before the take-over of this business by the government last year, may it be hoped that this source of finance for the private sector will not dry up now? Already the investment of these funds in government

High cost of imports

MR M.M. SEN, Chief Controller of Imports and Exports, government of India, and his senior colleagues have been recently touring the important commercial centres of the country with a view to ascertaining the difficulties experienced by industry and trade in implementing the import/export policy for 1972-73. These meetings serve a useful purpose to the extent to which they provide a forum for the exchange of views between the Chief Controller and the business community. But how far will Mr Sen be in a position to carry out the suggestions made at these meetings for the simplification of the licensing procedures or in other directions?

Though the import-export policy has lately been a little more realistic than before, there are many features which continue to cause a great deal of hardship, and even harassment, to those who have to depend on supplies from abroad for getting their requirements of raw materials, machinery and components. For example, the pricing policy of non-ferrous metals has come in for considerable criticism. It has been pointed out that the prices charged by the Minerals and Metals Trading Corporation do not generally have any relevance to the prices prevailing in the London Metal Exchange and that the commission and other charges levied by the MMTC have been far too excessive. This point has been several times brought to the notice of the Ministry of Foreign Trade but there has been no relief to the industries which have to use imported non-ferrous metals. The government of India has set up a committee under the chairmanship of the Chief Controller of Imports & Exports to consider the various aspects of the pricing policy of the canalised items. Mr Sen, as the chairman, should see to it that this committee is able to discuss thoroughly the various aspects of the pricing policy and arrive at realistic decisions so that importers and consumers are not fleeced by the state trading agencies.

During his visit to Calcutta in the last week of May, the attention of Mr Sen was drawn to the inordinate delay in getting the actual users' licences which are issued on replenishment basis. It was pointed

securities has been stepped up. There is need for striking a balance between the investment of these funds in government securities and the stocks of private sector industrial ventures.

out that by the time an actual user received a licence and got his import, there was a time-lag of between 9 to 12 months. In the meanwhile, the quantity of import becomes less than what is needed for replenishment because of the increase in the CIF price. It was, therefore, suggested to Mr Sen that a way should be found by which an importer could be compensated automatically for any price rise in the international market. The availability of spare parts from foreign countries has also been made more difficult by the present licensing procedure.

The amount licensed for the import of spares often falls far short of the actual requirements. As Mr D.K. Chaudhuri, Chairman of the Calcutta Import & Export Trade Association, pointed out, "I know of cases where the actual value of licences meets only 25 per cent of the annual requirement of the importer. What does he do now? The only way to keep going is to carry on with worn-out parts with whatever repairs possible — this means more down time, more loss of man-hours with corresponding decrease in productivity and increase in costs. Another way is to buy licences at a premium and use the flexibility clause of 25 per cent import for spares (now reduced to 10 per cent). The balance 75 per cent of the purchased licence is left unused. This, in fact, means spare parts imported at a cost of more than 600 per cent. With reduced flexibility of 10 per cent, the increased cost will now be more than 1600 per cent if someone decides continue production". Here is a specific case where the import policy needs suitable and immediate modification so as to permit industries to obtain their spares without delay.

Another difficulty faced by industry is in regard to export obligation. At present, certain industries are under an obligation to export five per cent of their production and if they fail to do so, there will be a cut of 20 per cent in their import licence. The Calcutta Import and Export Trade Association has suggested that, instead of having a uniform penalty of 20 per cent cut of all exporters, whether they have exported zero per cent or 4.9 per cent, it would be preferable to have a sliding scale type of penalty, that is, four per cent per percentage of export obligation, so that an exporter exporting four per cent may be subjected to a nominal cut of four per cent in licence and an exporter failing to export anything

will have his licence cut by 20 per cent. This suggestion merits consideration.

Mrs Indira Gandhi said, in her speech at the last annual meeting of the Federation of Indian Chambers of Commerce and Industry, that the Foreign Trade Ministry was going to evolve shortly a scheme to facilitate the speedy grant of replenishment licences to exporters as well as early payment of cash assistance. It is not clear why Udyog Bhavan has not yet announced the details of this scheme. The incentives indicated in the Red Book mean little to importers and exporters so long as red tape continues to stand in the way of clear decisions and their quick implementation.

The import policy also needs reconsideration in respect of items that are banned or restricted. Often, the decision in this regard is taken without due consideration being given to such factors as adequate availability, quality and prices. There have also been instances of certain products being permitted to be imported even though they are sufficiently available within the country. The latest annual report of the Ministry of Industrial Development says that the government continues to lay great stress on import substitution and that the saving in foreign exchange due to increased production in 1971 was about Rs 153.76 crores compared to Rs 140.10 crores for 1970.

The report reveals that an exercise has been undertaken to identify the items of raw materials or finished products of large value imports, that is, exceeding Rs one crore per annum with a view to starting their indigenous production. It is stated that 36 such items have been identified. It is necessary to ensure that in the drive for import substitution due care is taken not to affect industrial production. The World Bank is recently reported to have suggested that while India should strive for self-reliance, she should not over-emphasise import substitution policies to the extent that growth is affected. New Delhi would do well to heed this advice.

India's current imports consist mainly of such essential items as raw cotton, chemical elements and compounds, manufactured fertilisers, petroleum and petroleum products, iron and steel, non-ferrous metals, machinery and transport equipment. The regular and adequate availability of these items at competitive prices is of crucial importance to the maintenance of industrial production and exports at a continuously high level. The government of India should therefore suitably modify its import/export policy in the light of the suggestions made by the leading associations of industry and trade.

Brakes on progress

THE REPORT of the Committee on Automation released to the press recently has put together interesting information regarding the social-economic effects of the introduction of automation measures in industry, commerce, administration and other related fields but has failed to draw logical conclusions from its own findings. The committee has claimed that its "approach to the problem of the use of computers is positive" but its recommendation that the use of computers should be subject to a prior agreement with workers is not only negative but is designed to put brakes on progress in this country. What is more, its own researches have confirmed that the use of computers in this country has not in any way affected the working conditions of the employees. More explicitly, the computers did not bring about any fall in employment in over-all terms in the establishments where they were installed. Consequently there was no need for the committee to make the consent of the workers obligatory for the installation of a computer in an establishment.

The committee has collected valuable data regarding the utility of computers and the uses to which they have been put by different industries and institutions. According to the committee, several organisations, both in the public sector and in the private sector, have claimed that the use of the computer has enabled them to improve and rationalise their system of inventories and to effect considerable reduction in inventories. The railways have reported a saving of Rs 20 crores a year on inventories through the use of computerised techniques. A cement company has claimed that it has effected a saving of two rupees per tonne of cement produced. An electricity undertaking is said to have achieved a saving of Rs 50 lakhs on inventories. A number of other examples have been given in the report which clearly show that computers have brought about an improvement in the financial working of the various industrial ventures where they have been installed.

The questionnaire sent to a number of

establishments sought reasons for the going in for office automation. The analysis of the replies showed that a majority of them had solicited the assistance of computers for reducing time-lag in tabulation and analysis of data, improvement of quality of products, facilitating management in decision making and increase in output. A small number of respondents had opted for them for scientific research and reduction in labour cost. The most revealing finding of the committee related to the impact of computers on employment. Instead of bringing about any fall in employment, there was a rise of the order of 2.4 per cent among 24 undertakings which submitted their returns.

It was seen that computerisation of work had generally led to a decrease in employment in the affected departments but this decrease was more than offset by the increase in employment in the data processing sections, thus leading to an increase in total employment. The versatility and capacity of the computer enabled the management to take up many more jobs which they could not have taken up earlier for want of such a sophisticated tool as the computer.

In the case of research organisations and educational institutions also, the use of computers had no adverse effect on existing employment. In fact, their installation resulted in the creation of new jobs. In the face of this unambiguous evidence, the recommendation that "all use of computers by commercial and industrial establishments, whether by resort to the computer centre facilities or by installation of in-house computers should be subject to a prior agreement with the workers" seems strange and unwarranted. It would be difficult, surely, to get the consent of labour unions in this matter. The report itself very clearly depicts the thinking of the labour members of the committee which seem to have had a disproportionate impact in the drafting of the recommendations. Also, there is more than one labour union in various establishments and it would be a herculean task for any management to make all of them agree to the installation of computers.

The committee's analysis has shown

that out of 49 computers currently in use in commercial undertakings, as many as 19 were working three shifts i.e. round the clock, 23 were working two shifts and only seven were working on single shift basis. Similarly, out of 21 computers installed for research and development, seven were working three shifts, eight were working two shifts and only six on single-shift basis. This can in no way be described as under-utilisation of the computer capacity. And yet the committee has drawn the conclusion that in "many cases" the present underutilisation or improper use of existing computers is due to the fact that "they have been installed without sufficient justification, thought and adequate preparation and planning for their legitimate use." This is another instance of a conclusion having been drawn without regard to the facts collected and studied.

In an explanatory note appended to the report by Messrs Naval H. Tata, Babubhai M. Chinai and B.D. Somani — employers' representatives — it has been shown that the total number of additional computers likely to be installed by the companies registered under the Companies Act during the next decade is 139. If the experience of the past installation of computers in this country is taken as a guide, the introduction of these computers would at best affect 2,064 workers during the next ten years or more. It clearly shows that the fears of labour in regard to the impact of computerisation on employment are exaggerated. This note suggests that the attempt made in the committee to reconcile opposing points of view has resulted in the representatives of the employers failing to act up to their conviction.

And still they come

R. V. Murthy

PROLIFERATION OF statutory corporations has come to be accepted as a reality with which one has perforce to live, so much so that people these days do not even care to raise their eyebrows if and when one more is added to the list. Justification can always be, and is, found for any new agency, but it is a moot point whether the justification really succeeds in convincing the people.

This was and continues to be the reaction of the writer both when the Western Maharashtra Development Corporation Ltd. (WMDC) was started and even now after this corporation has completed one year. For, of all states in India, Maharashtra is certainly not one where there is either conscious neglect of development or lack of agencies catering to some aspect or other of economic development. Indeed, organisations in the state such as SICOM have made such notable contribution to economic development, especially in the backward regions of the state, including even some districts covered by the WMDC, that several other states have expressed a keen desire to have SICOM-like organisations in their jurisdiction too. One can very well understand, therefore, the time and trouble that Mr Naval H. Tata, Chairman of WMDC, took the other day to review the working of his corporation but, even more than that, to give the *raison de etre* of WMDC.

repetitive job

What has WMDC done over the past year which one or the other of the several state statutory corporations already there could not or would not have done? Mr Tata spoke, for instance, of the corporation having to work as a catalyst, say, by encouraging and assisting intending entrepreneurs to start industries. One thought that this was also the task of more than one of the other corporations in the state listed by Mr Tata himself. Again, the WMDC chief referred to a good survey that the WMDC has just completed of the industrial potential of this region. There is no doubt that this would be useful to potential entrepreneurs of the region. But one would like to know how many agencies are engaged in such surveys. The National Council of Applied Economic Research is the first to have con-

ducted several state-wide surveys of this nature. More recently the Industrial Development Bank of India and, now, the lead banks have also entered the field. More particularly, without necessarily minimising the importance of these surveys, one would like to know if the absence so far of such a survey alone has come in the way of an entrepreneur entering the region. As Mr Tata himself mentioned, these project ideas are only the beginning of a series of problems which a new entrepreneur has to face. To quote the WMDC chief "he (the entrepreneur) must know what clearances he has to obtain to start an industry; he must ascertain and/or ask for infrastructure facilities; he must find finance; he must secure the right type of plant and equipment; he may even need a status-symbol — like the token association of the corporation in his equity to obtain better and quicker results, and he must find some one to underwrite his capital offers and to guarantee the loans from financial institutions".

corporation's achievement

After saying all this, one must also take note of what interest, if any, the WMDC has evoked from respective entrepreneurs. From what Mr Tata disclosed, "the corporation has already received requests from various entrepreneurs for help" in respect of almost all the problems indicated above. That means there are entrepreneurs who feel the usefulness of one more institution such as the WMDC, which offers to go all out to their help, as a friend, philosopher and guide.

But it is significant that the WMDC feels there are areas where it has itself to take the initiative. Presumably the corporation has got into a mood to compete with development corporations in other states in this respect. In the year 1971, it is said, these corporations received as many as 70 letters of intent, covering a vast range of products, including cement, soda ash, caustic soda, auto tyres and tubes, scooters, toilet soap, cigarettes and so on. The list is clearly suggestive of the fact that, whether individual entrepreneurs or corporation entrepreneurs, the tendency is to follow the beaten path and not to blaze a new trail. At

least in one respect, the public would expect corporations set up by state governments such as WMDC to concentrate on pastures new, in particular on labour-intensive industries. What matters is not whether or not the corporation is able successfully to deploy the concept of joint sector. The joint sector has come to stay all right, and whether one likes it or not, it bids fair to be the new pattern of corporate growth for years to come. What is needed of the corporation is that it supplement the efforts of other entrepreneurs, private or public, with the sole objective of augmenting national output. This is no time to allow any wastage of our limited resources, and these precious resources are bound to be wasted if units already in the field are obliged to close down, or even if they are taken over for rehabilitation by a state agency.

drawing lessons

One scheme of the WMDC deserves particular notice. It is the corporation's powerloom project. With 1153 powerlooms allotted to it, the corporation wants to implement this scheme in stages, making a beginning with a 300-powerloom pilot project at Ahmednagar. Later, the corporation proposes to extend it to Jalgaon and Dhulia districts and also the Chaphal region in Satara district. It would have been useful if Mr Tata had given more details about this project. Powerlooms are a particularly explosive area, with politicians ranged for and against, on the one hand, and the powerful handloom lobby pitted against it, on the other. Even mill interests are not very happy with powerlooms. Be that as it may this project should provide employment to at least one section of the unemployed in rural areas. The corporation is in the happy position of not having to find resources in respect of some of its schemes to reduce unemployment, as these also appear to be the centre's schemes. It has been allotted Rs 5.87 lakhs, the whole of which the corporation expects to disburse soon for the purpose of enabling the educated unemployed in the area to start some industrial units. In all these, the corporation would do well to draw some lesson from the experience of Mr Arvind Mafatlal in his rural rehabilitation work, where the emphasis is not

just on providing employment as a short-term relief but on interesting the unemployed himself in a given line which he may eventually become keen to develop on his own, taking advantage of the technical guidance given to him.

Mr Tata's appeal to his fellow industrialists and business men to explore the possibility of farming out some of their needs of components and ancillaries to new entrepreneurs by offering designs and other technical know-how should also be heard. When the WMDC is there to take care of all the problems of new entrepreneurs, at any rate within the region under its jurisdiction, these industrialists should, as a matter of fact, seize the offer. In their own way, some business houses like Tatas and Kirloskars have tried out this farming practice with encouraging re-

sults. Between the corporation and the business houses, as also the public sector units in and near the region, it should be possible to raise a whole army of young entrepreneurs out of the many unemployed engineers and technicians there. As Mr Tata observed, there is considerable scope for such action in the vast network of large industries that have come up and are still coming up in and around Poona, especially when they have, or are working out, plans for future expansion. The merit of this scheme is that it will help build up a sense of participation which goes a long way towards creating a congenial atmosphere for industrialisation.

In the course of his speech at the last annual general meeting of the corporation Mr Tata was rightly critical of the centre's tendency to take control of more and more

industries, although, under the Constitution, industries happen to be very much in the state list. He quoted the Annual Survey of Industries to show that in all industries with fixed capital of Rs 25 lakhs and over, the centre's control extended to as much as 93 per cent of the value of output. He also recalled the note of warning sounded nearly 12 years ago by the late Prof D.R. Gadgil who had even then exhorted the state authorities to fight against this trend "so as to enable them to frame a real system of planning from the bottom". Whether or not the centre would heed to this and stop this trend, it must at least respond to the plea of Mr Tata to let the projects sponsored by development corporations be free of all the restrictive provisions of its industrial policy. Perhaps the centre might accept the plea if the state government backs it up too.

On threat to foreign aid

Dr Suresh Prakash

MUCH QUIXOTIC confidence has been shown by our leaders and the people following the US government's decision to suspend aid to India. Spontaneous statements like 'We will not yield to threats' or 'India can do without foreign aid' have been pouring from all quarters. Such a light-hearted view of the situation can be taken only by those who are in fact not aware of the intricacies of development finance. The threat to aid should certainly not cause pessimism but it does call for taking a more realistic and an active account of the things to come.

It is not that we can do much if the aid giving country refuses to extend the greatly needed resources. It is also not advisable to yield to threats and accept aid, which in fact is a long-term loan only, with strings from the aid giving country, let alone mortgaging the honour of our country. At the same time any light-hearted or slogan-oriented view of the situation can only lead to complacency. It must be fully realised that external aid is a very very great asset to a developing country and its withdrawal, especially by a country like America, which alone is responsible for nearly 50 per cent of the total foreign aid received by India so far, is going to create a big gap which can possibly be filled by other friendly countries which may come forward with larger long-term loans for our

economic development. Alternatively it will require tremendous will power and all-out effort by our people to carry forward the development programme on our own.

In spite of our so-called best efforts to boost our exports and thus reduce the balance of trade deficit it is common knowledge that the deficit has continued. Our exports have lagged far behind the targets and are insufficient to pay off for the current imports, let alone the burden of the liability of loan repayments and their interest. This gap last year was of the order of Rs 120 crores, excluding Rs 255 crores due for repayment and Rs 158 crores on account of interest payment. During the current year in spite of all efforts the trade deficit is likely to be of the order of Rs 225 crores. The total gap including the amount due for loan repayment and interest will, thus, be of the order of Rs 700 crores. Now can we boost up our exports overnight, or precisely over a period of coming one year or two, to do away with a gap of this magnitude? This will mean an increase of about 50 per cent on the export front.

All talk relating to the reduction in imports, too, is unrealistic. A close view of the structure of imports during the recent years will reveal that with the stepping up of import duty rates and the

various import restrictions from year to year the imports have been reduced to necessities or near necessities. It may be argued that with the growing self-sufficiency on the food front the country will be able to cut a large chunk of imports which was as high as about Rs 300 crores or nearly 20 per cent of the imports in 1969-70. During the last financial year, 1970-71, too, the import of foodgrains was nearly as high in spite of the bumper crop under the Green Revolution in the country. It is true that with the buffer stock of nearly 8.5 million tonnes of foodgrains, food imports do not seem so necessary, but only as long as we continue to have favourable monsoons. In spite of the high-yielding varieties it must be admitted that our agriculture is still dependent on nature. An occasional drought may not affect the rabi crop but will certainly affect the kharif crop which contributes as high as 70 per cent of India's total foodgrains production. The present buffer stock — 2.65 million tonnes of rice and 5.2 million tonnes of wheat — is by no means flattering. Moreover, even by doing away with the food imports, the deficit can not be wiped off.

A sizable part of our imports representing about 25 per cent of the total is that of machinery and transport equipment which are so vital for the development. Imports of chemicals, mineral oils, iron and steel

POINTS OF VIEW

non-ferrous metals, raw cotton, etc., in all accounting for over 35 per cent of the total, play a vital part in providing for the necessary inputs for agriculture as well as industry in the form of fertilizers or other raw materials, without which the hitherto unutilised capacity of our industrial units will assume serious proportions. Fertilizers alone, for which we spent about Rs 70 crores worth of foreign exchange, is something on which our agricultural self-sufficiency depends to a great extent.

The cotton textile industry the largest export industry of our country has not been doing so well during the recent years on account of the shortage of raw material. The shift of emphasis on agriculture has done some harm to the production of cash crop. Our dependence on imported raw cotton to keep our textile mills going

has been increasing and yet the idle capacity exists and several units have been closing from time to time. Same is true for the production of oilseeds. The volume of import of animal and vegetable oils and fats has been on the increase during the recent years.

The import of iron and steel and other non-ferrous metals has also been increasing and they being very important raw materials for our existing industries and for the development of capital goods industry, nothing much can be done to stop their imports except by increasing their production indigenously.

Besides the imports of food, machinery and raw material, the import of foreign technology has been a very important item among the types of external

assistance, sought by India. Import of technology has been significant in shaping our tools for development though it may not have been so important in terms of the value of total external assistance received.

It is therefore extremely important that our country must undertake the development and maximum utilisation of indigenous resources. At the same time false impression should not be created that it is already well-set to do without foreign aid. It is possible that, after a decade or so we may find ourselves strong in domestic resources and indigenous technology and therefore less dependent on external loans. But this happy state will necessarily have to be preceded by long years of positive planning, efficient organization and purposive hard work.

ssis a day during February, the management decided to lay off workers of the chassis assembly department without compensation as per 25 E (iii) of the I.D. Act since engines were not available for production of chassis. There was also a steep fall in the manufacture of components in other departments and so the process of laying off of workers in various departments was continued by the management, convinced as they were that it was not worth their while managing something over which they were fast losing control. When, on March 1, 1972, the union requested the management to withdraw the lay-off the management replied that unless normal production could be assured and the workers also agreed to the settlement of bonus as per management's formula, they were unwilling to change. The union Labour Minister, Mr Khadilkar's intervention on March 9, '72, when he advised management to lift the lay-off, did not improve the situation since the stalemate continued without any favourable response from the workers.

bonus issue

Mr Kuchelar was unwilling to settle the bonus issue on the management's terms. He insisted on his Rs 27 lakhs demand as bonus for the year 1970-71. One month later, towards the end of April, the Tamil Nadu Minister for Industries intervened; but this also did not help. Again, on May 2, 1972, the central minister, Mr Mohan Kumaramangalam, advised the workers to go back to work and give normal production, leaving the bonus issue to be settled by the state government. He condemned the work-to-rule tactics adopted by the workers and this provoked Mr Kuchelar to issue a bitter rejoinder to the minister. Thus the situation was going from bad to worse. On May 12, 1972 executives of the company, who came for work, were gheraoed. On the same day, the managing director, the works manager and the industrial relations manager were again gheraoed in front of the secretariat while they were coming out after discussions with the Labour Minister late at night. Abusive slogans were shouted and the managing director and the works manager were spat on. As a result, the management announced the complete closure of the unit from May 14 onwards. Subsequent efforts by Mr Khadilkar at Delhi did not improve the situation. Meanwhile, the majority of workers began to feel despondent and wanted to get back to work unconditionally. Sensing the mood of the workers,

the Chief Minister of Tamil Nadu advised the management to reopen the factory and appealed to the workers to go back to work. This had its salutary effect and now the factory is working to full capacity.

It may be asked how Mr Kuchelar was able to carry conviction to the workers when he demanded Rs 27 lakhs as bonus for them. His contention was that the sales income had gone up from Rs 33.80 crores in 1969-70 to Rs 37.34 crores in 1970-71 due to increased value obtained per vehicle, and that, therefore, the management should be generous in their attitude to the workers. As against this, the management's contention was that there was no increase in productivity and that there was a drop of 74 chassis in 1970-71 as compared to 1969-70. They further explained that the rise in sales income was due to a price increase per unit of Comet of Rs 3,857 which just covered the increases in customs duty and cost of indigenous materials without in any way increasing the profit margin for the company.

One other argument of Mr Kuchelar which swept the workers off their feet was the amount paid as royalty by the com-

pany to Leyland Motors in UK. The workers were told that the royalty paid in 1970-71 was Rs 45.95 lakhs whereas it was only Rs 38.65 lakhs in the previous year although the management had claimed there was a short-fall of production in the number of chassis. The management's contention was that royalty was calculated on the previous year's production and payment made in the following year and that the workers had been misled on this point.

It is too soon to predict whether Mr Kuchelar's hold over large sections of industrial labour in and around Madras city is on the wane as a result of a majority of Ashok Leyland workers having decided to keep him out of their affairs. If, per chance, the recent development in Ashok Leyland is indeed the beginning of the end of Mr Kuchelar as an influential and over-powering trade union leader in Tamil Nadu, one can hope for better industrial climate for the state in the near future. Meanwhile, the net result of all that has happened in Ashok Leyland is that there was a loss of production in this unit amounting to Rs 14.6 crores as against an annual turn-over of Rs 38 crores. The loss in wages for the workers was Rs 41 lakhs.

Lessons of labour trouble in Ashok Leyland

K. S. Ramanujam

VERY LITTLE is known outside Madras about the recent difficulties faced by the management of Ashok Leyland. Luckily, thanks to the whole-hearted and unstinting support of the state government, the management, consisting entirely of professional managers, was able to withstand successfully the pressures of the intransigent and unbending leadership of the Leyland workers numbering over four thousand. The repentant workers have decided to do away with their union president, the well-known labour leader of Madras, Mr R. Kuchelar, who, according to them, had guided them wrongly and jeopardised their interests.

Ashok Leyland, it may be mentioned, is one of the most successful automobile factories of the country turning out over 5,000 Comet heavy-duty vehicles annually. The turn-over in 1970-71 was Rs 37 crores and profit Rs 2.85 crores. The net profit for the same period was Rs 93 lakhs.

Ever since Mr Kuchelar managed to get control over the Ashok Leyland employees' union, he began inciting them with fabricated reports about the management.

The management, feeling quite helpless about his increasing hold and influence on the workers, had no other alternative than to prepare themselves for a show-down with him. At the same time, they could not precipitate a crisis which would only further strengthen his hands. Their patience in dealing with a deteriorating labour situation can best be understood by the trend in the figures of actual average production of their Comet vehicles per day. It was 20.4 in October '71 when the workers were attending to their duties normally. In November '71 it went down to 16.4 and in December '71 it showed a slight improvement at 17.2. In January '72, however, it was 11.1 and in February it came down to nine vehicles only per day.

The workers were incited to adopt severe go-slow tactics by Mr Kuchelar when his letter of December 14, 1971 demanding four months' total emoluments as bonus for the year 1970-71 could not be conceded by the management despite several meetings with the union. In fact, the management advisedly adopted an unduly stiff attitude over the bonus issue utilising it for a show-down with the union.

This was the plain truth as could be seen from the financial data. An amount of Rs 22.25 lakhs representing 20.4 per cent of the net profit was a negotiated settlement for 1969-70 bonus when the company made a net profit of Rs 109 lakhs. On the same basis, the management offered Rs 18.61 lakhs as bonus for the year 1970-71 calculating the formula on the same percentage when the net profit was Rs 9 lakhs. As against this, the union under Mr Kuchelar demanded Rs 2 lakhs as bonus for the year. The management's cleverly disguised contention "less profit less bonus, more profit more bonus" was wholly opposed by Mr Kuchelar while the management insisted on it claiming that that had been the formula adopted by both parties in all the earlier years. As already mentioned, the truth of the matter was that the management was simply disgusted with the attitude of the union leadership which had made it increasingly difficult for production to be maintained at the normal level of 20 chassis a day on an average as per the settlement that existed between the management and the union.

When production declined to nine chassis

Eastern Economist 25 Years Ago

June 27, 1947

In a propaganda article issued by the U. K. Publicity Services, Mr. Wickham Steed in true imperialist style states India's prospects and policy in the Far-East. He starts with a quotation from Mr Bevin that "the peace of the world for many years to come will depend to a large extent on a solution of the Indian problem." He refers to the Asian freedom movement as one of the symptoms of transformation and as 'danger' which might spring up unexpectedly. Therefore the Far East Peace Settlement is to be no exclusive concern of the Big Three or the Security Council, but to be participated in and determined by all the 11 powers which fought Japan, including all the British Dominions. These powers will have a permanent voice in the maintenance of peace in this region. The implications of this thesis are obvious. Indian and the Far East, National freedom movements are a danger and they are not to be allowed to have an autonomous foreign policy. From India and the Far East point of

view, the following issues need to be clinched. There could be no whittling down of independence and independent foreign policy. Co-operation with the United Nations there will always be in full measure. It is obvious that in the ultimate resort peace of the world depends upon agreement among the Big Three and the Security Council. But India and the Far East Nations have a right to be invited to the Council discussions of Far East peace as indeed to any important discussion of international issues. And if on the analogy of Palestine, any fact finding committee is to be appointed for the Far East, India and the East should be fully represented on it. These are the rights and responsibilities under the United Nations. Meanwhile men of Mr Wickham Steed's brand only damage Britain's bona fides about which there has not always been unanimity of opinion. Mr Wickham Steed is surely no friend of India, but he is no friend of Britain either.

Agriculture in Developing Countries

Josselyn Hennessy
London.

I Policies of Advanced Nations

WHAT LONG-term problems will be created by the expansion of agriculture in the less developed countries?

What policy adjustments should be made by the developed countries with a view to improving the situation in future?

At the invitation of the United Nations Food and Agriculture Organisation OECD has compiled a report dealing with these questions from the standpoints of agriculture, trade and aid. FAO has prepared a tentative *Indicative World Plan for Agricultural Development*,* which covers

population's food needs more fully. The forecasts in FAO's Indicative World Plan (IWP) indicate that, by and large, the caloric requirements could be satisfied in the future, but that there would still be a net deficiency of animal protein, with the calorie-protein balance even deteriorating in certain regions. The great inequality in incomes and in social-economic conditions leads to wide differences in the level and pattern of food consumption; there is thus some risk of much vaster areas of malnutrition persisting than the average figures suggest. The OECD countries are paying close attention to food problems and intend to contribute to their solution by adopting appropriate food aid programmes or by stepping up their

agriculture from the burden of excess labour.

The third reason is the importance of agriculture for the developing countries' balance of payments. The situation is not everywhere the same, but several countries depend heavily on agricultural exports, often confined to one or two commodities only. During the 1960s, the value of agricultural exports from developing countries rose much more slowly than the value of such exports from developed countries; in addition, the trend of the terms of trade has generally gone against the developing countries. The IWP targets for the developing countries' agricultural trade balance entail the reversal of the trends of the last fifteen years.

Non-agricultural exports from developing countries to the OECD area have gone ahead faster than agricultural exports. During the 1960s OECD imports of industrial and manufactured goods from these sources increased at a rate of about 16 per cent per year. The value of such imports is still lower than that of agricultural products and foodstuffs, but they offer the developing countries the best chance of raising their export earnings. The demand for manufactured goods is steadily expanding in the developed countries; the tariff preference system should facilitate access to their markets; and the general price trend in international trade runs fore in favour of industrial goods than of primary products.

II

Adjustment in the Developed Countries

The first need is to secure real progress in agricultural production in the developing countries. OECD is considering how to secure international action to improve output, but the attainment of the agreed targets may partly depend on the agricultural and trade policies followed in the developed countries. The ways and means of such a policy adjustment, and the effects it is really likely to have, call for analysis. It will indeed be pointless unless the developing countries really benefit by it. OECD also wants to make sure that such an adjustment furthers the

effective use of resources in the world as a whole.

The developing countries have tended to become increasingly self-sufficient during the last few years. The first result has been to restrict the developed countries' market for agricultural exports in those parts of the world. (Table I).

TABLE I

Trend in Exports by OECD Countries to Developing Countries

(Agricultural Products and Foodstuffs)

(Standard International trade classifications 0 and 1)

Year	Value (million of dollars)	As % of total exports to developing countries	As % of total exports of agricultural products and food-stuffs by OECD countries
1960	2,532	12.8	25.0
1964	3,247	13.6	22.2
1965	3,159	12.2	20.6
1966	3,587	12.8	21.4
1967	3,571	8.8	21.5
1968	3,561	7.8	20.7
1969	3,569	7.0	19.2

Source: OECD. Trade Statistics

This export flow has dwindled both in relation to total OECD exports to the developing countries and as a proportion of OECD's total agricultural and food exports.

The main traditional OECD exporters, especially Canada and the USA, which were able to satisfy the urgent food needs of certain developing countries in middle 1960s, have had to revise their production and export policies to suit the new world market conditions and to avoid interfering with the developing countries' efforts to increase their own production. This policy shift has raised some difficult problems for certain exporting countries and compelled them to cut down on cereal growing and to diversify their agriculture. If the tendency for markets in the developing countries to dwindle is confirmed and coincides with an economically justified increase in their home production,

the OECD countries will have to take this into account.

The Indicative World Plan also implies that the developed countries should increase their agricultural imports from developing countries.

Let us recall some elementary facts.

First, the demand for agricultural products and food-stuffs rises slowly in the developed countries; their population growth is slower, and their income elasticity for most of the products concerned is low. This is so not only for tropical products, but for products competing with the developed countries' agricultural output. For agricultural commodities which have to compete with industrial substitutes, even more complex problems arise.

Most OECD countries admit a number of agricultural exports from the developing countries on liberal terms; often tropical products and certain processed products are included in the system of generalised preferences. For these commodities, the growth of markets in developed countries depends less on policy measures than on the natural trend of demand, but steps might be taken to encourage the consumption of tropical products. The producing countries' export earnings could also be improved if means could be found to reduce the import protection still accorded to certain products and to eliminate undue price fluctuations.

Where products compete with OECD countries' agricultural output, most of their agricultural and trade policies may, indeed, be protective. The support furnished by most developed countries to their agricultural industries is meant to hold the latters' adjustment to economic growth, but it should be gradually reduced as agriculture becomes better adapted to economic development and the

world market is less affected by external interference.

In any event, the OECD countries as a whole have considerable agricultural productive capacity: without using their full production potential, they could increase their output far beyond the growth of their own needs for practically every major commodity group except beef and veal. They are therefore constantly on the watch for means of balancing the market and controlling production — often a ticklish task. Their policies will have to take increasing account of the developing countries. Production costs in developing countries may not invariably be lower than in others where conditions are often highly favourable in soil quality, ratio of land to labour, high investment capital, temperate climate, etc. If the developed countries with high production costs were to restrict their output and leave room for larger imports, the developed countries producing at low cost would be as well, or perhaps even better, placed as the developing countries to cover the import requirements.

III

Orientation in Developing Countries

While the OECD countries are affected by agricultural growth in the less developed countries, it is up to the latter to see that their growth is of a suitable pattern. When the food needs of the population in developing countries are remembered it is doubtful whether surplus supplies of some commodities will be available for export to developed countries; the additional quantities forthcoming might well be absorbed by the growth of home demand. Future consumer behaviour depends on changes in socio-economic structure and on the process of urbanisation.

