation, by pooling of members' resources. This system of farming can mobilise more resources, invest on modern inputs and adopt modern practices. It will help achieve growth with social justice. The programme of co-operative management of surplus land obtained after ceiling was very much emphasised in the second five-year Plan but subsequently the emphasis subdued and with the success of HYV programme and the government seems to have dropped its involvement in the co-operative farming. If the co-operative system does not succeed, then second best alternative can be the provision of liberal credit to the beneficiaries of the ceiling measure. The custom service facilities can be provided through the village institutions like co-operative societies and panchayats, so that small and petty farmers who have no resources can take advantage of the modern practices and costlier equipments.

FROM THE PRESS GALLERY

Our Parliamentary Correspondent

New Delhi, Saturday.

THE LOK Sabha this week completed the second stage of the consideration of the central budget for the current financial year by adopting the budget demands of all the union ministries and departments. The demands for grants of as many as seven ministries or departments—(1) the Ministry of Foreign Trade, (2) the Ministry of Works and Housing, (3) the Ministry of Shipping and Transport, (4) the Department of Company Affairs, (5) the Ministry of Tourism and Civil Aviation (6) the Ministry of Health and Family Planning, and (7) the Ministry of Petroleum and Chemicals—were passed, after brief to detailed debates. The demands of those ministries or departments including the Ministry of Planning, the Ministry of Finance and the Departments of Atomic Energy, Electronics, Parliamentary Affairs and Supply, which could not be discussed for lack of time were adopted otherwise, as the guillotine on the second stage of consideration of the budget was applied yesterday evening. The third and final stage of budget discussion starts next week when the Finance Bill will be deliberated upon. The Rajya Sabha, which re-assembled after a short recess on Monday, February 8, discussed, among other things, the affairs of the Ministry of Industrial Development.

lack of growth

During the debate on the demands for grants of the Ministry of Foreign Trade, considerable concern was expressed over the lack of adequate growth in export earnings. Some members made anxious inquiries about the fixing of minimum price for raw jute. The leftist members of the House pleaded for more and more canalisation of exports and imports.

In his reply to the debate, the Minister for Foreign Trade, Mr L.N. Mishra, disclosed that the government had decided in principle to canalise the exports of textiles through public sector agencies. He regretted that the industry had not been able to meet export obligations in the case of a number of countries, particularly the United Kingdom and the EEC countries. Another significant announcement made by Mr Mishra was that the government would not hesitate to make it statutorily

obligatory on the part of textile mills to buy cotton from the public sector Cotton Corporation, if they did not voluntarily do so. In view of the increase in cotton output this year, which had resulted in a sharp fall in the cotton prices a few weeks ago, the government, Mr Mishra disclosed, was considering relaxation of credit curbs as well as abolition of the limits for the holding of cotton stocks by mills. Efforts would be made to step up the exports of surplus short staple cotton.

Referring to raw jute, the Minister assured the House that the question of fixing a minimum price for this commodity was being considered by the government. Mr Mishra stated that the India-Nepal Trade Treaty was working to the full satisfaction of both the countries. Efforts, he added, were being made to conclude trade pacts with a number of African countries. There was ample scope of the development in trade with Latin America, he opined.

trade deficit

Mr Mishra admitted that during the last financial year, our trade deficit had widened to Rs 249 crores. He estimated that the deficit in the current year also might be of the same order. The primary reason for this expansion in the trade deficit, he pointed out, was the larger imports of essential raw materials. A keen watch, Mr Mishra declared was being kept on export performance so that expeditious remedial steps could be taken whenever necessary in the interest of stepping up exports.

During the debate on the budgetary demands of the Ministry of Works and Housing, the Minister of State in this Ministry, Mr I.K. Gujral, shared the widespread concern among members over the growing shortage of houses in the country, both in the urban and rural areas. He, however, lay the blame for this unsatisfactory state of affairs on state governments. The most important announcement made by the Minister related to the provision of houses to government employees who would be retiring soon. He informed the House that a scheme was being drawn up under which a government employee could own a house as he

reached superannuation. Though the full details of the plan were not given out by Mr Gujral, he indicated that the employees would have to make some contribution while in service. Houses would be built for them by the development authorities. Banks and the Housing and Urban Development Corporation would be asked to lend some financial help. To begin with, 570 houses were proposed to be constructed under this programme in Delhi during the current year.

housing for Harijans

Mr Gujral also stated that the government was going ahead with the scheme to provide housing sites to Harijans and other backward sections of society in the rural areas. About urban housing, he opined that the problem could be solved only through drawing up a national urban land policy. He favoured socialisation of all urban lands. This, he felt, would enable the government to regulate housing activities in towns as well as assist in raising resources. As an example, he cited of the Delhi Development Authority which starting with a capital of Rs 5 crores had now built up a revolving fund of nearly Rs 90 crores. Nearly 43 per cent of the government employees, he said, had been provided official accommodation. The government, he added, would build 8,000 units, costing Rs 6 crores, during the current Plan for housing its employees.

During the discussion on the demands for grants of the Ministry of Shipping and Transport, while various members criticised the inadequate development of port facilities and the likely shortfall in the attainment of the fourth Plan shipping tonnage target, the Minister incharge of this Ministry, Mr Raj Bahadur, revealed that the traffic handled by the major ports of the country last year was an all-time record. The Shipping Corporation of India, he revealed, had last year made a profit of Rs 7.25 crores. He described Calcutta as a sick port which is losing nearly Rs 6 crores per annum. The deterioration of this port, which at one time was the biggest in terms of cargo handled, he opined, was because of two main factors: (1) the completion or near-completion of the steel plants in eastern India for

which equipment used to be imported through Calcutta; and (ii) labour trouble not only in the Calcutta docks but also in most parts of eastern India.

Mr Raj Bahadur assured the members from Orissa that neither he nor his Ministry was allergic towards the development of Paradeep port. This port, he said, was being developed to handle four million tonnes cargo annually, as against 2.5 million tonnes at present. He, however, pointed out that the development claims of other ports where traffic was increasing very rapidly, could not be ignored. The laying of the railway line between Cuttack and Paradeep, he added, was progressing satisfactorily. The Haldia dock system, the Minister hoped, would be completed by the end of next year.

benefits from Farraka

The benefits from the Farraka barrage, Mr Raj Bahadur said, would begin to accrue very soon as this barrage had already been substantially completed. Besides yielding other benefits, this barrage would minimise the silting of Calcutta port. Talking about the development of roads and highways, the Minister expressed the hope that 8,700 engineers would be employed in road-building alone.

The main highlight of the debate on the budgetary demands of the Department of Company Affairs was the plea of several members, belonging to both the opposition as well as the treasury benches, for the continuance of efforts to end concentration of economic power in the hands of a few industrial houses. Some members, however, expressed the view that this department was delaying the clearance of applications for industrial licences. A CPI member called for the nationalisation of audit.

In his reply to this debate, the Minister for Company Affairs, Mr K. V. Raghunatha Reddy, disclosed that the government had decided to keep a close watch on the working of large industrial houses; the officials of his department would inspect the affairs of the top 20 industrial houses at least once a year to ensure that no malpractices were committed by them. He further revealed that a few more business houses, which had amassed assets totalling over Rs 35 crores, would soon be included in the list of dominant undertakings. His department, Mr Reddy added, was contemplating several amendments to the Companies and the MRTP Acts to make the law dealing with private undertakings more effective. Legislation was also proposed to stop take-over of foreign-owned companies by big Indian industrialists. The Minister assured the House that the government was keen on

rooting out monopolies, but at the same time it did not want to do anything which might inhibit industrial growth. Therefore, a proper balance between the need to keep up the growth rate and to curb monopolies had to be struck.

Two important announcements were made by the Minister of Tourism and Civil Aviation, Dr Karan Singh, while winding up the debate on the demands for grants of his Ministry. The first was that the government had decided to set up a National Tourism Board to draw up a massive plan for developing tourism. The second related to the employees of the Indian Airlines Corporation and Air-India. The Minister announced that the government would soon review the entire wage structure in the civil aviation industry.

Dr Karan Singh appeared to be particularly worried about the labour trouble in Indian Airlines. This, along with the difficult time through which the IA passed last year because of high fuel costs, insurance against hijacking, drop in tourists traffic, etc., he pointed out, had led to this corporation incurring a sizeable loss. Air-India, on the other hand, received kudos from the Minister for its efficient functioning. Though this airline also had incurred a loss last year and might not show any profit this year, also, its losses, Dr Karan Singh opined, were due to factors beyond its control. These included the fall in tourist traffic as a result of the Bangladesh crisis and the underutilisation of the vastly expanded capacity of the airline through the purchase of jumbo jets. He, however, justified the purchase of four jumbo jets by Air-India on the ground that the airline had to compete with other international air corporations.

development of tourism

Dr Karan Singh revealed that the government proposed to make large investments on the development of tourism during the fifth Plan. By 1980, he hoped, we would be having one million international tourists visiting the country which would help in earning foreign exchange to the extent of Rs 200 crores annually. Currently, about 300,000 tourists, out of the nearly one crore who went round the world every year, came to India. He and his colleague, Dr Sarojini Maheshi, dwelt at some length on the steps which were being taken by the government to attract tourists. An ambitious plan, they pointed out, had been drawn up to augment hotel facilities in the country.

During the debate on the budgetary demands of this Ministry, a good deal of concern was expressed by members over

the deterioration in the working of the two airlines. Members also showed keen interest in the development of tourism in the country.

The lack of adequate medical facilities in the rural areas came in for sharp criticism during the debate on the demands for grants to the Ministry of Health and Family Planning. Several members also assailed the government for the failure to provide drinking water in all villages. The problem of water and air pollution as well as that of adulteration of food and drugs too figured prominently in this discussion. Complaints were voiced about many primary health centres not being manned by doctors.

pilot projects

In his reply to this debate, the Minister of State for Health and Family Planning, Mr D. P. Chattopadhyaya, shared the concern of members over the above problems, but pleaded that paucity of resources was a great constraint on tackling them fully. He announced that the government proposed to launch 29 pilot projects in different states through which efforts would be made to meet the health requirements by indigenous medicine systems. The practitioners of these systems of medicine would be given three to four months' intensive training to enable them to treat common ailments in villages and to identify complicated cases. If these pilot projects proved successful, the scheme would be introduced in the entire country in about four years at a cost of about Rs 180 crores.

The Minister countered the charge that a substantial number of primary health centres did not have doctors or were not manned by competent personnel. Out of the 5,131 such centres at present, he pointed out, only 179 were without doctors and the percentage was progressively going down. With a view to imparting mobility to medical graduates, the union government, Mr Chattopadhyaya observed, was keen on the creation of an all-India medical service. Only three or four states, he said, were not in favour of this proposal. He appealed to members to put pressure on these states so that they could also come round to the union government's view.

Referring to the problem of drinking water in rural areas, the Minister pointed out that the solution of this problem fully required nearly Rs 5,000 crores. This was apparently beyond the governmental means at present. He, however, stressed that the government was fully alive to the situation and was steadily raising the outlays on drinking water schemes.

Earlier, while completing his reply to

the discussion on the demands for grants of the Ministry of Petroleum and Chemicals, the Minister for Law and Petroleum and Chemicals, Mr H.R. Gokhale, declared that the foreign exchange allocation for crude imports by foreign oil companies operating in this country would not be increased. Efforts were being made to locate alternative sources of crude oil. To meet the growing demand for petroleum products in the country, the public sector refining capacity was being expanded. Mr Gokhale was non-committal on the question of the nationalisation of the foreign oil companies. Quoting the Prime Minister, Mrs Indira Gandhi, he said that the government was neither averse nor in favour of nationalisation; it took a pragmatic view of the issue whenever it came up. Referring to the repatriation of profits by oil companies, he stressed that the Reserve Bank of India had to submit to the ministry for its approval all proposals regarding remittance of profits abroad. The Minister rejected the suggestions that the Ministry of Petroleum and Chemicals was not cooperating with the Tekru Commission. At the request of the Commission, his Ministry, he said, had provided the assistance of two advisers. It can never be the intention of the government to scuttle the conduct of the inquiry referred to the Commission in a fair and just manner, declared Mr Gokhale. The government, he revealed, would endeavour to increase the share of Indian enterprises in the pharmaceutical industry.

highlights of debate

Among the important economic discussions held in the Rajya Sabha was the debate on the affairs of the Ministry of Industrial Development. The highlights of this debate were the widespread concern over the growing unemployment in the country, the tardy pace of development of backward areas, and continued shortages of most consumer items and persistent rise in their prices. A good deal of criticism was voiced over the lack of coordination between the various economic ministries. Some leftist members expressed the view that the Ministry of Industrial Development was not doing enough to curb monopolistic tendencies in the economy. Several others, however, opined that through its licensing procedure, the Ministry was retarding the industrial growth of the country and was also creating a new privileged class.

The Minister's reply to this discussion was more or less on the same lines as his address to the Lower House while winding up the debate on the budgetary demands of this Ministry. Mr Moinul Haque Chaudhury stoutly refuted the allegation that he had diluted the policy on mono-

poly houses and foreign collaborations. He emphasised that the larger industrial houses and foreign companies had been allowed to participate only in the core sector and that too on their merit alone. The interests of the small investors were being fully safeguarded. In fact, the government, he revealed, had decided to bring forward legislation to protect small-scale and ancillary industries through a package of measures. The measures would be based on the recommendations of a committee studying the subject. The minister reiterated that in case the licences issued were not utilised according to the schedules stipulated in them, they would be revoked.

land ceilings

The agricultural land ceilings issue figured prominently during the question hour in the Upper House. While Young Turks accused the government of diluting the Congress Party's promise in the election manifesto of imposing a ceiling of 10 to 18 acres on the holding of all lands for which irrigational facilities were available for producing two crops in an agricultural year, the Minister for Agriculture, Mr Fakhruddin Ali Ahmed, and his colleague, Mr A. P. Shinde, stoutly refuted the allegation. They pointed out that the Central Land Reforms Committee at its recent meeting had cleared the union government of all blame of distorting its recommendation. The CLRC, they said, had reiterated that the interpretation of union government of its (CLRC's) recommendation that the 10 to 18 acre ceiling was applicable only to lands for which irrigational facilities for growing two crops were available from government sources only was correct. The two ministries, however, revealed that in view of the controversy over the issue, the CLRC and the union Ministry of Agriculture had decided to refer the entire matter to the state chief ministers.

Replying to a discussion on the affairs of the Indian Council for Agricultural Research, which have come in sharp focus as a result of the suicide of a young scientist a few days ago, Mr Fakhruddin Ali Ahmed announced that a committee of scientists was being appointed to review the recruitment rules and promotion procedures of ICAR. He rejected the demand for the constitution of a parliamentary committee to inquire into the issue. He as well declined to associate members of Parliament with the proposed committee of scientists.

The Prime Minister, Mrs Indira Gandhi, told the Rajya Sabha during the question hour that a group of union ministers, which was considering the question of the diffusion of newspaper ownership, would

shortly submit its recommendations. The group consisted of Mr Mohan Kumaramangalam, Mr H. R. Gokhale, Mr Raj Bahadur, Mr Uma Shanker Dikshit, Mr K.V. Raghunatha Reddy and Mrs Nandini Sathpathi.

The Minister of State for Home Affairs, Mr K. C. Pant, informed the Upper House that the reactor of the second atomic power station in Rajasthan was expected to go critical towards the end of June. The Kalapakkam nuclear power station would go critical shortly thereafter.

A good deal of concern was expressed in both the houses over the escalation of war in South Vietnam. The naval blockade of North Vietnamese ports announced by the US President, Mr Nixon, and the air strikes at the China-North Vietnam rail link, it was felt, had grave international implications. The Minister for External Affairs, Mr Swaran Singh, informed the Rajya Sabha that India was in touch in regard to the Vietnam situation with many countries, including the USSR and the UK which were the co-chairmen of the 1954 Geneva Convention under which the International Control Commission for Vietnam, of which India is the chairman, was set up. Describing it as "very dangerous, very explosive", he called for extreme care and restraint in handling the Vietnam situation.

Agriculture in German Democratic Republic

Dr K. J. Michalski

DURING THE past 26 years successful development of agriculture has taken place in the German Democratic Republic (GDR) which was engaged in socialist conversion of the agricultural conditions. We have now an efficient agricultural economy with 13 per cent of the total economically active labour employed in it. We have the most modern means of production. The application of the latest scientific knowledge ensures a high standard of living for the rural population. It provides a high degree of self-sufficiency in our country as regards foodstuffs and agricultural raw materials.

The socialist system of agriculture has ensured rapid increase in agricultural production, in transition to production me-

gradual transition to industrial-scale production methods.

By systematic mechanization it was possible to perform all heavy field operations such as ploughing, harrowing, sowing, fertiliser distribution, spraying etc. almost completely with tractors and modern implements.

A high degree of mechanization has been attained also in cattle rearing, notably in relation to milking and manure and dung removal as well as in fodder and storage economy. At present over 80 per cent of all cows are milked by machine. The erection of modern, automated large-scale installations for cattle industry is under way. Milk cattle yards for 2,000 cows,

education of the village children has been raised to that of the towns.

The process of agricultural development may be divided into four main phases:

1. The phase of the democratic land reform (autumn 1945).

2. The period of consolidation of the results of land reform and of the construction of a state sector of agriculture (1946-1952).

3. The period of co-operative-socialist conversion of present agriculture (1952-1960).

4. The period of transition of industrial-scale production methods on the basis of development of horizontal and vertical co-operation between the socialist farms and the processing industry (present phase).

The democratic land reform was accomplished within a few months. The land reform laws were decreed in the five "laender" of East Germany and all big estates with over 100 hectares were expropriated, and land was distributed to workmen, petty farmers and refugees. In this manner, 7,000 big estates with an area of 3.3 million hectares were expropriated within four months. The major part of this land (2.2 million hectares) was handed over in lots of five to eight hectares each to a total of 210,000 farm workers and refugee families. Further 120,000 families of petty farmers got additional land in order to make their farms viable. The remaining area (1.1 million hectares) was made available for the state farms, state-owned forestry enterprises and for gardens.

It was the task of the land reform commissions:

- to find out who has to be expropriated according to law.
- to inform the big land-owners of the expropriation.
- to confiscate land and make an inventory of the expropriated land.
- to examine candidates for allotment of land.
- to distribute land and equipment to new farmers.
- to help the new farmers in production and to promote co-operative work.

The second phase of the development

young cattle breeding plants for 5,000 animals, bull fattening plants with 14,000 places and poultry production plants with capacities of up to one million pieces are being erected.

After having received in the first few years considerable means of promotion and credits, the co-operative farms soon reached a state of stable profitability expressed by continuous rise in income of the co-operative farmers and by high rates of accumulation. While in 1964, 9.3 per cent of the total net income was accumulated with the coop. farm, i.e. added to the investment funds, this percentage rose to 19.5 per cent in 1965, 27.4 per cent in 1967 and 30.0 per cent in 1968.

At present over 80 per cent of all children in the rural districts attend a polytechnical secondary school. The previous backwardness of the rural school system has been overcome and the standard of

WINDOW ON THE WORLD

thods on industrial scale, in increasing its profitability and in raising the standard of education and living of the rural population.

Agricultural production has grown continuously and constantly as a result of the co-operative socialist conversion of agriculture ensuring a high per capita consumption and almost elimination of imports in this field.

The high level of consumption and the high percentage of domestic supplies—which is very rare for a densely populated industrial country—give proof that the peasantry enjoys very favourable production conditions and has a prosperous future ahead.

The formation of co-operative farms, moreover, has created favourable structural conditions for systematic mechanization of agricultural production and the

IOL spent many man hours and money making this Electrode—then rejected it

That's IOL building in "Quality-Plus"

The leadership that IOL electrodes have had and always will have is the result of many hours of specialised hard work. Hard work in choosing very carefully at the raw materials stage. Hard work at each and every manufacturing stage, where IOL puts added emphasis on quality. And hard work at the checking stage where the electrodes are given hours of attention by

specialised IOL technologists who are far ahead of their times. All this, coupled with the worldwide expertise and latest know-how and processes, build into each IOL electrode the well-known IOL "Quality-Plus". A coupling of the finest materials built into the finest products with the help of the most advanced welding technology which others can't beat!

IOL builds in "Quality-Plus" others can't beat.

INDIAN OXYGEN LIMITED

of agriculture in the GDR (1946-1952) was distinguished by the systematic consolidation of the results of land reform, by the inauguration of a new democratic agrarian policy and by the erection of a state sector of agriculture. In this period no co-operative farms had come into being. The increase in agricultural production was achieved by state promotion of the individual enterprises of the "land reform" farmers and of all other working peasants.

Important measures of this period were:

—The foundation of the VdGB (Farmers' Mutual Aid Association) as a political mass organization of the working peasants and its subsequent unification with the co-operative movement. A strong farmers' union was created having at the same time a widespread network of co-op. societies of multi-purpose character at its disposal, which effectively supported the farmers in increasing production.

—In the framework of this programme the authorities succeeded in four to five years to provide sufficient houses, stables and barns for the farmers who had been given land under the land reform laws.

—The inauguration of a new agricultural credit policy and giving the working peasants in sufficient measure production credits for intensification of their enterprises through state or co-operative channels.

—The establishment of a state trading organization (VEAB) and the enlargement of the commercial activities of the co-operative societies with simultaneous introduction of fixed prices for agricultural products and inputs.

—The delivery of fertilizers, implements and machinery, of seeds, breeding stock etc. were increased every year and partly supported by government subsidies.

—Establishment of a network of 540 agricultural machine hiring stations owned by the state which helped the farmers to do the heavy field work (ploughing, mowing, threshing, transportation etc.).

—The establishment of 500 state farms (6-7 per cent of the total farmland), where seeds, breeding stock etc. for the peasants sector was produced and the training of apprentices was concentrated.

The third stage took place in a period of eight years (1952-1960). It was the result of a broad movement of the peasants, which began with the democratic land reform and was broadly developed by the erection of the state-owned machinery hiring stations, the nationally-owned

farms, the VdgB as well as by intensive propaganda and persuasion activities among the farmers performed by all social and state organizations.

As a result of land reform of the many-sided measures of state promotion the wealth of a majority of the single farmer had grown fast. The medium size farmer had become the chief figure in the village. In view of the private-economic character of these farms the intended maximum increase of agricultural production would have resulted in a development of the medium farmers into big farmers with capitalist management. Urgent political reasons spoke in favour of the formation of co-operative farms. While before the establishment of co-operative farms there existed 788,500 single farms with an average size of 10.8 hectares, by the end of 1960 a total of 19,313 co-operative farms had been formed comprising all farmers of the GDR (961,539 members). Of these co-operative farms 12,908 (having 380,096 members) were of the types I and II, while 6,353 of them (having 581,443) members were of the type III.

farmer education

For the education of leading staff (co-operative farm chairman, production, managers, agronomists, engineers, economists) two special institutes of university character were established and the capacities of the other faculties of agricultural science were substantially enlarged. The number of university graduates for agriculture increased from 1,306 (1960) to 7,438 (1970)

The training of a sufficient number of middle personnel which is of the highest importance for the success of co-operative production was ensured by rapid broadening of technical college education and by the training of masters (diploma). The number of graduates from agricultural colleges rose from 5,768 (1960) to 28,313 (1970) while the number of "masters" increased in the same period from 10,412 to 47,135.

The unskilled workers are being superseded by skilled labour (specialists)— a process that had taken place in industry already many decades ago. Without having acquired basic knowledge in biology, in physics, electrical engineering, in mathematics and chemistry, without practical, technical knowledge, the co operative farmer cannot satisfy the requirements of modern mechanized co-operative production. In the GDR, therefore, the training of apprentices (2½ years) in modern apprentice boarding schools of the state farms and of co-operative farms was developed on

ANNOUNCEMENT REGARDING PROPOSED ISSUE OF 8% CONVERTIBLE BONDS

This is an Announcement only and NOT a Prospectus. Persons interested in more details may obtain copies of the Prospectus from the Company's Registered Office, Underwriters, Managing Brokers, Brokers or Bankers to this Issue.

THE STANDARD MILLS COMPANY LIMITED

(Incorporated in India 1892 under the Companies Act, 1882)

REGISTERED OFFICE : MAFATLAL HOUSE, BACKBAY RECLAMATION, BOMBAY-20, BR.

EXISTING AND PROPOSED ACTIVITIES :

The Company was incorporated on 25th January, 1892 with the object of carrying on the business of Spinning, Weaving, Manufacturing or Dealing in cotton or other fibrous substances and the preparation of dyeing, or colouring of any of the said substances and the sale of Yarn. Cloth or other manufactured fibrous products. The Company amended in 1965 the objects clause of its Memorandum of Association enabling it *inter alia* to carry on the business of the manufacturers of and dealers in Chemicals, Chemical compounds (organic and inorganic) in all forms and chemical products of any nature and kind whatsoever, and all by-products and joint products thereof, and other objects as set out in the Memorandum of Association.

The Company has obtained Licence No. L/19(1) (2) CH.II/SE dated 25th May, 1971 from the Government of India, under the Industries (Development and Regulation) Act, 1951 for substantial expansion in production of its existing Caustic Soda Plant to the extent of 17,330 Tonnes of Caustic Soda, 15,012 Tonnes of Chlorine and 5,000 Tonnes of Hydrochloric Acid respectively. Capital goods Import Licence No. P/C/2062637 dated 5-7-1971 for import of Plant, Machinery and Mercury has been issued to the Company, of the value of Rs. 111.49 lacs.

The Company has renovation and replacement programmes in its three Textile Units. The existing Looms, Ring Frames, Boilers and other various Machineries are being replaced and/or being acquired. Some of the buildings in the Textile Units are being renovated. A Welfare Centre for the employees of the Company is being constructed at Prabhadevi Road, Bombay.

Proceeds of the issue will be utilised for the substantial expansion of Caustic Soda Plant and renovation and replacement of machineries and buildings in the Textile Units.

LOCATION OF INDUSTRIES :

The Company has three Textile Units at—
(1) New Prabhadevi Road, Bombay-25,
(2) Tokersi Jivraj Road, Sewree, Bombay-15,
(3) Dewas, Madhya Pradesh and

Chemicals Factory at Thana-Belapur Road, Thana for manufacture of Caustic Soda/Chlorine, Hydrochloric Acid, Caustic Potash, Potassium Carbonate and Ethyl Chloride. The work pertaining to the substantial expansion of the Chemicals Factory at Thana-Belapur Road, Thana is going fast apace.

The application forms and copies of Prospectus are available on request from the Company's Registered Office, the Underwriters, Managing Brokers Brokers and/or Bankers.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 17TH MAY, 1972 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 31ST MAY, 1972 BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON 27TH MAY, 1972.

HINDALCO HELPS TO BUILD NATION'S ECONOMY...

In May, 1962 Hindalco started production of aluminium with a smelter capacity of 20,000 tonnes a year. The capacity was raised to 40,000 tonnes in November, 1965, 60,000 tonnes in August, 1967 and to 80,000 tonnes in May, 1969. Plans are in hand to expand the plant further to 120,000 tonnes by end-1973.

Between May, 1962 and December, 1970 Hindalco, now India's largest producer of aluminium, has produced 372,903 tonnes of aluminium, which has saved for the nation nearly Rs. 180 crores of precious foreign exchange.

As a substitute for imported copper in the electrical industries, the above output represents a much larger foreign exchange saving, since one tonne of aluminium is replacing two tonnes of copper and as imported copper is several times costlier than indigenous aluminium.

As a vital raw material for Electrical Conductors & Cables, Telecommunications, Electric Capacitors, Condensers and Motors, Transportation (by road, rail, air and

Sea, Drainage Culverts, Water Mains and countless other applications, HINDALCO aluminium is helping to build a new India. With its almost limitless variety of forms and shapes and its versatile properties, HINDALCO aluminium is sure to play a crucial role in meeting industrial India's challenge today and tomorrow...

a broad basis while at the same time adult farmers and farm workers were comprehensively trained as "skilled labour". In this manner the number of specialists (skilled labour) rose from 22,356 (in 1960) to 427,923 (in 1970). Now more than 60 per cent of all co-operative farmers of the GDR have had technical training.

The fourth stage of the development of agricultural economy is characterized by the development of comprehensive co-operation between the socialist farming enterprises and the plants of the foodstuffs industry as well as by the switching to industrial-scale production methods in agriculture.

Despite their relatively large size and economic strength, single co-operative farms are no longer able now to erect, by their own strength, modern large-scale plants (cattle rearing, land improvement), to buy big machinery complexes and to use them rationally, to perform the specialization of production that is possible and necessary today, and to ensure optimum

working and living conditions for their members.

The development of large-scale co-operative relationships between the enterprises of agriculture and the foodstuffs industry is, therefore, a necessary process that is caused by the growth of the agricultural productive forces and the necessity of progressive concentration and specialization of agricultural production resulting therefrom.

When co-operative unions of several farm enterprises with plants of the processing industry and of trade companies are formed, a long-time production and delivery agreement is concluded on contract basis for definite products (e.g. animals for slaughter, milk, potatoes, vegetables etc.). On the basis of such contracts the participating agricultural enterprises carry out their specialization, and make use of their production means on a co-operative basis. The chief problems are:

—The elaboration of rational economic

relationships within the co-operative unions and associations.

—Further development of the now existing production means and of the present technologies aiming at higher yields at a minimum of cost (e.g. maximum possible elimination of manual labour also with beets, potatoes, vegetables and in cattle rearing) in order to intensify the industrial character of agricultural production.

—Further raising of the level of qualification of the workers in agriculture and propagation of the latest scientific knowledge by a broad system of adult education

—Improvement of the working and living conditions of the rural population with the aim of gradually overcoming the still existing differences in this respect between the towns and villages.

—Perfection of economic collaboration of the farming enterprises and the processing industry with the aid of raising the level of quality of the products offered

Awaiting enlarged market

E. B. Brook

Vienna

LIKE MANY about to enter on a new association and face a fresh set of circumstances the countries of western Europe and across the Atlantic are becoming more individually defensive as west Europe's wider union within the Common Market draws nearer. Old methods are being given a new examination, old liberties scrutinised to make sure they are not letting in unthought of dangers: The General Agreement on Tariffs and Trade (GATT) is to be overhauled, EFTA reformed as a smaller body and the Market itself will undertake a thorough machinery overhaul when the political heads of the states forming it meet in Paris next October.

The next few months will show how wide the expansion of the Market will be. Britain has been taken into the Market with parliamentary techniques bordering on roller-coasting and no one doubts that many British people are uneasy and anxious about the whole business. There is no referendum for them; of the three states currently consulting public opinion directly the Irish Republic is the only one almost certain to vote affirmatively. For once, and briefly, no one will love the Irish more than the British government. But Norway and Denmark are much less certain to be affirmative but, even so, no one really doubts that the Ten and not an Eight will come into being at the opening of next year. But if either Norway or

Denmark should vote negatively in their referendums the diminished EFTA will be very pleased to continue their membership.

One factor making for nervousness about the new circumstances is the opportunity it will give for further big-business mergers. Across the Atlantic, Canada is introducing plans to tighten controls over business take-overs: benefit to Canada will be the sole criterion by which Ottawa will judge all proposed outside capital initiative. While the main target of this new Canadian policy is United States' big business, which now holds 80 per cent of all foreign holdings in Canada, there is a wary eye also for the British and the French.

Elsewhere, in Europe, legislation is being put through to avoid excessive foreign influence in industrial capital, in banking and banking policy and in movement of capital. Austria has recently imposed a low limit for conversion of foreign money into schillings — about £400 a time—a move aimed primarily at influence from the USA and Federal Germany. The Swiss have also shown nervousness in refusing to agree to alter at all materially their banking methods.

While Brussels, with expressed support from London, Bonn and The Hague and more covert support from Rome, appears

to keep its end up against the claims of Paris to be the political, as distinct from the administrative, capital of the enlarged Market, some other doubts are being voiced.

No one has ever thought much about the European Parliament at Strasbourg —although this headquarters is in France, de Gaulle studiously ignored it and Pompidou shows little interest in the fact that the Market's parliament meets in his Republic. The European Parliament has, so far, little influence but this circumstance is likely to change once four countries with strong parliamentary traditions and sharing a concept of parliamentary democracy join the Market. But the technique of electing the European Parliament's members indirectly—they are elected by the national parliaments of Market member states — is unlikely to satisfy for very long the British, Danish or Norwegians. They will also face the problem of deputing such of their own members who are willing to be abroad, away from their home parliaments and away from their constituencies for a long time: such men may not be numerous and may not be the best material the national parliaments could send.

The Treaty of Rome envisages "a uniform method of direct election" of national representatives to the European Parliament at Strasbourg but this, also,

according to the Treaty, is not to be instituted unless and until there is a unanimous vote of the Market's Council of Ministers and, even so, such a vote can only make recommendations.

One device to provide reasonably good national representation at the European Parliament without weakening representation and expression of opinion in the home parliaments is to give national MPs elected to Strasbourg the right to vote by proxy at home during their absence. Proxy votes in any parliament are not a popular idea and do not recommend themselves to either political or constitutional circles. But this and one or two other new constitutional devices are being considered and discussed in the present and potential Common Market countries. If the enlarged Market is to prove a success acceptable to the nations composing it as well as their governments, better representative manpower will have to be sent to the European Parliament and Strasbourg will have to move up several notches not only in international regard but in public awareness. Almost everybody in Europe knows about Brussels but few are aware of, fewer care about, what goes on in Strasbourg.

The crucial date of the Market's enlarge-

ment is now less than eight months ahead: allowing for the summer holidays there are not more than five working months left to get details worked out sufficiently to ensure that the huge enlarged machine takes over smoothly. There will probably be delays in some sectors, especially over international trade. The Americans are unlikely to be ready to begin the essential round of world trade talks before 1974, a year or more after the Market has been enlarged. The effect of this delay will be to make doubtful the durability of the preferential agreements negotiated between the Market and many African and east Mediterranean states and now, with more difficulty, with some remaining EFTA members. The USA is sharply opposed to any preferential agreements anywhere on principle and in practice. For this reason, the US-Market discussions, when they get finally fully under way, will be a contest between the preferential areas idea and the creation of a world free trade area in which west Europe could find itself in a minority.

The setting up of a 20-nation committee, including representatives of the industrially-developing countries, to plan, within the IMF, a world currency reform may help to create compromises that could

lead to closer agreement on a new world economic and trading order. But these monetary discussions will themselves be of a mammoth nature, are unlikely to begin before next year and could last till near the end of the decade. Also, although the group of twenty will make the decisions on any final agreement, it still appears likely that a small steering committee will be necessary to run the negotiations and to meet American objections that the group is already weighted heavily in favour of the Common Market.

As the date for the Market's enlargement approaches it is clear that this increased unity of western Europe is only one facet of a very involved change in world political and economic situations. There is growing emphasis on economic and fiscal differences between the nations on the east of the Atlantic and the USA. The USA appears to be looking increasingly away from its competitor western Europe towards east Asia and to east Europe also. Thirdly, there is the growing influence of eastern Europe as a catalyst in west Europe's politics and economics, a fact which the politicians are slower than governments and much slower than business and commercial interests to realise and acknowledge.

Nobody really knows

very much about those dark-grey hours through which a man or woman passes before he or she chooses to die by his or her own hand. Even suicides noted do not help much. More often than not, they tell only what its author wants to tell himself—or the world. In this twilight of unsure communication, what seems a little less uncertain than all else is that a man or a woman most probably never ends his or her life for any single, specific reason. The will to live is so powerful at all times that at no time can it be demolished except by an avalanche of numerous emotions or a massive landslide of accumulated physical pressures or both. If there is an exception to this rule, it may be found only in the case of mentally abnormal or otherwise grossly inadequate individuals who instinctively find an escape in the act of dying.

The late Dr Vinod H. Shah of the Indian Agricultural Research Institute, Pusa, is said to have committed suicide because of intolerable frustrations in his professional career, the precipitating factor being a selection committee passing him over for the post of professor of agronomy. In the testament of unfaith he has left behind as a suicide note, he has spoken eloquently of man's vileness to man, but he has also expressed a sneaking hope that, by giving up his life, he might be helping other scientists to get better treatment.

At the risk of being misunderstood or even called names, I would submit that there must be much more to Dr Shah's suicide than the motive or motives suggested or stated for it. For obvious reasons, I would prefer not to speculate further about this, but it is significant that he chose one of the most painful ways that there are of killing oneself. Here is, surely, an act of exhibitionistic sado-masochism in the act of hanging oneself, the grim psychology of which has to be fully explored and investigated before the totality of the context or the circumstances of this suicide can be as-

certained or justly pronounced upon.

Meanwhile Dr Shah's tragic death has naturally given rise to a demand that the government should inquire into the affairs of the IARI and, in particular, probe into allegations of favouritism, nepotism or other unfair practices in appointments or promotions. I have no difficulty in agreeing to this proposition and would in fact proceed to suggest that such investigations should be conducted periodically in respect of all other similar institutions. At the same time I have nothing but contempt for the jackals of our political jungle which (repeat *which*) have been unscrupulously exploiting the Pusa tragedy for their own private or political purposes.

The sensational aspects

of the episode apart, Dr Shah's suicide note has cast doubts about the quality of science scholarship at the IARI or the objectivity of the research work which is being carried on under its auspices. This is the issue which the Director of the IARI ought to concern himself most with. Dr M. S. Swaminathan's leadership of the new agricultural technology has been so brilliantly vindicated by results in the fields that he owes it to himself to face this challenge to his professional integrity with the utmost courage and candour. He would of course be strengthening his specialist position very considerably if he would refrain from committing himself to such *obiter dicta* as his notorious assertion that the new farm technology is neutral to scale. As an agronomist, he has no particular qualification to pronounce on this question which calls for a good deal of deep economic analysis.

I may recall here that when Mr C. Subramaniam met a small group of journalists in New Delhi soon after he had assumed office as the Chairman of the National Commission on Agriculture, one of the emphatic observations he made was that the new farm technology was neutral to scale. Whether this is a piece of wisdom which Mr C. Subramaniam had received

from Dr M.S. Swaminathan or *vice versa* it would surely be interesting to inquire into. In any case the Director of the IARI will have only himself to blame if people were to suspect that he is perhaps not slow to lend the authority of his scientific personality or record to maxims which, while being of doubtful scholarship, could be of obvious political convenience.

One of the more intri-

guing features of the editorial coverage of Dr Shah's suicide or its implications by our leading newspapers was the holy horror which one leader-writer after another had expressed at the alleged sins of the IARI in the matter of appointments and promotions. If one were to let oneself be impressed by all this piety, one might well be led into believing that, in the newspapers themselves, there is always perfect justice in recruitment or promotions, that only merit is rewarded and the right man always selected or seconded for the right job. The truth, however, could be that there is as much frustration per square yard of office space among journalists as there may be among scientists in the IARI. Some time back, a leading daily, I may mention here, daily went about raiding the senior staff of its contemporaries for no better reason than that it had money to throw about, with its editor maintaining for all and sundry to hear that 9 per cent of its existing staff was worthless.

I would also remind our leading newspapers that, not long ago, when a certain young man, who was working as a junior scientific officer at BARC in Bombay was brought to New Delhi and appointed as a Special Science Advisor in the Prime Minister's secretariat (so that he could be near his father who is a favourite at Mrs Gandhi's court) there was a front-page news story in one of the dailies, hailing the event as a first step towards a breakthrough on the nation's science front. No leader-writer had then suggested that this act of favouritism or nepotism might have run the risk of precipitating a mass suicide of scientific officers in BARC or other similar establishments. The truth is that there is a frightening amount of hypocrisy in the country and this is nowhere in ampler evidence than in the press or among the politicians. If frustrated careers are in themselves a compelling reason for suicide, Mr Uma Shankar Dikshit may soon be relieved of one of his ministerial appellations since the population problem would be regulating itself.

MOVING FINGER

Power

PRELIMINARY PROPOSALS for power development in the fifth five-year Plan, drawn up by the Ministry of Irrigation and Power, envisage the raising of the installed generating capacity in the country to 41.5 million KW by 1978-79. Construction of additional 37,450 circuit kms of transmission lines, electrification of 1,31,000 more villages and energisation of 2.5 million irrigation pump-sets are also proposed.

According to present indications, the installed capacity expected to be achieved by 1973-74 is 20.2 million KW and concerted efforts are being made to commission another 0.8 million KW of capacity by March 1974. The present proposals therefore amount to doubling the installed capacity during the fifth five-year Plan. It is also proposed to initiate advance action on additional generation schemes, which will have to be taken up during the fifth Plan for affording benefits during the sixth Plan, particularly its early period.

An important objective during the fifth Plan would be removal of region-wise and state-wise imbalances in power development and reduction in disparity of tariffs prevailing in various power systems.

The proposals were discussed at a two-day meeting of the chairmen of State Electricity Boards in New Delhi from May 10, 1972.

The assessment of the future power requirements are based on the broad indications available in the development programme in the various sectors of the economy during the fifth Plan period and the detailed studies undertaken by the Ministry of Irrigation and Power and the Central Water and Power Commission. For instance, the growth planned in the industrial sector, which accounts for about 70 per cent of the total energy requirement, is eight to ten per cent as against six per cent actually achieved so far.

Generation: Energy generation in the country increased at

TRADE WINDS

the compound rate of 11.8 per cent during the fifties as well as the sixties; from 6.6 billion kwh in 1960-61 and 61.2 billion kwh in 1970-71. Taking into account the accelerated tempo of industrial growth envisaged, the increasing power demands in the agricultural sector and the impact of the extensive rural electrification programme for the fifth Plan, a growth rate of 12.5 per cent a year would not be too optimistic. Based on this, the total energy generation required during 1978-79 has been assessed at 15.8 billion kwh. The corresponding peak load demand has been assessed at 29 million KW, of which 27.7 million KW will be in utilities and 1.3 million KW in non-utilities. The power generating programme for the fifth Plan has to be geared to meet these requirements adequately.

The addition of 21.8 million KW to generating capacity during the fifth Plan would comprise 6.7 million KW from continuing fourth Plan schemes, 7.8 million KW from proposed extensions at developed sites and 7.3 million KW from new generation schemes.

Of this, again, 11.8 million KW would be thermal, 1.4 million KW nuclear and 8.6 million KW hydro capacity.

Transmission: A special feature of the transmission system envisaged is the establishment of a broad 400 KV network to facilitate transmission of large blocks of power not only within states but also across state and regional boundaries. This would pave the way for the ultimate realisation of an All India Power Grid. The distribution network to carry power to the ultimate

consumers has also been provided for.

By 1969-70, about 38000 circuit kws of 110 KV and, 121 KV lines and 11,000 circuit kws of 220 KV lines had been constructed. To be able to cope with the additional power likely to become available by the end of the fifth Plan period, it would be necessary to add about 16,400 circuit kws of 220 KV lines and 7,300 circuit kws of 400 KV lines, over and above the additions to 66 KV and 110 and 132 KV network.

Under the proposals investment in transmission and distribution, which has so far been about 41 per cent of that in the generation sector, would be raised to 50 per cent. This increase is considered necessary for increasing the security of supply, promoting integrated operation, boosting the rural electrification programme and reducing transmission and distribution losses.

Rural Electrification: Against the fourth Plan target of electrifying 50,000 villages and energising 12.5 lakh irrigation pumpsets, achievement is expected to be electrification of 74,255 villages and energising of 14.7 lakh pumpsets. The higher achievement is mainly because of Rs 40 crores of additional funds provided by the Rural Electrification Corporation and a further sum of Rs 75 crores being provided by the financial institutions. State Electricity Boards are also expected to provide for an expenditure of Rs 351 crores against the Plan outlay of Rs 294.69 crores.

It is proposed to provide a sum of Rs 15 crores for electrification of Harijan Basties in the fifth Plan period. A sum of Rs five crores has been sanc-

tioned for this purpose for the last three years of the fourth Plan.

Electronics

The Electronics Commission has decided that the licensing of additional capacity for the manufacture of TV sets should be based on the guideline that there is no need for any foreign collaboration or know-how for the manufacture of TV sets in India. Other guidelines are: No TV sets with foreign brand names should be allowed to be manufactured and no licences need be given to companies with foreign equity holdings, 50 per cent or more of the total capacity should be sanctioned to units in the small-scale sector and here preference would be given to qualified engineers, scientists and consortia of small-scale units and reasonable capacity would be licensed to public sector undertakings, both central and state and those involving State Industrial Development Corporations. This is stated in the report of the Department of Electronics for 1971-72.

The Commission has also decided to set up, from time to time, expert technical panels to examine various questions relating to specified areas in electronics. So far, four such technical panels have been constituted covering electronic desk calculators, ferrites, semi-conductor devices and glass bulbs for television and such applications.

The panel on Electronic Desk Calculators has submitted its report. The other three panels have still to complete their work. Several other panels are shortly to be set up.

Set up in February 1971, the Electronics Commission has had six meetings during the year under review. The Commission has been charged with full responsibility to review the entire field of electronics with regard to research, development and industrial operations, with full authority to formulate policies in this field and to direct implementation, on sound technical and economic principles, of all measures, both promotional and regulatory that are necessary for the

country to attain self-reliance in the shortest possible time and in the best possible manner.

At present the Commission is involved in making an assessment of the present requirements and those over the future (during the next 5-10 years) in all sectors of electronics including equipment, components and materials. It is also making an assessment of the imports of all types in the field of electronics of the installed capacities, of letters of intent issued and of intrinsic manufacturing capabilities in the public and private sector and the future plans thereof over the next few years. Also the Commission is to determine the manner in which additional manufacturing capacity should be generated in the public sector and the private sectors.

Evaluation committees were set up by the Department of Electronics for carrying out an analysis of the computational demands for various application areas in different regions of the country: Bangalore, Calcutta, Delhi, Kanpur and Madras. An Evaluation Committee for examining the in-house computer requirements for the Atomic Energy Commission at Bombay which could also partially meet the requirements of the region till regional facilities get established was also set up.

The recommendations of these committees are being considered on an integrated basis, so as to arrive at decisions relating to the setting up of regional centres in the phased manner based on national priorities and availability of funds.

Assistance under the United Nations Development Programme (UNDP) has been sought for the proposed regional centre at Delhi, one computer at Bombay and the proposed regional centre at Bangalore for the period 1972-74, and these are on the list of approved projects in India's UNDP Country Programme.

Mini-computers represent one of the very significant development in the field of computers in the last two years. They have an important role

to play in the area of commercial and educational usages and replace the older unit record equipment. A panel to study the role of mini-computers in the Indian environment and to recommend a programme for building up this facet of industry in the country is being set up.

In keeping with the policy of encouraging indigenous design and production in the field of computers with a view to achieving self-reliance, a proposal from the Electronics Corporation of India Ltd, for the manufacture of small to medium sized-computers — the TDC-16 and TDC-32 machines — has been approved by the Electronics Commission.

As regards Research and Development, the Electronics Commission has already decided that specialised area where massive R & D effort is required should be selected, and an all-out effort made to undertake development of these areas within the shortest possible time. During the year 1971-72, funds to the extent of Rs 3.49 crores have been disbursed for R & D. During the financial year 1972-73, funds to the extent of Rs 3.50 crores have been provided for undertaking development, among others, for computer development, projects in progress and sanctioned by the earlier Electronics Committee; computer peripherals; electronic instrumentation; materials and components (including modern crystal growth facilities, semi-conductor memory systems, light emitting diodes, liquid crystal displays, magnetic materials).

Atomic Energy

An around progress in all the projects in hand and in the planning of major projects envisaged in the 10-year Profile have been reported in the annual report of the Department of Atomic Energy for 1971-72.

All construction work on Unit I in the Rajasthan Atomic Power Project has been completed and commissioning activities are in full swing. In Unit II, all major civil works,

including prestressed concrete domes, have been completed and installation of nuclear and conventional components is in progress. Unit I of the Rajasthan station is expected to become "critical" around June 1972, while Unit II will become "critical" in March 1975.

Commissioned in October 1969, the Tarapur Atomic Power Station (TAPS) generated 4,590 million units of electricity and earned a gross revenue of over Rs 25 crores. The station operated with high efficiency till March 1971, earning a working profit of Rs eight crores and a net surplus of Rs one crore after meeting interest dues and apportionment to reserves.

In the succeeding 12 months, the TAPS earned an operating profit of over Rs two crores only, the decrease being mainly attributable to an extended shut-down of one of the units due to special problems noticed during the first refuelling outage and a turbine overhaul on the other unit.

At the Madras Atomic Power Project, designs for civil structures for the sea water system, i.e., submarine tunnel, off-shore intake, pump house, conduits, seal-well and outfalls, etc. and the vapour suppression system, shield wall between reactor boilers and primary pump in the reactor building, and various auxiliary cooling systems inside the reactor building, have been completed. Work has also been taken in hand for construction of the reactor and turbine buildings of Unit II of the station.

New Nuclear Power Stations: A Site Selection Committee was appointed in September 1970 to examine suitable sites for new atomic power stations in the northern, western and southern electricity regions. The report of the committee on the northern region has been received and a decision regarding a new atomic power station in the region will be taken shortly.

Construction work on the Variable Energy Cyclotron at Calcutta is making progress. The Cyclotron will be a mo-

dern research facility for high quality work in nuclear physics. Because of its high beam intensity, it can produce a variety of isotopes, which is not possible in nuclear reactors. The proposed facility will provide new opportunities for research workers from the universities and other institutions in the country which by themselves may not be able to set up and operate a large and complex machine of this type.

Work on electro-thermal process for phosphatic fertilizers was initiated. Suitability of commercially available Indian phosphate rocks and other raw materials is being studied for the process. Design and project work on 600 KW capacity electro-thermal phosphorus plant is in progress to develop indigenous technical know-how and support the development of commercial phosphorus plants in the near future.

Nuclear Medicine: Clinical nuclear medicine, training of medical personnel in the use of radioisotopes, and application of radioisotopes in medical research form the major responsibilities of the Radiation Medicine Centre (RMC) of the Bhabha Atomic Research Centre. During the year, the RMC investigated about 5,000 patients with radioisotopes, some of whom were also given radiotherapy.

At the Tata Memorial Hospital which forms a part of the Tata Memorial Centre (TMC), Bombay, clinical research studies on treatment methods (surgery, radiation and chemotherapy) to improve the survival rate of cancer patients have been actively pursued. A programme to use cryosurgery techniques in the treatment of cancer is under way.

Anti-Cancer Properties of Indigenous Plants: The screening programme for detecting anticancer properties of indigenous plants has given some useful results. Out of 500 species of plants screened so far, Six plant extracts have shown good anti-cancer activity in experiments, isolation and characterisation of active principles is in progress.

In the field of Dental re-

earch, a project of the Tata Institute for the follow-up of individuals examined three years ago in the rural areas of five districts of Andhra Pradesh, Bihar, Gujarat and Kerala, is in progress. The second follow-up of the individuals is complete and a third follow-up is being conducted in three areas. The response in the second follow-up varied from 64.8 per cent to 79.2 per cent in different districts.

The Directorate of Radiation protection of the department is responsible for implementing a country wide Radiation Hazards Control Programme. The DRP is responsible for assessing radiation doses received by personnel using radiation sources in various fields such as agriculture, industry, medicine and research. During the year its film badge service covered a total of 24,000 workers from 1,600 institutions. The corresponding figures for the preceding two years are 21,000 and 1,400 respectively. With the recent promulgation of the 'Radiation Protection Regulations 1971' this service will soon cover all radiation workers in the country.

Space Technology: Development activities in connection with Satellite Launch Vehicle-3 in the areas of propellants, nozzles and motor chambers, control systems, telemetering and tracking, are in different stages. Besides other basic facilities which are already operating, a propellant fuel complex is being built at Thumba. The unit is expected to go into production by the middle of 1973.

With the commissioning of this complex, India will be considerably free from dependence on outside sources for basic fuel requirements of high energy propellants for rockets and space vehicles. The complex will produce high energy fuels like polysulphides, polyurethanes polybutadienes etc., and plasticisers, catalysts and stabilisers — items which are not readily available in the country.

The Thumba Equatorial Rocket Launching Station launched

a total of 129 rockets upto March 31, 1972. Of which 66 carried scientific experiments while 63 were test rockets. The rockets sent up include Soviet built M-100 meteorological rockets, Nike-Apache rockets, Rohini-100, Rohini-125 and Manaka-I rockets, Dual Hawks, British-made Skuas and Petrels etc. The scientific rocket experiments for the study of the equatorial ionosphere, the electrojet, and the neutral upper atmosphere were conducted with payloads developed and fabricated at the Physical Research Laboratory at Ahmedabad.

Besides Satellite Instructional Television Experiment, the Indian Space Research Organisation proposes to collaborate with NASA on the use of the latter's planned experimental earth resources technology satellite for multi-disciplinary investigations; the proposal envisages the study of pictures taken by the satellites, for application in the fields of oceanography, hydrology, geology, cartography, forestry and agriculture. Pictures from the first satellite ERTS-A are expected to become available in July 1972. ISRO proposes to act as a catalyst to enable Indian scientists to study the imagery thus obtained.

Taxes Bill

The Lok Sabha's select committee has proposed that the provision for acquisition of immovable property should include not only property transferred by sale but also transfers by way of exchange. In making the recommendation in a report presented to the House on May 10, the committee has said that unscrupulous persons could otherwise easily circumvent the acquisition by paying the consideration for the transfer of the immovable property, partly in cash and partly in kind or wholly in kind.

The observations are made on the Bill to amend the Income-Tax Act, 1961, the Wealth Tax Act, 1957 and the Gift Tax Act, 1958. The com-

mittee has also suggested guidelines on the basis of which references could be made of the valuation of any capital, asset or property to a valuation officer. The guidelines would become necessary in its view "to avoid arbitrariness on the part of the tax authorities in making such references."

Pact on Space Research

India and the Soviet Union signed an agreement in Moscow on May 10, which is expected to take Indian space research effort to a quantitatively new stage. Prof M.G.K. Menon, head of the Indian Space Research Organisation, signed the agreement for India and Academician M. Keldysh, President of the USSR Academy of Sciences, for his country.

Bombay TV Studio

The television studio in Bombay installed by a team of West German engineers has been handed over to government of India. The studio, like the earlier one in Delhi, is a gift from West Germany.

Industrial Estates in Nepal

India and Nepal recently signed an agreement for establishing industrial estates at Nepalgunj in western Nepal and Dharan in the eastern part of the kingdom at a cost of Rs 40.31 lakhs. India will bear 90 per cent of the cost.

Devaluation

Jordan: The Jordanian dinar was devalued on May 10, 1972, by 8.5 per cent in line with the dollar.

Pakistan: The Pakistani rupee has been devalued. The new rate is 11 Pakistani rupees equivalent to one American dollar. Previously, one US dollar was equal to 4.75 Pakistan rupees. The decision came into force on May 11. The bonus voucher scheme has also been abolished. The decision to devalue the rupee was taken at a special cabinet meeting presided over by President Z.A. Bhutto and attended by governors

and chief ministers of the provinces.

Bank Rates

Pakistan has raised the Bank Rate from five to six per cent. The Finance Minister, Mr Mubashir Hassan, is reported to have said that adjustments would also be necessary in deposit and lending rates. The raising of the Bank Rate came along with the devaluation of the Pakistani rupee. According to Mr Hassan, a stringent credit and monetary policy would be followed and exports would be more free than ever. While commodities like steel billets and industrial raw material could be imported freely, non-essential and luxury goods would continue to be banned. Import duties had been revised on the basis of the new rate of exchange.

Japan: The government and the Bank of Japan decided on May 10 to lower the official discount rate of the Central Bank by 0.5 per cent to 4.25 per cent per annum. The measure is designed to stimulate business following a prolonged recession as well as to normalise the nation's system of money rates.

Names in the News

Mr R.O. Jackson, Chief Executive of Burmah-Shell in India since January 1968, who recently left for London to take up a senior appointment with the Royal Dutch Shell Group, is succeeded by Mr M.S. Patwardhan who will also be Chairman of Burmah Shell Refineries Limited. After completing his earlier education in Bombay, Mr Patwardhan went to Cambridge University where he did the National Sciences Tripos. He joined Burmah-Shell on returning from the UK in 1951. After holding various positions in Burmah-Shell in many parts of India, he was attached to Shell International Petroleum Company, London, in 1964 for one year. On his return to India in 1965, he was appointed a Director of Burmah-Shell Refineries Limited.

COMPANY AFFAIRS

Century

THE CENTURY Spinning and Manufacturing Company Ltd is participating in a joint venture for setting up a composite textile mill in Indonesia. The government has approved the proposal in principle. Negotiations are underway for finalising financial arrangements with international institutions. Meanwhile the company has submitted a series of schemes for starting of new industries in the country and they are being processed. The company is still awaiting the government's final decision for industrial licence to manufacture 30,000 tonnes each of chemical pulp and paper although the Monopolies Commission had recommended grant of a licence to the company a year ago. In the meantime the company is going ahead with the implementation of its cement project for which it has been granted recently a "Carry on Business" licence. Necessary land has been acquired and construction work is in progress. The plant will have an installed capacity of six lakh tonnes and is expected to go into production during the second half of 1973.

Zuari Agro

The water treatment plant of the giant fertilizer complex of Zuari Agro Chemicals at Sancoale, near Mormugao port will be on stream in course of this week while the whole fertilizer complex will be commissioned sometime in October, three months behind the original schedule. The plant was stated to be completed on a turn-key basis within 27 months from the signing of the contract by Toyo Engineering Corporation and according to that schedule it should have been completed by July this year. But for various reason

including labour unrest and the Indo-Pakistan war, work was held up for three months.

The plant when commissioned will be producing 280,000 tonnes of urea and 150,000 tonnes of compound fertilizers per annum, valued at Rs 45 crores. For its successful functioning it will be requiring annually 220,000 tonnes of naphtha, 90,000 tonnes fuel oil and 87,000 tonnes of phosphoric acid. Both naphtha and fuel oil will be supplied by the Indian Oil Corporation while phosphoric acid will be imported from Mexico for five years. There are still many hurdles to be crossed so that the plant can function on a sound and uninterrupted basis. For instance, the company is currently faced with a series of problems such as shortage of water supply, bottleneck in power and want of special facilities at the port for handling the massive quantities of imported phosphoric acid. Various ways and means are being explored by the company to overcome these temporary difficulties.

Birla Jute

The directors of Birla Jute Manufacturing Company Ltd have a proposal to issue and allot debentures of Rs 1000 each carrying an interest of eight per cent per annum payable half-yearly on March 31 and September 30 in each year and repayable at par on April 1, 1983 or at the company's option at any time after April 1, 1981 by giving not less than three months' notice. This allotment shall be effective from May 15, 1972. This is entirely a private issue.

Pfizer

With increasing demand for its products sales of Pfizer Ltd have recorded a handsome rise to Rs 20.84 crores from

Rs 17.34 crores in 1970 but net profit was only a shade higher at Rs 1.73 crores as against Rs 1.55 crores in 1970. The drastic reduction in a quite number of important products of the company as per the Drugs (Prices Control) Order on the one hand and a continuous escalation in costs of materials and other expenses on the other, have by and large been responsible for the decline in the rate of profitability of the company. The impact of these on the working of the company would have been more severe but for the sustained efforts made by the company to improve the operational efficiencies at all levels to cut down costs and to increase productivity. These savings, however, have a serious limitation as it cannot be reaped on a continuing basis. Yet another factor which helped the company to neutralise the adverse effect of the Drugs (Prices Control) Order was the inventory of imported raw materials held by the company prior to the enforcement of the Pooled Prices Scheme which were procured at comparatively lower prices. This again was only a temporary benefit for 1971.

The company's plant at Chandigarh worked at rated capacity and the basic manufacturing facilities for broad spectrum antibiotics were helpful in maximising production. It was, however, not possible to utilise fully the capacity of the plant for turning out chlorpropamide, an essential drug, to the desired extent because of difficulties in matching imported raw materials. The performance of the company on the export front is quite encouraging. During 1971 exports touched figure of Rs 61.9 lakhs and the earnings from these exports have considerably assisted the com-

pany to improve its overall performance. The company has received the consent of the Controller of Capital Issues to capitalise a sum of Rs 97.74 lakhs out of the share premium account and Rs 60.72 lakhs out of general reserve for issuing bonus shares in the ratio of two shares for every five equity shares held.

Industrial Cables

Sharp upswing in sales and profits, spurt in export earnings and diversification in product range are some of the significant achievements of Industrial Cables (India,) Ltd during the year ended October 31, 1971. Despite fierce competition in international markets, magnificent efforts made by the company enabled it to fetch record earnings in exports amounting to Rs 138.28 lakhs (f.o.b. value) as compared to Rs 92.12 lakhs in 1969-70. Exports in terms of gross value, including incentives, aggregated Rs 201.79 lakhs and it represented 51.26 per cent of the total turnover — a commendable achievement indeed by any standard. It is worth mentioning here that the company's efforts on the export front has amply been rewarded as witness in the bagging of the Certificate of Merit for the outstanding export performance last year. Today it enjoys the proud privilege of being the largest exporter of engineering goods from Punjab and perhaps of being the largest exporter in underground paper insulated cables. What is more the company has recently been recognised as an export house.

Consistent with its tradition of product diversification and expansion, the company has for instance, proposes to set up a steel wire manufacturing unit in Haryana. The letter of intent has already been received and the project is in the process of implementation. The company has also to its credit a COB licence for the manufacture of AAC and ACSR conductors. Besides it has received a letter of intent for the manufacture of grooved contact wires (trolley wires) and it is proposed to undertake this project at Rajpura. Efforts are also being made by the com-

pany to obtain a licence for the manufacture XLP cables and to set up an aluminium rolling mill for aluminium rods. Negotiations are underway for obtaining technical know-how for XLP cables. The government's policy in regard to change over from PILC cables to PVC cables and XLP cables up to 11 Kv due to import substitution has adversely affected all the PILC cables units in the country but the company has taken appropriate steps to utilise the idle capacity for exports.

In spite of adverse circumstances such as acute shortage of essential raw materials, power bottleneck and a host of other factors the company was able to make striking improvements in its performance during the year under review. Sales, for instance, soared to Rs 3.94 crores from Rs 3.17 crores while net profit swelled to Rs 87.1 lakhs from Rs 8.24 lakhs in 1969-70. Out of the net profit a sum of Rs 1.05 lakhs was transferred to development rebate reserve, Rs 80,000 for taxation and Rs 6.86 lakhs to general reserve. The directors have declared an equity dividend of 10 per cent and it will be paid out of the general reserve. Keeping in view the rapid development of local skills and know-how the company has made a notable contribution of about two per cent of the turnover during the year to a research foundation recognised by the CSIR for research and development of cable technology.

Guest Keen

In his annual statement to the shareholders of Guest Keen Williams Ltd the chairman, Mr K.C. Maitra has focussed attention to the difficulties experienced by the engineering and other industries in raising output to the desired level and in preserving of the profit margins. Many leading manufacturers are finding themselves in such an awkward situation even with fairly large volume of orders in hand. Hence it is felt that a sustained increase in production as well as turnover can only be achieved if there was no serious hold-

up of operations in the industrial sector particularly due to labour unrest. Companies, especially enterprises such as Guest Keen Williams which is supplying materials and components to a host of manufacturing companies will be able to excel its performance of 1971 if its customers were in a position to implement their schemes without interruption and maintain also their output at a high level. Besides it is apprehended that just for retaining the earnings even at the 1971 level in the current year there will have to be a larger turnover as the new imposts imposed by the government in interim as well as regular budgets have resulted in escalation of costs and the impact has to be absorbed by the company without passing on the incidence of these levies fully to the customers. Apart from the difficulties experienced in maintaining of profit margins, it is also emphasised that there will have to be larger generation of internal resources for meeting the increasing working capital requirements resulting especially from further escalation in costs of materials and components. It is however, expected that Guest Keen Williams will be able to repeat its performance of 1971 or even surpass it in the absence of untoward developments.

The year 1971 was a landmark in the history of the company. Sales for the first time crossed the Rs 50-crore mark and the company is proud of its magnificent achievement.

Its performance on the export front in 1971 was, however, not encouraging. As regards issue of bonus shares the chairman stated that the government turned down the company's request for issue of bonus shares on the ground that Rs 1.11 crores of the total share premium account was created by consideration other than cash and hence it cannot be capitalised.

News and Notes

Expansion and Diversification

Tata Mills Ltd: has plans to produce new varieties of non-woven disposables by installing additional machinery worth Rs 30 lakhs. It is also planning to set up a strip mill to produce flat steel-products in coil form by the use of scrap and sponge iron. This venture, which would be a major diversification project outside the textile field, will involve a capital outlay of Rs 10 crores with a foreign exchange content of Rs 4.3 crores. This plant will be located in Chanda district, a backward area in the state of Maharashtra.

New Ventures

Trimurti Agrochemicals Corporation is venturing into a new project for the manufacture of complex fertilizers by wet chemical granulation process at Mangrol in Junagadh district of Gujarat. The company will include in its range of production ammonium polyphosphate and other types of high-

ly concentrated fertilizers. The plant will have a capacity of 50,000 tonnes per annum. Initially the company will manufacture fertilizers for groundnut, cotton, wheat, rice, plantations and sugarcane. All infrastructure facilities have been managed and land has already been acquired from the state government. The process has been obtained from Tennessee Valley Authority of the USA. Special arrangements have also been made with the TVA for technical consultancies. With the chemical wet process the company is hopeful of cutting down costs of production resulting in handsome profit margins. The capital outlay on the project is estimated at Rs 75 lakhs. To meet a part of the cost of the project the company will be offering shortly to the public for subscription equity shares worth Rs 14 lakhs.

The di-ammonium phosphate project of **Dharamsi Morarji Chemicals** claimed to be one of the largests of its kind in the world, has been cleared by the Central Public Health Engineering Institute in regard to its location at Sheva in the Konkan region of Maharashtra. The company is now negotiating with CIDCO which had raised an objection against the location of the project on grounds of pollution. If land becomes available the project would be completed by the end of 1974. The giant-sized nature of the project would necessitate the setting up of quite a large number of ancillary industries in the neighbourhood

The DMC might avail of some of these opportunities.

Ronald Steel and Rubber Industries has received a letter of intent to manufacture with foreign collaboration 36,000 metres of steel cord conveyor belting. The company has also been permitted to manufacture 36,000 metres of fabric conveyor belting in nylon, polyester fibre and cotton duck. This 1.60, crore project will be located at Itarsi in Madhya Pradesh. The plant is expected to go into commercial production in May 1974.

Joint Ventures

Jagatjit Cotton intends to invest Rs 90 lakhs in the share capital of Guptalone Ltd which holds an industrial licence for setting up a plant near Ludhiana for the manufacture of nylon filament yarn with a daily capacity of three tonnes. Possibilities are now being explored for establishing the new plant at the site of Jagatjit's present complex at Phagwara or as close to it as possible. This joint venture would be beneficial to both the companies as for instance, the polyester and nylon yarn to be produced by the new undertaking could well be utilised by Jagatjit for blending and processing by carrying out suitable modifications in the respective divisions while Jagatjit will provide Guptalone distribution and marketing expertise. As the present paid-up capital of Guptalone is only Rs 10 lakhs, it has to raise an equity capital of Rs 2.36 crores through subscription to implement its project. It has approached Jagatjit to subscribe to the equity capital to the tune of Rs 90 lakhs.

New Issues

Alfred Herbert (India) Ltd which has long been engaged in marketing and rendering of technical services of imported and indigenous machine tools and industrial machinery now proposes to diversify its activities by taking up the manufacture of various types of machinery in technical collaboration with a British firm. The company will include in its production range

intermixes, shear strip type tyre presses, tube presses for automobiles and trucks and bicycles tyre and tube presses and several other types of machinery. As the products which the company proposes to manufacture have not been locally manufactured so far it is expected that the internal demand will far exceed the production planned by the company. In view of the wide gap between supply and demand the company does not envisage any difficulty in marketing its products. The factory to be put at Bangalore is expected to be commissioned by the end of 1973.

To raise resources for implementing this project the company proposes to issue two lakh equity shares of Rs 10 each at a premium of Rs 5 a share. Out of these 10,000 shares have been reserved for subscription by the Indian Directors and the employees of the company. The remaining, 1,90,000 equity shares of Rs 10 each are being offered to the public for subscription at a premium of Rs 5 per share. The list for the fully underwritten issue opens on May 24 and will close on June 5 or earlier but not before May 29. With the proposed public issue the Indian participation in the company's equity capital amounts to 40 per cent. The directors hope to declare a dividend of 10 per cent for the current year.

Standard Mills Co. Ltd is offering 40,000 (eight per cent) convertible bonds of Rs 500 each at par for public. The list for the fully underwritten bond issue will open on May 24 and close on May 31 or earlier but not before May 27. The full amount is payable on application. Bond holders opting for conversion between July and December 1976 will be allotted for each bond of Rs 500, one equity share of Rs 100 each at Rs 375 and a sum of Rs 125 in cash. However, if the company issues before December 1976 bonus shares on a one-for-four basis, the bond holders who opt for conversion will get one equity share for every bond of Rs 500 and an amount of Rs 200 in cash. The bonds are being issued to raise

a part of the resources required for implementing the expansion programme of the chemical unit and modernisation and renovation of its three textile units.

Mohatta Chem will be approaching the capital market shortly by offering for public subscription 65,000 equity shares of Rs 10 each at par and 3,900 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each at par. The company has an authorised capital of Rs 50 lakhs — Rs 10 lakhs in preference shares and Rs 40 lakhs in equity shares — and an issued capital of Rs 17 lakhs consisting of Rs 4 lakhs in preference capital and Rs 13 lakhs in equity shares. Of these, equity shares worth Rs 6.50 lakhs will be taken up by the promoters and directors while preference 'A' shares of Rs 10,000 will be allotted to SICOM for preparing the feasibility report. The company proposes to set up a plant at Roha in Kolaba district of Maharashtra for the manufacture of formaldehyde. The company has entered into

an agreement with Indoc Berolina Industries, Private Ltd, Bombay, for the supply of plant and machinery. The plant is expected to go on stream within 18 months of the date of placing of orders for machinery. The capital cost of the project is estimated at Rs 62.51 lakhs and it will be financed through the share capital of Rs 17 lakhs, bank borrowings of Rs 5.51 lakhs, unsecured loans of Rs three lakhs and Rs 37 lakhs as term loan from SICOM.

Company Meetings

Hindustan Aluminium Corporation Ltd; Birla Matushi Sabhagar, 19, Marine Lines, Bombay-20; May 19; 4 P.M.

Mysore Lamp Works Ltd Old Tumkur Road, Bangalore 12; May 18; 4 P.M.