The OECD considers that there is still

TABLE II

Exports of Foodstuffs, Beverages and Tobacco by Developing Countries, in Value* and as a Percentage of Total Exports

Destination	World		Developed areas		Developing areas	
	Value	%	Value	%	Value	%

WINDOW ON THE WORLD

the developing countries, and wished to ascertain its implications for the OECD countries. A report on *The Policy Implications of the Indicative World Plan for OECD Member Countries*† has been approved by the Council of OECD and transmitted to FAO.

For three main reasons the OECD member governments consider that the faster expansion of agricultural production in developing countries is justified.

The first is the necessity of covering the

* The Indicative World Plan is intended as an international standard of reference to assist governments in formulating and implementing their agricultural policies. FAO means to supplement it by further research to be carried in connection with its "Perspective Study on World Agricultural Development".

† The report is now declassified and is available from the OECD Agriculture Directorate.

room in many countries for a new distribution of income, which would have a notable influence on demand. Thus, a policy aimed to concentrate the use of inputs on the most favourable areas would improve yields; but this would benefit only a fraction of the rural population—the fraction which is already well fed, and shows a relatively low demand elasticity. The remainder of the population could consume more, but would not be able to buy more — a situation which I may add in passing, certainly applies to me!

India's example

On the other hand, a broader re-distribution of inputs would probably lead to some drop in production, but also to a substantial rise in demand. India is a good example: the nine million tons of cereals shown in the IWP as the exportable surplus in 1985 represents only about five per cent of India's total cereal production; a slight change in the production/demand ratio would thus greatly effect the volume available for export.

In some countries, the social situation remains a serious obstacle to any increase in effective demand. The reason may be that there is little stimulus for the improvement of agricultural technology. If the social system is such that the over-concentration of wealth leads to substantial exports of capital, that capital will be lost to local development, and effective demand and output will be correspondingly reduced.

Another vital aspect of agricultural policy planning is the need to step up trade between developing countries. The diversity of technical and economic conditions in these countries should allow some scope for complementary production, both within agriculture and between agriculture and industry.

The trade in farm products between developing countries still accounts for only about seven per cent of the total international trade in those commodities. It is encouraging that the proportion of the total trade between developing countries represented by such products has declined slightly as it points to a growing diversification in their economies (Table II, p. 1223). However, the scale of agricultural trade between developing countries in relation to their total agricultural exports which remained low throughout the last ten years (from 18 to 19 per cent) might be increased in the future.

IV

Implications for Aid Policy

The achievement of the IWP targets depends above all on the means of production and investment resources available

to the developing countries to intensify agriculture.

To what extent will those countries be able to cover their own requirements, and how far will they have to depend on aid from the developing countries?

It is at present difficult to answer this key question.

The OECD member countries strongly urge the importance of the food problem in developing countries, and the necessity of helping them to build up an agricultural potential. The DAC's interest was first given public expression in a Recommendation on Food Problems of Less Developed Countries adopted in 1966. Member countries have lately become increasingly alive to the social importance of agricultural policy and development. The IWP's implications for aid policy fall under four main headings, beginning with food aid.

Food Aid: as early as 1962, the OECD countries' ministers of agriculture stressed to what extent food aid programmes could contribute to the developing countries' economic expansion. The food aid possibilities offered by the substantial surplus stocks then existing in developed countries were urgently needed, but it was considered, as now, that they should be used only if warranted by production difficulties or economic and social needs in the developing countries.

Four Food Aid Points: The OECD countries consider that food aid policies should note the following principles:

Food aid should not be allowed to slow down efforts to develop food production in the benefiting countries, impinge on commercial imports, or unduly depress the level of world prices for the commodities concerned.

Food aid should be focussed on badly needed commodities, the supply of which is particularly inelastic in developing countries (high protein products at present come under this heading and will continue to do so in the foreseeable future).

If food aid is to achieve maximum effect, it should be dispensed so that the benefiting countries are able to use it to best advantage; it should also be closely co-ordinated with other types of aid, especially technical assistance; the emphasis laid by the World Food Programme on project assistance makes it a particularly suitable instrument for this purpose.

Full co-ordination and harmonisation

should be ensured between various bilateral and multilateral food aid activities.

Agricultural Inputs: The Indicative World Plan allots priority to raising productivity rather than to extending the cultivated area; this is the approach adopted in many assistance programmes. It involves the necessity of appreciably raising the yields from land already cultivated, which will demand a considerable increase in the various inputs.

These inputs will be largely produced by the countries concerned, but even if they succeed in keeping the proportion of imports required within the IWP estimates (\$7,000 million at 1962 prices) the amount involved would still represent the equivalent of 5 to 10 per cent of the total value of developing countries' anticipated imports for 1985. It can be assumed that the total assistance granted for the purchase of inputs did not greatly exceed \$1,000 millions in 1969.

Investment: Investment in the domestic production of agricultural inputs and in the capital equipment directly needed to increase agricultural production is of major importance in the integrated ap-

proach adopted in the Plan. The donor countries have already helped to finance a fair proportion of such investment, mainly under large-scale projects with clearly definable economic benefits. Many of them would have been ready to increase their aid in this sector if they had not found it difficult to find suitable projects. This points to the need to pay attention to project identification and preparation.

The Indicative World Plan also has implications for aid policy in technical assis-

tance and agronomic research. The donor countries realise that, as well as appropriate agricultural techniques, the developing countries require a whole network of training and advisory services to enable them to apply those techniques on the farm. Several DAC countries have therefore strengthened their technical assistance programmes in favour of the agricultural sector in recent years, and are now supporting technical assistance projects fully integrated with the less developed countries' own efforts in this direction.

The donor countries now recognise the effectiveness of agronomic research as an important factor in programmed agricultural development. In connexion with the "Green Revolution" in particular, the role of research has been widely recognised for some time past. No really effective use can be made of physical inputs, of whatever kind, without the backing of large-scale research projects to improve the existing strains and varieties and determine which are the best methods to be applied, technically and economically speaking.

Hunger for Capital

THE RAPID growth of the multinational companies, which is one of the most significant circumstances which accompanies the expansion of economic grouping in west Europe, necessitates provision of ever larger quantities of investment capital. This is needed especially for ever more intensive research, development of new products and processes, to meet the cost of anti-pollution controls and provision of new equipment.

The number of new products and processes emerging from modern industrial enterprise in north America and west Europe every year exceeds one thousand. The anti-pollution controls will inevitably increase and will probably increase sharply after the Stockholm Conference on Pollution. Erection of new installations, setting up of new automatised plant and the often costly scrapping of still profitably operative plant because its processes have become outdated make a tremendous demand on capital, even for multi-billion multinational companies.

need for capital

This implies the need for them to provide ever larger quantities of investment capital which has to be found very largely from perpetual current cash flow — the proportion of gross income available for re-investment after all external payments have been deducted — such as wages, dividends and taxes. This means that these great companies are constantly consuming their own income to expand, develop and compete and that the value to them of publicly invested capital is very small. Because they have thus to live on their own earnings there is a constant upward pressure on prices so as to provide a sufficient margin of profit to yield enough money for expansion and constant modernisation.

An indication of the immense sums required for these processes of constant growth has been given by the petroleum

industry in its statement that it will need £200,000 millions during this decade. The chemical industry will require £125,000 millions and the plastics industry some £100,000 millions. Compared with what these industries spent in each of the last two decades these sums are immense and indicate how paramount to the companies' interests are their growth needs.

external effects

The external effects of this type of mammoth self-supporting growth are international, national and social. Internationally, these industrial giant corporations are becoming, as indicated in the preceding article, more powerful than many national banks and even than some of the governments. Nationally, the fact that they are obliged to consume a high proportion of their ever-growing incomes to finance new investment and that they need an ever-higher cash flow means an inflationary influence on prices, although the quality and efficiency of the products advances also steadily. Socially, the principal effect is a movement in the siting of industry, the rendering of increasing numbers of workers and technicians obsolete and a diminution in the total number of industrial units.

The great multinational companies of the USA, Britain and western Europe now account for more than 60 per cent of all annual capital investment most of which is concentrated in high-technology, capital-intensive areas. As a result, out-of-date (but not necessarily old) plant and equipment is being scrapped ever faster as investment grows in new techniques and much of the plant standing in these companies' countries of origin comes up for sale and their staffs are mostly laid off. The effect on what can be called the parent countries is a reduction of assets while in developing regions in which much of the new technology is installed the low scale of human employment required owing to automated working means that the effect

on their usual condition of high unemployment is not very helpful.

This has been found to be the case in several of the "development areas" in Britain, in Italy's southern regions, in France, in western Ireland and, in the USA, in the poor Appalachian and Kentucky areas as well as in the French-speaking Canadian province of Quebec. High technology industries are not and cannot be big employers of labour — only about 10 per cent of their earnings is provided by skilled human labour, the greater part comes from computerised and technological production. One huge combine last year simultaneously increased its output by six per cent and reduced its wages bill by about 18 million dollars.

social consequences

The social effects of this evolution in industry vary considerably from one country to another. In the world's most technologically advanced economy, the USA, where about 40 per cent of still functioning plant and equipment is regarded as obsolete and in need of replacement, the rate of unemployment remains obstinately high and, despite the administration's efforts to attract foreign industrial business, remains at over six per cent of the total labour force. In Britain, also, the growth of industrial technology must be regarded as a contributory cause of continuing high unemployment.

In western Europe it is otherwise. There is a very high percentage of unemployment in Italy. In the largely workless south the installation of some high technology industries has helped to reduce worklessness very little but industrial rationalisation remains still a small contributory cause of Italian unemployment. In the rest of the Common Market area there is not only very little unemployment but a very urgent need to import labour even though Germany, the Low Countries and France are centres of capital-intensive,

high-technology industry. In Germany, although the labour need is less intense than it was and there is some movement of south European labour homewards, there will be a market for foreign workers for some time to come. Holland, with the world's most intensely technological fuel and electrical industries, also needs to import labour even though it is a country of huge families and the population per square mile is the highest in Europe. Much the same may be said of Belgium where several old-fashioned industries have gone to the wall before the advance of the multi-nationals.

position in France

France, striving to remain the leader of the Common Market, is a country where almost all the younger men have left the land to work in the factories and help achieve the French mid 20th-century industrial revolution. The average age of the French farmer is now about 55 but the young men who have gone into the factories—most of them now in technologically-intensive areas—are not sufficient to make up the manual labour force needed to do the jobs it is not yet economic to make mechanical. To such an extent is this true in France that it is the immigrants who are making up the backbone of many essential French industries. About half of these immigrants come from Africa. Forty per cent of them are from north Africa and nearly 10 per cent from central and west Africa. The rest of the foreign workers in French factories are mostly Italian, Spanish and Portuguese with some from south-east Europe. In some French assembly lines the proportion of foreigners goes as high as 80 per cent. These workers do mostly simple, repetitive jobs which the French prefer not to do and even the many redundant French miners decline to do such deadly boring work.

The picture of the Common Market area as it prepares to enlarge is that it will be taking high unemployment areas in Britain and Ireland to add to its already high unemployment area in Italy. Its industrial core from Marseilles to Hamburg, on the other hand, employs at least six million foreign workers—some three million in Germany and about one and a half million in France.

The prospect is that this huge foreign labour force in these areas—to which must be added the considerable manual labour force of foreign origin in Switzerland and Austria, outside the Market—will remain for the foreseeable future while the weaker units within the Market area will be obliged to come within the orbit of the huge capital-intensive multinational companies which are already the economic units with which the Market's political leaders are having to reckon.

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

ASP/L-5

Mr Bhutto may not be

the only one who has decided views on the intellectual mediocrity of Mrs Indira Gandhi. It is said of a certain well-known (and well-worn) journalist in the capital that his column always shows whom he has last been talking to. Most of Mrs Gandhi's more important speeches reveal what particular book or magazine or newspaper article the not-so-faceless speech writers in the Prime Minister's secretariat have lately been reading. Occasionally, the speech writers do a bit of deliberate re-searching too, as when they came up with quotations from exalted sources for the Prime Minister's use. Thus she was made to quote from the *Atharva Veda* at Stockholm, the purpose apparently being to suggest that a deep and wide-ranging scholarship is to be reckoned among her many accomplishments. Mr Karan Singh who seems to be more at ease with the parasites and panders of Indian tourism than with the pilots or engineers of Indian Airlines, perhaps desired to make the point that the Prime Minister was not only scholarly herself but was also the cause of scholarship in her colleagues; he too put across a bit of his own Sanskrit learning. The foreigners, I am sure, were duly impressed.

What may be Orissa's

gain need not necessarily be New Delhi's loss. When the Prime Minister decided to reward Mrs Nandini Satpathy for her fidelity by placing her at the head of the new ministry in Orissa, the former might have permitted herself a feeling of relief. Mrs Satpathy has lately been becoming less of an asset and more of an embarrassment to her chief. Apart from having outlived her utility for Mrs Gandhi in central politics, she has started having ideas which are far less modest than her dress or demeanour. Her transfer from New Delhi suggests that Mrs Gandhi has more ways than one of putting in his or her place an associate who has come too close for comfort. Mrs Satpathy will no doubt discover soon enough that there are jobs more difficult than intriguing behind or between the political

scenes. Having played for so long the role of a mouse which has even forgotten to say "cheese", she will now have to address herself in earnest to the task of discovering in herself talents of a different and far more serious order.

Recently Rajaji wrote

in *Swarajya* thus: "The CBI report about the Tamil Nadu Chief Minister should be published if only to allay the strong public suspicions that Sri Karunanidhi cannot defend himself against what that report brings up". It is widely believed that the Prime Minister is in the habit of using CBI reports to brow-beat her political opponents or bully inconvenient or intransigent partymen, while there have also been rumours that fund-collectors for her party have not been above using CBI information to blackmail businessmen, big or not so big.

Mr Karunanidhi is a politician cast in Mrs Gandhi's own mould. Between them it has always been a case of Greek meeting Greek. I am sure that the Prime Minister will be the last person to make a gift to any one of any bargaining point she may have in her dealings with Mr Karunanidhi. All this, of course, is unfortunate. Allegations have been made from time to time against the Karunanidhi Ministry. It is naturally very difficult for private individuals or even organizations to compel the state government to face specific charges or clear itself of them before an appropriate authority. In such circumstances if the central government does have information of a kind which is relevant to such allegations it owes a moral obligation to the people of the state in the first instance and then to the country generally to institute proceedings on the basis of the CBI findings as it is legally entitled and empowered to do.

That no legitimate

means should remain unemployed for exposing the true character of the DMK government is a proposition which has become all the more respectable in the light

of recent happenings in Tamil Nadu. A few days back DMK goondas committed large-scale arson and looting at the offices of a Tamil daily which is far from friendly to the Karunanidhi brand of politics. A director of the newspaper (former DMK leader who had been expelled from the party) was reportedly assaulted in the process. The offices of another publication which is also critical of Mr Karunanidhi, a weekly with a large circulation, were also damaged by DMK fanatics. It appears that the police gave no protection to the victims of these outrages.

The alleged provocation for these acts of violence against the non-conformist press was the murder of a DMK trade union leader in the course of clashes between rival factions of workers. It is worth noting that it is the DMK which has introduced the philosophy of violent conversion in its efforts to capture trade unions in the state, its familiar instrument of persuasion being a cycle chain applied to the heads or faces of workmen who fail to see the light quickly enough. In its pre-government days the DMK was really never very far from dealing out threats of violence in order to generate a suitable atmosphere for its political work or aims. Today, with the administration of the state in its hands, this party is apparently emboldened to proceed from threats of violence to violence itself in the conviction that the police may be depended upon to look in the other direction whenever DMK activists chose to teach their political opponents a lesson. Such of us as may still be blind to the essentially fascist character of this party surely deserve to have their eyes examined.

Reporting on "howlers"

in text books for schools, which have been published in Kerala state, the staff correspondent of *The Statesman* in Trivandrum wrote recently: "According to the social studies textbook for final year school students Mahatma Gandhi was born in Rajghat (Gujarat State). Perhaps the author was carried away by the biblical saying 'Dust thou art and unto dust thou returnest' and failed to make any distinction between the place of Gandhiji's birth and cremation."

Would this mean, by any chance, that *The Statesman* will be perfectly satisfied if the version in the textbook is changed to read "Gandhiji was cremated in Rajghat (Gujarat state)"? Some of us, I must say, are easy to please.

MOVING FINGER

TRADE WINDS

ILO Conference

PARTICIPATING in the debate on the report of the Director General of ILO presented at the 57th International Labour Conference held in Geneva recently Mr R. K. Khadilkar, Minister for Labour said that the most valuable form of technical assistance that the developed countries could render at the present juncture is in the evolution of the most appropriate forms of technology for application in the developing countries. He also pointed out that if participation of the people was basic to the politics of a free society, willing participation of the workers is an equal necessity for the successful operation of the productive apparatus of society.

New Taxes in Maharashtra

Maharashtra's Finance Minister, Mr M. D. Chaudhuri proposed additional taxation estimated to yield Rs 5.27 crores in the current year and over Rs eight crores in a full year. Presenting the additional budget estimates for the current year to the state Legislative Assembly, he proposed an increase in the rates of sales tax, mainly on items of consumption by higher-income groups, higher rates of electricity duty and stamp duty.

Against an overall surplus of Rs 47.93 crores shown in the interim budget presented in March, the revised estimates presented on June 13, show an overall deficit of Rs 29.32 crores. The Finance Minister, however, anticipated the resources gap in the current year at Rs 5.08 crores, after taking into account cer-

tain anticipated receipts not budgeted for (including Rs 28 crores by way of market borrowings) and discounting certain liabilities. The taxation measures proposed by him would thus meet the current year's resources gap fully.

Additional yield expected from the increase in sales tax rates is estimates at Rs 274 lakhs in a full year and Rs 137 lakhs in the current year.

Canadian Loan

A development loan agreement for about Rs 35.7 crores (\$ 50 million) was signed on June 10, between India and Canada. This loan, which is the largest development loan Canada has so far extended, will be utilised to finance the import of industrial commodities, fertilizers and fertilizer materials over a period of two years instead of one year as in the case of earlier development loans. This is a new feature and would help in planning imports from Canada satisfactorily.

The agreement was signed by the Canadian High Commissioner, Mr James George, and Dr I. G. Patel, Secretary, Economic Affairs, Ministry of Finance.

The allocation for imports during the first year is \$ 30 million but this may be increased to a higher value depending upon the availability of resources. A second loan will be signed in 1972 to increase the funds available during 1973-74. The loan is on the same terms granted for all Canadian development loans to India during the last six years.

The loans are free of interest

and service or commitment charges and are repayable in 50 years, including a 10 year grace period.

This is the eleventh commodity and fertilizer loan provided by Canada since 1967. Under the loan, Canada will provide India with asbestos ferro-alloys, lead, zinc, newsprint, nickel, rubber, sulphur, woodpulp, potash and NPK. The rapid utilisation of earlier loans as well as an increased demand for fertilizers and industrial raw materials are evidence of the matching of India's requirements with availability from Canada and the full understanding which has been established between the governments of India and Canada.

Canada has been providing industrial commodities and fertilizers to India since 1953 when copper and aluminium were first provided under grant assistance. Since then, Rs 230 crores (\$321.5 million) worth of commodities and fertilizers have been provided.

1972-74 Commodity & Fertilizer Loan

(\$ Cdn. million)

Asbestos (6.00), Copper (1.00), Ferro-alloys (1.00), lead (2.50), Newsprint (7.25), Nickel (2.00), rubber (2.00), Sulphur (0.50), Woodpulp (5.75), Zinc (4.00), NPK (6.00) Potash (7.00) and Unstructured (5.00) Total 50.00 million Canadian dollars. For Industrial Commodity and Fertilizer Assistance see table below.

Zips in Danger Zone

The Zip Fasteners Manufacturers' Association was shocked by the import policy which came into effect on

April, 1, 1972. Their first shock, however, had come even earlier in May, 1971 when the authorities imposed the present excise levy of 20 per cent (plus sales tax of six per cent). From that time onwards, their ability to compete with imported zip fasteners was crippled. Today there is a surfeit of zip fasteners in the country made up of (1) indigenously produced zip fasteners, (2) legitimately imported zip fasteners and also (3) zip fasteners imported surreptitiously. And the indigenous zip fasteners which have to bear excise and sales tax cannot afford to sell at the inordinately low prices at which imported zip fasteners (which do not have to bear excise and sales tax) are sold in the Indian market.

The installed capacity of zip fasteners in the country (about 5000 kilometres) is adequate to take care of the entire requirements of different users of zip fasteners. The manufacturers have a phased programme for the next five years, at the end of which (1976-77) their total output would reach 9,250 kms. They claim that their wholesale market prices compare satisfactorily with the landed cost, inclusive of only import duty (110 per cent), of imported zip fasteners. Further, they say they have been providing employment to about 15,000 persons and have earned foreign exchange of over Rs two lakhs in 1971 on their exports of nylon zip fasteners only; besides nylon fasteners, metallic zip fasteners also were exported. Quality-wise they conform to international standard specifications.

The latest decision to allow more imports (by grant of 20

Industrial Commodity & Fertilizer Assistance (1953-54-1972-73)

(\$ Cdn. million)

	Grants	Development Loan	Total.

per cent replenishment—compared to only 10 per cent. Earlier—against export of garments which might be raised even up to 100 per cent on the recommendation of the Textile Commissioner! goes against the accepted tenets of import substitution and self-reliance and requires to be critically examined.

Madras Stock Exchange

Mr M. Sankaran, President of Madras Stock Exchange, stated in his address at the annual general meeting of the exchange recently that in cases of state take-over of companies, the government should refer the question of compensation payable to two representatives, one an expert conversant with the industry to which the company belongs and another, a financial authority, to arrive at the fair compensation by adopting standard methods of valuation. He also said that the shareholders should be paid compensation expeditiously. Referring to the recent take-over of the general insurance companies and the Indian Copper Corporation, he said that the shareholders of these companies were not in a position to raise any credit on their holdings due to uncertainty in regard to compensation and the approximate time of payment.

Mr Sankaran further said that representations have been made to the Finance Minister and the Governor of the Reserve Bank of India that adequate credit facilities should be given to stock and share brokers and investors to borrow on the pledge of stocks and shares but this suggestion had fallen on deaf ears. He also appealed to companies listed with the Madras Stock Exchange that they should issue brief quarterly progress reports to shareholders. This will assist the investors in taking investment decisions.

Instruments

The production of electrical measuring instruments in the country has shot up by more than 73 per cent. In 1971, electrical measuring instruments worth Rs 236.34 lakhs

were produced as against Rs 136.43 lakhs in 1970. During the same period, big increase in the output of water meters and house service meters was also recorded. The production of water meters went up from 1.60 lakhs in 1970 to 1.65 lakhs last year and the house service meters increased by over three lakh meters to 28.49 lakhs. Increase of more than Rs. one crore was also recorded in the value of output of industrial process and control instruments. The production of medical and surgical instruments which valued at Rs 113.74 lakhs in 1970 rose to Rs 162.29 lakhs last year, marking a rise of nearly Rs 50 lakhs. The output of x-ray and electro-medical equipment went up by nearly Rs 104 lakhs to Rs 254.66 lakhs last year.

Mahi Control Board

The Mahi Control Board, recently constituted in consultation with the governments of Rajasthan and Gujarat, has decided to complete the Bajaj Sagar Project on the Mahi river in Rajasthan within five years. Dr K.L. Rao, union Minister for Irrigation, has stressed the need for conserving the waters of the river, which go waste now, for the benefit of the people.

The board, constituted under a resolution of the union Ministry of Irrigation and Power, has been charged with the responsibility of ensuring efficient, economical and early execution of the Bajaj Sagar Project in Rajasthan. The governments of Gujarat and Rajasthan have agreed that the board's functions may be extended to cover such aspects of the Kadana Project on the Mahi river in Gujarat as may be agreed to by the two governments. The project is expected to cost over Rs 31.35 crores. Costs and benefits of the project will be shared by Gujarat and Rajasthan.

Indo-Bangladesh Educational Co-operation

India will share experience in educational planning, reorganisation and reconstruction with Bangladesh which

proposes to set up shortly a commission for remoulding its system of education. In this context, two joint seminars, one in Bangladesh and the other in India, will be organised. The Bangladesh education commission members will be invited to India to study problems of educational reform and the existing system.

If required by the government of Bangladesh, the services of eminent Indian educationists will be placed at the disposal of the commission in an advisory capacity. India will also supply books, reports and studies on the Indian educational system and send experts in specific field at the request of Bangladesh. These decisions were taken at a meeting held in the capital on June 10, between Prof. S. Nurul Hasan, union Minister of Education, Social Welfare and Culture, and Prof. Mohammad Yusuf Ali, Bangladesh's Minister of Education and Culture.

UN Conference on Human Environment

The UN environment conference at Stockholm which ended on June 16 approved plans for a structure comprising several bodies whose prime

task will be to co-ordinate efforts throughout the world to safeguard the environment and curb pollution. It also approved an environment fund to finance environment programmes. Without holding a vote, the plenary session of the conference approved five bodies to check pollution.

The USA has offered \$ 40 million to the Environment Fund over a five-year period. Canada is proposing to give \$ five million to \$ 7.5 million, Japan \$ 10 million and Sweden \$ five million. Eight other countries—Britain, Denmark, Norway, Spain, Nigeria, Switzerland, West Germany and Botswana—have offered "substantial" sums or funds "within their means".

The conference also voted on June 15 to meet again in five years time. A resolution recommending that a second environment conference be called in 1971 was approved in plenary session by 75 votes against one and three abstentions. The UN General Assembly will be asked to endorse this decision in September this year.

India won a major victory at the U.N. Conference on Human Environment when

CMVS-65-102

its major recommendation for the establishment of an international fund to assist in strengthening the national programmes for environmental improvements of human settlements, was accepted by an overwhelming majority. No less than 53 participating countries supported the motion as against 15 with 13 abstentions.

At the plenary meeting also, India emerged as the leader and spokesman of the developing world; it also won the support in principle from a large number of countries of the world for highlighting the real and most pressing problems of human settlements.

The following is the text of the recommendation: "It is further recommended that the Governments and the Secretary General take immediate steps toward the establishment of an international fund or a financial institution whose primary operative objects will be to assist in strengthening of national programmes in this field through the provision of seed capital and the extension of the necessary technical assistance to enable an effective utilization of domestic resources for housing and the environmental improvement of human settlements".

India's proposal was supported by the Philippines, Central African Republic, Kenya, Jamaica, Uganda and Senegal. Canada, UK, Italy and Sweden were in agreement with the principle of the recommendation, but stated that since they had no mandate for voting in favour of separate fund, UNDP, bilateral aid and existing institutions might take care of housing needs.

Aid-India Consortium

THE Aid-India Consortium's endorsement of the World Bank's aid target of \$1250 million is no doubt good news but there is considerable confusion about the American contribution and the quantum of debt relief. The consortium, in agreeing to \$700 million of non-project aid including debt relief and \$550 million of project aid for 1972-73, has assumed that the debt relief would be substantially higher

than \$100 million. But it is highly unlikely that the World Bank's recommendation for \$200 million of debt relief would be accepted. Some member-countries of the consortium were receptive to the idea of stepping up the debt relief (which is united loan) while others have not been enthusiastic about it. There is uncertainty about the contribution from the International Development Association (IDA), the World Bank's soft lending associate, which depends for replenishment from the US. If it came through, the IDA, it is believed, would make a contribution of about \$350-400 million.

Britain is understood to have offered £63 million project and non-project aid against £54.5 million in 1971-72. Japan last year offered £45 million non-project aid, including debt relief (which figure was later raised to £50 million in view of the revaluation of the Japanese currency) and also £20 million for steel as a special case outside the consortium. Japan has pledged \$73 million for 1972-73. The Netherlands which gave 40 million guilders in 1970 and 50 million guilders in 1971 has now pledged 68 million guilders. Denmark, Norway and Sweden not only increased their respective contributions but also indicated they would continue the same level during the next four to five years. Canada has already signed agreements for 50 million Canadian dollars in general aid and 30 million Canadian dollars for food aid covering rapeseed and skimmed milk. France too has signed agreements for increased quantum of aid than last year. West Germany has not been able to indicate its commitment as the German Parliament has not yet voted the budget.

The communique issued at the end of the meeting reviewed the progress of economic development in India and commended the government of India for its economic performance during a particularly difficult year. The continuing satisfactory rate of growth in agriculture was welcomed. The growing share of engineering

goods in exports was found to be especially encouraging. Disappointment was expressed at the slow rate of growth in industrial production but noted that the problems were concentrated principally in a few industries.

Indo-Swedish Trade Panel

An Indo-Swedish joint commission is to be set up for furthering economic industrial and technical co-operation between the two countries. This was the important outcome of the discussions held in Stockholm between Mrs Indira Gandhi and Swedish Prime Minister Olaf Palm. A press communique issued by the Swedish Ministry for Foreign Affairs said: "During the talks held during the official visit to Sweden of the Prime Minister of India, Shrimati Indira Gandhi, the two sides had discussed ways and means to strengthen and develop commercial, industrial and technical co-operation between India and Sweden.

"The Swedish and Indian Government have accordingly agreed to take steps to set up a joint commission on economic, industrial and technical co-operation. Both sides also agreed to maintain continuous direct contacts on bilateral as well as international questions of common interest."

Ban on New Capacity

The government of India has decided not to encourage new capacities in four items, namely, steel furniture, mechanical toys, fountain and ball point pens and aluminium utensils owing to raw material shortages. While no licences will be given for these items to the organised sector, DGTD also will not register any small unit for the purpose of assistance for obtaining raw materials for these items.

Differential Interest Rates

Guidelines have been issued to the custodians of the public sector banks and to the State Bank of India and its subsidiary banks, laying criteria for the identification of persons eligible to get loans at concess-

sional rates (four per cent) and the conditions under which such loans should be given.

In March this year, the Finance Minister, Mr Y. B. Chavan, made a statement in Parliament on the differential interest rates on advances by public sector banks. The main purpose of the concessional rates loan is to encourage productive endeavours in backward areas.

For lending at concessional rates, each bank should select at least one branch in every eight or 10, ensuring that backward pockets in rural, semi-urban and urban areas are well represented.

An endeavour which is receiving assistance of the differential rate should have the capability of standing on its own after some time. In other words, not merely viable proposals but even those which are potentially viable could be covered under the scheme. Normally a borrower should not need differential interest for more than five years.

All such loans given under the scheme should be covered under the Credit Guarantee Scheme. For this purpose, the Credit Guarantee Scheme will be suitably modified.

The guidelines also lay down the sectors to which the concessional rates of interest will be available. These include: Schedule tribes, schedule castes and others engaged on a very modest scale in agriculture and or allied agricultural activities; people who themselves collect, or do elementary processing of, forest products and people who themselves collect fodder in difficult areas and sell them to farmers or traders; indigent students of merit going in for higher education who do not get scholarships or maintenance grants from governmental or educational authorities; physically handicapped persons pursuing a gainful occupation where some durable equipment and or continuous supply of raw material is useful; and orphanages and Women's Homes where saleable goods are made and for which no adequate and dependable source of finance like

endowments or regular charities, exist.

To be eligible for differential concessional rates of interest, the family income of the person from all sources must not exceed Rs 2000 per annum in an urban or semi-urban area or Rs 1200 per annum in a rural area. The person must not own any land or the size of his holding must not exceed one acre in the case of irrigated land and 2.5 acres in the case of non-irrigated land. He must be prepared to work hard so that he can be helped to rise above his present economic level in the productive endeavour which would become economically viable within a period of three years or so. He must not incur liability to two sources of finance at the same time and must not engage any employees working for him.

Partial Control on Sugar

A PIB hand-out released on June 15 stated:

"Control over the price and distribution of sugar was removed with effect from May 25, 1971. However, in the context of the steady rise in prices of sugar thereafter, and the emergency arising out of the conflict with Pakistan, by an informal agreement with the industry, both in the joint stock and the co-operative sectors, an arrangement was brought into effect from January 1, 1972, for obtaining 60 per cent of the monthly releases of sugar at a fixed price of Rs 150 per quintal ex-factory, exclusive of excise duty, for D-30 grade for meeting certain emergent requirements and for distribution to domestic consumers through fair price shops. Similarly, a further 3.5 per cent of the monthly releases was also made available by the factories at the fixed price for meeting export commitments. The agreement with the industry was to be valid for the duration of the emergency or for a period of six months, whichever was shorter.

"Though the emergency still continues, and the prices of sugar in the open market have been steadily rising, the Indian

Sugar Mills Association have informed the government on June 13, 1972, that some factories are unwilling to continue the present arrangement beyond June 30, 1972, and that it has not been possible for it to recommend any other scheme instead.

"In these circumstances, and in order to ensure that the domestic consumers would continue to be in a position to procure a reasonable portion of their requirements of sugar, which is an essential commodity, at a fair price, the government has decided to continue the existing arrangements under the provisions of the Essential Commodities Act with effect from July 1, 1972. Accordingly, the Levy Sugar (Control and Supply) Order, 1972, the Sugar (Price Determination) Order, 1972, and other ancillary orders are being issued today in exercise of the powers under the Essential Commodities Act, 1955.

"For the month of July, 1972, the government has decided to release 3.25 lakh tonnes of sugar, 60 per cent of which will be available as levy sugar at the notified prices for meeting the emergent requirements and distribution to domestic consumers, 3.5 per cent for meeting the export commitments, and the remaining 36.5 per cent for free sale."

The new prices have been fixed on the basis of studies of the cost of production undertaken by the Tariff Commission. The following are the new ex-factory prices per quintal for the D-30 variety (exclusive of excise duty) for the various regions:

Punjab Rs 146.56, Haryana Rs 126.59, Rajasthan Rs 169.08, West UP Rs 134.40, Central UP Rs 136.87, East UP Rs 147.19, North Bihar Rs 156.40, Gujarat Rs 124.59, Madhya Pradesh Rs 183.77, Maharashtra Rs 125.80, Mysore Rs 125.10 Andhra Pradesh Rs 122.82, Tamil Nadu and Pondicherry Rs 134.01, Assam, Orissa, West Bengal and Kerala Rs 152.98.

Drilling in Kutch Area

The union Minister for Law & Justice and Petroleum &

Chemicals, Mr H. R. Gokhale, inaugurated on June 18 spudding of the first oil-well near Bhuj in the Kutch area of Gujarat by the Oil and Natural Gas Commission.

The well at Banni, one of the three locations in Kutch recently released for drilling after prolonged geological, geophysical and seismic surveys of the area, is projected to reach a depth of about 2500 metres. The surveys have indicated the presence of thick sediments in the area.

With the inauguration of drilling in Kutch, the Oil and Natural Gas Commission's operational area in Gujarat will get extended almost to the geographical limits of the state. The Commission has so far discovered in Gujarat about 65 structures of various types and sizes and drilled 735 wells of varying depths both exploratory as well as developmental.

Furnace Oil from Bangla Desh

Indian Oil's first chartered tanker carrying 9,180 tonnes of furnace oil from Chittagong refinery in Bangladesh has reached Calcutta. The tanker will make consecutive trips to Chittagong to bring surplus furnace oil from the refinery there.

The present consignment is a part of the total 150,000 to 200,000 tonne furnace oil imports from Bangladesh during the current year under a trade pact.

It is planned to import during 1972 about two million tonnes of furnace oil to meet indigenous demand furnace oil imports from. Bangladesh would represent about 10 per cent of the total imports of the product during the current year.

Engineering Industry Survey

The results of the eighth survey of trends in the engineering industry, covering the experience during October 1971—March 1972 and the prospects for April-September 1972 have been compiled by the

Indian Engineering Association. The survey covered 111 companies of varying sizes representing different sectors of the engineering industry. The engineering industry is more optimistic regarding the general business situation in the country than it was in the previous six months. As against 34 per cent of the respondents who had expressed such optimism in the last survey, there were 67 per cent in this survey.

The industrialists also appear to be more inclined towards authorisation of capital expenditure. In the earlier survey 32 per cent had indicated that they would authorise more capital expenditure during the year following the time of the survey; in the present survey 59 per cent have expressed such intention. There has been a slight improvement in the capacity utilisation over the period October 1971—March 1972. As against 70 per cent of the respondents who had reported working below a satisfactory rate of operation, in the latest survey their share has come down to 60 per cent.

The factors which are likely to affect engineering output adversely are shortage of raw materials and components (42 per cent of the respondents), lower orders or sales (19 per cent), credit or finance difficulties (14 per cent), lower plant capacity (10 per cent), and labour unrest (5 per cent). Employment prospects are expected to change for the better. As against 39 per cent of respondents who had expressed such a view in the previous survey, in the present surveys it has risen to 47 per cent. The order position and the value of output were expected to show marginal improvement. The stocks of raw materials and bought-out supplies as also those of finished goods are definitely expected to decline. The majority, however, expected that cost per unit of output would continue to rise as clearly indicated by past experience. The average selling prices may not increase to match the rise in cost and the apprehension is that the return

on capital would show no improvement.

The financial difficulties, which proved an impediment to raising output, were largely caused by extended credit given to customers (25 per cent), inadequate demand for products (17 per cent) and increase in finished stocks because of better utilisation of plant capacity (15 per cent). The proportion of the respondents who had difficulty in getting their limits revised with banks as an obstacle in obtaining credit or finance fell from 64 per cent to 45 per cent but replies relating to difficulties in obtaining term finance because of past losses rose from seven per cent to 29 per cent.

The export prospects for the next 12 months are not expected to be any better than they were six months ago as there is no change in the proportion (41 per cent) of the respondents who were optimistic on this score. While the value of export deliveries is expected to increase in the next six months, the average prices at which export orders are to be booked are unlikely to show any improvement. The majority of the respondents (70 per cent) expect these to remain at the same level as in the past six months.

It is discouraging to note that export promotion measures are not bringing the results that they should. During October 1971-March 1972, 51 per cent of respondents had expected to receive new orders while it was observed that a mere 28 per cent had received such, but (40 per cent) still anticipate that the situation would improve in April-September 1972. No significant change is expected in the volume of export orders. The factors likely to limit the industry's ability to obtain export orders over the next six months will be uncompetitive prices (indicated by 29 per cent of the respondents), restrictions by importing countries (18 per cent), inability to meet delivery schedule (13 per cent) and unfavourable economic conditions abroad (14 per cent).

ISMA

The Indian Sugar Mills Association has expressed serious

concern over the new levy prices announced by the government. The Association considers that the prices announced are highly unrealistic, arbitrary and without any regard to the actual cost of production. To follow rigidly the Tariff Commission Cost Schedules based on 1966-67 costs without adequately compensating the factories for subsequent cost escalations was highly unfair, according to ISMA. It was expected that at least the apparent lacuna in the Commission's Cost Schedules would be rectified by the government. The Association has regretted that this has not been done and a highly uneconomic price structure has been clamped on the industry. The Association fears that without an economic price structure the ability of the factories to maximise production would be seriously jeopardised and sugar output would suffer which the country could ill-afford.

Annual Meeting :

The 39th Annual General Meeting of the Indian Sugar Mills Association will be held on July 3, 1972, at the Convention Hall, Ashoka Hotel, New Delhi. Mr Bansidhar, the President of the Association, will preside over the meeting. Besides a review of the various important developments in the sugar industry during the outgoing year, it is understood that certain important resolutions, having a vital bearing on the sugar industry such as the need for a long-term sugar policy, licensing of capacity in the sugar industry, etc, will also be taken up for discussion.

Text Books in Sindhi

Prof S. Narul Hasan, Minister of Education, Social Welfare and Culture, said on June 14 that the government of India would provide facilities financial assistance for the production of text books in Sindhi both in Devanagari and Arabic scripts at the central level. The Minister made this observation at a Conference of Educationists and Writers convened by the ministry to discuss production of instructional literature in Sindhi. The Minister said that Sindhi was not a state language but

was spoken more or less throughout the country. The government was, therefore, taking up its promotion at the central level and had provided a sum of one crore of rupees during the fourth Plan for this purpose.

Cauvery Waters

The government of India has appointed a fact finding committee to collect data on the Cauvery Waters. This was in pursuance of a consensus reached at an inter-state meeting held recently. The committee will have four members. They are : Mr P. R. Ahuja, Retired Commissioner (Indus) and Joint Secretary, Ministry of Irrigation and Power; Mr Jatindra Singh, Retired Chief Engineer, Punjab; Dr J. S. Patel, Retired Agricultural Commissioner, Ministry of Food and Agriculture; and a judge, to be appointed later.

The committee will have the following terms of reference : (a) to collect all the connected data pertaining to Cauvery waters; its utilisation at different points of time; irrigation practices; as well as projects both existing, under construction, and proposed in the Cauvery basin; (b) to examine adequacy of the present supplies or excessive use of water for irrigation purposes; (c) to collect data relevant to the use of water in different states like physical and other features; cultivated areas; existing and proposed uses for domestic and industrial water supply; hydro-electric power generation, navigation Salinity control and other non-irrigational purposes; and (b) any other connected matters.

The committee has commenced work with effect from June 15, 1972, and submit its recommendations to government by September 15, 1972.

Names in the News

Mr. P.N. Kaul, Director, Mechanical Engineering, in the Railway Board, has been appointed General Manager, South Central Railway. Mr. Kaul succeeds Mr M.T. Lee, who is retiring from railway

service and taking over as chairman, Railway Service Commission in Madras.

Mr Kaul joined the former Nizam's State Railway after completing a course, a Special Class Apprentice at Jamalpur in 1941. Later, he worked with the GIP Railway after the State Railway was integrated with it.

From 1955 to 1958, Mr Kaul was on deputation with the Sudan Railways as Assistant Chief Mechanical Engineer. On return to India, Mr Kaul joined the Central Railway and worked in a number of capacities. During this period, he attended a course at the National Defence College, New Delhi. He worked on the Southern Railway as Chief Personnel Officer in 1966, and in the following year, he was posted as Chief Mechanical Engineer on the South Eastern Railway.

In 1967 Mr Kaul went to London as Railway Adviser to the Indian High Commission. Back in India in 1971, he was posted as Chief Mechanical Engineer on the Northern Railway and came to the Railway Board later that year.

At the fifteenth Annual General Meeting of the Madras Stock Exchange Ltd, held recently the following office-bearers were elected to the Council of Management for the year 1972-73.

President—Mr. J. V. Somayajulu (M/s Somayajulu & Co)
Vice-President—Mr K. Venkataraman (M/s Venkataraman & Co)

Treasurer—Mr V. K. Padmanabhan (M/s V. S. Krishnaswami & Co)

Council Members—Mr M. Sankaran

(M/s Ramshankar & Co)

Mr E. V. Rajagopalan

(M/s Paterson & Co)

and Mr Arunachalam

Mr C. R. Pattabhi Raman, Public Representative, S. C. Bafna, R. P. Dobe, Government Nominees and Mr E. R. Krishnamurti, Executive Director, are on the Council of Management.

COMPANY AFFAIRS

Mafatlal

THE DIRECTORS of Mafatlal Fine Spinning and Manufacturing Co. Ltd have maintained the equity dividend for the year ended March 31, 1972 at Rs 17 a share but unlike in the preceding year when the entire dividend was subject to tax, a portion of the dividend for 1971-72 i.e. Rs 5.50 a share is expected to be tax-free. This is because of the fact that the part of the company's profit has been derived from its chemical's division which is a separate undertaking within the meaning of the provisions of Section 80-J of the Income-Tax Act. The company is making the necessary application for the purpose.

Sales of the company, exclusive of excise duty, have edged up from Rs 27.89 crores to Rs 30.91 crores while the income from other sources have gone up to Rs 48.12 lakhs from Rs 29.44 lakhs in 1970-71. Gross profit at Rs 2.90 crores recorded a relatively smaller increase of 12.8 per cent over the 1970-71 figure of Rs 2.57 crores. Out of the gross profit, a sum of Rs 151.04 lakhs was appropriated to depreciation reserve as against Rs 143.25 lakhs in the preceding year while the allocation to development rebate reserve was stepped up Rs 2.79 lakhs to Rs 16.53 lakhs. Taxation reserve was allotted Rs 65.50 lakhs as againsts no provision in the previous year. This leaves a net profit of Rs 56.83 lakhs against Rs 110.35 lakhs in the earlier year. After tax deduction in respect of previous years amounting to Rs 15.40 lakhs there is a disposable surplus aggregating Rs 41.42 lakhs out of which a sum of Rs 15.50 lakhs was transferred to tax-exempt profits reserve and Rs 25.92 lakhs to general reserve No. 1.

Equity dividend will claim Rs 45.90 lakhs while preference dividend will absorb Rs 1.86 lakhs.

Bank of America

Bank of America plans to establish, subject to approval by the Federal Reserve Board, a multi-nationality owned regional merchant bank with headquarters in Singapore. The Union Bank of Switzerland, Zurich; Kleinwort, Benson Ltd, London; Banque De Paris Et Des Pays-Bas S.A. Paris and Overseas Union Bank Ltd, Singapore, have already agreed to participate in the proposed merchant bank. The initial authorised capital of the bank will be of the order of S\$ 30 million (US \$ 10.65 million). The bank which is intended to serve the south-east Asian region is expected to commence its operations towards the close of this year. It is expected to engage such types of business as discounting bills of exchange, short and medium term lending, acceptance and money markets operations, underwriting, syndicating loans, financial counselling and investment services. Singapore had been chosen as headquarters for the merchant bank because of its location in regard to the areas it plans to serve and its well developed currency trading centre. Bank of America originated the Asian dollar market in Singapore in 1969.

The Standard and Chartered Bank

The Directors of Standard and Chartered Banking Group Limited will recommend to shareholders at the annual General Meeting to be held on August 1, 1972 payment of a final dividend of eight per cent less income tax for the 12 months ended March 31, 1972. The total distribution for this period will thus be 14 per cent repre-

senting an increase of two per cent over the annual rate for the previous accounting period which was fifteen months. Preliminary profits of the Group after provision for taxation and subject to audit amounted to £ 18.2 million, the 1971 equivalent figure being £ 16.3 million.

Zenith Steel

Zenith Steel Pipes Ltd proposes to put up a plant in Indonesia for manufacturing steel pipes. A new company styled P.T. Zenith Steel Indonesia has been promoted for this purpose with an authorised capital of 33.20 crores Indonesian Rupiahs (equivalent to Rs 60 lakhs.) Zenith Steel Pipes will be supplying complete technical know-how for the project and also technical assistance for a period of ten years to the Indonesian company. Zenith will also arrange to supply plant, machinery and equipment valued at 11.08 crores Rupiahs (equivalent to Rs 20.03 lakhs) and in consideration will be allotted shares in the Indonesian company for this amount. The project as also the financial participation have received the approval of both the governments.

Hindustan Lever

Mr V. G. Rajadhyaksha, Chairman of Hindustan Lever Ltd, has chosen 'the battle against inflation' as the topic for his annual address to the shareholders of the company. Price control the world over, the chairman said, had more or less been most effective in the short run in dealing with inflation. But excessive restraint on prices, the chairman stressed, could lead to damage of the productive system, whether it was the farm or the factory and become itself a major factor in accentuating

shortages and hence aggravating inflation. But it is a sad commentary that enough attention had not been paid to the real effects of inflation and price control on corporate viability. As enough resources have to be generated to maintain industrial growth, excess restraints, in the Chairman's opinion, would discourage allocation of further funds for increasing production or improving industrial efficiency. In the last resort the government and the community as a whole, might have to pay a heavy penalty not only because growth of revenue and employment generating activities in the industry would begin to slow down but because the more unscrupulous elements within the industry—those who resort to such practices as evasion of taxes and duties—would also begin to flourish. The chairman, therefore, pleaded for realistic and imaginative pricing and industrial licensing policies to wage a successful war against inflation.

So far as the company was concerned, high priority had been given, in both policy and practice, to a programme aimed at containing inflation as far as it is within its limits. Many far reaching and pragmatic measures such as maximising the advantage of economies of scales in the fields of procurement, production and distribution, implementing of an integrated programme for increasing efficiency at all levels, eliminating waste, keeping down costs, reducing dependence on imports and a host of other steps are being actively pursued to neutralise the impact of inflation. Furthermore it is quite interesting as also revealing to hear from the chairman that the burden of inflation in the case of the company is borne not so much by the consumer of its products or by its employees as by its shareholders.

The chairman has however sounded a note of warning that in the long run inadequate returns to the shareholders as a group would choke off the flow of private savings into the industry and stifle investment in vital industries on which so much of future

economic growth depends. Despite the depressing situation prevailing at present the chairman was confident that the company would succeed in due course in striking the delicate balance between giving a fair return on investments and at the same time ensuring all that could be done to fight against inflation.

English Electric

The Directors of English Electric Co. of India Ltd have decided to issue 2,50,000 equity shares of Rs 10 each at a premium of Rs three per share as rights shares in the ratio of one share for every two shares held to the Indian shareholders. The permission of the Controller of Capital Issues has been received for making this rights issue to Indian shareholders in order to increase their participation in the equity capital to 33½ per cent from 25 per cent. The directors have also declared to enhance the equity dividend to 18 per cent for the year ended March 31, 1972 from 15 per cent paid for 1970-71.

Dunlop

Dunlop India Ltd has received the government's consent for the issue of rights shares to raise a part of the capital required for its expansion. But the proposal as originally approved by the shareholders has been radically amended. The Controller of Capital Issues has accorded consent to the issue of 10 lakh equity shares of Rs 10 each at a premium of Rs 11 per share in the proportion of one new equity share for every 10 equity shares held instead of the issue of 15 lakhs equity shares of Rs 10 each at a premium of Rs four per share on a three-for-twenty basis as was approved by the shareholders. A resolution to this effect is now being proposed for shareholders' approval at a meeting to be convened early next month.

News and Notes

Expansion and Diversification

Travancore Rayons : has obtained a licence for setting up a new unit for the manufacture of cellophane with a capacity of 3,000 tonnes. The project,

to be located near Coimbatore, is estimated at Rs five crores. The company is at present manufacturing annually 3,600 tonnes of cellophane paper at its factory at Rayonpuram near Ernakulam. With the issue of the licence for expansion to the company, the proposal for the merger of Indian Overseas Bank Ltd with it will be actively pursued. The Directors of IOB Ltd are in fact taking necessary steps to file a petition to the High Court for directions to convene a meeting of the shareholders of their company for considering the proposed scheme of amalgamation. Meanwhile the sum of Rs 2.50 crores received as compensation from the government has been kept intact so that this amount, may be available to Travancore Rayons on the proposed merger scheme being put through.

Modi Rubber : The Modis are now entering into the field of tyre and tube manufacture. Modi Rubber Ltd, a new company promoted by the Modis, is now setting up a most modern industrial complex at Modinagar, Meerut in UP and it has received a licence for manufacturing four lakhs each of tyres and tubes per annum. The plant will produce annually five lakh tyres and tubes when it reaches its full rated capacity which is likely to be achieved within two years from the date of commencement of commercial production. Keeping in view the heavy shortage of truck, bus and tractor tyres, the company plans to devote 77 per cent of its production to manufacture these types of tyres. According to current indications the plant is expected to go on stream by the end of 1973.

The company has entered into a technical collaboration agreement with the world renowned Messrs Continental Gummi Werke Aktiengesellschaft of West Germany for a period of five years with provision for renewal as mutually agreed upon subject to the approval of the government of India. The company has been given the right to use Continental's horse brand mark as a registered user. The

foreign collaborators besides assisting the company in the manufacture of tyres would also help the new company in marketing, distribution sales promotion of its products within the country and selling of its goods abroad.

To raise part of the resources required for implementing this project the company entered the capital market on June 21 with a public issue of Rs 2.95 crores consisting of 29,50,000 equity shares of Rs 10 each for cash at par. A sum of Rs 2.50 per share is payable on application and a like amount on allotment. The balance is to be made in two equal calls as may be determined by the board of directors of the company with an interval of at least two months between each call. The subscription list will close on June 29 or earlier but not before June 26, 1972. The issue is fully underwritten.

The cost of the project is estimated at Rs 18 crores out of which Rs six crores is proposed to be raised through equity shares of Rs 10 each and the balance of Rs 12 crores will be borrowed from financial institutions and commercial banks for which arrangements have been made. Out of the equity capital of Rs six crores, 40 per cent shares worth Rs 2.4 crores have already been taken up by the promoters and their business associates and shares of the value of Rs 65 lakhs have been reserved for financial institutions. The balance of 29,50,000 equity shares of Rs 10 each are offered to the public for subscription.

The company hopes to operate its plant at 75 per cent of the capacity in 1974, 90 per cent in 1975 and at the full rated capacity in 1976. The sales, excluding excise is expected to rise from Rs 15.36 crores in 1974 to Rs 21.75 crores in 1976 while the profit after providing for taxation, depreciation and development rebate reserve is anticipated to move up from Rs 1.51 crores in 1975 to Rs 2.47 crores in 1976. The directors are hopeful of declaring a maiden dividend of 10 to 15 per cent for 1976, i.e. after two years from the commissioning of the plant. Keeping

in view the good market potential, world renowned collaboration, ideal location, efficient and dynamic management and congenial labour relations this venture of Modis will be as successful as has been the case with Modipon and may even excel the performance of the existing enterprises of the Group.

Vardhman Spinning and General Mills Ltd which is currently running a spinning unit at Ludhiana is now setting up a mini-steel plant at Faridabad to manufacture 30,000 tonnes of mild, high carbon and spring steel ingots by putting up this 10-tonnes electric arc furnace. The first electric arc furnace has already arrived at the factory site and the supply of second furnace and other types of machinery are in progress. The plant is expected to commence production in October 1972. It is also intended to put up a third furnace to raise the production capacity to 50,000 tonnes per annum. To finance this project the company is offering for public subscription for cash at par 343,000 equity shares of Rs 10 each and 20,000 (9.5 per cent) redeemable cumulative preference shares of Rs 100 each. Besides 57,000 equity shares of Rs 10 each have allotted for cash at par to the directors and promoters. The subscription list for this fully underwritten issue opens on June 26 and will close on July 7 or earlier but not before June 28, 1972. Barring unforeseen circumstances the directors are hopeful of declaring a dividend within a reasonable period from the commencement of production.

The public issue of **Rathi Ispat Ltd** which opened for public subscription on June 12 had been heavily oversubscribed. At the insistent demand of Bombay and Bangalore Stock Exchanges the subscription list for the equity issue was kept open till June 17. For the preference issue the list was, however, kept open till June 21. The company offered for public subscription 200,000 equity shares of Rs 10 each and 5,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each, both at par. The public issue was fully underwritten.

COMPANY MEETINGS

COROMANDEL FERTILISERS LIMITED

CHAIRMAN'S SPEECH

Statement of the Chairman, Dr. Bharat Ram at the Tenth Annual General Meeting of the shareholders of Coromandel Fertilisers Limited held on June 21, 1972.

Ladies and Gentlemen :

I have great pleasure in welcoming you to the Tenth Annual General Meeting of the Company.

We passed through an eventful year in 1971 which ended with a sense of fulfilment and renewal of faith in the traditions that this country has always upheld. The national effort inspired by astute leadership once again rose to great heights and exemplified the unity of our people in times of stress.

The burden imposed on our country's resources, firstly, by the influx of refugees and by the armed struggle later has tested our inner strength, but its full impact on our economy is still in the process of being felt. The nation's new mood of self-reliance is a very welcome trend, although this cannot be translated into action straightaway.

The recent Government move in regard to ceiling on land holdings is another far-reaching measure as, besides its social objectives, it has direct effect on the agricultural development of the country. While the success of the Green Revolution has not been questioned many have asked whether the benefits have been widely shared. This, in turn, has set off much debate about the strategy for spreading the socio-economic benefits of the Green Revolution. Here, one has to be pragmatic and cautious, for any absolute definition of 'holdings' without

reference to their economic size may not be conducive to increased application of the package of practices, which alone can sustain greater agricultural productivity. Therefore, emotion alone should not guide us in this area. While structural changes seem to be necessary in the larger interests of the country, in our anxiety to achieve it, we should not lose sight of the necessary economic justification. Realities must be kept in perspective.

The past year has witnessed a further advance in application of agricultural technology towards increased production. Hybrid varieties in cereals have gained in popularity and it is hoped that equally important and great strides will be made in other crops. The increased attention being paid to cotton development in recent months is another happy feature. All this is an unmistakable sign of the greater application of science and technology in the service of agriculture and as a result, we are now poised for a Rice Revolution too. At the same time, it is heartening to note that greater awareness of the other implications of the Green Revolution has provoked informed discussion and study of the problem. While we need to display continued attention to the problem of environment, it is somewhat disturbing to find that many enthusiastic environmentalists are spreading panic without substantiating their statements.

The Director's Report and

Accounts were circulated to you earlier. The marked improvement in the profitability reflects a steady and progressive growth of your Company during the last four operating years. Many of the inhibiting factors, affecting production have been considerably minimised. Capacity utilisation has been steadily improving and your management is studying ways and means to achieve higher targets.

Your Company's products are being well accepted in all the major States in India. However, timely movement has not been possible due to the shortage of wagons and time and again this problem has assumed critical proportions. Consequently, your Management has had to move the product by road or by rail to the available point and then tranship by road. During 1971, of the entire quantity, only 55% could be moved by covered wagons; the balance had to be moved by uncovered wagons or by road. These additional movements and handling have naturally pushed up the costs significantly apart from the incidence of increased freight and warehousing/siding charges. To partially mitigate the heavy freight and handling costs, efforts are being made to increase the sales in the home area without completely withdrawing from other States so that your Company's product image is maintained.

Your Company has strengthened and enlarged the areas of demonstration plots, soil testing and farmer services. A

Dr. Bharat Ram

new N-P-K complex fertiliser with an analysis of 14-35-14 was added to the product line and launched in the market in April this year. The response has been encouraging. Special efforts are being made by the Govt. of Andhra Pradesh to bring at least 50% of paddy cultivation under the High Yielding Variety and it is reasonably expected that this will be achieved during 1972-73. From the fertiliser consumption angle, this is a very encouraging sign.

Costs And Profits

I would particularly like to comment on two significant and interrelated factors—profitability and price reduction. The shareholder is naturally interested in the profitability of his Company and compares its performance with similar companies in the industry. Members are no doubt aware that each Company faces its own problems, besides extraneous factors, which I will take up shortly. Your Company's performance has been steady and progressive but in the first two operating years, production was seriously hampered by unstable power and interrupted water supply. On the other side, sales were low due to excessive imports, natural calamities and the difficulties in getting a sophisticated but most excellent product accepted. Your Com-

phatic fertilisers whereas the the Indian market has been used to a nitrogenous mixture or straight nitrogen like Urea; hence it has taken some time for phosphatic fertilisers to be accepted.

The significant fact, however, is the abnormal rise in costs. The levy on naphtha from June 1971, now costs Rs. 31 lakhs a year additionally. Whereas world Sulphur prices have reached rock-bottom rates, we continue to get this vital raw material at a price which is much higher. The agency concerned with the supply of Sulphur has recently increased its price to Rs. 300/- per M. tonne, resulting in an additional cost of Rs. 34 lakhs a year to your Company. Further, the Andhra Pradesh State Electricity Board increased the power tariff which has pushed up the power costs by another Rs. 25 lakhs a year. Increases in rail freight siding charges and warehouse rental account for nearly Rs 40 lakhs a year. The Emergency Risks Insurance has cost us Rs 10 lakhs. These are strikingly significant; I am not cataloguing the hundreds of other items, the costs of which are going up year after year.

Now, I come to the next point — reduction in the price of fertilisers. Reduction in price can be made possible by optimising production or reducing operating costs. In your Company's case, where production is near capacity and increases will be minimal due to technical reasons, capacity utilisation alone cannot contribute significantly to increased profits, if operating costs outside your company's control rise steeply year after year. The recent increase in the excise duty on fertilisers, freight and raw material prices, cannot but go against the objective of reducing the price of fertilisers which will remain a distant goal. An industry is set up to produce goods and services at competitive rates, contribute to the economic activity and earn a profit for its investors. It would be a sorry state of affairs if industry

sheer economic survival.

Expansion

The preliminary negotiations on the technical and financial aspects of the phase I expansion were deferred in the light of the Ammonia Plant's performance last year, since your Directors felt that the expansion plan as originally envisaged required to be reassessed and revised. Fresh technical studies on the Ammonia, Phosphoric and Sulphuric Acid plants are under way and based on the technical report, a revalidation of the expansion licence will be obtained and the project finalised. Preliminary engineering and design work will commence thereafter.

Contribution to National Defence Fund

Immediately on the declaration of Emergency, your Company made a token contribution of Rs 10,000 to the the National Defence Fund. Early this year, another contribution of Rs. 2,51,500 was made. Besides this, the entire staff of the Company contributed a sum of Rs 10,690/-.

Directors

Since the last meeting, Mr. Harvey C. Auman joined the Board in place of Mr. C. S. Dennison. Mr. J. H. Eckart returned to the USA to rejoin his parent organisation and Mr. R. B. Lerner took over as Managing Director. Your Company's performance has been improving each year and this has been, in no small measure, due to a cooperative effort on the part of the entire staff, workers and management. Permit me to express the Company's appreciation of their dedicated and loyal performance.

Thank you, Ladies and Gentleman.

BHARAT RAM
Chairman

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

If a small-scale industrialist has his unit all geared up for production

Why on earth would he need

Because that's when he faces many problems: Like getting machinery on easy instalments, obtaining raw materials, marketing his products and finding export outlets. That's when MSSIDC steps in to help him.

MSSIDC offers a wide range of services that help the small-scale industrialist overcome such problems.

Over the past nine years, MSSIDC has supplied raw materials worth Rs. 45 crores, marketed products worth Rs. 9 crores, and imported goods worth Rs. 4 crores.

From as little as Rs. 86 lakhs in 1963-64, MSSIDC's turnover has reached Rs. 12 crores today.

Impressive though this is, MSSIDC views its achievements not in terms of turnover, but in relation to its aim of constantly making available new and better services to help the small-scale industrialist.

Shri O. S. Murthy

Gentlemen,

I welcome you to the 8th Annual General Meeting of the Company for considering the Audited Accounts for the financial year ended March 31, 1972.

The year under review has been one of substantial growth in the operations of the Company. The total value of production amounted to Rs. 59.33 crores, as compared with Rs. 48.26 crores in the previous year i.e. an increase of 23 percent. You will be glad to learn that while the Company made a profit for the first time in the previous year of a modest Rs. 65 lakhs, it has improved on it during the year with a profit of Rs. 319 lakhs thus consolidating its place among the profitable Public Sector enterprises. A significant feature of the working of the Company for the year is that two out of the three units of the Company namely Tiruchi and Hyderabad plants are now making profits.

The production during the year in Tiruchi included Rs. 29.15 crores of boiler components. Out of 26,295 tonnes of boiler components manufactured, 9,679 tonnes were pressure parts. Large size Axial fans of size dia. 2250 mm and 2500 mm were also manufactured for the first time in the Boiler Plant. The production of valves registered an increase of over 50% including an increase in the manufacture of 250 atm. valves.

Our boilers are under erection/commissioning at 15 sites including work at six new sites taken up during the year. At the Port Dickson Station in Malaysia, the erection has progressed to 60%.

The first 100 MW Boiler for Obra and three more industrial Boilers have been successfully hydraulically tested. Two 60 MW Boilers for utilities—were commissioned during the year. Supply of steam by these Boilers is in accordance with the design parameters.

The production at Hyderabad Plant was Rs. 16.24 crores including Rs 12.69 crores of turbosets and auxiliaries and Rs 3.53 crores of Air Blast and Minimum Circuit Breakers. The Hyderabad Unit has made a profit for the first time amounting to Rs 1.93 crores. The first 60 MW turboset for Faridabad Power Station in Haryana, the turbo-alternator for the 3rd 60 MW set for Harduaganj Station in U.P. and the 3rd 110 MW set for Pathrathu in Bihar were successfully tested during the year. This Plant also manufactured, tested and supplied one set of 9.5 MW for M/s. Tata Chemicals and one set of 12.5 MW for M/s TISCO, and one set of 2.5 MW has also been

BHARAT HEAVY ELECTRICALS LIMITED

Following is the text of the speech delivered by Shri O. S. Murthy, Chairman on June 21, 1972 at New Delhi.

despatched to M/s Shakti Sugars.

Production of turbosets at the Plant would have been better if the supplies of critical steel castings and forgings from indigenous and foreign sources had kept to the agreed schedules of delivery. The setting up of a captive foundry for complicated Alloy Steel castings and Foundry Forge Plant and atleast of medium size forgings proposed at Hardwar is presently under Government's consideration. This would be a long term solution to this otherwise perennial problem.

The production at the Hardwar Plant increased from 10.79 crores in 1970-71 to 13.12 crores in 1971-72, the value added being as much as 54% in 1971-72 as compared to 45% in 1970-71. Lack of adequate work in the pipeline due to paucity of orders in two years when the Power Plan was not finalised, affected the gross output in this year. It is also likely to affect the quantum of production in 1972-73. Electrical machines valued at Rs 1.56 crores were completed and the Plant manufactured, for the first time, a motor of 3500 MW rating, the largest rating so far. The turbine for the 4th set of 100 MW, was tested successfully. The stator for the generator for the 4th set was completed and the rotor was ready for balancing. Work on 200 MW turbosets being manufactured for the first time in the country, has been taken up as also work on the 235 MW turbo-generator for the Madras Atomic Power Plant. The production of hydro-sets increased to Rs 3.83 crores as compared to Rs 1.90 crores in the previous year. Embedded parts for Bhatgar, Vaitarna and Kulhal Hydro Projects were supplied. Part supplies were also made for Maneribhali Suberanarekha and Bairsaieul Projects. Despatches of main equipment for the two 30 MW hydro-sets for Giribata and one 4.5 MW hydroset for Chenani Project were also commenced. Erection work is in progress at Obra and has commenced at Badarpur.

In the initial stages, the capacity of a Heavy Engineering Industry cannot be measured merely in terms of the equipment physically installed, but it is based on the skills acquired by the workmen to whom the technology is totally new. This depends essentially on the number of machines that are actually built in the concerned Workshop—a factor controlled by adequate advance orders. Often the Project Authorities in their enthusiasm to announce the starting of production publicise the commencement, when only a notional start is made on a few minor parts of a sophisticated product. This in turn leads to the erroneous picture of the total period of gestation for the Heavy Engineering Industry.

Having regard to these factors, the Board of Directors

feel that judged by the value added within the short period of 2 or 3 years of commencement of the main product, all the units of the Company have done fairly well and are poised for rapid increase in the production both in physical as well as financial terms.

A superficial analysis of the financial achievements of the individual units, in relation to the ultimate capacity, as measured by the installed equipment, often gives an unrealistic idea of its performance. Even in financial terms, you will be glad to notice that two of the Units have turned the corner and are making profits. One unit with very heavy capital investment has recently come out of the construction stage. It was the misfortune of this Unit (namely the Hardwar Plant) that upto the end of 1970 it had no orders beyond the first lot of six 100 MW sets. This has resulted in a hiatus in the planning for man-power and material requiring long delivery which had to be imported because of its non-availability from indigenous sources. The result was that there was less work in the pipeline on the shop floor affecting the production in 1971-72 and also in 1972-73. Even so, within the short period of 2 years after commencement of the main equipment, this factory has increased substantially the value added, which during developmental stage is the correct measure of the health of the Unit. With the improved order book position, I am confident that all the Units of the Company are now geared for rapid increase in production both in physical as well as financial terms.