Ceat Tyres of India Limited Bombay House, Bruce Street, Bombay-1, May 18, 4.30 P.M.

Hindustan Lever Limited Hindustan Lever House, 165/166, Backbay Reclamation, Bombay-20, June 8, 4 P.M.

Interim Dividend

Upper Doab Sugar Mills Ltd has declared a gross interim dividend of 10 per cent for the year ending September 30, 1972.

		Dividends	
		Equity dividend declared for	
Name of the company	Year ended	Current year	Previous year
Higher Dividend			
Emco Transformers	Sep. 1971	8.0	Nil
Shaw Wallace Company	Dec. 1971	27.5	18.
Travancore Electro Chemical Industries	Dec. 1971	14.0	10.
Modella Woollens	Dec. 1971	12.5	10.
Same Dividend			
Schrader-Scovill Duncan	Oct. 1971	25.0	25.
Alembic chemicals	Dec. 1971	12.0	12.
Texmaco	Dec. 1971	Nil	Nil
Gaekwar Mills	Dec. 1971	16.0	16.
Bombay Silk Mills	Dec. 1971	9.0	9.
Dharamji Morarji Chemical Co.	Dec. 1971	20.0	20.
Reduced Dividend			
Coimbatore Cotton Mills	Dec. 1971	9.0	11.
Shreeniwas Cotton Mills	Dec. 1971	8.0	10.
Brady Morri Engineering Company	Dec. 1971	5.0	8.

Eastern Economist 25 Years Ago

May 23, 1947

The Bill instituting Investigation Commission for enquiry into taxation on income as altered and approved by the Select Committee has emerged with important modifications in several respects. The report of the Select Committee was almost unanimous but for a solitary dissident, Mr P.J. Griffiths. Mr Griffiths asserts that he entirely disagrees with the changes made by the Select Committee. One wonders whether the leader of the European Group in the Central Assembly would stomach the prospect of an inquisition in his own country by a commission invested with such drastic, unlimited and harassing powers as those proposed

in the original Bill. The Bill as modified by the Select Committee has been passed by the Legislature. The duties of the Income-tax Investigation Commission are: (1) to investigate and report to the Central Government on all matters relating to taxation of income with particular reference to the adequacy of the existing law and procedure for preventing evasion of assessment and collection of taxes and (2) to investigate specific cases of evasion referred to it and to report on them to the Central Government. The second object appears to be the predominant function of the Commission as disclosed by the whole trend of the Bill.

RECORDS AND STATISTICS

Report of Ministry of Petroleum & Chemicals: 1971-72

INDIA PRODUCED 7.2 million tonnes of crude oil in 1971—4,00,000 tonnes more than in the previous year, according to the Annual Report of the Ministry of Petroleum & Chemicals for 1971-72. The production of refined petroleum products increased to 19.6 million tonnes in 1971 compared to 18.5 million tonnes in 1970.

During the period under report, production activities of the Oil & Natural Gas Commission, a public sector organisation and the principal agency for exploration and production of oil in the country, were stepped up both in the eastern and western regions and the rate of production was increased from 10,000 tonnes per day in March 1971 to about 11,157 tonnes per day in December. 1971. During the period April-December, 1971, a total of 2.99 million tonnes of crude oil was produced and despatched from the oil fields of the Commission in Gujarat and Assam. Since its inception and up to the end of December, 1971, the commission had produced

and sold a total of 22.2 million tonnes of crude oil.

The Commission drilled 48 wells with a total metreage of 81,593 in Gujarat, Assam, Rajasthan, Cauvery Basin and Jammu & Kashmir, taking the number of wells drilled from its inception to 930, of which 504 were oil-bearing, 70 gas bearing, 22 water injection and 252 dry wells; 82 were under test.

Exploratory drilling was accorded high priority by the Commission with a view to discovering new hydrocarbon-bearing structures. Drilling of 10 wild-cat wells at Dalvade, Daswara, Deodar, Kanka, Ambala and Indrora in Gujarat; Banamali in Assam; Saliangalam and Dandanallur in Cauvery Basin and Surinsar in Jammu & Kashmir was continued during the year, said the report.

Off-Shore Drilling

The Commission, according to the Report, was now undertaking in a big way exploration for oil in the off-shore areas. Detailed seismic survey of offshore areas along the western coast had already commenced to pinpoint locations for drilling in deep waters. A self-propelled jack-up type drilling platform for the purpose was expected to be delivered to the Commission by the end of 1972.

A landmark in the development of pipeline technology in the country was the completion of Kalol-Nawagam pipeline to transport oil from the North Gujarat oil fields to Koyali Refinery. The pipeline was designed and executed with wholly Indian know-how and personnel.

During the year, the Hydro-

carbon (India) Private Limited, a subsidiary company of the Oil & Natural Gas Commission earned foreign exchange worth Rs eight crores from the sale of 0.931 million tonnes of crude oil. Hydrocarbons (In-

dia) Private Ltd, held 1/6th share in the Iranian Marine International Oil Company operating in the Persian waters of the Gulf. It struck oil in Rostum and Raksh fields in commercial quantities which

Oil India Limited

The Oil India Limited, another major oil producing organisation in which the government of India and the Burmah Oil Company are equal partners, produced 3.14 million tonnes of crude oil in 1971 from its oil fields in the North-Eastern region.

The company completed during 1971 one exploratory well and 13 development wells. Till December 1971, the company had drilled a total of 297 development wells and 15 exploratory wells with a total metreage of approximately 955,520 and 64,783 respectively.

The company declared a dividend of 13 per cent net (six per cent as final dividend for 1970 and seven per cent as interim dividend for 1971), after payment of all taxes. Government of India received a payment of Rs 241.06 lakhs during 1971 on this account on its investment of Rs 14 crores in the equity capital of the company.

New Refineries

During 1971, the nine operating refineries in India refined 19.6 million tonnes of crude oil, over one million tonnes more than in 1970. About 11 million tonnes of crude was refined by the five public sector refineries and the balance by the four refineries in the private sector.

Of the three refineries under the Indian Oil Corporation, refining capacity of Koyali (Gujarat) Refinery was augmented by 0.9 million tonnes per annum by revamping and debottlenecking. Expansion of the Barauni refinery from its present capacity of 2.2 million tonnes to 3.4 million tonnes was expected to be achieved by June 1974 when the third million-tonne unit of the refinery started operating on imported crude. The fourth refinery of the Corporation, being set up at Haldia in West Bengal was making steady progress. According to present indications the fuel part of the refinery was expect-

ed to be commissioned by the end of the first quarter of 1973 and the lube complex by September 1973. The refinery was expected to cost Rs 67.50 crores.

Government had decided to set up a one-million tonne refinery at Bongaigaon in Assam together with a related DMT (dimethyl terephthalate) polyester fibre petro-chemical complex. The foundation stone of the refinery was laid by the Prime Minister in January 1972.

Anticipated Demands

To meet the anticipated demands of the North-West region of the country, the government was considering a proposal for setting up a six million-tonne refinery at a suitable location in that region. The refinery will have to be based on imported crude to be transported by a pipeline from the Gulf of Kutch.

Cochin Refineries Ltd also completed another year of successful operation and earned a profit of over Rs 1.75 crores.

The capacity of the Cochin Refinery was being expanded from 2.5 million tonnes to 3.3 million tonnes. The additional capacity was expected to be commissioned by February 1973.

The Madras Refinery, which went on stream in June 1969, processed 2.09 million tonnes of Darius crude attaining a crude throughput of 84 per cent of installed capacity in 1970-71, the second year of its operation.

The Lubrizol India Limited, in which the government of India held majority share, showed satisfactory results. The plant with a capacity of 6000 tonnes blended intermediate components into various chemical additives used in the formulation of lubricating oils etc. The government had approved expansion of the plant's capacity to 12,000 tonnes at an estimated cost of Rs 185 lakhs. Expansion was expected to be completed by March 1974.

The refinery of Lube India Ltd. a 50 : 50 partnership of the government of India and

Esso, had produced lube and transformer oil base stock to the extent of 1,47,700 tonnes at 90 per cent of its installed capacity during the year under report. The refinery had gone on stream in January 1970.

Growing Role of IOC

According to the report, the Indian Oil Corporation handled more than half (51.60 per cent) of the petroleum products trade in the country. The total sales of the Corporation during 1970-71 were 11.61 milli kilolitres as against 10.64 million kilolitres in 1969-70, showing an increase of nine per cent. The Corporation expected to sell 13.40 million kilo-litres of petroleum products next year, i.e. 1971-72.

The number of retail outlets of IOC was 3004 in 1970-71. Since April 1971, 75 new retail outlets had been added. These included outlets set up in the rural areas to sell light diesel oil for the benefit of agriculturists. There were also 70 retail outlets where the sale of fertilizers and pesticides to agriculturists had commenced. In addition, the Corporation had developed 141 farm fuel centres to cater specifically to such needs of agriculturists as servicing of tractors, advice on the use of correct fuel and lubrications, sale of seeds etc.

Liquified Petroleum Gas

Steady progress was maintained in the production and marketing of liquified petroleum gas (LPG). Production of LPG increased from 161,000 tonnes in 1970 to 200,000 tonnes in 1971. Indane gas was made available to 54 more towns during the year under report. The Corporation also started a limited supply of LPG for industrial use.

The Corporation imported refined petroleum products and lube base stock amounting to Rs 23.15 crores from April to December 1971 to meet certain marginal deficits. It also developed an export market for disposal of surpluses from public sector refineries and the exports

amounted to Rs 1.11 crores during the same period.

War Effort

The Ministry took special steps during the hostilities in December 1971 to meet fully the defence requirements of oil products and succeeded in full measure in that task, the report said.

It had been decided that all new dealerships/agencies of the Indian Oil Corporation for retail outlets, kerosene and domestic gas, would be awarded to war widows or disabled defence personnel initially for one year.

Assistance to Bangladesh

As part of overall assistance to Bangladesh, Rs four crores had been sanctioned initially for the supply of crude oil and petroleum products to that country. The entire quantity of crude supply reached Chittagong by the end of February 1972 and with this, the Eastern Oil Refinery at Chittagong had started functioning. It was also proposed to supply 1,00,000 tonnes of petroleum products to Bangladesh during the the current year.

Engineers India Limited

Engineers India Limited, a wholly government owned company set up under the ministry, provided a complete range of services from concept to commissioning in respect of petroleum refineries, petrochemical and chemical plants, fertilizer plants, breweries, off-shore engineering, heat exchangers and non-ferrous metallurgical plants. During the period under report, the company secured a job in Iran (Shiraz Refinery) in association with Sham Progetti of Italy and had tendered in association with Procofrance, for expansion of a refinery in Burma. The company was at present engaged on process design, engineering procurement and on construction supervision of the Haldia Refinery, Koyali Aromatics Project, Cochin Refinery Expansion. Coke Calcination Plant at Barauni and LPG bottling facilities at Barauni etc.

After Santiago, what?

It is difficult to get a true picture or feel of UNCTAD III from newspaper accounts of its proceedings, the reported oratory or even the resolutions adopted or the proposals dropped or defeated. Subject to this limitation we would venture to suggest that the central and also the most disturbing feature of the conference in Santiago was a failure on the part of the developing countries to find adequate leadership in their ranks. In this respect UNCTAD II, which was held in New Delhi, was significantly different. The Indian delegation which had Mr Dinesh Singh for its ministerial head and Mr K.B. Lal as the chief of the official team was determined from the outset that New Delhi would not let UNCTAD go without solid gains to declare.

Without exaggerating the impact of this delegation on the course of the conference, it could be claimed that its clear-eyed vision and cool-headed purposiveness contributed a great deal towards steering the course of consultations and negotiations and even the controversies and debates into ultimately productive channels. It is not suggested here that UNCTAD II was a famous victory, but its success in carrying through the concept of generalized preferences to the point of acceptance in principle and subsequent implementation in detail did result in saving UNCTAD itself from the real danger of infant mortality. In Santiago there was apparently no such thrust of practical leadership set to achieve major results. To the extent that individuals make history, Santiago had also the further disadvantage that the present Secretary-General of UNCTAD does not have the crusading zeal or force of his predecessor in office.

All this is a pity, the more so since some truly liberal individual personalities from or speaking for the developed countries had gone to Santiago to assist in imposing on its discussions a grand design of ends and means. International statesmen of the calibre of the President of the World Bank, Mr McNamara and the President of the Brussels Commission, Dr Sicco Mansholt, had tried to breathe a spirit of idealism into UNCTAD III so that it would not become merely a sterile confrontation between the rich and the poor countries but would shape itself into an agreed endeavour to pursue common goals. It is possible that, had their efforts in the strategic as well as in philosophical fields, been adequately reinforced by activists of similar quality among the developing countries, Santiago might ultimately have had a different story to tell.

As it was, the official spokesmen of the more conservative or unhelpful national governments in the affluent world were able to brand UNCTAD III with the stamp of their cynicism. Indeed what particularly bodes ill for the future of the UNCTAD spirit are the attitudes of negativism and obstructionism characterising the role of the US government. Santiago provided disturbing evidence that Washington, under the Nixon administration, is retreating more and more into a mood of indifference and even callousness towards the revolution of rising expectations in the Third World. It is not suggested here that the positions taken up by the US delegation were entirely without merit. It is certainly possible, for instance, to believe that the question of linking special drawing rights to development assistance needs to be more deeply explored but what was grossly unjustifiable in the US stand was that the Nixon administration had very few initiatives of its own to sport. Considering how much the cause of international development assistance, whether through aid or trade, had owed in the past to American leadership, this development would seem to be almost tragic. It is significant that the American example was so effective in hardening or otherwise fouling the thinking of many other affluent countries at the Santiago conference. Japan, to name a country which was obviously influenced in this manner, was as rigid as the US itself in resisting or rejecting every liberal proposal at Santiago, while in the case of Britain, progressive opinion even within that country has confessed to feelings of shame and resentment over what has been described as the Heath government's failure to make any constructive contribution towards the objective of UNCTAD at the Santiago conference. In fact, only the delegation of the Federal Republic of Germany seems to have gone to any extent towards reshaping the role of the affluent countries on more progressive lines. Its Minister of Economics and Finance, Prof. Karl Schiller, was at least able to offer at UNCTAD III a package of new concessional terms for development loans.

The question now is: After Santiago, what? It has been suggested in some sections of the press in this country that the meagre results of UNCTAD III should provoke the developing countries to turn away from bargaining with the 'Haves' and instead develop and strengthen bonds of economic co-operation amongst themselves. This is clearly an irrelevant recommendation. The justification for trade and other economic co-operation among the developing countries must be sought in terms of

its own intrinsic advantages and not as a rebuff to the industrially advanced countries. The allied proposal that the developing countries could set up among themselves machinery for stabilizing the prices of their primary produce entering into world trade or otherwise improving the terms of trade, ignoring the industrially advanced countries who are the main importers, is so unrealistic as to be childish.

A more respectable reaction has been the proposal that Santiago should confirm the developing countries in their determination to mobilize and organize their own resources as efficiently and productively as possible so that their bargaining position would improve in international monetary or trade discussions. While this approach is inherently sound, so far as UNCTAD itself is concerned, this emphasis on self-reliance on the part of the developing countries may run the risk of avoiding the problem. If it is conceded that, as members of the international community, the developing countries have a right to claim a fair share in world economic opportunities, the pragmatic as well as the heroic course for these countries would be to seek to ensure that UNCTAD carries on despite Santiago.

Here the outlook is not altogether hopeless. There are, for instance, several liberal currents of thought flowing in western Europe in favour of the UNCTAD spirit. Dr Schiller for example has placed his government behind a proposal that the affluent countries should act boldly to accord tariff preferences to stimulate exports from the developing countries. The liberal ideas of Dr Mansholt on these and other connected questions are well known. Recently Mr Roy Jenkins, presenting his point of view as one of the foremost British enthusiasts for an enlarged Common Market, suggested that the time was not far off when the European Economic Community might come to think in terms of tariff-free entry for all the exports of all the developing countries. While it will not be prudent to be too optimistic about the immediate utility of such trends of thought among west European statesmen, it will not be evidence of intelligence either for developing countries to refrain from working for

a possible triumph of progressive west European ideas over the current obscurantism of the US government. From this point of view, it becomes necessary that the developing countries, having left Santiago behind, must now turn to Geneva and

Danger signal for tyres

THE AUTOMOTIVE tyre industry, indeed, rose to the occasion last year when large additional orders from the Defence Forces had to be met in the wake of the conflict with Pakistan. The total output of the industry in this year amounted to 4.66 million tyres, against the original estimated demand of about 4.5 million numbers. The 1971 production was approximately 14 per cent more than the output in the previous year.

The supply position this year, except in the case of the main truck tyre size 900-20, may not become unduly difficult since, as against an anticipated demand of 5.4 million tyres, the licensed capacity of existing manufacturers aggregates to 5.2 million numbers. Part of this capacity is in the course of being established, but the permission given to all manufacturers in 1966 to raise production up to 25 per cent over their licensed capacities and the recent liberalisation granted to the Indian firms, with some stipulations, under which they can increase their output up to 100 per cent of their licensed capacities, should help in meeting the marginal gap that might remain between the estimated demand and installed capacity, if all the expansion schemes under implementation do not materialise in time.

From the next year onwards, however, the situation may start deteriorating, for the growth in the installed capacity may not keep pace with the increasing requirements. By 1974 or 1975, the supply position may even become critical.

Various estimates are available of the likely demand in the next three years. While the Managing Director of Madras Rubber, Mr K.M. Mammen Mappillai, has estimated the demand in 1973 at 6.04 million tyres and in 1974 at 6.71

million and Mr R.G.S. Nairn, Chairman of Dunlop India Ltd., has referred to the estimated requirements in 1973-74 being 6.5 million, the Planning Commission's calculations put the requirements in 1974 at 7.2 million tyres. Fears have been expressed in some quarters that the estimate of the Planning Commission may turn out to be on the low side. The genesis of these fears is that the replacement demand for tyres is going up at a much faster rate than was the case till lately—thanks to the more intensive use of motor vehicles—and the growth in the production of motor vehicles may also be much higher in the coming years because of the recent licensing of new units. Taking into consideration these factors, the demand for tyres both in the domestic market as well as for exports, may go up by 1975 to over eight million numbers. In 1974, it may be around 7.5 million tyres.

Will we be able to produce tyres to meet the above projected requirements? If all the schemes which have been licensed, or for which letters of intent have been given so far, materialise by 1974 or even by 1975, the shortages may be only marginal. As mentioned earlier, the licensed capacity of the existing manufacturers aggregates to 5.18 million tyres per annum — Dunlop (14.49 lakhs), Firestone (6.72 lakhs), Ceat (6.50 lakhs), Madras Rubber (6.10 lakhs), Goodyear (6.03 lakhs), Inchek (6.00 lakhs) and Premier (6.00 lakhs). Besides this, letters of intent have been issued for as many as 13 other schemes, envisaging three lakh tyres capacity each — 3.9 million tyres capacity in all. The parties to whom these letters of intent have been issued include six state industrial development corporations — Punjab, Gujarat, Orissa, Andhra Pradesh, Tamil Nadu and Rajasthan — and seven private entrepreneurs — Madras Rubber (Goa unit), Modi, Universal Jaswant Vohra, N.B. Jesudasan (South

India Export Corporation), Ruby Rubber Works and J.K. organisation. The total capacity already installed or covered by the letters of intent, thus, comes to slightly over nine million tyres a year.

Of the 13 schemes for which letters of intent have been issued, only three — those of Madras Rubber (Goa unit), Modi and Universal — however, are expected to materialise by 1975 as they have already made some progress. The other 10 prospective manufacturers are unlikely to go into production by then since they have yet to arrange for technical collaboration. Even if this collaboration is arranged expeditiously, it will take four to five years for these entrepreneurs to go into production.

The total installed capacity may thus go up by 1975 to only about six million tyres. Even if the existing manufacturers are able to produce in excess of their capacities up to 25 per cent in terms of the 1966 relaxation (or they are given regular licences in lieu of this relaxation), the output that can be expected from this six million capacity cannot be more than 7.2 million tyres. This, of course, is doubtful because normally a tyre manufacturing unit produces around 90 per cent of capacity. The three Indian units among the existing manufacturers, no doubt, have been recently allowed to produce up to double their capacities, but the doubling of their production is beyond the realm of possibility as they could not do so even towards the end of last year when they went all-out to meet the demand of the Defence Forces. Then, some allowance has to be made for the gestation period of the three new units which may come up by 1975.

The importance of technical collaboration for new units cannot be over emphasised. The manufacture of tyres is an industry which is undergoing rapid innovations. Unless a unit keeps itself abreast of the new developments and techniques, it will soon become uncompetitive. The research and development effort of a new unit without technical collaboration from an already established manufacturer obviously cannot be any substantial. As a matter of fact, the existing units in the country too depend largely on their collaborators or parent

companies for the fruits of research. This is why there is an imperative need for the new entrepreneurs and the state industrial development corporations to arrange technical collaboration from established manufacturers who have capabilities to undertake adequate research.

The question that arises in the light of the above analysis is: Should the supply position of automotive tyres be allowed to deteriorate just because new entrepreneurs have to be encouraged? In its enthusiasm to encourage new entrepreneurs and to curb the concentration of economic power in the hands of a few, the government is inhibiting industrial growth. There can be no two opinions on the fostering of entrepreneurship in the country, but care has to be taken that the policy in this respect is not carried to absurd limits of stagnating the growth of an industry. There is obviously a case

Operation whitewash

THE CENTRE'S anxiety to prevent unauthorised overdrafts by the state governments and discourage resource mobilisation in this manner is reflected in the latest moves adopted by it to discharge the states' indebtedness to the Reserve Bank. For sometime past, it has been expected that major adjustments would be carried out by the central government and that the new procedures designed for eliminating deficit financing on states' account would be strictly enforced. It was not expected, however, that the unauthorised overdrafts would be eliminated completely so early and that the government would not wait till the usual adjustments were carried out in the last week of June.

In view of the elbow-room that the central government had for making these adjustments and the earlier suggestions that the transactions in this regard should be completed before the end of 1971-72, it was generally expected that the overall deficit of the central government in the revised estimate for 1971-72 would be even higher than Rs 800 crores. The union Finance Ministry, however, did not take

for striking a balance between the growth requirements of an industry, on the one hand, and the objectives of broadbasing entrepreneurship and extending the role of the state in manufacturing, on the other.

The country has already paid dearly in terms of stunted growth in several sectors of our industrial economy because of the misguided policy of the government to stall the expansion of the so-called monopolies. With seven tyre manufacturers already in the field and at least two more expected to join their ranks in the next two or three years, it could well be asked why there should be all this obsession with the alleged danger of monopoly, especially as the Monopolies and the Restrictive Trade Practices Commission has recently been asked to investigate whether any restrictive trade practices are in fact being resorted to in this industry.

over the liability of the state governments to the Reserve Bank because it was anxious to avoid the impression that it was committing itself to massive deficit financing for the sake of the states. On the other hand, the central government has been immensely successful in exposing the sad state of finances of many state governments since the overdrafts in the aggregate rose to well above Rs 700 crores in the last week of April after all payments in respect of 1971-72 had been completed.

In the absence of a proper analysis of the uncovered deficits of the state governments for 1971-72 it cannot be said what is the net deficit for 1971-72 on their account. It would indeed be wrong to presume that there had been an increase in overdrafts by over Rs 625 crores from the low level touched in the last week of June as this level was depressed artificially. The centre brought these overdrafts to less than Rs 100 crores with special assistance to the states and advance payments in respect of central assistance and grants needed for fourth Plan schemes. As the states could not overcome the situation arising out of reduced or no payments from the centre at a later stage and repayments against earlier loans had to be made to the centre, the overdrafts with the Reserve Bank started rising again in a big

way. The central government was a helpless onlooker. The central government actually has not been guilty of massive deficit financing and it may even be found, when the accounts for 1971-72 are finalised, that there is not any sizable deficit. The quantum of deficit financing of Rs 385 crores may not actually materialise as there are bound to shortfalls in expenditure on Plan schemes in the central sector and there may also be larger tax and capital receipts. It may thus come about that actual deficit financing will not be more than Rs 150 crores.

The same cannot, however, be said of the deficits of state governments. The overdrafts represent actual payments and taking into account the fact that in 1969-70 there was negligible deficit financing and large-scale special assistance was granted by the centre to the states in difficulty in 1970-72, aggregate deficit financing on states' account in these two years may be more than Rs 900 crores exceeding the total of the centre for the same period substantially. The net deficits of the latter for the two years under reference may not be more than Rs 500 crores. As a continuance of this form of undesirable resource mobilisation will result in unplanned development expenditure and accentuate inflationary pressures, the central government, in consultation with the Reserve Bank and the states, has made a serious effort to give proper shape to the budgets of the erring state governments and formulate new measures for preventing similar clandestine overruns.

The adjustments effected by the central government in respect of unauthorised overdrafts during the week ended May 5, 1972 provide clear evidence of the determined bid that is now being made to avoid deficit financing by the states.

The central government has obviously decided to carry out the adjustments which will usually take place in the last week of June in order to avoid suspense over the question of unauthorised overdrafts. The states are now having a clean slate and henceforth changes in loans and advances to state governments by the central banking institution should be reflecting only ways and means difficulties and the bulges under this head should be automatically corrected when open market loans had been issued by the state governments and there were also brisk tax collections in the latter half of the year. It is, of course, presumed that all the state governments will have overall balanced budgets for 1972-73 and that those state governments which have yet to present their regular budgets will propose new levies for closing uncovered deficits. Whatever might be done by the concerned states to correct their budgetary positions and mobilise the required resources for financing Plan

schemes, it must be acknowledged that the central government has made a successful bid to eliminate earlier unauthorised overdrafts of the states and neutralise the the harmful effects of indiscriminate deficit financing as far as possible. The operations during the week under reference have been carried out thoroughly and the centre's preparedness to use all available resources for repaying the states' liabilities with the Reserve Bank would seem to suggest that it is confident of raising the required resources for sustaining a higher level of Plan outlay in the central sector in the remaining months.

Thus, central government deposits have declined sharply to Rs 52.92 crores from 214.03 crores during the week ended May 5, while investments jumped to Rs 330.49 crores from Rs 74.86 crores. These would have been actually much higher at Rs 370.49 crores if there had been no transfer of rupee securities to the Issue Department. Other assets rose substantially to Rs 304.94 crores from Rs 49.80 crores. Holdings of treasury bills have recorded only a small increase to Rs 58.89 crores from Rs 51.65 crores. It will be seen from these adjustments that the decline in state overdrafts to Rs 37.34 crores from Rs 711.10 crores has been brought about mainly through technical adjustments except for the utilisation of central government deposits for over Rs 162 crores. This perhaps explains why there has been a balancing operation during this same week with the issue of treasury bills to the Reserve Bank of India for Rs 779 crores.

It can however be expected that the

sizable amount under other assets will be adjusted by using the large amounts held in suspense under "other liabilities" of the order of Rs 412.79 crores. If all goes well, the central government will have a problem of cancelling only about Rs 250 crores of *ad hoc* securities under the head "investments" during the rest of the year. If net borrowing through open market loans could be increased by Rs 100 crores over the target and there was also buoyancy in tax revenues, there may not be any compulsion to increase the overall deficit on central account due to the taking over the liability of the state governments to the Reserve Bank. As it cannot be expected that the centre should shoulder such a heavy responsibility even after providing for a much higher level of Plan outlay in the current year, there is reason to believe that the quantum of deficit for 1971-72 was exaggerated and the use of aid funds and other resources, which became available during the critical situation sometime back, have facilitated the massive operations indicated above. The actual position will become clear when the final and the telling adjustments are completed before the end of June. In any case, the state governments have now to be wary and there may not any longer be the consistent rise in overdrafts witnessed in the last two years necessitating periodical surgical operations. The changes in overdrafts will henceforth be only for ways and means purposes and the fluctuations should therefore be confined within reasonable limits. The effectiveness of the new arrangements may be borne out by the developments in the coming months.

Eastern Economist 25 Years Ago

June 6, 1947

The procedure Plan for the final transfer of power, revealed to leaders of Indian communities on June 2 and broadcast over the radio the following day, is really not a procedure Plan. It is a substantive Plan in the sense that its authors know very well—and knew at the time of formulating their procedure Plan—what the results of the procedure are going to be. Under every head of the Plan, the results are foregone conclusions. Hence, however innocent and well-meaning the British Government may be, it cannot escape the moral responsibility for partitioning India and for laying the foundations of a Fascist regime in parts of the country. The signs are ominous. Having accepted what he could get under the so-called

Procedure Planned gained a sovereign foothold in parts of the country Mr Jinnah, like Hitler would demand other contiguous parts on the analogy of German Sudetanland in Czechoslovakia. Then will come the demand for a corridor and free port in the east much as Hitler demanded a corridor in Poland and the port of Danzig. And then as Goebbels stood on the Berlin radio one evening and said, "Gentlemen, tonight Czechoslovakia has ceased to be" so does the new Hitler of Pakistan dream that one day he would stand on the Pakistan radio and say: "Tonight Gentlemen, Hindustan has just ceased to be". This is no idle working out of History, for Mr Jinnah works on Bismarck's theory of Real Politic.

Is Chavan right about banks ?

R. V. Murthy

REPLYING to the general debate on the Finance Bill, 1972, the other day, Mr Y.B. Chavan, the union Finance Minister, referred to the working of nationalised banks and remarked that "the banks were urban-oriented", perhaps implying thereby that they still needed to make a dent on the rural areas. More particularly, he wanted nationalised banks to reach unbanked and under-banked areas, mobilise deposits in these areas and extend credit to "neglected sections". But what is the position? After the undoubtedly good progress made since nationalisation, have banks reached a stage where further progress has necessarily to be slow and perhaps also more cautious than heretofore? Take, for example, the growth in the number of banks, both urban and rural. The table below indicates the progress at a glance.

Surely this is not unimpressive. A reduction in population per banking office from 65,000 to 42,000 over just 30 months is indeed creditable. From the table below one would be more correct if one were to say that nationalised banks are "rural-oriented" and not "urban-oriented" as Mr Chavan has suggested. Thus, the increase in the number of bank offices in rural centres over the period was as much as 3,057 which is almost double of the increase in the number of bank offices in urban, semi-urban and metropolitan centres put together. Between rural and semi-urban centres, the increase in the number of banking offices was a little short of 4,000—3,952 to be precise.

It is not known what the progress since has been, but, according to reliable sources, the total number of banking offices in India should cross 15,000 this year.

Quantitatively, therefore, the insinua-

tion of the union Finance Minister cannot be sustained. But, qualitatively, one cannot yet come to any considered conclusion, although profitability-wise, banking circles argue, the position has not been unsatisfactory, at any rate so far. Service-wise, however, whatever the authorities may claim, there has been considerable deterioration which must be attributed partly to the rapid pace of expansion and primarily to the admittedly reprehensible trade union activities of all banking staff. Rapid expansion has naturally put too much strain on the limited trained personnel of banks. Compared to other categories of white-collared workers, the most pampered—next only to airlines staff—are the bank staff. To some extent, the dislocation implicit in the socialist re-orientation given to banking by the ruling political party, some times on their own sometimes under pressure from like-minded but extremist leftist parties, is also responsible for the fall in quality of bank service. If the full impact of this has not made itself felt, it is because of a certain slack that developed in the economy last year. As and when the pace of economic growth picks up this is bound to come to the surface.

Until the other day, the emphasis was on "priority sectors". Now, Mr Chavan speaks of "neglected sections". It is not clear what exactly the union Finance Minister means by "neglected sections", unless he has in mind neglected sections in rural areas only. There are certainly some neglected sections in urban areas too and the neglect of these sections is the direct outcome of over pampering to "priority sectors".

Taking only the lending to priority sectors (of course by nationalised banks only), one notices that the percentage of credit to agriculture—direct financing

(excluding plantations) alone—rose from 1.5 in June, 1969 to 5.1 in September, 1971. Small-scale industry improved its percentage share to total credit from 8.3 to 11.1 over the same period—in December, 1970 it was even higher at 11.3. There was a similar improvement in the percentage share to total credit of road transport operators, retail traders, small businessmen professional and self-employed persons and education. But one feature that cannot escape any keen student of the trend of bank credit in India is that December, 1970, marked the peak of growth. Since then, the tempo has been uncertain and tending more downward than upward, possibly because of the slower rate of economic growth.

Adequate and separate statistics are not still available about the trend and rate of growth of deposits in rural areas. As of June, 1971, however, rural deposits garnered by all scheduled commercial banks, in both public and private sectors, were of the order of Rs 62.87 crores, giving an average of 3.4 lakhs per office. Taking only the 14 nationalised banks, the total deposits were of the order of Rs 42.96 crores, with an average of just a little over Rs three lakhs per office. Advances by all banks amounted to Rs 34.35 crores or Rs two lakhs per office. Advances by the 14 nationalised banks were Rs 26.43 crores which also worked out to more or less the same average sum per office.

For distribution of bank credit also, figures are not available for credit to different sections in rural areas, let alone to "neglected sections" in rural areas as such. But an examination of the overall distribution of bank credit among major sectors by all scheduled banks between 1970 and 1971 shows that, whereas credit to priority sectors rose appreciably, that to the residual sector, i.e., large and medium industry and wholesale trade, declined from 79.1 per cent of total bank credit in March, 1970 to 70.6 per cent in September, 1971, (the latter had gone down to 70.5 in June, 1971). While this may not afford any conclusive evidence, industrial interests argue that reduced credit has acted as a deterrent to production. Mr. S. Jagannathan, Governor of the Reserve Bank, however, defended the credit policy and contended recently that "credit policy is not intended to restrict the borrowings for productive use." But the last word on this debate has not been said yet.

Growth of Banks

No. of Bank offices	30-6-1969	30-6-1970	31-12-1970	30-6-1971	31-12-1971

Storm in the gold cup

S. P. Chopra

THE PRICE of gold attained an all-time peak at \$57.75 an ounce on May 17 in the London market. The equivalent price in rupees worked out at 149 for 10 gms. At Bombay the highest price for standard gold was recorded at Rs 234 for 10 gms on May 19. The margin between the Bombay and London prices of gold has been reduced to about 60 per cent whereas a year ago when the international price of this precious metal ruled around \$35 an ounce, the difference used to be about 100 per cent. It is highly likely that the price of gold in the Bombay market would rise to about Rs 300 for 10 gms in the coming months unless the world market price of the yellow metal drops. There is little prospect of the margin between the Indian and world prices of gold remaining as narrow as it is at present since smuggling remains hazardous and expensive. What is more, the gold control policy of our government has failed miserably in weaning the people away from this metal and all its efforts "to make smuggling more difficult by making it less easy to dispose of smuggled gold in the internal market" have come to nought.

benefit to S. Africa

For the last many years, the value of world production of gold (at \$35 an ounce) has ranged between \$1,400 million and \$1,500 million (See Table I). Nearly three-fourths of the supply of this metal originates in South Africa. Naturally, the present spurt in gold prices has imparted the largest benefit to South Africa in so far the current sales of this metal are concerned. The enhanced market prices of gold in the first four months of this year put the balance of payments of South Africa in surplus. Consequently this leading supplier of the precious metal might decide to reduce the monthly sales of gold which, in turn, would give a further upward push to its prices in the world market.

Even though the USA tried its best during the past two decades to reduce the status of gold as a reserve, the faith of many countries in this metal as a monetary reserve brought forth failure to it in this objective. Among the European countries, France led the rest in following a policy of converting a major part of its accumulated dollar holdings into gold. In 1968 the USA had adopted a two-tier

system which ensured gold-dollar parity at \$35 an ounce for transfers to monetary authorities while the free market price of gold was allowed to fluctuate under the influence of forces of demand and supply. On August 15 last year, President Nixon delinked the dollar and gold completely implying that the dollar was no longer as good as gold. Then followed a long period of uncertainty in regard to the exchange rates of various currencies of the world leading to substantial dislocation in international trade and payments. The world markets have not fully recovered from the shock administered by President Nixon in August last year.

It needs to be remembered that the international monetary system evolved at Bretton Woods was based on gold. Even the special drawing rights (SDRs) are linked to gold. This is why they are nicknamed as "paper gold." The realignment of currencies in any monetary shake-up has to be done through the medium of gold. That is why the process of easing gold out of the world monetary system is easier said than

done. The governments of the leading countries could be urged to assist in this task provided all the members of the IMF sincerely stood by the basic law chalked out for the guidance of the International Monetary Fund (IMF). The experience of the past 25 years indicate that the countries whose currencies depreciated in value due to inflationary pressures at home hesitated to devalue them. Also, the countries which had disciplined their economies in such a way that prices were not allowed to rise even by the average international annual increase, failed to revalue their currencies upward to the required extent. It was this basic failure on the part of both groups of countries to play the game according to the IMF rules which brought the international monetary system to a crisis from which it has yet to recover fully.

The demand for gold emanates from three sources. They are: (a) industrial and artistic uses; (b) private hoarding and (c) world monetary stocks. The consumption of the yellow metal for industrial and artistic uses has multiplied almost three times

TABLE I

* These figures include estimates for data not available.

Sources: International Financial Statistics and IMF staff estimates.

during the past 12 years (see Table II) and because of the fast expansion in the electronics industry in particular, it is estimated that the rate of consumption would continue to rise in the current decade as well. The demand from hoarders, especially in the poor countries, continues to be erratic and no forecast can be made in regard to future trends. The stocks of gold with central banks of many countries have continued to increase because, as Dr Karl Klasen, president of the German Federal Bank, said in November last year, "in practice the monetary authorities are as attached to gold as ever they were". It has been estimated that the "countries of continental Europe" have almost tripled their stocks during the past 15 years to about \$20,000 million (at \$35 an ounce). Thus it is obvious that there is no immediate prospect of a reduction in the demand for gold and South Africa, the main supplier of this metal, will be in a position to dictate its price now that it has overcome its balance of payments problem.

growing gap

A special report—Gold 1972—published recently by Consolidated Gold Fields in London states that the price of gold is expected to continue to increase in coming years because of the growing gap between rising industrial demand and new mine production. The report has estimated that by 1980, the non-communist world demand for gold for fabrication and hoarding would increase to 1,962 tons if the price were deemed constant at \$48 an ounce. The supplies however are expected to be between 1,325 tons and 1,400 tons including small sales by the USSR. The gap between demand and supply, it is computed, would raise the price of gold to \$61—\$63.50 an ounce in terms of the 1972 dollar. After allowing for inflation at four per cent per annum, the price of gold in 1980 would be between \$84 and \$87 an ounce. The rupee equivalent of this price of gold would be more than 250 for 10 gms and if the parity between dollar prices and rupee prices is maintained as in 1971, then the price of this metal should rise to more than Rs 500 for 10 grams in 1980.

President Nixon's decision to de-link gold and dollar in August last year was dictated by the continuous decline in US gold reserves which dropped to a little below \$10,000 million—less than half of the stocks held in 1958. Even though the US economy was basically strong, the continuous deficits in balance of payments for more than a decade shook the faith of the world in the

mighty dollar. Thus, the USA could not sustain convertibility since it mismanaged its balance of payments over a very long period. The heavy cost of the Vietnam war, economic as well as military assistance to a large number of countries and the stupendous expenditure on the space programme all combined to aggravate its balance of payments position.

The new gold-dollar parity at \$38 an ounce was intimated to the IMF by the US treasury only recently; the new rate came into force on May 8, 1972. But this does not imply convertibility i.e. the US treasury has not taken on the responsibility to change dollars into gold even for the monetary authorities. When will the US feel confident to re-establish convertibility? According to the 10-point monetary reform programme chalked out by Mr Arthur Burns, Chairman of the US Federal Reserve Board, it is possible to "re-establish some form of dollar convertibility in the future" if the processes of international consultation and cooperation are strengthened and responsible domestic economic policies in the major industrial countries, especially the USA, are pursued. Among other points made by him, the two most important are: (a) systematic long-range plans for the evolution of world reserves

and credit arrangements and (b) a continued but diminishing role for gold as a reserve asset with a corresponding increase in the importance of SDRs.

The IMF staff also is reported to have drafted a memorandum which makes the following four points for the guidance of the US treasury: (1) the US can no longer let dollars pile up abroad and must buy back dollars that flow out in the future with gold or other assets by definite deadlines; (2) the US should be prepared as any other nation promptly to devalue the dollar again (or revalue upward) as conditions change; (3) the US should expect to see thousands of millions of dollars now held by other governments turned in to IMF and gradually to buy them back and (4) the US must get over the ideas that other nations will be made to give up their balance-of-payments surpluses and that gold will soon fade from its place as an international reserve assets.

The IMF analysis clearly points out that if the USA has failed to wipe out its own balance-of-payments deficits, it cannot pressurise other nations to eliminate their surpluses. And if the present stalemate continues, there is little hope of convertibility in the near future and as forecast by the London firm, the free market price of gold cannot but rise.

Investment Policy of LIC

Dr B. R. Agarwal

POINTS OF VIEW

THE TWIN functions of the Life Insurance Corporation are to provide security against unpredictable contingencies including provision for old age and to create a channel of safe investment for the savings of the people resulting in accelerated economic growth. Since it covers risk, provides a moderate rate of return on premia, creates thrift habit and attracts sizable rebate of income-tax, it has become the biggest source of savings and builds up a huge reservoir of funds for investment. The investment policy of funds has an important bearing upon the willingness of the people to save. It is, therefore, of vital importance that the pattern of investment of the life funds should satisfy the objectives of high yield, have a multiplier effect on the economic growth of the country and ultimately maximize social welfare. The purpose of this article is to examine critically the operations of Life Insurance Corporation of India in the light of these objectives, and to suggest guidelines to utilise the funds 'in the interest of the community as a whole'.

Before nationalization in 1956, the Investment Policy of the Life Insurance Companies was governed by section 27 of the Indian Insurance Act, 1938 which required that at least 50 per cent of the adjusted liabilities must be invested in government and other approved securities. Taking advantage of this provision, the percentage of securities of the joint-stock companies in the investment portfolio of the Indian insurers rose from 10.1 per cent in 1946 to 16.2 per cent in 1955¹ resulting in the criticism

that the government was not getting enough share of the savings for its plans. Bharat Insurance scandal of Rs 2.20 crores securities, failure of life insurance companies to the detriment of the policyholders, concentration of investment of funds in the companies of the same industrial group and other malpractices, led Mr C. D. Deshmukh, the then Finance Minister, to observe in his broadcast on January 19, 1956, "The misuse of power, position and privilege, that, we have reason to believe, occur under existing conditions is one of the most compelling reasons that have influenced us in deciding to nationalise Life Insurance."² Consequently, the LIC came into existence on September 1, 1956 to secure the maximum yield for the policyholders consistent with the safety of the capital and utilization of these resources to reach the goal of a socialistic pattern of society.³ Announcing the new Investment Policy of LIC in Lok Sabha on August 15, 1958, the Finance Minister observed that though the primary obligation of LIC is to its policyholders whose money it holds in trust, it has to keep before it the interest of the community as a whole and may take advantage of temporary fluctuations in market price.

Since LIC is the biggest source of savings in the country, the investment policy should be so designed that it maximizes the return on investment on the one side and creates a self-generating economy on the other side. The private insurance companies could have worked on strictly business principles but securing a balanced regional growth; insuring a

balanced investment in private and public sectors; developing an infrastructure to initiate industrialization; creating an enterprising spirit and furthering the social welfare of the community should be the objectives of the investment policy of this nationalised institution. It is proposed to discuss these objectives under the following heads:

- (1) Maximization of return on investment consistent with safety of principal;
- (2) Balanced regional growth;
- (3) Development of industries in the private sector;
- (4) Creation of infrastructure facilities.
- (5) Encouragement to small industries sector; and
- (6) Promotion of social welfare measures.

One of the motivating factors for the propensity to save is the high rate of interest. The investment pattern ensuring a high rate of return will increase the rate of bonus and the policyholders will earn more due to reduced premia. The main motivating spirit in the economic growth process in most of the developed countries has been the willingness of the people to save a significant portion of their current income and divert it in the channels of more production. It is gratifying to note that the rate of return on the investments of Life Insurance Corporation funds has increased gradually from 4.58 per cent in 1956-57 to 6.06 per cent in 1969-70; but it cannot be said to be quite commendable as the existing market rate of interest varies between 8 and 12 per cent. In fact, the rate of return

Togetherness pays. Now, it pays more!

Fly to Europe, the U.S.A., U.K., Japan and Australasia and save big money.

Now you save more under Air-India's Affinity Group Fare Scheme. If your group consists of 30 members belonging to the same school/college, institute, firm, club, society, corporation, association or organisation for at least 6 months, you get a 45% discount if you are going to Europe.

If you are a group of 15 you get a 30% discount to Europe, Japan,

Malaysia, Australia. Wife/husband and children are included as part of the group.

And while you're flying at these low fares, you'll enjoy all the comforts of a passenger paying the normal fare.

Contact your nearest Air-India Office, or your Travel Agent without delay.

AIR-INDIA
The airline that saves you money (lots of it)

In our little way...

we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front, Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals

essential for the pharmaceuticals, paints, textiles, iron and steel and rubber industries. On the export front, Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts!

sowing the seeds of progress

POINTS OF VIEW

has been low due to many low-return government securities in the investment portfolio of LIC. "The challenge to investment officers of life insurance companies is to seek out those investments which will produce the highest net return without impairing the security of the principal amount involved." A perusal of Table I (p. 1076) shows that public sector has been claiming lion's share of the total investments of LIC since its inception, though the overall percentage has gone down a little from 77.3 per cent in 1957 to 73.6 per cent in 1970. This reduction has been to nurse another low-yielding sector of co-operation where the percentage of total investments increased substantially from 1.7 per cent in 1957 to 9.5 per cent in 1970. Thus the overall percentage of investment in preferred sector virtually increased from 79 per cent in 1957 to 83.1 in 1970. It is, therefore, suggested that the Investment Policy Committee should change the strategy of investing about 73 per cent of funds in government securities to 50 per cent as a maximum limit and the rest may be invested in high-yield industrial securities or in housing schemes which give a better return. The government can find funds for its projects from other sources and thus the savings of the people can be put in more rewarding avenues. Safety of principal, which is an essential element of the maxim of high ROI, is inbuilt through a high level Investment Policy Committee of LIC. Even if there is an improvement of 0.5 per cent in the return rate, the present level of earnings will increase by 7.5 crores, not an insignificant amount by any standard.

balanced regional growth

The integrated economic development of a big country like India with heterogeneous geographical regions is possible if the extension of the benefits of economic progress of the more developed regions are transferred to the less developed regions. Table II gives the regionwise and statewide distribution of the percentage of the investments of the life funds. It will be noted from the table that LIC is diminishing the percentage of the investment of funds in comparatively advanced regions. The investment in West Bengal has been reduced from 26.96 per cent in 1957 to 11.23 per cent in 1970. Similarly, the share of investment in an industrially backward state of Rajasthan has increased from 0.46 per cent in 1957 to 4.08 per cent in 1970. Regionwise also, the percentage share of eastern region has decreased from 35.31 per cent in 1957 to 24.69 per cent in 1970 at the cost of

southern region. Though the policy of this diversification is heading towards bringing a balance between backward and advanced regions, it is still questionable if about 30 per cent of the total investment should be concentrated only in two states—Maharashtra and West Bengal. Maharashtra and Gujarat seem to woo successfully the attention of LIC investment authorities and the percentage investment in these two states has not gone down substantially, while some states such as Bihar, MP., Haryana etc. have not received their due share under the policy

of balanced regional growth enunciated by the Planning Commission.

Mixed economy of India requires that the private sector should be given its rightful place in the process of economic growth of the whole country. Infact, the contribution of private sector has been more than the contribution of the public sector in the gross national product and its efficiency has also been superior to that of the government concerns. The malpractices by the private insurers justified its nationalisation but the reduction in the percentage of total investment of

POINTS OF VIEW

the investible funds of the LIC in the private sector can hardly be justified. As a matter of fact, the savings of the people must be shared by the various production sectors in proportion to their contribution to the national income. Moreover, the rate of return available from private sector is also higher. Denying the deserving share of the savings of the people to the private sector is neither ethical nor economical. Blocking 73 per cent of the life funds with LIC in the public sector (though the statutory limit is 50 per cent) is arbitrarily snatching away the share of the deserving private sector perhaps mainly because the other one is powerful.

The private sector has been helped in expansion through granting underwriting facilities. An analysis of Table III shows that during the last 15 years, only 830 issues have been underwritten for a total

amount of Rs 223.38 crores, which is merely 15 per cent of the total investible funds of 1970. Of this, only 37.70 per cent could go to underwrite issues in the private sector which itself speaks of the starvation of this sector.

Table IV gives the patronization of various industries for getting nourishment from LIC funds. Of the 28 industries classified by LIC for investments, in their annual reports, the maximum has been claimed by Engineering, Cotton Textiles, Iron and Steel, Cement and Electricity, attracting about 50 per cent of the total investment in industrial securities.

It seems that LIC is interested in playing safe regarding investment in the shares, debentures and loans to joint stock companies instead of protecting and expanding the new and less known enterprises. It is heartrending to note that of

the total investment in industrial securities during 1970, it had invested 36.87 per cent of the funds in the companies of the first ten business groups (12.59 per cent in the Tata group and 9.70 per cent in the Birla group) listed in order of their assets, as per Monopolies Inquiry Commission Report, 1965.

The process of economic development gets the speed automatically if the roads, water facilities, buildings, skilled labour and other facilities are made available to the entrepreneurs. The LIC seems to be aware of this responsibility but limits its vision to help the programmes of the Electricity Boards. Electricity is necessary to develop industries but roads and buildings for industrial establishments are essential to make fuller utilization of electricity. The planning approach of Haryana State can be a guideline to the

Investment Committee of LIC. The Haryana government has not stopped at taking electricity to each village but has launched a massive programme to connect each village with metalled roads and provide warehousing facilities at least at tehsil headquarters. The LIC has not at all thought of providing buildings for establishing industries or giving loans for this purposes.

Overpopulated India is suffering from a high degree of educated and uneducated unemployment. To enjoy the fruits of democracy, political stability is necessary which is possible only with contented masses. The remedy to provide large-scale employment, specially among technocrats, lies in the popularization of small-scale industries. Unfortunately, there is a mistaken view that small businesses have a high element of risk and also need cheap credit. In fact, the very principle of insurance to minimize risk through diversification applies here, as it is limited to small amounts through investment in numerous small businesses.

necessary evil

Risk is a necessary evil to be shouldered by LIC in the interest of eradicating unemployment. The risk is further lessened as the credit for establishing industries is granted to qualified persons after a careful scrutiny of feasibility reports. The financial facilities may be granted in the shape of buildings and machinery which may be mortgaged to LIC. The notion that small entrepreneurs require cheap credit is a misleading argument, as the margin of profit in small business is large due to the elimination of highly paid supervisory staff and expensive overheads. In the absence of financial facilities easily available otherwise, they have to resort to the money market and pay interest ranging from 20 to 40 per cent. LIC can charge a reasonable rate of interest and thus help in accelerating the economic development of the country as a whole. "It seems that the crux of the matter is the desirability of creating a body of new entrepreneurs who have the needed skills for production and management of industrial concerns but have no finance to own these concerns. The criterion applied is not that of creditworthiness as is normally understood but of capacity to produce."

Industrial estates have been one of the effective instruments to promote entrepreneurship in some developing countries and have proved quite effective in India, specially in Andhra Pradesh. It is unfortunate that LIC has invested only an insignificant amount of Rs 1.12 crores by 1970. With the fractional allocation of

even one per cent of investible funds each year, it can help build about 14000 sheds worth Rs 10,000 each every year and thus in a few years, the whole country will have a beehive of small-scale industries. The funds for this sector can be invested in construction of sheds, providing common facilities and service centres and building other items of essential infrastructure.

social responsibility

In his message dated August 25, 1956, at the time of the inauguration of the Corporation, the then Vice-President of India, Dr S. Radhakrishnan, rightly hoped, "The Corporation will work for the ideal of a Welfare Society inspiring confidence in the people..." Prime Minister Nehru also said, "... This is not only good investment, but has obvious social advantages when there is a great lack of housing..." Thus the welfare objective for the utilization of the funds of LIC had been uppermost in the minds of the leaders at the time of its nationalisation. But a glance at Table IV shows that investment in government securities had dominated the investment portfolio of LIC. Some schemes like 'Own Your Home' scheme, loans to cooperative house-building societies, expenditure on water supply and drainage etc. have attracted a limited attention of the LIC. The community can hopefully look to the LIC to extend a helping hand to the millions of the people who unfortunately do not have a safe and secure roof over their heads. The 'Own Your Home' scheme has now been extended to the localities with 10,000 population. By March 31, 1970, about 6000 loans valuing Rs 258 crores had been sanctioned. The results are good but the LIC can now speed up its programme of constructing ownership flats in overcrowded towns. The provision may be made in the Act that the workers of all industrial establishments will have to be provided with houses through loans granted by LIC instead of the existing provision that LIC can grant loans for industrial housing, if requested.

It is evident from the foregoing discussion on the various operational aspects of the investment policy of LIC since 1956 that the Corporation has made a significant contribution in channeling savings of the middle class into the socio-economic development of the country. However, the LIC has to go a long way to achieve the primary objectives of maximizing the benefits to the policyholder in particular and to the community in general. It appears that the Investment Committee of the Corporation is obsessed with the

POINTS OF VIEW

so-called safety considerations and consequently the lion's share of the investible funds is taken away by the public sector, perhaps due to the excessive domination of the officials under the policy enunciated by the Ministry of Finance of the government of India.

low return

In spite of the diversification made in the investment of funds in recent years, the return to the policyholder is still very low and consequently the small savings continue to be attracted by direct private investment in housing, securities of joint-stock companies and private loans and advances. The LIC could conveniently participate in the house construction programme of the community at large on a much bigger scale than it has actually done so far. Investment in housing provides full safety to the LIC as an intermediary, satisfactory return in the form of interest to the investor and a good attraction to the members of the community to own their own houses. It would perhaps be advisable to invest 10 to 15 per cent of the investible funds of the Corporation in this sector; and as this would be one of the most important activities of the Corporation, the LIC will be better advised to go in for a separate subsidiary organization charged with the responsibility of investment in housing projects.

Another glaring deficiency in the investment policy of the Corporation has been the neglect of private sector specially the small entrepreneurs. Keeping in view the socialistic pattern of society to which the government and overwhelming section of the community seems to be pledged, it would be in the fitness of things to channel at least 25 per cent of the investible funds of the Corporation into the private sector with due regard to the small entrepreneurs so as to promote effectively the expansion of self-employment opportunities in this sector. In this connection, perhaps, it will be better to tear off a leaf or two from the rise and growth of entrepreneurship in Japan and Germany.

[Our Parliamentary Correspondent

New Delhi.

THIS YEAR'S budget session, which comes to an end this week, should go down in the Parliamentary annals of our country as the dullest since Independence. There has hardly been a session of the Lok Sabha during the past 25 years in which the quorum bell had to be rung as many times as in this session.

Thin attendance by itself could make debates dull. But the demoralisation that has seeped into all the opposition parties after the recent state assembly elections is responsible for this to no small extent. It appears that the opposition parties have lost their moorings. The rightist groups have, on some crucial issues, started outbidding the ruling party, while the leftists have failed to show their separate identity. This hardly is conducive to healthy Parliamentary practices in the country.

The essence of democracy is the divergence of opinion on major issues. Should all the political parties start singing the same song, it obviously will become a herculean task for the electorate to differentiate one party from another. If the opposition parties do not wish to commit suicide, they will have to do some hard thinking on their programmes so that they may clearly establish their separate identities. There appears to be paramount need for a political organisation with a liberal outlook which may over the years develop as an alternative focal point for the electorate.

ruling party's responsibility

So far as lack of quorum is concerned, with the opposition ranks considerably depleted, there rests a big responsibility on the ruling party to ensure that the proceedings in the two Houses go on smoothly. The position taken by the Minister for Parliamentary Affairs that the opposition parties too have to co-operate with the treasury benches in main-

taining quorum, no doubt, is technically unassailable. But surely it is not too much to expect from the ruling party that it should ensure quorum on its own when the opposition parties are in disarray and have yet to overcome the shock of their reverses at the polls.

The highlights of the proceedings in the two Houses during the terminal 11 days of the budget session have been (i) the Rajya Sabha deliberations of the Finance Bill, 1972, (ii) the adoption by both the Houses of the budgetary demands of the Ministry of Railways, and (iii) short discussions on the reported fall in the prices of some farm products, particularly raw jute, and the question of ceiling on agricultural holdings. The important matters raised in the two Houses through calling attention motions included the erroneous depiction in the Soviet Encyclopaedia of our northern borders. Several bills were rushed through in the two Houses.

leftist dissatisfaction

The Rajya Sabha debate on the Finance Bill followed the expected course. The leftist members expressed their dissatisfaction over the government's handling of the issue of concentration of economic power in the hands of a few. They alleged that the budget had only helped in strengthening the hold of capitalists on the economy and called for the takeover of the wholesale trade in foodgrains and the nationalisation of such industries as textiles, drugs and sugar. The members with rightist leanings, on the other hand, wanted lowering of the tax burden. The performance of the public sector enterprises was criticised by several members. Mr T.N. Singh (Cong-O) wanted a parliamentary committee to go into the working of all those state undertakings which were incurring losses. He was also not happy

with the performance of the nationalised banks.

Widespread concern continued to be expressed over the growing menace of unaccounted money as also over the mounting unemployment and persistent rise in prices. Pleas were made for re-orienting development programme for the benefit of the weaker sections of society. The scheduled castes and tribes, it was stressed, ought to be given all assistance to improve their lot; effective steps should be taken to check their exploitation by money-lenders, unscrupulous traders and state government officials

"black money"

In his reply to the debate, the Minister of Finance, Mr Y.B. Chavan, indicated that concerted measures were being planned for tackling the problem of "black money". He reiterated that the public sector would continue to grow. Mr Chavan did not agree with the criticism that the nationalised banks were doing badly. The government decisions on the recommendations of the Wanchoo Committee, he said, would be taken in due course after consultations with opposition leaders and leading economists.

Earlier, while introducing the Finance Bill for consideration in the Upper House, the Finance Minister made three significant observations. He announced that while the contours of the fifth Plan had yet to be finalised, the major stress in this Plan would be on allocating much bigger funds than hitherto for those schemes which would directly benefit the underprivileged sections of society. The fifth Plan, Mr Chavan further stated, would also lay special emphasis on the development of backward regions in the country. The third announcement made by the Finance Minister was that the government would soon come up with

proposals for the grant of tax incentives for the establishment of labour-intensive industries, particularly in the backward areas.

The rise in prices, Mr Chavan felt, had not been very alarming if a period of four to five years was taken into consideration. The wholesale prices index between 1967 and 1971, he said, had gone up by 11.7 per cent. On an average, the rise in prices, thus, came to about three per cent per annum — somewhat lower than the rise in most countries.

scathing criticism

During the debates in the two Houses on the budgetary demands of the Ministry of Railways, members from both the treasury and the opposition benches scathingly criticised the stringent availability of wagons in some parts of the country, heavy administrative expenditure, corruption at all levels, overcrowding on most sections, increasing thefts and pilferages of consignments as well as railway property and considerable leakage of revenue because of ticketless travel. Pleas were also made for maintaining the continuity of service of all the railway employees who at one stage or the other in their careers had participated in strikes. Several members desired that a parliamentary committee should be set up to go into the affairs of the Railway Board. Some even went to the extent of demanding the abolition of this Board,

Replying to the Lok Sabha debate, the Minister for Railways, Mr K. Hanumanthaiya, announced that the government had decided to condone the break in service of railway employees who had taken part in strikes. He added that he was prepared to even withdraw the suspension orders served on the employees except those who had committed heinous crimes or who were facing proceedings in courts. He, however, stressed that the railway workers and their unions, in turn, should co-operate with the government in checking thefts and pilferages on the railways. Hailing the recent agreement among the three national trade union centres — the Indian National Trade Union Congress, the All-India Trade Union Congress and the Hind Mazdoor Sabha—on the setting up of national coun-

cil of trade unions, Mr Hanumanthaiya expressed the hope that this would have salutary effect on trade unionism in the railways.

The Railway Minister expressed satisfaction over the fact that the estimated deficit in railway finances for 1971-72 had been wiped out through economies in expenditure and better realisation of earnings, with the result that the concessions given by the Railway Convention Committee would lead to a surplus of Rs 19.94 crores for that year. He hoped that the financial position of the railways would improve further in 1972-73 and a much larger surplus would be thrown up than what has been estimated in the budget for this year. Mr Hanumanthaiya, however, declared that he would continue to make relentless efforts for cutting down excessive administrative expenditure and checking of thefts and pilferages on the railways as well as ticketless travel. He disclosed that with a view to economising on expenditure, three posts of additional members of the Railway Board were not being filled and one post of technical attache in Washington and one post of deputy railway officer at Berne were being scrapped.

exposing the racket

In his reply to the debate in the Upper House, Mr Hanumanthaiya stated that he wanted to appoint a committee of members of Parliament to go into the racket of sale of unauthorised railway tickets. He disclosed that he was thinking of utilising the 1971-72 surplus in railway finances for the production of more wagons. He wanted more and more wagons to be produced in the public sector.

The Railway Minister listed three reasons for the current shortage of wagons in some parts of the country: (i) the pressure of food supplies to Bangladesh; (ii) squatting of demonstrators on track leading to bottlenecks in the movement of wagons; and (iii) reluctance on the part of merchants to unload wagons quickly. Referring to over-crowding on railways, he pointed out that shortage of funds was responsible for not augmenting the passenger-carrying capacity to the desired extent.

The Lok Sabha discussion on land ceil-

ings brought out all the differences on the issue, but left the House no wiser about the intentions of the government. This was not unexpected in view of the forthcoming session of the All-India Congress Committee which also will be deliberating upon the problem because of the sharp differences that have cropped up over the question of equating the lands which are irrigated through private means with those for which perennial irrigational facilities are assured from government sources.

ministers' assurance

In his reply to this debate, the Minister for Agriculture, Mr Fakhruddin Ali Ahmed, only reaffirmed the determination of the government to evolve a national consensus on the issue. Both he and his colleague, Mr A.P. Shinde, took pains to assure the House that they had not misled anybody about the recommendations of the Central Land Reforms Committee, which, they stressed, had not grouped together the above two categories of land for the purpose of fixing ceilings on the holding of agricultural lands.

During the debate on the fall in the prices of some farm products, particularly raw jute, members stressed the need for safeguarding the interests of agriculturists. They called for the fixation of reasonable support prices for all agricultural commodities. The Minister for Foreign Trade, Mr L.N. Mishra, announced that the government had decided to take over, in a phased manner, the trade in raw jute. Statutory minimum prices would be fixed for all the secondary and primary markets in respect of all the varieties of the fibre. He disclosed that as a first step, the Jute Corporation of India had been directed to make massive purchases of raw jute, totalling about six lakhs bales, to ensure that the prices did not decline. Another step which the government envisaged for ensuring adequate return to jute growers, Mr Mishra said, was to set up five new jute mills in Andhra Pradesh, Assam, Bihar, Orissa and Tripura. The purchases by the Jute Corporation, Mr Mishra stated, would be made through departmental purchase centres, co-operative societies where viable societies were functioning, and also through private agencies where no other

channel was available. Adequate storage arrangements, he added, would also be made for storing jute. About other commodities, the members were assured by the Minister for Agriculture that the interests of the agriculturists would be fully protected.

The persistent erroneous depiction of our northern borders in the Soviet Encyclopaedia was strongly resented by members during the discussion on the subject. The Minister for External Affairs, Mr Swaran Singh, took great pains to explain that the Soviet Union had assured the Government of India that the wrong depiction of our frontiers in the Soviet maps "did in any way affect or reflect the Soviet Government's understanding of and respect for India's frontiers". But this could hardly satisfy agitated members. Ultimately, the Minister for External Affairs had to concede that the word "border" in the recently signed Indo-Soviet friendship treaty meant the "line of actual control" the violation of which by any country would invoke the provisions of the friendship treaty.

The two Houses have adopted two new constitutional amendments. One, the Constitution (28th Amendment) Bill, sought to empower the government to change the service conditions of the officials belonging to the Indian Civil Service. Hitherto, by virtue of an article (314) in the Constitution, the service conditions of these officials could not be altered. The Minister of State for Home Affairs, Mr Ram Niwas Mirdha, promised to introduce "follow-up legislation" in this regard soon. The second amending bill, the Constitution (29th Amendment) Bill, sought to confer the protection of the Ninth Schedule to the Constitution on the Kerala land legislation.

drafting doctors, engineers

The two Houses have also passed (i) the National Service Bill, (ii) the General Insurance (Emergency Provision) Amendment Bill, (iii) the Delhi Co-operative Societies Bill, and (iv) the Salaries and Allowances of Members of Parliament (Amendment) Bill. The National Service Bill aimed at empowering the government to draft doctors and engineers below 30 years in age for service for four

years in the armed forces or in the countryside where they normally feel reluctant to work. The General Insurance (Emergency Provision) Amendment Bill sought to make it clear that "the custodians alone have all the powers of management and that any resolution in relation to general insurance business passed after the takeover by any person who might have had authority in that behalf before the takeover, shall have no effect unless approved by the Central Government". The Delhi Co-operative Societies Bill aimed at consolidating and amending the law relating to co-operative societies in the Union Territory of Delhi. The Salaries and Allowances of Members of Parliament (Amendment) Bill says that every MP representing the Union Territories of Andaman, Nicobar, Laccadive and Minicoy and Amindivi islands will be provided with one free non-transferable pass to enable him to travel by the highest class by steamer at any time between any part of his constituency and the nearest port on the mainland.

important bills

Among the other important bills adopted by the Lower House in the last 11 days were (i) the Architects Bill which aimed at making it unlawful for any person to designate himself as an architect unless he has the requisite qualifications and expert experience and is registered with the Council of Architects, (ii) [the University Grants Commission (Amendment) Bill which sought to strengthen the UGC, (iii) the Delhi Land (Restriction on Transfer) Bill which aimed at putting certain restrictions on the transfer by unscrupulous persons of lands in the Union Territory of Delhi which might have been acquired or might be under acquisition by the Central Government, (iv) the Aligarh Muslim University Bill which sought to reform the administrative set up of this university; (v) the Hire-Purchase Bill which had the objective of regulating this business; and (vi) the Criminal Law (Amendment) Bill which aimed at curbing the "objectionable activities" of associations which promote enmity or act in a manner prejudicial to the maintenance of harmony between different groups on grounds of race, religion, language, etc. The Rajya Sabha passed the Industrial Disputes (Amendment) Bill

which sought to clarify that it would not be incumbent on industrial undertakings employing upto 50 workmen on an average working day in the preceding 12 months to give a 60-day notice of closure.

The long-awaited General Insurance Business (Nationalisation) Bill was introduced in the Lok Sabha. This bill seeks to establish a government company, to be called the General Insurance Corporation of India (GIC), which will supervise, control and carry on the business of general insurance. On the formation of this corporation, the shares of the Indian insurance companies, vested in the central government, would stand automatically transferred to the corporation, and all the Indian insurance companies would become the subsidiaries of the corporation.

merger of companies

The bill also seeks to inject an element of competition in the general insurance business by merging all, the Indian insurance companies so that, ultimately, there will be only four Indian companies. These will be so situated as to promote competition and effective service in the field of general insurance.

Fifty-five Indian companies and 52 foreign companies doing general insurance business are sought to be nationalised. The Bill contains schedules according to which "amounts" will be paid for the transfer of the shares of the general insurance companies. An amount of Rs 33,03,31,399 is proposed to be paid to the 107 general insurance companies that are being nationalised — Rs 22,56,39,399 to the 55 Indian companies and Rs 10,46,92,000 to the 52 foreign companies. The bill uses the word "amount" instead of "compensation" in view of the Supreme Court's judgment in the bank nationalisation case and the subsequent amendment of the Constitution. The Supreme Court had held that compensation means just equivalent of market value.

This bill was referred to a select committee of the two Houses after a brief debate. Two other bills which sought to amend the Untouchability (Offences) Act and the Representation of the People Act were also referred to select committee by the Lok Sabha.

"Chinoiserie"

"Sino-British Chinoiserie"

"CHINOISERIE" is a compact French word for which the English equivalent is something like "China's conduct and ideas in everything to do with China — politics, art, foreign relations etc. etc.". In this article I seek to try to understand China's current "chinoiserie" in foreign policy.

Sir Alec Douglas-Home, British Secretary of State for Foreign and Commonwealth Affairs, recently announced to the House of Commons that Britain and China had agreed to exchange ambassadors. This has ended the situation which existed for twentytwo years during which both countries were represented in each other's capitals by *charges d'affaires*. The communique stated:

"The government of the United King-

dom, acknowledging the position of the Chinese government that Taiwan is a province of the People's Republic of China, have decided to remove their official reorientation in Taiwan on 13 March 1972. The government of the United Kingdom recognise the Government of the People's Republic of China as the sole legal Government of China".

"The Government of the United Kingdom acknowledge the position of the Chinese Government that Taiwan is a province of the People's Republic of China. Both the Government of the People's Republic of China and Taipeh maintain that Taiwan is a part of China. We held the view both at Cairo and at Potsdam that Taiwan should be restored to China. That view has not changed. We think that the Taiwan question is China's internal affair to be settled by the Chinese people themselves."

Talking to the Foreign Press Association, the Prime Minister, Mr Edward Heath, described the exchange of ambas-

sadors as "the political pre-requisite to the development of our relationship with China in all fields. We regard this as an essential objective. The reason is simple. We expect to see increasing Chinese activity, not only on the mainland of Asia, but in international questions, such as disarmament, and in the United Nations. We believe that Chinese participation in such questions is essential if we are to approach them on a realistic basis. And I am glad that, in the last six months, an increasing number of nations have come to share this view. All this means that the Asian dimension to world affairs has become more active and significant."

It is worth noting that of the countries in the present Common Market, France,

Josselyn Hennessy

LONDON:

II

Sino-American "Chinoiserie"

"I go to Peking without illusions", President Nixon said in his recent report to Congress on US Foreign Policy, adding "We remain separated by profound differences in principle and the suspicion of decades".

One of the points of interest in this year's report on foreign policy is the revelation that within two weeks of coming into office in January, 1969, the President set in train the process of policy review which culminated in the Peking visit and the signature of the Nixon/Chou communique. Yet, to quote again from the President's Foreign Policy Report, "the trip to Peking is not an end in itself but the launching of a process... We are talking at last. We are meeting as equals".