Failure on the part of indigenous manufacturers in the supply of equipment has frequently been highlighted as the cause for present crisis in the power supply position in the country. While the manufacturing Units would readily accept blame where due, and take corrective steps for eliminating the delays, the problem will not be solved but will continue to recur and upset the power programme, if the root cause is not correctly identified and remedial measures taken in time. Making the indigenous manufacturers the scape goat and finding alibi for the shortcomings in planning, organization and execution of power projects appears to be an easy way to evade the issue. It has been mentioned that in the 4th Plan, there would be a shortfall of 2.1 million KW of power generation. An analysis of projects responsible for the shortfall would reveal that as much as 0.69 million KW i.e. nearly 33% is due to delay in the commissioning of schemes for which equipments were to be imported. (Incidentally in the previous two plans when all the equipments were imported, the shortfall was of the order of 35%). Out of the balance, BHEL is responsible for the supply of equipment for 0.543 million KW corresponding to 26%. All these schemes were originally not included in the 4th Plan. For most of these schemes letters of intent were placed on BHEL only in July-September, 1970. It is only after the receipt of these orders that raw material such as castings and forgings, which are long delivery items and which indigenous manufacturers like HEC and others could not supply, was ordered. In the circumstances, having placed orders for equipment late, blaming the indigenous manufacturers for late delivery of equipment which has a long manufacturing cycle, would be to draw a red herring. To make matters even worse for the manufacturing units, technical detail for about 0.4 million KW of generating equipment (e.g. thermal extensions for Barauni, Panki and Harduaganj) have not been finalised yet. In some cases, due to inadequate planning at site by the customer, finished equipment was held up at the workshops (e.g. Hydro schemes at Giribata and Bairsauiel, and Thermal Schemes at Badarpur, Pathratu and Faridabad from time to time). The lesson to be drawn from the past experience, therefore, is that Power Schemes are to be planned well in advance, adequate organisation developed and the schemes put through with vigour. It is time that schemes for the 5th

Plan are initiated immediately. Importing Power equipment is not the answer to the problem.

As I have apprised you in the earlier Annual General Meetings, your Directors have been pleading with the authorities concerned for the need to place adequate orders on the manufacturing units well in time to enable the deliveries to be affected according to requirements. Early in 1969, Government's attention was drawn to the lack of orders beyond the first order of 6x100 MW sets, 5x60 MW and 5x110 MW sets. The need for placing orders well in time to enable the manufacturing units plan for the procurement of long lead items of special castings and forgings not available in the country was also stressed and suggestions were made for an imprest order of 4x110 MW and 4x200 MW sets as standing arrangement to fill up the gaps in the order book as and when they occur to ensure minimum production being maintained at the Plants. Orders were canvassed with the Electricity Boards and orders were obtained for turbo-sets even in anticipation of their inclusion in the plan proposals. Thanks to these special efforts taken by your Directors, the order book position improved, but the lack of orders in two years upto end of 1970 affected the work-in-progress in the pipeline and, therefore, the quantum of production in the years 1971-72 and 1972-73. The adverse effect of the delay in the planning of orders on the operations of the Heavy Electrical Plants is not readily understood. Of the total orders of turbosets for power stations in hand valued at Rs 190 crores, orders for as much as Rs 119 crores were placed only in late 1970.

As reported to you in the last Annual General Meeting, Government have authorised the raising of Share capital of the Company from Rs 65 crores to Rs 80 crores. Government has made the conversion effective from 1-4-1971 by waiving interest charges on Rs 15 crores of loans. The raising of the Share capital from Rs 65 crores to Rs 80 crores (additional 15 crores) to restore the equity loan ratio to 1:1 was long over due and the Company had been loaded with additional interest charges of Rs 1.05 crores per annum for the last three years. We are grateful to the Government to have relieved us of this interest burden at last for the year under review.

Your Company is getting a fair price for the boilers and the switchgears largely due to the prices offered on the basis of open tenders for these products. In the case of turbosets, prices are negotiated with the Electricity Boards. The prices for 13x100 MW set and 8 sets of 60 MW have been settled with the customers directly. Efforts are being made to get the remaining two other customers to fall in line. When there is no agreement between us and our customers we are agreeable to get the prices settled through the Committee appointed by the Government, as in the case of 3x100 MW sets for Badarpur.

You will recall that the Company secured another contract from the National Electricity Board of Malaysia for three numbers of 120 MW oil-fired boilers at a price of Rs 9.3 crores in the face of stiff competition from reputed international suppliers. Work on these boilers has been taken up. Against 3,162 tonnes of total equipment to be delivered to this customer against their earlier order of 2x60 MW sets, 3112 tonnes have already been delivered. The balance is expected to be delivered shortly and in time to keep up with the commissioning programme already drawn up.

Hyderabad Plant exported one 66 KV Minimum Oil Circuit Breaker to Malawi, Africa, through the Indian Consortium for Power Projects.

Preliminary examination has commenced for the design and manufacture of 500 MW thermal generating sets and also 500 MW nuclear generating sets and the gaps in the expertise and

know-how for manufacture and design, will be filled up by securing assistance from collaborators.

Keeping in view the demands of various customers and the manufacturing facilities already set up in the country proposals are under consideration for taking up the manufacture of high speed driving turbines for centrifugal compressors, current and potential transformers which are required by the customers for the switchgear, air preheaters, soot blowers and fans for high rating boilers and reversible pump turbines. These will improve the manufacturing profile of the Company and will help in maintaining the technological level and improve economic viability of its operations.

I should specially acknowledge the employees' contribution to the Defence effort. The employees offered to work hard to increase the production as their contribution to the war effort and responded readily to the Prime Minister's appeal for contribution to the National Defence Fund. A total of Rs 2.38 lakhs was contributed by the staff of the Company to this fund.

On behalf of the Board of Directors, I gratefully acknowledge the valuable co-operation and assistance rendered by the collaborators of the Company. I wish to thank the large number of customers in the Public and Private Sectors for their patronage, the Comptroller and Auditor General of India, various Ministries of the Central and State Government's, Planning Commission, Central Water and Power Commission and State Electricity Boards for their continued help and co-operation. I value specially the contribution made by the employees of all categories of the BHEL whose devotion and endeavours have made it possible for the Company to improve production

and earn a profit for this year also and I have every hope that the improvement will be maintained in the coming years so that the BHEL complex plays its important role in the power development in the country.

I take this opportunity of thanking my colleagues on the Board of Directors for the consideration they have shown and for their unfailing help in the discharge of my functions.

I shall be laying down my office at the end of this month. The 3½ years, during which I had the privilege of serving the Company as its Chairman, have been the most fruitful and rewarding of the 36 years of my career as a public servant. During this period, the production of the Company has increased from Rs 35 crores to Rs 59 crores. The operating results have improved from a loss of Rs 3.4 crores to a profit of Rs 3.2 crore. The order book position is much brighter. A rational and realistic pricing policy fair both to the manufacturers and the customers has been introduced. Two of the Units are making substantial profits and the third is well on its way to break even. The Company as a whole with the target of production for the current year at Rs 82 crores is poised for contributing its share in the industrial development of the country. I could not have hoped for a better reward than this improved health of the Company. I relinquish my charge with the confident hope the progress of BHEL will be sustained and that all officers and staff will give to my successor the co-operation and loyalty, which they gave me in ample measure.

(O. S. MURTHY

RECORDS AND STATISTICS

General Insurance Business Bill, 1972

THE management of all insurers carrying on general insurance business was vested in the central government by the General Insurance (Emergency Provision) Ordinance, 1971 which was later replaced by an Act of Parliament. The General Insurance Business (Nationalisation) Bill, 1972, was introduced in the Budget Session of Parliament and was referred to a joint select committee of the two Houses for detailed consideration. Full text of the bill follows :—

The General Insurance (Nationalisation) Bill, 1972.

to provide for the acquisition and transfer of shares of Indian insurance companies and undertakings of other existing insurers in order to serve better the needs of the economy by securing the development of general insurance business in the best interests of the community and to ensure that the operation of the economic system does not result in the concentration of wealth to the common detriment, for the regulation and control of such business and for matters connected therewith or incidental thereto.

BE it enacted by Parliament in the Twenty-third Year of

the Republic of India as follows :—

CHAPTER I Preliminary

1. (1) This Act may be called the General Insurance Business (Nationalisation) Act, 1972.

(2) It shall come into force on such date as the Central Government may, by notification, appoint.

2. It is hereby declared that this Act is for giving effect to the policy of the State towards securing the principles specified in clause (c) of article 39 of the Constitution.

Explanation.—In this section, "State" has the same meaning as in article 12 of the Constitution.

3. In this Act, unless the context otherwise requires,—

(a) "acquiring company" means any Indian insurance company and, where a scheme has been framed involving the merger of one Indian insurance company in another or the amalgamation of two or more such companies, means the Indian insurance company in which any other company has been merged or the company which has been formed as a result of the amalgamation;

(b) "appointed day" means such day as the Central Government may, by notification, appoint;

(c) "Companies Act" means the Companies Act, 1956;

(d) "Corporation" means the General Insurance Corporation of India formed under section 9;

(e) "existing insurer" means

every insurer the management of whose undertaking has vested in the Central Government under section 3 of the General Insurance (Emergency Provisions) Act, 1971, and includes the undertaking of the Life Insurance Corporation in so far as it relates to the general insurance business carried on by it;

(f) "foreign insurer" means an existing insurer incorporated under the law of any country outside India;

(g) "general insurance business" means fire, marine or miscellaneous insurance business, whether carried on singly or in combination with one or more of them, but does not include capital redemption business and annuity certain business;

(h) "Government company" means a Government company as defined in section 617 of the Companies Act;

(i) "Indian insurance company" means an existing insurer having a share capital who is a company within the meaning of the Companies Act;

(j) "Insurance Act" means the Insurance Act, 1938;

(k) "Life Insurance Corporation" means the Life Insurance Corporation of India established under the Life Insurance Corporation Act, 1956;

(l) "notification" means a notification published in the Official Gazette;

(m) "prescribed" means prescribed by rules made under this Act;

(n) "Schedule" means the Schedule to this Act;

(o) "scheme" means the scheme framed under section 16;

(p) words and expressions used in this Act but not defined herein and defined in the Insurance Act, shall have the meanings respectively assigned to them in that Act;

(q) words and expressions used in this Act but not defined herein or in the Insurance Act and defined in the Companies Act, shall have the meanings

respectively assigned to them in the Companies Act.

CHAPTER II

Transfer to Public Ownership of General Insurance Business

4. (1) On the appointed day, all the shares in the capital of every Indian insurance company shall, by virtue of this Act, stand transferred to and vested in the Central Government free of all trusts, liabilities and encumbrances affecting them.

(2) Out of the shares so transferred and vested, the Central Government shall, immediately thereafter, by notification, provide for the transfer of not less than ten shares to such persons as may be specified in the notification to enable the Indian insurance company to function as a Government company.

(3) Every notification made under sub-section (2) shall specify the names and description of the persons to whom the shares are transferred and the particulars of the shares which are transferred to each such person.

(4) A copy of every notification made under sub-section (2) shall, as soon as may be after it is made, be sent by the Central Government to the concerned Indian insurance company, who shall, on receipt of such copy, and notwithstanding anything contained in the Companies Act or in its articles of association, forthwith rectify its register of members by including therein the persons mentioned in the notification as the holders of the shares specified therein.

(5) For the removal of doubts it is hereby declared that the transfer and vesting of shares effected under sub-section (1) shall not be deemed to affect any right of the Indian insurance company subsisting immediately before the appointed day against any shareholder to recover from him any sum of money on the ground that that shareholder

has not paid or credited to the Insurer whole or any part of the value of the shares held by him or on any other ground whatsoever.

5. (1) On the appointed day, the undertaking of every existing insurer who is not an Indian insurance company shall stand transferred to and vested in the Central Government and the Central Government shall immediately thereafter provide, by notification, for the transfer to and vesting in such Indian insurance company, as it may specify in the notification, of that undertaking.

(2) Any notification made under sub-section (1) may provide that any of the undertakings aforesaid may be transferred to and vested in more than one Indian insurance company in such manner and subject to such conditions as may be specified in the notification.

6. (1) The undertaking of every such existing insurer as is referred to in section 5 shall be deemed to include all assets, rights, powers, authorities and privileges and all property, movable and immovable, cash balances, reserve funds, investments and all other rights and interests in, or arising out of, such property as were immediately before the appointed day in the ownership, possession, power or control of such existing insurer in relation to the undertaking, whether within or without India, and all books of accounts, registers, records and all other documents of whatever nature relating thereto, and shall also be deemed to include all borrowings, liabilities and obligations of whatever kind then subsisting of the existing insurer in relation to the undertaking.

(2) Unless otherwise expressly provided by this Act, all deeds, bonds, agreements, powers of attorney, grants of legal representation and other instruments of whatever nature subsisting or having effect immediately before the appointed day and to which any such insurer as is referred to in section 5 is a party or which are in favour of such existing

insurer shall be of as full force and effect against or in favour of the Indian insurance company in which the undertaking or the part to which the instrument relates has vested and may be enforced or acted upon as fully and effectually as if, in the place of the existing insurer referred to in section 5, the Indian insurance company in which the undertaking or any part thereof has vested had been a party thereto, or as if they had been issued in its favour.

(3) If, on the appointed day, any suit, appeal or other proceeding of whatever nature in relation to any business of the undertaking which has been transferred under section 5 is pending by or against any such existing insurer as is referred to in that section, the same shall not abate, be discontinued or be in any way prejudicially affected by reason of the transfer of the undertaking or of anything contained in this Act, but the suit, appeal or other proceeding may be continued, prosecuted and enforced by or against the Indian insurance company in which the undertaking or the part to which the proceeding relates has vested.

(4) For the removal of doubts it is hereby declared that in the case of a foreign insurer or, as the case may be, the Life Insurance Corporation, the provisions of section 5 and of the preceding sub-sections shall only apply to the extent to which any property appertains, in the former case, to the general insurance business carried on in India and, the latter case, to the general insurance business carried on, whether within or without India, and to rights and powers acquired, and to debts, liabilities and obligations incurred and to contracts, agreements and other instruments made by the foreign insurer or the Life Insurance Corporation, as the case may be, for the purpose of such general insurance business and to legal proceedings relating to those purposes, and the said provisions shall be construed accordingly.

(5) If any question arises as

to whether any property appertains to any such general insurance business as is referred to in this section or whether any rights, powers, liabilities or obligations were acquired or incurred or any contract, agreement or other instrument was made by the foreign insurer or the Life Insurance Corporation, as the case may be, for the purposes of any such business or whether any documents relate to those purposes, the question shall be referred to the Central Government which shall, after giving an opportunity of being heard to the persons interested in the matter, decide it in such manner as it thinks fit.

7. (1) Every whole-time officer or other employees of an existing insurer other than an Indian insurance company who was employed by that insurer wholly or mainly in connection with his general insurance business immediately before the appointed day shall, on the appointed day, become an officer or other employee, as the case may be, of the Indian insurance company in which the undertaking of that insurer or that part of the undertaking to which the service of the officer or other employee relates has vested, and shall hold his office or service under the Indian insurance company on the same terms and conditions and with the same rights to pension, gratuity and other matters as would have been admissible to him if there had been no such vesting, and shall continue to do so unless and until his employment in the Indian insurance company in which the undertaking or part has vested is terminated or until his remuneration, terms and conditions are duly altered by that insurer :

Provided that nothing in this sub-section shall apply to any such officer or other employee who has given, in writing, notice to the Central Government or to any person nominated in this behalf by that Government within one month from the appointed day intimating his intention of not becoming an officer or employee of the insurer in whom the undertaking or part there-

of to which his service relates has vested.

(2) If any question arises as to whether any person was a whole-time officer or employee, or as to whether any officer or employee, was employed wholly or mainly in connection with the general insurance business of the existing insurer referred to in sub-section (1) or the Life Insurance Corporation immediately before the appointed day, the question shall be referred to the Central Government which shall, after giving an opportunity of being heard to the person concerned in the matter, decide it in such manner as it thinks fit and such decision shall be final.

(3) Notwithstanding anything contained in the Industrial Disputes Act, 1947 or in any other law for the time being in force, the transfer of the services of any officer or other employee from one insurer to another under sub-section (1) shall not entitle any such officer or other employee to any compensation under that Act or any other law for the time being in force, and no such claim shall be entertained by any court, tribunal or other authority.

8. (1) Where an existing insurer has established a provident, superannuation, welfare or any other fund for the benefit of his employees and constituted a trust in respect thereof (hereafter in this section referred to as an existing trust), the moneys standing to the credit of such fund on the appointed day, together with any other assets belonging to such fund, shall stand transferred to and vested in the Indian insurance company on the appointed day free from any such trust if the existing trust had been established before the appointed day either in relation to its own employees or in relation to employees of an existing insurer or the Life Insurance Corporation, as the case may be, whose undertaking has vested in that Indian insurance company.

(2) Where the undertaking of an existing insurer has vested

in more than one Indian insurance company, the Central Government may, by order, provide for the apportionment among such Indian insurance companies of any existing trust relating to that undertaking in such manner as in its opinion may be appropriate.

(3) The Indian insurance company shall as soon as may be after the appointed day constitute in respect of the moneys and other assets which are transferred to and vested in it under this section one for more trusts having objects as similar to the objects of the existing trusts as in the circumstances may be practicable.

(4) Where all the moneys and other assets belonging to an existing trust are transferred to and vested in an Indian insurance company under this section, the trustees of trust shall, as from the appointed day, stand discharged from the trust, except as respects things done or omitted to be done before the appointed day.

CHAPTER III

General Insurance Corporation of India

9. (1) As soon as may be after the appointed day, the Central Government shall form a Government company in accordance with the provisions of the Companies Act, to be known as the General Insurance Corporation of India for the purpose of superintending, controlling and carrying on the business of general insurance.

(2) The authorised capital of the Corporation shall be rupees seventy-five crores, divided into seventy-five lakhs fully paid-up shares of one hundred rupees each, out of which rupees five crores shall be the initial subscribed capital of the Corporation.

(3) Allotment of the subscribed capital of the Corporation shall be made in accordance with the memorandum and articles of association of the Corporation.

10. All the shares in the

capital of every Indian insurance company which stand transferred to and vested in the Central Government by virtue of section 4 (with the exception of the shares transferred to any person under sub-section (2) of that section) shall, immediately on the formation of the Corporation, stand transferred to and vested in the Corporation and every Indian insurance company shall forthwith give effect to such transfer of shares and rectify its register of members by including therein the Corporation as the holder of such shares.

CHAPTER IV

Amounts to be Paid for Acquisitions

11. (1) For the transfer of the shares of each Indian insurance company to, and vesting in, the Central Government, under section 4, there shall be paid by the Central Government to the Corporation, for distribution to the shareholders of each such company, the amount specified against such company in the corresponding entry under column 3 of Part A of the Schedule.

(2) For the transfer to, and vesting in, an Indian insurance company, under section 5, of the undertaking of each existing insurer, who is not an Indian insurance company, there shall be paid by the Central Government to the Corporation, for payment to each such existing insurer, the amount specified against such insurer in the corresponding entry under column 3 of Part B of the Schedule.

12. (1) The total amount paid by the Central Government under section 11 shall be treated as additional contribution to the subscribed capital of the Corporation and such additional subscribed capital shall stand allotted to, and vested in, the Central Government.

(2) The Corporation shall distribute the amount paid to it under section 11, to the shareholders of each Indian insurance company and to

each existing insurer, who is not an Indian insurance company, in accordance with their rights and interests, and, if there is any doubt or dispute as to the right, or extent of the right, of any person to receive the whole or any part of such amount, refer such doubt or dispute to the Central Government for determination and thereafter act in accordance with the determination made by that Government.

(3) Save as otherwise provided in sub-section (2), the amount referred to in section 11 shall be given in accordance with the provisions of section 13, section 14 or section 15, as the case may be.

13. (1) Where the amount referred to in section 11 is to be given—

(a) to the member of an Indian insurance company, the amount due to each such member shall be paid to him in full if it does not exceed twenty-five thousand rupees, and, where it exceeds that amount, shall be paid to him in three equal annual instalments, the first of which shall fall due on the appointed day;

(b) to a foreign insurer, it shall be given to him in cash as soon as may be after the appointed day;

(c) to the Life Insurance Corporation, it shall be given to it in three equal annual instalments, the first of which shall fall due on the appointed day;

(d) to an existing insurer who is a co-operative society, it shall be distributed as soon as may be after the appointed day in accordance with the rules of the society which will apply in case of dissolution of the society;

(e) to an existing insurer not falling within any of the foregoing provisions, it shall be apportioned among the individual policy-holders of the insurer whose policies with that insurer were in force on the appointed day and were comprised in the undertaking of such insurer in proportion to the premiums paid by the

policy-holders under such policies and every such payment shall be made either—

(i) in cash, to be sent by postal money order, or

(ii) at the option of the policy-holder, as a deduction in the premium due at the time of the renewal of the policy and such option shall be exercised by the policy-holder before the expiry of three months from the appointed day (or within such further time not exceeding three months as the Central Government may, on the application of the policy-holder, allow); and the option so exercised shall be final and shall not be altered or rescinded after it has been exercised:

Provided that if any policy-holder fails to exercise his option within the time allowed, he shall be deemed to have exercised his option in favour of payment in cash by postal money order.

(2) Where any amount is payable in instalments under the provisions of this section, each instalment shall carry interest at the rate of four per cent. per annum from the appointed day.

14. (1) Notwithstanding anything contained in sub-section (1) of section 13, if a majority in number of the persons, who, immediately before the appointed day, were registered in the books of an Indian insurance company as the members thereof, and representing two-thirds in value of the amount payable to the Indian insurance company, agree either in person or by proxy at a meeting specially convened for the purpose that the amount so payable instead of being distributed among the members, shall be given to any such person or body of persons as the members may nominate either at that meeting or subsequently for the purpose of carrying on any business, and the Central Government is satisfied that due provision has been or will be made for the payment of the value of their respective shares to persons who have dissented from the resolution, the amount may be

given to the person or body of persons so nominated in such manner and subject to such conditions as the Central Government may think fit.

(2) No resolution passed at any such meeting as is referred to in sub-section (1) held after expiry of three months from the appointed day shall have any effect unless the meeting has been convened after obtaining the approval of the Central Government.

15. Where a claim to the amount payable under section 11 is made by two or more persons adversely to one another, the Central Government may cause the amount to be deposited in any civil court having jurisdiction in that behalf and the court shall decide as to whom the payment shall be made.

CHAPTER V

Scheme for Reorganisation of General Insurance Business

16. (1) If the Central Government is of opinion that for the more efficient carrying on of general insurance business it is necessary so to do, it may, by notification, frame one or more schemes providing for all or any of the following matters:—

(a) the merger in one Indian insurance company of any other Indian insurance company, or the formation of a new company by the amalgamation of two or more Indian insurance companies;

(b) the transfer to and vesting in the acquiring company of the undertaking (including all its business, properties, assets and liabilities) of any Indian insurance company which ceases to exist by reason of the scheme;

(c) the constitution, name and registered office and the capital structure of the acquiring company and the issue and allotment of shares;

(d) the constitution of a board of management by whatever name called for the management of the acquiring company;

(e) the alteration of the memorandum and articles of

association of the acquiring company for such purposes as may be necessary to give effect to the scheme;

(f) the continuance in the acquiring company of the services of all officers and other employees of the Indian insurance company which has ceased to exist by reason of the scheme, on the same terms and conditions which they were getting or, as the case may be, by which they were governed immediately before the commencement of the scheme;

(g) the rationalisation or revision of pay scales and other terms and conditions of service of such officers and other employees wherever necessary;

(h) the transfer to the acquiring company of the provident, superannuation, welfare and other funds relating to the officers and other employees of the Indian insurance company which has ceased to exist by reason of the scheme;

(i) the continuance by or against the acquiring company of legal proceedings pending by or against any Indian insurance company which has ceased to exist by reason of the scheme, and the initiation of such legal proceedings, civil or criminal, as the Indian insurance company might have initiated if it had not ceased to exist;

(j) such incidental, consequential and supplemental matters as are necessary to give full effect to the scheme

(2) In framing schemes under sub-section (1), the object of the Central Government shall be to ensure that ultimately there are only four companies in existence and that they are so situate as to render their combined services effective in all parts of India.

(3) Where a scheme under sub-section (1) provides for the transfer of any property or liabilities, then, by virtue of the scheme, the property shall stand transferred to and vested in, and those liabilities shall be transferred to and become the liabilities of, the acquiring company.

(4) If the rationalisation or revision of any pay scale or

other terms and conditions of service under any scheme is not acceptable to any officer or other employee, the acquiring company may terminate his employment by giving him compensation equivalent to three months' remuneration, unless the contract of service with such employee provides for a shorter notice of termination.

Explanation.—The compensation payable to an officer or other employee under this sub-section shall be in addition to, and shall not affect, any pension, gratuity, provident fund or other benefit to which the employee may be entitled under this contract of service.

(5) Notwithstanding anything contained in the Industrial Disputes Act, 1947 or in any other law for the time being in force, the transfer of the services of any officer or other employee of an Indian insurance company to the acquiring company shall not entitle any such officer or other employee to any compensation under the Act or other law, and no such claim shall be entertained by any court, tribunal or other authority.

(6) The Central Government may, by notification, add to, amend or vary any scheme framed under this section.

(7) The provisions of this section and of any scheme framed under it shall have effect notwithstanding anything to the contrary contained in any other law or any agreement, award or other instrument for the time being in force.

17. A copy of every scheme and every amendment thereto framed under section 16 shall be laid, as soon as may be after it is made, before each House of Parliament.

CHAPTER VI

Functions of Corporation and acquiring Companies and their Management

18. (1) The functions of the Corporation shall include—

(a) the carrying on of any part of the general insurance

business, if it thinks it desirable to do so;

(b) aiding, assisting and advising the acquiring companies in the matter of setting up of standards of conduct and sound practice in general insurance business and in the matter of rendering efficient service to holders of policies of general insurance;

(c) advising the acquiring companies in the matter of controlling their expenses including the payment of commission and other expenses;

(d) advising the acquiring companies in the matter of the investment of their funds;

(e) issuing directions to acquiring companies by way of guidance in relation to the conduct of general insurance business.

(2) In issuing any directions under sub-section (1), the Corporation shall keep in mind the desirability of encouraging competition amongst the acquiring companies as far as possible in order to render their services more efficient.

19. (1) Subject to the rules, if any, made by the Central Government in this behalf and to its memorandum and articles of association, it shall be the duty of every acquiring company to carry on general insurance business.

(2) Each acquiring company shall so exercise its powers under this Act as to secure that general insurance business is developed to the best advantage of the community.

(3) In the discharge of any of its functions, each acquiring company shall act so far as may be on business principles and where any directions have been issued by the Corporation shall be guided by such directions.

(4) For the removal of doubts it is hereby declared that the Corporation and any acquiring company may, subject to the rules, if any, made by the Central Government in this behalf, enter into such contracts of reinsurance or reinsurance treaties as it may

think fit for the protection of its interests.

20. (1) After making provision for bad and doubtful debts, depreciation in assets, provident, superannuation, welfare and other funds, debts due to Government and all other matters for which provision is necessary under any law or which are usually provided for by insurance companies, every acquiring company shall distribute the balance of profit as dividends.

(2) Any profit made by the Corporation and any sums received by the Corporation by way of dividends or otherwise shall be dealt with by it in such manner as may be prescribed.

21. (1) Notwithstanding anything contained in the Companies Act or in the memorandum and articles of association of any Indian insurance company, on and from the appointed day and until a new board of directors of the Indian insurance company is duly constituted, the management of the company shall continue to vest in the Custodian in charge of the management of the undertaking of that company immediately before the appointed day by virtue of the provisions contained in the General Insurance (Emergency Provisions) Act, 1971, and the Custodian shall be entitled, subject to such directions as the Central Government may issue in this behalf, to exercise all the powers and do all acts and things as may be exercised or done by the company or by its board of directors.

(2) Nothing contained in sub-section (1) shall be deemed to prevent the Central Government from appointing any other person to take charge of the management of the undertaking of any Indian insurance company during the period referred to in that sub-section if for any reason it becomes necessary so to do, and any person so appointed may exercise all the powers and do all acts and things which a Custodian may exercise or do under sub-section (1).

(3) The Custodian referred

to in sub-section (1) and the person appointed under sub-section (2) shall be entitled to such salaries and other allowances as the Central Government may specify in this behalf and shall hold office during the pleasure of the Central Government.

CHAPTER VII

Miscellaneous

22. (1) Except to the extent expressly provided in this Act, on and from the appointed day, the Corporation and the acquiring companies shall have the exclusive privilege of carrying on general insurance business in India.

(2) Subject to the provisions of section 35, any certificate of registration granted under the Insurance Act to any insurer other than an insurer referred to in sub-section (1) shall, on and from the appointed day, cease to have effect.

23. (1) No person shall take out or renew any policy of insurance in respect of any property situated in India or any ship or other vessel or aircraft registered in India with an insurer whose principal place of business is outside India save with the prior permission of the Central Government.

(2) If any person contravenes any provision of sub-section (1), he shall be punishable with imprisonment for a term which may extend to one year, or with fine which may extend to one thousand rupees, or with both.

24. For the purposes of the Income-tax Act, 1961, every acquiring company shall be deemed to be an Indian company and a company in which the public are substantially interested.

25. An acquiring company may, having regard to its financial condition on the 13th day of May, 1971 or the financial condition on the said date of any existing insurer whose undertaking has been transferred to and vested in it under this Act reduce the amounts of insurance under contracts

of general insurance entered into before the said date in such manner and subject to such conditions as it thinks fit:

Provided that no such reduction shall be made except in accordance with specific proposals made by the acquiring company in this behalf and approved by the Central Government.

26. (i) Where an existing insurer has at any time within three years before the 13th day of May, 1971—

(a) made any payment to any person without consideration,

(b) sold or disposed of any property of the insurer without consideration or for an inadequate consideration.

(c) acquired any property or rights for an excessive consideration,

(d) entered into or varied any agreement so as to require an excessive consideration to be paid or given by the insurer.

(e) entered into any other transaction of such an onerous nature as to cause a loss to, or impose a liability on, the insurer exceeding any benefit accruing to the insurer.

and the payment, sale, disposal, acquisition, agreement or variation thereof or other transaction was not reasonably necessary for the purpose of the general insurance business of the insurer or was made with an unreasonable lack of prudence on the part of the insurer, regard being had in either case to the circumstances at the time, the acquiring company may apply for relief to the court in respect of such transaction, and all parties to the transaction shall, unless the court otherwise directs, be made parties to the application.

(2) The court may make such order against any of the parties to the application as it thinks just having regard to the extent to which those parties were respectively responsible for the transaction or benefited

from it and all the circumstances of the case.

(3) Where an application is made to the court under this section in respect of any transaction and the application is determined in favour of the acquiring company, the court shall have exclusive jurisdiction to determine any claim outstanding in respect of the transaction.

27. (i) Any foreign insurer may, within three months from the commencement of this Act, make an application to the Central Government stating that among the assets appertaining to the undertaking of the insurer in India, there are assets brought into India by the insurer for the purpose of building up his general insurance business in India or that there are any other assets in India belonging to the foreign insurer which, notwithstanding anything contained in section 5, should not be transferred to, and vested in, the Central Government or an Indian insurance company.

(2) On the receipt of an application made under sub-section (1), the Central Government shall, after giving to the foreign insurer an opportunity of being heard in the matter, by order, direct that such assets as it may specify in the order shall not be transferred to and vested in the Central Government or any Indian insurance company, or if the order is made after such transfer and vesting, that the Central Government or the acquiring company, as the case may be, shall be divested of the said assets.

(3) In the case of a foreign insurer the Central Government may also, by order, direct that any such liabilities in respect of general insurance policies expressed in any foreign currency as are specified in the order, together with any such assets necessary to meet the liabilities as may be so specified, shall not be transferred to and vested in the Central Government or any Indian insurance company, or if the order is made after such transfer and vesting, that the Central

government or the acquiring company, as the case may be, shall be divested of such liabilities and assets as aforesaid.

(4) The liabilities in respect of the policies referred to in an order made under sub-section (3) shall include the following, namely:—

(i) reserve for unexpired risks in respect of each policy in force on the appointed day, at such proportion of eighty per cent. of the last premium or instalment of premium paid as the unexpired period in respect of which the premium or instalment of premium was paid bears to the total period thereof;

(ii) the amount of estimated liability in respect of outstanding claims, whether due or intimated on the appointed day;

(iii) all other liabilities existing on the appointed day, including all contingent liabilities which may reasonably be required to be met on or after the appointed day.

28. (1) Where any property appertaining to an existing insurer has been transferred to and vested in an Indian insurance company under section 5:—

(a) every person in whose possession, custody or control any such property may be shall deliver the property to the Indian insurance company forthwith,

(b) any person who immediately before such vesting has in his possession, custody or control any books, documents or other papers relating to an existing insurer shall be liable to account for the said books, documents and papers to the Indian insurance company, and shall deliver them to that company or to such person as that company may direct.

(2) In particular, all the assets of an existing insurer appertaining to the undertaking held in deposit by the Reserve Bank of India under the Insurance Act or by trustees in trust shall be delivered to the Indian insurance company.

(3) Without prejudice to the

other provisions contained in this section, it shall be lawful for each Indian insurance company to take all necessary steps for taking possession of all properties which have been transferred to and vested in it under this Act.

29. If any person wilfully withholds or fails to deliver to an Indian insurance company as required by section 28 any property or any books, documents or other papers which may be in his possession or unlawfully retains possession of any property of an existing insurer which has been transferred to and vested in an Indian insurance company under section 5 or wilfully applies any such property to purposes other than those expressed in or authorised by this Act, he shall, on the complaint of the Indian insurance company, be punishable with imprisonment for a term which may extend to one year or with five which may extend to one thousand rupees, or with both.

30. Every officer of the Corporation or of an acquiring company shall be deemed to be a public servant for the purposes of Chapter IX of the Indian Penal Code.

31. Every officer of the Central Government and every officer or other employee of the Corporation and of any acquiring company shall be indemnified by the Central Government or the Corporation or the acquiring company, as the case may be, against all losses and expenses incurred by him in, or in relation to, the discharge of his duties under this Act except such as have been caused by his own wilful act or default.

32. No provision of law relating to the winding up of corporations shall apply to the Corporation or to an acquiring company, and neither the Corporation nor any such company shall be placed in liquidation save by order of the Central Government and in such manner as it may direct.

33. Any reference to an existing insurer in any law other than this Act or any contract

or other instrument shall, in so far as it relates to an acquiring company, be construed as a reference to that company.

34. (1) Subject to the provisions contained in sub-section (2) the following sections of the Insurance Act shall alone, so far as may be, apply to or in relation to the Corporation and every acquiring company as if the Corporation or the company, as the case may be, were an insurer carrying on general insurance business within the meaning of that Act:—

Sections 2, 2B, 3, 3A, 41, 46 and 64VB.

(2) The Central Government may by notification, direct that any other provision of the Insurance Act shall also apply to or in relation to the Corporation or the acquiring company subject to such exceptions, conditions and modifications as may be specified in the notification.