Essentially, this was a summit meeting, which was its own justification. It did not have to result in any substantial agreement to be worthwhile and, from the point of view of both parties' relations with other countries, it is perhaps as well that it has not.

divergent viewpoints

In large part, the communique consists of statements by each government of their divergent viewpoints on policy issues, but it recalls that both countries agreed that "it would be against the interests of the peoples of the world for any major country to collude with another against other countries, or for major countries to divide up the world into spheres of interest".

As stated in the communique, the American President and the Chinese Prime Minister agreed that their two governments should stay in contact through various channels, including the sending

of a senior US representative to Peking from time to time for "concrete" consultation. It has since been announced that the main point of contact will be through the ambassadors of the two countries in Paris. Furthermore, Peking and Washington agreed that steps should be taken to facilitate contacts in such fields as science, technology, culture, sports and journalism, as well as in trade relations. The American government has followed a policy of unilaterally removing restrictions on trade with China since 1969. This was taken a step further shortly before President Nixon's visit when it was announced that henceforth US trade relations with China would be on the same footing as American trade with the Soviet Union.

The part of the communique which attracted most attention concerned Taiwan, which the Chinese described as "the crucial question" obstructing the normalisation of relations.

Taiwan—the crucial "Chinoiserie"

The communique states the main tenets of the Chinese government's position, namely, that Taiwan is a province of China; the "liberation" of Taiwan is China's internal affair in which no other country has the right to interfere; and all US forces and military installations should be withdrawn from Taiwan. The Chinese government firmly opposes any activities which aim at the creation of 'One China, One Taiwan', 'One China, Two governments', 'Two Chinas' and 'Independent Taiwan' or advocate that 'the status of Taiwan remains to be determined.'

After a general statement of principles which should govern relations between the United States and China — including that international disputes should be settled without the use of force — the communique states the US position on Taiwan as follows:

"The United States acknowledges that all Chinese on either side of the Taiwan Strait maintain there is but one China and that Taiwan is a part of China. The United States government does not challenge that position. It reaffirms its interest in a peaceful settlement of the Taiwan question by the Chinese themselves. With this prospect in mind, it affirms the ultimate objective of the withdrawal of all US forces and military installations from Taiwan. In the meantime, it will progressively reduce its forces and military installations on Taiwan as the tension in the area diminishes".

On his return to Washington, President

Nixon gave the assurance that this statement of intention, which is in any case vague, did not mean that the United States had abandoned its defence commitment to Taiwan. He had not gone back on the undertaking given before the Peking visit not to negotiate on behalf of third parties whilst in China. In fact, credibility is given to the US commitment to defend Taiwan not so much by the contingent of US troops on the island as by the presence of the Seventh Fleet in the area. Of the 9,000 US troops on Taiwan at the moment, most are support troops for Vietnam and these will be reduced and then eliminated altogether as the disengagement of US forces from Vietnam continues.

III

Peking's Foreign "Chinoiserie"

China's admission to the United Nations and the American President's visit are the two main highlights of the trend which has brought China out of the self-imposed isolation and introversion of the Cultural Revolution.

In its more extrovert mood, Peking has launched a widening circle of diplomatic initiatives in pursuit of objectives, which, on the face of them, differ little from those which it was pursuing before the Cultural Revolution. As good a guide as any to what China is trying to do in foreign affairs today is contained in the speech which Mr Chiao Kuan-hua, a Deputy Foreign Minister, made in the United Nations General Assembly on November 15. It was the first speech made by a representative of Communist China in that body, and the other delegates could have been left in little doubt that, in Peking's eyes, the primary justification for being in the United Nations was to establish itself as the champion of the developing countries. Here are extracts from Mr Chiao's speech:

"Countries want independence, nations want liberation and the people want revolution; this has become an irresistible trend of history... The Chinese people... have consistently opposed the imperialist policies of aggression and war and supported all the oppressed peoples and nations in their just struggles to win freedom and liberation..."

The rolling rhetorical cliché prompts me to ask how Comrade Chiao knows that all the "people" in the world want revolution. Has there be a world public opinion poll on the subject, which I some-

how missed in my weekly scanning of a score of newspapers and periodicals from a dozen different countries in four continents? I am ready to agree that there are millions of poverty-stricken and suffering people spread across the world, and that there are plenty of despotically and tyrannically governed states dotted about, which, if coloured red on the map, would cover the whole of Europe east of the (now somewhat rusty) Iron Curtain, a vast area of Asia, most of Africa (including virtually all the newly independent ex-colonial states) and likewise South America (where periodical revolutions are a routine instrument of government). But having conceded the point, I must add that I have never yet heard of a violent revolution which did not create as much, or more, new suffering than existed under the displaced regime. I suppose the two best known revolutions in history are those of France in 1789 and in Russia in 1917. Agreed that the two regimes which were overthrown were corrupt, incompetent and arbitrary, it nevertheless remains true that the successor regimes, installed amidst rivers of blood, inflicted new miseries on a scale with which the old regimes were unable to compete because their tyranny sprang from accretions of inefficiency rather than conscious malevolence.

classic error

The French revolution was followed by twenty-six years of continental war in which millions suffered under Napoleon's attempt to establish a French dictatorship throughout Europe. The Bolshevik revolution was followed by the dictatorships of Lenin and Stalin, in which literally millions died. The classic error of foreign policy that Stalin committed after World War II (which could have been avoided if he and his advisers had maintained personal intercourse with the west, instead of isolating themselves behind the Iron Curtain) originated in Stalin's fixed idea that the west was bursting with "imperialist aggressiveness"—this in the face of the US demobilisation from 12,000,000 men in 1945 to 1,500,000 in 1947. Stalin's schizophrenic fear of western motives led him to deprive 24,000,000 Europeans of their freedom by annexing Estonia, Latvia, Lithuania, East Poland, Bessarabia, Northern Bukovina, Ruthenia, parts of Finland and East Prussia, and to establish control over another 37,000,000 by the Red Army's occupation of Europe as far west as a line from Lubeck (just south of Denmark) in Germany to Trieste on the Adriatic.

I conclude that revolutions do not originate in "the people", but in the lust for power of aggressive schizophrenes. The model of what a revolution should be

WINDOW ON THE WORLD

dom, acknowledging the position of the Chinese government that Taiwan is a province of the People's Republic of China, have decided to remove their official reorientation in Taiwan on 13 March 1972. The government of the United Kingdom recognise the Government of the People's Republic of China as the sole legal Government of China".

The UK was the first western country to recognise the Chinese People's Republic as far back as January, 1950. At the same time the UK withdrew recognition from the Nationalist Government, which by then, had crossed over to Taiwan. The consular representation maintained on Taiwan — the UK was the only country to have representation both on Taiwan and in China itself — was accredited to

The world of multinationals

was that of 1688 in England when the stupid and arbitrary James II was replaced by the statesman like William of Orange without a shot fired and without any subsequent witch-hunting of James' advisers and supporters.

China stands up for "the people"

Having unburdened myself of this aside, I return to the speech of the good Comrade Chiao Kaun-hua. He went on:

"China is still an economically backward country as well as a developing country. Like the overwhelming majority of the Asian, African and Latin American countries, China belongs to the Third World. The Chinese government and people resolutely support the struggles initiated by Latin American countries and peoples to defend their rights over the 200-nautical-mile territorial sea and to protect the resources of their respective countries. The Chinese government and people resolutely support the struggles unfolded by the petroleum-exporting countries in Asia, Africa and Latin America, as well as various regional and specialised organisations, to protect their national rights and interests and oppose economic plunder". Comrade Chiao proclaimed China's "resolute support" for other more familiar causes such as the "liberation movements" in southern Africa, the "Palestinians and other Arabs" and the people of Indo-China, who should be allowed "to solve their own problems independently of and free from foreign interference; this is the key to the relaxation of tension in the Far East".

"As China's economy is still comparatively backward," he continued, "the material aid we provide is very limited and what we provide is mainly political and moral support. With a population of 700 million, China ought to make a greater contribution to human progress and we hope that this situation of our ability falling short of this wish of ours will be gradually changed."

In fact, China is now offering more economic assistance to developing countries than any other Communist power. (In 1970 its credit offers had approached \$700 million, or \$400 million more than

those of the Soviet Union). China's "moral support" is given as readily to insurrectionary movements as to legitimate and recognised governments, and often — a curious piece of "Chinoiserie" — against those governments with which Peking has itself been cultivating better relations! I see no reason to expect that as part of its new outlook on the world, China will become any less determined a supporter of subversion and I therefore have every reason to predict that tension will continue to prevail in the Far East and other areas where the Communist powers are seeking to spread their influence.

the non-super-super-power

"The super powers", said Comrade Chiao, warming to his topic, "want to be superior to others and to lord it over others. At no time, either today or ever in the future, will China be a super power subjecting others to its aggression, subversion, control, interference or bullying". For the benefit above all of the developing countries, who have to be shown that China is their natural ally against the US and the Soviet Union, the Chinese leaders present a picture showing the world divided into three types of state—(1) super powers, (2) the medium and small states, who are believed to be increasingly restive under the super powers' high-handed behaviour, and, of course, (3) China. This non-super-super-power is determined to acquire at least one attribute of super-powerdom — a large arsenal of nuclear weapons which (as Comrade Chiao hastens to assure us) are, of course, "solely for the purpose of defence and for breaking the nuclear monopoly".

India can only size up China's claim to be free from the selfish motives of ordinary run-of-the-mill super powers in the light of the support that China gave Pakistan on the issue of Bangladesh, even though its stand on this question has probably had some appeal in the many developing countries who have secessionist movements to cope with. In the Indian sub-continent China's policy corresponded more to the tenets of old fashioned balance of power politics than to the ideals

of world revolution.

An undoctinaire trend is also evident in China's attitude towards European countries, the Soviet Union apart. China has restored ambassadorial relations with the arch-revisionist Yugoslavia, developed trade relations with Greece and welcomed the enlargement of the European Economic Community. But arguably the biggest piece of pragmatism of all was the invitation to President Nixon. This certainly needed some explaining. This was done by recalling Chairman Mao's analysis of exploiting divisions in the enemy camp and using "to good account all such fights, rifts and contradictions in the enemy camp and turning them against our present main enemy". This piece of "Chinoiserie" seems to me to be in line with the classic "Divide and Rule!" of which the "imperialist" powers were once said to be the arch exponents. Is there anything new under the (Far Eastern) sun?

WHILE EUROPE begins its summer holidays before entering on the final stage of its Common Market enlargement in the late autumn it may be useful to use the pause to examine a few major international economic changes which make even the Market expansion look relatively trivial.

The first of these developments, and easily the most significant, is the growth and change in manner of operation of the multinational companies.

If present trends in multinational company growth continue—and there is nothing in view that would prevent it—in about ten years' time three-quarters of west European and north American capital assets will be controlled by about 300 huge companies. This fact makes national banks, even governments and the expansion of an international economic and political group in varying degrees far less important than they would otherwise be.

association of convalescents

The Common Market, the International Monetary Fund, GATT and similar groups are the product of the recovery period that began in west Europe some five to seven years after the end of the last war in which most of the continent fought itself almost to its last shreds of being. They were, for this reason, at least at first associations of convalescents, anxious to restore the level of living they had destroyed; only in the last decade has the Market become a combative competitor of the United States in world markets. The United States, meanwhile, has spent much of its substance on wars in eastern Asia after contributing generously to the later stages of the anti-Axis war effort and then to economic recovery in west Europe as well as on space research which is, financially, a very long-term investment.

Officially, for these reasons, the United States is less financially well-off than it might have been had its administrations been less generous, less intent on "containing" the communist powers, and less competitive in space research. Similarly, owing to war and other debts, to inflation and resultant currency difficulties, west Europe's states, though prosperous and

in many ways progressive, are less able to resist strong economic influences of the international type than they might have been had a disastrous war and a post-war complete change in world political make-up not convulsed them.

It is possible that these weaknesses of governments may have passively aided the process of the growth of the giant multinational industrial and commercial corporations. The same post-war period which has been a time of slow and fluctuating recovery by governments and by national economies has been the time when the basis of the west's economic strength has totally changed its character.

sea-change occurred

The economic era of coal, steel, heavy engineering and consumer market commodities has given way to that of industrial chemicals, petroleum, electronics and plastics, that of woollen and cotton textiles to that of synthetic fibres. At the same time not only has the company-owned firms disappeared into multinational industrial complexes but direct exports account now for about one-tenth of sales income, the greater part of it is generated by manufactures and other products of the directly-owned overseas subsidiaries of the multinational corporations.

This is a fact of the greatest significance and one not sufficiently often remarked. It is a fact that makes such government devices as surtaxes on imports and even tariff barriers relatively unimportant. Import surtaxes arouse strong protests—but who now scarcely remembers the British surtax of the last decade and even Mr Nixon's 10 per cent surtax on imports is disappearing from memory. The reason for their very temporary significance is the fact that direct imports are becoming progressively less important. Over 75 per cent of foreign trade in manufactured goods in west Europe and the USA is carried out by corporations which have manufacturing and trading bases directly in the countries with whom they trade and to which they might in former years have shipped exports.

In the cases of several multinational corporations, for this reason, sales from

their foreign subsidiaries are three times or more as considerable as their direct exports. When their overseas investment in both book-value terms and in real terms is taken into consideration the sales generated by the multinationals' overseas operations are probably almost ten times the value of the direct exports.

Many angry voices have been raised in recent years in west Europe over the American industrial and financial "invasion"—and its significance and influence in Europe is tremendous—but though the Americans are ahead on volume, direct and portfolio investment is a two-way traffic. British firms already produce and sell in the USA at least four times as much as they export there; generally speaking there is probably about as much direct and portfolio European investment in the USA as there is US investment in west Europe.

a cosy refuge

The ramifications of the "tax havens" used very extensively by the multinational corporations almost nullify the controlling effects of such devices as national taxes and tariffs. West Europe itself provides these havens in Luxembourg and Liechtenstein—there are a dozen in other parts of the world—and in these cosy refuges the post-war phenomenon of the corporate money manager—a mid-20th century rationalisation of the Middle Ages Lombards and Hanseatic Fuggers and of the 19th-century London and Frankfurt financiers—hedge to protect threatened currencies by buying futures in stronger currencies and play ducks and drakes in the European money market. The Zurich bankers have more cunning competitors today nearby in central Europe, many of them operating on instructions from their home base in New York.

At the same time the tremendous total operations of the many new multinational banks are a clear indication of the waning influence of the national banks. The threat of an inflow of foreign money makes many smaller governments impose quite ridiculous restrictions on financial movements; fear of heavy outflow of foreign investment has moved the US government, with reluctant Congress

consent, to establish Domestic International Sales Corporations (conveniently DISCs) within a multinational company in the USA whose income would remain free of federal income tax until the revenues were turned over to the parent company, however far distant in the future that act might be.

The immense financial power of the multinationals "in all major industrial" and commercial States and their foreign manufacturing and sales activities has so extensively made rings round national controls that whether west Europe organises itself into a group of six or ten can make very little difference to these massive-

scale concerns. On the contrary, it is their existence, growth and ever adaptable techniques that make and will continue to make a very considerable difference to the influence of and to the type of policy operated by the Common Market itself and by every one of its members.

Karl Schiller

Better deal for developing countries

"BEGINNING immediately," said Prof-Karl Schiller, "my government will grant capital aid to these twenty-five 'least developed countries' on the terms of the International Development Association (IDA) that is, 0.75 per cent interest and a duration of fifty years, including ten years free of amortization. My government is also prepared to increase the volume of its capital aid for these countries."

Professor Schiller went on to elaborate on the government's ideas on the subject: "Above all, we shall improve conditions for productive public and private investments by means of increased technical aid. We extend our hand of co-operation to these countries. Chiefly in the following areas: education and training, health, water supply, improvement of the transport network, and finally the further development of agriculture and the development of the processing industry. We must apply the instruments of development aid more flexibly. We cannot insist on partnership performance when such performance simply cannot be expected of these countries in the foreseeable future.

"In the case of raw materials agreements for products of special interest to the twenty-five countries, we are prepared to grant these countries special arrangements, such as higher procurement quotas. Because of these countries' limited financial capability, we shall also examine the question of how to provide relief for them in the financing of buffer stocks by the industrialized countries."

Turning to the subject of "our general financial development aid," Professor Schiller made the following observations: "Pursuant to the government policy statement by Chancellor Willy Brandt on October 28, 1969, our financial planning provides for higher increments for co-op-

The announcement of substantial improvements in credit terms and a strong plea for tariff preferences to stimulate exports from the developing countries were the highlights of a speech by the German Economic Minister, Prof. Dr Karl Schiller, at the third UN Conference on Trade and Development at Santiago, on April 14. The text of his address is reproduced here.

ration with the developing countries than for the total budget. Despite temporary budgetary restrictions, in the case of the relevant fiscal appropriations, we have maintained an average annual increment of 11 per cent. We shall continue our endeavours to achieve the public assistance goal of 0.7 per cent as soon as possible.

"However, all the efforts of my government cannot ensure that the one-per cent goal set by UNCTAD II will be achieved each and every year. In a free enterprise system, economic trends are a factor here, after all. At any rate, in absolute terms the Federal Republic of Germany's public aid had distinctly increased, and this includes the most recent years, as well. It reached a total of 3,000 million marks in 1971.

"Special importance is attached by the Federal Republic of Germany to the activity of the multilateral financing institutes. We gave our approval to a doubling of the IDA contributions. This is the third increase of IDA funds. We contributed the initial instalment applying to this increase before the agreement went into force.

"Our response to the developing countries' desire for better capital aid conditions is positive. We have continually improved the terms in line with the recommendations of the development assistance committee of the OECD. In addition, I

can state the following for my government: In the future, the standard terms for capital aid credit granted by us will be two per cent interest and a duration of 30 years, including 10 years free of amortization. In the year of UNCTAD II, these terms were still three per cent interest and a duration of 24 years, including 7.3 years free of amortization. We shall also further increase the proportion of the grants to the total of our public development aid.

"For some time there has been a spirited discussion of the foreign indebtedness of the developing countries. In-depth studies by international institutions have now made possible an objective assessment of this highly stratified complex. One important perception that has come from these studies is that what we have to do with here is not a single, generalized problem of indebtedness on the part of the developing countries. This problem exists in many different forms. Consequently the problem of indebtedness must be resolved case by case in terms of each given situation. It will always be essential here to make optimum utilization of all the possibilities of co-operation between the credit-granting states, the international institutions and the country in debt.

"We support the developing countries' call for an international dismantling of procurement conditions. The Federal Republic of Germany has long advocated this, in line with its liberal trade policy. And we have set a good example here. I hope that this conference will give new impetus to the concluding of a multilateral agreement embracing all donor-countries. Right now, 75 per cent of the capital aid credit given by my country is without procurement ties. This proportion puts us considerably above the average of the members of the OECD development assistance committee."

For India that is Bharat,

Ceylon that is Sri Lanka cannot have the excitement of novelty. It is easy to appreciate that the island-state of Shrivav Bandaranayake must be anxious about rediscovering its identity. So much of this poor country has been broken up into such pitiable pieces that it has become urgently necessary for it to acquire at least the reassurance of a christening. Unfortunately, identity is not a matter merely of naming or renaming. Take for instance our own country. What does Bharat that is India now stand for? The obvious and perhaps the only true answer would be that India stands for Indira. The question is whether it is also a satisfactory answer. Poor Ceylon, poor Sri Lanka! When will your people come to know you really? More important still, when will you come to know your people? Our little neighbour to the south, perhaps you yourself may look to your north and pose similar questions.

The presiding officer of

a legislature is the natural and necessary guardian of the rights and privileges of its members. It is therefore quite proper for the Speaker of the Lok Sabha to feel upset when the famous incident in the Willingdon Hospital, involving a member of Parliament who complained that he had been manhandled by the hospital staff, was brought to his attention on the floor of the House. Even so, some of the reactions and observations of Mr Dhillon as reported in the press seem odd rather than odd, suggesting that he had allowed himself to be swayed unduly by the emotions, if not the passions, of the moment. I quote first from *The Statesman* of May 17 and next from *Link* of May 21.

The Statesman: "Mr Dhillon said that he was aware that the hospital employees talked derisively whenever members went there for treatment. 'If I go or a minister goes special attention is given. After we leave there is laughter amongst themselves', he said, directing the Health Minister to make a full statement after inquiry later".

Link: "Speaker G.S. Dhillon, too, seemed deeply affected by what he heard from his officers and others. He told the House that he had been informed of the incident

as soon as he reached his office. He sent the Superintendent of Police of the Watch and Ward Staff of Parliament to the hospital to make inquiries and help Shailani if he needed any help. Then the Minister for Parliamentary Affairs met him and related what he had seen. 'It is most shocking. Hospitals are meant to save people and not to kill them', he said. He thought the incident at the hospital was the result of a campaign to denigrate members of Parliament that was being carried on for some time now by certain government officials. The Speaker asked the minister to enquire into the incident fully and place the report before the House".

Could it be that our law makers are suffering from a persecution complex? Could it be a case, again, that, because there is this complex, so many of them are inclined to use the most extravagant language in Parliament when they happen to be commenting on or criticizing other people. For instance, a member of Parliament recently permitted himself the astonishing observation that the pharmaceutical firms in this country are worse than dacoits who take only money, whereas the pharmaceutical firms take both one's money and one's life. If my memory serves me right, this member was referring particularly to the foreign firms in the pharmaceutical industry. Patriotism has always been a heady sentiment and it possibly demands verbal exuberance to express itself adequately.

Other people's income-

tax affairs are always interesting news and it is perhaps natural that members of Parliament should attempt to punctuate the tedium of the routine of the House by talking about the income-tax affairs of newsworthy personalities. On May 23 a question was asked in the Rajya Sabha about the tax situation of Mr Sanjay Gandhi, the second son of the Prime Minister. The Finance Minister, in his reply, stated that over the period of the last three years Mr Gandhi was assessed to income-tax for the assessment year 1970-71 on a total income of Rs 722. The figure suggests that Mr Gandhi cannot be engaged or at least was not engaged during the relevant assessment year in any regular profession, business or trade. The amount, in fact, sounds not even like casual receipts but

simply pocket money. We have it on the authority of the Prime Minister of India that Mr Sanjay Gandhi is a young man of unusual enterprise. Could it be that this well-favoured youth in his twenties is earning less than what it takes to keep him in food and clothing?

It is true that, apart from newspaper reports that Mr Gandhi now and then does an odd political job or two whenever the Prime Minister's party goes electioneering, while waiting for the amber light to turn green for his small car project, not much is known about how he occupies himself. Information, however, has not been entirely lacking. He has been going abroad now and then presumably on business tours and the foreign exchange released to him on these occasions, incidentally, has been amounting to very much more than his total income assessed to income-tax for the assessment year 1970-71. It has also been stated that Mr Gandhi had functioned or is functioning as a consultant to a well-known firm on a new industrial project to be set up in UP for the manufacture of agricultural tractors. He is apparently providing his consultancy services either in a purely honorary capacity or for a token fee.

Recently, 'The Guardian'

(London) unintentionally generated a spate of mirth at its expense when one of its lead-writers delivered himself of the profound truth that "the problems of poor people would be a lot less if they had more money". The *New Statesman* (London) took full advantage of the occasion to organize its Weekend Competition around this solecism and asked for extracts from *Guardian* leaders arguing equally stunning theories. The entries as may be expected, provided a good deal of harmless amusement. Samples:

"Mr Heath's suicide means the Conservatives will have to find a new leader"; "If there were far more houses available, fewer people might lack a decent roof over their heads";

Without deliberately looking for parallels in our own daily press, I had the good fortune of coming across this gem in the main editorial of *The Times of India* of May 24: "In the absence of all the facts we are in no position to vouch for the accuracy of the statement of the CPM leader Mr Jyotirmoy Bosu in the Lok Sabha to the effect that a leading businessman or house in Calcutta had spent Rs five lakhs to print eight lakh copies of a poster for the Congress on the eve of the recent elections in the various state legislatures".

In other words, give the Editor of *The Times of India* all the facts and he will tell you whether it is the whole truth.

TRADE WINDS

The Poorest Twenty-Five

THE THIRD UNCTAD concluded in Santiago on May 21 after taking a unanimous decision to adopt special measures for assisting the 25 poorest countries of the world. Included in this list are sixteen African, eight Asian and one Latin American country. The various means to be adopted to help these countries are: (a) a programme of preferential financial assistance, (b) special consideration for commodity agreements, (c) priority in access to markets, (d) reduced shipping rates, (e) increased technical assistance and (f) efforts by international organisations to assist in diversification of the economies. The resolution was adopted by the conference and included all the above points, called on the socialist countries of Eastern Europe in particular to provide long-term technical and financial assistance on favourable terms to this group of countries.

Another result of the conference was the realisation by the EEC that the third world countries were highly dissatisfied with it. Mr S. Mansholt, Chairman of the EEC Commission, stated that the discussions in the conference will make the Community "consider demands of the third world" so as to find the best way for starting "a common road for multi-national co-operation."

The developing countries have made a gloomy assessment of the six-week discussions at Santiago. The developed countries however point to the brighter side of the picture, namely, the adoption of a number of unanimous resolutions passed by the con-

ference. The developing countries feel that the unanimous resolutions relate to minor subjects. The resolutions for assistance to land-locked countries is a case in point. It is important for the countries concerned but among the major problems of the third world, it is a relatively small one. The developing countries felt that they would have to be increasingly "self-reliant" in the coming years though there are limitations to it.

Fuel Policy

The Fuel Policy Committee has submitted Part I of its report covering the "Fuel Policy for the Seventies" to Mr S. Mohan Kumaramangalam Minister of Steel and Mines. This part of the report has been submitted with the object of enabling the government to take urgent decisions on investment requirements in the energy sector for the fifth five-year Plan period.

The Fuel Policy Committee was appointed by the government of India in October, 1970. The terms of reference of the committee were: (a) to undertake a survey of fuel resources and regional pattern of their distribution; (b) to study the current trends in exploitation and use of fuels; (c) to estimate prospective demand by sectors (in particular the transport industry, power generation industry and domestic fuel); (d) to study the efficiency in the use of fuels and recommend — (i) the outline of national fuel policy for the next fifteen years; (ii) a pattern of consumption and measures, fiscal and otherwise, which would help the best use of available resources; and (iii) the measures and agencies, to promote

the optimum and efficient use of fuel.

Mr R. Venkataraman, then Member (Industry), Planning Commission, was appointed the chairman of the committee. He resigned as chairman after ceasing to be member of the Planning Commission and in his place, Prof S. Chakravarty, Member, Planning Commission was appointed as the chairman.

In its report the committee has drawn the attention of the government to the investment and operational problems of the energy sector in view of the very substantial efforts called for in terms of men, materials and organisation to carry out the task of implementing the perspective plan as given in the fourth Plan document. The committee has emphasised the fact that it has kept its study within the framework of the perspective plan of the government which envisages a rate of growth of the country's economy at 6.2 per cent per annum during the fifth Plan period and up to 1980-81. The committee has taken these long-term targets as given and has not attempted to scale down the order of requirement merely because the estimates would appear to be on the high side.

The committee has come to the conclusion that if the targets indicated in the perspective Plan are to be achieved, the total demand for energy in 1978-79 and 1980-81 is likely to be of the following order:

Estimated demand in	Coal	Oil	Electricity
	m. tonnes	m. tonnes	billion KWh
1978-79	108	27.2	125
1980-81	125	31.7	150

The total requirement of coal, including the coal used in the generation of electric power, is estimated at 165 million tonnes in 1978-79. The total demand for oil products including those used in fertiliser manufacture and other sectors is anticipated to be of the order of 34 million tonnes in 1978-79.

The total generation of electricity required to meet the demand indicated above is estimated at 156 million KWh and the installed capacity would range between 37,000 MW and 40,000 MW in 1978-79.

The committee has noted that the critical shortage in coal would be in respect of prime coking coal. It has suggested that immediate attention should be paid to the development of additional production of medium coking coal and its use in steel plants so that the scarce reserves of prime coking coal could be conserved. The committee has attached great importance to the replacement of non-commercial fuels such as fire-wood and dung cake by soft coke. A rate of increase in the use of soft coke of 15 per cent per annum has been predicted. Regarding non-coking coal, a concerted and co-ordinated effort including the proving of new areas in outlying coal-fields where super thermal power stations can be set up as well as standardising the machinery and equipment used in the mines have been suggested.

The additional investment required for meeting the energy demand by the end of the fifth Plan has been estimated by the committee as follows:

Coal—Rs 690 crores.
Oil (Refining only)—Rs 323 to 390 crores on different alternatives.
Electricity—Rs 6,400 crores (including transmission facilities).

Among the new proposals which the committee has suggested for further study are the use of unit trains for speeding up coal transport, utilisation of coastal shipping, transport of coal along the river Ganga and creation of dumps for the smaller consumers of coal.

The committee has strongly urged that the use of fuel oil for power generation and by industrial consumers except in cases where its use is justified on technical grounds, should be discouraged.

As a means of replacing kero-

sene in the domestic sector, the committee has suggested the setting up of town gas plants for a few cities with a population of over one million on an experimental basis after a detailed techno-economic evaluation of the proposal. It has also suggested improvement of the Calcutta Gas Supplies Scheme.

The committee has found that the electrification of trunk routes as programmed by the railways should be implemented and accelerated.

TV Production

Mr K.L. Nanjappa, Development Commissioner for Small-scale Industries, said recently in Bombay that there would be no let-up in the government determination to keep the production of television sets within the purview of the small-scale sector, and any attempt by large units to circumvent the regulations would be defeated. Mr Nanjappa made this observation when his attention was drawn by Mr H. S. Bhatt, President of the Small-scale Electronics Industries' Association, to a reported attempt of a large-scale unit to lure small-scale TV licensees. Mr Nanjappa assured the representatives of small units that he would investigate the matter and recommend the cancellation of licence of small units which might be parties in these deals.

Joint Council

The formation of the National Council of Trade Unions by the three major trade unions viz. Indian National Trade Union Congress, All India Trade Union Congress and the Hind Mazdoor Sabha has been welcomed by Mr H. S. Sighania, President of The All-India Organization of Employers. The council will provide a common forum for different trade unions to promote mutual "understanding, co-operation and co-ordination" on all important issues. The first meeting of the council was held on May 30.

The agreement came after a meeting of trade union leaders convened by the Minister for

Labour Mr R. K. Khadiolkar, as a last attempt to reach a common understanding with them on the proposed legislation on industrial relations. It is hoped that the labour leaders would now be able to present a common viewpoint during discussions with the government. An important feature of the agreement is that all decisions taken by the council would be by "consensus".

Diplomas in Foreign Trade

Forty-three participants were awarded diplomas on May 22, at the Annual Convocation of Indian Institute of Foreign Trade by Mr A. C. George, Deputy Minister of Foreign Trade, after the successful completion of the 10-month Diploma Programme in International Trade. Twenty participants were sponsored for the diploma programme by business organisations, where they were already exposed to the handling of foreign trade. Three of them came from Malaysia, Nepal and Ceylon, while one was a released emergency commissioned officer of the armed forces.

The institute has so far conducted 70 training programmes with the participation of 2,000 persons including seventy from abroad. The objective of the programme is to build up a competent cadre of young export management personnel for Indian trade and industry.

Australia and the Asian Fair

Grant Advertising (India) Limited has been appointed by the Australian Department of Trade & Industry, to advise, co-ordinate and look after public relations work involved in Australia's participation in the Third Asian International Trade Fair, to be held in New Delhi from November 3 to December 17, 1972. This work was assigned to Grant on the basis of a competitive scheme which the Agency had submitted in response to a questionnaire circulated by Australia's Trade Representatives in New Delhi.

An ingenious attempt has

been made in the planned architecture of the Australian pavilion (by using basic elements in Indian philosophy and Indian symbol) to express the Australian way of life and Australia's role as a partner in the development of Asia. The exhibits will tell the story of Australia rapidly transforming itself into an important manufacturing nation. The commercial section will show mineral products, wool processing techniques, agricultural and mining equipment, bulk handling equipment, grain handling equipment and agricultural aircraft.

Debt Relief

Dr H.C. Coombs, who has been appointed as consultant by the World Bank for discussing debt relief arrangements with the member countries of the Aid India Consortium, was last week in New Delhi for discussions with the government of India.

The World Bank has undertaken a study of debt relief required by India in the last two years of the fourth five-year Plan. The study became necessary in view of the rising burden of debt service payments resulting from the hard terms on which loans were given in earlier years and suggests that debt relief should be pro-

vided at the rate of \$200 million per year in 1972-73 and 1973-74. The recommendations of Dr Coombs will be considered at the meeting of the Aid India Consortium scheduled to take place in Paris in the middle of this month.

The World Bank had organised a study of debt relief to India for three years from 1968. On the basis of the study and recommendations of the then consultant, Mr Guindey, the members of the Consortium provided debt relief for an amount of over \$ 300 million during these three years. By extending the same arrangement, a further debt relief of about \$ 92 million was also provided during the last financial year.

Foreign Aid

Foreign aid agreements signed during the year 1971-72 (April 1971 to March 1972) amounted to \$ 1084 million. Of this project aid was about \$ 709 million and non-project aid was \$ 375 million, which included assistance in the form of debt relief amounting to \$ 86 million.

Country-wise details of the aid agreements signed during April 1971 to March 1972 are as follows:

Name of the country/ institution	(\$ million)		
	Project	Non-project	Debt relief
1. Austria	—	—	0.88
2. Belgium	—	2.90	1.10
3. Canada	4.17	47.26	0.70
4. France	38.83	24.33	5.00
5. W. Germany	16.40	27.31	30.00
6. Japan	66.60	74.09	20.60
7. Netherlands	—	13.80	0.70
8. Sweden	5.00	—	—
9. UK	50.47	64.80	18.00
10. USA	21.00	35.00	8.70
11. IBRD	60.00	—	—
12. IDA	446.00	—	—
Total	708.47	289.49	85.80

India also signed Food Aid agreements with the following countries during April 1971 to March 1972:

Country	Amount (\$ million)
Australia	3.77
Canada	37.33
UK	1.92
PL -480 Wheat	98.70
Total	141.72

ITDC

The India Tourism Development Corporation made a net profit of Rs 37.06 lakhs in 1970-71 as compared to Rs 1.53 lakhs in the year 1969-70 including the profits of the shoka and Janpath Hotels (limited).

The increase in the profit is due to an increase in the gross turnover from Rs 4.03 crores in the year 1969-70 to Rs 5.64 crores this year. After making appropriations for retirement gratuity and general reserve fund, the net surplus carried to balance sheet is Rs 5.84 lakhs.

The authorised share capital of the corporation is Rs 10 crores. With a further investment of Rs one crore by the government in the shape of equity capital, the paid-up capital of the corporation as on March 31, 1971, stood at Rs 1,96,84,000 as against Rs 1,96,84,000 as on March 31, 1970.

Existing Hotels

Ashoka Hotel with a bed capacity of 651, made a net profit of Rs 18.71 lakhs as compared to Rs 6.90 lakhs in the previous year. The occupancy of the hotel improved considerably after the renovation of rooms and public areas and gross earnings rose to Rs 50.34 lakhs from Rs 180.08 lakhs in the last year.

Janpath Hotel with a capacity of 289 beds, earned a net profit of Rs 10.88 lakhs as compared to Rs 7.27 lakhs last year. The increased profits were due to higher room occupancy resulting from improved services, renovation of rooms etc.

Lodhi Hotel has a capacity

of 250 beds. Although the gross earnings increased from Rs 21.57 lakhs in the previous year to Rs 29.08 lakhs in the year under report, there was a loss of Rs 1.95 lakhs mainly due to the creation of a development rebate reserve and a new accounting system by which the entire value of uniforms issued to the staff was written off in the year.

Hotel Ranjit has a bed capacity of 222. As a result of the renovation and air-conditioning of some rooms, the gross earnings of the hotel increased from Rs 25.29 lakhs in the year 1969-70 to Rs 32.05 lakhs during the year under review. The hotel, however, suffered a loss of Rs four lakhs during the year. The operational results of the hotel are expected to improve with the completion of the renovation programme.

New Hotel Projects

The hotel building constructed by the New Delhi Municipal Committee at Chanakya-puri, New Delhi was taken on lease from May 1, 1971 by the corporation for being run in the name of **Akbar Hotel**. The hotel was commissioned on January 1, 1972. Another hotel namely, **Ashoka Hotel**, Bangalore, was also completed and formally inaugurated by the President of India on May 1, 1971. The construction of a 100-room hotel and 40 Kudils at Kovalam at an estimated cost of Rs 135 lakhs has been sanctioned by government as a part of the integrated project for the development of the Kovalam beach centre. The corporation also plans to construct a 100-room hotel at Dum Dum (Calcutta) at an estimated cost of Rs 120 lakhs, and a centrally heated 60-room hotel at Gulmarg at an estimated cost of Rs 110 lakhs.

Restaurant at Expo '70

The National Restaurant opened by the Corporation in the Expo '70 fair held in Osaka, Japan, earned foreign exchange worth about Rs 14 lakhs and netted a profit of Rs 11.57 lakhs. The restaurant was one of the best

three out of a hundred restaurants at the fair and won a medal and a certificate of Merit from the Governor of Osaka.

Motels

Work on the construction of a 50 room motel at Jammu at an estimated cost of Rs 25 lakhs is in progress. The motel is expected to be commissioned shortly. Another motel-cum-tourist centre project at Varanasi at an estimated cost of Rs 39 lakhs is also in progress.

Tourist Transport

During the year under review, tourist transport service was extended to Hyderabad, Agra, Bangalore, Madurai and Bodhygaya. The present effective fleet of the transport division comprises 71 luxury cars, 40 ambassador cars, 30 coaches and eight mini buses. The sale turnover of the transport service was Rs 40.87 lakhs as against Rs 27.21 lakhs in the previous year.

Duty Free Shops

The duty free shops at the four International Airports at Bombay, Delhi, Calcutta and Madras registered a sale turnover of Rs 28.70 lakhs during the year under review against Rs 22.52 lakhs in the previous year. The net foreign exchange earnings during the year amounted to Rs 22.55 lakhs.

Minimum Wages for Building Workers

The government of India has in a notification announced the draft proposals for revising the minimum wages under the Minimum Wages Act, 1948 for employees in construction and maintenance of roads and in building operations, in stone breaking and stone crushing, in maintenance of buildings and in construction and maintenance of runways.

Different minimum wages have been proposed for workers in four different areas. Area A comprises Bombay, Calcutta, Delhi, Madras and all places within a distance of eight kilometres from the periphery

of corporations/municipalities/cantonment boards of these places.

Area B. 1 comprises Ahmedabad, Bangalore, Hyderabad, Kanpur, Lucknow, Nagpur, Poona and all places within a distance of eight kilometres from the periphery of the corporations/municipalities/cantonment boards of these places.

Area B. 2 comprises Agra, Allahabad, Amritsar, Coimbatore, Indore, Jabalpur, Madurai, Patna, Sholapur, Varanasi and all places within a distance of eight kilometres from the periphery of the corporations/municipalities/cantonment boards of these places.

Area C includes such places as Abohar, Adoni, Cuttack, Calicut, Guntur, Ranchi, Rourkela, etc. Area D comprises of all places not included in A, B.1, B.2. and C.

Minimum wages proposed for unskilled workers are Rs 4.50, Rs 4.00, Rs 3.65, Rs 3.65, Rs 3.30 and Rs 3.00 for areas A, B.1, B.2, C and D respectively. Those for semi-skilled and unskilled supervisory workers are Rs 5.90, Rs 5.35 Rs 4.85, Rs 4.40 and Rs 4.40 respectively, while for skilled workers the minimum proposed wages are Rs 8.80, Rs 8.00, Rs 7.25, Rs 6.60 and Rs 6.00. For highly skilled workers they are Rs 11.00, Rs 10.00, Rs 9.10, Rs 8.25 and Rs 7.50. For clerical workers (Matriculates) they are Rs 8.80, Rs 8.00, Rs 7.25, Rs 6.60 and Rs 6.00 and for non-matriculates, the proposed minimum wages are Rs 5.90, Rs 5.35, Rs 4.85, Rs 4.40 and Rs 4.00.

Where in any area the wages fixed under the notification are lower than the wages fixed by the state government for the corresponding scheduled employment for which it is the appropriate government, the higher rate would be payable as minimum wage under the notification.

The minimum rates of wages are applicable to employees engaged by contractors also.

The minimum rates of wages shall consist of an all-inclusive rates, and include also the

wages for weekly day of rest.

The minimum rates of wages for young persons below 18 years of age and for disabled persons shall be 70 per cent of the rates payable to adult workers of the appropriate category.

Steel and the Small Consumer

At least one dealer in every district in the country will be appointed by the Billets Re-rollers Committee to ease the distribution of steel to the small consumers. This will be of particular help to those who are in areas far away from the stockyards of the producers. In the northern and western zones dealers are already being appointed in various districts. The scheme will soon be extended to other zones also. This information was given by Mr S. Mohan Kumaramangalam, Minister for Steel and Mines at a meeting of the Standing Committee of the Iron and Steel Advisory Council held in the capital on May 24, 1972.

According to Mr S. Mohan Kumaramangalam, the scheme of distribution of steel for house building by a joint committee of principal producers at Delhi was working satisfactorily and was by and large meeting the requirements of small house builders. The minister said that it was proposed to extend the scheme to some other big towns where house building activity was growing fast.

The minister informed the committee that at present about 70 per cent of the re-rolled products produced by registered billet re-rollers were allocated to the bulk consumers in the government priority sectors. The balance of 30 per cent was sold through the stockyards to genuine private citizens for house building purpose, small-scale industries, traders etc. About nine per cent of the total production of billet re-rollers was allocated to trade.

In regard to the supply of raw material to small-scale re-rolling mills, the Minister said that there was adequate re-rolling capacity already existing in the country and the

state governments were asked to discourage setting up of new units in the field. In spite of this clear warning many units had come up. As a result of this the share of each individual unit from the available raw materials has come down.

On a suggestion that the import of re-rollable scrap should be allowed, the minister said that the bulk import of re-rollable scrap was not practicable due to foreign exchange constraints. However, the minister said that with the release of about 150,000 tonnes of used rails, the raw material requirements of scrap re-rollers would be considerably met.

Pyrites Production

Pyrites, Phosphates & Chemicals Limited, a public sector undertaking under the Ministry of Petroleum & Chemicals, had developed Amjhore mines in Bihar for the production of 400 tonnes of pyrites per day. This was stated in the annual report of this undertaking which was engaged in the exploration of pyrites deposits of the country for the manufacture of sulphur and sulphuric acid.

The first phase of the Amjhore Mining Project was completed in March 1969 and during 1970-71, 35,000 tonnes of pyrites ore was produced. The ore was being mainly consumed by the Sulphuric Acid plant at Sindri.

The Fertilizer Corporation of India was setting up one more sulphuric acid plant at Sindri, which was expected to go on stream in 1973-74. When this plant is commissioned the requirements of pyrites from Amjhore will go up to 420,000 tonnes per year. The undertaking was accordingly drawing up a project report for necessary expansion of production from Amjhore.

PPCL had also taken in hand exploratory drilling for the development of pyrites deposits in Saladripura in the Sikar District of Rajasthan and investigations through drilling

and geological studies were in progress.

The company was also implementing the Rock Phosphate Mining Project at Maldeota in Uttar Pradesh. Geological investigations in the area had established an ore reserve of 7.25 million tonnes of rock phosphates. Mining operations were being undertaken in accordance with the demand for low-grade ore. The possibility of utilising Maldeota rock phosphates for the manufacture of superphosphates and as a diluent in the manufacture of calcium ammonium nitrate was also under examination.

Postal Life Insurance

The Posts and Telegraphs Department has decided to issue non-medical policies up to the value of Rs 3,500 from June 1, 1972. The facility will be available to those employees whose age at the time of getting an insurance policy does not exceed 28 years.

The total number of Postal Life Insurance policies in force on March 31, 1971 was 2,54,252 against 2,34,249 a year earlier.

During the year 1960-71, 25,498 new policies for a total sum assured of Rs 9,64,16,700 were issued against 23,872 policies for Rs 8,92,39,500 in the previous year. The number of policies went up by 6.81 per cent in one year and total sum assured by 8.04 per cent.

Names in the News

Mr C. R. Rao has taken over as Director General of Civil Aviation in place of **Mr G. C. Arya** who retired from service on May 25.

Mr C. R. Rao who was Joint Director General in the Department, has represented India at a number of technical conferences of the International Civil Aviation Organisation. In 1959 he was appointed as the principal training adviser and head of the ICAO technical assistance mission at Djakarta, Indonesia.

In 1963, **Mr Rao** was appointed as ICAO representative for the middle east and east African region accredited

to all the states in the middle east and eastern Africa with office in Cairo. In 1965, he was Civil Aviation Adviser and head of another large ICAO technical assistance mission in Saudi Arabia.

Mr R. D. Shah and **Mr R.P. Nevatia** were elected President and Vice-president of the Cement Manufacturers' Association for 1972, in Bombay on May 20. Those elected to the managing committee were:

Mr J. R. Birla, **Mr P. N. Bam**, **Mr N. H. Dalmia**, **Mr J. H. Dalmia**, **Mr V. L. Dutt**, **Mr A. K. Jain**, **Mr K. C. Jain**, **Mr K. N. Mehta**, **Mr K. N. Misra**, **Mr. P. K. Mistry**, **Mr S. P. Sinha**, **Mr. M. Somappa**, **Mr B. D. Somani**, **Mr N. Srinivasan** and **Mr J. N. Tewari**.

Mr Ram Lal Kapoor, General Manager of the Railcoach Division of Bharat Earth Movers Limited is the recipient of the Sir Walter Puckey Indian Prize for 1970. The Puckey award is presented for significant contribution to production engineering in India.

A mechanical engineer, **Mr Kapoor** is associated with the Railcoach Wing since 1964. Some of the 'firsts' to his credit include direct induction into the army as Lieutenant Colonel; first Indian Chief Production Engineer of HAL and one of the key persons involved in the production of the Gnat aircraft. As Managing Director of BEML for a brief spell he initiated the manufacture of heavy earth moving equipment in the country.

Mr Anand Prakash Kapur was elected President and **Mr S.C. Kadakia**, **Mr M. P. Choudhury**, **Mr M. B. Sivasani** and **Mr Singaram** were elected Vice-presidents of the Federation of Paper Traders' Associations of India at its annual meeting held recently in Madras. **Mr R. M. Gandhi** was elected Secretary and **Mr J. S. Shah** Treasurer.

Mr S. Y. Ranade has been appointed Chairman of the Board of Trustees of the Bombay Port. He succeeds **Mr Govind H. Seth**.

COMPANY AFFAIRS

Larsen & Toubro

LARSEN AND Toubro Ltd has received the consent of the Controller of Capital Issues to issue shares and bonds to the shareholders of Canara Bank Ltd in terms of the merger scheme. The consent marks the last step in completing the amalgamation of Canara Bank Ltd with Larsen and Toubro Ltd. According to the merger scheme, each holder of five shares of Canara Bank Ltd will receive eight L and T equity shares, three 9.5 per cent cumulative redeemable 'A' preference shares of Rs 50 each, five eight per cent convertible bonds of Rs 22 each and one eight per cent redeemable bond of Rs 85. Under the scheme of amalgamation, Larsen and Toubro will receive about Rs 3.05 crores from Canara Bank Ltd. The shares and bonds issued will be entitled to dividend and interest on a pro-rata basis for the period October 1, 1971 to March 31, 1972, since the amalgamation is effective retrospectively from October 1, 1971.

Indian Rayon

Indian Rayon Corporation proposes to extend the time limit of its 18,480 (ten per cent) redeemable cumulative preference shares of Rs 100 each bearing the distinctive numbers from 66,521 to 85,000 by a further period of three years. As per the terms of the issue, these shares issued in 1965, are redeemable on expiry, seven years from their date of allotment. These shares are mainly held by the Gujarat State Financial Corporation which has already consented to the extension of the time limit for the redemption of these shares to a date not later than June 11, 1975. The company has not earned enough profits for the

last several years so as to provide for redemption of these preference shares. In the existing circumstances it is also not possible for the company to make a fresh issue of shares for the purpose of redemption. It is therefore felt necessary to extend the date of redemption. According to the management's expectations a further period of three years for the purpose is considered to be appropriate.

National Rayon

The nylon tyre cord project of the National Rayon Corporation has been cleared by the Department of Company Law Affairs under Section 21 of the MRTP Act. The capital cost of the project has been estimated at Rs 7.14 crores while working capital requirements have been placed at Rs 1.20 crores. The foreign exchange content of the project is around Rs 163 lakhs—Rs 127.87 lakhs for machinery and Rs 34.88 lakhs for know-how and engineering fees. The company has entered into a collaboration agreement with Chemtex Fibres Inc. of New York for the supply of know-how and for providing engineering services outside India. The Chemtex Engineering Company of India Ltd, Bombay, are the principal consultants for rendering services in India.

The company has already purchased about 90 acres of land adjoining the present factory at Kalyan for putting up its plant. The plant will have a capacity of 2200 tonnes per annum. As there is at present an acute shortage of nylon tyre cord, marketing of the product will not pose any problem to the company when the plant is commissioned. When the plant starts operating at the full rated capacity,

the return on block investment after allowing for depreciation on machinery and buildings is expected to be about 20 per cent i.e. Rs 1.46 crores.

G.E.C.

The board of directors of General Electric Company of India Ltd has decided to increase the unissued authorised capital by an issue of 11,61,500 new equity shares of Rs 10 each at a premium of Rs 6.50 per share. Out of this issue, 262,500 equity shares of Rs 10 each at a premium of Rs 6.50 per share will be offered as a rights issue to those shareholders who are residents in India and whose names appear in the register of the company as on May 31, 1972 in the proportion of one new equity share for every two shares held. Apart from this 27,875 shares will be offered to the employees of the company who are Indian nationals at a premium of Rs 6.50 per share. The balance of 871,125 shares of Rs 10 each will be offered at the same premium to the public.

News and Notes

Expansion and Diversification

National Organic Chemical Industries' (NOCIL) plans to increase the production of ethylene have advanced a step further with the grant of a foreign exchange loan of Rs one crore to import the necessary furnace. The company hopes to commission this additional naphtha cracking furnace of a high ethylene yield in early 1973. This will increase considerably the company's production of ethylene which is presently below the licensed capacity of 60,000 tonnes a year. The company expects to achieve the rated capacity by 1973 in an

effort to meet the rising demands from the markets.

Devidayal Cable Industries Ltd is diversifying its activities by entering into the field of electronics, which being virtually a virgin field in India holds out great promise and handsome returns to the company. It has already received a letter of intent to manufacture 30,000 tape recorders a year. It has also applied for permission to manufacture electronic desk-top calculators and hopes to secure it soon. The company has purchased 11 acres of land at Bangalore to set up this electronics complex. It proposes to enter into a collaboration agreement with Vidyut Research Co. Pvt. Ltd, an Indo-American venture, which has already developed a prototype of electronic desk-top calculator. The project, which is expected to cost about Rs 25 lakhs, will be financed from internal sources and borrowings. Besides the company plans to venture into the manufacturing of diamond wire drawing dies with foreign collaboration. It has already secured a letter of intent to manufacture 2500 dies per annum. Apart from making dies available to ferrous and non-ferrous wire drawing industry, it will reduce company's cost of dies, thereby making its products more competitive.

Dunlop India has commenced production of tyres for the giant Boeing 747 planes at its Sahaganj factory in West Bengal. This is the first time that these tyres of highly sophisticated types are being manufactured in the country. The tyres made by Dunlop India are capable of taking a load of 20,910 kgs. and are cleared for running at a speed of 362 kilometres per hour. The initial supply of Dunlop tyres will be delivered to Air-India shortly. These tyres are being manufactured entirely by Indian technicians on the basis of the technical know-how received from Dunlop Ltd, UK.

Modella Woollens has obtained a letter of intent for setting up additional capacity of one million lb of wool tops at its Chandigarh unit and is

awaiting the licence for the import of capital goods. Meanwhile construction of buildings necessary for the installation of the balancing equipment and expansion has been taken in hand. The working of the Chandigarh plant showed a distinct improvement over last year and the management expects production to be maintained during the current year as well. In January last, the company received an import licence for Rs 18.67 lakhs for certain balancing equipment which would enable it to achieve the existing licensed capacity of the wool top unit. Orders are being placed and the machinery is expected to be received towards the end of the year. Arrangements have also been made for the indigenous machinery required for the purpose.

With the commissioning of M.G. Machine Straw Products Ltd has completed the first phase of its expansion scheme. The second stage of the expansion programme is expected to be completed by the third quarter of 1972. There is also a scheme for increasing the annual capacity for paper by 3,000 tonnes and for boards by 2,000 tonnes. A letter of intent for producing of 3,000 tonnes of paper has recently been received and for financing the expansion programme as well as escalation in cost for the projects in hand the company proposes to issue 55,000 (9.5 per cent) preference shares of Rs 100 each at par to the public.

New Venture

Fairbanks-Morse India Ltd, a new Indo-US venture, has been promoted to undertake the manufacture of a wide range of turbines, special pumps and other types of highly sophisticated equipments. The company which holds a licence for manufacturing 4,000 pumps per year is setting up a factory near Delhi. The plant is expected to go on stream by about the middle of this year. Starting with 2,000 pumps in the first year, the production is likely to reach the licensed capacity within three years. The promoters are hopeful of ex-

porting pumps worth about Rs 15 lakhs to south-east Asia in the first years itself. The company has an authorised capital of Rs 1 crore. Out of the proposed issued capital of Rs 40 lakhs, the foreign collaborators will take about Rs 14 lakhs and shares worth Rs 10 lakhs will be offered to the public.

New Issues

Sakthi Sugars Ltd entered the capital market on May 29 for mobilising resources of the order of Rs 28 lakhs in equity shares of Rs 10 each for Rs 21 lakhs and in cumulative redeemable preference shares of Rs 100 each for Rs 7 lakhs. The preference shares will be carrying an interest of 9.3 per cent per annum. The promoters, directors and their friends have agreed to take up equity shares worth Rs 10 lakhs. The balance of Rs 11 lakhs in equity shares of Rs 10 each and the entire preference capital of Rs 7 lakhs are being offered to the public for subscription for cash at par. The list will close on June 16 or earlier but not before June 14, 1972. The public issue is fully underwritten. The company which has been steadily increasing the crushing capacity, — almost doubled to 2,500 tonnes daily in the past five years,—extending the area under cane and improving its quality, is currently engaged in the construction of a distillery at Sakthinagar, near Erode, adjacent to the company's sugar factory. The capacity of the distillery, which is expected to be in operation shortly, will be of the order of 9.09 million litres per year. Molasses, the essential raw material, will be met from its sources to the extent of 25,000 tonnes while the balance of 15,000 tonnes will be secured from other sugar factories in the neighbourhood. The cost of the project is estimated at Rs 75 lakhs including the working capital of Rs 5 lakhs.

Shalimar Paints Ltd is offering for public subscription 3,70,530 equity shares of Rs 10 each for cash at par. The subscription for the fully underwritten issue opens on June 5 and will close on June 14 or

earlier but not before June 7. The issue is being made to raise Indian participation in the company's equity share capital from 16.25 per cent to 40 per cent. The proceeds will be utilised in enlarging the business activities of the company. The company which was the first large-scale unit to be established in the paint manufacturing industry, has steadily expanded its manufacturing activities and to-day it is a leader in its field. Its plant situated at Goabaria near Calcutta has an annual installed capacity of 14,210 tonnes and is producing currently a very wide range of sophisticated paints, pigments, resins, varnishes, oils and other allied products. The company's sales which were Rs 5.24 crores in 1969 increased to Rs 5.91 crores in 1970 and further to Rs 6.13 crores in 1971. Its pre-tax profit in 1971 was Rs 31 lakhs and there are firm indications that the pre-tax profit for 1972 will exceed definitely those for 1971. On this basis an equity dividend of not less than eight per cent is expected to be paid for the current year. The new equity shares will be entitled to a pro-rata dividend from July 1, 1972.

Parikh Engineering and Body Building Co is setting a most modern body-building factory at Adityapur, the newly developing suburb of Jamshedpur, for manufacturing different kinds of automobile bodies. In the first year of its operation the company intends to manufacture 400 bus bodies and raise the capacity progressively to 1500 bodies per year. To raise resources for financing this project, the company is offering for public subscription 100,000 equity shares of Rs 10 each and 4,000 (9.5 per cent) redeemable cumulative preference shares of Rs 100 each for cash at par. The subscription list opens on June 6 and will close on June 16 or earlier but not before June 9. The entire amount for equity and preference shares should be paid on application itself and the applications are to be made for a minimum of 50 equity shares or multiples thereof and for a minimum of five preference shares or multiples thereof.

The capital outlay on the project is estimated at Rs 40 lakhs. It is proposed to be met from the proceeds of equity capital of Rs 19 lakhs and preference capital of Rs 6 lakhs, including shares subscribed by the directors, promoters and their friends and from bank borrowings amounting to Rs 15 lakhs. In view of the ever-increasing need of the automobile industry for the products proposed to be manufactured by the company, a ready market is expected for its products.

ModiRubber Ltd which holds an industrial licence for the manufacture of four lakh tyres and tubes annually is setting up a plant near Meerut, UP. The plant is being designed to process 16,000 tonnes per annum of rubber compound into finished tyres and tubes. When the plant starts operating at the full rated capacity, it will be producing annually five lakh tyres and tubes. It has entered into a technical collaboration agreement with the Continental Group of West Germany. It is heartening to note that the company had been given the right to use Continental's horse brand mark as a registered user. To raise resources for implementing this project the company will be entering the capital market towards the end of June with a public issue of Rs 2.95 crores in 29,50,000 equity shares of Rs 10 each at par. Out of the public issue of Rs 2.95 crores, shares worth Rs 2.65 crores have been underwritten while for the remaining share capital of Rs 30 lakhs the promoters have guaranteed to take up such portion of the shares which have not been subscribed to by the public. The total cost of the project is placed at Rs 18 crores which will be met by the share capital of Rs 6 crores and loans from financial institutions of Rs 12 crores. The company expects to commence production in 1974.

Jotindra Steel and Tubes, Delhi, is issuing shortly to the public for subscription 2,10,000 equity shares of Rs 10 each and 1,00,000 (9.5 per cent) redeemable cumulative preference shares of Rs 10 each, both at par. The proceeds of

he issue will be utilised for financing partly the project to manufacture black steel and galvanised pipes and tubes with a capacity of 8,000 tonnes per annum. The company has set up a factory near Faridabad and the first line for the manufacture of black pipes of diameters 2.5 inches to six inches was commissioned towards the end of last year. Trial runs were successfully completed in February and production on a commercial basis was started subsequently. During the year ended March 1972, 5,000 tonnes of black and galvanised pipes were produced. The second line of production for manufacturing 0.5 inches to 2.5 inches is in the process of implementation. Barring unforeseen circumstances the management hopes to complete this phase in the course of this year and thus achieve a substantial portion of its licensed capacity besides crossing the break-even point. The project will involve an outlay of Rs 1 crore and it will be met by the share capital of Rs 15 lakhs and term loan from the IFC of Rs 55 lakhs. The directors are hopeful of declaring a reasonable maiden dividend for the year ending March 1973.

The Surat Electricity Company Ltd is offering for public subscription 50,000 (eight per cent) convertible debentures of Rs 100 each at par for cash payable in full on application. Debenture holders will be entitled at their option to convert, during the financial years ending March 31, 1976 and 1977, 22 per cent of their holdings into fully paid equity shares of Rs 100 each at a premium of 10 per cent of the nominal value of shares i.e. in the ratio 10 fully paid equity shares of Rs 100 each for 11 fully paid debentures of Rs 100 each. The subscription list for the fully underwritten issue opened on May 29. It will close on June 13 or earlier but not before May 31, 1972. The proceeds of the issue will be utilised for financing capital expenditure on power distribution facilities within the licensed area of supply of the company and for repayment of loans.

* * *
The eight per cent convertible

bonds of the **Standard Mills Co Ltd** for Rs 2 crores which opened for subscription on May 24 have been over-subscribed and the subscription list was closed on May 27.

The recent public issue of 1,20,000 equity shares of Rs 10 each by **Chemopulp Tissues Ltd** had been over-subscribed. Hence the subscription list was closed on May 25. The list for preference shares was, however, kept open till May 27.

Licences & Letters of Intent

The following licences and letters of intent were issued under the Industries (Development and Regulation) Act 1951, during the two weeks ended February 25, 1972. The list contain names and addresses of the licensees, articles of manufacture types of licences—New Undertakings (NU); New Articles (NA); Substantial Expansion (SE); Carry on Business (COB); Shifting—and annual installed capacity.

LICENCES ISSUED

Ferrous Industries

M/s Bhagwati Foundries Limited, Odhav Road, Ahmedabad-21. (Ahmedabad-Gujarat)—1. S. G. Iron castings—200 tonnes p.a. 2. High Duty Cast Iron Castings including Alloy Iron Castings. 1080 Tonnes p.a. (COB); M/s India Engineering & Construction Co. Ltd, 24/42, Birhana Road, Kanpur. (Uttar Pradesh)—Steel tubular poles of various types—39,000 Tonnes p.a. (after expansion) (SE); M/s Sakbry Engineering Corporation, C-3, Clive Building, Netaji Subhas Road, Calcutta. (Kamarhati-Calcutta - West Bengal)—Steel pipes & Tubes—22,000 Tonnes p.a. (after expansion) (SE).

Fuels

The Director (Technical), National Coal Development Corporation Ltd, Darbhanga House, Ranchi. (Gorbi Colliery-Dist. Sidhi—Madhya Pradesh)—Coal—1 Million

tonnes p.a. (NU).

Money in International Trade

Reviewed by
Academicus

Theory of International Trade and Money: U.N. Ghosh; S. Chand & Co. (Pvt) Ltd, New Delhi; 1972; Pp 180; Price Rs. 20.

Power Development in India: K. Venkataraman; Wiley Eastern Private Ltd, New Delhi; 1972; Pp 166; Price not given.

Financial Appraisal of Farm Investment: Bombay Agricultural Refinance Corporation; Pp 180; Price Rs 10.

International Trade and Development: Indian Institute of Foreign Trade, New Delhi; 1972; Pp 358; Price Rs 25.

Deposits with Non-Banking Companies and Monetary Policy: Mohandas Saravane; Thakar & Co. Ltd, Bombay; 1972; Pp 88; Price Rs 15.

Personal Taxation in India: O.P. Chawla; Somaiya Publications Pvt Ltd, Bombay; Pp 242; Price Rs 20.

Most theorizing on international trade even today is mainly in terms of the Ricardian comparative advantage which basically refers to a static or stationary condition. According to Dr Ghosh in his *Theory of International Trade and Money* the most baffling factor in the movement of international trade has been money. Is it controlled by real economic movements or does it control the movements of real factors? The Ricardian theory and the subsequent refinements kept money out as it were of real economics and thus introduced an ambiguity that has persisted throughout. Even at present foreign exchange rates are for all practical purposes treated separately from real trade movements. The author therefore rightly feels that the role of money in international trade should be re-investigated and "the significance of international money and finance re-discovered so that the duality of pure theory and monetary theory is removed."

vital requirement

In his thesis the author maintains that there is much talk about prices and exchange rates but very little about the role of the monetary and financial relations that is so important for trade. International finance is treated as a system outside the trade in goods and services. Yet international investment and financing of current trade are vital for international trade. What these have to do with prices and exchange rates are matters that need investigation. Obviously the international or common money (gold) has something to do with the international trade equilibrium in most theoretical analysis;

but the author rightly maintains that the gold exchange standard conceals and even distorts the role of the common money and financing for the simple reason that except for a few currencies, none are convertible even externally into gold and none probably maintains any relation between declared gold parities and internal prices. This divorce between external and internal values of money creates many distortions.

confidence crisis

The author has emphasised that the only reason why nations of the west and rest of the world keep to the gold exchange standard is that they cannot think of anything better. There is no immediate prospect of the abandonment of the gold exchange standard for it has been woven into national prestige and power. And yet we all know that the gold exchange standard is not only unstable but is also subject to repeated confidence crises.

The proposal for a common currency is often made, debated and laid aside. The difficulties are magnified because in the IMF most nations hold shares not only in gold but also in national currencies. This implies that national currencies are not intended to be suppressed. But the author has rightly emphasised that unless there is a common currency, not only the exchange rate crises will continue but the threat to liquidity of international reserves will not vanish. The tyranny of established ideology is always very great, especially when it suits national interests of some rich and powerful nations.

And therefore if the world economic

development and common market are to become real, new approaches instead of purely national approach will be necessary for "the sum of the nations does not amount to the world nor the economic systems add up to the world economy. "The introduction of a common currency will go a long way towards the rearrangement of national economies on the basis of real interdependence based on international division of labour and economic movements of capital and technology to the best advantage of all. For the ultimate effect of international trade should be the growth and development of the world economy and not merely of some national economies. The author has concluded that the way is unknown and hard; but it must be found out and adventured into.

The world has been repeatedly experiencing foreign exchange crises and there is no doubt that the existence of different national currencies and manipulation of exchange rates have very much distorted the quantum and pattern of international trade and hence of international division of labour. And yet our national proclivities are very powerful and one wonders whether in the near future most nations would agree to the substitution of international monetary standard for national currencies. And yet the world must move in the direction of a common currency if the world economy as a whole is to progress for the benefit of all mankind. The Special Drawing Rights Scheme is an extremely tentative step in that direction.

Dr Ghosh though thinking much ahead of his times has put forward in a very convincing way the case for a common currency. It is a provocative book ably written. It is rarely that Indian economist venture into theoretical field, much less into the formulation of new theories. Dr Ghosh has made an attempt to do it and has done it fairly satisfactorily.

Power Development

Power Development in India is the first book to deal with the financial aspect of this subject.

In an underdeveloped country electricity and transport are the two major consumer of capital in early stages of development. Electricity is one of the essen

ial ingredients of development and investment in power generation which is an important overhead should receive due consideration. What is more, power generation, transmission and distribution constitute an important public sector industry in India in which since 1950-51 about Rs 4000 crores have been invested. The lion's share of power generation in India is handled by the electricity boards established by various states. The finances of the electricity boards therefore ought to constitute an important area of public sector financing. It is only in recent years that there is a growing recognition that the finances of electricity boards constitute a major area of study. Naturally such a study of the finances of electricity boards ought to cover not only the methods of financing capital programmes but also the composition of their operating revenues as well as the operating expenses, provision for depreciation, payment of interest, repayment of loans and so on.

another dimension

There is another dimension to the problem. Brunt of the responsibility of power development in India has fallen on the shoulders of the states. The state finances in India have tended to exhibit a fundamental disequilibrium arising out of the distribution of powers and financial resources. Power development has been the major recipient of capital assistance given by the centre. These loans constitute a topic of current debate on central assistance to states. The problem of repayment of these loans by states is a major one, since the states pass on these loans to the electricity boards. Electricity financing in India has therefore a major dimension in the shape of centre-state financial relations. This aspect has however not received due attention either.

Another dimension to the financial problem of power development is added by the fact that power generating machinery requires a good deal of foreign exchange. Aid has been received from various countries for power stations in India and the terms of such aid have varied. This means that as the equipment has come from different countries, at least to some extent, power generation in terms of maintenance problems is tied to particular countries. Also, closely related to the dependence of foreign equipment so far is the question of the indigenous manufacturing capacity which is being developed in India. Two public sector companies with a total investment of Rs 250 crores have been set up for the manufacture of heavy electrical equipment. Apart from manufacture of generating equipment, the process of generation and distribution of electricity is supported by a whole host of electrical engineering industries. Here-

in lie some aspects of the inter-industry implications of power development.

In addition to the above financial issues, there are many other problems that have to be studied. The cost of generation of power and its transmission and distribution constitutes one area of study; the economics of rural electrification is yet another area. The cost of hydro and thermal power generation and the choice between them, the economics of composite irrigation and power projects are other issues. Then there is the economics of construction, transmission, distribution and maintenance and the optimisation of load utilisation. The advent of nuclear power also brings to the fore the economic problems of nuclear power development. Since the future trends and costs of power generation and distribution are a matter of great importance to the nation, the author has made an attempt in this book to study some of the financial problems such as the finances of the electricity boards, the tariff policies, the centre-state dimensions of electricity financing and the relation between foreign aid and electricity development.

scope for improvement

After analysing some of the above problems, the author has come to the conclusion that there is definite scope for improvement at various levels — operational, administrative and policy-making. For long, according to the author, there has been an absence of concerted thinking on the financial aspects of power development and considerable damage has already been done. In such a context, substantive and sustained improvements are called for and would need to be implemented with a sense of urgency and direction. According to the author the scope for improvement exists both by way of cost reduction as also optimisation of revenue. The working of the electricity boards in the past has been marked in most cases by bad management, poor load development and huge transmission losses, not merely due to technical defects but also due to undetected pilferage. Obviously the running of these boards has not been treated as a business proposition. What needs to be done immediately is that there should be a critical review by each state government of the working of the electricity boards followed by infusion of new and modern methods which would enable these boards to function in an efficient manner as commercial corporations and not merely as government departments. It is gratifying to note that at least some electricity boards are taking steps in this direction and especially in respect of load development and load dispersal which have important financial implications.

The author has drawn attention to an-

other important aspect. He is of the opinion that little or no attention has been paid so far to tackle the problem of load dispersion in the sense of flattening the peak demand. The demand for more and more power should be met not merely by more and more generation but by a policy of power load dispersion. Considering the need to disperse the load, it may be worthwhile for the electricity boards to adopt special measures to induce consumers. For example, no attempt has been made to provide electricity for tube wells and irrigation wells at night (i.e. off peak period) which may be offered at low rates. Once the electricity boards begin to exercise their minds vigorously on the subject, it is possible that various measures for improvements can be thought of. Transmission facilities would be an important means of load development which so far has been met only by generating more power. The investment made in transmission and distribution during the first three plans has been considerably less than proportionate to investment in generation.

Another policy aspect is the 'mix' of hydro and thermal schemes. Thus the Power Economy Committee has suggested that for some time in the past there has been a bias in policy towards thermal stations which needs to be corrected in coming years. The author has rightly stressed that at any given time the most economic sources have to be tapped.

nuclear power

As regards the question of nuclear power in India, there is the financial and economic aspect. But the arguments for and against the introduction of nuclear power programme are for all practical purposes unnecessary since already Tarapur Power Station has begun functioning and two more power stations in Rajasthan and Madras are under construction. Though one school maintains that India is undoubtedly on the right side in this respect as nuclear power stations are stationed in places where hydro power is not readily available and coal has to be carried over long distances, the fact remains that in regard to nuclear power generation, other than strictly financial considerations are involved. But the author maintains that we have not so far had sufficient evidence to judge whether the decision to introduce nuclear power has been right in financial terms.

All this is sufficient to highlight the fact that the future power programmes have to be carefully drawn and implemented, keeping in view the financial aspects. According to the author the benefits of better financial management should first of all go to relieve the state governments who are bearing indirectly the financial consequences of ill-planned power development

and distribution. If all these problems would be successfully tackled, a very significant area of infrastructure development would have been covered for the greater benefit of the entire Indian economy.

One some times wonders how the important problem of the economics of power development remained untouched for so long. It is therefore extremely heartening that K. Venkataraman has broken new ground and has successfully drawn attention to some of the financial aspects of power development programme. He may not have suggested the solutions to all the problems referred to above, but to have drawn attention to the problems is in itself a significant service for which the author deserves compliments.

Farm Investment

The participation of co-operative central land development banks and commercial banks has been growing not only in the sphere of agricultural credit projects but also in the financing of agricultural investments generally. The Bombay Agricultural Refinance Corporation therefore felt that some method of assessing the financial feasibility of each loan would be useful to the co-operative and commercial bank officials connected with the problems of agricultural finance. It was felt that it would provide guidelines for them since there is nothing at present to fall back on. It is impossible to over-emphasise the importance of these guidelines and hence the importance of *Financial Appraisal of Farm Investment*.

Though the guidelines have been drawn up to facilitate the appraisal of six of the most common farm investments (namely construction of dugwells and tubewells, setting up of river lift irrigation units in private and co-operative sectors, conversion of existing wells into dug-cum-bore wells, land shaping under canal systems, installation of pump-sets on existing wells and purchase of tractors), according to the author, they can be used with suitable modifications for the appraisal of other farm investments as well.

It is rightly insisted in this book that for initiating appraisal work, each bank should have at its disposal services of technical staff including agricultural economists, irrigation engineers and hydrogeologists constituting a small technical division stationed at the head offices of banks but capable of doing a great deal of field work. The Bombay Agricultural Refinance Corporation may have to help the banks in this endeavour.

As regards the main aspects of appraisal work the publication says that financial appraisal of a farm investment may be said to refer to "the profitability of the particular investment in terms of benefit

i.e., incremental income and cost." When a bank considers financing a project, it has to satisfy broadly the points of view of the financing bank itself as also of the cultivator. From the cultivator's point of view an investment proposed by him would be worthwhile if the benefit expected from the investment throughout its useful life will exceed its cost. From the bank's point of view the financing of the same project would be worthwhile, if the incremental income therefrom is adequate to enable the cultivator to pay back the loan, together with interest within the prescribed period and leave some surplus income to the cultivator.

As regards loans, the primary consideration which weighs with the bank is the need to balance the maturities of their borrowed resources such as time deposits and debentures and secondly the need to achieve quick turnover. It is insisted that the determination of the amount of investment loans by banks be fixed in the light of estimated investment cost and the contributions (down payment) they expect from the borrowers towards the investment cost. The determination of the size of the contribution by borrowers may be guided by factors such as "the borrowers' financial position, their capacity to contribute labour required for construction works, the desirability of borrowers having a personal stake in the investments and the need for banks to spread their resources widely among farmers." The rate of interest should be fixed from time to time having regard to cost which the banks have to incur on raising time deposits and debentures, administrative expenses, considerations of profitability and related factors.

capacity to pay

According to the thesis put forward in the book, the financing of an investment is worthwhile for a bank, if the annual income therefrom is expected to suffice for meeting the annual repayment instalment of the investment loan and leave some surplus with the farmer, i.e. to put it differently the investment should generate adequate capacity to pay.

Co-operative and commercial banks have been since recently undertaking in a big way provision of finance for agricultural investment. Unfortunately they have had no concrete guidelines. It is therefore very opportune that the Bombay Agricultural Refinance Corporation has brought out this booklet providing detailed guidelines. If the financing banks familiarise themselves with these guidelines as also with local agricultural conditions and the position of each individual borrower, there is no doubt that these guidelines will serve a useful purpose. Within the broad framework, financing

banks can introduce much sophistication and refinements. There is so much of variation in Indian agricultural conditions that it will almost be impossible to reduce them to any standardised categories. And yet when thousands of borrowers' applications are to be dealt with, the financing banks will have to devise some standardised forms and measures for appraisal work. The schedules provided in his book are comprehensive enough for fairly satisfactory financial appraisal work.

This pioneering work in the field of financial appraisal of loans to agriculturists should be a boon to the financing bank officials who are at present groping in the dark which explains the big arrears of agricultural loans granted and high proportion of bad debts.

Trade and Development

It was extremely appropriate and imaginative on the part of the Indian Institute of Foreign Trade, New Delhi, to have brought out *International Trade and Development* which contains resolutions, declarations and decisions of UNCTAD I and UNCTAD II as also other relevant papers such as Lima Declaration and the provisional agenda for UNCTAD III on the eve of the meeting of the UNCTAD III during April 13 — May 17, 1972 at Santiago in Chile. The session of the UNCTAD III has just ended and it would therefore be instructive to look back to see what all the UNCTAD is intended to achieve.

There are all the important documents connected with the United Nations Conference on Trade and Development (UNCTAD). There is the original resolution passed by the nineteenth session of the General Assembly establishing the UNCTAD, realising that "international trade is an important instrument for economic development." In view of the subsequent developments and especially what is happening at the UNCTAD III, it is amusing to note the objectives contained in the provisions. The aim of the UNCTAD is stated to be to promote trade between countries at different stages of development with different social and economic systems with an aim of helping the developing countries. The original document contains all the details regarding Trade and Development Board, its composition, functions, voting, financial arrangements and future institutional arrangements.

The original document is followed by the Charter of Algiers adopted by the ministerial meeting of the Group of 77 on October 24, 1967. This charter drew attention to the fact that the lot of more than a billion people of developing countries continues to deteriorate as a result of the trends in international trade, that while

developed countries are adding annually approximately 60 dollars to the per capita income of their people, the average increase of per capita income in developing world amounts to less than two dollars per annum, that the share of developing countries in total world exports declined from 27 per cent in 1953 to only 19.3 per cent in 1966, that the purchasing power of exports from developing countries has been steadily declining, increasing the indebtedness of developing countries, external public debt alone increasing from 10 billion dollars in 1955 to \$40 billion in 1966, that since UNCTAD I, no new commodity agreements on primary products of interest to developing countries have been concluded, that standstill arrangements have not been observed by developed countries, that fiscal charges continue to be levied on products of export of interest to developing countries, that proliferation of synthetic substitutes in developed countries has resulted in shrinking markets and falling prices for competing natural products of developing countries and that instead of unanimously agreed target of one per cent of gross national income to be given as aid to developing countries, actual disbursements have levelled off in absolute terms and declined as a percentage of gross national product from .87 in 1961 to .62 in 1966. In view of all this the charter decided upon a programme of action regarding commodity policy, trade liberalisation, synthetics and substitutes, general system of preferences, trade with socialist countries, development finance, problems of external indebtedness, shipping and so on. Reading this Charter of Algiers after about five years one wonders at the naive faith which the developing countries then had in the developed countries. It was the honeymoon period of foreign assistance.

greater realisation

We then get the resolutions, declarations and other decisions taken at UNCTAD II in March 1968. There was by now greater realisation on the part of all the delegates that international trade is a hard bargaining proposition and yet there was almost the same repetition of the same old platitudes regarding commodity agreements, trade liberalisation and one per cent aid and so on. The insincerity of the developed countries was almost palpable and as is well-known resulted in the resignation of Dr Prebish, the Secretary General of the UNCTAD immediately after the end of the session of UNCTAD II in New Delhi. Like the various agencies of the United Nations, developing countries began to realise what UNCTAD was really worth.

This document is followed by the document regarding the international development strategy for the second United Na-

tions 'Development Decade' beginning from January 1, 1971. There is again dedication by governments to the fundamental objective of the Charter of the United Nations to create conditions of stability and well-being and to ensure a minimum standard of living for all. There is the declaration of the goals and objectives of at least six per cent growth rate (four per cent in agricultural output and eight per cent in manufacturing output), raising the rate of domestic saving to about 20 per cent of domestic product by 1980 and seven per cent increase in exports. The policy measures are again decided upon expressing more wishful thinking totally unrelated to the prevailing realities.

This is followed by the document relating to the Declaration and Principles of the Action Programme of Lima, adopted by the Group of 77 at the second ministerial meeting on November 7, 1971. Lima Declaration is nothing but a repetition in milder form of the Charter of Algiers. Possibly there was now greater awareness of the hard headedness of the trading developed countries and their psychological inability to get over things to which they have become accustomed for more than 200 years.

routine debating

The UNCTAD III was again asked to go through the routine of debating on issues such as international trade principles conducive to development, impact of regional economic groupings, trade and economic aspect of disarmament, impact of present international monetary situation, special measures for the least developed countries, export promotion, financial resources for development, development of shipping, transfer of technology and so on and so forth. The UNCTAD III met for 37 days and disagreed practically on all issues passing only one unanimous resolution on aid to 25 least developed countries!

Holding of the sessions of the UNCTAD every third year has become a sort of routine devoid of the former enthusiasm and hope. The proceedings of the UNCTAD III have been reported in most papers including *Eastern Economist* and one was not surprised to note that if previously there used to be disagreement between developed and developing countries on various problems, this time there was a tendency on the part of the 77 to fall apart on various issues. This should not come as a surprise, for UNCTAD cannot be different from its parent body, the UNO. The various documents in this book make declarations of pious intentions, the attitude of the delegates of developed countries characterised by insincerity and hypocrisy and of the developing countries by naivety and ig-

norance of realities. One thing that stands out clearly after reading all the documents in this book is that the developing countries will have to stand on their own legs to the maximum possible extent and that there should be more co-operation among themselves before they begin to talk of co-operation among developed and developing countries.

Deposits with NBC

It is observed that deposit mobilisation from the public has come to stay as a preferred form of finance by an increasing number of non-banking companies (NBC). This new development in the domain of finance and of monetary policy creates a pressing need to elucidate the place and significance of deposits with NBC in monetary analysis. In *Deposits with Non-Banking Companies and Monetary Policy* Dr Saravane has made an attempt 'at providing a framework for the analysis of the role of such deposits in the monetary mechanism, the transmission of loanable funds and the financing of NBC.' He has also made an attempt to evaluate the effects of various types of regulations on the financial activities of NBC introduced by the Reserve Bank.

The author has arrived at some very obvious conclusions after a great deal of seemingly complex analysis. According to him deposits with NBC emerge as near-money substitutes in the assets portfolio of the household sector. From the standpoint of NBC, these deposits are to some extent the most 'illiquid' among their debt liabilities. Non-Banking companies mobilising deposits from the public function as financial intermediaries in the market for loanable funds and their financial activities which generate liquidity can have marked influences on both the income velocity of money and the velocity of current deposits with banks. The author feels that the NBC may become competitors of importance to banks in the field of mobilisation of deposits from the public in future. The competitive position of banks in their lending activities may be impaired as NBC may get money directly from the public instead of from them as before. As regards rates of interest, the author feels that the imposition of ceiling on lending rates of banks by the Reserve Bank reduces the ability of banks to compete effectively with NBC in mobilising deposits through offer of competitive rates of interest. The author also finds that debt finance is preferred (as compared with equity finance) by NBC on account of its being easily available and that too at relatively cheaper rates in the context of the existing corporate tax policy.

The author is of the opinion that regulations of 'deposit-accepting' activities of

NBC are called for out of consideration for the effectiveness of monetary policy and to safeguard depositors' interests. Indirectly such controls may even help NBC to maintain sound financial position. The author feels that the nature of some regulations is such that much of their potency may be lost in their implementation as the present regulations have enough loopholes. Further, by providing incentive of liberal development rebate allowance, pressure can be eased on ceiling limit imposed by the Reserve Bank on the acceptance of deposits from the public in the case of all non-banking non-financial institutions. However the author is not very sure and feels that the overall effectiveness of the regulations of the Reserve Bank can be ascertained only over a length of time as their full impact may be felt only after sufficient lapse of time.

The analysis in this book is extremely superficial and the conclusions arrived at are the quite obvious ones. The style of the author is extremely laboured. He has certainly failed to bring out the implications of deposit-acceptance by NBC for monetary policy. Here is a problem that needs systematic and detailed investigation by a competent monetary theorist.

Personal Taxation

If the main objective of national socio-economic policy is to realise rapid economic development along egalitarian lines implying fair distribution of economic gains and enlargement of economic opportunities for all, the primary task of tax policy is to wrest from the low-income low-output economy the maximum possible resources for economic development. The author of *Personal Taxation in India* has made an attempt to assess the impact of various direct taxes in India and has also made a number of suggestions with an aim to realise the objective of more effective mobilisation of resources for accelerating economic growth.

As regards income-tax, the author is of the opinion that there is no doubt that the scope of taxable income has been widened by extensive inclusion of income-in-kind, taxation of capital gains since 1956, treatment of capital receipts in substitution of a source of income as income, extension of the principle of constructive realisation and so on. There are, according to the author, however still a number of very significant categories of income (agricultural income, gifts and bequests) which due to constitutional, traditional and other reasons are still outside the ambit of central taxation. Their exclusion seriously hampers equity and also leads to inequalities in income and wealth.

As regards capital gains tax introduced

in 1947, the author feels that the comparatively small coverage of capital gains indicates avoidance and evasion on a very large scale.

In respect of expenditure tax introduced in 1958 (and abolished in 1966), the author believes that there were serious defects in the structuring of this tax which hampered its normal operation. Also, due to administrative machinery and its deficiencies, the reintroduction of this tax has not been suggested at present.

Wealth tax was introduced in 1957 to reduce, in combination with the income-tax, inequalities in income and wealth and to make the personal tax structure more equitable. To this end, it underwent amendments many times, the major onslaught being on its rate structure which has now attained the position of being the highest in the world. The desirable results, according to the author, do not however seem to have been realised because of large scale income and wealth splitting and use of other methods of avoidance.

Similarly the estate duty has not achieved its aim of deeply cutting into the property transferred from one generation to another because of various tax avoidance devices now in use as also because of the loopholes provided in the law itself. As regards gift tax, the author is of the opinion that it was never integrated with other direct taxes, not even with the estate duty.

The author has made a number of useful and practical suggestions in view of the fact that the personal tax structure has so far failed to achieve the major objectives before it.

The author is of the opinion that there is a need to review the whole question of constitutional allocation of tax powers between the centre and the states as the existing division of tax bases is a source of

perpetual conflict between the centre and the states. He further feels that gifts and bequests should be treated as income of the recipients, those made within the family being ignored. Capital gains should be fully assimilated in 'income', re-investment of capital gains being promoted by incorporating a tax-free roll-over provision. According to the author, the only effective method of preventing large-scale tax avoidance through manipulation of tax unit is to treat the family (single household alone as the tax unit under the personal tax laws.

Looking to the experience in the past the author strongly feels that there is a need to forge a legislative process through which proposed tax changes should pass with a view to insulating the tax structure against the vicissitudes of the personal whims of changing finance ministers so as to impart it stability and certainty. Tax proposals must pass through a parliamentary sub-committee (with a research wing manned by tax experts) which should arrange public hearings and invite memoranda before making its recommendation to Parliament.

There is no doubt that personal direct taxation in India is in a chaotic state. It was more than 15 years ago that a comprehensive review of the Indian tax structure was carried out by the Taxation Enquiry Commission. Since then the tax system has undergone revolutionary changes much beyond those contemplated by the TEC. The present and the future requirements for financial resources for economic development are enormous while the tax system has been stretched beyond capacity at many points. It is therefore felt that a second taxation enquiry commission be appointed by the government to carry out a comprehensive and critical survey of the entire Indian tax system.

Guidelines for Export Trade

Getting Started in Export Trade: Edited by Miss O. Mary Hill; printed and published by M.M. Sharma for Graphicarts Consultants, B-1/40, Hauz Khas, New Delhi-16; sale of copies by Export Development Services, G-44, Green Park, New Delhi-16; Pp 316; Price Rs 35 inclusive of postage and packing.

Reviewed by S. P. CHOPRA

This book was originally printed by the International Trade Centre UNCTAD/GATT, Geneva, and was priced at US \$20. The Indian edition at almost one-fourth the price has been made possible by special arrangements with the International Trade Centre.

The book is divided into four parts and 21 chapters. Part I discusses the elements of getting organized in export trade such as choosing an export market, direct and

indirect export selling, selecting and encouraging agents and drawing up agency contracts. The specimen of contract forms will be found extremely useful for all those companies which take to this business for the first time. Part II deals with various ways to expand the volume of export operations such as drafting of business letters, personal visits to foreign countries and participation in fairs. Even such trifling matters as politeness, precision, promptness and perseverance in business

letters have been given sizeable importance. The points to be borne in mind while choosing an advertising agency, the importance of public relations, advertising through various media and other usually neglected aspects have received detailed attention. Part III centres on pricing policy and trade terms, marine insurance, finance and credit and the barriers to foreign trade. The emphasis is on import duties imposed by different countries on various commodities and the preferential treatment accorded by some nations to certain products and groups of countries.

Reviewed by B. GANAPATHY SARMA

Manorama Year Book bears its own individuality and distinction. As an year book it is exceptionally different from other year books. Detailed discussion, comprehensive coverage, unique presentation and distinctive style are some of the salient features which mark it out significantly from the usual run of year books. But the special significance and perhaps the chief merit of the publication is that every subject is treated in the form of an article giving a general outline followed by critical comments which no doubt provide excellent background information to the reader on every subject. Besides exhaustive treatment, massive statistical and economic data have been packed into this handy compendium which makes it extremely interesting and quite informative.

Keeping in view the multiplying needs of the readers the publishers have paid special attention not only to cover as wide a range of topics as possible but also to cover in depth all the information. A cursory glance of the synopsis will convince the reader of the vast multitude of topics covered in the year book which in their range may simply be termed as encyclopaedic. The topics are surveyed in five sections. The world and outer world — 'Space' — are dealt with in the first two sections. The third section on 'India' presents a panoramic view of modern India in all its aspects. The states and the union territories, their economic programmes, budgets and other topics of current interest have also been dealt with in great detail. This is followed by the 'Sports and Games' section which covers, among others, Olympic games,

The last chapter discusses documentation i.e., the various documents which "must accompany every export shipment".

The chief merits of the book are the lucidity in expression and the exhaustive treatment given to the art (is it a science?) of exporting. This is a necessary publication for all exporters in this country as it gives ample background information which, however, will need to be supplemented with details regarding the rules and regulations governing exports in our country as well as in the importing countries.

Commonwealth games and Asian games. The last 'General' section has been completely overhauled and it has added to its fold several new features such as international system of units, standard time, progress of science, abbreviations and sobriquets. An atlas and a special feature on Indo-Pakistan war and the new state of Bangladesh have been included to make the publication most up-to-date.

Such wealth of data on India, the world and the outer world has rarely been so systematically assembled and nicely presented in an year book. Considering the rich information it gives there is no doubt this encyclopaedic work will serve as an indispensable and invaluable book of reference to busy executives, journalists, research scholars and university students in particular and educational institutions in general.

Data on Research Centres

Compilation of data regarding the activities of research centres is indeed a gigantic and arduous task. The Information Research Academy has ventured into this unexplored region and has brought out recently its magnificent *Directory of Economic Research Centres in India* which is a very welcome and precious addition to the literature on economic research. In this pioneering attempt the Academy has attempted to give detailed information about 250 economic research centres including departments of universities, colleges and other educational institutions, both government and non-government, and the government departments where research on economics

and other allied fields are carried on in one form or the other. Research efforts by individual research scholars, informal groups and teaching departments are, however, not included in this directory.

Full information regarding research works already completed in different centres during the period 1966 to 1971 is provided in the directory but in the case of the National Council of Applied Economic Research, the premier research institution in the country, the entire information about all the research studies carried out from its inception has been incorporated. Data regarding researches which are still in progress or will start in the immediate future have also been included in the directory with added advantage.

With the existing ones expanding their research activities and the new centres entering the field, it is quite possible that some research centres may have been left out due to lack of information. To bridge this gap the Academy has decided to bring out supplements, the first one being published shortly. These supplements will carry only those information not provided in the directory.

By assembling all precious data in a handy compendium the Academy has made a notable contribution to the advancement of economic research in the country. The research scholars and institutions can now know each other's subject of pursuit and field of investigation and thus avoid duplication of efforts. It is all the more necessary in order to conserve our research potential and make it to produce the maximum possible results. In short the Academy has fulfilled a long-felt need in the country by bringing out this valuable publication which will serve as a reliable guide and book of reference to scholars, institutions and other organisations which are engaged in economic research and other allied activities.

ALUMINIUM IN CONSTRUCTION & STRUCTURAL USES

For Building & Construction, HINDALCO offers Semi-fabricated aluminium products (sheets and extruded shapes) in a wide range to suit diverse jobs. High strength-to-weight ratio and low maintenance costs make Aluminium the ideal choice of modern builders and architects. Besides, for making buildings cool in summer and warm in winter, aluminium panels are being increasingly used today in modern sky-scrapers. HINDALCO Semi-fabricated products are so versatile that they can be used in making almost anything, from landing mat for Aeroplane in an emergency defence purpose to drainage culverts in farms for Agricultural purposes.

MODERN BUILDERS SPECIFY HINDALCO ALUMINIUM.

CEAT TYRES OF INDIA LTD.

Highlights of the Speech made by Mr. P. A. Narielwala, Chairman of Ceat Tyres of India Ltd., at the 14th Annual General Meeting on May 18th 1972.

For your Company, the year 1971 was a significant year. Our expansion programme was completed in early July, somewhat ahead of my own anticipation, and before any of the other tyre companies had completed theirs; the additional plant and equipment went into production without any significant teething troubles; and we received full co-operation from labour and all other employees in the completion of the expansion and in our operations. The result has been a substantial improvement in the Company's output of automotive tyres, from 4,83,544 units in 1969 to 7,24,265 units in 1971 (the figure for 1970 was only 3,70,410 units due to the strike), and a handsome growth in its profits as the shareholders must have noticed from the Directors' Report and the Profit and Loss Account for the year 1971.

With the plant continuing to run at more than its full capacity during the first four months of the current year, and a ready off take of the entire output, the shareholders may look forward to another successful and profitable year. With the constant stress that management has laid on the maintenance of quality control at every stage of production, your Company's products continue to enjoy a ready market both domestically and abroad.

As mentioned in the Directors' Report, our Bicycle Tyre plant at Nasik will be ready to go into production during the

second half of the current year. The civil construction work is expected to be completed before the onset of the rains. Machinery for the plant including the imported items are already at the site. If the quality of the tyres coming out from trial production is up to our satisfaction, "CEAT" bicycle tyres will be in the market during the last quarter of the year.

Supplies of natural rubber were available during the year freely, but the rubber growers in Kerala have been bringing considerable pressure upon the Government of India to compel the automotive tyre industry to carry a larger inventory of rubber than is warranted for its requirements. Some surplus stocks had accumulated on account of reduced off take by some of the units in the industry which have suffered or continue to suffer from a drop in their tyre production from prolonged strikes and slow downs. We are of course co-operating with Government in carrying 3½ months stocks of rubber but a large inventory inevitably puts a burden on our financial resources.

The supplies of other raw materials are on the whole adequate, but the tendency on the part of the suppliers to resort to unilateral increases in prices is a matter of concern to us. We are unable to pass on to the consumers the increase in the direct material cost of our products, as the

selling prices of tyres are regulated by Government and cannot be altered without consultation with them. The industry has on several occasions drawn the attention of Government, but there has been no response. We have recently seen newspaper reports that the Government of India has decided to enforce the three year old recommendation of the Tariff Commission that the rayon tyre cord manufacturers should reduce their prices, but no official communication has been received by the Tyre Industry.

The exports of tyres in 1971 were a record for the automotive tyre industry amounting to Rs. 706 lakhs. Your Company's exports amounted to Rs. 209 lakhs. The Company has more than fulfilled the guarantee given by it to Government of exporting 10% of its total production.

Although the performance of the Industry in exports is commendable, it is necessary to sound a note of caution that it may no longer be possible for the industry to maintain this tempo of progressively higher exports. This is because most of the developing countries to which we export, are establishing their own tyre plants and which would lead to a reduction in the exports and secondly, because of the changes which the Government of India brings about in its export Policy. From many forums and on many occasions the exporters have urged Government to follow

a stable export policy and if a change is desired by Government it should have prior consultation with the exporters or the industry as the case may be. Unfortunately this advice is not heeded and when a sudden change is brought about, it only leads to disruption in exports and hardship to the exporters.

Recently Government has chosen to drastically reduce the duty drawback on nylon tyres with retrospective effect from 1st January 1972. The industry's commitments and contracts for exports are made months in advance and as the change in duty drawback was imposed without any prior consultation with the industry, the exports which have been so assiduously built up over the past few years are likely to be affected during the current year. The industry has made a suitable representation to Government against this change and has called for a review of Government's policy.

Furthermore, in the new import policy for 1972-73 announced recently, the import entitlement for nylon cord has been substantially cut, we believe, as a result of the representation of two indigenous manufacturers who have recently gone into production of nylon tyre yarn and cord. These manufacturers have claimed that they have the capacity to cater to the entire demand for nylon cord of the tyre industry. Whilst we welcome the establishment of this

new industry in India, for which we have been pleading for the last few years, we doubt whether the two producers can meet the industry's needs. At present, the quality of only one manufacturer has come up to the tyre manufacturers' satisfaction after many trials and assistance from the tyre industry. The other manufacturer is still in a trial stage of production and his samples of cord have so far been found to be below the quality standards of the industry. It will be therefore hazardous for the tyre industry to depend on its requirements of nylon cord on only one manufacturer. As more than 80% of the exports from India are of nylon tyres, the reduction in import entitlement of nylon cord might also lead to a further fall in the exports of tyres in the current year.

I had referred, last year, to the large numbers of Letters of Intent issued by the Government of India to State Industrial Development Corporations for setting up new automotive tyre factories in the country. I had expressed a fear that many of them might not fructify into industrial licences. Our fears have turned out to be true as only one letter of intent has been converted into an industrial licence so far. We do not see any tangible steps taken by the other parties to obtain industrial licences.

Whilst the present licensed capacity in the automotive tyre industry is about 5.2 million units, the capacity installed at the end of 1971 was for only about 4.8 million units. The production during 1971 reached 4.64 million units, an increase of 620,000 units over the production of 1970. Assuming that the full licensed capacity will be installed during the current year and some of the units which suffered in their production last year from labour troubles, power cuts, etc., would be able to utilise their capacities better, the production of tyres in 1972 is estimated to reach 5.5 million units. We therefore do not anticipate any shortage of tyres during the current year except in few truck tyre sizes.

But the shortage is likely to arise in 1973 and will be felt more strongly in 1974, unless steps are taken to license additional capacities.

Our own application submitted to Government, last September, for a licence to establish a new automotive tyre factory for producing 400,000 tyres per annum in an underdeveloped area of one of the States, is still under Government's consideration. We live in hopes that it will be favourably viewed and a licence will be issued to us at an early date. As it takes anything between 24 and 30 months to install a new plant and put it into production, there is not much time left for Government to come to a decision and permit the existing units to expand and/or license new units.

At the Extraordinary General Meeting of the Company held in November last, there was a note of pessimism amongst some of the shareholders about the likelihood of a glut in the production of automotive tyres in the country and a caution to the Board about venturing into further expansion of our capacity. I had then assured the shareholders that the demand for tyres would continue to grow both in the domestic and export markets. We are also of the view that a small surplus in the licensed capacity of the industry is desirable as it will serve as a safeguard and a cushion against plant stoppages and a recurrence of shortages. If our application for a new factory is approved by Government, I can assure the shareholders that we will take urgent steps to proceed with its erection and to go into production as soon as possible to meet the growing demands of defence, road transport organisations, O.E. users and our other valued customers for our products.

Note:

This does not purport to be a record of the proceedings of the Annual General Meeting.

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

Stain-proof, easy to clean and polish, Linoleum comes in a wide range of colours and designs. Choose yours.

RECORDS AND STATISTICS

Wholesale Prices

The sub-group index for 'milk and milk products' advanced by 0.5 per cent to 215.8 due to a rise in the prices of ghee. Lower prices of all the edible oils brought down the sub-group

index for 'edible oils' by 2.0 per cent to 197.0. The index for 'fish, eggs and meat' sub-group stood at 202.5 as against 202.8 for the previous month. The sub-group index for 'sugar and allied products' stood at 232.0 as against 231.7 for the previous month. The prices of sugar and khandasari rose while those of gur declined. The sub-group index for, 'other food articles' recorded a fall of 0.2 per cent to 160.9.

Liquor and tobacco

The index for 'liquor and tobacco' moved up by 0.6 per

cent to 203.0 due to an increase in the prices of tobacco raw.

Fuel, power, light and lubricants

The index for this group remained unchanged at its last month's level of 175.2. The price of castor oil, however, registered a fall during the month.

Industrial raw materials

Lower prices of cotton raw brought down the sub-group index for 'fibres' by 1.9 per cent to 177.4. The prices of jute raw and mesta, wool raw and

silk raw, however, advanced. The sub-group index for 'oils seeds' declined by 3.5 per cent to 201.4 owing to a fall in the prices of all the oilseeds except castor seed which moved up. The sub-group index for 'minerals' remained unchanged at its previous month's level of 141.5. The sub-group index for 'other industrial raw materials' stood at 174.6 as against 174.5 for the previous month.

Chemicals

The index for 'chemicals' group registered a fall of 0.6 per cent to 198.0 as against 199.1 for the earlier month due to lower prices of nitric acid and copper sulphite. The prices of sulphuric acid, how-

ever, moved up.

Machinery and transport equipment

The sub-group index for 'electrical machinery' advanced by 0.2 per cent to 163.1. The index for 'non-electrical machinery' sub-group recorded a rise of 0.3 per cent to 171.0 due to a slight increase in the prices of machinery other than electric. The sub-group index for 'transport equipment' stood at 146.4 as against 146.2 for the previous month.

Intermediate Products

The index for 'intermediate products' rose by 0.7 per cent to 205.1 as against 203.7 for the earlier month due to higher

prices of rayon yarn, coir yarn, leather, zinc and tin. The prices of lead and linseed oil, however, registered a fall.

Finished Products

Higher prices of cotton manufacturers (mill made cloth) (+0.6 per cent to 163.8), jute manufacturers (+4.9 per cent to 211.8), silk and rayon manufacturers (+1.2 per cent to 130.6) and woollen manufacturers (+0.2 per cent to 194.4), raised the sub-group index for 'textiles' by 1.7 per cent to 172.4. The sub-group index for 'metal products' worked out to 182.8 as against 182.7 for the earlier month. The sub-group index for 'non-metallic products' advanced by

0.7 per cent to 154.0 as against 152.9 for the earlier month due to a rise in the prices of bricks and tiles. The sub-group index for 'chemical products' recorded a rise of 0.2 per cent to 151.6 as against 151.3 for the previous month due to an increase in the prices of essential oils. The indices for 'leather products', 'rubber products', 'paper products', and 'misc. products' remained unchanged at their last month's levels of 98.0, 157.3 135.7 and 123.9 respectively. The sub-group index for 'oilcakes' receded by 3.5 per cent to 179.4. On the whole the index for 'finished products' moved up by 0.7 per cent to 164.4.

An approach to an approach

THE PAPER presented to the National Development Council on behalf of the Planning Commission, which has been entitled "Towards an approach to the Fifth Plan" obviously begs to be excused from detailed or even serious consideration. It is primarily yet another political document, not essentially different from the election manifestos of the ruling party which are now attempted to be carried in the form of a little green book in the person certainly and the conscience possibly of our new breed of congressmen. The effort which the Minister for Planning, under the watchful eye of the Prime Minister, has made to dress this political document up in pseudo-economic jargon only succeeds in exposing the intellectual dishonesty of the powers-that-be.

Such is the naked and unashamed opportunism of the authors of this approach to an approach to a fifth Plan that they have not hesitated to foul their own nest in the grossest manner possible. The Paper starts with the lie that "in elaborating our strategy of development in the earlier Plan documents, we seem to have assumed that a fast rate of growth of national income will by itself create more and fuller employment and produce higher living standards for the poor". From this point onwards, lie is piled upon lie until a Himalayan structure of falsehood and prevarication is built up. Apart from the fact that there is a snide attempt here to denigrate the concept of economic growth, partly to suit the political convenience of the ruling party and partly to play down the gravity of its failure to achieve sufficient expansion of economy, there is also the wholly inexcusable insinuation that the previous Plans did not care for the socio-economic objectives, which are relevant to the all-round progress of our people.

Whether Mr C. Subramaniam & Co. have a short memory or not they certainly have a convenient one. Evidently in their desire to please the daughter they are only too willing to be less than fair—if this is necessary—to the father. Ever since Jawaharlal Nehru had anything to do with economic planning or the five-year Plans he and, under his leadership, his associates and advisers, whether in the government or in the party, did emphasize at every stage the need for development being directed towards increasing employment or raising the consumption levels of the poorer, the weaker and the vulnerable sections of the community. While it is true that there has been general dissatisfaction in the nation with the pace of growth of the economy it has nevertheless been felt by the people in their bones that, over the last thirty five years or more, there has been gradual amelioration of the living conditions of the poor of this land. The present Paper of the Planning Commission itself has been forced to concede that the "proportion of the poor, defined as those living below a basic minimum standard of consumption has slightly come down".

If more has not been achieved in this direction it is basically for two reasons. In the first place population has continued to grow and secondly, around the middle of the sixties, the administrative competence of the government to maintain the tempo of economic development had begun to break down. This was largely due to the fact that the economy was becoming over-regimented through the proliferation of the 'licence-permit Raj' which was steadily corrupting business and government and paralysing private enterprise. This unfortunate development was disagreeably reinforced by the growth of the public sector involving the wasteful use of scarce financial and physical resources. In the latter sixties and down to the present time, the progress of the economy has been slowed down further because economically irrelevant, but politically paying passions and prejudices have been deliberately cultivated and imported into the framing or application of the government's economic policies.

Since this is the objective background to our current problems of planning, it is apparent that the lot of the poor is not going to be improved appreciably merely by the politicians in power formally mouthing new incantations of welfare economics. Whether we consider the employment-oriented programmes listed in the Paper or the priorities of public consumption catalogued therein, we must surely realize that they are basically schemes of expenditure. Unless they are related to investment programmes which, in turn, are geared to certain capital output ratios, they will have no more worth than toy balloons sent into the air. To argue, as the Paper does, that poverty could be significantly reduced in a shorter time through redistributive policies, is an exercise far less innocent than it seems, since to try to treat as a matter of secondary importance the issue of economic growth in a country of mass poverty is not cleverness but low cunning of a kind which, it is to be hoped, will be self-defeating. Given the continuing growth of the population and the arrears in development occasioned by the administrative breakdown and the political opportunism of the government over the last seven or eight years, only an accelerated rate of economic growth in the period that lies ahead can create conditions in which schemes intended to reduce the rigours or the extent of mass poverty can hopefully go to work.

No 'heil' to HEIL

A RECENT advertisement released by Heavy Electricals (India) Ltd. (HEIL)—a public sector undertaking—states that its output since inception has been of the order of Rs 158 crores and that its production in 1971-72 at Rs 32.76 crores was higher by five crores of rupees over its output in 1970-71. The major accomplishments of HEIL, according to the copywriter, included three hydro power stations, two thermal power stations, over 230 diesel electric locomotives, three out of every four suburban trains operating in Calcutta area, one out of every four suburban trains operating in Bombay area, main steam turbines for propelling Indian navy ships and 120,000 kw steam turbine generator. This is indeed a formidable list of achievements but it has to be read with the 19th report of the Committee on Public Undertakings (CPU) if a full and true picture is to be obtained.

The CPU has not minced words in declaring that gross mis-management, lack of planning and absence of co-ordination of activities have resulted in the accumulation of losses up to Rs 58.97 crores at the end of 1970-71 as against HEIL's paid-up capital at Rs 50 crores. The CPU is naturally perturbed over this grave financial position of the undertaking and has urged that "it should improve its financial position by greater utilisation of its capacity, effecting maximum economies and review of its pricing policy".

Most of HEIL's customers were and continue to be government or semi-government undertakings. It was, therefore, not necessary for this undertaking to incur losses year after year as it could review its pricing policy taking into account all the elements in its cost structure. However, it is never too late to learn from past errors. The advice of the CPU that HEIL should review its pricing policy has pertinent relevance though this measure alone would not put an end to and its troubles. It is necessary that steps should be taken to increase the utilisation of machine capacity. The present "Job Card System" which records the work put in by a worker is defective and does not give a true picture of the working of machines. The CPU has rightly suggested that the "machine hour utilisation system" should be introduced in the undertaking because then alone it would be possible for the management to estimate the extent of under-utilisation of machines.

As far back as 1956, the consultants

had indicated in their report that HEIL's annual output would be worth Rs 12.5 crores of rupees on single shift basis. A decade later—in 1965-66—the total production of the undertaking was Rs 10.14 crores only. Again, it was in April 1966 that the management of HEIL had estimated that on attainment of full rated capacity the value of annual production would be Rs 33.65 crores. The undertaking had not attained this level even in 1971-72. The actual performance has thus shown a wide gap between target and achievement year after year.

In an undertaking of the size of HEIL, detailed planning for a period of four or five years is absolutely essential. This is not impossible to achieve especially because, as stated above, the undertakings which place orders on it are by and large in the public sector. The CPU noted during its examination of HEIL's affairs that different sections of the unit had orders for varying periods with the result that some sections were bound to remain idle if adequate arrangements were not made in time. The explanation put forward by the Ministry of Industrial Department that it was difficult for HEIL to keep track of all individual orders because it had to follow up the production of 500 individual items, did not satisfy the CPU; hence the recommendation that "integrated and detailed planning" of the working of HEIL should be ensured.

Not only has HEIL shown lack of foresight; it has even failed to streamline its working operations so as to deliver equipment to its customers on schedule. The blame for these failures is however passed on by HEIL to foreign and indigenous suppliers of castings and forgings. After analysing the data put before it, the CPU has come to the conclusion that the completion of six hydro projects and three thermal projects in the country has been delayed or would be delayed due to HEIL's non-adherence to delivery schedule. This has shifted back the generation of power equipment to nearly 1,425 Mw. If this dismal performance of the undertaking is due to sheer negligence and carelessness in planning its affairs, then its shift from the Ministry of Industrial Development to the Ministry of Irrigation and Power—as suggested by the CPU—will be of little use.

The sloppy manner in which HEIL is being run is evident from the treatment meted out to instructions issued by the Bureau of Public Enterprises (BPE) regarding the purchase orders. The instructions issued by the BPE in January 1969 were received by HEIL in August, 1969

i.e. after seven months. The CPU has not made it clear as to who was responsible for this delay. One more year passed in seeking clarifications and another seven to eight months in putting them before the board of directors for obtaining a decision. Surely, it is this lack of a sense of urgency which has made HEIL one of the most inefficient undertakings in the public sector. The BPE also should see to it that instructions issued by it are followed by the undertakings.

The undertaking suffers from gross mis-management. This is evident from the fact that on the one hand it has a heavy inventory and surplus of stores while the delay in the manufacture of equipment is often attributed to want of raw materials. The CPU found that the value of non-moving stores (those which had not moved for two years or more) at the end of 1970-71 was Rs 115.20 lakhs and the value of surplus stores as on March 31 1969 was valued at Rs 61.36 lakhs. Obviously no effort has been made in working out a relationship between this undertaking's inventories and its schedule of production. Also, the maintenance of records in respect of inventories was found to be defective as "value of raw materials and components not processed or consumed at the end of the year but issued to workshops were shown as work in progress". The CPU is right in holding that this procedure gives a misleading picture about the level of inventories.

The failure of HEIL (and also of Bharat Heavy Electricals Ltd) has caused great anxiety to the heads of the State Electricity Boards (SEBs) who assembled recently in the capital to chalk out a programme for the fifth five-year Plan. They expressed their dissatisfaction with the working of both these public sector undertakings to which they had been tied. Besides clearing a backlog of 500,000 kw for 1971-72, the SEBs had been urged by Dr K. L. Rao, union Minister for Irrigation and Power to build up generating capacity of the order of 1.9 million kw in 1972-73 and to make preparations for additional 21.8 million kw in the fifth five-year Plan period. In view of the poor performance of the public sector units, they appealed to the government to allow import of equipment wherever the indigenous manufacturers were not in a position to supply the equipment. Such imports would no doubt be a burden on our foreign exchange reserves for which the responsibility must rest on undertakings such as the HEIL which are consistently failing to deliver the goods.

Planning the steel map

THE statement in Parliament by Mr Mohan Kumaramangalam, union Minister for Steel and Mines, that it would be advantageous to give priority to the expansion schemes of the existing steel units instead of concentrating on the construction of entirely new plants was construed for a time as suggesting that there might be soft pedalling of the construction of the Vijayanagar and the Vishakhapatnam steel plants. That this was not the government's intention was subsequently clear from the statement by the same minister that the Salem steel plant may be ready by 1977-78. While this schedule may not be adhered to, there is the likelihood of this project being completed by the end of the fifth Plan. Mr Kumaramangalam, was making the earlier observation as it was demanded in Parliament that new steel plants should be established in Madhya Pradesh and Orissa which had all the facilities for such new units. The cost of new steel units will necessarily be more than that involved in expansion schemes as the mining facilities already exist and transport arrangements have to be only augmented. There will be no need for constructing housing colonies in a big way while excess capacity may exist in some departments.

It is no surprise, therefore, that the cost of new construction is nearly double that of expansion schemes. In the case of Bokaro particularly, the low cost of expansion is mainly due to deliberate heavy expenditure incurred, in the first phase, on the lay-out of the plant which was intended to facilitate future expansion and public memory is always short. In fact, it had been emphasised by experts that it would not be advisable for this sophisticated plant to continue to operate on the basis of a capacity of 1.7 million tonnes of ingots as heavy losses would have to be incurred and the break-even point may not be reached until a capacity of 2.5 million tonnes was achieved. In view of the need to eliminate losses and secure a higher level of production within a short period, there will necessarily have to be continuous expansion of the Bokaro unit until the four million-tonne and even the 5.5 million-tonne stage as it has been emphasised that the cost of additional capacity will be cheaper than in the case of new units. The government has rightly decided to accord higher priority for Bokaro's expansion though there may be difference of opinion over the conception of the project and the blueprint for a lay-

out which has compulsion about expansion in a big way resulting in the shutting out of other projects.

A similar approach also is being adopted in the case of Bhilai with greater justification and the capacity of this unit is being raised to four million tonnes from 2.5 million tonnes. While the compulsion and the desirability of expanding capacity of these two units were never in doubt what is really sad is the fact that no attempts have been made so far to expand the capacity of the two private sector units, which are the only steel plants functioning on a sustained profitable basis in spite of many handicaps. The government is culpable for not thinking of expanding the capacity of these two units because of ideological inhibitions and has needlessly inflicted a heavy loss on the nation in the shape of lost and cheaper production because of lower capital cost. The expansion scheme of Indian Iron and Steel Company particularly for raising capacity by three lakh tonnes with a small outlay, which even on the revised basis works out to only a little over Rs 2,000 per tonne of capacity, has been needlessly delayed. It has now been indicated that this project is being taken up. While an early decision may be taken in this regard and the project implemented without any further delay, what is more important is the need for thinking on ambitious line so that between Tata Iron and Steel Company Limited and Indian Iron & Steel Company Limited there can be a doubling of capacity to six million tonnes. Mr Kumaramangalam has given enough indication to suggest that he is in favour of expanding the capacity of these units and some tangible proposals may be made in the coming months.

Besides the lower capital outlay on the expansion of TISCO and IISCO, what is more important in the present context is the need for a continuing rise in production in the coming years. There has been an awkward increase in consumption of steel laterally and with greater emphasis on exports of engineering goods, it may well happen that an increase in production, with better use of existing capacity and the implementation of expansion schemes of Bhilai and Bokaro, will take care only of the rise in consumption in the next three or four years and it will not be possible to reduce imports. It may not actually be possible to effect a reduction in steel imports in the current year as even with a higher output of 7.2 million tonnes of ingots, availability may fall short of actual demand. Internal consumption and exports may require additionally one million tonnes of finished steel while the increase in output will be only 7.5 lakh tonnes of finished steel. Since it is unlikely that the

two new steel units proposed to be located in the southern region will commence production before the commencement of the sixth Plan, some more expansion schemes have to be taken up immediately for preventing the emergence of acute scarcity midway through the fifth Plan.

It has been conservatively estimated that aggregate capacity will have to rise to 19 million tonnes of ingots by 1978-79. The actual need, however, may be much higher at 22 million tonnes. How can this capacity be achieved? The present capacity is nearly nine million tonnes while Bhilai and Bokaro will be adding between themselves 5.3 million tonnes of new capacity. Assuming that it will be possible to raise the capacity of Bokaro to only four million tonnes by the end of the fifth Plan, there will be an aggregate capacity of only 13.5 million tonnes. Even granting that Bokaro's capacity can be raised to 5.5 million tonnes by 1978-79, the total will increase to only 15 million tonnes. The expansion schemes of TISCO and IISCO have, therefore, to be accorded the highest priority even for attaining the Planning Commission's target of 19 million tonnes. As there may be a faster growth of demand once the desired momentum had been gained by the economy, the capacity of the Durgapur and Rourkela plants also have to be raised to three million tonnes each which will give an additional capacity of 2.6 million tonnes. The balance of 14 lakh tonnes can be expected to be made up by mini steel plants and other measures.

Mr Mohan Kumaramangalam should be aware of these compulsions and early decisions on expansion schemes may be announced. But it is clear beyond doubt that only expansion schemes can meet the growing needs of the country in terms of steel in the next seven years. There will also have to be perspective planning for the sixth Plan as in 1979-84 only new plants can deliver the goods. If there is to be a target of at least 30 million tonnes for 1983-84, it will have to be decided that three more units should be located in different parts of the country with an initial capacity of even 2.5 million tonnes each. A decision about two more new steel plants, one in Orissa and another in Madhya Pradesh, cannot, therefore, be postponed for long. It may even be necessary to erect a third new plant and fifth in the new series in order to broaden and disperse the base further and improve the stature of the industry. The steel map is becoming important and it should not happen that the country is caught napping when new trends in steel consumption assert themselves forcefully.

Unreasonable attitude of UPSEB

THE Planning Commission and the Central government have clearly told state governments to raise more resources to finance their respective plans, none of which can be described as being non-ambitious. But the same fervour seems to be lacking in their insistence on state governments refraining from certain actions which have the effect of sharply reducing revenue both directly and indirectly. Otherwise, it is difficult to explain the actions of the UP government and, more particularly, the UP State Electricity Board, which run counter to advices and suggestions from the government of India, the Planning Commission and the Tariff Commission, among others, in the matter of rates charged for electrical energy to a basic and strategic industry like the Aluminium industry. The question of electricity rates charged to the industry, in particular to Hindustan Aluminium Corporation Ltd (HINDALCO) *vis-a-vis* the rates charged by other states governments to aluminium companies in their states (*i.e.* outside the UP) accordingly figured prominently at the annual general meeting of Hindalco (held in Bombay recently).

Mr G. D. Birla, Hindalco's Chairman, explained at length the position in regard to power supply from the UP State Electricity Board (UPSEB). There is a long-term agreement between the company and the UPSEB which is, more often than not, ignored by the latter. Not only does the UPSEB charge to Hindalco by far the highest rates paid by any aluminium producer in India; it also does not supply the quantum of energy undertaken to be supplied under an agreement. The situation gets aggravated every year by the power cuts imposed by the UPSEB on some pretext or the other. If complaints are made to the Board, instead of referring the matter to arbitration as has been mutually agreed upon, the UPSEB serves notices threatening to cut off even this reduced supply. Similarly, the Board has refused to renew the agreement providing for the supply of additional energy in case of an emergency or shutdown of any of the Renu-sagar thermal units for repairs, forcing the company to move the High Court so as to ensure continuance of power supply. Again, for the efficient functioning of its own thermal units, Hindalco has to depend on coal supplied by the National Coal Development Corporation (NCDC)—

another Public Sector project—which not only supplies bad quality coal but even this supply is woefully inadequate. So it remains to be seen how far Hindalco's power problem would be mitigated by the new licence for additional power production which Mr Birla told Hindalco shareholders, the company is likely to get. Meanwhile, it may be noted, the government of the UP and the UPSEB have already issued letters of authorisation for expansion of the company's Renu-sagar power plant to take care of the permanent requirements of power for its proposed expansion of production capacity by a further 30,000 tonnes.

Normally, the cost of electrical energy accounts for a major portion of the cost of making aluminium. It is, therefore, a matter of concern to Hindalco that the rates of tariff for the power supplied by UPSEB under the Emergency Assistance Agreement, which are high enough as originally fixed, are proposed to be stepped up further. (These have actually been raised with effect from January 1, 1972, making the power cost even more prohibitive, but the company has contested the rise). Mr Birla indicated that this would lead to an increase of Rs 1.22 lakhs over the 1970 figure under this head. Even in regard to the supply of power to Hindalco pending the expansion of its Renu-sagar thermal Plant, after the UP government had agreed to charge at the rate of four paise per unit, the UPSEB has stalled it on the score that this rate is not profitable.

One is at a loss to account for this strange attitude on the part of the UPSEB in particular and of the UP government generally. It cannot be that these authorities are unaware of the importance of the aluminium industry, especially as it is now in demand more and more for defence uses. This apart, the state government ought to be really concerned about any setback to this industry—in its case Hindalco—as this would adversely affect employment in the state (currently, staff and workers in Hindalco number over 4,000) and also state revenues. For instance, if production in Hindalco goes down, the state's revenue by way of sales tax would also go down. Instead of giving all encouragement to an industry like this, as other state governments have been doing the UP government would appear to be adding to its burdens. No less a person than a central minister informed the Lok Sabha recently that, compared to aluminium industries elsewhere, the aluminium industry in the UP *i.e.* Hindalco, suffered from a difference in costs of production on account of electricity to the tune of some six crores of rupees.

No chairman of the board of directors

of a company would like to present poor results of working of an industrial unit under his charge, if he can. Before any shareholder could point out to this, therefore, Mr Birla himself said, in the course of his introductory remarks at the last annual general meeting of Hindalco, that he was rather disappointed at the poor results, although he was at pains to explain why this was so—"for reasons beyond our control". Among the major causes he listed were prohibitive cost of electrical power, reduced prices of aluminium, rise in raw materials prices, tax liability and provision for gratuity. But the veteran captain of industry that he is, he said he was undaunted and would "depend on our own efficiency" to maintain profits. "We are trying our best to economise". However, he added significantly, "where a plant is already working efficiently, there is little scope, if any, for economy". Even so, Mr Birla pointed to efforts being made in the direction, such as establishment of a Recovery Division to plug all loopholes wastage and setting up of an Economy Division to effect further economies where feasible.

Explaining why the cost of production of aluminium has gone up so much over the past year, Mr. Birla said this was primarily due to the increase in prices of power, aluminium fluoride, cryolite CP coke, caustic soda, hard pitch and soda ash (both imported and indigenous) and also the rise in costs of steel and spare parts. He also made the point that the public sector concerns were frequently raising the prices of items supplied by them, thereby dispelling the popular illusion that prices charged by public sector concerns are reasonably stable. This is rather disturbing, because, if prices cannot be held by the public sector units which have come to occupy "commanding heights" the prospects of the government being able to hold the price line would be bleak indeed.

The arithmetic of farm mechanization

L.R. Singh and J.P. Bhati

THE technological breakthrough in our agriculture has increased the farm income. The introduction of short duration high-yielding crop varieties is fast replacing locally adopted crop varieties and thus opens new avenues for following multiple cropping. This has not only led to increased employment of human and bullock labour but has also helped to create employment for the major part of the year for small and medium farmers. On large farms, on the other hand, this increased demand of human and bullock labour brought forth by new technology would tend to increase the demand for farm mechanization. Farm mechanization replaces human and bullock power in preparatory tillage and threshing operations and thus creates unemployment. However, it ensures the completion of these operations well in time on large farms. Also mechanization increases employment of human and bullock labour in operation like lift irrigation involving use of persian wheels and tubewell. Since the employment situation in the country is alarming, the unemployment creating aspect of mechanization may be socially undesirable but increased productivity of the land due to timely operations and multiple cropping may be an economically desirable preposition particularly on large farms. In this paper an attempt has been made to examine the impact of mechanization on human labour employment and land productivity and its value in the context of new agricultural technology.

The paper is based on the data taken from a study¹ conducted in Nainital Tarai and Baduan district of north-western Uttar Pradesh in 1967-68. The selections

1. Changing Agriculture and Rural life in a part of Northern India-Socio-Economic Behaviour of Progressive Farmers in North-West U.P., UP Agricultural University and Rockefeller Foundation Co-operative Project.
2. A farmer was classified progressive if he satisfied any three of the following criteria (1) having at least 30 per cent of his sown area under HYV, (2) having at least 20 per cent of his sown area irrigated, (3) having at least 20 per cent of his sown area chemically fertilized, (4) having owned means of irrigation (5) having one agricultural machinery as tractor, thresher, etc.

of farmers was made by following a four stage stratified sample design, with district as the 1st stage unit, development block within the district as the second stage, agriculturally progressive locality (gaon sabha) within the blocks as the third stage and farmers within selected localities as the fourth stage units. Two blocks in each district and 6 gaon sabhas in each block were selected. From these gaon sabhas all the progressive farmers and 10 per cent of less progressive farmers were selected. In all 245 progressive² and 158 less progressive farmers representing three size groups of holdings *viz*; small with less than 10 acres, medium between 10-30 acres and large with 30 acres and above were interviewed.

To examine the impact of mechanization on farm productivity and its substitution rate with labour, aggregate farm production function for the two groups of farm separately were fitted in the following form :

$$[Y = a x_1^{b_1} x_2^{b_2} x_3^{b_3} x_4^{b_4} x_5^{b_5}]$$

The variable included are:

Y =The total value of farm crop output in Rs 100

X_1 =Expenditure on bullock labour in Rs.
 X_2 =Expenditure on technology (HYV, fertilizer and irrigation) in Rs.
 X_3 =Expenditure on machinery in Rs.
 X_4 =Operated area in acres.
 X_5 =Expenditure in labour in Rs.

a is constant and $b_1, \dots, b_5$ are the regression coefficients of respective variables.

The examination of simple correlation matrices indicated the absence of multicollinearity in the data for both the equations pertaining to progressive and less progressive farms.

results and interpretation

Table I indicates that the adoption of mechanization is visible only on medium and large farms. As a result of increase in the level of mechanization as reflected through expenditure per acre on machinery, there is decrease in the level of expenditure on labour. This in turn reflects the emergence of unemployment as a consequence of increased mechanization.

TABLE I
Findings : Per Acre Level of Resource Use on Farms of North-West Uttar Pradesh : 1967-68

Type of farms	No.	Size of holding (acres)	Exp. on bullock labour (Rs) X_1	Exp. on technology (Rs) X_2	Exp. on machinery (Rs) X_3	Exp. on labour (Rs) X_5
Progressive						
Small	41	6.73	96.70	129.2	2.52	259.10
Medium	120	17.20	65.11	105.0	29.30	247.26
Large	84	60.40	24.18	106.9	57.00	182.41
Average	245	30.32	38.21	106.9	47.20	203.22
Less Progressive						
Small	64	6.72	76.87	38.2	3.10	218.27
Medium	82	15.54	48.07	29.4	7.30	169.27
Large	12	49.80	22.09	23.1	27.70	118.47
Average	158	14.58	46.70	29.4	12.00	165.18

(Technology is defined as a package consisting of the expenditure on high yield variety seed, irrigation and Fertilizer).

POINTS OF VIEW

However, if now agricultural technology is adopted as could be seen for progressive farms, mechanization would make it possible to grow more than one crop and could not only offset the unemployment effect of mechanization but also create additional employment opportunity on the farms.

From table II it is clear that except the bullock labour, the coefficients of all variables are significant statistically. The non significant coefficient of bullock labour could be contributed to its indivisibility. Also on less progressive farm the impact of technology is not significant statistically.

The marginal value products of technology, machinery and operated area are significantly higher than that of their respective acquisition costs on progressive farms which indicate the scope for increasing use of these resources to increase farm returns. On less progressive farms only machinery has higher marginal value product than its acquisition cost. The productivity of labour on both types of farms is statistically equal to its acquisition cost indicating thereby an efficient and rational use of this resource. This seems quite plausible as labour supply in this region is scarce and most of the labour comes from the eastern part of Uttar Pradesh (a relatively surplus region of the state).

resource substitution

The rate of technical substitution between two inputs is computed by holding other inputs in the equation constant at their geometric mean levels (Table IV.)

Land is a scarce resource. It is seen that to replace one acre of operated area on progressive farms, Rs 203.78 worth of technology is needed. The annual acquisition cost of one acre of land is Rs 320.00. Thus it is economical to push the technology and substitute it for land.

Labour substitution through mechanization would reduce the cost considerably. To replace one rupee worth of labour the expenditure on machinery is 0.11 and 0.03 on progressive and less progressive farms respectively. Hence it is economical to have mechanization on both types of farms but relative economic efficiency of mechanization in terms of labour replacement would be higher on less progressive farms as compared to progressive to achieve the existing level of farm income.

Although this creates unemployment, its magnitude however would be less on progressive farms.

As a result of diversion of funds from labour to machinery, the productivity of land, technology and labour would increase and that of machinery would go down. On progressive farms the produc-

tivity of land is statistically higher than the acquisition cost and a further increase in its productivity as a result of increased mechanization would attract these farmers to increase their operated holdings by purchasing land even at higher acquisition cost. The existing land productivity on less progressive farms on the other hand is statistically equal to acquisition cost. The

TABLE II

Elasticity of Production R^2 and Return to Scale

Type of farms	Bullock labour	Technology	Machinery	Operated area	Labour	R^2	Return to scale as ind. by t-test
	X_1	X_2	X_3	X_4	X_5		
Progressive (245)	0.02157 (0.02156)	0.27403** (0.04432)	0.0293* (0.01064)	0.59836** (0.06114)	0.30512** (0.05366)	0.82	Increasing
Less Progressive (150)	0.00577 (0.03111)	0.04407 (0.02647)	0.03798* (0.01828)	0.70503 (0.09280)	0.30815** (0.08613)	0.64	Constant

* Significant at 5 per cent level.

** Significant at 1 per cent level.

TABLE III

Marginal Value Products of Farm Resources

Type of farm	Bullock labour	Technology	Farm machinery	Operated area	Labour
Progressive	0.46 (0.46)	2.47** (0.40)	9.73* (4.15)	503.36** (51.43)	1.25 (0.21)
Less Progressive	0.06 (0.35)	1.31 (0.79)	34.02* (16.37)	320.85 (42.23)	0.85 (0.24)

Note: Figures in parenthesis denote standard errors of marginal value products.

* M.V.P. significantly different from annual acquisition cost at 5 per cent level.

** M.V.P. significantly different from annual acquisition cost at 1 per cent level.

TABLE IV

Rate of Technical Substitution on Progressive and Less Progressive Farms of North-West (UP): 1967-68

Type of farm	Substitution between	Rate of technical substitution $\frac{dx_i}{dx_k}$
Progressive	Technology and operated area	-203.78
Progressive	Machine and labour	-0.11
Less Progressive	Machine and labour	-0.03

substitution of labour through machinery may not boost the productivity of land to such an extent that the less progressive farmers could compete with the progressive counterpart in acquiring more land from the inflexible market dominated by higher prices put forth by progressive farmer. Thus progressive farmers tend to increase their farm size. But due to the fact that the attachment to land in India is

high and alternative employment opportunities are rare, the less progressive farmers may not dispose of their land so readily. However, the less progressive farmers particularly the small ones are finding it hard to survive due to (a) a decline in product price from a shift in product supply function whose benefit they have not reaped fully (b) by their failure to share in increased land values, through

denial of access to the land market which would otherwise transmit the machine effect. Both the things are clearly visible in this area where the land prices have gone upto Rs 4,000/- per acre, (the price of land was comparatively very low before the advancement of new agricultural technology) and the small and less progressive farmers are finding it difficult to hold their own.

Economics of Tourism

S. Venu

INTERNATIONAL TOURISM is the largest single item in the world's foreign trade and for some countries the most important earner of foreign exchange. For other countries, it represents a promising new source of economic growth.

In economics, the demand for goods and services is regarded primarily as a function of price. Some public products are supplied free. Others are determined by the 'Invisible Hand'. Tourism is somewhere midway between these extremes. The costs of transportation are borne by the consumer, while others, such as infrastructure costs are borne by the public sector. The tourist, as a buyer, travels to the origin of the product to acquire it.

Apart from the balance of payments aspects, tourism's benefits extend to other directions. It promotes balanced regional development as tourist centres are developed away from the industrial areas. The money spent by tourists is re-spent or saved by the local population. The income 'multiplier' effect determines further employment and output. It is a service industry and labour-intensive; hence of special interest to the labour-surplus traditional societies. Finally, the 'cross-fertilization' of ideas between peoples has intangible social benefits.

Who is a tourist? He may be regarded as a recreational traveller, a business traveller or a traveller for other purposes such as meetings. The recreational traveller's demand is price-elastic as tourism has rapidly extended to the middle income classes in the age-group of 25-40. The business traveller's expenses are usually "on the house"; his demand is neither price nor income elasticity over a wide range. The third category is the miscellaneous traveller who goes abroad for health reasons, to international conferences or for domestic reasons etc. The 'stopover' visitors are excluded from the purview as

statistical data on this category will be difficult to compute. His behavioural pattern, too, is indeterminate.

The receipts from international tourism over the period 1955-1968 increased, at a phenomenal annual average rate of 20 per cent, while world exports increased at 7.8 per cent. Tourist receipts as a proportion of world exports increased from 4.2 per cent in 1955 to 7.1 per cent in 1968 (Table I.)

Unlike many of the developing and developed countries, India suffers from a paucity of statistics regarding receipts from tourism. In the Reserve Bank of India's annual reports no attempt has been made at any estimation of tourism earnings under 'invisibles'.

A tentative estimate can be made thus. In 1968, approximately 2,00,000 tourists came into India. Assuming a per capita outlay of \$250, and allowing for a leakage of 25 per cent by way of 'blackmarket sales' of currency and expenditure on imported content of products purchased, the net foreign exchange earnings would be in the region of Rs 25 to 30 crores per annum. More detailed presentation of a model to work out all the income and foreign exchange effects will be attempted later.

For 1968, on this basis, tourism receipts

as percentages of value of exports and gross domestic product in various countries are given in Table II.

TABLE II

Tourism Receipt as Percentage of Export and Gross National Product 1968 and Ranking of Receipts in Export Trade

	% of export earnings	% of GNP	Ranking in export trade
Barbados	32.4	14.3	1
Ceylon	2.6	.6	7
Jordan	21.6	5.1	1
Malta	17.8	4.4	3
Spain	22.3	5.2	1
INDIA	2.4	.0102	12

Note: For Hong Kong, Mexico and Panama also the receipts from tourism exceeded those from any industry.

Source: Individual statistics of different countries.

It is evident that India is a 'laggard' with 'miles to go'. But before we propose any specific panacea a model analysing the economic effects of tourism is necessary.

the Zinder report—a critique

This report* has had considerable in-

TABLE I

Tourism Receipts and World Exports

Item	Amount in £ Billion 1955	1960	1968	Percent increase	Average annual growth rate

Value of tourist receipts	1.36	2.43	4.76	250	20.0 (Approx.)
Tourist receipts as percentage of world exports	4.2	5.4	7.1	—	—

Source: U.N. Balance of Payments Statistics.

POINTS OF VIEW

fluence on economic precept and practice in the field of tourism.

The crux of the report is the 'multiplier' effect of tourist spending in different countries where the following figures are derived :

Yugoslavia	8.4
South-east Asia	3.2
Caribbean	2.3

These are specific income multipliers. One thousand dollars spent by tourists would add \$2300 or \$3200 as the case may be before the impact wears off by leakage.

However, all the calculations rest on the unrealistic assumption that the propensity to import and consume, the ratio of yield from taxation to the national income and the share of wages in the national income are constant.

The basic fallacy is that the income multiplier is in reality only a transactions multiplier. It is merely a measure of "dollars changing hands" as under:

First Round	Tourist pays hotelier	315.00
Second Round	Hotelier pays wages, buys goods, pays taxes on the goods.	248.37
Third Round	Wages and salary receipts; spent on goods; government spends tax revenue.	151.91
Fourth Round	Same as above	61.00
		776.28

(I) The General Multiplier

In an open Keynesian Economy, the basic equation is :

$$S + E_a = I + E_t \quad (1)$$

Where S and E_a represent 'leakages' from the tourists' home country in the shape of savings and expenditure on tourism abroad. I and E_t represent injections of investment and expenditure by foreign tourists in the nation visited.

It is assumed that S and E_a vary solely with households' income within a relatively narrow price range of services. Thus

$$S = f_1(y) \quad (2)$$

$$E_a = f_2(y) \quad (3)$$

$$\text{Further } \Delta S = s \Delta y$$

$$\Delta E_a = ea \Delta y$$

These equations mean that 'S', the marginal propensity to save out of incremental income is constant; the expenditure on tourism ' ea ' is the marginal expenditure propensity, also constant in terms of incremental incomes.

From the equilibrium condition of (1)

$$\Delta S + \Delta E_a = \Delta I + \Delta E_t \quad (4)$$

from (2), (3) and (4) we get

$$S \Delta Y + ea \Delta Y = \Delta I + \Delta E_t$$

$$\Delta Y = \frac{I}{S + ea} (I + E_t)$$

Thus, the change in income will be K_t times the change in investment or expenditure by foreign tourists where K_t is equal to the reciprocal of the marginal propensity to save plus the marginal propensity to spend abroad. If 25 per cent of an increment in income is saved and 15 per cent spent on tourism, then $S = .25$ and $K = 15$.

$$\text{Hence } K_t = \frac{1}{.25 + .15} = 2.5$$

A change in I or E_t will lead to an increase in income of two and half times the amount. This is the *tourism multiplier*.

(II) Income Multiplier and Import Coefficient

Let us assume that the import coefficient is .1 or 10 per cent. This refers to the imported goods bought by tourists and

also accounts for the net foreign earnings after allowing for the cost of imported materials bought by hotels in developing countries. For India, this assumption seems reasonable. For a Rs 50 million '5-Star' hotel, the foreign exchange allowed for acquisition of fixed assets is usually Rs four million and allowing for imported supplies of liquor and any 'overrun' on costs, the 10 per cent assumption is valid. Most consumer goods are made indigenously; antiques are entirely of local origin.

The final multiplier can be calculated on the assumption that the propensity to consume and the government propensity to spend both equal unity with the import coefficient at 10 per cent.

If \$ 100 is spent on accommodation, local expenditure is generated as given in Table III.

The initial accommodation multiplier is \$ 180. Allowing for a second and third round effect with smaller incremental doses, the total works out to \$ 250 as an approximation. The accommodation multiplier is 2.5.

The Food and Drinks (F & D) multiplier can now be calculated. The total volume spent on F and D is about 50 per cent of that on accommodation. Allowing for a 20 per cent imported content, \$ 40 is the net local proceeds for every \$ 50 spent. The multiplier is given in Table IV.

Successive rounds of decreasing intensity

TABLE III
Accommodation Expenditure

First Round :	Tourist to hotelier	Local Purchase	\$ 90
	Leakage		\$ 10
Second Round:	Hotelier's expenditure		\$ 80
	profit		\$ 20
Third Round :	Wages spent		\$ 80 (c, the consumption propensity is unit
	Hotelier's expenditure from profits		\$ 10 (his value of $c = .5$)
	Tax yield		\$ 10
	Government expenditure		\$ 10

TABLE IV
Food and Drinks Expenditure

First Round :	Tourist to hotelier	\$ 50
	Import content	\$ 10
Second Round :	Hotelier's expenditure	\$ 40
	profit	\$ 10
Third Round :	Wages spent	\$ 40
	Hotelier's expenditure	\$ 5
	Tax yield	\$ 20 (high liquor taxes)
	Government expenditure	\$ 20

*Report prepared by H. Zinder and Associates for the US AID in 1969.

POINTS OF VIEW

can be assumed. The F & D final multiplier is about 3.0.

Allowing for a 1.5 multiplier value without import leakages from spending on local transportation and shopping, on a \$50 initial outlay, the total income multiplier from an outlay of \$200 is :

$$\$250 + \$150 + \$95 = \$475.$$

The final multiplier in India is around 2.37. It must be emphasised that this is highly tentative and more data on the domestic marginal propensity to save is necessary. Allowing for errors of estimation or extrapolation, the multiplier could easily reach 3.0, if not more, by 1975.

(III) Foreign Exchange Earnings

Postulating a savings rate of .2 and import coefficient of .2 (on the high side for India) the position would be :

Foreign Exchange brought in	Tourists' spending Spent	Local income Saved	Spent	Saved
\$ 200	\$ 160	\$ 40	\$ 128	\$ 32

The pure 'isolated multiplier' of foreign exchange spending is $288 \div 200 = 1.44$, but this has been included in our earlier estimates.

Tourist Multipliers for other countries as assessed in different reports are :

Pacific and Far East	3.2 to 4.3
Hawaii	1.3
Pakistan	3.3
Ireland	2.7

Thus, our results appear to be valid.

(IV) Tax Revenues

The proportion of tax revenue to national income varies from 10 to 20 per cent in the developing societies. The revenues accruing to the government can be ex-

pressed by the following equation :

$$T = E_f K_t p$$

Where T=Tax revenue, E=expenditure by tourists, K_t is the tourism multiplier, and p=proportion of national income accruing to the government by all taxation.

Where statistics are available of the revenue from tourists' spending it should be possible to effect broad assessments of the cost-benefit ratios of public outlays to achieve these revenues.

policy implications

The volume of tourist traffic is estimated to go up to 5,00,000 in 1975 and 9,00,000 in 1980.

This indicates that about 45,000 rooms are required by 1980 as against 9,000 rooms available in 1971. A total outlay of Rs 350 crores is indicated and the capital-output ratio is in the range of 3:1.

On our previous analysis, the estimated foreign exchange earnings for 1975 and

1980 are:

	Multiplier	Foreign exchange earnings
1975	\$ 27 billion Rs 202 crores	\$ 8 million Rs 60 crores
1980	\$ 31 billion Rs 225 crores	\$ 1.4 billion Rs 105 crores

The moral of these findings is quite clear. While the Ministry of Tourism is looking on proposals to put up hotels with favour, the Ministry of Company Law is regarding this area as a loophole used by 'monopoly houses' to increase their stronghold on the economy. Our analysis shows that irrespective of ideological considerations, the building of hotels is a must as the benefits far outweigh the visible costs and also the invisible costs of any 'concentration'.