35. (1) Nothing contained in this Act shall apply in relation to—

(a) any general insurance business carried on by a State Government, to the extent to which such insurance relates to properties belonging to it or undertakings owned wholly or mainly by the State Government;

(b) any general insurance not falling within clause (a) which has been carried on by a State Government before the 14th day of May, 1971, to the extent to which it is necessary to allow such business to run off;

Provided that nothing contained in this clause shall be deemed to authorise the State government to issue any new policies or renew any existing policies;

(c) any insurer whose business is being voluntarily wound up or is being wound up by a court;

(d) the insurance business carried on by the Calcutta Hospital and Nursing Home

Benefit Association Limited;

(e) the insurance business carried on by the Export Guarantee Corporation and the Deposit Insurance Scheme;

(f) any scheme in existence immediately before the 14th day of May 1971 or any scheme framed after the said day with the approval of the Central Government for the insurance of crops or of cattle or of flood risks or of war or emergency risks.

(2) If the Central Government is satisfied that an insurer, whether established before or after the appointed day, carries on only such general insurance business as is not carried on ordinarily by insurers, it may, by notification, direct that nothing contained in this section shall apply to such insurer in which case the Insurance Act shall apply as if the insurer were an insurer.

36. No act or proceeding of the Corporation or of an acquiring company shall be called in question merely on the ground of the existence of any vacancy in, or defect in the constitution of, the Corporation or the company.

37. No suit, prosecution or other legal proceeding shall lie against any officer of the Central Government or officer or other employee of the Corporation or of the acquiring company for anything which is in good faith done or intended to be done under this Act.

38. (1) The Central Government may, by notification, make rules to carry out the provisions of this Act.

(2) In particular, and without prejudice to the generality of the foregoing power, rules made under this section may provide for—

(a) the period within which and the manner in which any loans advances to the Corporation by the Central Government shall be repaid by it;

(b) the manner in which the profits, if any, and other

monies received by the Corporation may be dealt with;

(c) the conditions, if any, subject to which the Corporation and the acquiring companies shall carry on general insurance business;

(d) the terms and conditions subject to which any reinsurance contracts or treaties may be entered into;

(e) the form and manner in which any notice or application may be given or made to the Central Government;

(f) the reports which may be called for by the Central Government from the Corporation and the acquiring companies;

(g) any other matter which is required to be, or may be, prescribed.

(3) Every rule made under this section and every notification issued under section 34 shall be laid, as soon as may be after it is made, before each House of Parliament, while it is in session, for a total period of thirty days which may be comprised in one session or in two or more successive sessions, and if, before the expiry of the session immediately following the session or the successive sessions aforesaid, both Houses agree in making any modification in the rule or notification or both Houses agree that the rule or notification should not be made, the rule or notification shall thereafter have effect only in such modified form or be of no effect, as the case may be; so, however, that any such modification or annulment shall be without prejudice to the validity of anything previously done under that rule or notification.

THE SCHEDULE

(See section 11)

Amounts to be paid

PART A

Serial number	Name of Indian insurance company	Amount to be paid (Rs)
(1)	(2)	(3)
1	All India General Insurance Company Ltd	10,00,000
2	Anand Insurance Company Ltd	3,50,000
	Preference shares	2,00,000
	Equity shares	12,764
3	Bhabha Marine Insurance Company Ltd	
4	Bharat General Reinsurance Ltd	8,18,000
	Preference shares	
	Ordinary shares	12,63,558
5	British India General Insurance Company Ltd	37,50,000
6	Calcutta Insurance Limited	7,30,450

Statement of Objects and Reasons

By the General Insurance (Emergency Provisions) Ordinance, 1971, which was later replaced by an Act of Parliament, the management of the undertakings of all insurers carrying on general insurance business was vested in the Central Government, pending nationalisation.

The object of the present Bill is to complete the process of nationalisation which is sought to be effected in the following manner. On a day, to be appointed by the Central Government, the shares in insurance companies carrying on general insurance business, which are incorporated in India and having a share capital, would automatically stand transferred to, and vested in, the Central Government. A few shares, however, would thereafter be formally transferred to the nominees of the Central Government in order to enable each of the Indian insurance companies to function as a Government company. On the appointed day, the undertakings of all other insurers, including foreign insurers, and the LIC is so far as it relates to the general insurance business carried on by it, would also stand transferred to, and vested in such one or other of the Indian insurance compa-

nies as the Central Government may specify.

It is also proposed to form under the Companies Act, 1956, a Government company, to be called the General Insurance Corporation of India, which will be entrusted with the task of supervising, controlling and carrying on the business of general insurance. On the formation of the Corporation, the shares of the Indian insurance companies, vested in the Central Government would stand automatically transferred to the Corporation and all the Indian insurance companies would become the subsidiaries of the Corporation.

The Bill further provides for the framing of one or more schemes whereby the Indian insurance companies would so get merged in one another that ultimately there will be only four Indian companies, so situated as to promote competition between them so that effective services in the field of general insurance may be rendered by them in all parts of India.

Y. B. CHAVAN
NEW DELHI :
The 26th May, 1972

Financial Memorandum

Clause 9 of the Bill requires the Central Government to

form a Government company to be known as the General Insurance Corporation of India for the purpose of superintending, controlling and carrying on the business of general insurance, with an authorised capital of Rs 75 crores out of which Rs 5 crores shall be the subscribed capital of the Corporation. Non-recurring expenditure on this account to the extent of Rs 5 crores is therefore likely to be involved during the financial year 1972-73.

Clause 11 provides for payment by the Central Government to each shareholder of every Indian insurance company and to the insurer himself where he is not an Indian insurance company, the amounts specified in the Schedule to the Act. Clause 13 provides that the amount to be paid to the Life Insurance Corporation of India and the amounts to be paid to those members of Indian insurance companies the payment to whom exceeds Rs 25,000 shall be paid in three annual instalments, the first of which shall fall due on the appointed day and each instal-

ment shall carry interest at the rate of 4 per cent per annum from the appointed day. The total amount payable by the Central Government under this clause amounts to Rs 33,03,31,399 which will have to be paid in three instalments from the appointed day; the amount payable in the first year is estimated to be Rs 23,63,62,300. It is estimated that the interest payments in terms of the provision in clause 13 will amount to about Rs. 19 lakhs during 1973-74 and Rs 38 lakhs during 1974-75. After the year 1974-75 no expenditure on this account is involved.

Clause 16 of the Bill empowers the Central Government to include, in the schemes which will be framed, provision for the rationalisation or revision of pay-scales and other terms and conditions of service of officers and other employees wherever necessary. It will be necessary under these powers to integrate and rationalise the emoluments and other service conditions of all employees in all the insurance companies.

For this purpose Government has already set up an Expert Committee which has started functioning from 1st May, 1972. The annual recurring cost on this Committee is estimated at Rs 7.30 lakhs. However, since the full complement of staff for the Committee will be in position only gradually, it is estimated that the cost during 1972-73 will be Rs 5.00 lakhs. The Committee is expected to function till the end of the year 1973-74 and no expenditure on the Committee is expected thereafter. In the beginning a non-recurring expenditure estimated at Rs 0.83 lakh would also be incurred on the Committee the whole of which will be incurred during 1972-73 itself.

The total recurring expenditure on account of pay, allowances and other expenses in case the Bill is passed into law, will therefore be Rs. 7.30 lakhs per year and the total non-recurring expenditure on account of subscribed capital of the General Insurance Corporation of India amounts specified in the Schedule to

the Bill, etc., will be Rs 3804.14 lakhs.

Memorandum Regarding Delegated Legislation

Clause 16 of the Bill empowers the Central Government to frame one or more schemes for the merger of one Indian insurance company with another or for the amalgamation of two or more Indian insurance companies and for matters consequential to such merger or amalgamation, as the case may be. Every such scheme is required to be laid before each House of Parliament.

Clause 38 of the Bill empowers the Central Government to make rules to carry out the provisions of the Act.

The matters in relation to which such scheme or rules may be made are matters of procedure or detail and it is not practicable to provide for them in the Bill itself. The delegation of the legislative power is, therefore, of a normal character.

ALUMINIUM IN CONSTRUCTION & STRUCTURAL USES

For Building & Construction, HINDALCO offers Semi-fabricated aluminium products (sheets and extruded shapes) in a wide range to suit diverse jobs. High strength-to-weight ratio and low maintenance costs make Aluminium the ideal choice of modern builders and architects. Besides, for making buildings cool in summer and warm in winter, aluminium panels are being increasingly used today in modern sky-scrapers. HINDALCO Semi-fabricated products are so versatile that they can be used in making almost anything, from landing mat for Aeroplane in an emergency defence purpose to drainage culverts in farms for Agricultural purposes.

MODERN BUILDERS SPECIFY HINDALCO ALUMINIUM.

Floating, but not fancy free

FOR ONCE the gnomes of Zurich are not the villain of the piece. Nor has the dollar sneezed infecting the pound sterling with pneumonia. If Britain's currency is embattled again, its war front runs along its own domestic economic front, where inflation is the enemy. It is true that, when Mr Denis Healey, the opposition "shadow" chancellor, said recently that he did not see devaluation being delayed beyond the summer this year, he had added that this was also the expectation of a very large number of foreign businessmen.

Nevertheless, if there has been a loss of confidence in the immediate course of the British economy, most of the more important doubters are to be found very much nearer home. For quite some time now London has been talking itself into a pessimistic mood about the Heath government's management of the economy. The question that is being raised is not whether this government's economic policies are faltering, but simply why they are doing so.

This has not been an easy question for the City to answer. The Heath government has been doing or attempting to do almost everything the Tory textbooks have prescribed as sound economic philosophy. Efforts have been made to liberalise the tax structure and reform the industrial relations law. It has been plain enough, moreover, that the government is willing to encourage and enable the market mechanism to function more vigorously for stimulating investment while reflation demand. All this, however, did not prevent the business world from celebrating earlier this month the conclusion of Mr Heath's second year of office with a marked lack of enthusiasm for his government's prospects of success in energising Britain's economy. The official growth target of 5 per cent was widely discounted and openly scoffed at with the stock market suffering its sharpest one day fall since 1967. More serious and sinister, still, was a run on the pound which called for support by some £500 million on a single day. Since then the pound has known no peace and it came particularly under pressure during the last few days.

In these circumstances the Heath government can draw only limited comfort from the fact that, even after having paid off all of the £1500 million overseas debts it had inherited from the Labour administration, it had been able to see the country's resources doubled in the past year. The pound, of course, is not under siege in the world's exchange markets in the way it was in the period culminating in the devaluation of November 1967. The decision taken now to let it float freely makes it possible that should the pound be depreciated the authorities would be in a position to arrange what is known as a 'cold' devaluation, as against a 'hot' devaluation carried out under the fierce compulsions of a crisis.

It is of course not possible to say right now what exactly the British government would do in the days that lie immediately ahead, but a safe suggestion would seem to be that the pound would be allowed to float for some time until it is able to establish a relatively stable value for itself. This assessment seems reasonable particularly in view of the statement of the Chancellor of the Exchequer, Mr Anthony Barber, a few days ago that "there can be no question at the present time that the pound is not at an unrealistic rate". Actually the main economic issue for the Heath government now is not the shoring up of the pound but the shoring up of Britain's confidence in Britain's economy. The floating of the pound is relevant to this larger task only to the extent that it adds to the freedom that the Heath government must have for planning its domestic economic strategy. That strategy must seek a difficult package of results. Inflation has to be countered and growth stimulated while unemployment is reduced to acceptable levels. One of the most intractable problems here has been wage inflation. Indeed much of the weakness of the economic policy of the Heath government is to be traced to its political feebleness in coping with wage claims in a way which would avoid inflationary wage settlements or awards. So long as this political feebleness continues a recommendation that part of the answer to Britain's problem of inflation should be sought in an incomes policy clamped on the country by the government would remain an unrealistic prescription. Perhaps the best hope of progress might lie in the direction of consensus being evolved on a voluntary income restraint through tripartite discussions of government, labour and industry.

Meanwhile, as Lord Robins has pointed out, the value of money is depreciating in Britain at a rate which is without precedent, save in war time, in British economic history. The general index of retail prices, with 1962 as the base year, now stands at

over 160. What domestic inflation of this order must mean to the economy of a trading nation may be gathered from the fact that Britain's gains of competitiveness from the devaluation of the sterling in November 1967 and the revaluation of the Deutsch Mark in October 1969 were more than wiped out by early 1970. The seriousness of this trend gets further emphasized by the fact that export prices for machinery and transport equipment—the sector which makes up nearly half of all the

manufacturing exports of Britain—have gone up by 27 per cent since early 1970. Against this background, it is evident that whatever may be the decisions taken specifically with regard to the value of the pound sterling abroad, they will be only tentative in terms of the planning which the Heath government must now under-

Neyveli creates a problem

THE POWER situation in the southern region has suddenly deteriorated and a cut of 25 per cent in the consumption of electricity by high-tension consumers in Andhra Pradesh and Tamil Nadu has had to be imposed. The availability of power in Andhra Pradesh has been difficult for some time past with a growing demand and no great additions to generating capacity. However, with the export of sizable quantities from Mysore and Kerala, the cut was removed in the case of some classes of consumers. Kerala's supplies were transmitted through Tamil Nadu.

With the delay in the onset of the south-west monsoon and the low level of storage in the hydel reservoirs, Mysore had stopped supplies to Tamil Nadu some months back especially as it had to meet its commitments to Goa and Gujarat. Kerala, however, continued to supply sizable quantities to Tamil Nadu and Andhra Pradesh until it felt compelled to suspend completely export when its reserve declined to the low level of 150 million units.

The Tamil Nadu State Electricity Board was somehow managing to meet a growing demand by staggering agricultural loads and increasing its own thermal and hydel

take to stop the erosion of the worth of the currency of Britain in the hands of the people of Britain themselves.

Meanwhile, the government of India has to take a look at the rupee's relations with the pound sterling. If the latter is to float freely for any length of time, the Indian authorities will have to consider whether any consequential uncertainties in foreign exchange transactions will not be too unreasonable a burden for our trade to be asked to bear. Much would depend on the degree of fluctuation to which the pound sterling becomes subject. A reasonable guess could be that the movements are unlikely to be excessive. In that case the Reserve Bank's resources for handling the situation are unlikely to be seriously strained. It is, of course, too soon yet to consider whether the rupee should seek other moorings. As the pound sterling floats downward, more or less gently, we may perhaps sit back and quietly enjoy the modest benefits of a vicarious devaluation of the rupee. It cannot be said, after all, that India's exports will not be the better for such windfalls.

generation. Since its storage position in the hydel reservoirs was quite satisfactory after the end of the north-east monsoon last year, it was confidently expected that there would be no shortage of power in the current year and any shortfall could be made good by maximising generation at the Ennore thermal station and coaxing also the Neyveli Lignite Corporation to use its capacity more effectively. The inability of the latter to export power on the anticipated scale and a slight delay in commissioning the third generating set at Ennore have upset the calculations of the electricity board especially as it was not expected that the import of power from Kerala and Mysore would be completely unavailable.

With the storage in hydel reservoirs under its control around only 250 million units and a high level of consumption, as a matter of precaution the consumption of high tension consumers has been reduced by 25 per cent. This is the first cut in power supply after 1965 when there was a serious shortage for nine months. There was, of course, a temporary cut in 1970 for a few days as a result of a total shutdown of the Neyveli thermal station due to a labour strike. With the fast additions to the generating capacity in Tamil Nadu in recent years there should not have been any occasion for restricting power consumption if only Neyveli could generate power at an average of over 400 MW daily. The Neyveli Corporation, however, has been in a bad way in the past three years and

with lignite raisings at not more than 3.75 million tonnes, due to a breakdown of mining machinery, there has been a shortfall in export by over 300 million units in a year. The corporation should actually export around 2,400 million units even after meeting its own requirements against only about 1800 million units in a year. It is quite surprising that the central government has not taken energetic action to improve the efficiency of mining operations even though it was abundantly clear that the removal of overburden was not taking place quickly enough and the lignite bed could not be exposed at the desired rate.

It took a special committee to find out that at least 4.5 million tonnes of lignite should be available for helping the corporation to avoid heavy losses and enabling optimum power generation. The committee has affirmed that open cast mining is best suited for raising lignite and there should immediately be expenditure of Rs 8 crores for improving mining operations. Further outlay for increasing the output to six million tonnes is to be incurred after the preparation of a feasibility study. There is no need for any elaborate enquiry into the economics of mining lignite because the project has to be saved and the huge investment already effected prevented from going waste. It is not a question of running a high-cost show regardless of its economics. For, sales of electricity are now being made to the Tamil Nadu Electricity Board at less than six paise per unit when the cost of generation at Ennore on the basis of imported coal is over 8.5 paise per unit. It is also necessary to remember that a pithead power station relieves considerable strain on the transport system and the efficient functioning of the thermal station of the size of Neyveli has a stabilising effect on power availability in the whole region. In view of the developments in the current year and the likelihood of delays in the construction of huge projects immediate attention has to be paid to an improve-

ment in the operating efficiency of the existing thermal stations.

The power cut in Tamil Nadu may be shortlived with the regular functioning of the third unit in Ennore which has nearly double the capacity of the earlier units and the availability of irrigation discharges. What is, however, really important is the adoption of an overall view for planning immediately what should be done in the next few years. Even with a sharp increase in hydel and thermal generation by the Tamil Nadu Electricity Board from its own sources, it has not been possible to meet fully all demand without purchases from Kerala and Mysore. There has certainly been a shortfall on account of Neyveli's peculiar problems and some allowance has to be made in purchases from neighbouring states on this account. But the fact remains that consumption of power in Kerala, Mysore and Andhra Pradesh has also been rising at a fast rate with brisk implementation of rural electrification schemes and energisation of pumpsets. Kerala and Mysore may not, therefore, be in a position to export power except for peaking purposes until the Idikki and Kalinadhi projects arrive on the scene.

The Idikki project might probably generate some quantity of power by 1975 if all goes well. But Kalinadhi can be of some help only towards the close of this decade. It will be idle therefore to expect that Mysore will have an exportable surplus. On the other hand there will be a shortage and the neighbouring states should go to its help at least out of gratitude. There should also be no complication on account of the difficulties now being experienced in rushing water to the penstock pipes through the long tunnels. It is proposed to shut down the affected tunnel for repairs after the end of the monsoon period. While it is hoped that there will be no serious upsets and efficient technical guidance will be available, there can be an increase in total availability of power only if the construction work on the Idikki project is hastened and it is also decided to erect a thermal station in Kerala or Mysore. The remaining sets at the Ennore thermal station in Tamil Nadu will of course have to be erected without delay while examining the scope for augmenting the capacity of the Ramagundam and Kothagudem stations in Andhra Pradesh. Unless there is effective coordination of the activities of the four electricity boards and some new schemes are implemented on an emergency basis power cuts will be a regular feature in the coming years. In the light of the experience of Tamil Nadu which is power-hungry even after capacity for over 2,000 MW, including Neyveli, has been created, it will be wrong to expect that the level

of power consumption in Kerala, Andhra Pradesh and Mysore will remain low.

Both Andhra Pradesh and Mysore are anxious to execute rural electrification schemes ambitiously besides energising pumpsets in a big way. The development of industries is also taking place at a faster rate than in recent years in these two states while Kerala is anxious to promote big and small industries. The Tamil Nadu Planning Commission is proposing to double the generating capacity in its region to 4,000 MW. In the neighbouring states also additional capacity of at least 4,000 MW will have to be created which would mean that before 1978-79 hydel and thermal schemes having an aggregate capacity of 6,000 MW will have to be brought into being. The

existing capacity is only around 4,500 MW for all the four states put together. In view of the fact that there can be no surfeit of power at any stage anywhere in the country, for at least a decade, even with a spectacular growth in generating capacity, the warning given by the Tamil Nadu State Electricity Board's decision to cut power consumption should be heeded. The spectre of power famines talking the whole country is extremely discouraging at a time when it has been repeatedly emphasised by the central government and the Planning Commission that agricultural and industrial production should be maximised for achieving a faster rate of economic growth. The ambitious goals now being fixed can have meaning only if there are no bottlenecks on account of power and rail transport.

Ray's style of government

MR SIDDHARTHA Sankar Ray, the Chief Minister of West Bengal, has expressed his determination to streamline the state's administration; and, in the last three months, he has already taken some commendable steps in this direction. Officials have been warned of stern action against corruption, inefficiency and indiscipline. Some have been already suspended or dismissed, and a sense of urgency is being instilled into the various departments. But, despite Mr Ray's initiative and enthusiasm, it may take a long time before the administrative machinery can be brought up to a high level of efficiency, and effectively geared to cope with its enormous responsibilities.

The bane of West Bengal's administration in the past has been the frequent interference in its affairs by political parties. Whether in or out of office, most parties have tried to exert their influence on the administration in various ways. Mr Ray has said that some five per cent of the employees still believe that they can continue their political activities even while remaining in the employment of the government. He has told the employees that unless they give up their political activities within two months they would be asked to quit.

But how is Mr Ray going to deal with the Youth Congress, which also claims to have an effective voice in the state's administration? The leaders of the Youth Congress have their own ideas about enforcing integrity and discipline among government officials, recruitment by the public sector and by the private sector, the levels of salaries and wages that should

prevail, and on other topical issues. It is indeed a healthy sign if the Youth Congress takes a keen interest in the problems of administration but when it resorts to pressure tactics in various forms, it is high time that the Chief Minister did something to halt this trend.

An interesting innovation introduced by Mr Ray is to announce, at the beginning of each month, targets to be reached in that month as well as the achievements of the previous month. This practice is useful to make the administration alert and to bring it close to the people. But public opinion should see to it that the monthly targets are actually achieved. For example, when Mr Ray claims that during a particular month, a certain number of villages were electrified, is he sure that they actually get the electricity? Doubt may arise in this regard because of the widespread and prolonged load-shedding that continues to take place in the state, especially in the Calcutta area. When even major industries like jute are acutely feeling the impact of power shortage, one wonders to what extent the people in the villages are getting electricity even after having been electrified! There have been too many hospitals without doctors, schools without teachers, and wells without water. When the Chief Minister claims that so many small-scale industrial units have been set up in a month, one would like to know how many of them are really viable and have started production. The other fields in which monthly targets are announced relate to the construction of houses, roads, irrigation schemes and various development projects. It would also be useful if the Chief Minister gave details every month of the number of the closed units that have been reopened, and the sick ones that have been rehabilitated.

Mr Ray's decision to give more impor-

tance to the improvement of the administration in the districts deserves appreciation. West Bengal's districts have been badly neglected for too long. Most of them are grossly deficient in respect of even the elementary amenities. It is hardly surprising therefore that few industries flourish in most districts. In fact, the government has very little reliable data in regard to the agricultural and industrial development of the various districts. Mr Ray has decided to undertake three-day tours every week in the districts. It is hoped that, at the same time, the Chief Minister will give adequate encouragement and support to the district authorities in the discharge of their duties without fear or favour. The industrial development of the districts is expected to gather momentum in the next few months as a result of the various incentives offered by the government. It is therefore all the more important that the administration in the districts should be made quite competent to deal with the problems of industrial growth.

Mr Ray's administration will, however, be judged by the extent to which it is able to create opportunities for employment. Though the magnitude of the problem of unemployment is colossal, it should not be difficult to solve, considering West Bengal's immense potential for industrial development, the assurance of generous assistance from New Delhi, and the eagerness of many entrepreneurs to invest in this state. But the government is not helping the generation of more employment by the manner in which it is pressurising employers to prefer "the sons of the soil".

If the government is really keen about this matter, it should clearly announce its policy. It should define "local people" and provide guidelines so that employers can know whom, and how, they should recruit and the unemployed can also understand where to look for jobs. But it seems that the government is not going to clarify its policy in this regard because in whichever way the "locals" are defined, it is bound to create embarrassment and complications. Perhaps, it is the intention of the government that employers should take the hint from ministerial speeches and, accordingly, give the maximum

encouragement to the "sons of the soil", as this term is generally understood. But so long as the government continues to be deliberately vague in this matter, and at the same time, exerts pressure in various forms on employers, it is doubtful if industrial expansion can take place on the scale and the speed that is necessary to create new jobs on a massive scale. West Bengal happily has been free from the curse of provincialism and it will be most unfortunate if, when the state is poised for economic revival, divisions and differences are sought to be created between the so-called insiders and outsiders. Incidentally, it is significant to note that Assam also is intensifying its agitation to give preference to the local people in employment and this movement is likely to affect the Bengalees who have migrated there in search of jobs.

The government of West Bengal has announced that it is drawing up its fifth five-year Plan on an ambitious scale, involving an outlay of over Rs 600 crores, which will be about double that of the fourth Plan. The state's planning board, set up recently, is expected to complete its draft for the fifth Plan shortly. Whatever may be the size of the Plan, West Bengal can implement it successfully only if its machinery of

government is able to work with far greater speed, vigour, and coordination than what it is capable of doing at present

"Poverty is the greatest single disability of Bengal", wrote Mr R. G. Casey who was its Governor between 1944 and 1946. He observed, in his memoirs published in 1947, that for about 50 years, the government of Bengal had been starved of money. He added, "Money is the fertiliser that Bengal needs most, and there is no soil in the world that will respond quicker than the soil of Bengal". Today poverty in this state remains as acute as, or perhaps even worse than what it was in the days of Mr Casey. But there is one difference. Money seems to be no longer a problem for West Bengal. In fact, in the last few years there have been many instances when the state government had to surrender sizable sums of money received from the government of India. The Prime Minister has repeatedly assured West Bengal that no development schemes in the state need suffer for want of funds. If therefore the state government also tries its best to mobilise its resources and its machinery of government is continuously improved, Mr Ray and his colleagues should not find it difficult to justify the confidence that the people have reposed in them.

Eastern Economist 25 Years Ago

July 4, 1947

One of the important aspects of partition is the future of the currency system and the division of the sterling balances between India and Pakistan. As regards the Reserve Bank of India, when Pakistan becomes a sovereign State, it shall be open to Pakistan either to utilise the present Reserve Bank of India or to establish its own separate Central Bank. Although Burma was separated from India under the Government of India Act, 1935, Burma continued to be under the currency system of India and used the Reserve Bank of India as its monetary authority. It was only a few months back that Burma decided upon making a separation so far as currency was concerned and upon making its own arrangements. It is doubtful, however, whether the newly

created sovereign Pakistan State will be in a mood to utilise the Reserve Bank as its monetary authority with all its advantages, because the present communal temper does not give much promise.

The division of the sterling balances between India and Pakistan is one of the most thorny questions because sterling balances represent our foreign exchange resources and, therefore, our reconstruction chest. In settling this question there is no problem of the sterling balances being divided between India and Pakistan on the basis of population resources, taxable capacity area or a combination of one or more of these criteria.

Cloth control : options

TWO IMPORTANT issues are currently before the cotton mill industry—the controlled cloth scheme which came to an end on May 31, 1972 and the cotton mill industry's export target for 1972. Both these questions are linked together, in that the answers to both must needs be determined on the basis of the total quantum of cotton imported from abroad.

The controlled cloth scheme came into force in June, 1971. As per this scheme, the cotton mill industry was required to supply controlled cloth at May, 1968 prices [the Minister of Foreign Trade recently confirmed in the Lok Sabha that "there has been no increase in the prices of controlled cloth (coarse and medium B) since May, 1968"]. Mills producing controlled cloth were, however, given a subsidy to compensate for the rise in production cost, and this has ranged from 50 paise per sq. metre for the first two quarters (June to August and September to November, 1971) to 30 paise for the latest quarter (March to May, 1972). Between December, 1971 and February, 1972, the subsidy was of the order of 35 paise per sq. metre.

The major portion of the funds from which this subsidy came was raised by the industry itself in the form of a voluntary levy on foreign cotton. (Incidentally, this levy is a twin-purpose levy, in that it also happens to be the source for promotion of textile exports). Thanks to the bumper harvest of Indian cotton during the current cotton season, imports of foreign cotton have been cut and with that the income from the levy also has fallen. The industry is, therefore, naturally concerned whether it can raise sufficient funds to take care of both controlled cloth subsidy and the country's exports of cotton textiles. Each of these, it is needless to add, is of vital importance to the country's economy.

The subsidy scheme never found unqualified acceptance with the industry, which favours a straight-

forward rise in prices instead. (The industry agreed to the scheme finalised by the Ministry of Foreign Trade in May, 1971, as a gesture of goodwill, pending the report of the Bureau of Industrial Costs and Production on controlled cloth). A suitable increase in the price of controlled cloth, coupled with a rational basis for pricing the controlled cloth, according to spokesmen of the industry, would not only eliminate the need for subsidising controlled cloth, but also make controlled cloth available to the consumer on a steady basis.

"What is a suitable price"? it may be asked. It is easier to say what is not a suitable price than to define what is. Prices fixed in April, 1967, according to the Tariff Commission formula, were certainly not what one would deem to be "suitable prices". Nor were the prices fixed in May, 1968 when an *ad hoc* increase (of two per cent) was granted, inasmuch as this increase fell very much below the increase in costs between April, 1967, and May, 1968. Those who have been demanding a cut in cloth prices on the plea that cotton prices have fallen since must be made to realise that even the cotton prices prevailing today are higher than those in April, 1967. Other costs also have risen appreciably in the meantime.

It is against this background that some of the options now exercising the minds of people in the mill industry have to be judged. The more important and, in fact, the really relevant ones are the following three :

- (1) to find other sources of finance, if any, for producing controlled cloth on the basis of a subsidy;
- (2) to place an obligation on mills to produce controlled cloth by reactivating the Controlled Cloth Order, and
- (3) to make certain changes in the lapsed controlled cloth scheme by offering the facility of inter-mill transfers in obligation for the manufacture of controlled cloth.

The choice, here, lies mainly between

submitting again to a full-fledged control by government and operating a voluntary scheme mutually agreed upon by the industry among its units and also by the industry and the government jointly.

Had the government of India announced the revised prices for controlled cloth, the industry would doubtless have been able to arrive at a satisfactory decision on the question of controlled cloth production, especially about inter-mill transfers of obligation.

As the industry is structured today, not all mills are equally well-equipped to manufacture controlled cloth or to market it. Those who are would willingly accept the obligation to manufacture the controlled cloth varieties, provided they find the game worth the chase. Those who are not so equipped may also be glad to let those who are well-equipped to take on their obligation, provided it is worth their while. Not until the new prices of controlled cloth are known could either of these interests take a final decision. From this point of view, one feels the Indian Cotton Mills' Federation (ICMF) would have done well to postpone its proposed meeting to consider this question until the government's decision on prices of controlled cloth come to be known.

The second important question before the industry today is the future of cotton textile exports. On the face of it, in the context of the uncertainties created by the entry of the UK into the Common Market, the trend of exports so far in 1972 would appear to be satisfactory, but this is after taking into account the special exports to the USSR under the cotton conversion deal also. Thus, up to the end of May last, exports of mill-made cotton textiles amounted to Rs 56.49 crores, as against Rs 42.97 crores for the corresponding five-month period of 1971. But even assuming that the average monthly rate of exports of these five months continues to be maintained, the total for the year would fall short of the export target of Rs 142 crores accepted by the industry. Actually, the flow of export orders has been on the decline of late.

Modernisation of trade union movement

M. R. Meher

IT HAS been generally recognised that the traditional role of trade unions, that of opposition and furtherance only of group interests, is out of date and inadequate in the present context. The country is confronted with the problems of unemployment and under-employment, and a steady rise in consumer prices. There is urgent need for growth in the economy and increased production of goods and services. Has the trade union movement lived up to its social responsibilities in this context? How far has the movement been progressive or regressive as an instrument of legitimate labour advancement? A look at the trade union movement from this aspect is overdue and an attempt is made in this short article to make a broad assessment.

basic needs

The National Labour Commission has, in its report, referred to the basic needs of the movement. Among the basic needs is mentioned offering responsive co-operation in improving the levels of production. The commission has emphasised that unions should keep the well-being and progress of the community constantly before them even in the midst of their endeavours to help the working class. The unions have a stake in the success of the national Plans for economic development, since these are formulated and implemented as much for maximising production as for distributing the product in an equitable manner. It is only thus that they can progressively become instruments for constructive purposes.

Judged from these standpoints it is evident that unions in general have, in the pursuit of their aims, not lived up to these responsibilities. They have been only demands-oriented, in no wise duty-oriented, in most cases. Not a day passes without ready resort in some industry or other to direct action, both in the private and the public sector as also in public utility industries, without any regard whatsoever for national interests, the effects of their policy

on the state of employment or the hardships that are caused to the community. Strikes, go-slow and the so-called work-to-rule which is a species of go-slow and even violence against the managerial staff have been resorted to press unreasonable demands and force the employers to concede what is often beyond the capacity of the industry, and also to prevent the management from taking action against persons guilty of serious misconduct. Except politicians who have an eye on votes, public opinion has no sympathy with these attitudes of industrial labour which has shown to be bent on securing advantages which cannot be secured except at the cost of other sections of the community. But public opinion has in most cases been unable to assert itself. Government policy has assumed the unions to be the weaker side needing intervention on their behalf by the government, but as a matter of fact, in large industries with organised unions, the balance of power has, as in other industrialised countries, shifted to the unions.

sense of service

One would have expected that the public sector would at least evoke in the workers and unions a sense of service to the community. On the contrary there is more intransigence and ready resort to direct action to extract the grant of demands, however, unreasonable, from the "model employer". In the private sector there is the limiting factor restraining unions, viz., that forcing the employer to give wages and conditions of service beyond the capacity of the industry may result in closing down of the industry and would ultimately harm the workers. But this restraint does not operate in the public sector as there is no question of closing down. The tax-payer would continue to bear losses.

At the conference convened by the union Labour Minister in May, 1971, the Prime Minister called upon both labour and management to end the present state of anarchy in labour-manage-

ment relations. She pointed out that it was understandable if organised labour demanded higher wages and other benefits but these demands had to be pursued within a policy framework which paid due regard to the general state of the economy and the under-employed. The conditions in the country were such that to be employed was itself a privilege. These just observations met with little response and were even resented by some hard-boiled trade unionists. The union Labour Minister's appeal at the conference for increasing productivity and emphasis on productivity bargaining also evoked no response, and some of the labour leaders even suggested that increasing productivity was not their business.

sharing responsibility

At a recent seminar on the "Modernisation of the Trade Union Movement" the union Labour Minister observed that "it was time that trade unions thought of sharing the responsibility of production along with demanding a share in the management." He went on to observe that when the state was eager to concede legitimate demands of workers, for example having worker directors on some public sector undertakings, they must be equally responsible for production and productivity, but he was very sorry that neither the trade unions nor the workers were prepared to share this responsibility.