It is also essential that foreign firms operating in India are encouraged to go into this line with expansion of Indian equity holding. Thus, the government fulfils two objectives; first, greater domestic ownership and second, reducing the strain on the balance of payments as exchange earnings will be greater than the marginally greater flow of repatriation abroad.

Eastern Economist 25 Years Ago

June 13, 1947

A document of some practical value reflecting the judgement of men intimately connected with the industry was rescued from the dusty archives of the Central Secretariat a few days back. It is the report of the Post-war Sub Committee which was constituted in September 1944 and considering the nature of the report itself there is no doubt that it must have taken at best a few months to cover the subject of enquiry. The date of its preparation has been conveniently left to the imagination of the reader, but there is cogent internal evidence to show that it is in any case prior to the Insurance (Second) Amendment Bill which is on the legislative anvil for more than one year. The first Amendment Bill to the Insurance Act of 1938, the appointment of the Jehangir Committee; the Second Amendment Bill embodying practically all its recommendations and the setting up of the Sub-committee of the Advisory

Committee almost about the same time are proof positive that the former Government of India did not feel it worthwhile to formulate a definite and clear-cut policy in respect of this vital national industry. The sole term of reference of Sub-Committee was couched in vague and rather indifferant language—to consider "all the problems relating to Post-War India"—as if the entire vast field from corp and cattle insurance right up to social security can be covered in a brief investigation. But the Sub-Committee has done well to confine its attention to life insurance in particular and also to the main problems of general insurance. Its recommendations clearly point out what independent action insurers on their own part can and ought to take to revitalise the industry and at the same time indicate lines on which the Government should contribute its primary share to the requisite reform.

India, Nehru and Australia

Josselyn
Hennessy

London.

Some Forthright Views

I FIRST began contributing this column to *Eastern Economist* in October, 1946.

With a glow of modest pride and keen gratitude I record that, in these 26 years, on the one hand, I have received only a single letter of criticism (which I published) for what the writer amiably called my "laughably obsolete economics" and my "quaintly archaic social outlook", while, on the other, it has won, from countries far apart—including India, Australia, England, Kenya and the USA—a continuing trickle of fan mail, applauding the beams of free enterprise that I send forth in skies heavy with dark clouds of social

industrial civilisation, anti-colonialism, Zionism, the United Nations and other topics, spiced with lively portraits, including Dulles, Nehru, Sukarno, Kenyatta, Haile Selassie, Henri Spaak, and Australians such as Casey, Hasluck and Evatt—altogether an interesting historical record.

Not all Mr Crocker's views will be popular either in India or in Australia, but whatever one thinks of them, the experience and observation of men and affairs behind them compel one to reflect. One cannot brush them lightly aside or ignore them. I will quote three examples, the first on India, the second on Pandit Nehru, and the third on Australia's foreign policy.

"I will not go into Indian politics or

pritated, but now many millions are being made out of speculating in real estate in the ever-growing urban areas?

Non-violence was the sincere creed of Gandhi but not of many other Indians."

Crocker on Nehru

"I have given some impressions of the India of those days in my book *Nehru*. As Galbraith's *Ambassador's Journal* testifies, Nehru, like other Indians panicked in 1963 when China decided to give India a reminder. Nehru's twenty-one years' Prime Ministership will probably come to be seen as having had less effect on India than had been thought. His driving passions are largely irrelevant to the India he bequeathed. And Nehru will have to take his share of the blame for nationalist fury, for false hopes about paradise regained once independence had been gained and, above all, for bringing the mob on to the stage, including student mobs (which now riot because examinations are 'too hard' or they cannot get free or cheap cinema tickets). His enormous prestige will probably be written down in the future. That of Gandhi, on the contrary, will wear better. Gandhi was an Indian Nationalist but much more; for instance, he had taken the measure of machine civilisation and of some great truths. Yet whatever mistakes Nehru made they will never diminish his interest as a man. For me he was so fascinating as by himself to make my India assignment fascinating."

II

Australia as Crocker Sees Her

Mr Crocker has contributed to the latest issue of the *Australia Institute of Public Affairs Review* (289 Flinders Lane, Melbourne 3000) a reconsideration of Australia's foreign policy, which the pundits of India's External Affairs Department, and all interested in the current international kaleidoscope, should ponder.

Mr Crocker begins by asking "Does Australia know what she is doing?" I summarise his reply:

Australian foreign policy has been founded too much on fear, notably the fear that "they"—"they" being all the more menacing because of their shadowy vagueness, sometimes the Japanese, as twenty years ago, then the Indonesians, but more and more the Chinese, and more and more the all-comprehensive

devils, the unfailing stand-by of politicians at a loss, the communists—will come down and get us. Fear as a major ingredient of foreign policy is neither unusual nor unreasonable. But if fear takes on too much fantasy, if it is too disconnected from the facts, it becomes costly and perilous in foreign and in defence policy. The essential criticism of Australia's foreign policy is that it has been based too much on ignorance. It seems incredible but it is true that until last year at least, though the public had been made familiar with the phrase "the threat from China" as it had been with the phrase "there is no substitute for wool", our Department of Foreign Affairs had no section, no person even, specialising on China.

The first, and the never-ending, need in foreign relations is to get at the facts. This can be done only in a spirit of objectivity. The half facts or pseudo-facts of the mass media are not good enough. Nor are the highly selective tit-bits, which the (American) CIA might care to provide us with. A primary function of our Foreign Office doing its job properly, is to work at the balance sheet of likely developments and to calculate our true interests, as distinguished from our alleged or apparent interests. China is an obvious case for such an exercise. So too is the hypothetical situation of a Malaysia or an Indonesia going communist, or the lessons of events in Vietnam and the rest of south-east Asia since the expulsion of the French. The Pentagon Papers, recently leaked and published, illustrate the yawning gap between public beliefs and the realities.

Australia has no foreign policy

As a result of our ignorance, Australia has been prone to a satellitism to the United States of a singularly passive and uncritical sort. "All the way with LBJ". The case for the American alliance was clear, but we went too far. Indeed it could almost be said that the essential characteristic of Australian foreign policy is that Australia has no foreign policy of its own. We accepted American public estimates and attitudes on virtually all the great issues of the last two decades. We made speeches at the UN, and we made diplomatic representations in various capitals, at American behests, and at times in the very phrases concocted in Washington. Our assiduity and docility have been paralleled only by Russia's tame, or most cowed, satellites. That is why Nehru could not be shaken in his belief that Australia did not have an independent foreign policy.

Moreover, and leaving aside questions at the sufficiency or insufficiency of our

senior officials in Canberra for working out cohesive independent foreign policy, too much of the time and staff of the Department of Foreign Affairs has been taken up with peripheral matters. These become a substitute for the real thing. A glaring example is attendance at the innumerable and largely useless meetings at the UN and its dozen Specialised Agencies (FAO, ILO, etc.), a hangover from Evatt's days but greatly multiplied. There is probably not a day in the year, certainly not a week, outside of the holiday periods, when the Australian taxpayer is not supporting some delegation or other at some UN meeting or another.

conditions for development aid

Another example of the substitute taking the place of the real thing is aid to foreign or developing countries. The idea of aid as an expression or human solidarity is in itself good up to a point. The question is, or should be, in each specific case: How far can this aid be effective in any meaningful sense? For the painful truth is that the gap in economic development between, say, Canada and the Congo is the expression of a historical if not a mental gap, and this is not to be closed just by shovelling in tractors, iron works, or technicians. The Australian taxpayer has been paying a heavy bill for aid—nearly \$14 per man, woman and child annually, about \$1500 million since the war. We pay out a bigger proportion per capita of our national income than USA or Canada. And of course, a sizeable bureaucracy has grown up to deal with it. Vested interests are now deeply and powerfully involved. The UN and its agencies have thousands of tax-free employees spanning the world on aid programmes. There had been tremendous waste. There is little gratitude in the receiving countries. There has not been a proportionate effect for the expenditure. The whole aid phenomenon has been shot through with fictions and misapprehensions, such as about hunger. There is no world shortage of foodgrains. Even India has a surplus. The handling of aids has improved in recent years but the requirements I listed a decade or more ago when I was responsible for aid programmes have not yet been achieved: in the receiving country a proper budget system, a proper plan, proper preliminary investigation, an adequate public service which can use the aid, a proper appreciation of the population problem (rampant in the so-called developing countries), and aid not to be diverted to military purposes.

It is significant that the Australian Commonwealth Parliament in this year of high inflation and budgetary difficulties has made no comment on our aid bill of about \$14 million to Indonesia—an

expenditure hard to justify on any objective count.

The ignorance predisposing us, as our relative defencelessness predisposes us, to satellitism, is connected with Australia's geographical position and our newness to the responsibilities of foreign relations. Until recently, when the aeroplane drastically reduced distance, Australia was remote from the world—a far-away continent, mostly desert and populated thinly around some of its edges. The world scarcely knew us. And we knew little of the world. Until recently only an infinitesimal number of Australians had seen Chinese, or Africans, or Spaniards, or even Americans, at home; and the proportion which knew a foreign language was (with New Zealand) probably the lowest in the world of the white races. A special responsibility as regards the ignorance behind our foreign policy belongs to our parliamentarians.

Australia's legislators are near the world record for their numbers in proportion to the population and also for the scale of their remuneration. Yet no parliaments in the White World (other than New Zealand) have had such a small proportion of members with a tertiary education. I have no undue respect for formal education, the value of which is often exaggerated in this epoch of the neo-literate. There is no necessary correlation between diplomas and force of mind. But there are limits to the acceptability of average uneducatedness. The stark truth is that Australia has had the worst informed parliaments, as well as carrying on proceedings with the worst manners in the White World. There has been nothing to choose between the parties in this respect. More disturbing even than the ignorance of the average MP about the outside world is his lack of curiosity about it. Such parliaments are an easy prey to shibboleths and subjectivity. And equally bad is the mentality of treating every issue according to what party advantage can be got out of it. The need for bipartisan approach to foreign affairs is urgent.

III

Facts of Australia's Position

The press and the mass media, which are controlled by a handful of men, have done too little to rectify the error and illusion. They deny to the citizen his rights as regards adequacy of relevant information or of comment though Australia has some journalists of outstanding capacity who could well meet the need.

How much basis is there to the fears

WINDOW ON THE WORLD

ism, whose silver linings are streaked with bureaucratic red tape. Every now and again one of my correspondents publishes his views, and I seize the opportunity to give them wider publicity in this column.

The latest example is Walter Crocker, who first wrote me a letter of gracious appreciation as far back as 1954, when he was High Commissioner for Australia in India, and with whom—although I have not yet had the pleasure of meeting him—I have ever since periodically exchanged views. He published an intimate first hand assessment of Pandit Nehru in 1955, entitled *Nehru* (Allen and Unwin). Having retired from Australia's diplomatic service, he has just published a very personal account of his experiences of international relations in eleven countries since World War II, entitled *Australian Ambassador* (Melbourne Univ. Press), in which he offers challenging thoughts on the adequacy of the USA for world leadership, Australia's immigration policy,

politicians though they were my daily environment for some years. Politics meant personalities and these in turn meant largely personal interests. But there were ideological alignments too. And there was some corruption. The higher levels of the Civil Service, formed by, or formed in the image of, the British Civil Service, had some very able men. The lower levels, which meant over 75 per cent, and which numbered tens and tens of thousands, were a marvel of inertia, fussy inefficiency and predatoriness. One could not see how normal decent day-to-day government could ever be carried on by such people let alone huge development plans involving hundreds of millions of human beings. Today, twelve years after beginning arrangements, how much of the oil in Cambay is being brought into use? How much of India's equally vital needs of fertilizers are being produced, as they can be produced, in India? The old and useful landowning class, the zamindars, have been expro-

about someone coming down and getting us? Have certain primary facts about Australia's strategic position been grasped?

No country, no matter how powerful or how favourably placed by geography it might be, can have complete security any more than any human being, however strong and well doctored, can have complete security against cancer, or heart disease or earthquakes. Australia is no exception. Some risks have to be accepted. Over-insurance is no safeguard. Australia, within the foreseeable future, cannot indulge in an arms race with China or Japan or perhaps even India. Population and other military potential make that self-evident. China is developing thermo-nuclear capacity. It is not excluded that Japan will be starting on the process soon. This is likely to increase the claims, so far muted, that Australia should make the bomb. A thermo-nuclear arms race on Australia's part will not only eat up our resources enormously but instead of adding to our security is likely to lessen it. The bomb would put us among the potential targets for one

or more of the thermo-nuclear powers much greater than ourselves. (The present American gases in Australia could do the same).

There can of course be several views on this subject. It is highly technical. What is needed is calm discussion and cold evaluation, not emotionalism. My own view, concludes Crocker, is that in the long run Australia not only gains nothing by satellitism or commitments but does not require them. We are blessed with a strategical position which is as inherently favourable as Canada's.

China ? Japan ? India ?

Who is likely to come down and get us?

To examine China, India or Indonesia one by one, or that old favourite "world communism", with objectivity and in depth, would give us encouragement, either from the point of view of motive or of capacity. Still more to the point, none of these Powers would acquiesce in the

take-over, or a threat of take-over, of Australia by any one of the others. Nor would either Russia or the United States. This pleasing situation is not because anyone of them loves us, or because we are such fine fellows, but because such a take-over would upset the world strategical balance and especially the balance of the Pacific-Orient region. England and France declared war on Germany in 1939 because it took over distant Poland. In the last fifteen year we have heard much nonsense about Laos or some other area in south-east Asia being a vital national interest for Australia; but if any Power seriously threatened Australia we can be sure that we would become or be treated, as a matter of truth and not of slogans, as a vital national interest for half a dozen powerful countries. The balance of power is no empty phrase. Australia will have a major defence policy problem only if it is foolish enough, through phobias or fantasies or slogans (such as "Australia's responsibilities in the Pacific") to meddle in Asia's stresses and struggles. What we should be studying is the defence policies of Switzerland and Sweden. They have much meaning for Australia.

Investment Opportunities in Malaysia

B. S. Venkata Rao

Malaysia offers impressive opportunities for overseas investors seeking joint venture participation in the industrial field. Judged from the standpoint of governmental support for industrialisation, the fiscal and other incentives offered by the Malaysian government must be rated as very outstanding, and are among the most attractive ones available from newly industrialising countries. In the south-east Asian region, Malaysia is well known as a country which continues to enjoy a very high degree of social and political stability. She has a well-knit national government which is dedicated to the advancement of people's living standards through the implementation of well conceived economic development plans.

Malaysia has a forward-looking economy with economic growth and living standards continuously on the upward trend since the country attained independence. Her gross national product (at current prices) has risen from \$6,649 million in 1960 to \$11,951 million in 1970 and increase of about 80 per cent in 10 years, or an annual average rate of eight per cent. The GNP for 1971 is placed at

Ms12,170 million. Her per capita income is one of the highest in south-east Asia, an index of the high standard of living enjoyed by the people: it is estimated to have risen from \$845 in 1963 to \$1,099 in 1970 an increase of 30 per cent in seven years, or an annual average rate of about 4.3 per cent. The rate of economic growth has been particularly impressive under the stimulus of the first Malaysia Plan, the rate of increase in GNP having averaged over eight per cent during the period. According to present indications, the planners expect that by 1985, the GNP will go up to about \$27,000 million, which means that Malaysia will then be producing four times as much goods and services as in 1960. The per capita income is expected to go up to \$1,580 in 1985. An idea of the living standards of the people may be gained from the fact that out of the total GNP of \$11,951 million in 1970, consumption expenditure accounted for \$9,400 million, of which \$7,030 million was private consumption expenditure.

Although the high purchasing power of the people provides a solid base for the production and sale of goods and services,

the domestic market is small in absolute terms, with a population of about 10 million. However, in considering the size of the market in Malaysia, one has to take into account two essential factors, viz. (i) the country's high and continuously rising per capita income and (ii) the market potential in the countries of the south-east Asian region. As against Malaysia's population of 10 million, others in the region have a population of about 260 million. Besides, both Malaysia and her neighbours continue to depend on imports for substantial part of their requirements of industrial goods and services. These factors should place the market 'potential in Malaysia in its perspective.

Despite the economy's somewhat heavy dependence on the exports of a few primary commodities, viz rubber, tin, timber, and oil palm, it must be noted that these commodities have a reasonably assured international market. Any possible downward change in prices, which is relevant perhaps in the case of rubber, is not likely to produce any seriously adverse effect on the country's econo-

Milk co-operatives as an instrument for creating new jobs

Survey of two villages in Kaira* traces half their income to milk

Rearing milk cattle has become as important an occupation as agriculture in many villages in Kaira. In villages with milk co-ops, slightly over half the income is from milk, as against 20% in villages without milk co-ops.

Apart from raising village incomes, milk co-ops have created more jobs in villages, in collection centres, in cattle feed plants and in animal husbandry services.

With mechanisation of farming displacing people from agriculture, it is imperative that villages should offer alternative opportunities for employment. The traditional farmer is under-employed in any case. Dairying offers a part solution to both problems.

*This survey was conducted by the Department of Economics, Sardar Patel University, Vallabh Vidyanagar. The computed income included remittances from relatives in Africa.

Amul has shown the way.

Financial Directors
Don't just bite your nails
over the money your organisation
is losing because of
late submission of invoices..

Instal a SOEMTRON Electronic Invoicing Machine

And save Rs. 30,000 a year on an average daily billing of Rs. 1 lakh

If the present time-lag between the sale and preparation of invoices is 3 days, you're losing Rs. 30,000 as yearly interest charges at 12% on a daily average billing of Rs. 1 lakh.

The SOEMTRON Electronic Invoicing Machine can

eliminate the delay in submitting invoices. And save you a big chunk of money each year.

Interested? Then call in Blue Star for complete information on this remarkable machine.

And bite your nails over other important problems.

YOU CAN COUNT ON THE SOEMTRON ELECTRONIC INVOICING/ACCOUNTING MACHINE FOR:

Flexibility A choice of 4, 8 & 12 totalizers. Easily interchangeable pre-programmed modules permit preparation of different types of invoices. Also a number of accounting functions, including financial postings.

Speed The blind-touch 10-key keyboard and press-button calculations speed up postings, yet cut down operator fatigue.

Service Prompt, expert service by factory-trained technicians free for the first 12 months. Thereafter, under a fixed-price annual preventive maintenance contract.

Available to actual users only against Rupee-payment.

* Sold and serviced in India exclusively by

bme **BÜROMASCHINEN-EXPORT**

my. This is because of two important reasons—the efforts being made to set up a joint regional marketing system for rubber will prove helpful in exercising control over the production and prices of natural rubber. Secondly, by launching bold and progressive agricultural development and industrialisation programmes, a diversification of the economy is steadily taking place.

Excepting for a dip in 1967, the value of exports have maintained a steadily rising trend, having gone up from M\$3,749 million in 1965 to M\$5,106 million in 1970, an increase of about 24 per cent. Malaysia has, therefore, enjoyed a highly favourable balance on merchandise account, the surplus on this account having increased from M\$531 million in 1965 to M\$948 in 1970. The overall balance of payments position on current account has also continued to be favourable, the surplus having risen from \$127 million in 1965 to M\$976 million in 1969, M\$281 million in 1970 and M\$427 million in 1971. A significant feature of the Malaysian economy is the maintenance of a remarkable degree of price and monetary stability. While the US dollar lost 1.86 per cent of its purchasing power during the period 1956-1966, and is still under pressure, the loss in the case of the Malaysian dollar was only 0.45 per cent.

The country has a well organised stock market and a developed banking system. There is no dearth of private savings, and in fact many of the stock issues in the last couple of years have been over-subscribed. An important developmental institution, which has played a significant role in industrial financing, is the Malaysian Industrial Development Finance Limited (MIDFL) which provides medium and long-term loans to industries in Malaysia, and underwrites new stock issues.

aggressive approach

The enunciation, by the government, of its new economic development policy about the middle of 1969, calling for an aggressive approach to industrialisation, greater federal-state government cooperation, a greater dispersal of industries to the smaller towns and rural areas, etc. has infused additional dynamism into the country's industrialisation programmes. And the constitution of a Capital Investment Committee in June 1969, "to provide for top level review of the country's industrial development policies and programmes... with a view to co-ordinating these into a stronger, more consistent and integrated development strategy" augurs well for the acceleration of the industrialisation process.

Malaysia has well developed infra-

structure facilities which are a prerequisite for industrial development—roads, rails, ports, civil aviation, electricity, telephones etc. She has more than 11,000 miles of first class roads and highways; good ports at Port Swettenham (now Port Klang) and Penang where containerisation facilities are being developed; and fast and efficient air transport providing international contact, and connecting important commercial and industrial centres in the country. It is the policy of the government to promote industrialisation mainly through (i) a programme of building infrastructure, (ii) a scheme of appropriate incentives to industry owners; (iii) provision of technical assistance services, where needed; and (iv) stimulation of and assistance to private enterprise in the field of industry.

Under the Investment Incentives Act of 1968 as amended in 1969 and 1971, the following types of incentives are given to industrial establishments which are "resident companies", i.e. companies whose control and management are exercised in Malaysia.

pioneer status

Pioneer Status is given to industrial firms which manufacture products which are gazetted as *pioneer*. This entitles the firm to certain fiscal incentives which are related to the amount of fixed capital investment made by it during a given period. The firm is exempted from the company tax of 40 per cent and a development tax of five per cent for a period of two years regardless of the amount of investment made; for three years if investment is not less than M\$250,000; for four years if investment is not less than M\$500,000 and for five years if the investment is not less than M\$ one million.

An additional three years of tax holiday can be claimed by the firm if it (a) manufactures a priority product; (b) uses specified local content in the end product; and (c) is established in a development area. The areas declared as development areas by government are the states of Perlis, Kedah, Kelantan, Trengganu, Pahang, Sabah and Sarawak.

Where a pioneer firm incurs losses throughout its tax holiday period, capital allowances are allowed to be accumulated and carried forward for deduction in the post-pioneer period.

In addition to the above, pioneer firms are exempted from the payment of pay roll tax of two per cent and a surtax of two per cent on imported raw materials and machinery. In the budget of 1971, this tax has been abolished for all

industrial firms. The dividends paid by pioneer firms are exempted from tax in the hands of shareholders.

investment tax credit

This credit is given to a firm not qualifying for pioneer status or to a firm which does not apply for pioneer status. It takes the form of deductions from taxable income. The rate of Investment Tax Credit given will not be less than 25 per cent of the capital expenditure incurred on a factory, plant or machinery for approved projects. The amount of credit tax-exempted during the first five years, however, can be carried forward in case of loss or insufficiency of income until fully utilised against subsequent profits. If the approved company establishes its factory in :

- (i) a development area;
- (ii) produces a priority product or products;
- (iii) uses specified percentage of Malaysian content, an additional tax credit of five per cent will be given for each of the three conditions fulfilled.

The following export incentives are given :

(i) Deduction of expenses for promotion of exports: The expenses qualifying for deductions for tax purposes under this Act includes:

- (i) Overseas advertising expenses;
- (ii) Cost of supplying and delivering free samples;
- (iii) Expenses of carrying out market research or obtaining export market information, etc. etc.

(iv) Foreign investment guarantee agreements (against expropriation) with US and West Germany. Malaysia is prepared to sign similar guarantee agreements with other governments. Malaysia is also a member of the Convention for the Settlement of Investment Disputes.

(v) Protection against dumping: Malaysia has anti-dumping laws to take care of this eventuality.

(vi) Preferential government buying of locally manufactured products : All government ministries, departments and quasi-government bodies are required to purchase locally manufactured products provided their quality is acceptable and their price does not exceed equivalent imported price by 10 per cent.

(vii) A number of well developed

Industrial areas and estates are available close to air and sea ports. The premium for industrial sites varies from 3.5 cent to 70 cents per sq. ft. (The values given are in Malaysian currency). All the industrial estates of which there are 11 in West Malaysia (3 proposed/being developed) and four in East Malaysia (2 proposed/being developed) are provided with water, telecommunications, power, roads, etc. facilities. The Malaysian Industrial Estates Ltd which is a subsidiary of the Malaysian Industrial Finance Ltd provides standard factory buildings on selected sites either on hire-purchase or outright sale basis.

Incentives are also available for encouraging hotels of international standard, and tourism. The following three types of incentives are given to hotels depending on their geographical location:

(a) An annual abatement of profits to the extent of 20 to 30 per cent for 12 years excepting for hotels in Kuala Lumpur and Penang Island;

(b) Normal industrial building allowances with the exception of Kuala Lumpur and Penang Island;

(c) Accelerated depreciation for qualifying plant and machinery for all hotels irrespective of location.

Tourist resort complexes are eligible for pioneer status irrespective of their location. Hotels in such complexes enjoying pioneer status will not qualify for incentives offered to the hotel industry after the end of the tax relief period.

utilisation of labour

Under an amendment to the Investment Incentives Act 1968 made in October, 1971, additional incentives are offered for encouraging increased utilisation of labour and the growth of electronics manufacture. A new incentive known as the Labour Utilisation Relief provides for exemption of income of manufacturing concerns from income tax in the same way as in the case of pioneer companies. The difference is that in this case, tax exemption is based on the number of full time paid employees working in the concern instead of the amount of fixed capital expenditure incurred. The tax exemption period and qualifying requirements are as follows:

(a) For companies employing 51—100 workers, the tax exemption period is two years.

(b) For companies employing 101—200

workers, the tax exemption period is three years.

(c) For companies employing 201—350 workers, the tax exemption period is four years.

(d) For companies employing more than 351 workers, the tax exemption period is five years.

To encourage the growth of the electronics industry, electronics projects which are approved by the government prior to January 31, 1973, will be given tax exemption for periods ranging from 4 to 7 years. In addition to this the projects are also eligible for a further extension of one year of tax holiday, if they satisfy any of the three conditions which are applicable to other projects as well, namely location in a development area; production of priority product; and utilisation of a specified percentage of local content. In other words, electronics industries will be entitled for a maximum tax relief period of 10 years as against eight years in the case of non-electronic companies.

Under the amended Investment Incentives Act, provision is also made for the grant of *increased capital allowances* at specified rates for qualifying building or plant expenditure in respect of approved projects to encourage modernisation.

abundant labour

Labour is abundant and highly adaptable. Wage rates are reasonable and compare favourably with those in other countries in the region, such as Hong Kong, Singapore and Japan. Depending on the nature of industry, location of the factory, whether the worker is male or female, and the nature of in-school or post-school training undergone, wages for skilled workers range from M\$4 to M\$10 per day. Those for semi-skilled and unskilled workers range from M\$1.50 to M\$3.50.

The level of salaries for technical and managerial personnel varies according to the nature of the industry and its location. Generally, the salary range for top level management personnel is M\$2,000 to M\$5,000. Engineers of various categories are available in the salary range of M\$800—M\$1,850. Trainee engineers generally ask for salary of about M\$450 to M\$500. Technicians in the engineering category and chemists will have to be paid between M\$500 to M\$1,100. Administrative assistants can be employed in the range of M\$600 to M\$1,000.

Foreigners setting up industries on a

joint venture basis in Malaysia may bring in skilled personnel from their home country, subject to the regulations of the Immigration Ordinance of 1959 and the Immigration Act of 1965. It is the government's policy that as many Malaysians as possible are employed by industries in the country. However, a certain minimum number of key posts in a joint-venture industry are allowed on a continuing basis to be filled by foreigners. All this is however, subject to the prior approval of government.

Malaysia has a high reputation for maintaining industrial peace. While trade unionism and collective bargaining are recognised, the government's mediation machinery is effective in ensuring good worker-employer relations. Industrial strikes are on the decrease and the number of man-days lost due to these fell sharply by 44 per cent from 580,000 in 1964 to 280,000 in 1968. Number of workers involved in the strikes decreased by about 87 per cent from about 226,000 to about 31,000 during the same period.

investment opportunities

There are a number of ways in which Indian private industry can offer partnership to Malaysian industrialists to set up industrial ventures. These include participation in joint-ventures; provision of technical and managerial expertise; carrying out feasibility studies; and undertaking turn-key projects. The specific areas in which such collaboration can be forged will have to be determined after mutual consultation and careful studies. In the meanwhile some of the industries which Indian investors can think of include machine tools; industrial and scientific instruments; electronics; castings and forgings; automobile ancillaries; small-scale and medium-sized metal working industries; electrical machinery and equipment; industrial plastics; rubber manufactures; knock-down furniture and plywood; food processing and chemical industries.

Already more than 20 Indo-Malaysian joint ventures have been approved, and some of these have already gone into production. Some of the products which have been taken up by such ventures are textiles; sugar; glass; steel furniture; electric motors and transformers; synthetic resins; scooters; steel castings and confectionery. Well known among the Indian partners in such ventures are Birlas, Kirloskars; Godraj & Boyce; Mukand, API; Asia Paints and Parry's.

Shades of panch sheel

or panch sheela or Panchsila or whatever it may be! The Soviet-American joint declaration on the basic principles which are expected to guide the relations between the two countries in the future smells to me of the statement on peaceful co-existence on which China and India were once supposed to be keen on building their mutual relations. It could be assumed that Jawaharlal Nehru signed then hopefully and Mr Chou en Lai with at least a part of his barrel of his pen pushed well back up his sleeves. On the present occasion, however, Dr Kissinger has chosen to be promptly cynical. He blandly told the world that the Moscow summit documents represented "aspirations and an attitude" and that either side could ignore it at will. This means that there is to be no shouting of *Russi-Amriki bhai bhai* either in Washington or in Moscow. Business, in other words, will be much as usual. The pessimist may say that the people are becoming more cynical but the optimist could believe that governments are becoming more realistic.

The Pakistan lobby in

our country has always been a very resolute one and it is therefore unlikely to let itself be unduly embarrassed by Mr Bhutto's latest indiscretion. I have no doubt at all that this lobby is capable of arguing that his fulminations against Mrs Gandhi only reveal how acute the feeling of insecurity which the people and the government of Pakistan are suffering from is and that this is one more reason for the Prime Minister and the government of India being generous in dealing with Mr Bhutto when he comes for the talks. In other words, the basic position which is sought to be sold by the Pakistani lobby is that that country is merely a spoilt child and that its tantrums therefore ought not to be taken seriously.

According to this reasoning, the government of India is under an eternal obligation to be infinitely patient with Pakistan. Whatever may be the validity of this logic before Bangladesh, it is now clear enough that Pakistan as it now is has no special significance for us in political, economic or cultural terms. It is just

another neighbour, no more, if no less important than Burma or Ceylon. In fairness to Mr Bhutto it must be said that he is not at all muddle-headed on this point. His current diplomatic excursions show that he views Pakistan essentially as a West Asian country the relevance of which to the Indian sub-continent has greatly diminished and is diminishing.

It is in our interest to encourage this trend of thinking in Pakistan and other West Asian countries, particularly Iran and Saudi Arabia, so that we may gradually rid our national psyche of the incubus of Jinnah's nightmare state. Unfortunately, the Pakistan lobby will continue to obstruct this process of rationalisation by confusing issues and peddling one false gospel after another.

I was recently in Cal-

cutta and one of the more important impressions I gathered was that the people who are actually concerned with the revival of industrial activity in West Bengal seem to think that what would be of the greatest relevance is the sufficient availability of raw materials and early prospects of improvement in power generation and distribution. The economic future for West Bengal may in fact be defined as a function of steel plus electricity. Responsible observers suggest that the supply of raw materials and power must vastly improve before any significant results may be achieved in terms of creating productive employment in the state.

To the question whether the leadership of the present state government is adequate for its responsibilities in the economic sphere, I got answers which were rather discouraging. It seems to me that not much faith is being placed in the Chief Minister's qualifications or talents so far as the prompt economic regeneration of West Bengal is concerned. A view I often heard expressed is that Mr Siddhartha Shankar Ray is neither politician enough nor tough enough. It is being freely said that he has come to political prominence and high political authority too easily too soon and that his qualities of leadership therefore still remain to be formed, let alone tested. His chief ministership is widely regarded simply as a gift which has been given to

him by the Prime Minister and that, so far as the people of his own state are concerned, he has still to earn it. Mr Ray then is very much on trial in Calcutta although he may have been taken on trust in New Delhi.

Meanwhile the West Bengal government seems to be doing all the easier things to show that it is concerned about the unemployment prevailing in the state. The Minister for Industries, for instance, has been writing to trade associations and chambers of commerce emphasising the need for business firms recruiting only 'the sons of the soil' for factory employment or clerical or white collar jobs. Here the West Bengal government is only following in the foot-steps of the government of Maharashtra. Nevertheless it is still relevant to point out that jobs have to be created before they can be reserved for 'the sons of the soil'. West Bengal as a state has many legitimate grievances and it is perhaps natural that it should try to unburden itself of them in ways which may be politically attractive. Only, in the process, it should not sin against itself even more than others may have sinned against it. Economic growth must be the first priority of the state government and if it must battle with New Delhi in this cause, it must do so boldly and even rashly and if it finds it necessary to get itself a sufficiently forceful chief minister for the purpose, it need not be over-patient with the dilettantism of Mrs Gandhi's favourite Bengali non-politician.

I am sorry I cannot

congratulate Mr Sudhir Dar of *The Hindustan Times* on his pocket cartoon which appeared on the front page of that paper on May 27. In my view it was an unnecessarily cruel cartoon which made savage fun of an intensely personal and private tragedy. It is true that the involvement of the son of our Deputy High Commissioner in Australia in an act of smuggling hashish into that country has public aspects, but my complaint against Mr Dar is that he has exploited without mercy and with gross insensitivity its 'family' aspect. Incidentally I wonder whether our Deputy High Commissioner in Australia should not be considered by our Ministry of External Affairs for a change of assignment. It seems to me that, a 'home posting for a period would, all thing considered, be a suitable arrangement. Drugs and more especially the international traffic in drugs are now an extremely sensitive business and India's image certainly does not profit when one of its senior diplomats happens to get dragged, however unfortunately or unwittingly, into such episodes.

MOVING FINGER

TRADE WINDS

L. N. Mishra on UNCTAD-III

At a meeting of the Parliamentary Consultative Committee for the Foreign Trade Ministry held on May 31, Mr L.N. Mishra, union Foreign Trade Minister, is understood to have told members that the results of UNCTAD-III have been far from satisfactory. The attitude of the rich nations of the west at the Conference has been unhelpful and negative. In contrast to this, Mr Mishra said the socialist countries of eastern Europe have taken an extremely helpful and constructive stand.

Outlining government's approach to some of the important problems dealt with by UNCTAD-III, Mr Mishra stressed that the developing countries must be actively associated in the search for solutions to the international monetary crisis and remedial measures. The developing countries have suffered enormously on account of the tariff barriers, monetary crisis and other restrictive policies followed by the rich nations of the west. Even Mr McNamara has recognised, in the course of his address at UNCTAD-III, how discriminatory are the tariff walls raised by the rich nations to shut out exports from the developed countries.

Mr Mishra is understood to have criticised the unhelpful and negative role played by the USA in UNCTAD-III. He made it clear that decisions arrived at by the rich western nations, without full consultation with and concurrence of the developing countries, would not be acceptable to India. "We shall not implement unilateral decisions arrived at by

the Rich Men's Club after consultations among themselves", he added.

The committee discussed the problems concerning the textile industry and exports. Members are understood to have stressed the need for speedy implementation of the modernisation programme so that the industry's competitive efficiency could be stepped up and exports increased.

The committee was informed that the textile export trend during the current year has been encouraging. Exports during the first three months of 1972 have been estimated at Rs 34 crores as against Rs 29 crores during the corresponding period of the previous year. Similarly, the downward trend of yarn export has also shown signs of being reversed. For 1972, an export target of Rs 142 crores of textiles has been envisaged as against Rs 106 crores in 1971.

Mr Mishra also informed the members that a Task Force has been set up to review periodically textile exports and formulate suitable measures to rectify "unforeseen situations on an emergent basis".

IDA Replenishments by USA

The US Congress is now reported to have cleared the way for the overdue replenishment of IDA, the World Bank's soft loan agency. A compromise formula has been evolved which should enable the US to ratify the agreement it made with the other donors over its contribution to the \$2,400 million operation. A pledge by the US Congress will provide the full \$960m. which the adminis-

tration had promised. However the first instalment of \$320 million would be paid later than expected, and only after the start of fiscal year 1973.

In the past American practice has been to withhold this authorisation until Congress has approved the whole aid programme and appropriated funds for at least one year's contributions as a sign of good faith. However in this case there is a feeling in the US Treasury that the instrument of ratification should be deposited with the World Bank as soon as possible to enable the whole replenishment to go ahead. Nevertheless, throughout the three years period covered by the agreement the US contribution will be running a year late. This could create technical problems with the Bank's lending schedule.

IDA Aid

The Finance Minister, Mr Y.B. Chavan told the Rajya Sabha that some of the projects in the country would be delayed for want of assistance from the International Development Association (IDA). Mr Chavan said the US was to provide assistance to the tune of \$960 million to IDA for the three year period beginning from July 1971. That had been delayed. "It is understood that the intention is to make the US contribution to the IDA for the three-year period beginning from the next fiscal year commencing from July 1972". Mr Chavan said: "It is likely that further commitments of assistance by IDA will be delayed. The proposal for an IDA credit of \$83 million for the acquisition of oil tankers has been approved but the credit agreement can be signed only after IDA funds.

"Proposals at an advance stage of consideration for IDA assistance were: industrial imports, non-project credit, power transmission project, agricultural universities project and assistance to the industrial Development Bank of India."

The Finance Minister said that in regard to some projects

negotiations had been completed but agreements had not been signed. In some other cases, the World Bank had approved the schemes but agreements could not be signed for want of funds with the IDA.

IDB Transport Survey

An Asian Development Bank (ADB) transport survey team has predicted that the volume of trade in south-east Asia will triple over the next 18 years and the poorly-located and inadequate sea ports of this region will bear the brunt of this growth. The IDB survey covers seven countries: Indonesia, Laos, Malaysia, the Philippines, Singapore, Thailand and Vietnam. Analysis of port possibilities forms part of the survey report.

"Container traffic (alone) will rise from one per cent of general cargo in 1970 to 50 per cent in 1990," the ADB survey team has said. "There will be a need for some \$233 million in new port investments as well as major changes in port management and operation." The ADB projections reveal that the volume of cargo for the whole region will rise from 45.1 million tonnes in 1975 to 118.4 million tonnes in 1990. Port capacity will be strained unless improvements start early enough.

FICCI on Nationalisation

At a meeting held recently the Standing Advisory Committee of the Federation of Indian Chambers of Commerce and Industry expressed the view that in the event the government felt that nationalisation of an industry or business was desirable, the matter should be referred for study to an independent body. This body ought to be entrusted with the task of finding out as to how best the objectives of nationalisation could be realised and also the quantum of payment to be made to those who were dispossessed of their interests in business.

The committee felt that such a payment should be made not only when industrial under-

takings were nationalised but also in the case of take-overs of trade by the government. This was necessary because besides the traders being deprived of their means of livelihood, they had to give compensation to their employees who lost their jobs. The committee pointed out that in the recent past, a variety of imports and even some sectors of internal trade have been canalised and no compensation whatsoever has been paid to the importers or traders. For example, the canalisation of cotton imports has deprived the importers of a gross commission of approximately Rs 80-100 lakhs annually. After the canalisation of cotton imports, the erstwhile importers of this commodity are now in a dilemma.

The committee stressed that the basis of payment for nationalisation of an industrial unit ought to be fair to the shareholders. It regretted that no specific principle had been enunciated by the government in the case of payments to be made to the shareholders of the general insurance companies under the nationalisation bill and even the principles set out in the Insurance Act for the take-over of companies which were mismanaged, had not been followed. Besides being inequitable, the inadequacy of payments to general insurers, the committee feared, was bound to affect the general sentiment and discourage general public from holding any shares as worthwhile assets. The committee called upon the Select Committee of Parliament to which the general insurance nationalisation bill has been referred recently to take the above factors into consideration and provide an economic basis for determining the amounts payable to the erstwhile insurers.

Automation

The Committee on Automation has recommended that the use of computers by commercial and industrial establishments should be subject to a prior agreement with the workers. As far as possible, the needs of computer use should

be met from computer centre facilities, it observes. The ten-member committee headed by Prof V.M. Dandekar submitted its report to Mr R.K. Khadilkar, union Labour Minister on June 2. According to the committee, computer facility should be as far as possible created in the public sector as it is in the nature of a public utility facility. It has recommended the provision of adequate computer service facilities in appropriately located Computer Service centres.

The committee was set up by the central government in July 1969 with Mr R. Venkataraman as chairman, to review among other things the effects of automation in enterprises in which it has already been introduced, to recommend criteria for the determination of areas in which automation may be permitted or restricted and to recommend safeguards for avoiding or minimising any harmful social effects of the introduction of automation. Subsequent to the resignation of Mr R. Venkataraman from the chairmanship of the committee, Prof V.M. Dandekar was appointed the chairman in July 1971.

The report says that if an agreement is reached between the management and the workers on the repetitive use of computers through negotiations on the basis of a justification report, the use of computers should be permitted according to the terms of the agreement. In case no agreement is reached the matter should be referred to a bipartite machinery at the national level, comprising representatives of the employers and trade unions. As for the use of computer on a casual or non-repetitive basis, the job may be directly sent to an approved computer centre with intimation to the workers.

The committee has emphasised the need for appropriate regulation of the use of computers in the present stage of socio-economic development in the country and safeguards to prevent its adverse effects. The use of computers by educational, research and scienti-

fic institutions (non-profit making), statistical organisations of the central and state governments and defence establishments should be permitted, subject to reasonable provisions to protect the existing employment and ensuring proper working conditions.

In August 1971, there were 140 computers in India, out of which 55 were in the private

sector, 39 in public sector undertakings, 10 in government departments and 36 in centres of research and development. A majority of the computers are in use in a few major centres of industry such as Bombay (35), Delhi (20), Calcutta (14), Bangalore (11), and Madras (7). Statewise, the largest number of computers (39) was in Maharashtra, followed by Delhi (20) and

the symbol of new industrial resurgence!

In steel ingots—whose quality can rock any specification!

The quality over which We keep a steel grip.

The kind that leaves nothing to chance!

Not even when it comes to quantity. Some 60 to 80 tonnes a day!

But We aren't going to rest on our oars—soon we shall double it.

By commissioning the second plant!

RATHI ISPAT LIMITED
GHAZIABAD (U.P.)

West Bengal (18).

Bank of Baroda

The annual report of the Bank of Baroda for the year ended December 31, 1971 shows a sizeable rise in deposits from Rs 421 crores to Rs 489 crores. As against an increase in deposits by 12.7 per cent in 1969, 18.6 per cent in 1970, the growth rate in 1971 was 16.18 per cent which was higher than the average growth rate for the previous four years. The deposits of the rural branches of the bank increased by 23.06 per cent and those of semi-urban branches increased by 33.03 per cent during the year under review. This was made possible by the marked increase in the number of branches in rural and semi-urban areas.

The bank's credit expanded from Rs 310.14 crores to Rs 337.47 crores recording a rise of 8.81 per cent only. Because of the tight resources position in the 1970-71 busy season, the bank fell in line with the restrictive credit policy pursued by the Reserve Bank of India.

Even though the bank continued to support the priority sectors of the economy, its advances stood at a lower level in 1971 as compared to the previous year. The outstanding advances to agriculture and small industry did show an increase but outstanding advances to exports and small borrowers declined marginally.

The programme of branch expansion has been carried forward by the bank with great zeal. The bank had 538 branches at the beginning of 1971; out of these 21 were overseas. During the year under review, the bank opened 95 branches—93 in India and two in Fiji islands. Thus the total number of branches of the bank at the end of 1971 totalled 633—610 in India and 23 in foreign countries.

As a result of the all-round progress of the bank, the profit, subject to bonus, for the year stood at Rs 218.79 lakhs as against Rs 143.48 lakhs in 1970. The increase in business

necessitated increase in manpower at various levels; there was a sharp rise of 2652 in the working force to 15,181 at the end of 1971.

ECGC

The Export Credit and Guarantee Corporation Ltd. (ECGC)—a public sector undertaking—has shown sizeable increase in its business in the year ended December 31, 1970. The value of risks cover increased by 19.0 per cent to Rs 318.21 crores during the year under report. Out of this as much as Rs 207.93 crores were accounted for by bank advances covered under the corporation's guarantees. The business under the guarantees accounted for about two-thirds of the total business of the corporation and contributed more than 45 per cent of the total premium receipts.

The total number of policies issued during the year totalled 1,774 out of which as many as 952 were issued to exporters who came into the corporation's fold for the first time. At the end of the year as many 3,361 policies were current and the maximum liability of the corporation under them came to Rs 156.22 crores.

The premium income for the year under review amounted to Rs 95.77 lakhs as compared to Rs 70.47 lakhs in 1969 showing an increase of 35.9 per cent. The total value of claims paid during the year was Rs 10.97 lakhs as against Rs 9.47 lakhs in 1969.

The corporation now covers about seven to eight per cent of the total exports of the country or roughly 20 per cent of the insurable exports under its insurance schemes. According to the chairman, Mr T.R. Varadachary, there can be only two reasons for the large number of exporters doing business without seeking the protection of ECGC: (1) lack of knowledge or understanding of the corporation's schemes; and (2) the cost of insurance cover. The directors of the corporation feel that more effective publicity for the

schemes operated by the corporation would go a long way in bringing more exporters to its fold. Consequently, arrangements have been made to launch a concerted publicity campaign and to give the corporation a new symbol which will signify the new dynamism which is being injected into the organisation.

Lotteries and Crossword Puzzles

The Finance Act of 1972 has made provisions in the Income-Tax Act for deduction of tax at source from winnings from lotteries or crossword puzzles and from payments made to contractors and sub-contractors at the specified rates with effect from June 1, 1972.

Every person responsible for making any payment by way of winnings from any lottery or crossword puzzle being an amount exceeding Rs 1000 will be under statutory obligation to deduct income-tax at source from such payment. Income-tax will be deductible from prizes given after May 31, 1972, even if the relevant draw or competition may have been held on or before that date. Where prizes are paid in instalments, tax will have to be deducted on each instalment paid. Liability for deduction of tax will arise in all cases except where the prizes are paid entirely in kind.

Provision for deduction of tax from payments to non-residents already exists under Section 195. According to the amendments now made, every person responsible for making any payment to a resident contractor and every contractor, not being an individual or Hindu undivided family, making any payment to a resident sub-contractor, will be under statutory obligation to deduct income-tax at source from such payment. The provision will apply only in relation to 'work contracts' and 'labour contracts' and will not cover contracts for sale of goods. No deduction is required to be made if the consideration for the contracts

does not exceed Rs 5000. Income-tax will be deductible in cases where the payments are made after May 31, 1972, even in relation to contracts or sub-contracts entered into on or before that date.

Engineers India

Engineers India Limited, a public sector undertaking under the Ministry of Petroleum & Chemicals provided engineering and consultancy services from concept to commissioning to a broad range of industrial projects both in the public and private sectors during the year 1970-71, according to the Annual Report of the company.

The company, which was set up in March 1965, had a total turnover of Rs 277.63 lakhs as compared to the previous year's turnover of Rs 182.91 lakhs, earning a gross profit of Rs 79.24 lakhs. This was Rs 29.12 lakhs more than the gross profits earned in 1969-70.

During the year under review the company was engaged in design engineering, equipment procurement, construction and supervision of the Haldia Refinery, Koyali Aromatics Project, Cochin Refinery Expansion and Coke Calcination Plant and LPG bottling facilities at Barauni. The modernisation of LPG facilities at Barauni and the Coke Calcination Plant there had been completed.

During the year, the company also provided a whole range of services for petroleum refineries, petrochemical and chemical plants, fertilizer plants, breweries, offshore engineering, ports and harbour engineering and non-ferrous metallurgical plants.

Mineral Resources

Several important measures were taken during 1971-72 to ensure planned conservation, exploitation and rapid development of mineral resources in the country, which constitute an important base of economy. This has been revealed in the annual report of the

Department of Mines for 1971-72.

During the year under review the government decided to set up an explosives factory in the public sector. Preliminary examination of the techno-economic feasibility report of the project has been completed and further action is in progress.

A long-term national programme for exploration and quantitative evaluation of groundwater resources in all the major river basins, minor and sub-basins and in hard-rock areas was launched by the Geological Survey of India in the country. Under this programme 430 permanent groundwater level observation stations were set up. In the hard rock areas of Chotanagpur plateau, Deccan Trap area in central India, interior parts of Andhra Pradesh, northern Mysore and in Rajasthan and Gujarat surveys for groundwater resources were undertaken.

During the year management of 214 coking coal mines and 12 coke oven plants was taken over. This was done to ensure scientific exploitation of coking coal mines and proper conservation of limited resources of coking coal. With this, about 50 per cent of the production capacity of coal in the country has been brought in the public sector.

Copper: To ensure conservation and exploitation of copper deposits in the Singhbhum belt in Bihar in a scientific and rational manner, government took over the management of the private sector Indian Copper Corporation through an Ordinance. This has been a significant measure as this will enable to increase production on priority basis. During the year, the Khetri Copper Project in Rajasthan made satisfactory progress. The concentrator plant of Khetri project is expected to be commissioned by the end of 1972 and production of copper will commence towards the end of 1973. The targeted production of 31,000 tonnes of copper metal and two lakh tonnes of triple super-phosphate is expected to be achieved by 1975.

Aluminium: Work on the first phase of the Korba complex, one of the two projects of Bharat Aluminium Co., has made considerable headway. The alumina plant of this project is scheduled to be commissioned in early 1973. In the second phase the smelter and rolling mill are expected to be commissioned in phases starting from September, 1974. Another aluminium project, the Koyna plant, will be completed by 1975-76.

Ore Production: The expansion and modification scheme of the Kiriburu mines, which will supply ore to Bokaro Steel Plant made considerable progress during the year. The project is expected to be completed by August 1973. Bailadila project (Deposit No. 5) being developed for the production of four million tonnes of ore annually for export to Japan is likely to be completed by June 1974.

Export: Export of iron ore increased from 0.8 million tonnes in 1950 to nine million tonnes in 1960 and 20.82 million tonnes in 1970-71. During 1970-71 such exports fetched about Rs 115 crores in foreign exchange. The anticipated exports during 1971-72 are placed at 21.5 million tonnes. In achieving the remarkable progress in the last decade, the National Mineral Development Corporation Ltd played a notable role.

Coal: The year 1971-72 has been a hard one for the coal industry. There was large unutilised capacity in the coal mines due to shortage of transport and non-materialisation of demand, particularly from metallurgical consumers. Thus the coal industry during the year continued to face serious difficulties due to poor wagon availability for the transport of coal and shortfall in the estimated off-take of coal by the steel plants, and other large consumers. This resulted in piling up of pit head stocks. The pit head stocks were as much as 9.21 million tonnes at the end of 1970-71 and 8.40 million tonnes at the end of November 1971 as against normal level

of about six million tonnes.

Tourism and Civil, Aviation

At a meeting of the Consultative Committee of Members of Parliament of the Ministry of Tourism and Civil Aviation held on May 17, Dr Karan Singh said that with the commissioning of Air-India's flight kitchens, "Chefair", the Indian Airlines were picking up a large proportion of their flight meals from them. This had led to a considerable improvement in quality of food served over board. The Minister added that by 1973, India Tourism Development Corporation's hotel being set-up at Calcutta will start providing food for the two airlines.

Regarding the punctuality performance of the Indian Airlines, Dr Karan Singh said that he was concerned over the deterioration in the services of the airlines. He explained that a variety of reasons were responsible for the unpunctuality of Indian Airlines services including weather, technical and operational. Since Indian Airlines could not afford to keep spare aircraft in the regions, if a flight was delayed for any reason, a number of consequential delays became inevitable, he added.

Speaking in the context of the jumbo jets, the Minister told the members that expenditure on a new aircraft was higher in the first year of operation because of outlay on spares, stores and equipment, interest on loans and burden of depreciation and insurance. He expressed hope that with the addition of third and fourth jumbo jets to the fleet shortly, and the steady rise in passenger traffic, the losses will come down.

A suggestion was made by Mr Shankar Dayal Singh that the variety of articles offered for sale at the duty free shops at international airports should be increased. Dr Karan Singh explained that a sum of Rs one lakh had already been spent on the renovation and decoration of the duty free shop run by the India Tourism Development Corporation at Santa Cruz and the development and expansion of such shops at other airports would be taken up shortly.

Revenue Collections

During the financial year 1971-72, the revenue realised by the central government under various heads and revenue from opium amounted to Rs 3803.15 crores. This was Rs 667.91 crores more than the collections during the year 1970-71. The revenue collected in March 1972 was Rs 523.33 crores as against Rs 424.39 crores in the corresponding month of the previous year.

The following are details of the revenue collected under various heads:

Revenue Heads	(Rs lakhs)			
	During March		Upto March	
	1972	1971	1971-72	1970-71
Customs	7,719	7,000	68,365	49,462
Union Excise (excluding cess on salt, rubber, coal and Iron ore)	20,908	16,133	2,08,746	1,76,767
Corporation Tax	10,571	7,275	48,669	38,556
Income Tax	12,208	11,247	49,680	45,260
Wealth Tax	524	301	2,530	1,558
Expenditure Tax	73	52	354	236
Gift Tax	233	235	906	777
Estate Duty	97	196	1,065	908
Opium				
Total	52,333	42,439	3,80,315	3,13,524

Madras Refineries

Madras Refineries Limited processed during 1970-71, the second year of its operation, 2.09 million tonnes of Darius Crude, achieving a throughput of 84 per cent of the installed capacity. Asphalt production increased from the designed capacity of 3.23 per cent to 6.4 per cent of crude throughput.

A joint venture of the government of India, the National Iranian Oil Company and Amoco India Incorporated, a subsidiary of American International Oil Company, the Madras Refineries Limited earned during 1970-71 a net profit of Rs 405.01 lakhs. In 1969-70 the company had showed a loss of Rs 367.31 lakhs

According to the Annual Report of the company for the period July 1, 1970 to June 30, 1973 the refineries exported 1,35,623 tonnes of Naphtha earning foreign exchange of \$22,87,540.

Foreign Exchange for Import of Crude

The Minister for Law and Justice and Petroleum and Chemicals, Mr H.R. Gokhale informed members of the Parliamentary Consultative Committee of the Ministry of Petroleum and Chemicals on May 27 that the government had not accepted the price increases claimed by the three foreign oil companies and that foreign exchange for crude was being released to them on an *ad hoc* basis determined in 1971 to meet the developing emergency at that time.

The committee was told that, as a result, oil companies were importing lesser quantities of crude by charging higher prices. The deficit in product availability was being made good by import of petroleum products whose prices have presently slumped in contrast to the foreign oil companies claim of increases in crude oil prices.

The Minister informed members that after the Tehran Agreement of February 1971 between international oil companies and Organisa-

tion of Petroleum Exporting Countries, the oil companies in India had also asked for an increase in the prices of petroleum products commensurate with the increase in their "tax paid costs" of crude. The government decided to increase from May 28, 1971 the FOB value of each major petroleum products by only eight per cent as against 16 per cent claimed by these companies. These prices have continued to be in force except for changes on account of excise duties levied from time to time. The government had not agreed to any increases in ex-refinery prices beyond eight per cent.

Mr Raja Kulkarni said that in view of the Tehran agreement between international oil companies and OPEC which had put consumer countries on the defensive, the government should reorient its national oil policy and urged that decision may be taken soon on the three alternatives before it viz nationalisation of foreign oil companies in a broad economic sense, holding majority shares in those companies and revision of the refinery agreements with them earlier than it was due. He also suggested that government may consider offering excise concessions to bring down prices of petroleum products.

The Minister informed the members that a detailed study of the various alternatives open to the government to deal with the question of refinery agreements and other connected matters had been undertaken. A final view would be taken after this study had been completed.

The members were also told that offering of excise concessions to cut down prices of products will only boost up demand whereas the government was striving to curb consumption of certain products to depress crude import requirements. Moreover, excise concessions will mean loss of revenue to the government.

Raising the issue of structural changes in Public Sector undertakings in the oil industry, Mr Raja Kulkarni pointed out that the Malviya Committee set up to review working of the Oil and Na-

tural Gas Commission had so far not submitted its recommendations to the government. Meanwhile, the Public Undertakings Committee of Parliament had made certain suggestions in their report regarding structural changes in the ONGC. The government may, therefore, consider acting on the PUC report to stem deterioration in the performance of ONGC. He also suggested that a common holding company may be formed for the Indian Oil Corporation and the Oil and Natural Gas Commission.

Names in the News

Mr R. Ray Chaudhuri is taking over as General Manager of the Assam Oil Company Limited, a subsidiary of The Burmah Oil Company Limited, in June. He will be the first Indian to hold the post. Mr J. W. Wilkinson, who was the General Manager of the company before Mr Ray Chaudhuri, is proceeding on leave prior to taking up a senior appointment with Burmah Oil Group in Australia.

Mr Ray Chaudhuri, who has successively held the posts of Chief Marketing Manager, Operations Manager and Technical Manager of Assam Oil Company, has wide experience of all aspects of petroleum industry covering crude oil production, refining operation, distribution and marketing.

Mr Geoffrey Cross has been appointed Managing Director of International Computers (Holdings) Ltd, and International Computers Ltd.

Mr M. L. Capoor of Dunlop and Mr S. K. Datta of William Jacks have been elected Chairman and Vice-chairman respectively of the Calcutta Import and Export Trade Association for 1972-73. The other members of the committee are: Mr V.S. Bhatia (Industrial Development Services), Mr R.C. Chaudhuri (Imlemex India), Mr H.C. Dewan (Bata Shoe), Mr M.L. Nayar (India Tobacco), Mr Aloke Ray (Union Carbide) and Mr D.K. Choudhuri, the past chairman, are ex-officio members.

COMPANY AFFAIRS

India Tobacco

INDIA TOBACCO Company Ltd has declared a final dividend of 7.5 per cent for the year ended March 31, 1972, which together with the interim makes a total of 14.5 per cent against 14 per cent paid for 1970-71. The pre-tax profit has edged up from Rs 7.42 crores to Rs 7.59 crores during the year under review. The directors have enhanced the allocation to development rebate reserve by Rs 12.74 lakhs to Rs 23.41 lakhs while taxation has claimed Rs 3.56 crores as against Rs 3.84 crores in 1970-71. This leaves a higher net profit of Rs 3.80 crores as compared to Rs 3.47 crores in the preceding year.

National Tobacco

National Tobacco Co. of India Ltd has maintained the equity dividend for 1971 at 10 per cent. Despite a smart rise in sales from Rs 27.43 crores to Rs 29.04 crores the company's net profit has declined to Rs 15.02 lakhs from Rs 21.56 lakhs in the preceding year. The net profit has been arrived at after providing Rs 11.73 lakhs for depreciation, Rs 70,403 for development rebate reserve and Rs 19.90 lakhs for taxation as against Rs 12.46 lakhs, Rs 26,687 and Rs 27.32 lakhs provided respectively in the previous year. The entire net profit had been transferred to the general reserve. The dividends—equity and preference—will be paid out of the general reserve. The directors have attributed the reduction in profit margins to substantial increase in operational and material costs and to a steep rise in prices of cigarettes brought about by heavy imposts in excise levies.

Exports have amounted to Rs 2.72 crores in 1971 as

against Rs 2.24 crores in 1970. The company is currently engaged in developing tobacco cultivation in the new areas of Mysore state where there are good prospects for producing exportable flue-cured virginia tobacco of superior quality.

Metal Box

Metal Box Company of India Ltd has declared a final equity dividend of six per cent for the year ended March 31, 1972 which with the interim makes a total dividend of nine per cent as against eight per cent paid for 1970-71. During the year under review the company has earned a higher pre-tax profit of Rs 1.85 crores as compared to Rs 1.69 crores in the previous year. Out of the profit a sum of Rs 94.79 lakhs was earmarked for taxation, Rs 13.75 lakhs for development rebate reserve, Rs 15 lakhs for debenture redemption reserve and Rs six lakhs for general reserve.

Bharat Commerce

An extraordinary general meeting of Bharat Commerce and Industries Ltd will be held in New Delhi on June 26 to consider the company's proposal to issue 25,000 third redeemable cumulative preference shares of Rs 100 each to the public for subscription. The preference shares will be offered at par and the entire amount is payable in full on application. The preference shares will be carrying dividend at the rate of 9.5 per cent per annum free of company's tax but subject to deduction of tax at source and they will be redeemed by the company at par after December 31, 1982 but not later than June 30, 1984 by giving not less than three months' notice to the holders of such shares.

In case the public issue is

oversubscribed, the shares will be allotted to the applicants in the manner as may be decided in consultation with the Calcutta Stock Exchange. The company has embarked on a substantial renovation and modernisation programme in some of its units and the proceeds of this issue will be utilised for financing these schemes.

Ceat Tyres

Although the supply position of tyres is quite comfortable during the current year, shortages are likely to arise in 1973 and the situation may become even critical in 1974 unless immediate steps are taken to license additional capacities. Moreover, it is desirable to have a small surplus in the licensed capacity as it will serve as a safeguard and a cushion against plant stoppages and recurrence of shortages. Mr P. A. Narielwala, Chairman of Ceat Tyres of India Ltd had made these observations in his annual statement circulated to the shareholders of the company.

As it takes anything between 24 and 30 months to install a new plant and commission it into production the chairman had urged the government to permit either the existing units to expand or grant licences for the setting up of new units. Meanwhile the company has submitted to the government an application for establishing a new automotive tyre factory for producing 400,000 tyres per annum in an underdeveloped area of one of the states. The proposal is still under the consideration of the government.

Although the supplies of raw materials was more or less satisfactory, the unilateral increases in prices resorted to by the suppliers were causing much embarrassment and great concern to the industry. As the

selling prices of tyres cannot be altered without the permission of the government the industry is not in a position to pass on to the consumers the increase in the direct material costs of its products. Representations are being made to the government but with no encouraging response so far.

The year 1971 was a significant year for the company. The expansion programme was completed ahead of schedule. The result had been a spectacular improvement in the company's output of tyres from 483,544 units in 1969 to 724,265 units in 1971 and a handsome rise in profits. The company too had made satisfactory progress in the implementation of its bicycle tyre plant at Nasik. The plant is expected to go on stream in the second half of the current year. Its performance on the export front was also equally impressive. Its exports in 1971 amounted to Rs 2.09 crores and the company had more than fulfilled the guarantee given by it to the government for exporting 10 per cent of its total production. Encouraged by the working results the directors have declared a higher dividend of Rs 15 per share, an increase of 36 per cent above the dividend of Rs 11 per share distributed in each of the years of 1969 and 1970. It is heartening to note that the new 30,360 rights shares issued by the company to the Indian shareholders at a premium of Rs 100 per share had been oversubscribed. The company had received amounts totalling Rs 66.44 lakhs.

With the plant continuing to run at more than its full capacity during the first four months of the current year and a ready off-take of the entire output the company is looking forward confidently to another successful and profitable year.

News and Notes

Expansion & Diversification

The Indian Cable Company Ltd has started manufacturing for the first time in India, continuously transposed conductors (CTC), a major development in the field of high

voltage transformer winding. Commissioned in March 1972, INCAB's new CTC plant is claimed to be the only one of its kind in Asia, apart from Japan. Continuously transposed conductors incorporate a number of individual rectangular copper conductors each covered with polyvinyl acetal-based enamel having excellent and well proven resistance to transformer oils and abrasion. Arranged in two groups side by side with a paper separator in between 5 to 31 (always on odd number) such enamelled conductors are continuously transposed mechanically and paper-lapped overall. As opposed to individual paper lapping of conventional conductors, CTC greatly improves the winding space factor, reduces stray losses and loads to better heat dissipation resulting in efficient cooling of power transformers. All these add up to considerable savings in material, time and labour costs.

Omega Cables has taken up the manufacture of armoured cables up to 4 core $\times$ 16 sq. mm. size. In addition to the two extruders one more was installed during November last to cover the manufacture of cables of sizes from 6 mm to 12 mm. OD. The company has also under consideration to take up the manufacture of new varieties such as cross-linked polythene cables to replace paper insulated cables in 1.1 kv to 11 kv varieties, radio frequency cables (used in sound recording and communication equipments in studios) and asbestos covered cables for ships and furnaces. Recently it has developed a new type of cable called the 'Television radio suppression cable' and it will be meeting the requirements of defence services, automobiles, television and a host of other industries.

New Venture

Saru Engineering Corporation has commissioned its new plant designed for the manufacture of aluminium, and aluminium alloys. Its aluminium tube drawing unit is expected to go on stream shortly, while its rerolling mills and wire drawing and wire flattening plants are

scheduled to commence production in August. On completion of the entire manufacturing schedule, the company's turnover is expected to be around Rs three crores.

Joint Venture

Phaltan Sugar Works Ltd, Maharashtra, is setting up a sugar unit in Malaysia in collaboration with the State Industrial Development Corporation of Negri Sembilan. The plant will have installed capacity of 2,500 tonnes per day. Crushing activities are expected to be started in early 1974. Messrs Phaltan Sugar Works will be providing all the technical know-how right from sugarcane cultivation to sugar production as well as marketing. The capital outlay on the project is estimated at Rs 15 crores.

New Issues

Rathi Ispat Ltd is offering for public subscription 2,00,000 equity shares of Rs 10 each and 5,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each, both at par. The list for the fully underwritten issue opens on June 12 and will close on June 21 or earlier but not before June 14. Applications for shares must be for a minimum of 50 shares of multiples thereof in the case of equity shares and five shares or multiples thereof in the case of preference shares. The proceeds of the issue will be utilised for financing partly for the installation of the second 10-tonne electric arc melting furnace at its factory at Ghaziabad, UP. The plant will be producing mild steel and alloy steel, ingotstor, steel and other sophisticated steel items and is expected to go on stream by the end of June. The project cost for the second phase is estimated at Rs 66 lakhs and it will be financed through the present public issue of Rs 25 lakhs, term loans of Rs 23.40 lakhs and internal sources of Rs 17.60 lakhs.

The company has already commissioned its first electric arc furnace and it went into production in September last. During the year ended March

31, 1972 the company earned a gross profit of Rs 15.69 lakhs while its sales amounted to Rs 84.62 lakhs. During the year ending June 1972, the gross profit is expected to be around Rs 25 to Rs 27 lakhs. The company has declared recently a maiden interim equity dividend of five per cent, and hopes to pay a final dividend of five per cent during the current year. The directors are hopeful of raising the dividend to 12.5 per cent for 1972-73.

Vidarbha Glass Works will be issuing shortly for public subscription equity shares worth Rs six lakhs. The company proposes to manufacture 2700 tonnes of glass bottles per annum in the first two years and more than double the production thereafter. Land has already been acquired at Nagpur and construction of buildings and erection of plant and machinery is proceeding apace. If all goes well the plant is expected to commence production in October 1972. As the present requirement of glass containers in the central region is met entirely from manufacturers from other parts of the country, a glass factory in Nagpur can attract a fairly large volume of business in view of the substantial savings in freight. Hence the company does not expect any difficulty in marketing its products. The cost of the project is estimated at Rs 25.55 lakhs.

The debenture issue of Surat Electricity Company Ltd which opened for subscription on May 29 had been oversubscribed and hence the subscription list was closed on May 31. The company offered for public subscription 50,000 (eight per cent) convertible debentures of Rs 100 each at par for cash payable in full on application.

Capital and Bonus Issues

Consent has been accorded to 17 companies to raise capital of over Rs 18.17 crores. Six of them are to issue bonus shares totalling over Rs 95.17 lakhs and the amount of bonus shares ranges between Rs 1.50 lakhs and Rs 65.08 lakhs. Following are the details:

The Share Investment Trust

Private Limited, Bombay, has been accorded consent, valid for three months, to capitalise Rs 1,50,000 out of its Free Reserves and issue fully paid equity shares of Rs 1000 each as bonus shares in the ratio of one bonus share for every two equity shares held.

The India Thermit Corporation Limited, Gwalior, has been accorded consent, valid for three months, to capitalise Rs 10,00,000 out of its General Reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one bonus share for every two equity shares held.

Sukhjit Starch & Chemicals Limited, Phagwara, Punjab, have been accorded consent, valid for three months, to capitalise Rs 8,99,150 out of its General Reserves and issue fully paid equity shares of Rs 10 each, as bonus shares, in the ratio of one bonus share for every one equity share held.

Gokak Mills Limited, Bombay, has been accorded consent, valid for three months, to capitalise Rs 65,08,000 out of its General Reserves and issue fully paid equity shares of Rs 100 each, as bonus shares, in the ratio of one bonus share for every two equity shares held.

Recondo Private Limited, Bombay, has been accorded consent, valid for three months, to capitalise Rs 3,00,000 out of its General Reserve and issue fully paid equity shares of Rs 10 each, as bonus shares, in the ratio of one bonus share for every equity share held.

National Wire Herald Works Private Limited, Bombay, has been accorded consent, valid for three months, to capitalise Rs 6,60,000 out of its general reserve and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of three bonus shares for every equity share held.

The Industrial Credit & Investment Corporation of India Limited, Bombay, has been accorded consent, valid for 12 months, to issue redeemable unsecured debentures of the value of Rs seven crores in units of

Rs 3,000 each for cash at 99.5 per cent of the nominal value. The debentures will carry interest at six per cent per annum and will be redeemed at par after the expiry of 12 years. The proceeds will be utilised to augment the rupee resources for meeting the demands of industries for financial assistance.

The Coromandel Engineering Company Private Limited, Madras, has been granted consent for issue of Rs two lakhs value of equity shares of Rs 100 each, to be offered to the existing shareholders of the company for cash at par on rights basis. The proceeds of the issue will be utilised in meeting the working capital requirements of the company.

Aluminium Corporation of India Limited Calcutta, have been granted consent for issue of Rs 250 lakhs capital comprising of Rs 100 lakhs in 9.5 per cent redeemable preference shares and Rs 150 lakhs in equity shares. All the shares will be issued for cash at par. The proceeds of the issue will be utilised in financing an integrated aluminium plant with an annual capacity of 30,000 tonnes of aluminium metal in Orissa.

Modi Rubber Limited, Modinagar, has communicated to the government its proposal to issue capital under clause 5 of the Capital Issues (Exemption) Order, 1969, to the value of Rs 3,60,00,000 in equity shares of Rs 10 each to be offered to the public for providing part of the finance required for implementing the automobile tyre and tube project.