How can society protect itself against the parasitical tendencies that have grown up in trade unionism? Exhortations to workers and unions on their social responsibilities is not likely to achieve anything. In the long run it is only the collective bargaining power of the employers that can do something to combat these tendencies, provided undue pressure is not brought on employers by the government to purchase peace at any price. It is understood that the government will be introducing a bill to revamp industrial relations in the light of the Report of the National Labour Commission and the recent discussions between the represen-

tatives of the three central trade union organisations, viz. the INTUC, AITUC and HMS. The formula on bargaining evolved in the discussions, where there is no statutory provision at present would help to reduce those evils in trade unionism which have arisen from multiplicity of unions and inter-union and intra-union rivalry. The recent formation of a national council by the INTUC, AITUC and HMS would also help in that direction and lead to more co-operation and co-ordination between unions.

Before concluding, a brief reference may be made to the question of outsiders in trade unions and the hold of political parties containing trade unions within their power and influence. Decisions on matters of trade union policy and action

are often taken by outsiders who may be political leaders, while the lower trade union officials, not to speak, of the rank and file of workers, have little to do with the decision-making process. The injection of politics in trade unionism has harmed employer-employee relations. The National Labour Commission has observed that the issue of outsiders in trade unionism should solve itself as workers become more educated and conscious. Already in some white collar unions and in newly developing industries the unions are managed effectively by persons from the rank and file. This trend should gather momentum. With the spread of workers' education and a greater emphasis on training of trade union workers, internal leadership should develop. Compulsory recognition of majority unions

to represent workers and negotiate with the management would vest union officials with greater responsibilities and give them the necessary competence to build up internal leadership. Outsiders in trade unions should be made redundant by forces from within rather than by legal ban. It is a question whether these proposals go far enough. There is a point of view, expressed, for example by no less a person than Mr V. V. Giri, President of India, that outsiders should be eliminated from trade unions. The veteran trade unionist, Mr V. B. Karnik, has also expressed the view that reliance on outside leaders has led to some undesirable consequences and however, necessary it may have been in earlier years, it should be ended as early as possible after trade unions reach a certain stage.

Social responsibilities of business

S.K. Jain

THE CLASSICAL economist believed in self-interest as the motive behind all economic activities and 'money-making' rather than the production of goods as the purpose of business. Production of goods for them was only incidental to the making of money. To their way of thinking end was all and means meant nothing. Maximisation of profits was their sole objective and its use their personal privilege.

With the spread of education and adoption of corporate form of organisation it was realised by some business leaders in western countries, particularly in the United States of America, that profit-making was only a means of achieving certain objectives and a measure for assessing the economic efficiency of business enterprise rather than an objective in itself. It was further pointed out by social scientists that the means employed to earn profit and the purposes for which it was used were as important as the making of profit itself. "Today there are two separate and fairly well-defined business ideologies; the classical business ideology and the managerial business ideology. The classical ideology is the foundation of the profit ethic and the managerial ideology is the foundation of

social responsibility ethic".¹

Of late the role of business in modern society has been a topic of widespread discussions and an attempt has been made here to prove that a firm can attain greater degree of economic efficiency by realising and discharging its social obligations. "The modern manager should act more like a political office-holder than an entrepreneur. He is responsible to several constituencies: owners, workers, suppliers, dealers, customers, government and the local community. He should use the power he exercises in the firm's name to balance the interests of all these constituencies."²

A firm in order to carry out its economic activities requires, besides other things, manpower. Manpower planning and forecasting ought to engage, therefore, the utmost attention of the firm. Attempt should be made to select a right man for each job with the help of scientific staffing techniques. Recruitment on an arbitrary basis may have an adverse effect on the economic efficiency of the firm. An employee should be given a chance for improvement by providing him enough training and development opportunities. Promotions should be

based on sound considerations like quality of performance and seniority. Salary or wages paid should be adequate and determined on the basis of collective agreements and/or wage board awards. Both group incentive and individual incentive plans should be introduced to motivate each individual employee to use his maximum efficiency for attaining firm's objectives.

Working conditions provided should be such as to protect the health and efficiency of each individual employee. His participation in decision-making should be not only welcomed but vigorously sought in order to give him an opportunity to satisfy his urge for self-expression and use his energy for constructive purposes. Adult education programme should be sponsored to make an employee realise his responsibilities towards his family, the firm and the consumers beside the public in general. Provision of necessary knowledge about organising union activities without having to depend on outside help will greatly benefit the workers. Assurance of work stability will make each employee think of long-term association and identification with the firm.

Recent studies have shown that jo

POINTS OF VIEW

satisfaction results in a strong motivation to workers. "Man needs to find significance in what he does. Unconsciously, at least, he needs to feel that he has created something, served others, and left his mark upon the world."³

If an employee is treated as a friend and a partner his interest in work and consequently his efficiency is bound to increase. Increased efficiency will make for higher production and higher profits. Benefits from the increased size of the economic cake will accrue both to the firm and its employees without causing any harm or loss to either party.

Shareholders are a source of economic strength to the firm as suppliers of capital and customers of its products. The firm should use its resources effectively so as to be able to earn a reasonable profit for them. Besides giving a fair return on the capital invested and risk taken, the firm should supply to its shareholders factual and true information continuously. The shareholders also have certain obligations. They should encourage the firm to pursue a dynamic policy and to plough back sufficient profit for research and expansion.

Consumer satisfaction is the primary and ultimate aim of all economic activities. This involves fair pricing of quality and standardised goods. Suitable channels of distribution should be established and arrangements made for providing after-sale service at reasonable rates. Middlemen's profits should be regulated and care taken to ensure that they supply the firm's products to the consumer at a price fixed by the firm in unadulterated form. Sales promotion techniques like advertisements should be honest and factual and should not mislead the innocent customers. The advertisement expenses should be bare minimum, for, they are ultimately paid for by the consumers. Conscious efforts should be made by the firm to prevent its middlemen from creating artificial scarcity conditions with the idea of charging inflated prices.

Informal meetings, with a few local consumers and community members may be arranged by a firm from time to time for feedback purposes.

Increased industrial activity has, on the one hand, helped in economic growth and, on the other, given rise to the problem of environmental pollution. Industrial sewage and effluents have turned many rivers in India into poisonous nullahs.

New business units should not be

located in crowded and congested areas of the country. The Planning Commission has recently selected 78 industrially backward districts in 14 states. By locating an industrial plant in any one of these districts a businessman would help in achieving the national objective of balanced economic growth of various regions of the country and at the same time entitle himself to get concessional financial help from various financial institutions.

A firm should welcome ITI trained persons sponsored by the state government concerned for industrial training in designated trades as per the provisions of the Apprenticeship Act, 1961. It would be a great service to the community if a firm accommodates a physically handicapped person who has been given necessary vocational training by a vocational rehabilitation centre, short-service commission officers who were recruited during a war and subsequently released by the government also need similar help and accommodation.

A firm should act honestly in maintaining its financial statements and records and pay all taxes to the government concerned in time. Government depends to a significant extent on tax revenue for financing its public welfare activities. A firm should also take note of problems of unemployment and over-population faced by our country. Its schemes of rationalisation should not displace present employees or limit the number of new job opportunity likely to arise as a result of the proposed expansion of its economic activities.

A firm which sincerely discharges its obligations towards its employees, shareholders, consumers and public at large will not be a loser from economic point of view. Such a firm would benefit from increased efficiency of its employees and greater demand for its products. In simple terms it will produce more, sell more and consequently, earn more. The employers and the employees will enjoy the benefit of creating better social image and thus satisfy their need of social approval and recognition.

The directors and managers of a firm should act as trustees for the society. It is unfortunate that the idea of trusteeship has not been accepted by the business community in the country of its birth in spite of Gandhiji's efforts to popularise it. Mr Arvind Mafat Lal, recipient of Business Leadership Award, 1970, pointed out that one of the most distressing developments in India was the abdication of

social responsibilities by the business community.⁴ "Similar trusteeship ideas have been debated upon or worked into the fabric of business organisations in advanced countries. In the US, there seems to be a prevailing trend to equate social responsibility with enlightened self-interest."⁵ To quote William T. Gossett, Vice President, Ford Motor Company, "The basic real interests of the corporation are indivisible from those of the community at large. The modern large industrial corporation is in some respects a public institution...it holds power in trust for the whole community."⁶ General Electric Company has specifically stated that its corporate objectives include "a greater social content" by bringing its technological strengths to bear on urgent problems of society. Ford Motor Company has stated four "challenges" which will be prominent in the firm's thinking in the 1970s reduction of environmental pollution, provision of full equality of opportunity for minority groups, reaction to consumerism, and creation of safer automobiles.⁷

Progressive firms in India should follow the lead given by corporate leaders such as General Electric or Ford Motors. They should include a social objective clause in their policy statements and set specific social goals to be attained in a planned period of time.

Big firms may create a department of social affairs. Such a department would effectively promote the development of a planned, integrated approach to handling social issues which confront these firms.

Two communist economies battling on

Poland

AFTER VIRTUAL stagnation in 1970, the Polish government is giving priority over the next few years to completing existing projects, eliminating bottlenecks in supply and making investment more effective in the short-term. On the basis of nine months' figures, when industrial output rose at an annual rate of 7 per cent and goods supplied to the consumer market increased by a tenth, targets for 1971 as a whole are estimated to have been more than fulfilled so that the economy in 1972

output of grain and livestock fell sharply, the 1971 harvest was satisfactory and this should help to improve export earnings from farm produce; indeed Poland's foreign currency position strengthened markedly towards the end of last year.

Mr Gierek has continued to consolidate his position as party leader since he succeeded Mr Gomulka in December, 1970. The new government came into being after widespread discontent arising from the former regime's neglect of consumer's interests. Its isolation from, or at any rate indifference to, public opinion and the imposition of very steep increases

how, to be combined with a tight political control.

Under the revised plan for the current five years, investment in consumer goods is to be increased by 60 per cent, exceeding for the first time proposed expenditure on heavy industry. Within heavy industry, investment is to be increased by 50 per cent with greater emphasis on special categories such as electronics, electrical and building machinery, computers, medical equipment and engines. The Comecon Investment Bank has granted Poland some \$ 16 million to build three factories for the output of precision machinery, small electric cars and parts. Spending on services is also to be expanded by just over a half with redeployment of the surplus labour which should be released by mechanisation. This is in interesting contrast to what goes on in many capitalist countries, where redundant workers expect adequate unemployment pay to compensate them for lost jobs rather than that they should learn new techniques and take new jobs in new industries. In the consumer sector, an important project is the production, under licence from Fiat, of a new small car which is to come on to the market in 1974; an initial output of 150,000 a year is planned eventually to reach 300,000 a year.

Social conditions

The most urgent social problem facing the Polish authorities is the acute housing shortage—at least one million families are estimated to be on waiting lists for flats. It is hoped to complete 1,075,000 dwellings during the plan, an increase of a quarter compared with the previous five-year programme. Real incomes have arisen more slowly in Poland over the past decade than in any other Comecon country; under the 1971-75 plan, however, there is to be an increase of nearly a fifth, compared with a rise of less than nine per cent in the previous programme. Indeed, personal incomes expanded much more rapidly than industrial output in the first three quarters of last year, partly as a result of increased pensions and family allowances, partly because of increases of up to 30 per cent for lower workers, and partly because of a substantial increase in contract prices paid to farmers. In contrast, a Soviet loan granted to the present administration

should develop from a considerably strengthened base.

In an effort to encourage farm output, prices paid to producers of beef and milk were raised last year and the previous scheme of compulsory deliveries of produce was discarded in favour of long-term contracts. With a world shortage of beef, Polish farmers who concentrate on fat stock should do well in the next year or two. In addition, special tax reductions for the purchase of land have been announced—it is estimated that two million acres are unused because people are reluctant to create large farms, doubtless from fear of attracting attention as being "too rich for a socialist state" and drawing down confiscatory taxes on themselves. Some 85 per cent of cultivated land in Poland remains privately owned, and although there are some 250 acre holdings, the average is only 12 acres. Following two disastrous years, when

in the price of basic foodstuffs culminated in serious riots in the Baltic ports and the threat of a national strike. "Technocrats" and experienced managers are now playing a much more important role in planning and there had been a gradual streamlining of Communist Party membership, partly because the new administration took over within the framework of the party, and there was no threat of 'counter-revolution', and partly because the impetus for political change came from the workers—not from suspect academics or professionals—it has so far been supported by the Soviet Union, both politically and financially. However, no erosion of party authority over the economy (on the Hungarian model) is likely to get Soviet backing. Any change to a more realistic economic approach, necessary if Poland is to carry through its industrial and technical revolution with resources limited by a basic dependence on an inefficient agricultural system, will have, some-

early in 1971 made it possible for food prices to be adjusted in March 1972, to the levels prevailing before the increases imposed in December, 1970.

Trade Figures (in \$ million)

	Exports	Imports	Balance
1968	2,858	2,853	+5
1969	3,144	3,210	-66
1970	3,547	3,605	-60

Imports from the west are planned to expand rapidly over the next few years and there is also to be more co-operation with western firms in industrial ventures. A more selective import policy gives priority to the purchase of technical equipment, grain and fodder concentrates, raw materials and consumer durables; imports of consumer goods and food products are to increase by 75 per cent, compared with a total growth in imports of 60 per cent.

Concern over UK's action

A trade agreement, signed with the United Kingdom in April, 1971, is to run until the end of 1974, and several large contracts are being negotiated with British companies. There is, however, concern over the effect of British entry into the European Economic Community on Poland's traditionally large market in the UK for agricultural produce, particularly ham, bacon, eggs and butter; it is expected that earnings from these will fall by some £20 million. Nevertheless, UK suppliers are offered major opportunities to provide plant and equipment, industrial processes under licence and consumer goods. An important ten-year contract was agreed in 1971 after several years of intensive negotiation with British Petroleum for the supply of three million tons of crude oil annually. The high cost of transport of oil from the USSR, together with mounting demands on Soviet supplies, has been reflected recently in Polish measures to diversify sources of supply; in addition, a second refinery with a capacity of six million tons a year is being built at Gdansk to supplement the ten million tons a year refinery at Plock and a third will be needed before the end of the 1970s.

Import requirements must be approved by the planning authorities. Commercial transactions with non-communist countries are conducted through government foreign trade organisations to which the necessary foreign exchange is made available.

There are no difficulties with payments

for exports to Poland, provided the terms of contracts are strictly observed.

II China

The new foreign policy of China, reflected, for example, in the visit of President Nixon to Peking, is one indication that policies associated with the "Cultural Revolution" have declined in importance, although the new political pattern is still unclear. During 1971, however, there were a number of signs that a reform of the administrative structure was under way and the names of several new ministers were announced.

There are indications that the economy has now recovered ground lost during the "Cultural Revolution"; indeed it may be moving ahead rapidly. Figures calculated in Japan suggest that China's national income grew by 10 per cent in 1970, and figures announced for 1971 show that the output of steel reached 21 million tons compared to 18 million tons for 1970, while the output of crude oil and of chemical fertilisers rose by 27 and 20 per cent respectively. Last year marked the beginning of China's fourth five-year Plan. No official programme for the period has been published but it became apparent from comment during the year that agriculture and large-scale industry are to receive priority and that emphasis upon basic heavy industry is to be given at the expense of previously important light industries such as electronics. There have also been indications that it is hoped to make each area self-sufficient in major industrial products such as iron, steel and chemicals. This may reflect difficulties in matching supply to demand, but it also suggests that the government is still very concerned with defence.

Coal remains the main source of energy but the output of crude oil has increased and the chief fields appear to be expanding output considerably. The bottleneck to the building up of a petro-chemical industry may therefore occur in refining, which is believed at present to have a capacity of some ten million tons per annum. Attempts are also being made to build up a modern and comprehensive transport system, while in the textile sector a man-made fibre industry is developing quickly.

Agriculture remains China's largest industry and figures released recently suggest that grain production for 1971 reached 246 million tons compared with 240 million tons for 1970 against estimates of 200 million tons per annum in the second half of the 1960s. Overall it has been estimated that for 1970 agricultural pro-

duction rose by some 10 per cent which because the increase in grain output for that year was only 2 to 3 per cent, suggests that substantial gains were made in livestock, market gardening and other crops. Despite increased production, however, the import of agricultural crops, such as wheat, is expected to continue.

The period to 1980 is seen as one for the mechanisation of agriculture in order that progress should not be slowed as the once-for-all benefits to be obtained from irrigating new crops, such as winter wheat, and better agricultural practice are gained. So that this may be achieved, however, a larger part of the surplus now arising from agriculture must be ploughed back into investment in the rural areas. Allied to this problem is the form of social organisation which is best suited to current farming needs and strategy. The growing surplus in many communes is provoking a crisis, because these centres wish to retain a larger proportion for themselves; this appears to be contrary to official policy and may also act as a deterrent to growth in the long term. A debate as to the policy to be adopted is continuing, but the need to ensure that agricultural output continues to expand is likely to entail during the period of mechanisation, up to 1980, the introduction of some form of incentive system.

Finance and banking

The financial and banking sector of the economy functions only within the context of the pattern of national planning and it appears that the central government is urging self-financing for each district and that profits from one enterprise should be used as capital investment in another venture. The control by the government of much of the economic life of the country means that standard western financial methods of accounting capital allocation and the measurement of efficiency are not applicable to China, but it is thought that the new economic Plan has sought to introduce economic accounting and investment appraisal, thus putting capital spending under tighter review. There has also been criticism of banks for failing to supervise strictly the activities of organisations to which they were lending money.

I should have thought that Mr A. N. Banerjee, Director General of the Indian Bureau of Public Enterprises, [who was reported on page 1057 of *Eastern Economist* dated May 26, as revealing that the gross return on the total capital employed in India's state enterprises was 3.9 per cent before provision of interest and taxes on profits wherever (sic!) made] might be interested to compare notes with his Chinese opposite number to ascertain which of the two was losing most public

money in the shortest time.

The amount slated for investment to carry out the new Plan ensures that the demand for capital will exceed supply for some considerable period. Because national revenue depends largely upon profits from states enterprises which supply some 90 per cent of the budget revenue (no personal taxes exist), the amount of capital investment which the government can provide by itself is therefore unlikely to be capable of being increased greatly without upsetting the current price structure. The function of the banking system as a collector of personal savings is likely therefore to be more important than ever.

All foreign trade is managed by the government through a Ministry of Foreign Trade and is, therefore, politically controlled. Although China issues no figures on trade, it is estimated that in 1970 foreign trade reached \$4,000 million, a rise of 8 to 10 per cent on 1969 levels, but estimates of the 1971 total suggest that the level fell by about three per cent. In part this represents a lower level of wheat imports, especially from Australia, during the year. It is thought that in recent years imports have exceeded exports although the reduction in grain imports during 1971 may have given rise to a surplus for that year.

A large part of trade is conducted via the Chinese Commodities Fair, which is held twice yearly. In case you thought of going, I must point out that only businessmen officially invited can attend. Foreign businessmen attending during 1971 came from some ninety countries. Despite the recent more favourable climate for trade, China continues to watch political attitudes towards herself and conditions have been laid down for trade with both the USA and Japan. Recently, there has been an attempt to extend the trade carried on in renminbi; it is not linked to gold but its stability in contrast to the currencies of other countries is being emphasised and there is growing pressure to draw up trade contracts in the currency. The ability of Chinese banks in Macao and Hong Kong to open savings accounts with capital and interest payable and repayable in Hong Kong dollars or renminbi may indicate that China intends the currency to circulate outside China as well as being used as a unit of account.

The performance of British exporters to China has been disappointing, especially during 1971, but the appointment of an ambassador to China should help a revival of trade. The main commodities exported to China in the past have been manufactured goods, non-ferrous metals and machinery and transport equipment. The

present amounts of electrical machinery and chemicals exported to China suggest, however, that an expansion of trade in these goods is possible. A plan for a trade exhibition in Peking during 1973 could provide the opportunities to enter the market for firms so far without trade links, and some five hundred British firms have already expressed interest. In the longer term, the Chinese desire to keep trade with each country in approximate balance may limit the expansion of British exports, because Britain may find it difficult to raise imports from China either rapidly or by sufficient amounts; this problem is not, of course, special to the UK but applies to all countries ready to trade with China.

Import requirements are decided by the authorities, and all foreign trade is conducted through state trading corporations. There are no difficulties with payments for exports to China, provided the terms of contracts are strictly observed.

The publication includes economic and trade profiles of 109 countries with enlarged coverage. Each country profile provides information of practical interest on

- * Economic Perspectives
- * Monetary Policies and Banking
- * Import Policy
- * Exchange Systems
- * Trade Agreements
- * Trade Prospects
- * Investment Opportunities
- * Tariff Concessions Under GSP

An absolute MUST for those interested in furthering their business with countries abroad. Is particularly useful to exporters, importers, chambers of commerce, trading bodies, embassies, researchers and universities.

The progress of VAT

E. B. Brook

Vienna :

ONE of the most deep-reaching and intimate changes that is being wrought in western Europe by the coming rearrangement of its economic grouping is a new system of taxation. This new system is no new device to "soak the rich" or to make such homely relaxations as smoking, drinking or entertainment more expensive as a slight disincentive but one that will effect every man and woman in the countries adopting it. The Value Added Tax, as it is called in English, or VAT, was invented—as were many Market devices—in France and bears all the coldly logical characteristics of that country. It is due to be fully operative in all Common Market countries and those in west Europe which have association with it by January 1 next year.

So far nine countries have already adopted VAT, the latest being Austria whose Parliament adopted it recently. According to the Common Market directives all member countries were to have introduced the tax by January 1, 1970, but there have been laggards, notably Italy which has not introduced VAT, or any equivalent of it, yet.

There are many variations in the form of Value Added Tax adopted, but the general effect is to make everyday life more expensive for the poorest as well as the richer. In Austria it is estimated VAT or *Mehr wertsteuer* as it is known in German, may raise the cost of living by 16 per cent; since official estimates of this type are usually on the optimistic side, it is reasonable to think all who live in Austria will be paying out one-fifth more for many articles next year than they are at present. The effect in Norway which introduced the tax on time in 1970, is even more expensive and France itself carries the onus of its own invention by a standard tax as high as 23 per cent.

The result of the new form of taxation varies considerably according to the exact form in which it has been adopted. Lucky Luxembourg, that smallest member of the Market and tiniest component of the Low Countries that fairly rolls in prosperity, gets away with a standard tax of only eight per cent and as low as four per cent on many articles. Federal Germany, not quite so prosperous, takes the tax as high as 11 per cent and as low as 5.5 per cent, Holland varies between 14 per cent and four per cent while Belgium and Sweden take the tax as high as 18 per cent.

There is much variation between country and country in method of applying the tax and the Market directives leave much room for choice of administrative application. There are luxury and reduced rates, some exceptions for small businesses if governments choose to adopt them (some have not), some special treatment for agriculture and some latitude for transitional measures while the tax is being brought into operation. Everywhere the cost of introducing the new tax and adapting government methods to it are considerable; in Austria, for example, the cost will be about £33½ million.

According to the Common Market rules the tax need only go as far as the wholesale stage, but many countries are taking it to the whole scale of mercantile operations in order to avoid confusion in working more than one system of government charges on sales. France, where the Value Added Tax was introduced first in 1954, it was applied first to the wholesale stage of manufacturing and merchandise and extended to the retail stage only in 1968. A year earlier Denmark had brought the VAT system of taxation into full operation at all stages, being the first country to do so and two other Scandinavian countries have done the same since. Only Finland in northern Europe remains outside the VAT system.

While the VAT system results in general in a higher cost of living its purposes are generally unexceptional. It is essentially a means of rationalising the indirect tax system and replaces a whole range of other taxes. One reason why Italy is so laggard in coming into line with a Value Added Tax is that it has so wide a range of small and complicated taxes that their replacement is a matter of major difficulty, especially at a time when politics are in a confused condition and the country is without a political government for weeks on end.

The French, Belgian and Germans have swept away a medley of indirect taxes which means that the expense involved in introducing the tax administratively will fairly soon be recovered in saving the cost of collecting these many and often troublesome smaller taxes. The Value Added Tax system, also, allows a whole range of tax rebates on purchases which the earlier taxes did not allow at all. Taxes levied at wholesale and retail stage (such as purchase tax) will disappear, but the more the number of stages of production for a product the heavier the new tax burden will

be. Value added charges on luxuries will be high and those on everyday necessities relatively, but not essentially, low.

The greatest benefit deriving from the new style of tax system—whatever the variations adopted in its practicing countries—will be its incentive to export. Exporters can reclaim the tax on their purchases and sell their products and services abroad tax free. Food is usually taxed but ships and aircraft, since they are mostly sold to foreign countries or used for foreign trade, are VAT tax free.

Reliefs vary from one country to another but generally favourable treatment in the form of either exemption or reduced rates is given to food of the more essential types, to housing, transport, to some social and medical services and, in places, to power supplies and communications. The French, Belgian and the Irish are especially severe with luxuries, among which ranks the motor car—the Dutch, with a combined standard and special tax rate, charge 32 per cent on the purchase price of cars. West Europe, with fairly highly developed public transport services (though the degree of development varies widely) still regards a motor car as a luxury while many owners find them a necessity. Since most cars are used in cities the most appropriate standard for comparison is the urban bus and tram service which remains in many cities inadequate, crowded and some ten times as slow as moving by car, despite traffic jams.

The value of the Value Added Tax to the consumer remains to be proved over a long period; immediately, he does not benefit and is often a loser. Its value to the export services of industry and commerce will be considerable and there is advantage in having a relatively uniform system and philosophy of taxation in the Common Market area and among its nearest associates. Within the European Community, when full Value Added Tax harmonisation has been achieved, the tax will always be paid within the country in which it arises; only those outside the Market area will help pay the tax on merchandise they buy from Common Market suppliers. The tax revenue from VAT will provide varying percentages to the total tax revenue of its operating countries—from a small 10 per cent of the total tax revenue of Sweden to 26 per cent in neighbouring Norway, 16 per cent in Germany and nearly a quarter of France's overall tax earnings.

Mr Kuldip Nayar, Resi-

dent Editor of *The Statesman* in New Delhi (who is perhaps better known as the author of *Between the Lines*—that interesting gossip peep into the green room of New Delhi politics in the immediate post-Nehru years) published last week another bit of "Between the Lines" stuff in his column for his newspaper. He wrote that the reshuffle of the central cabinet was being delayed because the Prime Minister was having difficulty in persuading Mr V. V. Giri to step down from his office in favour of Mr Jagjivan Ram. Mr Nayar suggested that a deal of sorts was being mooted and that a proposal was in fact made to the President of India that, in return for his complying with the wishes of Mrs Gandhi, the latter would be prepared to consider offering a place in the council of ministers to one of the Giri sons who happens to be a member of the Lok Sabha. Never one to let go an opportunity of adding extra spice to whatever he may be dishing out, Mr Nayar thoughtfully said that Mr Giri was insisting on his son being made a minister first.

This story was denied within hours of its publication by a spokesman of the Rashtrapati Bhavan who characterised "Mr Nayar's report as totally false and irresponsible", adding for good measure that the idea was too ridiculous to call for comment. I beg to differ so far as the last part of the stricture is concerned. There is certainly nothing ridiculous about the notion itself. Whether Mr Nayar's story is true or not—its veracity has been challenged on behalf of the President—it undoubtedly has the ring of truth. To start with, from the Prime Minister's point of view, Mr Giri had served her political strategy and purpose as soon as he got elected as President. It is possible that the time has come when he could be useful to her once more only by helping to create a vacancy in Rashtrapati Bhavan. Mr Jagjivan Ram succeeding Mr Giri sooner rather than later is an idea which must clearly appeal to the Prime Minister.

The Constitution prescribes only the maximum period for a presidential term. It is therefore open to the holder of this office to give it up or be persuaded to give it up at any time. Mrs Gandhi, moreover, has been evolving in terms of her own person and authority a presiden-

tial form of government for all practical purposes. In the circumstances there is political sense in a situation in which the President is to be deemed to hold office at the pleasure of the Prime Minister. This is an amendment of the Constitution which applies to the spirit and not the letter of that document. It can therefore be effected not only in an informal manner, but without a single word being articulated to that effect. This, of course, is a great convenience for there is no need here for the time of the legislature to be spent on amending Article 75 of the Constitution.

Mr Kuldip Nayar's insinuation—actually, it is more open and direct than that—that an inducement had to be thought of to bring about the change in the tenancy of the Rashtrapati Bhavan which the Prime Minister desired, is one which was bound to be indignantly challenged, as indeed it was. But here, again, even if the allegation is untrue, can it be said that the idea itself is wholly fanciful? I am not dealing here either with the private ethics or the public morality of it. The question I am concerned with is that the notion itself cannot be easily dismissed as fantastic, given the quality of contemporary politics and the wheeling dealing that has been going on. It has been a common occurrence for instance for decrepit or discredited politicians to beg for governorships and get them too. There is a number of cases on record where it has become impossible to prize a governor out of his post although he has been occupying it for donkey years. In this state of public morals or manners, if the Prime Minister were to ask the President to do her what is more or less a favour, why should the President do it free, gratis and for nothing? Incidentally, Mr Kuldip Nayar's report was not without a touch of verisimilitude. Mr Shankar Giri, MP and son of the President, did meet the Prime Minister a few days before she went on her recent visit to certain countries in Europe. There was speculation at the time that this might have been in connection with possible changes in the council of ministers or, did she call him to her presence only for giving him a piece of her mind?

Mr E.V. Ramaswami, the

famous "Periyar" of "Dravida Kazhagam" and four of his followers, who were prosecuted for taking out a procession

in which the images of Hindu gods were shown in obscene pictures and beaten with shoes to the accompaniment of abuses and offensive slogans, were acquitted last week by the District Magistrate of Salem who had tried the case. I am not going into the merits of the verdict but I must say that I am surprised at the observation in the judgment that the intention of the procession was not to wound religious feelings. "Periyar" should certainly be laughing in his nonagenarian beard. As a practising and preaching atheist the founder and leader of "Dravida Kazhagam" has always been relying on shock tactics. For him the medium has always been the message. Neither the details of the procession nor the responsibility of "Periyar" and his followers for this affair has been in dispute and since the prosecution itself owes a great deal to the private initiative of individuals who have professed and testified to their religious feelings being hurt, it is rather intriguing that the learned district magistrate should have raised the issue of "intention" and decided it in favour of the accused. It seems to me that even the "Dravida Kazhagam" leader's boundless ingenuity will be greatly strained if he were to make the courts take him seriously.

Leafing through a recent

issue of *The Spectator*, I came across the name of that much-maligned Italian journalist, the female of the species, who had interviewed Mr Zulfikar Ali Bhutto and Mrs Indira Gandhi and reported that he said this and that about her. Some among us who seem to have convinced themselves that the fate of India for the next thousand years is going to be decided at "The Retreat" in Simla, had been upse over the possibility that Miss Fallaci's quoting of Mr Bhutto might cause mischief between Pakistan and India and prejudice the summit prospects and have been bending over backwards to present the offending reporter as, professionally speaking, less than a zero. Actually, however Miss Fallaci's journalistic credentials do not seem to be as negligible as all that Mr George Gale, Editor of *The Spectator* writes: "I have been reading three books on Vietnam: one, a sustained piece of emotional reportage by a well known Italian girl who first discovered the taste of violence reporting the Hungarian revolution...". Mr Gale proceeds to say that, of the three books, he found the reportage "the most interesting". The reference is to *Nothing and Amen* by Miss Oriana Fallaci, translated by Miss Isabelle Quigly. I cannot imagine Miss Quigly translating a book by an itinerant reporter of no credentials or consequence, or Mr Gale finding it worthy of his notice.

MOVING FINGER

TRADE WINDS

Joint Sector

THE SCOPE of the joint sector in industry is proposed to be clearly spelt out in the new industrial policy resolution which is currently under preparation. Disclosing this to newsmen, the Minister for Industrial Development, Mr Moinul Haque Chaudhury, stated here last week that his ministry had prepared a basic paper for amending the present industrial policy resolution. The Planning Commission had also prepared a paper reacting to the draft of the Ministry of Industrial Development. The matter would go shortly to the Committee of Secretaries for consideration. Thereafter, it would be taken up by the union cabinet.

With a view to attuning the programmes of industrialisation to the proposed emphasis in the fifth Plan on the production of basic necessities of life, the list of industries in which there was scope for further growth, Mr Chaudhury said, would be revised in the near future. In drawing up the new list, both the existing and the anticipated shortages of the items of general consumption would be taken into consideration. No Luxury item would be included in this list.

Backward Areas

For fostering industrialisation of backward areas, Mr Chaudhury revealed, the government was considering increasing the number of backward districts for which special concessions were available, from two to six in the less industrialised states and from one to three in the advanced states. The total number of backward districts to be accorded special treatment, thus,

would go up from 44 at present to about 100.

Another significant measure under consideration in this connection, Mr Chaudhury stated, was that the central subsidy of 10 per cent which was currently available for investment in a unit in a backward district up to the level of Rs 50 lakhs, would be made available for projects involving investments of more than Rs 50 lakhs. In these cases, the subsidy, however, would be limited to Rs five lakhs. An Additional Secretary was being put in charge of the backward areas to keep a close watch on their development. All the backward districts would be surveyed for their industrial potential in about 18 months. In course of time, all the districts in the country would be surveyed with a view to identifying the particular industries which can be developed there on the basis of the local resources.

Licensing Procedures

Mr Chaudhury indicated that he would be convening a conference of the state industries ministers in the last week of July for an exchange of views on the bottlenecks in the way of industrial growth. Several steps, he said, had been decided upon to speed up the clearance of applications for letters of intent and industrial licences as well as their implementation. In view of the rapid increase in the number of applicants for letters of intent and industrial licences—currently despite the grant of exemption from licences to investment proposals upto Rs one crore in terms of the 1970 revision of the industrial policy resolution, the number of these applicants was about three times the figure nearly two years ago—Mr Chaudhury

added that it had been decided that the licensing committee should meet once a week, instead of once a fortnight, and at least 75 cases should be cleared at every meeting. He was also thinking of increasing the strength of the staff who deals with these applications so that the applications were speedily processed and cleared.

In the interest of expeditious conversion of letters of intent into industrial licences, Mr Chaudhury observed that it was proposed to reduce the period for the submission of the applications for capital goods licences from one year to three months of the grant of the letters of intent. A sub-committee had been set up to consider whether the present procedure of advertising the requirements of capital equipment so as to find out whether they could be met from indigenous sources, could be waived in cases in which the non-availability of equipment from domestic sources was well known.

The Directorate-General of Technical Development was also proposed to be oriented more towards development work. It was envisaged to be relieved, through computerisation, of excessive statistical work.

The follow-up action on letters of intent and industrial licences, Mr Chaudhury said, was proposed to be intensified. A special committee was being set up to identify the hurdles in the way of implementation of letters of intent and industrial licences industry-wise so that the union Ministry of Industrial Development was able to devise ways and means to overcome these hurdles.

Foreign Collaborations

Mr Chaudhury refuted the allegation that he was liberal in granting foreign collaboration arrangements. Since the number of applications for industrial licences had multiplied fast during the past two years, the number of foreign collaboration proposals, he thought, could be expected to go up. However, the percentage of collaborations allowed

to the total number of applications for letters of intent and industrial licences, he stressed, remained about the same. Mr Chaudhury further pointed out that as we were going into more sophisticated lines of production, collaboration with foreign countries had to be allowed.

Advisory Council

The Central Advisory Council for Industries, Mr Chaudhury disclosed, would soon be reconstituted. Its complexion was proposed to be changed to reflect the present situation in the country. The representation of the private sector in this council was envisaged to be reduced from 10 to six. The new council would consist of six representatives of the private sector, three of the joint sector, three of the public sector, three of the small-scale sector, six labour representatives, one representative of the backward areas, two representatives of financial institutions, one consultant, one economist, two members of Parliament and two representatives of consumers.

Refinery at Mathura

The government of India has decided to locate the proposed 6-million tonne oil refinery at Mathura, 130 kms south of Delhi. Location of the refinery at Mathura offers some excellent advantages since the town is connected by broad gauge as well as metre gauge train systems and has good road links with the rest of the north-west region. Product movement in all directions, including towards Delhi will be facilitated by the multi-track rail system and by the network of roads.

The location which gives maximum economic advantage, will also benefit adjoining regions of Rajasthan and Madhya Pradesh.

The Indian Oil Corporation which considered several locations from the techno-economic and logistical angles after the Planning Commission had approved in principle the establishment of a new refinery in the north-west re-

gion, is being asked to take up this project on high priority.

On the basis of demand projections for 1978, the refinery is being designed for a capacity of 6-million tonnes. This will make the north-west refinery the largest in the country. The refinery will produce every year 495,000 tonnes of motor spirit, 369,000 tonnes of naphtha, 1723,000 tonnes of high speed diesel oil, 1576,000 tonnes of kerosene oil, 90,000 tonnes of light diesel oil, 820,000 tonnes of furnace oil including fertiliser feed stocks, 50,000 tonnes of L.P.G., and 278,000 tonnes of bitumen.

The refinery is being designed with sufficient flexibility to use one or more of several typical Middle-East crudes including India's share in Rustom and Raksh crude oils. The import of crude will be through a single buoy mooring off-shore terminal in the Gulf of Kutch which will be the first such off-shore terminal in the country. The terminal with a deep draught will be capable of receiving some of the largest tankers of upto 300,000 tonne capacity and will have ideal protection from weather conditions. The utilisation of large size tankers will offer maximum economies in ocean freight transportation costs.

A 1200 km pipeline will bring the imported crude from the terminal to the refinery. The longest crude oil pipeline, it will on the way have the largest diameter of 24-30 inches and will also feed the Koyali Refinery near Baroda through a 165 km long branch line.

The total investment on the refinery, pipelines, off-shore terminal and on-shore facilities on the basis of tentative estimates is likely to be Rs 161.15 crores including the foreign exchange component of Rs 30.9 crores. The refinery (excluding townships) is likely to cost Rs 78.70 crores and the pipelines Rs 74.9 crores. The investment on off-shore terminal is expected to be Rs 2.9 crores. Another Rs 4.65 crores are likely to be spent on on-shore facilities.

A special feature of the refinery will be the likely provision of 1-million tonne Hydro-

Cracker involving sophisticated technology to convert heavy oils into more valuable middle distillates for which there is a large and growing demand in the north-west region. The Hydro-Cracker will enable the refinery to produce as much as 57 per cent middle distillates as compared to an average of 47 per cent being obtained now. The first of its kind in the country, the Hydro-Cracker would pave the way for acquiring technical know-how and expertise in this sophisticated field so that more such Hydro-Crackers can be put up as and when necessary. The Fuel Policy Committee also has specially recommended increasing installation of Hydro-Crackers.

The refinery will be able to feed four to six fertiliser plants. Naphtha from this refinery will meet essential needs of the large fertiliser factory at Kanpur to the east and at Kotah to the south of Mathura. The refinery will also produce feed stock for the Nangal Fertiliser Factory and for other fertiliser units which may be established in the region.

Pound Sterling Floats

Britain let the pound sterling float freely on the world markets on June 23, in the hope of stopping flow of funds from its national reserves. A day earlier Britain had raised its Bank Rate from five to six per cent to attract hot money. For the time being the pound will no longer be firmly tied to the dollar and the currencies of the European Common Market members. This step is similar to the one taken by President Nixon in the dollar crisis of August last year.

For almost a week, the pound was under intense pressure following rumours of approaching devaluation. During the week, large amounts had been poured out of the Treasury's reserves to prop up the pound at its agreed floor level of \$2.58.

Mr Anthony Barber, Chancellor of the Exchequer, stated in the House of Commons that the lack of confidence in the pound was unjustified. There was nothing in the objective

facts of Britain's balance of payments of the level of its reserves to justify the flight of international capital.

Mr Barber also told the House of Commons that another measure taken was to restrict capital movements from Britain to sterling area countries so as to close any loophole for speculative outflow.

The rupee is pegged to the

pound, especially after the December 1971 agreement among the group of Ten richer countries which involved devaluation of the dollar. Official circles in this country would prefer to wait and see what effect the decision to float the pound has on speculative tendencies. To the extent the rupee is linked to sterling, a downward float of pound means that the rupee

You need money to be your own employer.

Where is it going to come from ? UCOBANK

If you are thinking of starting a business of your own, we can provide you with the means for doing so. That's our job. And, we like doing it.

At UCOBANK, we know your needs. And, we are prepared to help you. In any kind of

business that you have in mind.

We can help you buy machinery or raw materials. Or give a loan for you to set up your shop. Assist you to utilise your skills in a profitable way.

At UCOBANK, we help you to help yourself.)

(Meeting the needs of the people.)

goes with the pound. The exchange rate of the rupee vis-a-vis the pound was fixed at Rs 18.9677 in December last.

Japan Lowers Bank Rate

Japan has lowered its official Bank Rate by half per cent to 4.25 per cent, its lowest post-war level. The reduction is supposed to be a step by the Japanese government to avert international pressure for another yen revaluation. The banking circles have hailed it as opening a new era in the nation's financial history, as for the first time since World War II Japan has a lower Bank Rate than the United States, which is currently 4.5 per cent. The cut in the rate is the sixth since October 1970 when it stood at 6.25 per cent.

Building Our Warships

India has built her first warship—INS Nilgiri which takes its place among the 36 Leander class frigates in the world today. The UK being the pioneer, naturally has the largest number (25), followed by Holland (6) and Australia and New Zealand (two each). India thus becomes the member of this club, but its special pride must be in having built it herself with indigenous components up to 53 per cent. Although built in collaboration with Messrs Vickers Ltd and Yarrow (Shipbuilders) Ltd, the construction was done essentially with Indian know-how and Indian labour and in the Indian shipyard, viz., the Mazagon Dock Ltd (MDL). The shipyard has acquitted itself creditably on this precision job, although the commissioning of INS Nilgiri has been delayed by seven months. Prime Minister Indira Gandhi, who laid the keel in October, 1968 and commissioned the frigate on June 3, 1972, however did not seem disappointed by this delay. On the contrary, she complimented Rear Admiral B.A. Samson, Director of MDL, for making a good job of it and conferred on him the honorary rank of a Vice-Admiral.

According to MDL sources, INS Nilgiri has cost Rs 18.50

crores, of which only 50 per cent., i.e. Rs 9.75 crores, represents the foreign exchange spent, whereas a similar frigate, if it had been ordered from abroad, would have cost Rs 21 crores, all in foreign exchange.

Abolition of Special Trade Account

Czechoslovakia has agreed to abolish the special trade account in India which entitles it to purchase goods other than those covered in the trade plan. There will be only one trade account and one trade plan between the two countries in future. The Czech Prime Minister, Dr Lubomir Strougal, agreed to this suggestion of Prime Minister Indira Gandhi who during her recent visit to Czechoslovakia, pointed out that it was imposing a heavy burden on India's foreign exchange reserves. In this special account, 10 per cent of the sale proceeds were to be paid to Czechoslovakia in free foreign exchange.

Mrs Gandhi pointed out to Dr Strougal that India was faced with similar requests from other socialist countries to open special accounts. This is described as a very significant and important outcome of discussions which mainly centred on economic co-operation. Another major gain of the talks is that both the Prime Ministers have agreed that their Planning Commissions should have periodic consultations to co-ordinate their development programmes on a long-term basis.

Hitherto, the Indo-Czech Joint Economic Commission has mainly been dealing with trade problems. The new suggestion would add a new dimension to the co-operation between India and Czechoslovakia in industrial, technical and scientific spheres.

India and Hungary

India and Hungary have agreed to set up a joint commission to explore the avenues of increasing trade and economic co-operation. This decision was taken by the Prime Ministers of India and Hungary

during Mrs Indira Gandhi's visit to Hungary. The joint commission will meet alternately in New Delhi and Budapest and will have two Indian and Hungarian ministers as co-chairmen. At the political and diplomatic levels, the two sides have decided to systematise their mutual consultations. These will be held periodically.

Lambretta Scooter Project

The Lambretta scooter project in the joint sector is a reality. The agreement was signed recently between the Italian collaborator, Innocenti, the Indian private firm, Automobile Products of India, and the government of India. With an annual capacity of 100,000 scooters the unit is expected to go into production within two years. The agreement provides for shifting of the entire plant at Milano (Italy) to Lucknow. An official team will soon go to Italy to inspect the dismantling of the unit and the shipping of the machinery to India.

A company for implementing this project is being formed with the union government holding 51 per cent of the shares, Innocenti about 20 per cent and API and the general public together the remaining 29 per cent.

Income-tax and Wealth-tax Returns

The Central Board of Direct Taxes will shortly be notifying new forms of returns of income and net wealth which will come into force from a date to be specified in this behalf in the notification. To enable taxpayers to furnish their returns of income and net wealth in the new and up-dated forms, the Board has decided to extend the time for furnishing voluntary returns of income and net wealth for the assessment year 1972-73 till July 31, 1972, in cases where such returns are due before that date.

The Board is also issuing instruction to the Income-Tax Officers to waive in such cases, the interest chargeable under the Income-Tax Act for belated submission of return in respect

of the period of delay up to the end of July 1972.

Lending by Nationalised Banks

The first meeting of the Regional Consultative Committee of the Central Area (consisting of UP and Madhya Pradesh) of the nationalised banks, decided that further substantial efforts should be made to increase lending in rural and semi-urban areas as well as to small borrowers specially in agriculture.

The meeting was held at Lucknow recently under the chairmanship of the Finance Minister, Mr Y. B. Chavan and was attended among others by the Chief Minister and Finance Minister of UP, Industries and Agriculture Ministers of Madhya Pradesh, the Governor of the Reserve Bank of India and the Chief Executives of the 11 public sector banks.

The meeting decided to set up a working group to go into the question of procedures and the simplification of application forms relating to lending to small borrowers in agriculture, small-scale industries, transport, etc. It also decided to select a few districts in UP and Madhya Pradesh on an experimental basis in which steps could be taken to evolve plans of action for identifying bankable programmes for lending and related operational aspects.

Glass Industry

The glass industry in the country has achieved substantial progress over the past twenty years. The production of glass has increased by more than three times, from 92,000 tonnes in 1951 to 2.90 lakh tonnes in 1971. During these twenty years, many new varieties of glass have been produced in the country. These are wired and figured glass, safety glass, fibre glass, capillary glass tubing, optical glass, glass building blocks, glass chatons, and thin sheet glass required for microscopic slides

BHEL Makes a Profit

The Bharat Heavy Electrical Limited (BHEL) made a profit of Rs 3.19 crores in 1971-72 as compared to Rs 65 lakhs in the

previous year. This was stated by Mr O.S. Murthy, Chairman, Bharat Heavy Electricals Limited, at its annual general meeting held recently. He said that the total value of production increased by 23 per cent over the previous year. It amounted to Rs 59.33 crores as compared to Rs 48.26 crores in the previous year.

Mr Murthy said that a significant feature of the working of the company for the year was that two out of the three units of the company, namely, Tiruchy and Hyderabad plants, were now making profits.

Income-tax Assesseees

The Income-tax Department has recently been issuing permanent account numbers to all tax payers. The object of issuing these numbers is to enable proper identification of every taxpayer on all-India basis so as to facilitate communications and improve the procedures of work in the department. If any taxpayer has not received an intimation regarding his permanent account number, he may write to the Income-tax Officer assessing him.

A separate permanent account number is being allotted to each person who is assessable to tax.

Bonus Review Committee

The Bonus Review Committee, set up by the government of India, has invited views, relevant information and statistics from organisations and individuals on the terms of reference of the committee. The committee will like to receive by July 10, 1972 any views on whether there is any case for raising of minimum bonus and whether the present minimum bonus may continue with a provision for its being supplemented through suitable schemes of production or productivity.

Asia 72 and GDR

Mr W. Koehler, Commercial Attache, Consulate General of the German Democratic Republic in India, said at a press conference in the capital recently that the

theme of the GDR pavilion was "The GDR—A Reliable Economic and Trade Partner" and "The GDR—for World Wide Trade and Progress".

Four state owned foreign trade enterprises of the GDR will demonstrate the economic power of the GDR by displaying exhibits which are carefully tuned to India's demand. The foreign trade enterprise Transportmaschinen e.g. will display the harvesting combine E-512, silo equipment and seed dressing equipment which are already well-known in India. The foreign trade enterprise Polygraph Export, the printing equipment of which already operates in many cities of India, will demonstrate the latest products of printing and allied industries of the GDR in operation. The foreign trade enterprise Schiffssommerz will display models of its ships. Cameras, film material and photo chemicals will be exhibited by the foreign trade enterprise Kamera/ORWO whose products are equally well-known in the Indian market.

Mysore's Deficit Budget

Mr M. Y. Ghorpade, Mysore's Finance Minister, presented the state budget for 1972-73 on June 21, which revealed a revenue surplus of Rs 7.30 crores and an overall deficit of Rs 3.45 crores after proposing taxes to yield Rs 2.65 crores in the remaining part of the year. Mr Ghorpade's first regular budget revealed a marked improvement in the state's finance during the three months since he presented the vote on account budget which showed a big overall deficit of Rs 30.52 crores. The budget estimates revenue receipts at Rs 307 crores, against Rs 271.30 crores in the revised estimates for 1971-72 and the revenue expenditure of Rs 299.70 crores compared to the figure of Rs 274.24 crores in the revised estimates for the previous year.

On the capital account, Mr Ghorpade's budget estimates the outgo at Rs 198.00 crores and the receipts at Rs 186.20 crores, leaving a deficit of Rs 11.80 crores. The revenue surplus of Rs 7.30 crores is thus

converted into an overall deficit of Rs 4.50 crores.

The new levies proposed include (1) revision of the water rates to fetch Rs 1.75 crores in a full year and Rs one crore in the current year, (2) an increase in the motor vehicle tax on contract carriages to yield Rs 65 lakhs in a full year and Rs 40 lakhs this year, (3) revision of the sales tax structure to yield Rs 1.50 crores in a full year and Rs 1.25 crores this year. These three measures together are expected to yield Rs 3.9 crores in full year and Rs 2.65 crores in the budget year.

Names in the News

Mr Prem Pandhi has been elected Chairman of the Punjab, Haryana and Delhi Chamber of Commerce and Industry for 1972-73. He succeeds Mr Man Phool Chopra. Mr Raunaq Singh has been elected Deputy Chairman.

Mr Morris Mathias, 42, a Director of Hindustan Lever, will join Hindustan Thompson Associates on July 1, 1972. He will take over as Chief Execu-

tive of the company on January 1, 1973 on his return from a 4-month visit to Thompson offices in Europe and America. He will be the first Indian to assume this office at HTA.

Mr Sriman Prafulla Goswami, the new Chairman of Oil India, is a parliamentarian and political leader of over forty years standing. He succeeds Mr Sarat Chandra Sinha who has become Chief Minister of Assam.

Mr. W. C. Shrishrimal, Managing Director, Maharashtra State Co-operative Bank Ltd, Bombay, has been elected a director of the Industrial Finance Corporation of India from the Co-operative Banks' constituency. The vacancy was caused by the resignation of Mr Vasant Rao Dada Patil on his joining the Maharashtra state cabinet.

Mr V. Krishnamurthy has taken over as the Deputy Chairman of BHEL from Mr B M. Kapoor. Mr P. V. K. Achan has taken over as General Manager of BHEL Trichy from Mr V. Krishnamurthy.

Let Pan Am show you there's a big difference between airlines.

If you think all airlines are the same, you don't know Pan Am. We are way ahead with new ideas and services to make your flights more comfortable, your travel more enjoyable. With ideas that add up to greater value for your rupee. Services that invite comparison-shopping with any other airline in the world.

Whether you're flying East or West or "round the world", we can plan every detail of your trip. And wherever you go, you'll know you're flying with the very best, the most experienced. That makes all the difference in the world. After all, our only reason for flying is YOU.

One airline to the world
Travel farther with us and see more places. In fact, on a single Pan Am ticket you can go clear 'round the world'. We fly to more than 120 cities and over 80 lands. And now you can catch a 747 in over 30 cities. So we're the most likely to have a flight to where you want — and when.

The airline for businessmen
Anywhere in the world that business might find you, you'll find a Pan Am office ready to help. And any one of them can make a tremendous difference in helping your business go better. We'll plan your entire itinerary before you leave. And help with information about the countries you plan to visit. We'll book hotels, arrange guided tours, hire cars. We'll do almost anything you might ask us to.

Call your Pan Am Travel Agent or call us.

 **Pan Am.**

COMPANY AFFAIRS

Hindustan Motors

AS A PART of its diversification programme, Hindustan Motors Ltd has established a Rs 15-crore earth moving equipment project at Trivellore, near Madras. This unit has been set up in collaboration with the Scottish subsidiary of General Motors Corporation of the USA. The construction of the plant commenced in October 1970 and the first phase of the project involving an investment of Rs 2.5 crores was completed early this year. In 1972-73, the first of its operation, the plant will be producing 120 units of rear dump trucks and front end loaders and it will be reaching the optimum capacity, as licensed by the government, of 600 units per annum in the next few years. The product range will also be expanded so as to include the manufacture of crawler, tractors and scrapers. The turnover of the factory is expected to cross the Rs 40-crores mark in about five years.

All the equipments to be manufactured in this factory will have a very high percentage of indigenous content. Moreover the foreign collaborators has given the right to the company to use the popular American brand name 'Terex' in its products and for enjoying this facility the company will be paying a nominal royalty to General Motors. The first batch of eight machines assembled here have already been delivered on schedule to the Beas project. The company is now having on hand orders exceeding 100 units. Meanwhile the company is planning in a big way to export its products to south Asian and east European countries. Negotiations are already under way for conducting a contract for the sale 80 units to Poland. Inquiries have also been received

from Yugoslavia. The foreign collaborators have also shown keen interest in about 50 components manufactured by the company and hence there are immense possibilities for export of these items to Scotland.

TOMCO

Tata Oil Mills Co Ltd has produced excellent working result during the year ended March 31, 1972 with sales and gross profits recording significant improvements over the previous year. With a smart increase in turnover from Rs 50.83 crores to Rs 60.74 crores, gross profit recorded and impressive rise to Rs 3.57 crores from Rs 2.52 crores in 1970-71. The directors have maintained the equity dividend at 18 per cent—Rs 4.50 per share of Rs 25 each. But it is payable on a enlarged capital as increased by the one-for-two rights issue.

Out of the gross profit the directors have provided Rs 83 lakhs for depreciation, Rs 7.50 lakhs for development rebate reserve and Rs 151 lakhs for taxation as against Rs 82 lakhs, Rs 12.80 lakhs and Rs 74 lakhs allocated respectively in 1970-71. This leaves a balance of Rs 115.22 lakhs and it has been transferred to the general reserve. Equity dividends will claim Rs 52.98 lakhs—Rs 17.66 lakhs more than in 1970-71 while preference dividends will absorb Rs 4.60 lakhs the same as in the earlier year. The dividends will be paid out of the general reserve.

Sales of toilet and washing soaps and synthetic detergents increased by 23 per cent while sales of 'magic' the detergent powder and 'bonus', the detergent cake were up by 64 per cent as compared to the previous year. Exports aggregated Rs three crores during 1971-72

recording a marked rise of about 48 per cent. Exports of shrimps totalled Rs 1.16 crores recording an increase of about 69 per cent. Valuable research and development work has been done in evolving processes for higher utilisation of inedible and minor oils, consumption of which has increased by 21 per cent over the previous year. Further progress has been made in the development of indigenous engineering know-how and in the last three years the company has made 54 new indigenous machines of special and intricate design which in the past were imported. The company's Malaysian project set up with the approval of the government is progressing satisfactorily.

Coromandel Fertilisers

An Industry is set up with the intention of producing goods and services at competitive rates, contribute to the economic activity and earn a profit for its investors. But it would indeed be a sorry state of affairs if industry is reduced to a position of sheer economic survival. This strikingly significant observation was made by the Chairman of Coromandel Fertilisers Ltd, Dr Bharat Ram in his annual statement circulated to the shareholders of the company. Full utilisation of capacity alone, the chairman further observed, cannot contribute substantially to increased profits, if operating costs which are beyond the control of a company rise steeply year after year. Mounting costs of production, for instance, is adversely affecting the performance of even well-managed and efficiently run enterprises such as Coromandel. In this connection the chairman made pointed reference to the abnormal rise in costs of specific items which

are making heavy inroads into the profitability of the company. Although sulphur prices have touched rock-bottom levels the world over, the agency concerned with the supply of sulphur has recently increased its price to Rs 300 per m. tonne resulting in additional cost of Rs 34 lakhs a year to the company. The hike in power tariffs has pushed up power costs by another Rs 25 lakhs annually while increases in rail freight, sliding charges and warehouse rental account for nearly Rs 40 lakhs a year. The Emergency Risks Insurance costs the company by as much as Rs 10 lakhs while the levy on naphtha from June 1971 has burdened the company with an extra amount of Rs 31 lakhs a year.

The company has maintained a steady and progressive growth during the last four operating years. Many factors affecting production have been minimised and consequently the utilisation of capacity is improving steadily. The management is now studying ways and means to achieve higher targets. Fresh technical studies on the expansion of ammonia, phosphoric and sulphuric acid plants are underway and based on the technical report a revalidation of the expansion licence will be obtained and the project finalised. Meanwhile the company has strengthened and enlarged the areas of demonstrations plots, soil testing and farmer services. A new N-P-K complex fertiliser with an analysis of 14-35-14 was added to the product line. It was introduced in the market in April this year and has met with an encouraging response. To overcome the serious bottleneck in transport the company was forced to move the product by road or by covered and uncovered wagons to the available points and then tranship by road.

Indian Organic

Indian Organic Chemicals Ltd has suffered a sharp setback in its working during the year ended March 31, 1972. With a jump in sales from Rs 8.80 crores to Rs 10.98 crores gross profit has slumped to Rs 44.50 lakhs from

Rs 86.44 lakhs in 1970-71. Nevertheless directors have decided to maintain the equity dividend at 12 per cent for the year. Of the proposed equity dividend about 40 per cent is expected to be tax-free.

Heavy imports of plasticizers have adversely affected the company's sales of Phthalete plasticizers. Acute shortage of PVC resins too had its impact on the company's production. However, it is expected that there will be a recovery in the latter half of this year due to the ban on imports of plasticizers and the likelihood of a larger availability of PVC resins. Meanwhile the company is going ahead full steam with its scheme for the completion of the polyester fibre unit at Manali, near Madras. There had been some delay in commissioning of the plant due to late receipt of local fabricated equipment. According to current indications the plant is expected to be commissioned for trial runs sometime in August. Meanwhile the company has received recently an licence for import of raw materials subject to certain stringent export conditions and the matter is being taken up with the government.

The company has earned a lower net profit of Rs 26.01 lakhs during the year under review as compared to Rs 33.48 lakhs in 1970-71 after providing Rs 14.29 lakhs to depreciation, Rs 3.20 lakhs to development rebate reserve, and Rs one lakh to taxation as against Rs 16.21 lakhs, Rs 3.75 lakhs and Rs 33 lakhs allocated respectively in the previous year. After adjustments an amount of Rs 31.27 lakhs was appropriated to general reserve as against Rs 33.35 lakhs in the earlier year. The proposed dividends will be paid out of the general reserve.

Bajaj Electricals

Bajaj Electricals Ltd has reported all-round improvement in its working results during the year ended March 31, 1972. With a jump in sales from Rs 8.80 crores to Rs 10.98 crores gross profit has slumped to Rs 44.50 lakhs from

the company's performance has continued during the current year as well with sales for the first two months being higher at Rs 1.76 crores as against Rs 1.31 crores for the previous year. The directors have proposed to maintain the equity dividend for 1971-72 at Rs 12 per share and the dividend on deferred shares at Rs 9.28 per share.

An outstanding feature of the company's operations during the year is the management's decision to participate in a new venture in the joint sector to manufacture G.L.S. lamps and fluorescent tubes in Madhya Pradesh. An agreement for the same has been entered into with the Madhya Pradesh State Industries Corporation Ltd. The new company styled MP Lamps Ltd will manufacture six million G.L.S. lamps and one million fluorescent tubes per year. Bajaj Electricals will invest 24 per cent and Madhya Pradesh government 27 per cent in the shares of the new company while the remaining will be offered to the public. The cost of project is estimated at around Rs 1.50 crores.

Out of the gross profit the directors have transferred a sum of Rs 1.84 lakhs to depreciation reserve and Rs 39 lakhs towards tax liability as compared to Rs 1.58 lakhs and Rs 27.38 lakhs provided respectively in 1970-71. The proposed equity, preference and deferred dividends will absorb Rs 13.68 lakhs.

News and Notes

Expansion and diversification

National Machinery Manufacturers Ltd is embarking on a large-scale diversification of its lines of manufacture. It has already received a letter of intent for the manufacture of hydraulic motors and gear boxes, and negotiations for a suitable collaboration agreement are under way. An application has been made for permission to manufacture textile and industrial bearings though no letter of intent has been received. The management is also exploring the possibility of manufacturing plastics and printing machinery and mechanical presses. Recently it

has received a licence for the manufacture of machinery for synthetic fibres. Technical collaboration agreement has already been completed with Barmag Barmer Maschinensabrik AG of West Germany and the company hopes to roll out the first machine before mid-1973 from its new factory at Baroda.

New Venture

Tanfort Tyres Ltd proposes to set up project in Bangalore for the manufacture of various types of tyres and tubes, initially for scooters, motor cycles and light vehicles and later on for heavy vehicles in progressive stages. An outstanding feature of this new venture is that the entire project will be executed with local plant, machinery and equipment. To start with the proposed factory will have an installed capacity of 16.50 lakh tyres and tubes for various kinds of light vehicles. The cost of the project is estimated at Rs 70 lakhs of which Rs 44 lakhs will be spent on plant and machinery. It will be financed through the share capital of Rs 50 lakhs and a loan of Rs 20 lakhs from Mysore State Financial Corporation. Land has been acquired and the entire equipment has been procured from indigenous sources. A major portion of the plant and machinery is now under erection.

Out of the share capital of Rs 50 lakhs, equity shares worth Rs 12.82 lakhs have already been subscribed. The present issue consists of Rs 37.18 lakhs—Rs 30.68 lakhs in equity shares and Rs 6.50 lakhs in preference shares. Equity shares of the value of Rs 50,000 have been reserved for the Mysore State Industrial Investment and Development Corporation while equity capital of Rs 8.68 lakhs have been reserved for allotment to promoters for supply of machinery. The company now proposes to make a public issue of 2,15,000 equity shares of Rs 10 each and 6,500 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each at par.

New Issues

Jg Glass Ltd is setting up an

automatic glass manufacturing plant at Rishikesh in Uttar Pradesh, capable of producing bottles of one oz. to 40 oz. capacity and in different shapes. This new venture has been promoted by Jg Glass Industries Pvt. Ltd which has been engaged in glass manufacturing since 1957 and is one of the leading manufacturer of glass containers in the country. The company will initially undertake the manufacture of vials for packing antibiotics. The surplus capacity, if any, will be utilised for manufacture of bottles for cosmetics, dairies, aerated water, and chemicals. Production is expected to commence by the end of this year.

To raise resources for financing this project the company will soon be entering the market to raise a capital of Rs 30 lakhs consisting of 3,00,000 equity shares of Rs 10 each. The capital outlay on the project is estimated at Rs 1.29 crores and it will be met through the share capital of Rs 50 lakhs, loans to the tune of Rs 72.50 lakhs and by deferred payments of the order of Rs 6.55 lakhs. The management hopes to declare a maiden of 10 per cent in 1973 and raise it to 15 per cent in subsequent years.

As the public issue of Atlas Copco (India) Ltd was oversubscribed several times on the very first day of its opening the company had decided to close the list on June 23. The company offered for public subscription 289,250 equity shares of Rs 10 each at a premium of Rs 7.50 per share. The subscription list for this fully underwritten issue opened on June 21.

The Industrial Credit and Investment Corporation of India Limited (ICICI) received applications for debentures exceeding Rs nine crores as against the issue of Rs seven crores. In view of this oversubscription, ICICI closed the subscription list on June 22. This is the third issue of debentures by ICICI. Its previous two issues of Rs six crores and Rs five crores made in 1967 and 1969 were also oversubscribed.

Readers' Roundtable

Performance of HEIL

Sir, Your editorial, (June 9, 1972), throwing light on the poor performance of Heavy Electricals India Limited, is most timely. Having invested huge amounts in the three factories at Bhopal, Hyderabad and Hardwar, the government had planned to meet all the future requirements for new power plants from the production of these factories. But, after eight years of their commencing production, these factories have succeeded in supplying only six thermal plants which were fully imported and about the same number of plants were manufactured at the Bhopal and Hardwar factories. The Hardwar factory, which is supposed to manufacture the larger size of 200 MW thermal plant units, is not ready even to start production. The slow progress of these factories has resulted in a serious power shortage which is likely to increase in future as the demand for power is growing very rapidly.

It may be pointed out that the success of such undertakings of national importance largely depends on the practical managerial experience and factory expertise of persons who have actually worked in such factories and become specialists in their operations. The top management of these factories has continued to demonstrate expertise only in finding alibis for its poor performance and transferring the blame to other departments and electricity boards. No doubt, the working of some of the state electricity boards is also very far from satisfactory in the matter of planning for new generation of power, but this should not be advanced as a justification for the dismal performance of both Heavy Electricals Limited and BHEL.

May I also correct one wrong impression which your comments might create. The losses incurred by the HEIL as well as

the BHEL could not have been avoided by a review of its pricing policy as you seem to imply. In fact, their prices have already been very high. It seems that their losses are not due to low prices but very low level of production. Unless the production goes up 4 to 5 times of its present level, these undertakings will continue to pay a very high price for its power plants which in turn will affect the cost of power which should be as low as possible in order to bring down the cost of industrial production.

Delhi B. R. POHOJA
(Mr Pohoja's fear that the

Incentives to Cottonseed Crushers

Sir, We are highly thankful to you for the discriminating support extended to the cause of the scientific cottonseed crushing industry through the article entitled "Incentives for Cottonseed Crushers" appearing in your esteemed journal of May 26, 1972.

In the course of the article, it has been asked "what efforts have cottonseed crushers made to bring down their costs, so as to bring down the prices of edible oil and other products? It is to be hoped that AICOSCA would address itself to these important issues."

The answer to these queries is provided in the following paragraphs:

(a) The availability of cottonseed has been much larger (22 lakh tonnes) in the current season as a result of the bigger cotton crop. Our members stepped up crushing to produce more edible oil at a time when the country is facing a wide edible oil gap as a result of

article "No 'Heil' to HEIL" is likely to create a wrong impression about the pricing policy is unfounded since, immediately after urging this undertaking to review its pricing policy, we have clearly pointed out that "this measure alone would not put an end to all its troubles" and that "it is necessary that steps should be taken to increase the utilisation of machine capacity". All the three statements have been made one after the other and they must be considered together. The attention of readers is also invited to the speech of the Chairman of Bharat Heavy Electricals Ltd, which was published in our issue of June 23, pp. 1237 to 1239—Ed.)

the stoppage of imports of soya bean oil.

We enclose a statement showing the monthly average prices of washed cottonseed oil at Bombay during the past 12 months (alongside). It will be seen that the prices of cottonseed oil have declined by 12 per cent in the aforesaid period.

(b) In spite of the withdrawal of the cash incentive of 12½ per cent on export of cottonseed extraction since April 1, 1971, to which you have made an appropriate reference in your article, the scientific crushing industry has reluctantly shouldered the burden of disposal of the by-products, namely, cottonseed extraction, which has only an export outlet, and cottonseed expeller, which has to be marketed in a saturated indigenous market.