Rajgarh Tea Company Limited, Calcutta, has been accorded consent to issue a capital of Rs six lakhs in equity shares of Rs 10 each as rights shares in the ratio of one equity share for every share held. The proceeds will be utilised for meeting a part of the purchase price of the Tinkong Division of Assam Consolidated Tea Estates (India) Limited. The consent is valid for 12 months.

Andhra Pradesh Paper Mills Limited, Bombay, has communicated to government its

proposal to issue capital under clause 5 of the Capital Issues (Exemption) Order, 1969, to the value of Rs 75,00,000 in equity shares of Rs 100 each as right shares for cash at par for expansion under the crash programme for paper initiated by government.

Voltas Limited, Bombay, has been accorded consent for issue of capital of Rs 103,89,600 in equity shares of Rs 100 each, as right shares for cash at premium of Rs 50 per share. The proceeds will be utilised for augmenting the working capital requirements of the company. The consent order is valid for 12 months.

Andhra Sugars Limited, Andhra Pradesh, has been accorded consent to the issue of 8½ per cent debentures of the value of Rs 35 Lakhs, to be offered to the Unit Trust of India for cash at par.

English Electric Company of India Limited, Calcutta, have been granted consent to further issue of Rs 25 lakhs in 2,50,000 equity shares of Rs 10 each, for cash at a premium of Rs three per share. The shares will be offered on rights basis only to the Indian shareholders of the company. The object of the issue is to raise Indian participation in the share capital from 25 per cent to 33½ per cent.

Punjab Tractors Limited, Chandigarh, has communicated to government of their proposals to issue capital under clause 5 of the Capital Issues (Exemption) Order, 1969, to the extent of Rs 140,00,000 (including Rs 7,02,030 already subscribed) divided into 11,00,000 equity shares of Rs 10 each and 30,333 9.5% per annum cum. red. preference shares of Rs 100 each, for cash at par. The proceeds are for establishing a plant for the manufacture of 5,000 'Swaraj' 20/30 HP agricultural tractors per annum at Mohali Industrial Estate, Punjab.

Engineering Construction Corporation Limited, Bombay, has been granted consent to the issue of Rs 25 lakhs in 2,50,000 equity shares of Rs 10 each, to be offered to the existing shareholders of the company, for cash at par. The object of the

issue is to increase the liquid resources of the company for meeting increased turnover.

Company Meetings

The Century Spinning and Manufacturing Company Ltd; Birla Matushri Sabhagar, 19, Marine Lines, Bombay-20; June 14; 4 P.M.

Textile Machinery Corporation Ltd; Registered Office Belgharia, Calcutta-56; June 28; 4 P.M.

Coromandel Fertilisers Ltd; 126, Sarojini Devi Road, Secunderabad; June 21; 11.00 A.M.

Interim Dividends

Pfizer Ltd has declared the first interim dividend of 50 paise per share of Rs 10 each for the current year ending November 30, 1972. This dividend is payable on an enlarged capital resulting from the recent issue of bonus shares in the ratio of two shares for every

five shares held. In 1970-71 the company had declared four interim dividends totalling 27 per cent, the first two of 60 paise each, the third of 70 paise and the last one of 80 paise per share.

Alkali and Chemical Corporation of India Ltd has maintained the interim equity dividend at 7.5 per cent for the year ending September 30, 1972.

Rathi Ispat Ltd has declared a maiden interim dividend of five per cent for the year ending June 30, 1972.

Chemicals and Fibres of India has announced an interim dividend of 10 per cent for the year ending September 30, 1972 on the increased capital of Rs 5.35 crores resulting from the rights issue and public issue of shares. The company paid in 1970-71 a first interim of 11 per cent and a second interim of 10 per cent on the capital of Rs 4.90 crores. It paid a final divi-

Licences & Letters of Intent

The following licences and letters of intent were issued under the Industrial (Development and Regulation) Act 1951, during the three weeks ended March 18, 1972. The list contain names and addresses of the licensees, articles of manufacture type of licences—New Undertakings (NU); New Articles (NA); Substantial Expansion (SE); Carry on Business (COB); Shifting—and annual installed capacity.

Licences Issued

Metallurgical Industry (Ferrous)

M/s. Bhoruka Steel Ltd, 57/58, 2nd Cross, New Kalasipalyam Extn., Bangalore-2, Mysore. (Bangalore—Mysore) —M.S. Billets—50,000 tonnes p.a.—(NU); M/s Hyderabad Tools (P) Ltd, 4-1-920, Dinabad Estate, Tilak Road, Hyderabad-1. (Visakhapatnam—Andhra Pradesh)—Ferro Silicon—20,000 Tonnes p.a.—(NU); M/s Steel Complex Ltd, Wisco Manor Feroke, Kerala. (Calicut—Kerala)—Mild, Medium, Carbon and Spring Steel Billets—50,000 tonnes p.a.—(NU).

Fuels

M/s The Tata Iron and Steel Co Pvt Ltd, Bombay House, 24, Bruce Street, Fort, Bombay-1. (Jamadoba/Sijua/Bihar)—Coal (at Jamadoba and Sijua) & 80 million—1.20 million/tonnes p.a. after expansion respectively)—(SE).

Electrical Equipment

M/s Sahney Kirkwood Commutators Pvt Ltd, 27, Kirol, Near Vidyabihar Station, Bombay-77. (Kirol—Ghatkopar—Bombay—Maharashtra)—Micanite Products—240 tonnes—(NA); M/s Standard Batteries Ltd, Vakola, Santa Cruz, Bombay-55, (Maharashtra)—Train Lighting Cells—Capacity 24,000 Nos. p.a. capacity will be 48,000 nos. p.a. after expansion—(SE); M/s Bijlee Products (India) Pvt Ltd, 70, Hadapsar, Industrial Estate, Poona-19. (Poona—Maharashtra)—Motor car Head light

side and Tail Lamps—3 million Nos. p.a.; Photo flash lamps—1.5 million Nos. p.a.—(SE); M/s Gramophone Co of India Ltd, 5, Old Court House Street, Calcutta-1. (Calcutta—West Bengal)—I. Pick up Cartridges for complete equipment and replacement purpose—2,30,000 nos. p.a.; Pick up cartridges for export—12,000 nos. p.a. (Total capacity for (I) 350,000 Nos. p.a.; II. Stylus for replacement purposes—1,80,000 nos. p.a.; Stylus for exports—1,20,000 nos. p.a.—(Total capacity for (II) 3,00,000 Nos. p.a.—N.A.; M/s D.P.V. Industries, Pollachi Road, Podanur Post, Coimbatore-18. (Coimbatore—Tamil Nadu)—Electrical Stampings—1,800 tonnes p.a.—(NU).

Telecommunications

M/s Nippon Electronics (India) Pvt Ltd, Bull Temple Road, P.B. No. 1905, Bangalore-19. (Bangalore—Mysore)—Plastic Film Capacitors.—Expansion from 5.0 million nos. p.a. to 15.0 million nos. p.a.—(SE).

Transportation

M/s Standard Radiators Pvt Ltd, Industrial Estate, Baroda-3. (Baroda—Gujarat)—Radiators—24,000 Nos. p.a.—(NU).

Industrial Machinery

M/s Shalimar Wires and Industries Ltd, 25, Ganesh Chandra Avenue, Calcutta-13. (Calcutta—West Bengal)—Dandy Rolls for Paper Mills Machinery. (capacity to be determined, after-words)—(NA); M/s Elecon Engineering Co Ltd, Vallabh Vidyanagar, Distt. Kaira, Gujarat. (Vallabh, Vidyanagar—Distt. Kaira—Gujarat)—Large capacity mobile crawler mounted and rail mounted type spreaders for overburden and free flowing material such as iron ore, lignite, manganese ore and coal, etc.; Bucket Wheel and Bucket Drum Stackers/Reclaimers/Blenders and Excavators; Mobile Scrapers for reclaiming Fertilizers from Silos; Rotary Disc Loaders—Rs 34.00 lakhs p.a.—(COB); M/s Jessop & Co Ltd, 63, Netaji Subhas Road, Calcutta-1. (24-Parganas—West Bengal)—Aerial Ropeways—Rs 5 crores p.a.—

(NA); M/s Bharat Heavy Plate and Vessels Ltd, Post Box No. 100, Visakhapatnam-1 A.P. (Visakhapatnam—Andhra Pradesh)—Oxygen, Nitrogen and other gas separation plants—Worth Rs 600 lakhs per annum; Multilayer Vessels for high pressure—Worth Rs 96 lakhs p.a.—NA.

Machine Tools

M/s Promain Ltd, D-24, Himalaya House, 2nd Floor, Kasturba Gandhi Marg, New Delhi-1. (Ballabgarh—Gurgaon—Haryana)—Bar Twisting Machine—Rs 4.5 lakhs p.a.; Straightening Machine—Rs 3.5 lakhs p.a.; Cold Shears—Rs 1.5 lakhs p.a.; Equipment for finishing of Tubes such as; (a) Straightening Machines—4.5 lakhs p.a.; (b) End Milling Machines—2.5 Lakhs p.a.; (c) Threading Machine—4.0 Lakhs p.a.; (d) Embossing Machine—1.0 Lakhs p.a.; Complete Tube Galvanising plant (6" size) including furnace etc.—Rs 15.0 lakhs p.a.; Draw Benches for Bars and Tubes Rs 3.5 lakhs p.a.; Swaged Poles—Complete Plant—Rs 8.0 lakhs p.a.; 8.6" Tube Mills—20.0 lakhs p.a.—(NA); M/s Raja Bahadur Motilal Poona Mills Ltd, Hamam House, Hamam Street, Fort, Bombay-1 BR. (Poona—Maharashtra)—Internal Grinding Machines (Max. swing over table 400 mm Max min diameter to be ground 125/8 mm)—24 nos. p.a. (Worth Rs 16.80 lakhs)—(NA).

Agricultural Machinery

The Chairman & Managing Director, Hindustan Machine Tools Ltd., P.O. HMT, Bangalore-31. (Pinjore—Haryana)—Agricultural Tractors 'Zetor' (Model 2011/2511 of 20 HP)—(NA); M/s Raja Bahadur Moti Lal Poona Mills Ltd, 5, Raja Bahadur Moti Lal Road, P.O. Box No. 50, Poona-1. (Maharashtra)—Agriculture Tractors (Indigenous-37 HP—10,000 Nos p.a.—(NA).

Office and House Hold Equipment

M/s IBM World Trade Corporation, Nehru House, 4-Bahadur Shah Zafar Marg, New Delhi. (Bombay—Maharashtra)—Key Punch Model-

129—2,000 Nos. p.a.—(NA).

Chemical (other than fertilizers)

M/s Eastern Air Products Private Ltd, 1 & 2, Industrial Estate, Govindpura, Bhopal (MP)—Oxygen Gas—0.45 million cubic meters p.a.—(SE); M/s Bombay Oxygen Corpn Ltd, 5-Convent Street, Colaba, Bombay-1 (BR) (Muland—Bombay—Maharashtra)—Oxygen Gas—0.45 million cu. m. p.a.—(SE); M/s Allied Resins and Chemicals Limited, 13, Camac Street, Calcutta-17. (Rampur—West Bengal)—Paraformaldehyde—600 tonnes p.a. with existing capacity for Formaldehyde—(NA).

Drugs and Pharmaceuticals

M/s Chemical Industrial and Pharmaceutical Laboratory Ltd, 289, Bellasis Road, Byculia, Bombay-8. (Bombay—Maharashtra)—Ampicillin Capsules B.P.—one million Nos. per annum; Ampicillin Syrup BPC—one lac bottles p.a.; Ampicillin Sodium for Injection B.P.—one lakh vials p.a.—(NA).

Textiles

M/s Nirlon Synthetic Fibres and Chemicals Ltd, 115, Mahatma Gandhi Road, Bombay-1. (Bombay—Maharashtra)—Polyester Filament yarn—360 tonnes p.a.—(COB); M/s J.K. Synthetics Ltd, Kamla Tower, Kanpur, (Kota—Rajasthan)—Polyester Filament yarn—360 Tonnes p.a.—(COB).

Paper & Pulp

M/s Cellulose Products of India Ltd, P.O. Kethwada Maize Products, Distt. Ahmedabad, (Gujarat) (Ramol, Dist. Ahmedabad—Gujarat)—Filled corrugated Boards—6,000 tonnes per annum; Pulp—6,000 tonnes p.a. (COB).

RECORDS AND STATISTICS

Approach to the Fifth Plan

AT THE two-day session of the National Development Council held in the capital on May 30 and 31, a special paper prepared by the Planning Commission entitled "Towards an Approach to the Fifth Plan" was discussed. The central theme of the paper was intensification of the war on poverty. While the emphasis in the earlier five-year plans has been on economic growth, the fifth five-year Plan will take specific measures in order to raise the standard of living of the underprivileged sections of society. At the end of the session, Mr C. Subramaniam told correspondents that the war on poverty did not imply wholesale nationalisation. He said that there would be no nationalisation for the sake of nationalisation. Full text of the Approach paper is given below:—

The basic premise of our five year Plans has been development along socialist lines to secure rapid economic growth and expansion of employment, reduction of disparities in income and wealth, prevention of concentration of economic power, and creation of the values and attitudes of a free and equal society.

In elaborating our strategy of development in the earlier Plan documents, we seem to have assumed that a fast rate of growth of national income

will by itself create more and fuller employment and produce higher living standards for the poor. We also seem to have assumed that, for reduction of disparities in income and wealth, the scope of redistributive policies is severely limited.

Economic development in the last two decades has resulted in an all-round increase in per capita income. The proportion of the poor, defined as those living below a basic minimum standard of consumption, has slightly come down. Yet the absolute number of people below the poverty line today is just as large as it was two decades ago. And these people living in abject poverty constitute between two-fifths and one-half of all Indian citizens. Available projections suggest that if one were to rely on growth alone without directly tackling the problems of unemployment and income distribution, it may take another 30 to 50 years for the poorer sections of the people to reach the minimum consumption levels. It will neither be feasible nor desirable to contemplate a waiting period of anywhere near such a duration.

assumed debate

The assumed conflict between growth and social justice in earlier Plans has been premised on arguments which assert that whatever surpluses can be mobilised from the richer classes are needed for investments primarily directed at raising the future rate of growth. There might have been some justification for this view in the initial years of planning. However, the economy now has reached a stage where larger availability of resources makes it possible to launch a direct attack on un-

employment, underemployment and poverty, and also assure adequate growth.

There would seem to be a conspicuous element of historic inevitability in a direct approach to reducing poverty becoming the main thrust of the fifth five year Plan. The Plan is being formulated by a government that has won a massive mandate from the people, both in the parliamentary elections of 1971 and the state elections of 1972, on the basis of a programme whose centre piece is 'Garibi Hatao'. The homogeneity of the governments in the Centre and most of the states during the formulation and early years of the fifth Plan is guaranteed. This should enable bold and imaginative proposals being put through on the basis of an enlightened national consensus. Another element which lends support to a strategy of development being directly anchored to the objective of removal of poverty in the fifth Plan is the existence of some sustained thinking on the part of economists in this country on this very problem in the last three years.

double concept

Poverty is both an absolute and a relative concept. When we talk about the elimination of poverty as a goal development, what we have in mind is not the relative concept but a definition of what could reasonably be considered as an absolute level of poverty. This poverty line has to be defined in terms of a minimum level of consumption. Available estimates show that at 1960-61 prices, private consumption of Rs 20 per capita per mensem would be needed to assure a reasonable minimum level. In present day prices, these figures will have to be multiplied by a factor of about 1.86. At present over 220 million people are estimated to be living below this level. The size of the problem and absolute numbers vary from State to State. The urban poor, to a large extent, are an over-flow of the rural poor. The main attack will therefore have to be on rural poverty. A little less than half of the rural poor are landless

labour and a little more than half are small and marginal farmers. The two categories overlap since small farmers also work as agricultural labour.

II

Employment Opportunities

The main causes of abject poverty are :

- (1) open unemployment;
- (2) under-employment; and
- (3) low resource base of a very large number of producers in agriculture and service sectors.

The elimination of abject poverty will not be attained as a corollary to a certain acceleration in the rate of growth of the economy alone. In the fifth Plan, it will be necessary to launch a direct attack on the problems of unemployment, underemployment and massive low-end poverty. The essential ingredient of this line of attack would have to be provision of employment opportunities on as large and wide a scale as necessary and to make this effort technically and administratively feasible.

In order to improve their lot, the poor would have to have incomes. Incomes will accrue to them only if they have meaningful employment. However, the generation of employment (with low per capita incomes) by itself would not be enough to provide a minimum level of consumption for the poor unless prices of essential goods such as foodgrains including pulses, edible oils, standard cloth, sugar and cooking fuels are stabilised. Ensuring stable prices at a reasonable level for these basic elements of consumption must, therefore, be one of the dominant objectives of the fifth Plan. Appropriate prices and distribution policies will be necessary for this purpose.

Price stability in items of essential consumption can be ensured only if production policy is also oriented to increasing availabilities of these items. The pattern of investment and the composition of output in the fifth Plan will specifically need to take into account this aspect, and the

implications for industrial policy to achieve these objectives will have to be studied in detail. Secondly, the potential of science and technology for increasing production, locating substitutes and substituting imports will have to be fully exploited. At the same time there will have to be a much more determined restraint on inessential consumption of the relatively well-to-do classes than in the past so that national resources are effectively mobilised for priorities. A consumption policy of this kind will have to include an approach towards wages, incomes and profits and its implications will also have to be studied.

maximising production

Our march towards a minimum level of income for all can be conceived only on the basis of a programme of maximising all possible avenues for productive employment. Leaving aside the question of employment generation an expanded programme of social services in the fifth Plan (this is dealt with separately in the latter part of this paper) employment-intensive heads of development would include :

- (1) minor irrigation;
- (2) soil conservation;
- (3) area development;
- (4) dairying and animal husbandry;
- (5) forestry;
- (6) fisheries;
- (7) ware-housing and marketing;
- (8) small scale industries including agro-industries;
- (9) roads; and
- (10) special programmes such as the small farmers development agencies, marginal farmers and agricultural labour agencies, crash scheme for rural employment and drought prone areas programme.

The outlay on these heads of development by the Centre and the states (including institutional finance) during fourth Plan works to about Rs 3600 to 3900 crores. The level of outlay on these employment-intensive programmes in the last year of the Plan would be

around Rs 1075 crores. The tempo of investment in these employment-intensive programmes as well as on similar other programmes such as construction activity, road transport and processing could be substantially stepped up in the fifth Plan.

While the goal of the 'Garibi Hatao' programme will have to be the provision of a guarantee of a minimum level of income from work hypothesis for the fifth Plan, however, should be to explore to what extent employment can be expanded by stretching administrative, institutional and financial efforts to the maximum. In this context a number of questions arise. These are :

- (i) The maximum possible that can be provided in the rural areas in a way that the assets created increase productivity and the welfare of the people;
- (ii) The maximum employment that can be provided in urban areas in small scale industries, trade and services;
- (iii) The extent to which the present institutional, administrative, technical and financial constraints on the expansion of productive employment can be removed;
- (iv) The extent to which the quantum of employment likely to be created will fall short of that needed to bring the poor up to the minimum levels; and
- (v) Any further measures to this end that will be necessary to this end.

specific programmes

The general programmes for expanding employment opportunities will have to be supplemented and co-ordinated with specific programmes to tackle the problem of the educated unemployed. The special schemes that have been introduced during the fourth Plan are a recognition that the original programmes included in the Plan were inadequate for the purpose. In formulating the fifth Plan we shall have to bring these special programmes into the Plan itself. Many of the programmes outlined above for tackling rural unemployment and the pro-

grammes for meeting basic minimum needs outlined in Section III will provide employment to teachers, doctors, para-medical personnel, engineers, veterinarians, agronomists and other educated unemployed. In addition, the programmes for surveys of natural resources and those in the field of science and technology can substantially increase employment opportunities for the educated.

principal causes

Unemployment, under-employment and low resource base of a multitude of producers, particularly in agriculture, are the principal causes of poverty. An expanded programme of employment generation will, therefore, have to be supplemented by redistributing the means of production in favour of the poor, in part by providing the self-employed with the wherewithal to achieve greater productivity from land and also through a programme of land redistribution and other transfers. Profiting from past experience, land policy decisions on the nature of the legislation and the processes of implementation will be necessary. The problem of an appropriate balance in the redistribution of available surpluses as between farmers with small holdings and landless labour is also an issue which will have to be faced. An assessment will have to be made during the current year of the impact of the envisaged land reform measures on the problem of rural poverty. The employment programme for the rural areas will have to be so designed that it can meet the requirements of the small and marginal farmers and the landless labour after allowing for the effect of the land reform measures as finally decided upon.

We have to ensure a credit structure that provides money to the smallest farmer and is capable of recovering it from him. Further, in order to expand employment opportunities for the rural landless labour to the maximum and to cut down the degree of under-employment from which the small and marginal farmers

suffer at present, it will be necessary to reorient and integrate various schemes of rural development (such as minor irrigation, soil conservation, area development, animal husbandry, forestry, fisheries, roads, and certain special programmes like SFDA and MFAL, Crach Scheme of Rural Employment and Drought Prone Areas programmes) into a comprehensive programme of land consolidation, land and water development, drainage and other infra-structural activities in the rural areas.

Even if we succeed in producing vast employment opportunities for the poor, they will not be able, with their level of earnings, to buy for themselves all the essential goods and services which constitute quality of life. The programme for providing larger employment and incomes to the poorer sections of the population will, therefore, have to be supplemented by a national plan for the provision of social consumption in the form of education, health, nutrition, drinking water, housing, communications and electricity up to a minimum standard.

III

As a natural first step, it is necessary to identify the items of public consumption that need to be included in the list of basic minimum needs and to lay down the minimum acceptable norms for them. Taking into account the constraints, it would be necessary to work out a reasonable time-phasing for meeting these needs fully. Furthermore, it will also be necessary to work out (i) the order of financial outlays required to fulfil the above commitments, (ii) the financial mechanism to ensure that these outlays constitute a prior charge on the national resources and (iii) the administrative innovations that would ensure efficient implementation of the programme.

The list of basic minimum needs will have to be short and self-evident so that realistic time-frames could be adopted. The following are suggested:

- (i) Elementary education for

children up to the age of 14;

(ii) Minimum public health facilities integrated with family planning and nutrition for children;

(iii) Rural water supply;

(iv) Home-sites for landless labour;

(v) Rural road;

(vi) Rural electrification; and

(vii) Slum improvement in the larger towns.

elementary education

The Constitutional directive is that children upto the age of 14 should be provided with free and compulsory education within a period of ten years of the commencement of the Constitution. That date was passed in January 1960. The likely enrolment at the end of the fourth Plan will be 84 per cent in the age-group 6-11 and 40 per cent in the age-group 11-14. There are wide regional disparities in aggregate enrolment particularly among girls. While it should be possible to cover fully boys in the age group 6-11 by 1975, the problem in regard to full enrolment of girls will pose special difficulties. The constraints are mostly social and non-availability of women teachers in adequate numbers. Special measures will therefore be called for tackling these difficulties and stepping up enrolment of girls to acceptable levels. In respect of age-group 11-14, while it may not be possible to go beyond overall coverage of 50% by the end of the fifth Plan special efforts at accelerated enrolment could achieve the target of 100 per cent in respect of boys in the early years of the sixth Plan. The problem being basic to our objective of creating a socialistic society, special attention will be required for devising a set of measures that will improve enrolment and reduce wastage at all levels.

A primary school within 1.5 Kms. and a middle school within five Kms. of each village appear to be an adequate geographical norm. At the same time, expenditure will have to be stepped up on items such as

free text books and midday meals. Adequate provision will have to be made for school inspectors. Large expenditure will be necessary on the construction of class-rooms. This, incidentally, will also provide employment. Taking into account the condition in each state, detailed state-wise plans will have to be drawn up covering the manpower, financial and other requirements for the implementation of the programme by the target date.

public health

In regard to minimum public health facilities, generalised norms such as improvement in the doctor-population ratio or the bed-population ratio or per capita expenditure on health are not enough since the availability of health facilities in rural *vis-a-vis* urban areas has continued to be extremely lopsided. Instead, the norm will have to be related to adequate extension of medical care in the rural areas. The present standards is one public health centre for a block population of 80,000 to 100,000 supported by eight to 10 sub-centres, each serving a population of 10,000. Accepting this as the minimum, the programme should consist in filling up deficiencies in construction of buildings, of staff, equipment and drugs in a co-ordinated way. This may be a realistic target for the fifth Plan. Ultimately, the coverage of a sub-centre will have to be reduced to a population of 4,000 to 5,000. The emphasis in rural health will have to be on prevention, family nutrition and detection of early morbidity with adequate arrangements for referring serious cases to an appropriate higher echelon such as the tehsil or the district Hospital. Such a multi-tier system cannot be built on a national scale on the basis of the present expensive system of prolonged medical education. A new approach towards the raising of suitable medical and paramedical cadres for the lower tiers has to be worked out. It is necessary that health education should be woven into the general education system. In order to provide an adequate number of doctors for

the fifth Plan programme and as advance preparation for a more intensive coverage later, it would be necessary to consider the revival of the three-year medical diploma. Indigenous systems of medicine will also have to be utilised for the purpose.

The Family Planning programme will need continued emphasis. Apart from the intensification of methods currently adopted, rapid progress will have to be made in integrating family planning with health and nutrition facilities. It is only in this manner that the concept of small families can be promoted on a durable basis among our people.

As part of the minimum needs programme, it will be necessary to take care of pregnant mothers and pre-school children so as to attack the problem of protein malnutrition at its root. The benefits of schooling can be safeguarded and the problems of wastage and stagnation tackled only if nutrition programmes are commenced right at this stage. Nutrition facilities to pregnant mothers and young children will need the highest priority consistent with our ability to design an adequate delivery system.

There is the need to take care of the old and the handicapped who, being unemployable, cannot be brought into the mainstream of economic activity. Outlays will have to be enlarged, to the extent feasible, on special programmes for this segment of the population.

drinking water

In the matter of drinking water supply it has been estimated that about 150,000 villages out of a total of 567,000 villages suffer from either scarcity and health hazards or special problems such as salinity, iron and fluorides. In addition, there are villages which do not have an adequate supply of drinking water or where the provision of water supply to Harijans and backward classes is inadequate. Currently the states spend about Rs 40 crores annually on rural water supply. This provision has been in-

creased by Rs 20 crores in 1972-73. In order to meet this basic minimum need by the end of the fifth Plan, it may be necessary to step up expenditure to an average of Rs 100 to 120 crores per annum.

sites for homes

Home sites for landless rural labour also fall in the category of minimum needs. They are as important to them as employment opportunities. A considerably enlarged programme will have to be taken up in the fifth Plan with a view to securing a substantial coverage of landless labour in all the states. The need for land reform of the kind referred to earlier is further underlined by the scope it would offer for providing home sites to the landless.

roads and electricity

Roads and electricity in rural areas have so far more or less been conceived as part of the productive infrastructure; roads being primarily intended for marketing, and electrification for the energisation of agricultural pump acts. It is expected that by the end of the fourth Plan about 40 per cent of the rural population will have electricity. There are, however, very wide regional variations. The highly industrialised state of West Bengal for instance, has less than about 10 per cent of its rural population enjoying the benefits of power. Similarly, a large majority of villages do not have the facility of an all-weather road. The time has come to recognise that roads and electricity contribute to quality of life. It is necessary to aim at providing all-weather roads by the end of the fifth Plan to all villages above a minimum population size, say 1500 people. The strategy of linking these villages will automatically attract feeder roads to them from villages with smaller populations and eventually cater to about 80 per cent of the entire rural population. Similarly electricity will have to be extended so that by the end of the fifth Plan, at least 30-40 per cent of the rural population receive this facility in all states. For

both these items, planning will have to be on an integrated basis. Village roads should be properly linked to district roads and plans for rural electrification will have to be on a minimum cost-maximum population coverage basis, consistent with generation and transmission capacities.

slum improvement

The long-term solution to urban poverty lies in tackling the root of it—which is rural unemployment. In the interim, the living conditions of the poorest section of the population such as slum and pavement dwellers have to be brought up to some minimum standards. The approach to the problem of *slums* will have to consist in a mix of slum clearance and re-development and environmental improvements. Acquisition of land will be necessary, subject to local conditions, for both types of schemes. In 1972-73 a beginning has been made with a Rs 20 crores scheme for slum clearance and re-housing and slum improvement in eleven cities. These are, Calcutta, Bombay, Delhi, Madras, Hyderabad, Bangalore, Ahmedabad, Kanpur, Poona, Lucknow and Nagpur. In respect of the remaining areas, it will be necessary to identify problem cities and devise suitable programmes of urban development for their improvement. Considering that many of our existing programmes have been launched, but recently, the further experience we gain in the next two years should prove valuable in designing an appropriate programme to cover more cities. In the light of the above, the immediate programme for action will consist;

(1) States will be requested to prepare detailed district plans for ensuring full enrolment of all children up to age 11 during the fifth Plan and spell out the expenditure required on teachers, buildings, text-books, mid-day meals and special incentives for the enrolment of girls. In regard to the age group 11-14, states will be requested to outline the maximum programmes for pos-

sible enrolment by the end of the fifth Plan the target being to push up the enrolment percentage to a minimum of 50 per cent in all states.

(2) The implication of reviving the three year medical diploma course will have to be examined in detail. States will be requested to undertake detailed planning for providing a primary health centre in each block with the full complement of sub-centres, adequate staff, equipment and drugs by the end of the fifth Plan.

(3) States will be requested to draw up detailed plans for providing drinking water supply to all villages by the end of the fifth Plan.

(4) States will be requested to estimate the financial requirements of providing all-weather roads to villages with a population of 1500 or more. These plans will have to be ranked in order of priority, having regard to population, availability of main roads to which they can be linked and marketing requirements, so that a phased programmes of road construction can be formulated.

(5) The backward states will be requested to work out, consisted with generation capacity, an economical programme for rural electrification which may cover up to 40 per cent of the population.

(6) States will be requested to prepare master plans for slum clearance and improvement in respect of towns with a population of five lakhs or more.

(7) States will be requested to authorise expenditure for technical investigations and preparation of suitable programmes and projects reflecting the new approach.

The minimum needs programme will naturally have to be based on the active involvement of all sections of the population. For the success of this programme, financial and administrative decentralisation will be necessary which will ensure public co-operative as well.

Both in regard to the inten-

sive employment programme and the basic minimum needs programme, the importance of implementation cannot be over-emphasised. There is need to avoid delays, leakage and waste. Part of the problem of implementation arises because programmes are not soundly conceived and properly structured. Co-ordination of the various schemes for rural employment and those for the benefit of small and marginal farmers and landless labour would ensure a more effective and fruitful implementation. Secondly, there will have to be a considerable decentralisation of planning, decision-making and implementation. This would call for an effective system of multi-level Planning.

A very tentative estimate of the cost of the proposed needs programme is Rs 3000 to Rs. 3500 crores for the five year period. The concept of a national programme designed to provide facilities in every state to satisfy the minimum norms entails that the necessary financial resources should be made available to each state in accordance with proven needs. To ensure effective utilisation of funds released for these programmes, the implementation capacity of each state will have to be adequately strengthened. Effective mechanisms to ensure both these objectives will have to be evolved.

resource mobilisation

The level of development outlays on employment-intensive programmes, enumerated earlier, during the fourth Plan is anticipated at Rs 3600 to Rs 3900 crores. The outlay on those and other employment intensive programmes indicated above, may have to be about twice as much in the fifth Plan. The National Plan for the provision of basic minimum needs in education, public health, nutrition for pre-school children, drinking water supply, rural homesites, rural roads, rural electrification, and slum improvement and clearance in the larger towns may involve a further outlay of Rs 3000 to

3500 crores during the Fifth Plan. It may be noted that these programmes are also labour intensives. These two sets of programmes will involve an outlay of the order of Rs 10,500 to Rs 11,500 crores during the fifth Plan. While these estimates will have to be firmed up by detailed calculations, nonetheless they are fairly indicative of the order of effort that could make a substantial impact on employment and on the progress towards the objective of Garibi Hatao.

small part

It is needless to say that these programmes, while they are very important from the point of view of social justice, would nevertheless be a comparatively small part of the total Plan. In order to ensure adequate development of agriculture, industry, transport and communications to support the above programmes and to safeguard sustained growth in the period beyond 1978-79, the total level of outlay in the fifth Plan period would have to be around twice the size of the fourth Plan. To firm up the content of the fifth Plan, profiles of investment and output in different sectors will have to be worked out. In order to carry out these exercises in the proper context, it is essential to have a prior consensus about the orientation of the Plan towards the provision of larger employment opportunities and basic minimum needs. Given this a consensus, the implications of different rates of growth of national production and the composition of investment and the implied efforts for resource mobilisation in the fifth Plan can be worked out in detail. In order to finance an outlay of the required order, it would seem necessary to raise Rs 6,000 to Rs 7,500 crores by way of additional resource mobilisation. This would compare to the effort of about Rs 4000 crores undertaken during the fourth Plan period. The effort would call for the states raising around Rs 2500 crores, the Centre making up the balance. Besides, the efforts along conventional lines, major thrust

will have to be in the following directions :

(1) Comprehensive direct tax reform to check evasion and avoidance of all kinds and to make the tax system elastic to income growth, and

(2) To bring agricultural incomes within the tax net. In this effort it may be necessary to go beyond the recommendations of the Wanchoo Committee. It is expected that the Raj Committee would provide valuable suggestions in regard to taxation of agricultural incomes. The remaining two years of the fourth Plan must be utilised to push through this comprehensive tax reform.

The resource mobilisation effort will have to take into account the need for mopping up surpluses arising from existing wealth. Large unearned incomes accrue in the urban areas from property and from transactions relating to land. The recent constitutional amendments have cleared the deck for an approach oriented to changing property relationships, both in urban and rural areas. Reforms in the tax system will have to take fully into account the redistributive aspects and ensure that a significant proportion of wealth as well as income arising from wealth is channelled into public resources.

self reliance

The profile of balance of payments, the size and pattern of investment in the fifth Plan and quantum of domestic resource mobilisation are inter-linked. It is, therefore, necessary to clarify the approach to self-reliance at this initial stage of the fifth Plan exercises.

The objective of self-reliance within a definite time-schedule was formulated for the first time in the third Plan in the following terms;

"The balance of payments difficulties the country is facing are, it must be stressed, not short-term or temporary; they will continue for several years to come. The external assistance is essential for this period, but the aim must be to make the economy more and more self-reliant, so that it is able

to support within a period of 10 or 12 years and adequate scale of investment from its own production and savings. Normal inflow of foreign capital may continue but reliance on special forms of external assistance has to be reduced progressively and eliminated. The third Plan represents a very crucial stage in this process."

While the third Plan gave an indicative schedule of 10 or 12 years from 1961 from the termination of aid, the fourth Plan adopted a more concrete policy objective which was defined as follows:

"...reducing foreign aid net of the debt servicing (inclusive of interest payment) to half of the current level by the end of the fourth Plan and to eliminate it altogether as speedily as possible thereafter."

projections for 1980-81

In the chapter, "Long-term Perspective of Development" in the fourth Plan document, there is also a projection for 1980-81. This shows that on certain assumptions regarding the growth of exports, the foreign exchange resources generated would be adequate to meet import requirements as well as interest obligations on foreign debt. The position anticipated for 1980-81 was a projection based on certain assumptions and was neither meant to be nor presented as an objective.

Net aid in 1965-66, the last year of the third Plan, was Rs 701 crores including food aid and Rs 472 crores excluding food aid. The corresponding figures for 1971-72 are estimated as Rs 328 crores and Rs 202 crores respectively. With continued restriction of imports and promotion of exports, it will be possible to do even better than the fourth Plan objective of reducing net aid in 1973-74 to half the level in 1965-66.

The balance of payments gap during the fifth Plan period and in the last year of the Plan can be worked out only on the basis of certain detailed assumptions. These include growth

rates in the commodity producing sectors, size and content of the investment programme, rates of utilisation of existing capacities, availabilities from capacities under construction, likely performance of exports taking into account also the exogenous factors pertaining to the world markets, trends in invisibles, and so forth. This kind of projection has to be consistent with the rest of the Plan and can therefore be firmed up only as an integral part of Plan formulation. Secondly, the projection cannot be a static extrapolation of present trends and policies but will have fully to take into account the feasible policy changes in regard to exports, invisibles such as shipping, tourism and remittances, import substitution, accent in investment policy for stimulating new capacity in critical sectors, and the like.

In view of the paramount need to achieve by the end of the fifth Plan, self-reliance in the sense of zero net concessional aid, the magnitude and kind of effort required on the different aspects relevant to the balance of payments will need to be carefully worked out. It will be necessary to examine the policy, organisation and resource mobilisation implications of this objective. It is only on the basis of such a thorough exercise that it will be possible to say whether the zero net aid position can be achieved without too great a cost in terms of growth and, if not, in what ways the investment pattern needs to be adjusted to fulfil the objective. In other words, it is suggested that, to start with the exercises connected with the fifth Plan may proceed on the basis of zero net aid position by 1978-79. The objective of bringing down net aid to zero implies that gross aid will be required only to the extent of repayments of principal and interest. To the extent that debt rescheduling is available, the requirements of other gross aid can be reduced. Where debt repayments have to be met from free foreign exchange, debt relief is in fact equivalent to united aid. For these reasons, it is necessary to emphasise debt relief more and

more as a referred form of assistance.

The time schedule for the formulation of the fifth Plan is given in Appendix. The fifth Plan document will be finalised by March 31, 1974.

APPENDIX

Time Schedule for the fifth five year Plan

The following time schedule for the preparation of the fifth Plans has been drawn up so as to finalise the document at the latest by March 31, 1974, that is by the beginning of the fifth Plan period:

30-9-72: Preparation of an **Approach Paper** on dimensions, hypotheses for the fifth Plan, the policy and resource-(domestic and foreign exchange) implications of alternative rates of growth (macro and sectoral) and of other objectives such as employment, income distribution, regional balance, satisfaction of basic minimum needs, self-reliance.

15-10-72: Consideration of the **Approach Paper** by the Planning Commission and approval of guidelines for (a) preparation of a Draft Outline of the fifth five year Plan and (b) size and content of state plans.

30-4-73: First version of **Draft Outline**.

15-5-73: Consideration of **Draft Outline** by Planning Commission.

1-6-73 Consideration of **Draft Outline** by the National Development Council.

30-6-73: Publication of final version of **Draft Outline** after incorporating the views of the National Development Council.

30-1-74: Preparation of **Draft Outline** document after discussions with ministries and states and after bringing the resources estimates up to date.

15-2-74: Consideration and approval of **Draft Fifth Plan** by the Commission and by the Cabinet.

28-2-74: Consideration and approval by the National Development Council.

31-3-74: Publication of the **Fifth Plan**.

Government by Dishonesty

WE ARE surprised that many newspapers have expressed surprise at the Finance Ministry's recent effort at stage-managing a meeting of economists so as to pave the way for the government rejecting the Wanchoo Committee's recommendation in favour of a reduction in the rate of tax. It was evident from the beginning that the government was not going to play fair. In the wake of the last central budget, this journal wrote:

"...the Wanchoo Committee's main recommendation that rates of income-tax should be moderated to more reasonable levels is unlikely to be accepted by the government which is now ruling in New Delhi. If the possibilities were otherwise, the Finance Minister, while presenting the central budget recently, could at least have said that the government accepted in principle the proposition that existing rates of direct taxation needed to be reconsidered. Mr Chavan, of course, said no such thing. In the absence of even this broad commitment on the part of the government to honour the spirit of the Wanchoo Committee's report, Mr Chavan's announcement of the government's intention to reorganize tax legislation in the light of that report must definitely constitute a threat of further accentuation of the punitive and penal fiscal approaches of the government. In other words what seems probable is that the government will exploit for its own purposes such proposals of the Wanchoo Committee as are calculated to aggravate the harshness of the enforcement of the tax laws. Additionally, it is also more than likely that the government would cast its covetous eye on such suggestions of the Wanchoo Committee as a recurring capital levy on companies. In sum, then, the net result of the Wanchoo Committee's report is likely to be the further hardening and sharpening of the tax laws accompanied by new imposts in the field of direct taxes.

"Such of us as may be naive enough to nurse other expectations will do well to consider certain relevant points. It must be easy to appreciate, for instance, that the government cannot give up the confiscatory rates of direct taxation unless it is prepared to abandon also its commitment to impose effective ceilings on incomes or wealth. While it may be doubtful whether such ceilings will be actually fixed and implemented, it is obviously the case that the regular mouthing of the related slogans has an obvious demagogic utility which the political party in office or even some of the political parties out of office are most reluctant to deny themselves. Then, again, as the Wanchoo Committee has pointed out, the confiscatory rates of direct taxation apart, the administrative controls on the economy particularly the permit-licence raj, have been a potent breeder of black money. The committee has recognised and recorded the truth that the government's control over industry and commerce must be very considerably curtailed if the scope for black money is to be significantly narrowed. The government of course has known this truth even without the benefit of this advice, but, as in the case of the confiscatory rates of direct taxation, the government is most unlikely to act on the logic of this linkage of controls and black money because controls have become a part of the literature and oratory of its demagogic approach to politics and partly because these controls are immensely helpful to the machinery of the politics of power. In these circumstances, so far as the government currently in power is concerned, it is altogether unlikely that there will be any material reversal of the fiscal policies which have been steadily shaped into the prevalent design of confiscatory direct taxation as a part of a deliberate effort by the ruling party to create in the country a political climate which is conducive to that party acquiring and maintaining a *zamindari* of political influence and authority over the mass mind." (cf *Eastern Economist*, March 31, 1972, p. 505).

It follows that this journal cannot have a quarrel with the Finance Minister for acting as it knew he would. At the same time it is entitled to rebuke the government for having been mean and dishonest about it. This farce of consulting economists on an issue on which a political decision has already been arrived at is a fraud on the public. Boasting as it does in season and out of season of its massive mandate from the electorate, New Delhi, surely, should have had the guts to shout openly "To hell with the Wanchoo Committee's advice. We will do exactly what suits us".

Fuel policy for the seventies

IN THE absence of the complete details of the interim report of the Fuel Policy Committee (FPC), which the union government has preferred to keep back from the public view at least for the time being, it is difficult to appreciate the rationale of the committee's assessment of the country's requirements of the various types of fuel in 1978-79 — the end of the fifth Plan period — and in 1980-81, as also of some of its suggestions. Taking the overall growth in the economy at 6.2 per cent per annum, as assumed in the Perspective Plan, the FPC, according to the brief summary of its interim report, which was released to the press a few days ago, has estimated that the demand for coal (excluding that used in power generation) would go up to 108 million tonnes in 1978-79 and 125 million tonnes in 1980-81. The estimated requirements of oil for fuel purposes are put at 27.2 million tonnes in 1978-79 and 31.7 million tonnes in 1980-81 and those of electricity at 125 billion kwh and 150 billion kwh, respectively. Including the coal used in the generation of power, the total requirements of coal in 1978-79 are estimated around 165 million tonnes. The aggregate demand for oil products, including those used in fertilizer manufacture and other sectors, is anticipated in the terminal year of the fifth Plan at about 34 million tonnes. The total generation of electricity required to meet the 1978-79 demand of 125 billion kwh is envisaged around 156 million kwh. This will need an installed power generation capacity between 37 and 40 million kw.

These estimates are at variance with those of the concerned ministries which too take into consideration the calculations in the perspective Plan. The preliminary proposals for power development during the fifth Plan period, which have been recently drawn up by the union Ministry of Irrigation and Power, for instance, suggest that the installed generation capacity will have to be raised by 1978-79 to as much as 41.5 million kw and not to only 37 to 40 million kw, as envisaged by FPC. In the case of oil, similarly, a committee of officials of the union Ministry of Petroleum and Chemicals worked out about two years ago the requirements at 34.1 million tonnes in 1975 itself. Later on, towards the close of last year, the demand for petroleum products in 1975, however, was estimated by the Ministry at about 32.8 million tonnes on the basis of macro-economic indicators and between 31.9 and 32.3 million tonnes on the basis of sectorial targets. Even if the lowest

The Prime Minister is

like a fountain which feeds on its own waters. Her ideas being strictly limited, her arguments are necessarily repetitive. Her party and her government having decided for reasons of their own to discipline the press, she has been straining her capacity for logical discussion in her attempt to invent more and more justification. Last month, speaking at the golden jubilee celebrations of the *Ananda Bazar Patrika* in Calcutta, Mrs Gandhi, for a change, trained her guns on the editors of newspapers instead of the proprietors. She accused the present generation of editors of having fallen from both the high professional and even more elevated patriotic standards set by the eminent journalists of the era of the nation's freedom struggle. She suggested that the editors of today had sold their souls not indeed for a mess of pottage but for a fat packet of pay and perks. As

history. I do not suggest that Mrs Gandhi is at fault in pointing to the venality of the journalist profession as it is now being practised. But I would certainly ask her to consider the possibility that today's politicians may be getting the press they deserve. When the pot calls the kettle black, the kettle is entitled to be amused.

The Prime Minister virtuously declared that newspapers should not be house magazines for big business. The phraseology is significant, since the *National Herald* has often been described as her house magazine. There are house magazines and house magazines and some of the newspapers have been accused of either drawing their capital from the industrial units of big business houses or investing their own earnings in such undertakings. There are again other newspapers whose financial affairs are of a different category. They apparently are blessed with

WITHOUT CHARITY

she put it, there is no longer to be seen the reforming zeal of the best journalist of olden days. Increasing prosperity, Mrs Gandhi observed, has taken the present-day editors further away from the people.

I wonder whether it has struck her that the charges she makes against present-day editors or other journalists are on the very same lines as the charges levelled by journalists, as well as a much larger public, against the politicians of today. Surely it cannot have failed to reach the ears of the Prime Minister that she and her tribe of politicians are also generally held to have betrayed the values and standards of the politicians of an earlier generation. It was said of Gandhiji that out of dust he made us men. What he achieved thus lasted long enough for Jawaharlal Nehru to be able to serve the people reasonably well and truly up to the middle years of his long prime ministership. By that time, however, he had managed to exhaust his legacy and the rest is recent

powerful patrons who could collect funds for them through political blackmail. Even so their financial viability does not prove to have been automatically ensured. In fact they even find it difficult to comply with provident fund obligations. Only, their lapses are apt to be treated with a certain maternal indulgence. Mr Khadiolkar at any rate is hardly likely to address to them the menacing admonitions which he so freely lavishes on defaulters less privileged.

The Prime Minister again complained that the press was unduly interested in 'narrower politics'. Her officials, it seems, told her that "in the last few weeks ten times more questions were put to them on the so-called impending cabinet reshuffle than about economic policy". What her officials dare not tell her, of course, is that this state of affairs is mainly to be blamed on the fact that she has made this government such a grossly personal one. As a result, policies do not matter any longer except

as creatures of personal or party political interest. Mrs Gandhi's officials have evidently been telling her what it pleases her to hear. If journalists do not ask her officials about economic policies, can it not be that behind her back, officialdom is apt to be cynical if not sarcastic about the government's economic policy or the lack of it? In any case, does the Prime Minister really mean to argue that, under her dispensation, politics is all that distinct from policy?

There is, however, one observation of the Prime Minister with which I am more in agreement than disagreement. At Calcutta, she said that today's editors and journalists "are more anxious to be heard and to give advice to the legislature and government rather than to find out and report trends in different phases of activity".

While it is almost an universal weakness of the journalist profession the world over for editors to desire to be considered the *confidantes* of presidents or prime ministers, some of our editors have certainly been essaying the role of part-time politicians to an extent which has done neither them nor their newspapers any good. Recalling my days in *The Hindustan Times*, I am reminded of a certain editor who used to meet Mr Morarji Desai every Sunday afternoon when the latter was the Finance Minister in a Nehru cabinet. When this editor returned from these meetings I used to ask him mainly for the sake of polite conversation, what he had been talking about with Mr Desai. The information I invariably got was that, besides being told to reconsider his views on Prohibition, Mr Desai had also been advised to assert himself against Mr Krishna Menon who was then Defence Minister or even to organize himself and his followers for an attempt to topple Nehru. I must add in fairness to Mr Desai that I would also be informed that Mr Desai was too timid or thick-headed to respond properly to the advice to stage a coup.

Before I leave this topic, I would suggest to the Prime Minister that there is an easy way of legitimizing politicking by journalists. This, obviously, is to make everyone of them a member of parliament or decorate each of them with a 'Padma sri'. The process, after all, has been started.

TOUCHSTONE

estimate of the ministry for the year 1975 is taken into consideration, the aggregate requirements of petroleum products in 1978-79 should considerably exceed the FPC's estimate. In fact, the Malaviya Committee, which has recently reported on the functioning of the Oil and Natural Gas Commission (ONGC) refers to some estimates according to which the requirements of crude oil by 1980 would go up to 45 million tonnes — 42-43 million tonnes of petroleum products. As regards coal, the assessment of the FPC apparently should not hold good if the power generation capacity has to be augmented to a level higher than what has been suggested by it.

In view of the snail's pace increase in the domestic production of crude oil and the recent sharp uptrend in the world prices of this source of fuel, which is likely to persist during the current decade, the conclusion of the FPC that much greater reliance than hitherto will have to be put on coal as a source of fuel, apparently, is not unwarranted. We have vast resources of this commodity which can be tapped expeditiously, provided, of course, a rational pricing policy is adopted for the development of the coal industry. The committee's suggestions for the setting up of town gas plants for catering to the domestic fuel requirements of the big cities, with population of 10 million or above, and increasing the production of the solid smokeless domestic fuel too are quite eminent; their adoption should help in discouraging the use of firewood, dung-cake and kerosene as fuel. Its plea for the development of additional production of medium coking coal and its use in steel plants, similarly, is based on sound premises as our resources of prime coking coal are quite limited.

Two other recommendations of the FPC, namely, the stepping up of the use of coal for the manufacture of fertilizer and discouraging of the dieselisation of railways, however, have obvious limitations. No doubt, two coal-based fertilizer plants are currently under implementation and a couple of other such units also have been proposed, but it remains as yet to be conclusively proved that the high initial cost of these plants, despite an element of hidden subsidy in it, will not make them uncompetitive with those based on petroleum as feedstock. The large-scale electrification of railways, again, is not possible, as according to current thinking, the high capital cost of electrification is justified only on sections which have a traffic of about seven million tonnes per annum. On routes on which traffic cannot be expected to reach this level soon after electrification, dieselisation is a must for reducing congestion and expediting movement.

The FPC rightly emphasises the need for

the expeditious implementation of the atomic power projects, which are currently under implementation in Rajasthan and Tamil Nadu. In the areas far removed from the main coal supply sources in the country, where hydel power too cannot be produced in abundance, atomic energy, obviously, will have to play a crucial role in meeting the growing fuel requirements. As the FPC has stressed, there is also need for an advance investment in nuclear power projects for getting the maximum benefit out of the fast breeder reactor technology. The difficulties of hauling huge quantities of coal to these far flung areas is an additional argument in favour of planning the development of nuclear stations on a substantial scale.

In the circumstances in which we are placed at present, there is admittedly no alternative to reducing the consumption of petroleum products in the country. But care has to be taken that this policy is not pursued to absurd limits. Mere curtailment of the demand for petroleum products, through indiscriminately raising their prices by stepping up excise duties or substituting coal in the case of fertilizer manufacture and by electricity in railway traction, apparently is not going to solve the problems on the oil front. What is needed is the acceleration of oil exploration in the country.

Whether one agrees or does not agree with the Malaviya Committee's diagnosis that the present unsatisfactory state of affairs on the oil exploration front is due to the lack of faith that developed in the ONGC and those in authority in the central government in the second half of the last decade, there can be no denying the fact that the pace of oil exploration in the country during the last seven or eight years has not thrown up new substantial reserves of crude. Known crude resources are confined to upper Assam and Gujarat where oil had been found by the early sixties.

The main reason for this is not the so-called "lack of faith" in the oil potential of the country, but the ideological overtones of the government's oil policy. Over the years, under pressure from the leftist lobby, to which Mr K.D. Malaviya himself belongs, the oil policy of the government has become more and more inflexible. The inordinate delay in the exploration of Bombay High — the most promising oil-bearing area identified in the country so far — can be directly attributed to this fact. Had the Tennico proposal, which went up to the union cabinet for approval nearly five years ago been accepted, this promising offshore oilfield would have been in operation by now. The other instances of the cavalier

fashion in which oil matters have been considered by the government in the recent past are (i) the delayed sanction of foreign exchange for the import of sophisticated equipment for extra deep drilling; (ii) the unduly prolonged consideration of the question of setting up a refinery in the north-west region of the country; and (iii) the ad hoc arrangement for the last over two years in regard to the chairmanship of the ONGC. There have also been too frequent changes in the headship of the union Ministry of Petroleum and Chemicals. The ministry at present does not have even a whole-time minister. After Dr Triguna Sen, it was headed only by a minister of state.

The recent announcement by the Ministry of Petroleum that the output of crude oil from the known reserves of the ONGC would be raised from slightly over 3.5 million tonnes per annum currently to eight million tonnes a year by 1978 and further to 13 million tonnes annually by 1983 should help in containing the crude oil import bill to some extent. But this is no substitute for intensifying the search for oil both on land and off-shore if the long-term interests of the economy are not to be jeopardised.

The Malaviya Committee has made several suggestions for stepping up the oil exploration programme. The most important among these obviously are : (i) a radical change should be effected in the policy-making machinery as well as administrative set-up in respect of search for oil; (ii) exploration efforts should not only be to discover oil accumulations, but also to establish that a sedimentary basin or its part had no commercially exploitable oil potential; and (iii) serious thought should be given to securing exploration concessions abroad.

As for the administrative and policy-making set-up, the Malaviya Committee desires that the Prime Minister herself should head the Petroleum Ministry so that adequate dynamism is imparted to the oil exploration programme. In a country where the pressing problems are not one or two but many, it is naive to expect the Prime Minister to start looking after each and every problem. The Prime Minister herself holding the portfolio of petroleum, thus, is not necessary. Did, one may ask, the Prime Minister head the Ministry of Agriculture when the Green Revolution was ushered in? The formation of a cabinet sub-committee and the creation of a special department in the composite Ministry of Petroleum for looking after oil exploration should serve the purpose. But what is more important is that one single agency for field work cannot be anticipated to yield the results expected in oil exploration. The sugges-

tion of the Malaviya Committee that there should be two public sector oil explorers in the country — one for the more difficult areas and the other for the comparatively easier ones — and a third one for undertaking exploration jobs abroad reiterates the above contention. A single agency to undertake the entire exploration work, apparently, will become unwieldy. It will also become red-tape ridden.

The objective that exploration efforts should not only be for discovering oil accumulations but also for establishing that a sedimentary basin or its part has no commercially exploitable oil potential is all right in the ultimate analysis. But, today, when our resources, both financial and technical, are not too abundant and even several promising areas are yet to be fully explored, is it advisable that efforts should be unnecessarily diffused over wide areas? The more promising areas obviously have to be accorded priority. The recommendation of the committee that top-ranking experts should be invited for a second opinion on the prospects of individual basins, of course, is quite wholesome.

In so far as the securing of exploration concessions abroad is concerned, the Malaviya Panel's stress on this aspect needs to be fully endorsed. It is a pity that offers for oil exploration abroad in partnership with foreign explorers, particularly the Burmah Oil Company, which shares on a 50:50 basis the ownership of the only other oil exploration agency in the country — Oil India — were not grasped by the go-

vernment. In Oil India's case, the slow decision-making is said to have been responsible for the opportunity being lost.

Self-reliance in fuel does not imply total dependence on domestic resources irrespective of the costs involved. Technological and economic considerations also have to be given due weight in finalising a rational fuel policy. Let not governmental failures on the oil front prejudice its thinking on the fuel plan. The stress put by the FPC on maximising the production of middle distillates through the hydro-cracking of heavier fractions of oil, incidentally, is quite judicious, for the import of middle distillates involves a much larger expenditure than the import of crude or furnace oil.

Fuller comment on the interim report of the FPC must await its release, for the official summary is lacking in crucial details. May it be hoped that the release of the full interim report will not be unduly delayed? The evolving of a fuel policy is a subject which deserves a national debate. Fuel policy is of vital importance for the drawing up of the developmental programmes in agriculture, transport and industry. The industrial consumers in particular should have a clear idea of the availability of fuel and its sources so that their manufacturing programmes can be chalked out judiciously. Power shortages are a headache at present; they ought to be ended. It will be a step in the right direction if, in the fuel field, we plan at least for marginal surpluses rather than reconcile ourselves to growing shortages as has been the case hitherto.

Eastern Economist 25 Years Ago

June 20, 1947

Under the present atmosphere of labour ferment, the national labour policy will surely be judged by what the Government does to maintain industrial peace. In this sphere, Government has already taken a bold step by enacting the Central Industrial Disputes Act, while a Bill for the compulsory recognition of trade unions is on the legislative anvil. Though the machinery set up for the settlement of industrial disputes is important in itself, more importance is to be attached to the measures taken by the Government to lay the foundations of industrial harmony. The establishment of national tri-partite committees for major industries

and the organisation of works committees, it is expected, will go a long way towards minimising the causes of industrial conflict. On one point, however, Government policy is not clear. It is not known what types of political activities Government will allow healthy trade unions to perform. Time and again, Members of Government have complained that workers are being made 'powers in politics', yet recently some of them publicly blessed the formation of a new trade union organization with pronounced sympathies for a particular political party. This is not to be understood as a criticism of the formation of new body.

Money to spare

THE DETAILS made available by the Reserve Bank of India about expansion of credit in the 1971-72 busy season for meeting the needs of industry and trade and for financing procurement operations clearly indicate that the earlier calculations about an increase in demand for funds which will be nearly equal to the fresh growth in deposits have not materialised. In November last year, it was anticipated that there would be an increase in deposits of the scheduled commercial banks by Rs 530 crores and in advances to the extent of Rs 480-500 crores. It was presumed that procurement operations of the Food Corporation and other agencies would require Rs 120 crores against Rs 70 crores in the 1970-71 busy season. It was also stipulated that there should be no excessive reliance on refinance facilities provided by the central banking institution and the level of borrowing should not in any case exceed Rs 191 crores at the end of April 1972.

The actual developments however have come about in an entirely different manner. The growth in deposits in the six months ended April 28, 1972 was quite impressive at Rs 590 crores exceeding the target by Rs 60 crores. It is also noteworthy that there was an increase of Rs 158 crores as compared to the growth in the corresponding period in 1970-71. On the other hand, the net increase in advances was only Rs 351 crores against Rs 394 crores in the previous season and nearly Rs 150 crores below the assumed level. Even excluding procurement operations, the demand for credit was not such as to be unmanageable. There was no doubt a bigger rise by Rs 425 crores against Rs 325 crores in 1970-71, about Rs 45 crores more than the earlier estimate. This order of expansion was necessitated by larger imports, a bigger cotton crop and other factors. The net increase in advances however was only Rs 351 crores representing a drop of Rs 43 crores over the earlier season in the face of a bigger rise in deposits.

The reduced pressure on the banking system was of course due to the large sales effected by the Food Corporation to keep down wheat prices. There should have also been a sizable reduction in stocks of rice and wheat on account of heavy despatches to Bangladesh. The Food Corporation must have been paid by the central government against these deliveries which were made as an outright grant by the latter. There was thus a net contraction in procurement credit by Rs

76 crores against a net expansion of Rs 70 crores. It was not necessary therefore to borrow heavily at any stage especially as even the seasonal increase in sugar stocks was not on the anticipated scale because of lower production and larger monthly releases. In the event, there was a net decline in borrowings by Rs four crores at the end of the season instead of the anticipated sizable rise and against the reliance of member banks on the lender of the last resort for an additional amount of Rs 81 crores in 1970-71. Investments thus rose substantially by Rs 147 crores against only Rs 38 crores previously. It will thus be clear that the operations of the scheduled commercial banks in the 1971-72 busy season have been very nearly financed out of owned funds and there was no compulsion at all to use refinance facilities in a big way.

It could not have been anticipated even at this time last year that such an extremely easy situation would develop in the money market and there would actually be a problem of utilising available funds remuneratively. At the present moment procurement of foodgrains is going on briskly but with continuing despatches to Bangladesh and a fast growth of deposits any net increase in advances could be met easily with available resources. There will certainly be heavy purchases of foodgrains till the middle of July along with large scale buying of cotton by the Cotton Corporation of India and the textile units. However, with the prospect of additions to deposits at the rate of Rs 120 crores a month, from May even an immobilisation of funds to the extent of Rs 300 crores in wheat and raw cotton as a result of the operations of the two statutory corporations cannot be reflected in any big rise in borrowings, at the end of July. There will actually be a sizable release of funds as a result of a decline in sugar stocks by over eight lakh tonnes in May-July. Besides fresh purchases of raw cotton are being effected at much lower prices than in the corresponding period last year and it is felt in knowledgeable circles that net advances against cotton may even tend to decline after June once stocks of higher priced cotton had been exhausted. There may not actually be a larger outlay in cotton stocks at the end of August in spite of an increase in the carryover by five lakh bales. This will be because the average of prices for all grades of cotton will be lower by 30 per cent.

What then exactly is the outlook for the current slack season? In the six months ending October '72 the growth in deposits may be easily Rs 750 crores while the expansion of credit for procurement of foodgrains and other purposes may not absorb more than Rs 300 crores. The central and state governments can therefore borrow their requirements without any difficulty

through open market loans. The state governments will be seeking to raise a net amount of only Rs 109 crores and the central government Rs 215 crores. It had been explained by the union Finance Minister, Mr Y.B. Chavan, that the target for net borrowing by the central government for 1972-73 had been fixed considerably lower because of the likelihood of net expansion of procurement credit by banks for Rs 95 crores. Net borrowing in 1971-72 was much higher at Rs 294 crores.

Even if the borrowing programme of the centre was on the ambitious scale of 1972-73 and an amount of Rs 300 crores was siphoned away from the organised sector, through open market loans the scheduled commercial banks would still be in a comfortable position at the beginning of the next busy season. It is necessary to point out however that the borrowing programme in 1971-72 was spread over a longer period as the Defence loans for Rs 110 crores were issued only in December 1971. If the fresh additions to deposits in the five months ending March 31, 1973, which may be about Rs 600 crores, were also taken into consideration there would be surplus resources available for investment in loans and bonds for another Rs 120 crores. All these calculations do not take into account the possibility of larger support being extended to the new loans of the central and state governments and bonds of the state electricity boards and statutory financing corporations, by the Life Insurance Corporation, provident funds and trusts. To put it in a nutshell the scheduled commercial banks will be mobilising freshly deposits for Rs 1400-1500 crores in 1972-73 out of which only Rs 700-800 crores may be utilised for extending loans to the different classes of borrowers. There will thus be investible resources of the order of Rs 700 crores to which must be added the quota of Life Insurance Corporation, provident funds and trusts.

The central and state governments should therefore take note of the vastly changed situation in the money market and stagger their borrowing through open loans in such a way that the surpluses of banks and other institutions can be easily absorbed and deficit financing prevented. While the Reserve Bank should help the central government to realise even Rs 350 crores (net) through new loans, the state governments should be allowed to borrow in excess of the target only for productive purposes. The funding operation of the centre can thus be carried out comfortably by the middle of July and the state loans likewise in the first week of September. Their prospects will not be in anyway prejudiced even if the credit institutions liberalised their lending policies.

Shipping at Santiago

It is generally held that not much was achieved at the third session of the United Nations Conference on Trade and Development which concluded recently in Santiago, Chile. Even so, UNCTAD III has at least initiated a move towards a fair deal in shipping.

The resolution of the Group of 77 on a draft code of conduct for liner conferences invites government members of UNCTAD to urge liner conferences to adopt the code. A concomitant recommendation to the General Assembly urges it to convene a Conference of Plenipotentiaries early in 1973 to prepare, on the basis of this draft code, a code of conduct to be adopted by the governments of all countries "in a manner that is binding on them and can be suitably enforced". From the "Common Measure of Understanding" adopted by UNCTAD I in 1964, the submission of a draft code of conduct for liner conferences to a full conference of UNCTAD at the Santiago session is a leap forward indeed.

It must be recalled that this is the third attempt, but the first successful one at drawing up, let alone securing the acceptance of such a code. The first attempt was made in Lima in November, 1971 when the ministers of the Group of 77 agreed that the UNCTAD should undertake the preparation of a code of conduct taking into account the trade and development needs of the developing countries, as also the need to ensure an increasing share in the carriage of maritime cargoes by their shipping lines, but there was no unanimous agreement. A second effort was made later at Geneva, but there was no unanimity. There were strong differences, for instance, on whether or not there should be government regulation. But, at Santiago, they wanted, worked on, and had a common code on behalf of the Group of 77, of course after a good deal of discussion and making mutual compromises, and this was the first big step forward. On April 27, 1972 this was submitted to the full conference in the form of a draft resolution together with a covering letter recommending its adoption.

The preparation of a text on which there could be complete agreement naturally posed a problem. There were endless discussions on the structure of the code and on how the text could be finally evolved. Anyway, after a good deal of discussion at the main committee — Fourth Committee — an informal contact group was set up to consider the draft resolution

submitted to the committee by Indonesia on behalf of the Group 77. A lucid and dispassionate summing up of the informal discussion by this group, prepared by Mr C.P. Srivastava, Chairman and Managing Director of the Shipping Corporation of India, who was the Chairman of Committee IV, which was accepted by every one, helped the full conference eventually to arrive at a consensus on a number of important issues. The Indian delegation thus played an important role in getting a common draft approved.

Even two years ago, the concept of such a code would not have been acceptable, especially to developed countries, but ideas take time to evolve and become acceptable after understanding discussions. As discussions went on, according to observers, developed countries began to side more and more with developing countries. It is amazing how the idea of outside regulation and the urgency of evolving it have at last, albeit slowly, come to be accepted. Of course, on all the subjects discussed — membership, admission to conferences, conciliation, consultation with public authorities, etc. — there was no complete unanimity as such; nor is such unanimity conceivable. There were areas of agreement as well as of disagreement.

On the question of freight rate fixation, for instance, there was considerable discussion on whether this must be the business of conferences or of governments, although there was unanimity on the point that governments also must play a part in it. Similarly, compulsory arbitration as suggested by most developing countries was not universally accepted. The Group of 77 and socialist countries were generally in favour of compulsory arbitration, but developed countries were not. Similarly, not all the countries were as keen on cargo reservation as Latin American and Afro-Asian countries. But a gratifying feature is that there was unanimity on a number of important points, such as a world-wide agreement on a code of conduct for liner conferences for whom there has been no regulation at all these hundred years past. The crucial point came when the question of whether the code should be a legal instrument, as developing countries urged, or it should be just a code to be implemented on the basis of a resolution, as developed countries urged, but no acrimonious debate was allowed to develop as it was suggested that it should be left to the preparatory committee to evolve a code and suggest whether such should be made legally binding or voluntary. The basis of such a code will, of course, be the code evolved by the Group of 77 and the discussions thereon at the meeting of the informal contact group referred to earlier.

The ball is now in the court of the General Assembly which is due to meet in September, and, if all goes smoothly and according to present indications, the code should be a *fait accompli* by the end of 1973.

Next to a code of conduct for liner conferences in importance was the question of development of merchant marines. Developing countries, with their present capacity, account for only 7.1 per cent of the total world trade and they wanted this to be improved to at least 10 per cent by 1980. An increase of less than three per cent over the next eight years may appear insignificant, but it is possible that, unless something spectacular is done (and here developed countries and international financial agencies should co-operate by helping developing countries to acquire both new and old tonnage), that is, unless developing countries acquire 40 million tonnes Dwt, even the present share of 7.1 per cent may go down!

Evidently realising this, developed countries said they had no objection to the note indicating this, although they categorically refused to accept it. Despite this, developing countries must regard even this non-ambitious target as important for the reason that it is for the first time that there is any reference at all to this percentage share business in world trade in an UNCTAD paper. Meanwhile, prospects of an improvement in the terms offered by OECD countries for purchase of ships (eight years' duration and 7½ per cent interest) on a case by case basis, as and when proposals come up, seem to be bright, what with the undertaking of all UNCTAD government members to help developing countries achieve this objective and the insistence that, unlike hitherto, guarantees of national banking institutions should also be accepted. There was also special stress on preference being accorded to developing countries acquiring bulk carriers and tankers.

Another important subject was freight rates, also covered by the code. Initially, developed countries wanted to take up both code and freights, but developing countries feared this would prolong the issue unduly.

A case was also made for the need to review and, if necessary, readjust freight rates, so as to keep them as low as possible bearing in mind the needs of developing countries. A notable gain here would appear to be the stress on indication of the reasons for revision of freight rates, along with an aggregate analysis of financial accounts by independent agencies. The code also refers to such aspects as promotional freights and averaging of freights

(on this latter, developed countries have reserved their position). Incidentally, it is understood, the note on freight rates was accepted unanimously.

Even as more technical assistance is to be given to developing countries for both shipping and shipbuilding, ports in these

countries could expect substantially enlarged financial assistance from UN agencies for modernisation. There is particular stress on liner conferences using these improved facilities, as greater use of ports by these conferences would mean a growing volume of trade for developing countries.

Who gains in Indo-Bangladesh trade?

THE INDO-BANGLADESH trade agreement which was signed in New Delhi on March 28, has been dedicated to the common people of both countries, who are expected to be the main beneficiaries from the close co-operation in trade and development. It is premature to consider to what extent this objective is being realised but have Delhi and Dacca at least made the right beginning in this direction? It was expected that as a result of the trade agreement, smuggling across the border would decline substantially and that the people on either side would be able to get their essential supplies at reasonable prices. But reports from Dacca indicate that Bangladesh continues to suffer from acute scarcity and high prices of many commodities which enter into the cost of living of the common man. The fact that the government of Bangladesh had recently to issue a special order, providing heavy punishment for "grave offences" like hoarding and black-marketing gives some indication of the seriousness of the situation. The price disparity between the border areas seems to be too drastic in respect of many essential commodities. For example, in the middle of May while the price of salt in Murshidabad on the Indian side was Rs 21 per quintal, it was Rs 37 in Rajshahi in Bangladesh. The price of the hilsa fish in Murshidabad was Rs 475 per quintal against Rs 350 in Rajshahi. The prices of other commodities like rice, wheat, atta, flour, sugar, mustard oil, kerosene, eggs, dhotis and saris also vary considerably, which makes smuggling attractive despite the risks involved.

The trade agreement provides for a review of its working after six months but if before this period, either country feels the need to modify the facilities, it should enter into immediate consultation with the other to take the necessary measures. New Delhi and Dacca will do well to undertake the review even now in order to make the agreement really effective. In particular, the government of India

should examine to what extent its excessive reliance on state trading is helping our country to develop the trade with Bangladesh. Complaints are being heard from Dacca about delays in getting the supplies through the Indian state trading agencies. There have also been reports about the high prices charged for Indian goods as well as the supply of sub-standard products. These complaints, if true, are hardly surprising in view of the lack of sufficient experience on the part of our state trading agencies and the absence of adequate and satisfactory transport facilities between India and Bangladesh. The fact that the state trading machinery in Dacca also is not yet well equipped to handle its job competently should also be considered in this context. It is significant that although the trade agreement provides for the export of fish to India, valued at Rs nine crores, this item has not yet started coming to India because of administrative bottlenecks and the lack of sufficient surplus of fish for export.

While New Delhi is trying to keep our businessmen at arm's length in regard to the trade with Bangladesh, other countries are making energetic efforts to develop their commercial contacts with Bangladesh. Dacca has already concluded trade agreements with some countries of east Europe. Businessmen from various parts of the world are coming to Bangladesh in large numbers seeking opportunities for trade and economic co-operation. But New Delhi is deliberately discouraging our businessmen from visiting Bangladesh and building up contacts with their counterparts there. In the last week of May, a goodwill delegation from the Indian Chamber of Commerce, Calcutta, visited Bangladesh. When Mr Bhupesh Gupta asked in the Rajya Sabha how this delegation happened to go to Dacca, Mr A.C. George, the Deputy Foreign Trade Minister, replied in a manner which seemed to indicate that New Delhi was unhappy about this visit. Mr George said that the government was not aware of this visit although the delegation had been given the clearance by the Ministry of External Affairs and by the government of West Bengal. Moreover, the delegation had gone on the invitation of the Dacca Chamber of Commerce. Mr George seemed unaware of these facts and, what was more unfortunate was that he did not indicate

any desire to ascertain what were the impressions and the findings of the delegation. On the other hand, he declared that it was the policy of the government of India to discourage private entrepreneurs from having trade relations with Bangladesh.

The government of West Bengal has expressed its anxiety that this state should be able to play a major role in developing the trade with Bangladesh and has expressed the view that the goods to be supplied from India to Bangladesh should, as far as possible, go from West Bengal so that its industries can function better and create more employment. But so long as New Delhi continues its policy of distrust towards the private sector, West Bengal will not be able to derive much advantage from developing the trade with Bangladesh. The latter needs substantial quantities of various types of consumer goods and capital equipment but only a few items are mentioned in the trade agreement with India. According to the import policy of Bangladesh, out of 269 items, only 26 are handled by the Bangladesh State Trading Corporation. The other items can be imported through private channels against payment in sterling. According to Article III of the Indo-Bangladesh Trade Agreement, imports and exports of commodities and goods produced or manufactured in India or Bangladesh, which are not included in Schedule A, and in the case of those in excess of the values specified therein, shall be permitted in accordance with the import, export, and foreign exchange laws, regulations, and procedures in force in either country from time to time. But how can businessmen take advantage of this provision so long as they are not freely permitted to travel to Bangladesh and build up contacts?

The government of Bangladesh has been inviting global tenders from time to time but their details are not promptly available to our businessmen. The jute and other industries in Bangladesh urgently need various kinds of spare parts which India is in a position to supply. But, again, the lack of contacts between the businessmen in both countries stands in the way of taking advantage of these opportunities. Under the trade agreement, the two countries have undertaken to make mutually beneficial arrangements for the use of waterways, railways and roadways for commerce. This provision needs to be implemented immediately since the lack of transport facilities is severely handicapping the promotion of trade. New Delhi and Dacca should therefore have a fresh look at the trade agreement and consider how best it can be effectively implemented so as to benefit the common people in both the countries.

To the rescue of the sick

V. Balasubramanian

THE WORKING of the Industrial Reconstruction Corporation of India Ltd, which has its headquarters in Calcutta, has lately attracted the attention of the Press and the Parliament. This agency, which has the purpose of reviving sick or closed industrial units particularly in West Bengal, was established by the central government in the middle of April last year. It has, therefore, been functioning for only a little over a year and this is certainly too short a period for an assessment to be undertaken of its performance. All the same it is not entirely pointless to look or even probe into what it has been doing or how it is doing it since, in the case of institutions of this kind, there is a grave risk of problems or even lapses piling up cumulatively unless care is taken in the initial stages to set the working of these agencies on the straight, even if not narrow, path.

rehabilitating workers

In its immediate context, the IRCI has certainly been helpful in rehabilitating workers who had lost jobs or livelihood through the closure of factories brought about by one reason or another. By providing reconstruction finance to the sick and closed industrial units, it has been able to secure the reemployment of 19,319 workers besides warding off the threat of unemployment to another 19,007 workers. Especially in view of the political and social conditions prevailing particularly in West Bengal, this is an achievement of no small significance. It follows that any examination of the working of the IRCI could therefore validly concern itself only with improving its performance and warning it of the pitfalls it is liable to run into. Although the IRCI is free to go to the aid of sick or closed industrial units anywhere in the country, its activities have been confined mostly to West Bengal where the need for the services of such an institution has obviously been most acute. Answering a question in the Rajya Sabha on May 23, the Finance Minister gave details of the assistance sanctioned or disbursed by the IRCI thus far. According to his statement, the amount sanctioned as on May 16 aggregated to Rs 7.44 crores

and the amount disbursed Rs 1.41 crores. These loans were spread over 48 industrial units of which engineering units numbered 24 and textile units nine. Rather interestingly, while 47 out of these 48 units are located in West Bengal, the remaining one, an engineering works engaged in the manufacture of textile machinery is located in Tamil Nadu.

careful selection

The IRCI's resources at present consist of a paid-up capital of Rs five crores out of an issued capital of Rs 10 crores and a loan of Rs five crores drawn out of the total loan of Rs 10 crores sanctioned by the government of India free of interest. The Finance Minister informed the Rajya Sabha that the Corporation was expected to call up during the current financial year the balance of Rs five crores of its issued capital as well as draw the remaining interest free loan of a like amount from government. The IRCI is intended to aid or save industrial units fallen on evil days whether due to factors within the control of the managements or outside. Nevertheless, a good deal of its ministrations is directed towards industrial undertakings which have suffered either because of incompetent management or due to downright mismanagement. It follows that the viability of the IRCI would depend heavily on its careful selection of projects to be assessed as well as on its capacity to ensure that the assisted undertakings are managed along sound lines in the future.

It has been stated that the IRCI has received over a period about 300 applications out of which 48 which are considered to be potentially viable have been sanctioned assistance. Some 13 cases which had no potential for viability have been rejected, while another 47 cases have been redirected to banks and financial institutions as they do not qualify for assistance from the IRCI. Other cases are either in the pipeline or are awaiting their turn for study. These details *prima facie* suggest that the IRCI does follow a strict procedure of scrutiny and selection. This is of course as it should be. Nevertheless there seems to be a feeling in

responsible quarters that the selection procedure has not always been foolproof, or knaveproof. There have been reports of political pressure from the state government. Especially with regard to the cotton textile mills, which have been taken under the umbrella of the IRCI, complaints have been made that some of the units are past the stage of revival, reconstruction or resurrection and that they should therefore be scrapped. It is pointed out that pouring good money into these doomed derelicts would be a bad bargain on any reckoning and that even from the employment angle it would be a wiser use of national resources to encourage and assist in the setting up of new and modern cotton textile units which could pay their way.

inefficient management

An even more serious criticism is that the management of the units — the reference once more is particularly to the cotton textile mills — which have come under the protection of the IRCI has not been organized properly and is therefore not being carried out in an efficient or honest manner. It is alleged that there are cases where unqualified persons have been appointed as directors due to political pressure and it is also said that malpractices are becoming widely prevalent particularly in the purchase of raw cotton or stores or the sale of yarn or cloth. The union Ministry of Finance which has the responsibility of ensuring the proper functioning of the IRCI should certainly look into these criticisms and complaints and take remedial action in time. This is all the more important since the soft loan terms of IRCI assistance are such that considerable time will elapse before the repaying capacity of the assisted units come to be tested. During this period there is every chance of the financial assistance received by these units getting exhausted through losses due to malpractices in management or sheer incompetence on the part of those who have been put in charge of the assisted units. In fact there is already a fear that some of the cotton textile mills receiving IRCI assistance are headed this way.

A course of action which appears to be

urgently needed is for the marginal units among the assisted undertakings to be screened once again and the prospects of their viability very strictly assessed. Any unit which fails to make the grade must forthwith be scrapped. Secondly, there is the need for the Finance Minister to take another and a really close look at the Directors appointed by the IRCI and evaluate their qualifications and backgrounds and above all the way they have been functioning in their present positions. A serious weakness in the present scheme of IRCI assistance is that the IRCI itself is not exercising any control over the operations of the assisted units. It is important that this state of affairs should not be allowed to continue. The IRCI should hereafter devise procedures for ensuring sound financial control. One formula

could be for the IRCI to insist on monthly statements of accounts and promptly investigate the affairs of any unit the actual performance of which is not keeping up with the projections made by the IRCI for its reconstruction.

There is also the interesting possibility that the banks which have extended loans to the assisted units under an IRCI guarantee should be encouraged to take an active interest in the financial position or trends of these undertakings. It is worth noting that banks have sanctioned loans up to total of Rs 5.15 crores to the various units under the IRCI umbrella. This is apart from the fact that they have also contributed to the share capital of the IRCI; the United Commercial Bank, for instance, has in-

vested a sum of Rs 12.5 lakhs in this manner. Thanks to such relationship bank managements are already represented on the IRCI and it is therefore both proper and possible that they should be enabled and in fact required to assume their due share of responsibility in terms of keeping a vigilant watch over the financial affairs of the assisted units. Incidentally, if the banks' role is to be projected in a healthy way, it is important that no political pressure should be brought to bear on them to eschew legitimate banking considerations while scrutinizing loan applications. To sum up, if the IRCI is to do an honest and efficient job, it must be more professional and less political in its promptings and proceedings. It is always desirable that a warning, where needed, must be given early as well as heeded equally early.

Growth trends in public sector

V. S. Mahajan

AN ATTEMPT is made here to analyse the growth trends of certain public sector undertakings during the last few years. The study is confined to iron and steel, chemical and engineering sectors which are indeed the core sectors in the process of economic development. Out of a total investment of Rs 3,902 crores in public sector industrial and commercial undertakings by the end of March 1969, investment made in these three sectors was of the order of Rs 2,686 crores constituting 70 per cent of the total investment.

The data used in this article has been culled from the four annual reports of Industrial and Commercial Undertakings (from 1965-66 to 1968-69), published by the Bureau of Public Enterprises of the government of India.

massive investment

The investment made in this sector by the end of March 1969 was of the order of Rs 1,099 crores — the largest investment ever made in any industrial undertaking whether in the private or public sector. If we add to this the investment made in the Bokaro Steel Plant which is under construction, the investment figure would rise to Rs 1,305 crores—indeed a record figure. However, it is not the imposing

investment which is all that important, but it is the net benefit derived by society with the help of such investment which is going to be far more significant.

How to evaluate the performance of a public sector undertaking? Should it be purely in terms of (monetary) rate of return derived from such investment, or should it also take into account both direct and indirect benefits derived by the society as a consequence of the expansion of output of, let us say, iron and steel industry? We should not go purely by the first criterion but rather by the second one since such an industry as iron and steel has also a large social benefit. For instance, when there is a comfortable supply of iron and steel at reasonable prices, there would also be all around spurt in the manufacturing, construction and farm activities. In other words, while an iron and steel plant might be running at a loss in a pure accounting sense, but if we take into consideration the growth it has encouraged in a number of economic activities, it would not be a losing proposition.

Notwithstanding this, the economy could not at the same time tolerate the occurrence of continuous losses in industrial undertakings even though these yield a large social benefits. This would go against the whole philosophy of econo-

mic development where reinvestment of accumulated gains from industrial undertakings plays an important role. A plant which is continuously losing would be a big social liability and would have to be written off.

teething troubles

In view of this, the losses to which we have referred above are entirely those which result on account of the teething troubles and are only for a short period. As soon as engineering and managerial expertise has been mastered and a rational price policy has been adopted, there is no reason as to why a particular plant should not start yielding a reasonable return on investment.

There are three running steel plants in this sector — Bhilai, Durgapur and Rourkela. These plants were set up during the second five-year Plan period and were ready for operation at full capacity by the middle of the last decade.¹

Incorporating the latest advances in steel technology and with no dearth of technicians as the Indian universities had turned out a large number of engineers during the first two plans, one should have thought that these plants should have done a wonderful job. Unfortunately this has not been the case as is revealed by

POINTS OF VIEW

(Table I a). In fact, during the later part of the last decade, the losses have been continuously rising. For instance, from a profit of Rs two crores during 1965-66 (the terminal year of the third five-year Plan), it turned into a loss of Rs 19.4 crores in the following year. The losses rose further to Rs 38.5 crores and Rs 43.8 crores in the subsequent two years.

Notwithstanding the fact that a part of the period under study synchronised with the occurrence of recessionary conditions in the economy, such performance did, not speak well of the public sector steel plants. One could have appreciated these losses if these were due to mere teething trouble. But unfortunately this was not so. The poor performance was mainly due to defective planning and the absence of dynamic management.

It is unfortunate that, inspite of the repeated assurances by the government to introduce professional management in steel plants, not much headway has been made so far. And no wonder, with such approach, the latest report (1970-71) on the performance of these plants does not make encouraging reading.

uniform deterioration

Analysing the performance data of all three steel plants, one notices that the level of deterioration in their performance is fairly uniform. For instance Rourkela, which had shown a profit of Rs 5.3 crores in 1965-66, has shown a loss of Rs 7.1 crores in 1968-69; similarly at Bhilai profits of Rs 1.8 crores during 1965-66 had turned into a big loss of Rs 11.2 crores during 1968-69; and Durgapur's losses steadily rose from Rs two crores to Rs 17.5 crores during the same period.

Such uniform rise in losses in all steel plants is in no small degree due to the concentration of control of all steel plants under a single management (Hindustan Steel Limited). It would be a herculean job for a body such as Hindustan Steel to manage these plants at a uniform level of efficiency. The earlier the management of these plants is decentralised the better it would be for the economy. It would introduce a spirit of healthy competition among all plants and lead to greater efficiency, fuller utilisation of plant capacity and improvement in marketing techniques.

Equally disturbing results are obtained when one makes an analysis of returns obtained from these plants (Table II p. 1171). It is interesting to find that while the ratio

of gross sales to capital employed improved by four points in 1968-69 as compared with 1965-66 when the ratio was 32.3 the ratio of both net profit to equity and gross profit to capital employed showed losses.

This is another way of saying that no economies were exercised on the cost of production which kept on rising at a rapid rate during this period. Here an important contributing factor has been the rising wage cost. This coupled with overstaffing of steel plants, made the situation still worse.

Shifting next to the general engineering sector, which is also a significant consumer of the output of steel industry, one notices

performance at various degree of efficiency. For instance, while Bharat Earth Movers, Bharat Electronics and Hindustan Aeronautics have shown rapid advances in their profits from Rs 12, 60 and 104 lakhs respectively during 1964-65 to Rs 126, 218 and 232 lakhs during 1968-69. Hindustan Machine Tools (HMT) has been going down from a profit of Rs 178 lakhs to a loss of Rs 42 lakhs during the same period. The losses of Heavy Electricals, Heavy Engineering Corporation, Bharat Heavy Electricals and Mining and Allied Machinery Corporation are on the decline though at a very slow rate.

The overall picture is that losses far outweigh gains during the period under study, and further that losses rise at an

POINTS OF VIEW

fact that raw materials for the operation of these plants are easily available from the public sector steel plants.

Still far more disturbing is the growth of the Hindustan Machine Tools (HMT) where investment of Rs 53 crores was reported by end March 1969. That this unit which had shown a commendable performance up to the end of the third Plan should be in the red thereafter leaves much to be desired. The general excuse put forward that there was an overall decline in demand of machine tools during this period could not provide the sole answer to such poor performance.⁴ Perhaps an answer has again to be found in the poor management and technological lapses. Not only the demand for all sorts of machine tools has been rising within the country, a growing scarcity is also found in the international market for selective tools. Unfortunately we have failed to exploit this opportunity mainly because we lack in competitive strength and also because we have failed to build up dynamic

accelerated rate during the last two years 1967-68 and 1968-69) as compared with the earlier period. Whether these losses are to be imputed to teething trouble, or overall inefficiency of management, only time would tell.²

It is found that both the units in the electrical sector—Heavy Electricals and Bharat Heavy Electricals; the former set up during 1956 and the latter during 1964—are in the red. The investment made in these two units by the end March 1969 amounted to Rs 231 crores—which is not a small sum. While a loss of Rs 4 crores by Bharat Heavy Electricals in 1968-69 is understandable—for it was set up during 1964 and the loss is against a total investment of Rs 168 crores, a loss of Rs five crores in Heavy Electricals (set up as far as 1956 and having a total investment of only Rs 64 crores) is indeed disturbing. Also in view of a heavy demand for the electrical goods in the expanding economy of India and also from the developing countries, a continuous loss by

the electrical sector needs a thorough investigation.

Further, Heavy Engineering Corporation³ as well as Mining and Allied Machinery Corporation—both allied to Hindustan Steel are also in the red. In fact these two units suffered a heavy loss of Rs 20.7 crores during 1968-69 as against an investment of Rs 269 crores. In particular Heavy Engineering Corporation (established in 1956), where a total investment to the tune of Rs 189 crores had been made upto March 1969, a loss of Rs 3.4 crores during 1968-69 should be disturbing.

A significant reason for the occurrence of these losses has been that these plants have been working below capacity. That this should happen in the Indian economy which is heavily dependent on foreign countries for the import of heavy engineering equipment reflects on the gross inefficiency of our units. This is all the more painful in view of the

TABLE II

Principal Operational Ratios of Public Sector Undertakings

Notes :

- (1) For the names of various units under Engineering (2.1 to 2.8) and Chemicals (3.1 to 3.4) see the previous table.
- (2) Most of the fractional figures in the table have been rounded up.

Codes :

- a. stands for ratio of net profit to equity capital;
- b. stands for the ratio of gross profits to capital employed (aggregate);
- c. stand for the ratio of gross sales (turnover) to capital employed;
- L. stands for loss.

POINTS OF VIEW

marketing links with the overseas markets.

As compared with steel and engineering sectors, this sector appears to have put up a relatively better performance. For instance, the Fertilizer and Chemicals Travancore (FACT), which had an investment of Rs 22 crores by end March 1969, had yielded a profit of Rs 44 lakhs during 1966-67 after showing losses during the previous two years. Although profits have been declining thereafter and had touched Rs 27 lakhs during 1968-69, the FACT promises a good growth trend over time and hence an additional investment of Rs 44 crores for its expansion is fully justified.

Similarly Fertilizer Corporation of India (FCI), with a total investment of nearly Rs 131 crores by end March 1969, has shown a profit of Rs four crores during 1968-69. Keeping in view that the trend of profits is rather erratic, FCI like FACT, promises a good growth trend and should do well over time. It has an expansion programme of Rs 195 crores which, considering the growth trend of the industry is fully justified.

decentralisation of control

However, attempts should be made to save FCI from the same fate as met the Hindustan Steel. In other words, if all¹³ (excepting FACT) public sector fertilizer units have to be concentrated under its single control, one fears that this would lead to an unwieldy control and might give rise to discouraging results, as are already in evidence in the profit trend of the corporation during the five years period under study. Consequently, decentralisation of control would definitely lead to a better performance and introduce a spirit of healthy competition among different units.

Hindustan Photofilms and Indian Drugs and Pharmaceuticals⁶, where total investment of Rs 60.7 crores had been made by end March 1969, are yet experiencing teething trouble and consequently show discouraging results. However, considering that over ten years have passed since these plants were set up, the teething trouble appears to have been unnecessarily prolonged. Especially that this should happen in the Indian Drugs and Pharmaceuticals, which had a total investment of Rs 50 crores, is deplorable.

Also a major objective of setting up of different units under Indian Drugs and Pharmaceuticals is that the quantum of

life saving medicines has rapidly increased so that people could have them at reasonable prices. This would also have its healthy effect in inducing the private sector to bring down the drug prices. Keeping this in view, one still expects the public sector pharmaceutical industry to put up a better performance, especially when it has set up latest plants and as well hired the services of top experts in the profession.

regional dispersion

Interesting results are obtained when one makes an analysis of the location of public sector enterprises (Table III) It is found that Bihar, Madhya Pradesh, Orissa and West Bengal are the first four states where over two-third of the total investment in public undertakings has been made. Looking slightly differently, the three states of the eastern part of the country — Bihar, Orissa and West Bengal — account for nearly 50 per cent of the total investment. This shows that these states among themselves have a lion's share in the total investment in public undertakings.

The south, comprising Tamil Nadu, Kerala, Andhra Pradesh and Mysore, has

a total investment of Rs 566 crores, which is equivalent to the investment made in Madhya Pradesh alone (Rs 543 crores).

The western India, comprising Maharashtra and Gujarat, have a total investment of Rs 188 crores which is equally spread among these two states. The

TABLE III b

(arranged region/statewise)

Region/State	Property (Rs crores)	
I. Eastern		
1. Bihar	621	
2. Orissa	423	
3. West Bengal	411	1455
II. Southern

2. Rajasthan	27	570
VII. North-Eastern		
1. Assam	64	64

Note: The data excludes investment made by the Indian Air Lines which is not possible to apportion statewise. It also excludes investment made by the Indian Oil Corporation.

north-western India — comprising Punjab, Delhi, Haryana and Himachal Pradesh — has a total public investment of Rs 54 crores. However, Haryana and Himachal Pradesh have a very small share in such investment—just Rs Seven and two crores respectively. Further Himachal Pradesh has the lowest ranking in public industrial investment, while Haryana is a step above it.

The central India, comprising Madhya Pradesh and Rajasthan, accounts for a total investment of Rs 570 crores, over 90 per cent of this being the share of Madhya Pradesh alone. The northern India, comprising alone Uttar Pradesh which is the most populous state in India, has an investment of the order of Rs 137 crores. This works out to 4.5 per cent of the total investment, which indeed is very low.

Assam in the extreme north-east, has a share of Rs 64 crores. However, if we add up the investment made in oil by the public sector, for which separate figures are not available in the annual report, Assam's share would be larger.

heavy concentration

A brief analysis of the public sector investment in different states of the country shows that investment is heavily concentrated in the eastern part—West Bengal, Bihar and Orissa; and also in Madhya Pradesh which has a rank number two in total investment in public undertakings. As against this, investment made in the north-western states—Punjab, Haryana, Delhi and Himachal Pradesh — is the lowest. Investment in the south (Tamil Nadu, Kerala, Mysore and Andhra Pradesh) follows the middle path, while that in western India (Maharashtra and Gujarat) and northern part of the country (Uttar Pradesh) hardly makes an impressive reading.

Notwithstanding the fact that investment in the eastern states and Madhya Pradesh is mostly in steel, heavy engineering and electrical sectors, which are essential for a rapid growth of the economy, one cannot at the same time fail to point out that such concentration of investment in a few pockets of the country has led to concentration of basic industry in a few states and deprived others of the same. This is all the more difficult to understand in view of the government's avowed policy of encouraging regional balanced growth through decentralised in-

dustrial development.

This, at the same time, does not mean that heavy industry should be equally spread in all parts of the country. This would be highly undesirable as scarce resources would be wasted by establishing basic industry even when basic inputs are not available. However, seeing the pattern of industrial growth, one cannot fail to observe that the establishment of basic industry in the eastern states has not encouraged industrial activity over a wider area. Thus, while establishing basic industry, it should be seen that maximum benefits of the same are spread over the largest possible area of the country. In this connection the decision taken recently to set up mini-steel plants in the south is indeed to be welcomed.

main facets

A few conclusions follow from the above study. First the public investment in the industrial sector is heavily concentrated in steel, engineering and chemical industries. This has been done to accelerate the pace of economic development, as output from these industries would yield a large benefit to the economy. Secondly, while the largest investment is concentrated in the iron and steel sector, it is found that the performance of this sector does not make a happy reading. Much of this poor performance, as seen earlier, is due to the unwisely size of the Hindustan Steel and the gross inefficiency of the management. Thirdly, the engineering sector, which is a large consumer of the output of the steel industry, also does not display an encouraging growth trend. Barring a few units like Bharat Earth Movers, Bharat Electronics and Hindustan Aeronautics, the remaining five units under study have not put up good performance. In fact efficiency of some of the units like Hindustan Machine Tools seems to be on the decline.

Fourthly, among the four chemical units under study, the two relating to fertilizers (FACT and FCI) are all right, but the other two (Hindustan Photofilms and Drugs and Pharmaceuticals) are not. We had suggested that if the management of the FCI was not decentralised it might not become a viable corporation. Fifthly, our study of the location of public sector undertakings points to highly uneven distribution of investment. While the eastern states and Madhya Pradesh have a fairly high share of such investment, the north-western states have hard-

POINTS OF VIEW

ly received any attention. Though equidistribution of investment in different parts of the country was ruled out, it was however suggested that fruits of such investment should yield a balanced industrial growth in the country, which had not happened so far.

references

1. In fact these were running near full capacity during 1965-66, as evident from the data given below. However, since then the performance has been getting worse.

Year	Capacity utilisation in major branches of public sector iron and steel industry		
	Hot Metal	Steel Ingots	Malleable Steel
1965-66	100	95	91
1966-67	99	88	82
1967-68	87	70	69
1968-69	69	79	87

2. Of course it would be extremely difficult to suggest that the management of these units is more efficient than in public sector steel plants. It might be that if the management of these plants has to face the same troubles as in steel industry, its performance was equally bad.

3. The company is entrusted with the development of the following projects:

1. Heavy Machine Building Plant — Ranchi, mainly designed to produce metallurgical equipment needed for the iron and steel industry;
2. Foundry Forge Project — Ranchi, intended mainly to supply forgings and castings to Heavy Machine Building Project and Heavy Machine Tools Project;
3. Heavy Machine Tool Project — Ranchi, designed to produce annually 10,000 tonnes of heavy machine tools, with a provision for the expansion of capacity upto 20,000 tonnes.

4. It is interesting to find that while the rate of gross sales to capital employed declined only marginally during 1967-68 and 1968-69 as compared with 1965-66 just by one point from 40.6 to 39.4 (1967-68) and to 39.8 (1968-69), the losses have been substantial. This is another way of saying that it was not so much the fall in output in machine tools which gave rise to losses in HMT, but some other factors.

5. It has at present seven units under its control, Sindri, Nangal, Trombay, Gorakhpur, Namrup, Durgapur and Barauni.

6. The following plants are controlled by the company; the Antibiotic Plant, Rishikesh; the Synthetic Drug Plant, Hyderabad; and the Surgical Instrument Plant, Madras. It is stated that although sales rose to Rs 105 lakhs during 1968-69 as against 9.1 lakhs in the previous years, the losses were fairly high. This was stated to be due to stiff competition from the imported products. Consequently until the various plants are able to produce pharmaceutical products at competitive prices it would not be possible to justify their existence.

POINTS OF VIEW

Economic philosophy of Ranade

S. K. Ray

THE WRITINGS in the nineteenth century in India, in the framework of the political movement, or as ancillary to it, had a clearly discernible economic content in the sense that the motivation was to serve the cause of the economic emancipation of a people in bondage. By the time Britain had established its governance over the greater part of the Indian sub-continent, India had a developed agricultural economy of the basic unit structure, labour-intensive, but profitable as an economic unit with the peripheral support of cottage and village-level industries. The price spiral was by and large at a plateau of economic stability. The living standard of the community, compared to present-day levels, was also at a plateau governed by simple laws of demand and supply. There were pockets of concentrated wealth, but its manifestation was to a large extent in agricultural holdings fostering a sort of paternal development of agricultural and quasi-agricultural pursuits: the multitude in the villages could make their living. Famines did come, in pockets or in a wave, but usually these were the direct results of wars or invasions and the resultant plundering and temporary cessation or disruption of economic pursuits or not infrequently because of acts of God. The fundamental stability of the economic fabric however would generate adjustable economic forces over the economy as a whole, and the people would soon get back to their economic vocations and pursuits, and the economy would soon pick up at the pristine levels.

doctrinaire tenets

The British government in the 19th century brought to bear on their meandering economic policies an application of the unduly doctrinaire tenets of political economy as formulated by them in the popular English text books of the lily-white classical content. The purely axiomatic and hypothetical character of the classical theories of political economy was conveniently glossed over. The presumptions as to the environments were also forgotten in deliberate econo-political manoeuvres.

Friedrich List in Germany came down

heavily on such suit-the-purpose application of economic principles. It was particularly against the cosmopolitan principle in the modern economic system that he protested, and against the absolute doctrine of free trade, which was in harmony with that principle. He gave prominence to the *national* idea, and insisted on the special requirements of each nation according to its circumstances and especially to the degree of its development.

Friedrich List was not alone in pointing out the fallacy in presuming that classical economic laws were universal in their application. Apart from many important continental economic theorists, there were a few in Great Britain even — Alfred Butler for one—who were emphatically protesting against such a dogmatic and colonial application of the principles of economic laws.

vehement criticism

Criticism of the economic policies of the government during the greater part of the nineteenth century was vehement. The motivation was however principally political. The texture of such criticism did not bring out the economic fallacies in the enunciation and consideration of the principles of political economy. It was here that (Mr Justice) Ranade stepped in. In fact it will not be incorrect to conclude, after a research on the works of both List and Ranade, that Ranade had accepted List as his mentor. In the evolution of Indian economic and econo-political thoughts Ranade's contribution was no less momentous than List's contribution to the formulation of political economy in Germany in his time.

Compared to his compeers, Ranade had two advantages: his accustomed erudition and an almost unsurpassed brilliance in the use of the English language in his time. Both of these he brought to bear on the interpretation of his economic thoughts and in spotlighting the hollowness in the firmament of economic policies of the British government in India.

Because free trade was useful for Eng-

land, the government emphasised, it must be good for India also. Because the principles of *laissez faire* suited the conditions of the British economy, the government imposed it on the Indian economy, and had the audacity to postulate that it would be equally beneficial to India, intentionally skipping over the fact of the non-existence or only marginal existence of a silken infrastructure of private enterprise, already being annihilated systematically by the British as an integral part of their establishment of political suzerainty. Ranade went about with remarkable aplomb to expose the incorrectness of these policies.

Indian context

Ranade took it upon himself the national responsibility of proving that many of the assumptions at the background of all dogmatic treatment of the subject of political economy were inapplicable to India and also that, public policy, if it was really to further the economic development of the country, could not afford to ignore the peculiarities of the Indian context.

In his exposition of the wanton disregard of the realistic tenets of the Indian economic condition by the government, what Ranade wrote became the plinth of our economic thoughts at that time. As the assumptions (Ranade is referring to assumptions like enlightened individualism, completely free competition, mobility of labour and capital, etc.) did not hold good of even the most advanced societies, it was obvious that, in societies such as ours, they were chiefly conspicuous by their absence.

There was neither the desire nor the aptitude for free and unlimited competition except within certain predetermined groups or grooves. Neither capital nor labour was mobile, nor entrepreneurship intelligent enough to shift from place to place. Wages and profits were fixed and not elastic and responsive to change of circumstances. Population followed its own law, being cut down by disease and famine,

Let Pan Am show you there's a big difference between airlines.

If you think all airlines are the same, you don't know Pan Am. We are way ahead with new ideas and services to make your flights more comfortable, your travel more enjoyable. With ideas that add up to greater value for your rupee. Services that invite comparison-shopping with any other airline in the world.

Whether you're flying East or West or "round the world", we can plan every detail of your trip. And wherever you go, you'll know you're flying with the very best, the most experienced. That makes all the difference in the world. After all, our only reason for flying is YOU.

Pre-flight assistance

Because we know that in travel every detail counts, we count every detail. Pan Am can provide complete, up-to-the-minute information on travel, emigration, customs and other formalities.

Assistance anywhere in the world

Our unique brand of services goes everywhere we fly. Just drop into any of our worldwide offices. You'll find Pan Am Travel Experts ready to help you with hotel reservations, sight-seeing, currency regulations, anything that you might need.

One airline to the world

Travel farther with us and see more places. In fact, on a single Pan Am ticket you can go clear 'round the world'. We fly to more than 120 cities and over 80 lands. And now you can catch a 747 in over 30 cities. So we're the most likely to have a flight to where you want — and when.

The airline for businessmen

Anywhere in the world that business might find you, you'll find a Pan Am office ready to help. And any one of them can make a tremendous difference in helping your business go better. We'll plan your entire itinerary before you leave. And help with information about the countries you plan to visit. We'll book hotels, arrange guided tours, hire cars. We'll do almost anything you might ask us to.

Pan Am.

while production was static and stagnant, and the bumper harvest of one year was needed to provide against the uncertainties of alternate bad seasons and two consecutive bad crops often brought about a famine. In a society so constituted, the tendencies assumed as axiomatic were not only inoperative, but were actually deflected from their proper direction.

At the present time, when the principles of economic laws of money, profit, surplus and liquidity preference, as enunciated by Keynes and the post-Keynesian economists, are applicable in their respective spheres to both the continental and extra-continental countries like India, the economic concepts of Ranade have a look of comparative exaggeration. If one goes through the stimulating works of Ranade, one would naturally realise that there was really a played-up emphasis on the inapplicability of the classical economic laws, and that this emphasis was deliberate.

The classical economic principles very much suited the pursuits of the government, in the background of what came to be known as imperial preference. Ranade's philosophy, which postulated that it was mainly the responsibility of the government to sponsor and accelerate industrial and agronomical development in the country, was diametrically opposite, and in order to achieve his points the political overtones in Ranade's articles are understandable.

inglorious concept

To a student of Indian economic development, the concept of imperial preference fostered by the British rulers in India looms large as an inglorious concept, which wanted to develop the country as a producer of basic resources, required for industrial development of the United Kingdom, and for ploughing back finished products in the vast Indian colony. Tariffs and licences, priorities, economic assistance, shipping and transport, in short every economic vehicle, was geared to this responsibility of the government.

The country was thus being used for export of raw material to aid industrialisation of Britain and also as a market for dumping of the finished products of the British industry. As a result, while industrialisation could not take any meaningful step, agriculture was falling into pieces. Even the tenancy laws and the settlement systems degenerated to produce a multitude of uneconomic holdings controlled by pockets of vested *talukdars* interlocked by pockets of real grievances. It did not, however, furnish anything like a

tion or towards introduction of collective farming.

Ranade decided to hit the government hard on such economic policies, which he said were anti-national and retrograde to economic development. He made no bones about the fact that the government, which was filling up its exchequer by deploying its machinery of public finance through taxation, tolls, excise duties etc., was bound under the modern concepts of government to plough back the public surplus in the industrialisation of the country and also in the modernisation of agriculture and cottage industries. He thus developed the theory of public surplus in India and was all the time urging the government to set the pace of industrialisation in big cities, modernise the tenancy and settlement systems and rationalise the agricultural economy.

remarkable contribution

Another remarkable contribution by Ranade to the debate on public issues of economic significance concerned the arrangement under which 'home charges' and 'imperial levies' were being repatriated to Britain in lieu of the so-called security and governance provided by the British in India. It was being urged that, after all, England had conferred on India the inestimable boon of peace and had made possible an orderly development of the country in all directions and that, therefore, India's losses due to the 'drain' were as dust in the balance when weighed against these blessings. On this plea, as Gokhale pointed out before the Welby Commission, it would have been possible to justify every kind of government extravagance and unfairness.

Ranade, too, would not go unchallenged such deceit in the formation of public policy for economic development. The advantages to India of the British connexion, such as they were, or *vice versa*, were not capable of being precisely measured. They were therefore out of place in a discussion occupied with concrete and calculable items, just as much as the incalculable, though none the less real, advantages which England derived from India.

Ranade considered the whole controversy as entirely academic and incorrectly opinionated, and a deliberate attempt to shift emphasis from the down-to-earth factors of economic development. At the best it can be said the analysis undertaken in connexion with the 'drain' theory did help to indicate various directions of urgent reform, and pointed to the existence of a number of real grievances. It did not, however, furnish anything like a

complete explanation of Indian poverty. The first Indian thinker to see the necessity of emphasizing many other more important causes was Ranade, who was a path-breaker in this as in so many other matters. Later writers perhaps did not always show Ranade's insight and his exquisite sense of proportion.

two considerations

The effectiveness of Ranade's posture should be judged against two considerations. First, he did provide a very effective economic forum to the developing political movement of the country. The cudgels of Ranade were later taken up in the political manifesto of the Indian National Congress increasingly. Secondly, even in those early days of political movement, the thoughts of Ranade compelled the government to come down to brass-tacks in matters of development and principles of government.

The government was certainly being obliged increasingly to take to economic measures leading to the industrialisation of the country in phases, and later towards revision of the ryotwari settlement and even towards modernisation of the agricultural units and methods. The measures taken might have been only marginal, but they did certainly set the pace of things to come in the next few decades.

USA through British and American eyes

Josselyn Hennessy

London:

I A British View

EVER SINCE the Congressional mid-term election in November, 1970, the US administration has pursued one over-riding objective — to get the economy moving. Having discovered that the combination of a recession, high unemployment and inflation added up to a prescription for straight electoral poison, President Nixon threw policy into reverse. The balance of payments, never a really major factor in policy-making, was left to look after itself; we saw record budget deficits while the Federal Reserve was firmly told that it was expected to provide the monetary fuel for expansion.

When it became apparent in mid-summer of last year that the policy was not

upsurge in August had gone into a decline — the Dow Jones Industrial Average dipped to its low point for 1971 a few weeks before the end of the year — took heart once the uncertainties cleared. On April 18, the Dow Jones had reached 968, less than 30 points below the all-time peak in those far-off and trouble-free days in early 1966, and people were once again talking confidently of going through the 1,000 mark.

The Democratic primaries, normally a matter of passionate interest, seemed almost an irrelevance. True, Senator Muskie's failures at the polls provided a surprise, as did the strong showing of Governor Wallace (whose attempted assassination has been for him an electoral blessing in an unusual disguise) and the re-emergence of the seemingly ever-green

annual rate of 5.3 per cent. This was marginally below the rate achieved in the last quarter of 1971, but the recovery now had a much more lasting and broadly-based look. The savings rate remained high but the expansion in money incomes allowed the consumer to step up his expenditure nonetheless and with unemployment fears receding he did just that. Car sales in April set a new record. The upsurge in private housing, on the way ever since monetary restraints were eased and interest rates fell, shows every sign of continuing.

The latest set of leading business indicators in March were up again by 0.9 per cent, the ninth consecutive monthly increase. On the business front too, optimism suddenly blossomed. A flood of good first quarter profit figures was accompanied by confident statements that the best was yet to come and that profits would continue rising not merely this year but through 1973. Most important, business and industry have been rediscovering their zest for investment. At the beginning of the year forecasts suggested a rise in capital spending of some seven per cent this year. The latest survey has raised this to well into double figures.

II

Poor Productivity Performance

Inevitably there were one or two discordant notes. On trade account the USA chalked up its largest-ever deficit in the first quarter, but with the expansion getting under way and the adverse initial terms of trade effect of the dollar devaluation this was hardly surprising. In any case, if foreigners were to amass too many dollars for their liking, this was their headache, not Uncle Sam's. More worrying has been the poor productivity performance at a stage in the cycle when the gains should be above rather than below average. In the first three months of the year productivity rose at an annual rate of 2.1 per cent, well below the underlying trend and sharply down on the average of 3.6 per cent for the whole of last year. It could, of course, be argued that, as a result, the unemployment problem will be eased more quickly, but on the other hand inflationary pressures will be in-

creased and inflation has been the main cause of worry so far this year.

In the first quarter of the year prices throughout the economy rose at an annual rate of no less than 6.2 per cent, more than three times as fast as in the final quarter of last year and only fractionally below the rate in the bad old days towards the end of 1970. Some bulge in prices had been expected as the freeze imposed last August came to an end, but the figure still came as a shock to the administration. The growth target for the year — six per cent in real terms — still looks within reach and should it be missed the shortfall should be insignificant. But the forecast 3.25 per cent inflation rate for 1972 as a whole now looks wildly optimistic. Little wonder that Mr Peter Peterson, the Commerce Secretary, said that inflation remained "the toughest challenge we are facing now".

Industry seemed less worried, inflation with expansion is not stagflation — as long, of course, as the inflation rate does not actually jeopardise the continuation of expansion. (This incidentally is an attitude which the London Stock Market has also been reflecting for some time now). But such disregard for what until recently was regarded as a major threat to the American economy may not persist if the Price Board were to follow through with its suddenly very tough line. A series of pronouncements instructing companies to hold prices, or actually to roll back price increases, came as a distinct shock and was one of the factors inducing a greater mood of caution on Wall Street.

The impact of Viet Nam

More important, however, has been the deterioration in the Viet Nam situation. The President's talks in Moscow, which are taking place as I write, are, I believe, the most encouraging "non-event" in current international relations. Although American mines threaten Soviet ships they are at pains to avoid them lest they blow up the Soviet-American talks! Splendid!

Though the business community has as a whole been anti-war for a long time it is still not psychologically adjusted — just as little probably as most Americans — to the possibility that the USA might for the first time in its history lose a war. A more vital factor in the equation is the fear that the high risk strategy adopted by President Nixon could jeopardise the chances of his re-election. Whatever the Justice Department may have got up to, the President's policy has not been as favourable to Big Business as might have been expected from a Republican. The very existence of price controls is worrying,

the prospect that they may be more strictly enforced — if only because more easily enforceable — than wage controls can only make for greater fears.

But the chances are that any Democratic President would take a tougher line with business than Mr Nixon, and this has become more likely as a result of the evident response which the "populist" line pursued by some Democratic runners has evoked. As Senator McGovern discovers that he really has a chance of securing the Democratic nomination, even more if the situation were to develop in such a way that he saw a genuine possibility of becoming the next President of the United States, he would no doubt decide that a straight soak the rich ticket may not be the highroad to success. There are indications already that he, if not as yet necessarily his followers, have decided that a President cannot be elected without a compromise with some of the more conservative forces in the country. But that is for the future.

For the moment all eyes are on Viet Nam. This should not, however, obscure the fact that the economic prospect is now better than at any time since President Nixon was elected. Whatever disasters may lie ahead in Viet Nam are unlikely to change this. And the chances are that even if Wall Street gets the jitters, it in common with most Americans, will come to recognise this.

III

An American View

The US economy appears to be moving into a period of significantly faster growth according to the latest issue of the Chase Manhattan Bank's *Business in Brief*. Recent experience does not as yet confirm the more extremely optimistic forecasts for 1972, but it has revealed the most encouraging indications of higher production and employment in several years.

Industrial production has been rising for the past six months. In the most recent three-month period, the annual rate of gain averaged a healthy 7.4 per cent.

The average manufacturing employee worked 40 4 hours a week in February — the best figure in more than two years. Rising hours of work are usually early signs of a faster increase in the number of available jobs.

Employment has been growing rapidly; more than two million new civilian jobs have been created since mid-1971. While the unemployment rate is still too high (in part because of abnormal growth in

the civilian labour force) the job climate has clearly improved.

Economic growth promises to be not only faster but also more broadly-based in 1972 than it was during the first year of recovery from the 1969-70 recession. In 1971, there was marked improvement in sales by the consumer goods industries, and the beginning of a real boom in home-building. But business investment — always the key to a vigorous and sustained advance in the economy — was virtually flat during most of the year.

Business investment in new plants and equipment began to level off in the second half of 1969. The principal weakness was in the manufacturing industries, which were handicapped by the existence of considerable excess capacity in the face of a slowdown in sales. Companies in many lines of business — not just in manufacturing — also found their ability to finance new investment severely eroded by rapidly falling profits. But profits began to improve in 1971, and are still rising in 1972. And the Revenue Act of 1971 provided the seven per cent investment tax credit and liberalised depreciation rules as additional incentives to invest. The response has been good.

New orders for capital goods increased

WINDOW ON THE WORLD

working, further expansionary measures were accompanied by the devaluation of the dollar. In order to secure growth without inflation the administration introduced the most comprehensive system of wage price controls ever seen in the USA in peacetime. What was lacking was business confidence — the East Coast financial community and the big international companies did not look on the possibility of a trade war with the other industrialised countries with quite the degree of relaxation exhibited, at any rate outwardly, by Mr. John Connally and his closest collaborators in the US Treasury. The Smithsonian settlement in December eliminated that particular cause for concern and formally recognised a substantial dollar devaluation.

Wall Street, which after a short-term

Hubert Humphrey. But the only issue at stake apparently was who might gain the privilege of being beaten out of sight by President Nixon come November, and that was not something to get terribly excited about. President Nixon was riding high. Just what he may or may not have achieved by his Peking spectacular did not really seem to matter, for at long last, the one pre-condition for his re-election appeared to be fulfilled, the economy was responding to treatment and for once the administration could claim that it was more or less on the target set in the game plan, according to the latest issue of the Ionian Bank's *European News Letter*.

In the first quarter of the year Gross National Product in real terms grew at an

sharply in late 1971 and early 1972. Capital investment began to rise modestly late last year and recent surveys of business investment plans indicate a good increase of 10 to 11 per cent for 1972. By contrast, investment rose by a total of less than four per cent in the two years between the third quarters of 1969 and 1971.

Business investment in inventories also made little contribution to economic growth in the past two years. In a three thousand million dollar company, inventories should normally rise by \$7,100 million a year. In 1970 and 1971, the gain averaged only 2,500 million a year. But here too, the outlook appears to be improving.

More businessmen report either that their inventory cutbacks have been completed or that inventories are now too low. The inventory-sales ratio for all business is at its lowest point in more than five years, implying that stocks of finished goods, work in progress and materials must be increased to service growing sales. The recent pattern of production gains itself indicates that inventories are being rebuilt.

As the expansion spreads from consumer goods and homebuilding to busi-

ness investment, the outlook is also improving for producers of basic materials. Already there is encouraging evidence of growth in demand for chemicals, metals and other materials.

If recent trends continue, US growth in 1972 will fall well within the 5 to 6.5 per cent range predicted by most forecasters. For perspective: if the US growth rate reaches six per cent—which now seems a real possibility—this would represent the largest advance since 1966. And it would be significantly greater than total growth for the last three years put together.

Faster growth will not, of course solve all the domestic economic problems of the United States. Unemployment, especially among minority groups, poverty, pollution and inflation are too fundamental and too complex for that.

Nevertheless, faster growth is essential for real progress in most of these basic problem areas. Six per cent growth would bring a reduction in unemployment, although probably slowly at first, and would set the stage for further improvement in the job situation in 1973. It would provide more of the funds — both public and private — required to reduce pollution and alleviate poverty and would create a

climate in which the battle against inflation might be waged more successfully.

Many nations have found that it is difficult if not impossible to follow non-inflationary policies while unemployment is high; to do so defies the reality of political priorities but as the US economy turns upwards, fiscal and monetary moderation become both more economically appropriate and more politically acceptable. Thus the Chase Manhattan Bank blandly concludes that the improving prospects for economic growth in 1972 also offer a new opportunity to make progress in moderating US inflation.

I find it interesting to note that if the facts and figures above are changed into those covering the current UK economy eventually the same picture emerges—a basically optimistic outlook, perplexed but not unduly worried, by expansion with staggered inflation rather than stagflation.

The acquittal of Miss

Angela Davis by a court in the US, on the basis of an unanimous verdict of 'not guilty' by an all-white jury, is a heart warming indication of the vitality of those progressive and indeed revolutionary forces which currently seem to make up the essential American ethos. It has been demonstrated to the world that American law, American justice and indeed American public opinion are powerfully relevant institutions in the free society which the United States basically is. The Establishment has been shown to be without the authority or power to rebel or even wanting to rebel against the Rule of Law.

In contrast we have in this country the outrageous episode of the Nagarwala affair. Let it be said to our shame as a people that the powers-that-be have so far been successful in suppressing truth and suggesting falsehood. In spite of the fact that the scandal cries out to be properly investigated, the government has been able to keep the doors of its cupboards stubbornly shut and its skeletons securely secreted. Worse still, the Finance Minister had the audacity to say in Parliament that it did not matter who else was dissatisfied since he himself was completely satisfied that no inquiry was called for. After this, there cannot be many Indians who can honestly take pride in the way in which the politicians in power are assisting — if this is the word — this country in realizing its democratic destiny.

'The Hindustan Times'

has a certain editorial point of view on Indo-Pakistan relations and it must be said to its credit that it has been arguing its case with a vast professional competence as well as great conviction. I am therefore left to wonder why it has chosen to go out of its way to invite damage to its credibility by laboriously attempting to question the authenticity of the account which an Italian woman journalist has given of what Mr Bhutto has said to her about Mrs Gandhi.

In a leading article in its issue of June 5, this newspaper has been at pains to prove that Miss Oriana Fallaci is a superficial and unreliable journalist.

Since there was never any danger that Miss Fallaci would be mistaken in any quarters for another Walter Lippmann or James Reston or even another Kuldip Nayar, *The Hindustan Times'* effort was a curiously misdirected expenditure of mental and physical energy. The point is that Miss Fallaci did interview Mr Bhutto and that the latter has not so far written to Mrs Gandhi — as he could very easily have done if such were the case—that he did not use against her the offensive language which Miss Fallaci has attributed to him. It follows that the caption given in *The Hindustan Times* editorial viz., "An interview Mr Bhutto disclaims" is most definitely inaccurate.

Mr Bhutto himself has so far said nothing one way or the other and, even on his behalf, it has not been denied that there was this interview. The only question is whether Miss Fallaci has exaggerated or distorted Mr Bhutto's observations and if so in what way and to what extent. To say that some people feel that they have reason to regard her as a thoroughly unscrupulous and dishonest reporter is certainly not the most satisfactory way of establishing the proposition that she must necessarily be lying about what Mr Bhutto had said to her during the interview. It is to be presumed after all that, when the President of Pakistan gave an interview to a foreign journalist, certain obvious precautions would have been taken. First, the journalist's credentials would have been examined and secondly arrangements made to maintain a true record of what had passed at the interview and also to check against this record the account which was to be published. It could therefore not have been easy for Miss Fallaci to get a grossly inaccurate report of the interview passed by Mr Bhutto's secretariat unless she had double crossed Mr Bhutto by publishing an account which was cooked up without the knowledge of Mr Bhutto's office.

Neither Mr Bhutto nor any spokesman of his has so far alleged that Miss Fallaci has played such a trick. In any case, there is ample internal evidence in Miss Fallaci's account to suggest that she could not have fabricated Mr Bhutto's observations about Mrs Gandhi. To have been able to do this she should have had

not only vivid imagination but also a degree of background knowledge of both Mr Bhutto and Mrs Gandhi which she is unlikely to have come by. It may be readily granted of course that the Fallaci interview should not be allowed to upset the summit schedule. There has been no sign, of course, that New Delhi would be inclined to act that way. Mr Bhutto is, for the time being at any rate, the President of Pakistan and if the government of India wishes to do business with the government of Pakistan, the Prime Minister has to sit down with the President for talks. This is the long and the short of it, but this does not mean that Mrs Gandhi has to (or can) be lulled into a belief that Mr Bhutto is other than what he is.

Mr Romesh Thapar has

been writing a lot on the politics of ceilings in recent issues of *Economic and Political Weekly*. It is easy to see that Mr Thapar is trying to get at something, but it is rather difficult to discover what he is trying to get at. Take, for instance, the following passage from his column in the issue of May 13:

"The whole point of the ceilings demand is to get at surplus land for the landless. Judging from the way the debate sways to and fro, we have lost sight of our objective. Bits and pieces of surplus land here and there will become available, but the resettling of this surplus will present massive problems — even though the conviction persists that the loopholes will be many, what with double-cropping hardly practised and village records in utter confusion. The truth is that no one has done a total exercise. As for the old war cry, 'Land to the Tiller', it is not heard".

Now compare what he has said here with what follows in his column in the issue of May 20:

"The fundamental flaw in the reasoning of the Congress leadership is the attempt to tie up the concept of ceilings with dispossession. The two objectives are different and should be sought at different levels. To attempt a single formula to serve two objectives — or to kill two birds with one stone! — is not possible in the mixed-up muddle that is the Congress party. The tackling of one objective is impossible enough in democratic conditions, but no one seems to think so". The country is being tormented by confused counsel. Mr Thapar, like so many of us, has much to answer for.

ACTIVITIES OF THE COMPANY AND PROSPECTS :

The Company was incorporated on 27th February, 1971 and received the Certificate for Commencement of Business on 28th April, 1971. The objects of the Company are fully set out in the Memorandum of Association and the immediate object of the Company is to set up a factory for the manufacture of automobile tyres and tubes. The factory is located on the main highway and is approximately six kilometers away from Meerut.

The Company is licensed to produce 4 lakh numbers each of tyres and tubes per annum. The proposed plant will produce 5 lakh tyres and tubes per annum when the plant achieves its full rated capacity, which is likely to be achieved within two years from the date of commencement of commercial production. The Company expects to go into production by the end of 1973.

The Company has been promoted by Modi Industries Limited and belongs to Modi Group of Industries. The Modi Group under the leadership of its founder Rai Bahadur Seth Gujar Mal Modi (Padma Bhushan) is successfully managing the Modi Industries Limited, Modipon Limited and Modi Spinning and Weaving Mills Company Limited besides other Companies.

The Technical Collaborators of the Company are M/s. Continental Gummi Werke Aktiengesellschaft, Hannover (West Germany). The Company will produce high quality products and will have the right to use the "Rampant Horse" trade mark of Continental which is a symbol for the highest quality standard and workmanship.

Keeping in view the heavy shortage of truck, bus and tractor tyres, 77% of Company's production will consist of these categories of tyres and Company anticipates no difficulty in selling the various types of tyres at a profitable margin. Also, the Collaborators have assured the Company that they will provide all possible assistance in establishing the export market for the products of the Company.

INTERAIDS

TRADE WINDS

Tapping Australian Market

THE VICE-PRESIDENT of the Federation of Indian Chambers of Commerce and Industry, Mr Charat Ram, who led a six-man delegation to the last month's Perth conference of the Confederation of Asian Chambers of Commerce and Industry, and later on visited the other trading and industrial centres of Australia along with his fellow delegates, told newsmen recently that the two way trade between India and Australia could be doubled within the next two or three years if concerted efforts were made. Currently, our exports to Australia are of the order of Rs 28 crores against import worth Rs 33 crores. Besides providing preferential tariffs for imports from the less-developed countries, subject, of course, to certain annual quotas, Australia, Mr Charat Ram stated, had referred to its Tariff Board a comprehensive list of items to critically examine the import tariffs applicable to them. This list included 1,000 items which were characterised as excess margin items, i.e. items on which the difference between the general and preferential rates of duty exceeded 7½ per cent ad valorem. Several other items, which bear a comparatively high rate of import levy, have also been referred to the Tariff Board for critical examination. The lowering of the high tariffs which are applicable to countries other than Britain and Canada, should help diversification of Australia's imports. Our country can, thus, improve our exports to the affluent Australian market.

Mr Charat Ram felt that there were good prospects for increasing our exports to Aust-

ralia of such goods as jute manufactures, tea, tobacco, cotton yarn and textiles, ready-made garments, dyestuffs and machine tools, certain iron and steel manufactures (such as wire ropes, galvanised ropes and hardware) electrical domestic appliances, footwear, canned products, etc. We, on the other hand, can import from Australia larger quantities of greasy wool, tallow and various non-ferrous metals.

Referring to joint ventures, Mr Charat Ram stated that his delegation had noted that Australia, being a free economy, did not impose any restrictions on the import of capital and technical know-how. Indian enterprises would be welcomed to set up industries either on their own or in collaboration of Australian counterparts. The capital market in Australia was highly developed. An Australian delegation, the FICCI Vice-President added, was expected to visit India some time in the beginning of 1973 to find out the scope for setting up joint ventures in India. One line which offered a promising scope for Indo-Australian ventures in India, he felt, was the processing of greasy wool and the production of wool tops, yarn, fabrics and knitwear.

Mr Charat Ram disclosed that, on an invitation from the FICCI, the next conference of the Confederation of Asian Chambers of Commerce and Industry would be held in New Delhi in January-February 1974.

The Constitution (Twenty-ninth Amendment Bill) 1972

The President has given his assent to the Constitution

(Twenty-ninth Amendment) Bill, 1972. The Bill seeks to give protection under article 31B to the Kerala Land Reforms (Amendment) Act, 1969 and the Kerala Land Reforms (Amendment) Act, 1971 by including them in the Ninth Schedule to the Constitution.

It may be recalled that the Kerala Land Reforms Act 1963 (Act 1 of 1964) is the principal land reform law in the state of Kerala and as included in the Ninth Schedule to the Constitution. In the course of implementation, the state government faced serious practical difficulties and to overcome them, that Act was extensively amended by the Kerala Land Reforms (Amendment) Act 1969 (Act 35 of 1969) and by the Kerala Land Reforms (Amendment) Act 1969 (Act 25 of 1971). Certain crucial provisions of the principal Act as amended were challenged in the High Court of Kerala and in the Supreme Court, creating a climate of uncertainty in the effective implementation of land reforms. Although the High Court of Kerala and the Supreme Court have generally upheld the scheme of land reforms envisaged in the principal Act as amended, a few vital provisions have been struck down by both these courts.

Liquidity Ratio

According to a directive by the Reserve Bank of India, the minimum of the assets of each scheduled commercial bank that go to make its statutory liquidity ratio shall be raised from 28 per cent to 29 per cent of its aggregate demand and time liabilities with effect from August 4, 1972. This is in pursuance of the Reserve Bank's earlier intention conveyed to banks at the commencement of the last (1971-72) busy season. Thus, the minimum liquidity ratio (including the statutory cash balances of three per cent with the Reserve Bank) shall be 32 per cent, against 31 per cent at present. The minimum net liquidity ratio that is applied to calculate the higher rate of interest on banks' borrowings from the Reserve Bank will,

however, continue to remain at 34 per cent.

In a letter to banks, the Governor of the Reserve Bank, Mr S. Jagannathan, has urged them to build up adequate investments in government and other approved securities for plan requirements and also for providing the necessary cushion to meet the needs of the ensuing busy season. Recalling that the increase of Rs 590 crores in the deposits of scheduled commercial banks in the 1971-72 busy season had turned out to be somewhat higher than anticipated and that the prospects for higher deposit accretion during 1972 appear bright, the governor has said that the banks should have no difficulty in meeting any needs for contra-seasonal expansion of bank credit during the 1972 slack season.

India-Peru Trade

The Instruments of Ratification of India-Peru Trade Agreement were exchanged in the Capital on June 6, between the Minister of Foreign Trade, Mr L.N. Mishra and the Ambassador of Peru at New Delhi, H. E. Rene Hooper-Lopez. With the exchange of Instruments of Ratification, the Trade Agreement between the two countries has come into force.

The Trade Agreement between the two countries was signed at Lima on November 4, 1971, when the Minister of Foreign Trade, Mr L.N. Mishra, visited Peru in connection with the meeting of the Group of '77'.

The Minerals and Metals Trading Corporation's recent three years contract for the import of 54,000 tonnes of copper from Peru is one of the examples of the mutual desire for trade expansion embodied in the Trade Agreement.

Exports from India to Peru during the period 1967-71 averaged Rs 63 lakhs and imports Rs 210 lakhs per year. India chiefly exports jute goods to Peru and imports raw cotton.

There have been encouraging signs of expansion in the two-way trade with Peru following the signing of the

Agreement in 1971. During 1971-72 trade is estimated at three crores of rupees. The major items of India's exports to Peru are jute goods, cycle tyres and tubes, shellac etc. The main items of import are raw cotton and antimony ore.

With the coming into force of the new trade agreement, trade exchanges between the two countries are expected to expand and diversify further. Besides cotton and antimony ore, India is likely to import copper, zinc, lead, tungsten etc. and export, apart from the traditional goods, a wide range of industrial items, such as bicycles and parts, hand-tools, wire ropes, mining machinery, textile machinery, railway and tele-communication equipment etc.

It is also expected that the two countries would co-operate in setting up joint industrial units and joint shipping lines to their mutual advantage.

The Trade Agreement provides for reciprocal extension of most-favoured-nation treatment by the two countries in matters of trade and tariffs. It also provides for the exchange annually of lists of goods in which the two countries are specially interested and for periodical consultations for the harmonious development, diversification and expansion of trade between the two countries. The agreement shall remain in force for a period of three years and thereafter for successive periods of one year at a time.

Space Commission

The government of India has decided to set up a Space Commission with immediate effect to promote the rapid development of activities connected with Space Science, Space Technology and Space Applications. The Commission will be headed by Prof. S. Dhavan, Director of the Indian Institute of Science with headquarters at Bangalore.

The Commission will be responsible for formulating the policy of the Department of Space and for implementing government's policy in all matters concerning outer space.

In its constitution and functioning the Space Commission will broadly follow the lines of the existing set-up of and functioning of the Atomic Energy Commission and the Electronics Commission.

The Commission will consist of not less than four and not more than seven members; its chairman will also be the secretary to the government in the Department of Space. Prof. S. Dhavan, while continuing Director of the Indian Institute of Science, Bangalore will be the first chairman of the Space Commission and Secretary to the government in the Department of Space.

Raw Materials

No export order will be allowed to fall through for want of raw materials such as steel, union Foreign Trade Minister, Mr L.N. Mishra, assured the engineering exporters recently.

Inaugurating the Conference of Engineering Exporters, Mr Mishra also said that the situation in 1972 in all major respects — the supply of raw materials, speedy grant of cash assistance and reduction of licensing delays — would constitute a definite improvement over 1971.

Emphasising the need for speedily moving towards the achievement of the national goal of self-reliance, Mr Mishra said: "We must adopt energetic measures to eliminate our dependence on foreign aid, which is often not without political and economic strings. However, self-reliance cannot become a living reality unless there is a massive increase in our export earnings".

Referring to the recent UNCTAD Conference, he said that developing countries can no longer take for granted that rich countries would be willing to provide them with more aid to overcome their balance of payments difficulties.

Mr Mishra stressed that in sharp contrast to the attitude of the western countries, the USSR government has taken attitude helpful to our export drive. He said there is great scope for increasing export of

engineering goods to the USSR which can be doubled or even trebled if their requirements and specifications can be met. Describing the USSR as a great consumer market of everything, 'more specially for engineering goods', the Foreign Trade Minister said that by overcoming the raw material shortages the country can substantially step up its export.

Indian Institute of Mass Communication

The government of India has appointed a committee to review the performance of the Indian Institute of Mass Communication, which was set up as a centre for training, research and development of the media of mass communication in the country. The Committee has been set up under the chairmanship of Mr Dharam Bir Sinha, Deputy Minister of Information and Broadcasting. The Institute has been functioning as an autonomous body, registered under the Societies Registration Act, 1860, since January 1966.

The Committee will make an assessment of the performance of the institute during the period from 1965-66 to 1971-72 and how far it has contributed towards the fulfilment of the objects of the society as enunciated in its Memorandum of Association. The committee will also examine whether the expenditure incurred during the period in question was commensurate with the results achieved.

The members of the Committee are: Mr G. Parthasarathy, Vice-Chancellor, Jawaharlal Nehru University; Dr Prodip-to Roy, Director of Research, Council for Social Development; Mr Eric D'Costa, Managing Director, Indian Institute of Public Opinion; Mr Jog Chatterjee, Managing Director, Advertising & Sales Promotion; and Mr I.P. Tewari, Director, Indian Institute of Mass Communication. (Member-Secretary).

Mass Vasectomy Camps

The role of mass vasectomy camps in reducing the birth rate from 37.1 per thousand

at present to 32 per thousand by the end of the fourth five-year Plan and 25 in another five to seven years was discussed recently in the capital at the Conference of state Health Secretaries, Administrative Medical Officers and Family Planning Officers.

It was agreed that large-scale vasectomy camps on the lines of Ernakulam Camp in July 1971, Thanjavur and South Arcot (Tamil Nadu) in December 71 and January 72, Visakhapatnam (Andhra Pradesh) in November 1971, Gorakhpur (Uttar Pradesh) in January-February 1971 and Gujarat state in December 71 and January 72, would help achieve the set target of protecting 28 million couples in the next two years as against 12.9 million protected at present. This, required over 10 million sterilisations performed during this and next year; five million IUCD insertions and increase in the number of users of conventional contraceptives from the present 2.23 million to 10 million.

Off-Shore Drilling

The mobile platform for oil drilling in the Bombay High area is due to be delivered to the Oil and Natural Gas Commission in Japan by September 1972 and is expected to reach Bombay port in November 1972. Drilling for oil in the Bombay High structures is likely to commence soon afterwards.

Meanwhile various preparatory steps have already been taken in connection with drilling in the area. Detailed seismic surveys to pinpoint locations for the first few wells have already been completed. The data pertaining to these surveys is being processed by the French firm, which conducted the surveys on contract.

A number of ONGC technicians have, in the meanwhile, been sent abroad for training in off-shore work as part of the contract with the American firm, Oil International SA, whose services would initially be used for one year for drilling in the Bombay High area.

Drilling in Aliabet: Drilling for another well in the

shallow waters of the Gulf of Cambay, off Aliabet islands, is under consideration. Oil was struck in the first well drilled in Aliabet West structure in March 1971, but on testing it was found that it had no commercial significance. Drilling is now proposed in the Aliabet East structure.

Sugar output

The latest figures released by the Indian Sugar Mills Association show that the production of sugar in April — the seventh month of the season dropped to 193,000 tonnes. Production in March was 492,000 tonnes.

The principal reason behind the sharp fall in sugar production in the current season is the decline in cane acreage which reduced the quantum of cane supplies to the mills, particularly in northern India. The supplies dropped further because of the reported diversion of cane to khandsari producers.

The total production till the end of April this year suffered a drop of over 500,000 tonnes at 3.0 million tonnes as compared to the corresponding period of the 1970-71 season.

With despatches on account of internal consumption and exports standing at 2.29 million tonnes and 80,000 tonnes respectively, the closing stocks at the end of April were lower at 2.03 million tonnes as compared to 3.16 million tonnes at the end of April, 1971.

Ordinance on Land Alienation

Alienation of vacant lands in urban areas in Andhra Pradesh has been prohibited by an Ordinance promulgated on June 5. The Ordinance came into immediate effect. The prohibition covers vacant lands in the twin cities of Hyderabad and Secunderabad and all district municipalities as also other areas notified as urban areas for this purpose.

Vollrath Plan

The Indo-German engineer-

ing export promotion project has been extended for a few more years to help India increase its export of engineering goods to West Germany and other EEC countries. Also, the possibilities of promoting exports of wool textiles and other products within the framework of German technical assistance are being examined.

According to West German government sources in Bonn, while W. Germany would help India increase exports of items which are important in world trade, it could not ask its importers in a free market economy to buy from particular countries. The W. German government has however agreed to India's proposal for prolongation of the export promotion programme for engineering goods, known as the Vollrath Plan which was started in 1967.

Raw Goods Bank

To help small-scale industries, a raw material bank has been set up by the West Bengal Small Industries (WBSIC) Corporation and the state government has already moved the centre for making available 82,000 tonnes of raw materials as a special quota.

The functions of the West Bengal Small Industries' Corporation have been enlarged to enable it to function as a raw material bank for supply of raw materials to small industries according to availability and set up three industrial estates — one each at Durgapur, Haldia and Salt Lake near Calcutta.

The industrial estates of the Haldia and Salt Lake areas will be bonded industrial estates and will cater only for export orders to be secured with the help of the Trade Development Authority of the government of India.

The WBSIC will also function as an export house for small industries' products abroad. The corporation will act in close co-operation with the

various export promotion councils.

The state government is also considering setting up the North Bengal Industrial Development Corporation to ensure co-ordinated development of industries in the five backward districts of North Bengal.

The state government has also adopted short term schemes to wipe out the present shortage of power of the order of 60 mw in south Bengal including the Calcutta industrial area and prepared a comprehensive plan for the next decade when the power generation gap is expected to shoot up to 1000 mw.

Power Tariff in Haryana

Power tariff for most categories of consumers in Haryana has been raised by 20 per cent. As a result of this, the annual income of the Haryana State Electricity Board, will increase by about Rs one crores — from Rs 19 to Rs 20 crores.

Certain categories of consumers have been, however, exempted from the new increase. These include agriculturists who would not pay more for the power consumed at their tubewells. There would be no increase in the case of new industries for five years, i.e. the industries set up in 1968 would not have to pay increased tariff until 1973.

Also, there would be no increase for small-scale industries in such backward areas as Loharu, Bhiwani, Mahendragarh and Jhajjar. The increase would also not apply to threshers and "tokkas" used by consumers for their personal purposes; it would only apply to threshers and "tokkas" used for industrial purposes. Domestic consumers up to 40 units would also not have to pay higher electricity rates.

According to Mr P.N. Sahni, Chairman of the Haryana State Electricity Board, the new increased rates were in most cases lower than those in some

neighbouring states such as Uttar Pradesh, Delhi and Rajasthan. In a few categories, these were higher than those in Rajasthan and in many cases higher than those in Punjab where there had been no upward tariff revision since 1966. In Haryana, the return on the capital of the Board was six per cent as against 5.1 per cent in Punjab. The government of India wanted this return to be eight per cent.

Mr Sahni said that the increase became necessary because the original rates were based on availability of hydel power which cost the Board only 5.5 paise per unit. Until December 1966, Haryana was consuming only hydel power. Now 30 per cent of its consumption was thermal power, and this was likely to increase to 50 per cent in next two years. The average cost of the unit of thermal power was 11.8 paise.

Provident Fund Interest Raised

The government of India has decided to increase the rate of interest on provident fund accumulations from 5.8 per cent to six per cent from the current financial year, it was officially announced recently. This action has been taken on the recommendation of the Central Board of Trustees of the Employees' Provident Fund.

World Bank Report

According to the Press Trust of India, the World Bank has suggested that while India should strive for self-reliance, it should not over-emphasise import substitution policies to the extent that growth might be affected. This observation has been made in a report on the Indian economy which was considered by the Aid-India Consortium at its meeting in Paris on June 12 and 13. The Bank is believed to favour a gradual approach in the matter of import reduction and increased efforts at export promotion.

The report takes note of

India's essential import needs for step-up in industrial production and a five to six per cent growth rate in the economy and recommends a total of \$ 1250 million as the desirable level of external assistance including debt relief in 1972-73. A major question before the Consortium apart from the quantum of assistance that each member-country is willing to indicate, is the order of debt relief that should be provided for 1972-73.

A World Bank study undertaken recently urged that India should be given debt relief at the rate of \$200 million for each of the remaining two years of the fourth Plan—1972-73 and 1973-74. This implies a doubling of the debt relief quantum provided in the past four years.

State Budgets: 1972-73

Assam: The Assam Chief Minister, Mr Sarat Chandra Sinha, presented a no-tax budget on June 5 for the year 1972-73 showing a deficit of Rs 1180.77 lakhs. The Chief Minister, however, indicated that fresh taxes might be levied later on to raise additional resources. On the revenue side, the estimated receipts have been placed at Rs 113,83.56 lakhs and expenditure at Rs 119,52.24 lakhs. On capital account, receipts have been placed at Rs 144,88.54 lakhs and estimated expenditure at Rs 152,49.26 lakhs.

Himachal Pradesh: Dr Y.S. Parmar, Chief Minister, who also holds the Finance portfolio, presented a tax-free budget for 1972-73 in the Himachal Pradesh Vidhan Sabha. The estimates show total receipts of Rs 8447.87 lakhs, including domestic receipts of Rs 3289.95 lakhs, grant-in-aid from the central government of Rs 2805.95 lakhs and central loans of Rs 2351.98 lakhs.

On the expenditure side the estimates show a total spending of Rs 9057.87 lakhs, including non-Plan expenditure of Rs 5952.95 lakhs, Plan expenditure of Rs 2442 lakhs and

the centrally-sponsored schemes of Rs 662.92 lakhs.

The gap of Rs 610 lakhs has been left uncovered and Dr Parmar propose to meet it by obtaining special assistance from the central government.

The main highlights of the budget are the announcement of a new transport policy, joining of the state in the Northern Zone Permit Scheme, uniformity in the rates of cesses, fees, levies etc. between the old and the new areas of the state including school fees for 9th, 10th and 11th classes, and abolition of all surcharges on land revenue. Dr Parmar said increases and decreases involved in the rationalisation of rates would not have any measurable impact on the resources of the state

In order to bring about uniformity between the old and the merged areas, the government had decided to abolish the attachment system inherent in the nationalised mode of goods transportation hitherto in force in the old areas. The rate of Goods Tax would now be Rs 2500 per annum and the rate of Token Tax Rs 1000 per annum throughout the state with effect from July 1, from which date the attachment fee in the old areas would stand abolished.

The Chief Minister said this step had been taken because of the state's exclusion from the transport system of the Northern Zone, which had been adopted by all the other eight states and the union territories

Dena Bank

The working results of Dena Bank for the year ended December 31, 1971, have shown a smart rise in net profit from Rs 51.00 lakhs to Rs 65.14 lakhs. This was made possible by the expanding activities of this nationalised bank. Its deposits rose by Rs 30 crores to Rs 185 crores as against a rise of Rs 19 crores only in the preceding year. The tempo in branch expansion got

hastened. Whereas 93 new branches were opened in 1970 this number rose to 102 in 1971. Out of these, as many as 91 branches were in rural and semi-urban centres.

The increase in deposits enabled a rise in advances. The total advances of the bank rose by Rs 11.03 crores to Rs 121.77 crores during the year under report. The advances to agriculture, small-scale industries, road transport operators, retail trade, small business, exports, professionals and the self-employed persons were stepped up in keeping with the declared policy of all nationalised banks. In those districts which were assigned to the bank for "the lead role", the possibilities revealed in the surveys have now to be exploited for which the bank will have to strengthen its bases in these districts.

Marine Products

The deep-sea fishing industry earned Rs 44.55 crores in foreign exchange last year from the export of different varieties of fish, shrimp and lobster.

Apart from contributing substantially towards the foreign exchange earnings, the industry has helped to bridge the protein gap in the dietary needs of the country.

Efforts are being made to start the commercial exploitation of the off-shore and deep-sea fish resources. The fourth five-year Plan envisages the introduction of 300 off-shore and deep-sea fishing vessels. The central government is providing the infrastructure mainly in the shape of harbours, training of personnel and resource surveys.

Oil Drilling in Tripura and Kutch

The Oil and Natural Gas Commission will start work on two important drilling projects in new areas during the current month. The projects are located in Tripura in the east and Kutch in the west.

The ONGC has spent six

field party-years in Tripura since 1962 and has mapped a structure in detail in the Baramura area. The geological data studies done by the Commission indicate good prospects for finding oil or gas at Baramura. The reserves here can be expected to be considerable since the structure is quite large.

In the Kutch area, geological and geophysical mapping was taken up by the ONGC as early as 1956-57 when it sent its first field parties for geological and gravity-magnetic surveys.

The two drilling projects in Tripura and Kutch can be considered part of the five-year operational plan of oil exploration and production being drawn up by the Oil & Natural Gas Commission. The plan was outlined in the Tech, no-Economic Report jointly prepared by Soviet and ONGC experts last year. The Techno-Economic Study stipulates production of 28.62 million tonnes of oil over a period of five years, establishing a production rate of eight million tonnes of crude every year towards the end of that period.

Names in News

The government has appointed Mr B. Israni, Chairman, International Airports Authority to represent on the boards of directors of Air India and Indian Airlines Corporation as one of the director. The representation of the International Airports Authority on the boards of the two airlines will be in addition to the existing number of directors.

Dr Raja Ramanna has taken over as the Director of the Bhabha Atomic Research Centre at Trombay. This post was held by Mr H.N. Sethna, who has now been elevated to the position of Chairman of the Atomic Energy Commission. Dr Ramanna will also be an ex-officio member of the Atomic Energy Commission in charge of research and development.

COMPANY AFFAIRS

Usha Martin

USHA MARTIN Black (Wire Ropes) Ltd has obtained a letter of intent for setting up a 50,000-tonne continuous casting plant with a view to supplementing the supplies of the much-needed high carbon steel which is still being imported in considerable quantities to meet the increasing demands of industry. The company has already promoted a new undertaking styled Usha Alloys and Steels Ltd for implementing this project. Besides participation by financial institutions in its capital, the new company will be making a public issue before the end of the current year. When the plant goes on stream the engineering industry will be assured of timely supplies of this critical raw material which is posing a formidable problem to the industries located particularly in the eastern region. This was disclosed by the chairman Mr G.D. Jhawar while addressing the annual general meeting of the company.

The company which is constantly engaged in exploring areas for further growth and diversification has taken on hand a number of schemes which promise of handsome returns to the company. The company has already completed all formalities for expanding the production of fine cords. Orders for plant and equipment have been placed and production is expected to commence before the end of this year. With the start-up of production the company will be catering the widest possible range of products for exports. It has also received the necessary licences for expanding the production of wires by 9000 tonnes. It will now be possible for the company to further diversify and produce a very wide

varieties of specialised wires for which the company has been able to develop the know-how by continuous experimentation and constant product research. The directors are confident that the company will be able to meet effectively the new challenges and competition from the manufacturers of stainless steel wires, alloy steel and ball bearing wires and other varieties of highly specialised high tensile galvanised and black wires.

Although the company can boast of having one of the most modern wire drawing plants capable of producing quality wires at considerably high speeds the chairman felt that for the future growth of the company as well as for the country's wire drawing industry, efforts should be made to develop the supply of these sophisticated machines from indigenous sources. The company is actively pursuing a scheme for manufacturing high quality machines and it has already obtained the approval of the government for the necessary collaboration agreement. Steps for installing plant and machinery towards the implementation of this project will be undertaken in the near future.

South India Shipping

Although earnings of South India Shipping Corporation Ltd from freight have looked up from Rs 6.61 crores to Rs 6.75 crores, and the income from other sources has improved from Rs 30.56 lakhs to Rs 48.28 lakhs the gross profit has declined to Rs 2.97 crores during the year ended December 31, 1971 from Rs 3.32 crores in the preceding year. The reduction in profit margins is attributed to a very steep rise in expenditure on items over

Which the company has little or no control such as the increase in expenses on items such as bunker costs, insurance premia and protection and indemnity club fees, and salaries, wages and benefits to floating staff and ratings. Besides the larger provision for depreciation following the revaluation of the deutsche mark and the considerable loss in foreign exchange due to floating of currencies have also exerted their pressure on the profit margins of the company. This apart, due to the nature of voyages performed in 1971, the voyage expenses also recorded a marked rise such as for stevedoring and cargo expenses. But the timely contract for moving Indian ore to Romania concluded late in 1970 had helped the company to produce the somewhat encouraging results for 1971.

Out of the gross profit the directors have allocated a sum of Rs 1.20 crores for depreciation and Rs 1.10 crores for development rebate reserve. After adjusting credits and debits relating to previous years the profit and loss account is left with an amount of Rs 71.39 lakhs out of which the interim dividend declared at the rate of 10 per cent on the paid-up capital of Rs one crore absorbed Rs 10 lakhs leaving a disposal amount of Rs 61.39 lakhs. Adding Rs 44,179 brought forward from the previous year's account there is a surplus of Rs 61.83 lakhs. Out of this a sum of Rs 61.50 lakhs was transferred to the general reserve leaving a balance of Rs 33,090 to be carried forward to the next year's account. The directors have recommended a final dividend of 10 per cent on the enlarged equity paid-up capital of Rs 2 crores. This will claim Rs 20 lakhs and it

will be paid out of the general reserve.

Hindustan Sanitaryware

Marked increase in output, substantial improvement in sales, handsome rise in profits and a significant thrust forward in export earnings are some of the solid achievements of Hindustan Sanitaryware and Industries Ltd during the year ended March 31, 1972. During the year production shot up to 5002 tonnes, registering an increase of 1463 tonnes over 1970-71. Sales soared to Rs 2.09 crores from Rs 1.54 crores while gross profit swelled to Rs 57.41 lakhs from Rs 39.61 lakhs in 1970-71. During the year earnings from exports were more than doubled and the company's exports are currently accounting for 83 per cent of the total exports of sanitarywares from the country. Not content with its past proud achievements the company is making an all-out bid to improve its performance on all fronts. The company is installing its own generating station to overcome power shortages while arrangements are being made for the import of some sophisticated machinery and equipment for improving the quality and quantity of production. Besides the company is installing its own grinding plant at Gurgaon under a wholly-subsidiary company—Messrs Ceramic Services Ltd — which will ensure the company of regular supplies of fine raw materials.

Out of the gross profit of Rs 57.41 lakhs, a sum of Rs 11.81 lakhs was appropriated to depreciation reserve, Rs 0.45 lakh to development rebate reserve and Rs 25.82 lakhs to taxation as against Rs 11.04 lakhs, Rs 1.15 lakhs and Rs 12.40 lakhs provided respectively in 1970-71. This leaves a net profit of Rs 19.33 lakhs as compared to Rs 15.02 lakhs in the previous year and the entire amount had been transferred to general reserve. The directors have proposed an equity dividend of 10 per cent which is 25 per cent higher than in the preceding year. The proposed dividend will absorb Rs 7.38 lakhs and it will

be paid out of the general reserve.

Dunlop

The directors of Dunlop India Ltd have proposed to issue 10,00,000 ordinary shares of Rs 10 each in the proportion of one-for-ten at a premium of Rs 11 per share ranking *pari passu* in all respects with the existing ordinary shares of the company. These shares will be offered for subscription for cash to those shareholders registered in the books of the company on such date as may be determined by the directors.

Indo-Burma Petroleum

Indo-Burma Petroleum Co., a subsidiary of Indian Oil Corporation, has taken over the control of Balmer Lawrie & Co, following the acquisition of its shares from Duncan Brothers. Following the takeover the board of directors of Balmer Lawrie and the boards of subsidiary companies of Balmer Lawrie namely Bridge & Roof, Biecco Lawrie, Industrial Containers and Steel Containers have been reconstituted.

An agreement has been entered into by Indo-Burma Petroleum with Duncan Brothers for the acquisition of its 22.6 per cent shareholding in Balmer Lawrie at the rate of Rs 95 per share. (Rs 100 paid-up shares). Indo-Burma Petroleum has also decided to acquire 27.6 per cent shareholding of Balmer Lawrie from Alex Lawrie and Company, a sterling company, at the rate of Rs 85 per share. The payment for the acquisition of these shares will be made in foreign exchange. It is significant to note that Indo-Burma Petroleum over a decade has been the single largest shareholder of Balmer Lawrie with a holding of about 30 per cent. With the acquisition of shares from Duncan Brothers and Alex Lawrie, IBP's holding in Balmer Lawrie will increase to over three-fourths of the total shareholding.

News and Notes

Expansion and Diversification

To soften the impact of recession in stationary diesel engines Fuel Injections is diversi-

fying into the manufacture of spares suitable for automotive and tractor engines. But the management is implementing diversification programme a little cautiously so as to maintain quality and establish a strong foothold in the automotive field. Meanwhile the gallant efforts made by the company in the manufacture and marketing of precision gear pumps and other ancillary items have started yielding rich dividends and are expected to contribute significantly to earnings in the coming years. The overseas markets also hold out promise of better business which by and large will neutralise the impact of fluctuations in demand in home markets. The company has taken on hand an ambitious modernisation programme and it has also submitted to the government a proposal for substantial expansion. Meanwhile the management is considering certain proposals for a technical tie-up with Bryce Berger whose collaboration agreement expired in March 1969 and could not be extended.

New Venture

Choksi Tube Company Private Ltd is setting up at Vatva near Ahmedabad a continuous mill for the production of stainless steel welded tubes. This is the first project of its kind in the country for the manufacture of stainless steel welded tubes on such a mass scale. Another remarkable feature of this new venture is that it is a cent per cent swadeshi project in the sense that this unit has been established entirely with local men and materials without receiving any technical or financial assistance whatsoever from abroad. Stainless steel welded tubes are at present not manufactured in the country except in limited quantities. The entire requirement is met through imports resulting in a substantial drain on the foreign exchange resources of the country. Moreover stainless steel tubes are essential components for such priority industries as fertilisers, chemicals, pharmaceuticals food processing, dairy, brewery and a host

of other industries. Choksi Tubes is expected to save as much as Rs 1.20 crores in foreign exchange in full year's production. The capital outlay on the project is estimated at about Rs 66 lakhs.

New Issues

The Tata Iron and Steel Company Ltd is making the first public debenture issue and perhaps the biggest debenture issue ever made by a company in the private sector in the recent past. It is offering for public subscription mortgage debentures (1983-87) worth Rs 15 crores. The subscription list for this fully underwritten issue opens on June 26 and will close on June 29 or earlier but not before June 28. The debentures will carry an interest (taxable) of eight per cent per annum and it will be paid half yearly. The debentures, which will be secured by a first legal mortgage on all existing and future fixed assets of the company, will be redeemed at par by drawing lots in five equal annual instalments commencing from June 30, 1983 and ending on June 30, 1987.

What makes the issue really unique is that this will be the first case of debentures of an industrial concern being declared by the government of Maharashtra to be "public securities" under section 21 (12) (D) of the Bombay Public Trust Act 1950. This will enable various public and private trusts to invest their funds in these debentures and earn a higher rate of return than that generally obtainable from other investments open to them.

The proceeds of the issue will be utilised for financing a part of the cost of the company's modernisation and renovation programmes, which are already underway. The expenditure on these schemes spread over a period of five years is estimated at Rs 106 crores of which the company had spent Rs 35 crores from its internal sources in the past two years.

Although the profit margins of the company are under considerable pressure, still the directors have decided to

maintain the equity dividend at Rs 8.60 per share of Rs 75 each for the year ended March 31, 1972. Sales during the year recorded an increase from Rs 150.75 crores to Rs 162.11 crores, but gross profit declined to Rs 28.01 crores from Rs 30.22 crores in 1970-71. Out of the gross profit a sum of Rs 16.07 crores was earmarked for depreciation, Rs 5.80 crores for taxation and Rs 2.40 for development rebate reserve as against Rs 16.10 crores, Rs 6.70 crores and Rs 3.10 crores provided respectively in the previous year. This leaves a net profit of Rs 3.74 crores as compared to Rs 4.32 crores in the preceding year. The directors have transferred the entire profit to general reserves. The proposed dividends — equity and preference — will claim Rs 526.78 lakhs and it will be paid out of the general reserve.

The company is negotiating with LIC, UTI, IDBI and IFC for a loan of Rs five crores which will follow after the present debenture issue of Rs 15 crores is completed. These loans will be repaid during the period 1983 to 1987. In case there is default on repayment of principal, these loans will be converted into equity shares.

Atlas Copco (India) Ltd is entering the capital market on June 21, with an offer of 3,21,340 equity shares of Rs 10 each at a premium of Rs 7.50 per share. Out of this 32,090 shares have been reserved for subscription by the Indian directors and the employees of the company and the remaining 2,89,250 shares are now being offered to the public for subscription. An amount of Rs nine per share is payable on application and the balance of Rs 8.50 in one call to be made within 12 months of allotment. The subscription list will close on June 29 or earlier but not before June 23. The present issue is being made with the object of having 40 per cent Indian participation in the equity capital of the company.

The company, which is at present a wholly owned subsidiary of Atlas Copco Aktiebolag, Sweden, is currently en-

gaged in the manufacture of air compressors, rock drills, pushers, lubricators, grinder-and couplings and other allied equipments at its factory located near Dapodi, Poona. With the rising demand for its products, a steady increase in sales and profits is anticipated in the coming years. The working of the company during the current year is quite encouraging and the directors are hopeful of declaring not less than 15 per cent on the increased capital for the year ending December 31, 1972. This dividend will be payable about June 1973 and the new equity shares will participate in this dividend on a *pro rata* basis from the date of allotment. The proceeds of the present public issue will be utilised for expanding the business activities of the company.

The public issue of **Shalimar Paints Ltd** had been oversubscribed and hence the list was closed on June 10. The company offered 370,530 equity shares of Rs 10 each for cash at par. The subscription list for this fully underwritten issue opened on June 5.

Capital and Bonus Issues

Consent has been accorded to nine companies to raise capital of over Rs 3.14 crores. Seven of them are to issue bonus shares totalling over Rs 84.18 lakhs and the amount of bonus shares ranges between Rs 82,700 and Rs 39,09 lakhs.

Unichem Laboratories Ltd, Bombay, has been accorded consent, valid for three months, to capitalise Rs nine lakhs out of its general reserve and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of one bonus share for every six equity shares held.

Chamundi Textiles (Silk Mills Ltd), Kottaiyur, has been accorded consent, valid for 12 months, to capitalise Rs 2,64,000 out of its general 1 free reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of three bonus shares for every two equity shares held.

Agfa Gevaert India Ltd, Bombay, has been accorded

consent, valid for three months, to capitalise Rs eight lakhs out of its general reserves and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of one bonus share for every five equity shares held.

The New India Industries Ltd, has been accorded consent valid for three months to capitalise Rs 39,09,500 out of its general reserve and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of two bonus shares for every five equity shares held.

Ideal Jawa (India) Private Ltd, Mysore, has been accorded consent, valid for three months, to capitalise Rs 12 lakhs out of its free reserves and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of 12 bonus shares for every 30 equity shares held.

The Bombay Silk Mills Ltd, Bombay, has been accorded consent valid for three months to capitalise Rs 82,700 out of its general reserves and issue fully paid equity shares of Rs 50 each as bonus shares in the ratio of one bonus share for every ten equity shares held.

Jagatjit Industries Ltd, New Delhi, has been accorded consent valid for three months to capitalise Rs 12,62,090 out of its general reserve and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one bonus share for every five equity shares held.

India Engineering & Construction Co. Ltd, Kanpur, has communicated to government of its proposal to issue capital under Clause 5 of the Capital Issues (Exemption) Order 1969 to the extent of Rs 30,70,000 in 2,57,000 equity shares of Rs 10 each and 5000 redeemable preference shares of Rs 100 each for setting up an automatic tube mill for manufacture of steel tubular poles for transmission of electricity.

Punalur Paper Mills Ltd, Kerala, has been accorded consent for issue of further capital of Rs 199.82 lakhs as to Rs 48,17,280 as fully paid bonus shares in the ratio of 24 bonus

shares for 25 equity shares held and Rs 151,64,720 in 10,16,472 equity shares of Rs 10 each and 50,000 in 9.5 per cent cumulative redeemable preference shares of Rs 100 each for cash at par to the general public through a prospectus immediately after issue of bonus shares referred to above.

New Registrations

Two hundred and five companies were registered under the Companies Act, 1956 in the different states and union territories during the month of January, 1972. All these were limited by shares. These 205 companies comprised 14 public limited companies and 191 private limited ones having an aggregate authorised capital of Rs 10.30 crores and Rs 62.53 crores respectively. One of these, namely, **Bharat Coking Coal Pvt Ltd**, was a government company registered in the state of Bihar with an authorised capital of Rs 50 crores.

Interim Dividend

Carborundum Universal Ltd has declared an interim equity dividend of seven per cent for the year ending August 31, 1972.

Generating power is not enough.

The electrical power generated has to be properly controlled. Power plants and equipment have to be protected from electrical hazards. BHEL Circuit Breakers do both. They act as connecting devices which allow or stop power flow. And, when "faults" threaten to damage costly power installations, they protect the plant by breaking the excessive fault currents.

BHEL, Hyderabad, has put on the market a wide range of Minimum Oil Circuit Breakers (33 KV to 132 KV) of very reliable and economic designs.

After successfully executing an order from Malawi, the Hyderabad Plant recently won a prize order from Kenya for five Minimum Oil Circuit Breakers. Of course, within India, in almost all the States, Minimum Oil Circuit Breakers from BHEL, Hyderabad, continue to give faultless service.

SPECIAL FEATURES:

- Light in weight and bulk, requiring light support structures and foundations
- Balanced dynamic forces, resulting in economic structures
- Designed to withstand earthquake shock corresponding to 0.5 g. horizontal acceleration
- Very low oil content: Minimum FIRE HAZARD, low oil cost (investment) and purification charges
- Self-acting contraction chamber requiring no external arc-quenching medium
- Rapid and smooth extinction of arc

COMPANY MEETINGS

HINDUSTAN LEVER LIMITED

Registered Office : Hindustan Lever House, 165/166, Backbay Reclamation, Bombay-20

THE BATTLE AGAINST INFLATION

Speech delivered by V. G. Rajadhyaksha, Chairman, at the Annual General Meeting of Hindustan Lever Limited, held at Bombay on Thursday, 8th June 1972.

Winning the war against poverty is, as the Prime Minister has declared, by far the nation's most urgent and important goal. This war, like any other war, is made up of a series of battles—the battle against unemployment, against drought and floods, against population growth and against inflation to name only a few. It is the battle against inflation, particularly as it concerns your Company, that I propose to speak to you about today. Inflation is no new phenomenon. Many of us recollect our grandmother telling us how she could buy ten seers of rice for a rupee when she was a girl. What is relatively new is the extent to which governments, industry, trade unions, economists, accountants and bankers are increasingly worried about how to deal with it.

The problems of inflation, although arising out of different reasons, are not the affliction of economies at any particular stage of development. In fact a recent report—'Present policies against inflation' published by the Organisation for Economic Co-operation and Development admits that most countries, whether developed or developing have largely failed to produce effective policies to conquer inflation. Against this background, India's management of her economy over the past two decades, despite three wars and two droughts, has been commendable and inflation, except for two or three bad years, has been kept within reasonable limits. Figures given by the International Monetary Fund show an average annual rate of inflation of 6.6 per cent from 1963 to 1971 for India, compared with 6 per cent for Japan and 5.4 per cent for the U.K. and no less

than 34 per cent per annum for Brazil. Whatever measures are taken to limit the rate of inflation, we must, as realists, accept that inflation of the order of 5 per cent in the years to come is something we shall have to learn to live with; but containing inflation even at these levels is a major battle and one which has to be fought on many fronts.

The first casualties in this battle are the overwhelming majority of our people—the lower income groups. It is only to be expected therefore that in a democratic system, and one in which the vote is being exercised with an increasing degree of independent judgement, inflation should produce a severe reaction at the political level and that our Government, like many others the world over, should turn to the weapon which certainly in the short run appears to be the most effective in dealing with it, namely, price control.

Excessive restraint on prices however can lead to damage to the productive system, whether it is the farm or the factory and become itself a major factor in aggravating shortages and hence increasing inflation. In spite of this, there has been to my mind astonishingly little attention paid to the real effects of inflation and price control on corporate viability and this speech is mainly about what has happened to your Company due to these factors and what we are doing about it. The subject is of relevance not only to the private sector, in this respect sectors are immaterial. As professional managers we could regard the resources of the entire corporate sector, drawing as it does on public sayings and

taxes, as public resources.

If we examine the ten-year record of your Company with the eyes of an economists and adjust the figures for the inflation that has taken place, our achievements will be seen in their harsh reality. While the growth in turnover adjusted for inflation is not unsatisfactory and amounts to 45 per cent for the period 1961 to 1971, profits present a very different picture and at 1961 values have actually fallen by 33 per cent. Nor do these figures tell the whole story and we come to a major weakness—the inability of conventional accounting methods to deal properly with inflation. Firstly, depreciation based on the original purchase price of the fixed assets, which is all that the tax laws allow, is not sufficient to pay for the asset when it is finally replaced. Secondly, while there is a growing awareness of the effect of inflation on fixed assets, there is less when it comes to its effect on working capital, particularly in industries such as yours where such capital tends to be relatively high.

The impact of inflation of working capital on the real worth of the Company will depend on the way in which this working capital is financed, namely, how much is covered by borrowings and how much is funded by the shareholders. The increase due to inflation in that part of the working capital which is financed by the shareholders must be met out of retained profits if the real worth of the Company is not to be eroded. The effect on your Company, where a substantial part of the working capital is financed by shareholders' funds, can be roughly illustrated as follows. In 1971 our profits before tax in conventional accounting terms was Rs. 759 lakhs. If full allowance had been made for the effect of inflation in that year on working capital and fixed

assets, this figure would have been reduced by as much as Rs 200 lakhs.

Before you all rush out to dispose of your shares in this Company, I would only request you to ensure that the profits of your alternative investments are also expressed in real terms—their figures then may also look rather different! What we now do in your Company is to ensure that we are at least aware of the true impact of inflation. All the costs we use in our management accounting now include this component.

Why then, you will be asking, have companies not been presenting this situation in their published accounts and why have they not been making the necessary provisions to protect themselves against the erosion of the real worth of their assets?

The answer to the first question is that accounting practice has not yet completely adjusted itself to the full consequences of inflation. It will be many years before accountants agree upon how to arrive at how much inflation has, in fact, taken place and then how to provide for it in the accounts. It may be longer still before inflation provisions become legally acceptable for calculating the real profit for tax purposes.

The answer to the second question is that, in the past, successful entrepreneurs have instinctively protected themselves against the impact of inflation without the benefit of formal accounting assistance by changing the financial structure of their companies (for example, by using more borrowed funds) or by increasing profit margins. Today however, particularly in several consumer product businesses, the Government decides not only what prices are therefore profit margins shall be, but by its control over the

banking system, how much firms may borrow. Controls on prices are not confined to India and the creation of the Prices and Incomes Board in the UK and the recent price freezes in that bastion of the concept of a free economy—the USA—have led to similar restrictions on the manufacturer's traditional freedom to decide his own prices.

One must admit that some of the effects of price control have been beneficial. They have often prevented an industry from automatically passing on its inefficiencies to the consumer. In a protected and planned economy, such as India's, normal competitive pressures do not always operate and in these circumstances a measure of price restraint may help to ensure that the incentives to efficient operation are maintained. However, while recognising the benefits of price control measures, it would be unwise not to be aware also of the damage they can cause, not only to business, but to the consumer, to the Government and to society at large. While rigid adherence to the priceline has a short-term result in "taking up the slack" in a wayward industry, it cannot, in the face of even controlled inflation, provide a long-term solution.

We have to face the fact that in an inflationary situation, however mild, prices of essential consumer goods have to rise in order to generate the resources required to maintain the health of the industrial machine producing them. Why should this be so? To begin with, the business, however committed it may be to the social good, is unable to justify the allocation of further resources if excessive restraint on prices has driven yields below acceptable levels. The investing public will be understandably attracted to investing in more profitable but perhaps less important industries, and the finance required for increased production of essential goods will not be available and shortages will ensue. Resources moreover are required not only for increasing production in the short-term, but also to secure the long-

term improvement in industrial efficiency which is the only effective answer to excessive inflation. It is only by substantial investment in Research and Development in both technical and non-technical areas that we, as a nation, can rid ourselves of obsolete processes and sub-standard products.

After the business itself, the next to feel the impact of excessively harsh price controls are the more vulnerable sections of the community who inevitably come last in the struggle for products in short supply. While it is possible to partially protect, by rationing and other measures, the few who live in the larger towns and cities, it is impracticable to try and extend these measures effectively to the large bulk of our population living in the smaller towns and villages. In spite of the best efforts of Government and industry to distribute as equitably as possible, experience has shown that the only satisfactory answer to the injustices that shortages create is increasing production.

Lastly, Government and the community as a whole also pay a heavy penalty, not only because growth of revenue and employment-generating activity in the industry begins to slow down, but because the more unscrupulous elements within the industry—those who resort to such practices as evasion of duties and taxes—begin to flourish. An example of what the country stands to lose if this happens can be judged by the contribution to Government revenues by your Company. Against a profit after tax of less than Rs. 3 crores that the Company made in 1971, the amount it collected directly and paid to the exchequer by way of excise duties, corporate tax, sales tax, income tax deducted at source, etc., amounted to Rs. 22 crores! These are the resources that the nation needs for its social objectives, for schools and hospitals, for housing, for public transport and communications, for water supplies and drainage. It is not that this is a problem faced by the private sector alone. Public sector units are

no less hit by inflation and in their case too a realistic pricing policy, based on satisfactory levels of efficiency, is essential.

It is clear that inflation and pricing are major economic problems. On whom does the responsibility for dealing with them fall? First of all, on the Government whose monetary and fiscal policies are clearly a major factor. It is not about these but rather about its price control and industrial licensing policies to which I would draw your attention today. There is a greater need in this area to evolve a policy which makes the fullest use of the resources of the corporate sector. About three-quarters of your Company's products by turnover are under some form of price control and subject to industrial licensing. On pricing we have been making representations to both the Tariff Commission and the Bureau of Industrial Costs and Prices and we have been deeply impressed by the thoroughness with which they have gone about their difficult task, as also the patience and understanding with which they have listened to our submissions on complex issues such as inflation.

Turning to industrial licensing, growth is one of the most potent weapons that the Government can employ in its battle against inflation and should thus be an immediate and overriding component of its industrial policy. The recent circular to manufacturers issued by the Ministry of Industrial Development urging them to mark the Silver Jubilee year of the nation's Independence by producing to full capacity is a welcome step in this direction.

Next, we in business like everyone else must avoid the temptation to regard inflation as somebody else's problem and merely to add to the list of those who complain. Whatever the dangers of too severe a price control, it is nevertheless the duty of all concerned, including business itself, to do everything possible to keep to a minimum cost increases and hence unavoidable price increases.

In your Company we have

given high priority, in both policy and practice, to a programme aimed at containing inflation as far as it is within our power. We believe that this is not just a matter for the Board or a select group of senior managers, but for all employees from the most junior worker to the members of the Board who are facing you this afternoon. Our policy as a firm is and has been to pay all levels of our employees well and in return to seek from them maximum commitment to the pursuit of efficiency. This clearly calls for a high degree of motivation coupled with the development of the appropriate skills.

We have over the last few years been progressively introducing a system of management by objectives (MBO). Every unit and department so covered is clearly aware of those areas in which improvement in efficiency is considered not only possible but vital. Clear quantified targets are set quarter by quarter in consultation with those key personnel who will themselves be largely instrumental in attaining them. We have learnt that the commitment to a target which has been discussed and agreed is far greater than that which has been imposed by some remote authority located in our Head Office here. We are frankly pleased and proud of the progress which has been achieved and feel confident that it will be maintained.

As an essential prerequisite to introducing MBO, we have begun an ambitious programme of communicating with and training employees at all levels so that there is a wider understanding of corporate objectives, problems and solutions. For example, special courses are being conducted in Head Office and in the branches aimed at improving the efficiency of our distribution system. Managers, supervisors and salesmen have all been involved in these. Special attention is being paid to what is recognised to be one of our higher cost operations, namely, that of pioneering our rural markets, as also to the efficient

use of resources whether those of the Company or those of our stockists. A more recent and successful innovation has been the involvement of service groups, the clerks and stenographers attached to the sales management and the clerical staff of the warehouses, transport, planning and accounting departments. How to contain inflation is one of the major topics of discussion. The response has been most encouraging and a number of excellent suggestions have emerged which very often the participants themselves, working as a team, are asked to implement.

Coming to the third agency in this battle—obviously this programme of increasing efficiency to beat inflation can only succeed with the co-operation of the trade unions in our Company. By accepting the fact that any real increase in the stable and long-term prosperity of their members must ultimately rest on their ability to increase productivity, they have clearly seen their crucial role.

A further strategic weapon that we have employed in the battle against inflation is to ensure that we take maximum advantage of the economies of scale whether it is in the area of procurement, production or distribution. Procurement, we believe, is not just a matter of buying as cheaply as one can from the existing market. It must go much further—like reducing our dependence on a single supplier by helping to build up competitive suppliers, or by developing wholly new materials. A typical example of the latter is our decision several years ago to contribute equity capital, loans and know-how in setting up a factory to make solid board containers, an alternative to wood boxes where prices are rising sharply. Today this factory, Solid Containers Ltd., is one of our important sources of supply of packaging materials. Likewise our research skills have been used to help manufacturers in whom we have no direct interest other than as their customers to develop more effective and cheaper chemical ingredients for our products.

EASTERN ECONOMIST

We also subject our products to the discipline of value analysis. This is not as you might suggest another name for quality reduction! It is in fact a difficult and complicated process to ensure that every component of cost is necessary to give the consumer the values she seeks for her money and not unnecessary frills which bring no benefit. This involves not merely production processes, but also formulation, perfume, packaging, advertising, the choice of the sale outlet, etc. Nor do we presume to act as judge and jury. Every major product change is subjected to careful consumer testing to ensure that in economising we have not affected some preferred attribute in the product characteristic or performance. Only after a positive verdict from the consumer does the Board approve a product modification.

Eliminating waste is always a major area of attack on costs. What we have achieved can be judged from the fact that 98 to 99 per cent of the materials we buy end up in products we sell. For example, even the small quantities of oil that are trapped in the bleaching earth we use for decolourising oil are recovered and reused.

Another area in which we have had a major success in neutralising some of the impact of inflation has been distribution. In active co-operation with the railway authorities we have helped to develop the use of containerised rail services in order to reduce damages and save handling costs. The number and location of our stock-holding points around the country are under constant review. We work together with our road transport and forwarding agents to ensure that their operations and those of the Company are dovetailed to achieve optimum efficiency, and have introduced a system which ensures that the economies of scale in distribution are shared between the transport contractor, the consumer and the Company.

Not all the increase in costs, however, are the result of normal inflationary effects. We are, as I have mentioned in my earlier speeches, in the

forefront of the battle to reduce the industry's dependence on imports—whether it be in the developing of new indigenous raw material or in the manufacture of chemicals hitherto imported. But there is a price to pay for this in our fight against inflation because, almost invariably such substitutions tend to increase our costs. Again, many of our exports are often possible only by accepting prices which result in a substantial loss for which the rest of the business must pay. While these are tasks which we undertake gladly in the national interest, we cannot ignore the fact of their effect which is over and above the general inflationary trend.

The result of this integrated programme of fighting inflation has been very satisfactory for the consumer. Take, for example, soap which is one of the basic products of your Company. The soap industry has an impressive record of price stability despite the continual inflation in costs. Not only have prices been largely held over the last six years, but they compare very well internationally despite the fact that our oils, chemicals and packaging materials are amongst the most expensive in the world. While standards of presentation and perfuming have had to be sacrificed, the fact remains that the consumer in India is getting her toilet soap, for example, at one of the lowest prices anywhere. Weight for weight, a tablet of toilet soap costs 40 per cent more in the USA (which produces the cheapest raw materials) and up to two and a half times as much in Europe. There is obviously a limit to the extent to which prices can be held in an inflationary situation, however efficient and ingenious we are. In many parts of the business that limit has already been reached and passed. Soap is one instance and vanaspati another and more extreme case where the consumer is enjoying what is in effect a price subsidy.

Nor can we, as employees, in fairness say that the burden of inflation has fallen all that severely upon us. While it has not been possible to meet all

the demands of our work force and at times we have had to be more restrictive than we would have ideally chosen to be, the record speaks for itself and our people have, by and large, been protected from a reduction in their own standards of living. To illustrate, between 1960 and 1970 the average cost of management employees rose by 70 per cent and the cost of non-management employees by 131 per cent, while the wholesale price index rose by 82 per cent.

In effect, therefore, the burden of inflation in the case of your Company has been borne not so much by the consumer of its product, or by its employees, as by its shareholders. In the long run, inadequate returns to the shareholders as a group will choke off the flow of private savings into industry and stifle investment in vital industries on which so much of future economic growth depends.

Even in the short term, the consequences of allowing such a situation to develop are generally that one of the main objectives which we, as a nation are seeking to achieve, namely containing inflation, is likely to be defeated. Without the expansion needed to spread overheads and overcome shortages, without the ability to attract and retain good management and to reward labour adequately for improving its productivity, without the resources to conduct research and development in all sides of our business and without the ability to give our shareholders an adequate reward for the investments they have made and the risks they are taking, the cutting edge of a major weapon in the battle against inflation—a healthy, industrial machine—must inevitably be blunted. We believe, nevertheless, that despite the worrying situation facing us at present, we shall succeed in due course in striking the delicate balance between giving you, our shareholders, a fair return on your investment and at the same time ensuring that we do all we can in fighting inflation.

"This does not purport to be a report of the proceedings of the Annual General Meeting."

USHA MARTIN BLACK (WIRE ROPES) LTD.

SHRI G. D. JHAWAR

Speech Of The Chairman, Shri G. D. Jhavar

The following is the text of the speech delivered by Shri G. D. Jhavar, at the 11th Annual General Meeting of the Company held at its Registered Office at 14, Princep Street, Calcutta 13 on the 7th June 1972.

It gives me great pleasure to welcome you at the Annual General Meeting of the Company. I presume by this time you have gone through the annual report of the Company for the year ended December 31, 1971.

During the course of the year behind us, the country has passed through a most crucial period in its history. A nation-state born in the minds of seventy-five million people of Bangla Desh in the dark night of March 25 last year has received baptism in a war that has inflicted a crushing defeat on those who tried to suppress the democratic aspirations of its people. The victory in Bangla Desh is a tribute to the spirit of freedom and dignity of man—which we in this sub-continent have cherished for centuries.

I will take this opportunity of expressing our gratitude towards our valiant armed forces and those Jawans who have laid down their lives and lost limbs in the service of the Motherland.

The tragic circumstances which brought India and Bangla Desh together may represent, in the perspective of history, one of the turning points in the future of the whole of Asia. Today, if we can raise our heads high in the comity of

nations, it is largely due to the inspiring leadership of our beloved Prime Minister, Srimati Indira Gandhi. This augurs well for long-term growth and stability of the country; in fact the air of gloom and despondency which prevailed in the first half of 1971 has now been largely replaced by a new air of confidence and a revival of hopes and aspirations for a constructive surge forward in the country.

The burden of refugees and the consequent war with Pakistan has had its impact on the economy of the country. The damage done to the economy cannot be explained in terms of a draft on current resources alone. The wear and tear of the economic infrastructure and the stresses and strains on the social fabric, which are no less significant, are yet to be quantified. All these have implications for the country's economy many of which will unfold only with the passage of time. Meanwhile, we find that the problems facing our economy are substantially the same as they were last year. After recording an annual rate of growth of 6.4 percent in 1968 and 7.1 percent in 1969, the rate of increase in industrial output declined to 4.8 percent in 1970. This declining trend became more pronounced in the latter half of 1970 when a rise of only 3 percent over the

level attained in the corresponding period of 1969 was recorded. The latest available statistics indicate that during the first 8 months of 1971, the rise in the index of industrial production was only 2 percent as compared to 5.5 percent during the corresponding period of the previous year.

The Government of Smt. Gandhi could be a milestone and a turning point in our history—she is in firm control of the situation. Let everyone know that she is re-structuring all her economic policies and will call for results instead of arguments, thesis and files.

Recent elections to the state assemblies with a massive victory for the Congress have strengthened Smt. Gandhi's hands further. Now it should be easier for the Government to pursue a more stable economic policy for much faster progress and prosperity of the country.

I am pleased to report that your Company carried out its expansion programme by installation of Balancing equipment mentioned in my last report with great speed, for which a loan of Rs. 25 lacs was taken from ICICI. The benefit of increased production helped the Company to increase its sales during the second half of the year. During the year under review, the

prices of raw materials, especially high carbon wire rods, zinc, lead, Acid, Fibre Core, Oil and Lubricants, all soared high both due to statutory imposts and otherwise. The Company has tried to absorb some of these costs and all the increases have not been passed on to the customers. The policy has been to continuously try and expand production as well as turnover to face the challenge of ever-increasing cost of production.

Further Growth

We have been constantly exploring areas for further growth and diversification with a view to increase our exports. We had approached the Government to allow us expand the production of fine cords. I am glad to inform you that all formalities of getting the Industrial Licence, Import Licence etc. have been completed and orders for the Plant and Equipment have also been placed. The Company is vigorously pursuing the matter and phased production of this project should start before the end of this year. With the start up of this, the Company would be in a solid position in offering the widest possible product range for exports.

The Company has also been pursuing its project to further expand the production of wires

by 9000 tonnes for which necessary Industrial and Import Licences have already been obtained. It will now be possible for the Company to further diversify and produce larger varieties of specialised wires for which the Company has been able to develop the know-how by constant research development in all its aspects. It is confidently anticipated that the Company's team of young technicians will be able to face new challenges in the manufacture of stainless steel wires, alloy steel and ball bearing wires, and other varieties of highly specialised high tensile galvanised and black wires. Rapid progress is expected in the very near future in all these fields.

Your Company has been lucky in having one of the most modern Wire Drawing Plant in the world. Most of its plant and machinery having been imported from the world famous manufacturer of Wire Drawing Machine, Marshall Richards Barcro Limited, U.K. It has been possible to produce high quality wires at considerably high speeds on these machines achieving very high efficiency. Indigenously such machines were not available and it was felt that for future growth of the Company as well as the Country's Wire Drawing Industry, it was necessary to develop the supply of such sophisticated machines from indigenous sources. We had been actively pursuing this scheme for a long time, and are glad to inform you that the necessary approval of the Collaboration Agreement has been obtained by the Company from the Government of India. Very shortly, positive steps by way of installation of plant and machinery will be undertaken to implement the project. With this, it is hoped, that the much felt gap of high quality machines will be met.

Supply of high carbon wire rods, particularly in the Eastern Region of the country, has been posing a formidable problem. The shortage of steel, as you know, has been crippling the progress of the Engineering Industries of the coun-

try. With a view to supplementing the supplies of high carbon steel, considerable quantity of which is still being imported, the Company has made an application for putting up a 50,000 tonnes per annum Continuous Casting Plant. I am glad to inform you that the Company has received the necessary letter of intent and considerable progress has also been made in promoting a new Company by the name and style of Usha Alloys and Steels Limited for taking up this Project. The Company's application to financial institutions has made considerable progress and very shortly, it is proposed that the new Company will approach the Public with its Share Issue before the end of this year. Land has already been acquired and all plant and equipment having long delivery, have also been ordered for. With the start-up of production of this unit, the industry in the Eastern Region should be assured of timely supply of raw material from indigenous sources. This will be a major contribution by your Company towards the national goal of 'Self-Reliance'.

Power Crisis

We have seen in recent times—with little sign of abatement—the power crisis faced by almost all the States in general and the Eastern States, in particular. Press reports and informations trickling from Power Plants that are being run by Electricity Boards give a picture of near-chaos and deplorably incompetent management of these Plants. The present generation of Indians have mortgaged generations to come by the long term loans taken from foreign countries to set up these plants, Power stations and projects. How can the country continue to accept indifferent operations jeopardising the economic structure and seriously affecting industries and agriculture in the area? The Eastern States are potentially very rich in natural resources like Minerals, heavy industries and good agricultural land, yet all this potential has been left to waste, resulting in stagnation and massive unemployment.

tion and massive unemployment.

Much stress is being laid on development of backward states and areas. The Government at the Centre should seriously think of not only providing extra monetary resources but insist on providing competent management for such Power Plants in the backward States. The example of Patratu, Barauni, Bandel etc., should be utilised for corrections. It will be in the interest of these backward States to agree to give up the management of these Power Plants or the new ones that are coming up in the area to Central Government or enter into some alternate management arrangements under contract for a minimum period of 10 years and in due course, build up good team and expertise before they take over the management. The commanding heights can only be achieved by efficient running of Plants of whatever capacity which have been put up.

Wagon Shortage

Eastern Sector has been equally hit by shortage of wagons and we constantly hear of Railways blaming the consuming industries and *vice versa*. We hear of Collieries closing down due to excessive Pithead stocks. We hear of Power Stations on verge of closure due to paucity of coal. We hear of C.M.D.A. programmes being hit—due to shortage of stone chips and cement due to non-supply of wagons. While every attempt should be made towards improving the Railway services and extra wagons obtained to take care of the increasing traffic, I feel, the problem deserves to be looked into from an altogether different angle.

Railways and road transport have been treated as competitors to each other and unfortunately, till now the Road Transport has been loaded with all sorts of taxes to protect the Railway. A situation has been reached where Railways definitely have more than they can cope with. Even if they deny it, the economy would gain by exposing the transport

system of the country to some competition. If necessary, the Railway freights should be so re-arranged that for short distances, say within a radius of 300-400 miles, Road Transport could compete and provide the necessary safety valve to take care of such difficult situation as we face today.

This opportunity could be utilised by arranging trucks for unemployed persons through Banks to be usefully employed and play their part in the economic activity of the country. This will necessitate the improvement of roads—another labour intensive employment generator and also solve the transport problem to some extent. The Government should be fully aware of the dangers of its total dependence on Railways when in the recent past some sections of its employees had started pressurising the whole economy at a most delicate time.

Conclusion

It is my privilege to report that your Company's labour relation has been satisfactory. The Company is also actively pursuing policies to materially improve the living standards of its employees. It has started a Social Centre at its Plant with Rest Rooms, Libraries, Demonstration rooms, Cooperative Stores and a well equipped Medical Centre. It is also taking active interest in arranging to guide its employees and nearby villagers in modern methods of agriculture, animal husbandry and vegetable growing. All these steps should help the development of the area in which your factory is operating.

My thanks go to the labour, officers and the Secretariat. Thanks are also due to Martin, Black & Co. (Wire Ropes) Limited and Rylands-Whitecross Limited for their valuable assistance and co-operation towards on all-round progress and development of the Company.

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

Report of Ministry of Steel and Mines :

THE production of steel in the country during 1971-72 totalled 6.3 million ingot tonnes as compared to 6.13 million ingot tonnes in the previous year, according to the annual report of the Ministry of Steel and Mines for 1971-72.

The production of tool alloy and special steels during the year was about 0.3 million tonnes and saleable pig iron about 1.00 million tonnes. With the substantial increase in the production of alloy steels, imports of alloy steels have been stopped.

A target of 7.2 million ton-

nes of steel ingots has been set up for the main steel plants during 1972-73. This will mean an additional production of about a million tonnes of steel ingots representing on the average 80 per cent utilisation of rated capacity. In addition there will be production of mild steel from Mysore Iron and Steel Limited and electric furnaces, to the extent of six to seven lakh tonnes of mild steel.

The steel manufacturing capacity at the end of the fourth Plan is expected to be 12 million ingot tonnes. In the fifth Plan period this capacity will be further augmented by expansion of Bhilai Steel Plant and the Bokaro Steel Plant to about four million tonnes each and by establishing two new steel plants at Visakhapatnam and Vijayanagar. The implementation of these schemes by the end of the fifth Plan will create a capacity to manufacture approximately 19 million ingot tonnes of steel.

A long term development programme has been formu-

lated for expansion of alloy steel production in the country. The product-mix for the expansion of alloy steel plant Durgapur and the new steel plant at Salem was being examined, keeping in view the likely demand of various categories by 1980.

Expansion of Capacity

Steps are being taken to augment the steel making capacity, with the expansion of the capacity of Bhilai in the public sector and Indian Iron and Steel Company Ltd in the private sector.

The Bhilai Steel Plant is being further expanded to about four million tonnes steel capacity from the present 2.5 million tonnes. This will be achieved by the end of 1976.

Action is also in hand to develop the further supporting facilities including mechanisation of the captive iron ore mines and the setting of the second sintering plant.

The Indian Iron and Steel Company has submitted a detailed scheme for expansion to 1.3 million tonnes of steel ingots from its present installed capacity of one million tonnes of steel ingots. The scheme is under detailed examination.

Bokaro

The construction work on stage I of the Bokaro Steel Plant for production of 1.7 million tonnes made progress

at a rapid pace during the year 1971-72, according to the report. The civil work on the first blast furnace complex is almost complete. The first coke oven battery was lighted in March 1972, and the first blast furnace is expected to be commissioned within the next few months.

For stage I, as a whole, 99.3 per cent of the earth work excavation, 85.8 per cent of RCC and concrete, 83.7 per cent of ground communication have been completed. The steel structures erected during 1971 was more than 71,000 tonnes, this is one and a half times more than was done during 1970. About 39,000 tonnes of equipment have been erected during 1971; this is double the quantity erected during 1970. In fact the monthly rate of erection of structures and equipment has more than doubled from about 5,500 tonnes in October 1970 to more than 11,000 tonnes per month towards the end of 1971. The refractory lining work increased by five times from 5,568 tonnes in 1970 to 34,026 tonnes in 1971.

The government has taken a decision to launch a crash programme for achieving a capacity of 2.5 million tonnes of steel ingots between the first (1.7 million tonnes) and second (4.00 million tonnes) stage at Bokaro Steel Plant. The work on the 2.5 million tonnes is expected to be completed by the end of the fourth Plan. The

Data received from Iron and Steel Controller, Calcutta.

Sources: I. & S. Control Bulletin.

work on the second stage has commenced and possibility of further expansion to 5.5 million ingot tonnes is under examination.

New Steel Plants

The techno-economic feasibility report, of the new steel plants at Salem, Vijayanagar and Visakhapatnam, which have been received from the consultants, are under examination of the Department of Steel. Meanwhile considerable progress has been made on preliminary items of work for setting up of these plants. Action has been taken on acquisition of land for these plants.

Soil tests, plate bearing tests etc. for the three projects have been completed by the Hindustan Steel Construction Ltd and other investigations are also underway.

The survey of India have completed the topographical surveys of the three plants sites, railways have completed survey for exchange yards, sidings etc., water supply schemes drawn up by the state governments are being finalised and testing of raw materials is being done by the National Metallurgical Laboratory.

According to the schedule of construction as indicated by the consultants in the feasibility reports, the Salem Steel Plant would be commissioned in seven years, while the commissioning of the Vijayanagar and

Visakhapatnam Steel Plants would take about eight years from now.

Hindustan Steel

According to the report, under the original programme formulated by HSL, a production of 4.75 million tonnes of ingots and 3.59 million tonnes of salable steel was expected from the three integrated steel plants at Durgapur, Bhilai and Rourkela. The total production level envisaged in the three plants, however, could not be reached although the anticipated production of 1.954 million tonnes of ingots at Bhilai is the highest in the plant so far and 14,000 tonnes more than last year's production; production at Durgapur has exceeded previous year's production by 6,000 tonnes of ingots. Total production was only marginally less than in the previous year in spite of the serious mishap in Rourkela which resulted in the loss of production of about 35,000 ingot tonnes of steel.

The main factors, listed in the report, responsible for shortfall in production as compared to the targets are: the major break-down in some of the coke oven batteries in Bhilai, collapse of the roof structure of the steel melting shop in Rourkela and the general disturbed industrial relations in Durgapur.

To improve the performance of coke ovens special repairs

Mrs. Chaudury is coin-conscious

Who cares? PNB does!

Mrs. Chaudury is a thrifty housewife. She buys for her family the best provisions at bargain rates. From every purchase there is a lot of small change left over. She tries to save each one of these coins, for she knows that if she takes care of the coins the rupees will take care of themselves.

She is a disciplined saver and out of her savings she deposits every month Rs. 50/- in her Recurring Deposit Account at PNB.

She is saving for a purpose. She is planning to buy a refrigerator. She will buy one when her Recurring Deposit Account matures at the end of 48 months. She will

then get Rs. 370/- more than she had deposited, i.e., Rs. 2770/-...sufficient to buy the refrigerator of her choice!

You too can benefit from PNB's Recurring Deposit Scheme and buy anything you want...a sewing machine, a bicycle, a scooter, a TV set, a car, or even a house!

Indeed, PNB has deposit schemes to suit everybody. Here are some of them:

Recurring Deposit ★ Special Fixed Deposit ★ Old Age Provision Deposit ★ Automatic Extension Deposit ★ Student Deposit ★ Mini Deposit.

For further details please contact our nearest branch. We have over 825 branches throughout the country.

ALUMINIUM CAN MAKE YOUR HOME LOVELIER AND LIVELIER

Sleek, elegant, light, bright, strong, durable, rust-proof, hygienic...one could go on listing the virtues of the wonder metal, ALUMINIUM. Every modern home uses versatile aluminium furniture, fixtures, utensils and appliances. Join the modern trend—use aluminium in your home too. Make sure that your furniture is made of Hindalco Aluminium. Hindalco does not make these finished goods but it supplies the much-needed aluminium (in primary & Semi-fabricated forms) for their manufacture.

have been undertaken. A special group was constituted to suggest the most effective measures for increasing coke production. The suggestions are under implementation.

To meet shortage of coke oven gas, supplementary fuels are being used. A new coke oven battery was commissioned at Bhilai in January 1972. The reconstruction of the roof of the steel melting shop at Rourkela was completed in record time. Production had picked up to a good level by February 1972.

To ensure timely availability of stores and spares, rolls, raw materials, refractories, etc. a three-year rolling plan for these items, has been formulated for the integrated steel plants in

the country. Likewise a three-year maintenance programme for the integrated steel plants has also been finalised. These measures will result in a better and timely maintenance and utilisation of existing installed capacity, and will contribute towards self-sufficiency.

HSL has evolved new production incentive scheme designed to motivate labour productivity and discourage absenteeism and reduce over-time payments. In the field of industrial relations, the emphasis at all levels is on a participative approach to the solution of the problems.

Total	4,270	100,459	71,552	2,00,724	..

Total exports of Iron & Steel during the 11 months period ended 29-2-1972; 3,93,005 tonnes F.O.B. Value Rs 24. 13 crores.

tion Ltd manufactured 30,468 tonnes of mechanical equipment and structurals (23,109 tonnes in 1970-71), 20,954 tonnes of forgings (16,021 tonnes in 1970-71) and 20 numbers of machine tools (28 number in 1970-71) valued at about Rs 39 crores as compared to about Rs 28 crores in the previous year. The value of machine tools produced during 1971-72 was Rs 126.26 lakhs as against Rs 105.43 lakhs during 1970-71.

The report points out that during the year HEC made a net cash gain of about Rs one crore, excluding interest charges and depreciation. If the present rate of improvement is maintained the company would reach the break-even stage in 1973-74.

Many important items of equipment were manufactured for the first time in the country, according to the report.

The main work load of the company at present relates to supply of equipment for the first stage of the Bokaro Steel Plant. Most of the equipment required for the erection of the first blast furnace complex has been supplied. During this year, orders for the second stage of Bokaro have been received.

Engineering Units

The report brings out a significant feature that the Mining

and Allied Machinery Corporation which were incurring substantial losses and the Committee on Public Undertakings had recommended its closure has improved its performance. During the last quarter of 1971-72 it did not incur any operating cash loss, excluding interest charges and depreciation. Production is expected to improve in 1972-73 and reach break-even stage by end of the year.

In the engineering units under the Ministry production was as follows: Mining and Allied Machinery Corporation Ltd. 11,300 tonnes (7,742 tonnes in 1970-71); Bharat Heavy Plate and Vessels Limited 2,480 tonnes (548 tonnes in 1970-71); Tungabhadra Steel Products Limited 4191 tonnes (3587 tonnes in 1970-71) and Triveni Structurals Limited 10,214 tonnes (8,908 tonnes in 1970-71).

Distribution of Steel

The various measures for streamlining the distribution system, along with a fairly liberal import policy in respect of items in short-supply and the setting up of Steel Bank, coupled with a regulatory policy in respect of exports, contributed to a large extent in bridging the gap between supply and demand.

The Steel Raw Materials Bank has been set up with the

objective of physically maintaining the requisite level of stock of specified, critical and strategic categories of steel. The Bank has started functioning under the operational control of the Hindustan Steel Limited.

The policy of distribution of steel is being made more and more consumer-oriented. The steel plants are at present supplying over 90 per cent of their production to actual consumer.

Some of the special features of the new policy are that the small scale industries corporation in the various States are now responsible for bulk procurement of steel and its distribution to the small scale units. The small scale units are no longer required to send individual indents or deposit earnest money under this scheme.

The distribution and price of the products of the re-rollers have been regulated

through the billet re-rollers committee set up recently. Used rails are being made available to the scrap re-rollers in a regulated manner by the Ministry. The railways were earlier selling the rails by auction.

To keep pace with the rising demand and the short fall in indigenous production, bulk imports were arranged during the year for small-scale industries, export oriented engineering industries and for other actual users. There were canalised through HSL and MMTC.

The export policy in 1971-72, continued to be regulatory. Limited exports were permitted so as to make more steel available for meeting internal growing demand of engineering and other industries. An effort was made to fulfil to past commitments and maintain foreign markets with a view to stabilising trade relations with friendly countries.

HINDALCO HELPS TO BUILD NATION'S ECONOMY...

In May, 1962 Hindalco started production of aluminium with a smelter capacity of 20,000 tonnes a year. The capacity was raised to 40,000 tonnes in November, 1965, 60,000 tonnes in August, 1967 and to 80,000 tonnes in May, 1969. Plans are in hand to expand the plant further to 120,000 tonnes by end-1973.

Between May, 1962 and December, 1970 Hindalco, now India's largest producer of aluminium, has produced 372,903 tonnes of aluminium, which has saved for the nation nearly Rs. 180 crores of precious foreign exchange.

As a substitute for imported copper in the electrical industries, the above output represents a much larger foreign exchange saving, since one tonne of aluminium is replacing two tonnes of copper and as imported copper is several times costlier than indigenous aluminium.

As a vital raw material for Electrical Conductors & Cables, Telecommunications, Electric Capacitors, Condensers and Motors, Transportation (by road, rail, air and

water), Containers & Packaging (in both rigid & flexible forms), Building & Construction, Furniture, Paints, Surface Coatings, Explosives and Rocket Fuels, Industrial Castings, Steel Deoxidizing, Coinage, Missiles, Rockets, Satellites, Sophisticated Consumer Durables (like air-conditioners, refrigerators, electric fans), Business Machines (computers, typewriters, etc), Irrigation Piping, Grain

Bins, Drainage Culverts, Water Mains and countless other applications, HINDALCO aluminium is helping to build a new India...With its almost limitless variety of forms and shapes and its versatile properties, HINDALCO aluminium is sure to play a crucial role in meeting industrial India's challenge today and tomorrow...

Stockholm, a success story

THE UNITED Nations conference on the human environment held at Stockholm earlier this month had a truly vast and varied agenda ranging from the conservation of whales to ecocide in Vietnam. This would have justified the government of India chartering an entire Air-India Boeing 747 and sending all of its council of ministers, complete with their entourage, to the capital of Sweden for the duration. Instead, only the Prime Minister (who was also visiting Sweden, Czechoslovakia and Hungary on the invitation of the governments of these countries), Mr C Subramaniam in his capacity as Minister for Science and Technology, Dr Karan Singh in his capacity as Minister for Tourism and Mr Inder Gujral, as Minister of State for Housing and Urban Development, made or were asked to make the trip. New Delhi, therefore, has every reason to be amazed, astonished and altogether astounded by its moderation.

Its performance is all the more commendable in view of the fact that so very few ministers had managed to achieve so much at the conference. Mr Subramaniam has already announced that Stockholm was a famous victory for the Indian delegation. We must, however, wait for Mr Gujral for the full story and, if his account happens to be larger than life, so much the better for the morale of our government on the eve of the summit conference in Simla.

At the time of writing, however, we have to make do with whatever particulars certain enthusiastic news agency reports have provided about what our delegation had been able to achieve for India and the world. The most exciting of these achievements was the adoption, in the teeth of opposition from developed countries, at the plenary session of the conference a recommendation that the UN should immediately set up a new and separate fund for housing aid. The vote in this case was in favour of an amendment by India and Libya calling on the UN Secretary-General to "take immediate steps towards the establishment of an international fund or a financial institution whose primary operative objectives will be to assist in strengthening the national programmes (in the field of human settlement) through the provision of seed capital and the extension of necessary technical assistance to enable an effective mobilization of domestic resources for housing and the environmental improvement of human settlements." The language of the amendment bears the stamp less of Libya than of India's New Delhi where officials have always been cultivated to the point where more and more words are uttered to mean less and less. It would not be wrong therefore to ascribe the lion's share of the credit for the amendment and its passage to Mr Gujral who master-minded the transaction on behalf of the Indian delegation.

A nagging question, however, remains. Of what use is it to pass a resolution calling for the setting up of a fund which, presumably, must be fed for the greater part by the developed countries when those countries have unequivocally declared their opposition to the resolution? The question here is not whether the national delegations which voted against the India-Libya amendment had right or reason on their side or not, but whether it is not merely demonstrative politics for the developing countries to press a proposition which, in terms of credibility, was clearly a still-born one. It is true that, in our own country, the government has ways and means of persuading big businessmen to contribute big money to "gharibi hatao" posters if not programmes, but it is not by any means clear that it is also possible to extract money from industrialized countries for international projects they happen not to think much of.

Even apart from this, the developing countries, individually as well as collectively, seem to have played with a vengeance the sour and sulking role of the poor relative at the rich man's table. Even while demanding that the developed countries should assist them with resources and technology for environmental programmes, they have been cavilling at the very productivity and prosperity of the industrialized countries out of which assistance must come to them. The United States, in particular, has been a popular target and the complaint here is that the Americans, who form only some six per cent of the world's population manage to consume about 40 per cent of the world's goods and services and in the process gravely deplete the world's natural resources as well as cause the bulk of the industrial pollution which threatens ecology across the world.

These critics forget that it is societies with high consumption standards that also have a high stake in the conservation of the environment. Moreover, it is the countries with highly productive economies which have the resources to spare for environmental programmes. In any case, industrialized countries including the US have done

General Insurance Business	
Bill: 1972	.. 1240

so well in regulating their populations that they are entitled to ask the developing countries to show substantial progress in this direction before they start preaching the Doomsday gospel to them. There is surely no gainsaying the fact that the growth of population in poor countries could be the most important contributing factor to the environmental deterioration in their parts of the world as well as to their lack of resources for countering or

controlling this deterioration. To put it differently, the industrially advanced countries are both better motivated and endowed with greater capacity to regulate man's relations with his environment than underdeveloped countries with large and growing populations. It was a pity that Mr Uma Shankar Dixit, India's Minister for Family Planning, did not find a seat in one of those flights to Stockholm.

Out in the cold

THE WORST fears of general insurers in respect to the compensation that may be paid to them by the union government for the acquisition of their undertakings have come out to be true. The General Insurance Business (Nationalisation) Bill, which was referred, towards the close of the recent budget session, to a Joint Select Committee of both the Houses of Parliament, provides for a total amount of Rs 33 crores to be disbursed as compensation to 63 Indian and 44 non-Indian general insurance companies the management of which was taken over by the state on May 13 last year through an ordinance issued by the President. That this compensation is grossly unfair and inadequate should be evident from the fact that the paid-up capital and free reserves of the Indian insurers now being nationalised, alone exceeded Rs 88 crores at the end of 1969. The total assets of the 44 non-Indian insurers were of the order of Rs 25 crores as on December 31, 1968. The liabilities of non-Indian insurers had to be set off against their total assets, but even then their net assets at the end of 1968 should have exceeded at least Rs 15 crores. Since the above valuation, contained in the Indian Insurance Book, 1970, the value of the assets of both the Indian and non-Indian insurers should have gone up as a sequel to the expansion in their business as well as owing to the appreciation of the properties held by them. The proposed compensation, thus, does not even come up to 33 per cent of the net assets being acquired by the government. The position would not improve materially even if allowance is made for setting off against these net assets some unexpired risks at the end of the accounting year of an insurer.

The government has preferred to keep back to itself the basis on which the compensation amounts mentioned in the bill have been determined. An analysis of the amounts proposed to be paid to some of the leading insurers, however, suggests that they have been fixed at three times the total dividend disbursements by them in 1967, 1968 and 1969. The enclosed

table (p. 1215) reveals that the amounts payable to British India General, Concord of India, New Great Insurance, Hindustan General Hercules Insurance, Madras Motor and General Insurance, Oriental Fire and South Indian Insurance exactly tally with the figures arrived at by trebling the aggregate of the dividends paid by them to their shareholders in the three years up to 1969. In the case of some companies — Jupiter General, Marine and General Insurance and National Insurance—additions appear to have been made to the amounts determined on the above basis so as to raise the compensation to the level of their respective paid-up capitals. In certain other cases, on the other hand—for instance, Ruby General and Sterling General—some small deductions seem to have been made after computing the compensation payable in these cases according to the above formula.

Of the 63 Indian insurers, 27 companies will be getting compensation which will be more than their paid-up capitals. In the case of 17 others, the amounts proposed to be paid just equal their paid-up capitals. The exact position in regard to one insurer — Millowners' Mutual — is not very clear. There are 18 insurers in whose case the compensation amounts mentioned in the bill fall short of even their paid-up capitals. Among these 18 companies, nine are such which will be receiving just nominal compensation. Their working at the time of the takeover by the government of their management last year perhaps left much to be desired.

The basis for determining the compensation amounts payable to the non-Indian insurers appears to have been different. An indication of this is available from the fact that whereas the Indian insurers are to get about Rs 25 crores for the acquisition of their net assets aggregating to over Rs 75 crores at the end of 1969 (after making some allowance for the unexpired risks against the paid-up capital and free reserves totalling nearly Rs 88 crores) the non-Indian insurers will be getting approximately Rs eight crores for nearly Rs 25 crores total value of their assets in this country as on December 31,

1968, against which all their liabilities had to be set off.

The Indian insurers have been discriminated against in the General Insurance Business (Nationalisation) Bill in other ways also. The non-Indian insurers are proposed to be paid the amounts due to them in one lump sum, the recipients being the corporate bodies. In the case of Indian insurers, the compensation is proposed to be paid to the shareholders directly. If the shareholders of an Indian company, representing two-thirds of the value of the amount payable to it, however, decide at a specially convened meeting that their dues should be paid to a person or a body of persons authorised by them at that meeting or subsequently for carrying on any business, such an arrangement would be made. But the bill specifically provides that those shareholders who dissent from this arrangement will have to be given their individual dues. A shareholder of an Indian company, it is further provided in the bill, will get his compensation amount in one instalment if the amount he is entitled to does not exceed Rs 25,000. The amounts in excess of this sum will be disbursed in three instalments.

No doubt the Indian shareholders belonging to the latter category will be paid interest on the second and third instalments of the payments due to them, at the rate of four per cent per annum, this would be poor consolation to them as the four per cent interest is not only a third of or less than what they can get in the market, but is also lower than even the bank rate. It is worth pointing out here that the government pays as much as six per cent interest per annum on income-tax refunds if they are not paid out expeditiously. In the case of compensations for land acquisition, which have been stepped up by the high courts or the Supreme Court, the arrears to be paid to the owners of the acquired lands also attract interest at this higher rate. Another case that can be cited in this connection is that of gold bonds. As the government had issued these bonds in the mid-sixties against surrenders of gold at the international price which was much lower than the then prevailing rate in the Indian market, interest at the rate of 6.5 per cent per annum was allowed on these bonds.

The most reprehensible feature of the compensation amounts provided in the bill—if, of course, the above analysis that these amounts, in the case of most insurers, have been determined on the basis of trebling the dividend disbursements by them in 1967, 1968 and 1969 is correct—is that no weightage has been given to the reserves accumulated by different companies as also to their growth prospects.

As a result, the companies which have been following the prudent policy of restricting dividend disbursements in the interest of building up reserves have been penalised. The companies declaring large dividends, whether such dividend declarations were justified *vis-a-vis* the allocations to reserves or not, have stood to gain.

The bill further seeks to penalise the insurers who, besides faithfully carrying out the directions of the Controller of Insurance in their operations, had managed their business well, both in the interests of the policy-holders and shareholders. Under Section 52 (H) of the Insurance Act, the union government was entitled to acquire an insurance company which persistently failed to comply with the directives of the Controller of Insurance or which was managed in a manner detrimental to public interest or the interests of the shareholders, by paying compensation under section 52 (J) of this Act. In terms of this provision, the compensation to be paid to a defaulting company was to be the market value of its assets — land,

buildings, securities, shares, debentures, bonds, etc. — minus liabilities. Since the amounts payable to the insurers whose concerns are now being nationalised, do not bear any relation to the market value of their assets, they are at a disadvantage compared to the law-breaking and mis-managed concerns which were taken over by the government under the Insurance Act.

The compensation provided in the General Insurance Business (Nationalisation) Bill of the assets and liabilities of general insurance companies, thus, is highly unsatisfactory. If not stepped up, it can have a demoralising effect on investments in the private sector. The Select Committee of Parliament to which this bill has been referred for detailed consideration ought to bestow some thought on this aspect of the problem. The general investment climate in the country is far from promising at present. It should not be allowed to deteriorate further. The amounts to be paid to the nationalised companies must be equitable to all; their reserves position as well as growth rates

ought to be taken into consideration while determining compensation. In the interest of conserving the resources of the corporate sector, it is also necessary that the already mobilised resources should not be demobilised. They ought to be channelled into new productive lines.

It is encouraging to note that, instead of seeking to set up one monolithic corporation like the Life Insurance Corporation, the bill provides for the amalgamation of the nationalised general insurance concerns into five large companies. This should ensure some competition among them. If the example of the Life Insurance Corporation is any indication, the recent trend of lowering the premia on general insurance policies, which resulted from the severe competition among general insurers, of course, is not likely to persist. But with four companies in the field, the service interests of the insured will be safeguarded at least to some extent.

In view of the fact that the general insurance funds were available to the private sector in industry to a significant extent