That the grant of cash assistance for exports will only benefit the country can be seen from the following calculation:

For every 100 tonnes of

cottonseed crushed in the organised sector, the country gets four additional tonnes of oil as compared to the unorganised sector. Additional four tonnes will be a valuable substitute for four tonnes of soya bean oil, roughly valued at Rs 9,000 in foreign exchange.

Further, there would be 43 tonnes of decorticated extractions available for export, which will fetch exchange of the order of Rs 21,000. In addition, there will be a production of 7.5 to 8 tonnes of linters if proper delinting is done, capable of yielding five tonnes of rayon and chemical grade pulp, thereby saving a minimum of Rs 8,000 worth of imported pulp. As against this, the exchequer will lose only about Rs 5,200 by way of cash assistance at the rate of 25 per cent. It is clear from these figures that by grant of incentive of Rs 5,200, the

Monthly Average Prices of Washed Cottonseed Oil at Bombay During May 1971 to April 1972

Month	Price per tonne (Rs)
May 1971	3884
June 1971	3711
July 1971	3923
August 1971	4232
September 1971	4196
October 1971	3979
November 1971	3742
December 1971	3793
January 1972	3867
February 1972	3867
March 1972	3791
April 1972	3577

country gains in foreign exchange to the tune of Rs 38,000 (i.e. Rs 9,000+Rs 21,000+Rs 8,000), besides substantially contributing to self-reliance in edible oils.

The vital role of cash assistance in exports will be clear from the fact that the development of the industry during the past decade is related entirely to the quantum of export assistance. When the export assistance was at the rate of 25 per cent, the exports of decorticated cake/extractions went up to 1,34,000 tonnes in 1967 (Rs six crores). When assistance was withdrawn from April 1, 1971, exports slumped to 63,000 tonnes in 1971 (Rs three crores).

(c) The industry is undertaking widespread propagation of the use of cottonseed cake in the country through demonstrations, visual and other forms of publicity and personal contacts. If this drive is successful, it will help to wean the cattlefeeders from the use of cottonseed as such and that, in turn, would be conducive to the increased production of cottonseed oil and to the gradual decline in the price levels of oil.

(d) The third by-product namely, cotton linters has also been produced to a substantial extent along with the cake. Our members, however, have found it most difficult to dispose of the linters, even though they form a good raw material for linter pulp, and by replacing imported wood pulp, would enable a substantial degree of import substitution to be achieved. In spite of the repeated representations by AICOSCA to government, wood pulp imports have not been reduced, leaving our crushers without a market for our stock of cotton linters.

We shall be grateful if the attention of the public could be directed to the above aspects.

Bombay. R. V. KOPPIKAR
Secretary,
All-India Cottonseed Crushers' Association

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

Stain-proof, easy to clean and polish, Linoleum comes in a wide range of colours and designs. Choose yours.

MAHINDRA UGINE STEEL COMPANY LIMITED

Statement of the Chairman MR. HARISH MAHINDRA

Following is the statement of the Chairman, Mr. Harish Mahindra to the Members on the occasion of the 9th Annual General Meeting of the Company held in Bombay on 26th June 1972.

Political and Economic Outlook

The year 1971 was a difficult and eventful one for our country. It was the most tumultuous year in certain respects after we attained independence. Under the inspiring leadership of our Prime Minister Smt. Indira Gandhi, in our hostilities with Pakistan, we were able to register a victory for truth, liberty and democracy, the ideals which we cherish so dearly. It was a Dharmayudha in the real sense of the term and it was a unique kind of war, which resulted in the creation of an entirely new nation.

It is more than two months ago that we have had the fifth general elections to the State Assemblies. In almost all the States stable Governments have been formed by one and the same party, which is in power at the Centre. This should herald a period of political stability in the country and also a certain measure of uniformity, coherence and consistency in various economic policies. This is also the right occasion to concentrate on the foremost problems before the country and for implementation of various programmes for solving the over-riding issues of poverty and unemployment.

The ruling party is engaged in discussing certain far-reaching radical reforms. Many of us here at the moment have little doubt as to which way we are heading in the realisation of our desire for a socially

and economically more egalitarian society. Most of our economic policies which decisively set the pace and pattern of economic development still suffer from ambiguity, nebulousness and anomalies.

Certain basic lessons in economic development which we learnt from the past are being ignored in the rush and tumble of events. While it is true that growth in GNP does not necessarily mean an improvement in the living standards of the masses, we cannot afford to go to the other extreme and decry rapid growth which we must have at all costs. While it is essential that we introduce equalisation measures, as one of the solutions to the contentious problems of poverty and unemployment, such a solution, however, does not necessitate the slackening of our development efforts for one reason or the other. On the contrary, an accelerated rate of development will in fact reduce the intensity of the problem.

While, I for one, welcome the radical measures initiated or contemplated by the powers that be, I feel that this should not become an obsession with the planners to the detriment of the growth of the economy as a whole. Although it is a truism and platitude, I would like to reiterate that only through implementation of massive labour intensive schemes such as construction of national highways, bridges,

interlinking of inland water ways etc., the seemingly intractable problem of unemployment can be overcome.

Budget 1972-73 :

The Budget for 1972-73 has been rather disappointing for the corporate sector which had looked forward to certain development-oriented taxation measures. Contrary to the expectations of the corporate sector, the Government has withdrawn the allowance of a special deduction of an amount equal to 5% of profits of domestic companies engaged in the priority industries. Conversely, the surcharge on corporate tax has been enhanced from 2½% during 1971-72 to 5% in the current year's Budget.

It is not these imposts that are causing concern. It is on the other hand what the Budget has failed to offer to enliven the investment climate has been a source of anxiety. I refer here to my previous statement to you wherein I had taken the position that the abolition of Development Rebate after 31st May 1974 would positively hinder capital formation. The same view has been continued to be echoed and stressed by various other persons and organisations. The Finance Minister has reiterated on several occasions that there is no possibility of revival of Development Rebate in its original form. However, it now appears that the Government is searching for a suitable substitute so

that the withdrawal of the Development Rebate does not have a negative impact on investment policy and an inhibiting effect on the growth of industrial activity in India. I would plead for the reconsideration of the question of withdrawal of Development Rebate because I do not share the view that the Development Rebate contributed in any way to over-capitalisation as argued by its detractors. No management worth its name, while planning the capital structure of a Company, would deliberately over-capitalise only for the sake of availing itself of the benefits of Development Rebate. If Government feels that Development Rebate cannot be reinstated, I would suggest that either accelerated development rates should be allowed or grant of initial investment allowance as prevailing in other countries should be given as a corrective factor to counteract the rise in replacement costs of plant and equipment. If the Government is serious in directing industrial investments into so-called backward areas, it would be well advised to retain the incentive of Development Rebate at least for projects located in such areas. In the context of all these tax reforms and measures, the most important factor to be kept in mind is that what is at stake is not the growth, expansion, prosperity or adversity of a few organisations, but the very industrial development of the country itself.

Working Results :

Coming to the affairs of our own organisation, I am sure you would have observed the very satisfactory and marked increase in the sales of your Company and the consequent surplus position obtaining therefrom from the Directors' Report and Accounts for the year ended 31st December 1971. We were able to achieve an increase of more than 26 per cent in the income from sale of products and other income which is gratifying by any standard. The increase was of the order of about Rs 2.188 crores from Rs 8.265 crores. In terms of quantity, the output of saleable finished products increased to 31,836 tonnes—an increase of approximately 22 per cent over the previous year's output.

The turnover during the first five months of the current year has worked out to Rs 427 lakhs as against Rs 429 lakhs in the corresponding period of 1971. The order load at the moment is quite satisfactory and we expect that the inflow of fresh orders would be at the same levels as in the past.

Expansion :

You are aware that we had received some time back an expansion licence permitting us to produce tool, alloy and special steels of all types, grades and categories (with the exception of sheets and plates) upto 36,000 tonnes per annum of finished steel. After a detailed study, your Company had come to the conclusion that additional capital outlay for implementing the expansion of the existing capacity of 24,000 tonnes to 36,000 tonnes per annum would be disproportionate to the incremental return on the extra output of 12,000 tonnes, particularly as the prices for arc furnaces, blooming mill, etc. had registered a phenomenal increase since 1968. After considerable deliberations and advice received from our collaborators proposals for expansion of the productive capacity of the plant from 24,000 tonnes to 60,000 tonnes per annum in terms of finished steel were initially submitted to the

Government on 9th June 1970. Our expansion scheme as submitted to the Government is more in the nature of quantitative expansion inasmuch as product diversification is covered by the licence already held by us.

So far as the overall position of Alloy and Special Steel is concerned, the recent projections of NCAER and market surveys of different Agencies have proved beyond doubt that by 1980-81 there would be a substantial gap between the estimated demand and availability and especially in respect of Alloy and Constructional Steel, the gap would be quite appreciable. To ensure a balance between the demand and availability by 1980-81, additional capacities would have to be necessarily planned and action initiated as expeditiously as possible having due regard to long gestation period.

Basically, there is an acceptance by the Government that priority should be accorded to the expansion of the existing Steel Plants over the establishment of new Plants for three principal reasons viz. (1) The cost of expansion would be appreciably lower than construction of a new Plant, (2) Expansion would be comparatively less time-consuming and (3) Economies stemming from larger scale of production would render some of the existing Units more viable.

For instance, it has been reported that the Steel Ministry now admits that the investment costs per tonne of steel ingots for the proposed Vijaynagar and Vizag Steel Plants in the South would be almost double that of the cost involved for expansion of Bokaro or Bhilai. Whereas investment per ingot tonne for plants located on green-field site is expected to vary between Rs 3,750 and Rs 4,000, the corresponding capital cost on identical basis for expansion of the capacity of Bhilai (from 2.6 million to 4.0 million tonnes) has been estimated at Rs 2,500 and, in the case of Bokaro, about Rs 2,160 (for expansion from 1.7 million to 4.0 million tonnes).

The capital outlay on our project based on an annual capacity of 60,000 tonnes would work out considerably less than the corresponding capital outlay on new projects recently sanctioned by Government.

If we had received the approval of the Government to our Expansion Scheme within a reasonable period we could have taken advantage of the prices of plant and equipment prevailing in 1971 thereby saving a considerable amount of foreign exchange expenditure. Increase in the price of the plant and equipment in the Continent has been anywhere from 10% to 15% per year and the delay in going ahead with the Expansion Scheme will result in avoidable increase in the capital outlay, particularly in terms of foreign exchange.

Another factor which is in favour of expansion of a plant like ours is the shorter gestation period resulting in quicker displacement of imports and consequential savings in foreign exchange as well as larger earnings of foreign exchange through exports of alloy-steel-based engineering products.

Moreover, in respect of royalties, MUSCO's expansion would yield a distinct and recurring advantage from the point of view of National Exchequer in terms of smaller outflow of foreign exchange. Our Collaborators have agreed graciously not to charge additional royalty on any quantity beyond 36,000 tonnes. This advantage alone should weigh heavily in the minds of the Authorities in favour of our proposal for expansion of plant capacity upto 60,000 tonnes.

Summing up, I feel that our Expansion Scheme is basically in consonance with the Government's thinking on the expansion of Mild Steel Plants. The social cost benefit of our Scheme from a macro perspective is also too obvious to be emphasised. In spite of these advantages, the fact that our expansion scheme has been virtually kept in cold storage by the

Government for nearly two years is rather inexplicable in the face of the avowed policy of the Government that units in the Private Sector are expected to augment the production of Alloy and Special Steels in the country. In these days when self-reliance, import displacement and rapid growth of economy are the cornerstones of our economic planning, we cannot afford to let industrial applications, based on sound economic reasons, shrivel up in delays like this. I therefore fervently hope that the Government will accord its approval to our Expansion proposals without and further loss of time.

Scrap :

Over the year under review, the capacity utilisation of Alloy Steel Industry has not been upto the mark. We have, as in the past, met with snags in the supplies of several of our most essential raw materials. In the case of scrap, the severity of shortage is fully manifest in the relentless surge in prices. It is desirable that scrap dealers voluntarily agree to exercise some restraint in the matter of scrap price increases. A recent study indicates that the requirements of scrap in 1976-77 would be double that of 1972-73, being of the order of 1.37 million tonnes. The supplies, however, are not growing at the same rate. From a nominal surplus position in 1970-71, we have today reached a stage when we have to start importing heavy melting scrap.

Even after measures are taken to improve scrap collection and scrap processing, there would still be a wide gap between scrap requirements and availability. It is, therefore, necessary to plan ahead, foresee gaps in supplies and attempt to bridge them by setting up sponge iron plants/metallised iron pellet plants.

Power :

In respect of power, there are mainly two points which are of immediate relevance to the operations of your Company.

The first relates to the apprehended serious shortage of power which is an essential input for melting operations, in the coming years. As you know, the present power situation in Maharashtra is not that comfortable and this situation is likely to continue unless immediate steps are taken to augment power generation. If I may say so, the Electric Furnace Industry, which is a power intensive one, has a share in the total generation capacity of only about 0.2 million K.Ws or about 1.5% of the generation capacity or 2% of the peak demand. We would, therefore, urge the authorities concerned to ensure adequate supplies of this essential input round-the-clock and all through-the-year. I would also suggest the creation of regional grids, which will help any Power Authority to take advantage of the ups and downs in the daily and seasonal peak demands, so that temporary shortages in one State may be made good by the temporary surplus in another State. Attention has also to be paid to the question of reducing energy losses in transmission and distribution. Hand in hand with these measures, there should be no slackening in the creation of fresh capacity for power generation.

A second and more urgent issue relates to the power tariff. At the moment the power cost for electric steel production in Maharashtra is almost prohibitive. I had referred in my previous statement that a Committee headed by the Industries Commissioner had been appointed by the Government of Maharashtra to inquire into this question. We learn that this Committee has recommended granting of exemption from Electricity duty to power intensive industries and bringing the tariff for power intensive units on par with those prevailing in States such as Mysore, Tamil Nadu, Gujarat and Madhya Pradesh.

Of late the Union Government is said to be advocating a concessional tariff of about 4.5 Paise per KWH for purposes of encouraging Mini Steel

plants in order to stimulate the growth of indigenous technology for sponge iron. Needless to say this is a move in the right direction and I only hope that the Maharashtra Government will act quickly in the matter of restructuring the MSEB tariff for electro-metallurgical industries.

Exports :

Although the indigenous output of Alloy and Special Steels is not sufficient to meet the requirements of the country, which position is likely to continue for a few years to come, there is, in my opinion, scope for direct export of certain types of Alloy and Special Steels. Of course, indirect exports of Alloy and Special Steels are taking place at the moment in the form of sophisticated engineering products. My submission to the Government is that those Alloy Steel Plants which have been able to establish reputation for consistency in quality should be offered adequate incentives for export of Alloy and Special Steels. Although initially the quantity which could be spared for export market would not be substantial, the efforts to find markets for such sophisticated products will pay dividends from a longterm perspective when the country's output of Alloy Steel will be sufficient to meet the entire domestic demand, leaving some exportable surplus.

Imports of Canalised Items :

As I had mentioned in my previous statement, the imports of Graphite Electrodes, Refractories, Ferro Alloys, Heavy Melting Scrap, Sponge Iron and Nickel were canalised through Government Trading organisations. On this matter we have had an open mind despite our misgivings. Nevertheless, I am now constrained to say that our experience so far in the matter of our obtaining these imported materials has not been happy. Nor are we satisfied with the manner in which imports are arranged, the lead time for physical receipt of the material and finally the actual cost we have to incur

for their supplies. The commission of the order of 5 to 7½% of the CIF value charged by the Canalising Agencies is definitely on the higher side and by any measure, out of proportion to the actual costs involved in the import of such materials. A better way to calculate commission would be to work out the actual cost of imports and to charge about 1% extra over and above such actual costs.

There is not much of a business-like approach in arranging imports. The time taken for finalising firm orders is nearly 6 to 7 months, whereas it never ought to take more than 2 to 3 months. Secondly, to curtail such delays, regular live-wire contacts with the consumers for purposes of consulting them regarding the most desirable source of supply, prices, quality, specifications and so forth are lacking. I suggest that the Canalising Agencies permit the consumers to scrutinise the offers received by them so that they could identify the best offer without any undue loss of time. Such a procedure will also ensure that specification-wise the material ordered by the Canalising Agencies is strictly in accordance with their requirements. The time lag involved between the date of the application for release order and the physical receipt of the canalised material is such that the expressed intention of the Government that the consumers could get their half-yearly requirements on a replenishment basis is defeated. Timely receipt of the materials is a *sine qua non* for keeping the wheels of production running. Clubbing all release orders for small values entails a certain amount of delay in placing the final orders with the foreign suppliers, completely upsetting the delivery requirements of the consumers. There is, therefore, a *prima facie* case for Canalising Agencies issuing letters of authority in favour of consumers to import on their own wherever the value of each individual release order is less than Rs 50,000.

Collaborators :

The Shareholders will be

glad to know that there has been a merger effective from 1st January 1972 between our Collaborators—Ugine Kuhlmann and Pechiney Group in France. This merger has resulted in the creation of a super conglomerate with an annual turnover of 2.7 billion dollars—according to various rankings, this new undertaking shall be number one in France and will be one of the top ten companies outside the United States. As a result of the merger, the assets and industrial activities of various companies belonging to Pechiney and Ugine Kuhlmann Group have been regrouped within the seven divisions viz. Aluminium, Copper, Special Steel, Ferro Alloys, Chemicals, Special Products and Nuclear Products.

Our association with Pechiney Ugine Kuhlmann opens up new vistas for close cooperation and collaboration in several fields whereby we can make fuller use of our financial and manpower resources and the expertise we have been able to build up within our own organisation. With a view to selecting some of the products within the gamut of activities of Pechiney Ugine Kuhlmann for eventual manufacture in the country, it is proposed to establish a Merchandising Division to acquire the necessary skill and experience in marketing PUK's products and sale of their techniques to third parties in India wherever considered necessary.

Before I conclude, I would like to express my sincere appreciation of the unstinted efforts put in by your officers, staff and workers in setting new records. I am also grateful to my colleagues on the Board for their sound advice and counsel. We are also indebted to Ugine Aciers for providing technical assistance in solving some of the production problems and in establishing new grades of steel.

Note : This does not purport to be the record of the proceedings of the Ninth Annual General Meeting of the Company.

RECORDS AND STATISTICS

Population of India : April 1, 1971

THE 1971 decennial census enumeration of the population of India was carried out from March 10, to April 3, 1971 with reference period as the sunrise of April 1, 1971. The abstracts of the population figures were collected from more than a million enumeration staff engaged in the gigantic operation through a relay system from the field and the provisional population figures were released by the Registrar General within a record time of ten days from completion of the enumeration. This was the shortest time in the history of Indian Census, as indeed in the census history of any country in the world, that the provisional results were announced after the Population Count. The schedules canvassed for every individual in the country were processed in hundred and old Regional Tabulation offices opened all over the country and now the final figures of population are available.

The final population of India as on sunrise of April 1, 1971 was 547,949,809; the break-up by sex and rural-urban areas, is as follows.

For the first time, the 1971 Census covered the Indian members and their families of our Missions abroad (Diplomatic Corps).

The difference between the final population now compiled after detailed sorting and tabu-

lation of the schedules and the provisional population figure released last year with the help of the census enumerator's abstracts is extremely small being only 0.11 per cent. Besides, the provisional figures did not include the figures of our Indian Missions abroad :

(1) Final population 547,949,809

(2) Provisional population 547,367,926.

(3) Difference between Provisional and Final Population (1)–(2) 581,883.

(4) % difference over (2) +0.11.

The total population of scheduled Castes and scheduled Tribes as revealed by the 1971 Census was as follows :

Total Population 547,949,809.

Scheduled Caste Population
Number 79,995,896. % to the total population 14.60.

Scheduled Tribe Population
Number 37,974,953; % to the total population 6.93.

The present volume of final population figures is being re-

*Note : The 1961 figures do not contain the figures of Arunachal Pradesh as the All India Schedule was not Canvassed throughout that Pradesh then.

leased to meet the persistent demands for the statutory use of the 1971 Census figures for various purposes such as delimitation of electoral constituencies, allocation of funds, determination of city allowances, etc.

Over one million population cities

The final population figures now compiled confirm the following nine urban areas as having a population of over one million :

The broad picture revealed of the major religious communities in India at the 1971 Census is as follows :

Table IV indicates the trends observed in the last two decades :

Hindus

The Hindus form the bulk of India's population, accounting for 82.72 per cent of the total population. The states and union territories in which Hindus constitute less than 60 per cent of the population are : Kerala (59.4 per cent), Manipur (58.97 per cent), Punjab (37.54 per cent), Jammu & Kashmir (30.42 per cent), Arunachal Pradesh (21.99 per cent), Meghalaya (18.50 per cent), Nagaland (11.43 per cent), L. M & A Islands (4.86 per cent). In 38 districts out of the total of 356 districts in the country the Hindus form less than 50 per cent of the population. The growth rate (23.69 per cent) of Hindus who constitute the large majority of the population conforms to the general growth rate of 24.80 per cent.

Muslims

The Muslims constituting 11.21 per cent of the total population form the next largest section of the population. The states and union territories in which their proportion is larger than the national average are : L. M & A Islands (94.37 per cent), Jammu & Kashmir (65.85 per cent), Assam (24.03 per cent), West Bengal (20.46 per cent), Kerala (19.50 per cent), Uttar Pradesh (15.48 per cent), Bihar (13.48 per cent). There are 38 districts in the country in which Muslims form more than 20 per cent

of the population. The growth rate recorded by the Muslims in 1961-71 was (30.85 per cent) which is much higher than the general growth rate of 24.80 per cent. The higher growth rate of Muslims has been attributed by some research scholars to the higher fertility among them due to their socio-cultural traits such as permissiveness of remarriage lesser extent of abstinence etc.

Christians

The Christians form only 2.60 per cent of the population. The southern states of Kerala, Tamil Nadu and Andhra Pradesh together account for more than 60 per cent of the Christian population of the country. The states and union territories in which more than a fifth of the population is made up of Christians are : Nagaland (66.76 per cent), Meghalaya (46.98 per cent), Goa, Daman & Diu (31.77 per cent), Andaman & Nicobar Islands (26.35 per cent), Manipur (26.03 per cent) and Kerala (21.05 per cent). The Christians have recorded a high growth rate of 32.60 per cent during the decade 1961-71. Excepting in Gujarat, Himachal Pradesh, Kerala, Punjab, West Bengal, Andaman and Nicobar Islands, Delhi, Goa, Daman and Diu and Pondicherry, the growth rate of Christian population has been higher than that of the respective general population growth rates in the rest of the states and union territories.

Sikhs

The Sikhs who form only 1.89 per cent of the total population are concentrated largely in the Punjab which accounts for 78.62 per cent of the Sikh population of the country. 60.22 per cent of the population of Punjab and 25.45 per cent of the population of Chandigarh Union Territory, 7.16 per cent of the population of Delhi Union Territory and 6.29 per cent of the population of Haryana is made up of Sikhs. In no other state or union territory do they form even five per cent. However, the growth rate recorded by the Sikhs during 1961-71 has been quite high, viz., 32.28 per cent.

Buddhists

The Buddhists constitute only 0.70 per cent of the total population of the country. Maharashtra accounts for over 85 per cent of the total Buddhist population of the country though forming only 6.47 per cent of the population of the state. In Arunachal Pradesh 13.13 per cent of the population are Buddhists. At the district level, in the three well-known Buddhist districts of Lahaul & Spiti (61.53 per cent) in Himachal Pradesh, Ladakh (51.82 per cent) in Jammu and Kashmir and Kameng (37.98 per cent) of Arunachal Pradesh, the Buddhists form a substantially large proportion. The growth rate recorded of Buddhists in 1961-71 was only 17.20 per cent as against the phenomenal growth rate of about 2267 per cent in the previous decade. The decade 1951-61 witnessed the neo-Buddhist movement which led to large-scale adoption of Buddhism by the Scheduled Castes, particularly in Maharashtra. It is possible that during 1961-71 certain

converts from Scheduled Castes to Buddhism preferred to return their religion as 'Hindu' with the hope of not depriving themselves of the concessions available to Scheduled Castes.

Jains

The Jains constitute only 0.47 per cent of the population and they are spread largely in the Western part of the country viz. Maharashtra, Rajasthan and Gujarat, but even in those states they form a very small proportion of the total population. The only states and union territories in which at least one per cent of the population are Jains are : Rajasthan (1.99 per cent), Gujarat (1.69 per cent), Maharashtra (1.40 per cent) and Delhi (1.24 per cent). The Jains are essentially concentrated in urban areas. This is the only religious community whose total number in urban areas exceeds its strength in rural areas. There is nothing striking about their growth rate which was 28.48 per cent during the decade 1961-71 except that it exceeded the general growth rate of 24.80 per cent.

GOVERNMENT OF INDIA

4½ PER CENT LOAN 1979 TO BE ISSUED AT RS. 100.00 PER CENT AND REPAYABLE AT PAR ON 15TH JULY 1979
5 PER CENT LOAN 1983 TO BE ISSUED AT RS. 99.50 PER CENT AND REPAYABLE AT PAR ON 15TH JULY 1983.
5½ PER CENT LOAN 2002 TO BE ISSUED AT RS. 100.00 PER CENT AND REPAYABLE AT PAR ON 15TH JULY 2002

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 350 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of the Government of India 4½ per cent Loan 1972 and/or 4 per cent Loan 1972 which will be accepted for conversion at par. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

If the total subscriptions received for the new loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the cash subscriptions received and the balance refunded in cash as soon as possible.

Interest on the securities of 4½ per cent Loan 1972 and 4 per cent Loan 1972 tendered for conversion into the new Loan will be paid at the rate of 4½ per cent per annum and 4 per cent per annum respectively upto and inclusive of 14th July 1972 at the time of issue of the new securities.

Interest will be paid half-yearly on the 15th January and 15th July. Interest on all the loans now issued together with interest on other previous Government Securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs. 3,000 per annum and subject to other provisions of Section 80L of the income-tax Act, 1961. The value of investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs. 1,50,000/-.

Subscription lists will open on 15 July 1972

and close on 18th July 1972 or earlier without notice.

Applications for the new loans will be received at :

- offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna ;
- branches of the subsidiary bank of the State Bank of India conducting Government treasury work except at Hyderabad; and
- branches of the State Bank of India at other places in India.

For full particulars please apply to any of these offices or branches.

Financial Performance of 543 Companies 1970-71

THE CORPORATE sector performed well in 1970-71, according to a study by the Industrial Credit and Investment Corporation of India (ICICI) of the finances of 543 companies. The companies reviewed consist of 454 public limited companies and 89 private limited companies which received ICICI assistance in the year ending September 30, 1971. Sales net of excise duty for these companies increased from Rs 3,489 crores to Rs 4,010 crores; correspondingly, gross profit increased from Rs 584 crores to Rs 676 crores. Among industry groups, automobile and cycles, chemicals and petro-chemicals, machinery, manufacture, metals (ferrous and non-ferrous), shipping, sugar and textiles show a gain both in sales and gross profits.

At present there is a considerable time-lag in the availability of data on the financial performance of the private corporate sector. A systematic analysis based on a sample study of the private corporate sector is available from two sources, namely, the Reserve Bank of India (RBI) and The Economic Times Research Bureau. The latest sample study of RBI for 1501 public

limited companies, just published, provides data for the financial year (April-March) 1969-70 and the one by The Economic Times, based on a sample of 686 public limited companies, also covers the same financial year.¹ To some extent RBI has made an effort to bridge this gap by publishing a study on 290 large public limited companies for the year 1970-71.²

The sample of 543 companies to which the following tables relate, is composed of 454 public limited companies and 89 private limited companies. In terms of paid-up capital, the 454 public limited companies in ICICI's sample form about 65 per cent of the RBI's sample of 1501 public limited companies and 53 per cent of the private corporate sector. However, in interpreting the ICICI data, it should be borne in mind that the ICICI sample is not a statistically representative sample of the private corporate sector.

Following the pattern of distribution of ICICI assistance, the sample is heavily weighted in favour of non-traditional and new product industries as well as textiles, where ICICI has provided assistance to a large number of companies for modernisation and replacement purposes.³ Thus, as the table below, industry groups such as chemicals and petro-chemicals, ferrous metal products, machinery manufacture, and automobiles and cycles account for nearly 48 per cent of the total paid-up capital of companies covered by the sample.

These 543 companies have combined gross fixed assets of Rs 3,351 crores in 1970-71 which are spread over 17 industry groups spanning 15 states and three union territories. The industry group-wise classification of the companies is based on the United Nations "International Standard Industrial Classification" of all economic activity. The industry groups are very wide in their coverage; for example the chemicals and petro-chemicals group includes products ranging from fertilisers and pharmaceuticals to varnishes and lacquers. It is, there-

TABLE I
Industry-wise Classification of Companies

Industry Group	Number of Companies	Paid-up Capital (Rs crores)	Per Cent of Total
Automobiles and Cycles	26	71.48	7.6
Cement	11	56.20	5.9
Chemicals/Petro-chemicals	74	216.07	23.0
Electricity, Gas & Steam	7	37.54	3.8
Electrical Equipment	43	45.58	4.8

Interest	122.96	137.73
Depreciation	177.23	192.90
Operating Profit	274.62	339.78
Taxation	103.47	134.67
Retained Earnings	90.52	111.58
Net cash Accruals	267.76	304.47
Dividends (ordinary and preference)	80.62	93.53
Gross Value—Added	1070.03	1235.86
Net Value—Added	892.79	1042.96
Quick Ratio	39:61	39:61
Current Ratio	56:44	56:44
Equity-Debt Ratio	64:36	67:33
Operating Profit and interest as % of Capital Employed	12.8	14.5
Gross Value—Added as % of Total Assets	26.9	28.6
Net Value—Added as % of Total Assets	22.5	24.2
Asset Turnover Ratio (Net)	112.0	119.6
Asset Turnover Ratio (gross)	87.9	93.0
Inventory Turnover Ratio	24.5	24.0
Operating Profit as % of Sales	7.9	8.5

1. Reserve Bank of India Bulletin, April 1972. The Economic Times, October 26, 1971.

2. Reserve Bank of India Bulletin, February 1972.

3. It should be mentioned that the sample does not cover all companies assisted by ICICI. Companies excluded are mainly those which were not yet in production or those for which balance sheet data were not yet available.

fore, important to use caution in identifying particular industry groups with particular products. Broadly, the product coverage of each industry group is given in Appendix I.

For the purpose of aggregation, the industry classification of a multi-product and diversified company is on the basis of the product accounting for the largest share in the turnover of the company. Similarly, a multi-product firm having plants in various states is classified as belonging to a particular state, if the product having the largest share in the total turnover of the company is manufactured in that state. It should be stressed that state-wise distribution of companies in the sample is highly uneven. The sample covers only a few companies from five states, viz, Assam, Madhya Pradesh, Orissa, Punjab and Rajasthan. For these states, in particular, the sample is highly unrepresentative and should be interpreted with caution.

In terms of size, companies having paid-up capital above Rs 50 lacs constitute nearly 60 per cent of the total number of companies covered in the sample (as against 37 per cent in the RBI's sample of 1501 companies). The ICICI sample, however, also includes 27 small companies with paid-up capital of less than Rs five lacs (RBI's sample covers only companies with paid-up capital above Rs five lacs).

The accounting year for the present study is October-

TABLE III
Distribution of Companies

Year ending	Number of companies
October 1970	18
November 1970	2
December 1970	199
January 1971	2
February 1971	2
March 1971	200
April 1971	12
May 1971	5
June 1971	63
July 1971	6
August 1971	10
September 1971	24

September. Thus, for 1970-71, financial statements ending from October 1, 1970 to September 30, 1971 are included in the ICICI sample. These cover balance sheets received upto end of March 1972. The table below shows the distribution of 543 companies according to the month in which their financial year ends.

It is interesting that as many as 324 companies out of 543 have their year endings in 1971. For the year 1971, therefore, the tables provide the latest available aggregated balance sheet data (the financial year for RBI sample of 290 large companies is April 1970 to March 1971).

The definitions of some of the items included in the tables are as follows :

Gross Fixed Assets : Gross fixed assets are all fixed assets including capital work-in-progress.

Total Assets : Total assets are gross fixed assets and inventories.

Current Assets : Current assets are inventories, stores, receivables, advances and cash, bank balances.

Current Liabilities : Current liabilities are short-term loans, bank borrowings for working capital, and other usual current liabilities.

Operating Profits : Operating profits are profits before tax but after interest, depreciation and management remuneration.

Net Cash Accruals : Net cash accruals are depreciation and retained earnings.*

Gross Value-Added : Gross value-added is operating profits interest, depreciation and salaries and wages.

Net Value-Added : Gross value-added minus de-

* Operating profits as well as retained earnings are based on current year operations only. Adjustments in respect of previous years have been ignored.

preciation.

Equity-Debt Ratio : Proportions of equity and debt expressed in percentage terms : debt includes long term loans only.

Current Ratio : Proportions of current assets to current liabilities expressed

sed in percentage terms.

Quick Ratio : Proportion of liquid assets (i.e. cash and bank balances, investments, receivables and advances to current liabilities expressed in percentage terms.

Asset Turnover Ratio (gross) : Net sales as a percentage

of gross fixed assets and inventories.

Asset Turnover Ratio (Net) : Net sales as a percentage of gross fixed assets.

Inventory Turnover Ratio : Inventories as a percentage of net sales.

The fifty-four tables in Part II are organised in three sections. Tables 1A and 1B give data for entire sample; Tables 2A to 18B for each of the 17 major industry groups; and Tables 19 to 36 for 15 states and three union territories. Selected items from the accounts of companies have been summarized and presented in the order of (a) balance sheet items, (b) profit and loss account items, (c) some important ratios. In addition, for the entire sample as well as for each industry-group tables on frequency distributions have been included for equity-debt ratio, Current ratio, and return on capital employed.

Points of Interest

It is not the purpose here to critically review or provide a prose summary of the tables that follow. However, it may not be out of place to touch upon some points of interest regarding the financial state of the corporate sector that emerges from these tables.

Profitability

The first point of interest is that during 1970-71, there has been a significant increase in sales and profitability of the sample companies. Sales increased by 15 per cent and operating profits by about 24 per cent. Operating profits as a percentage of sales thus increased from 7.9 per cent in 1969-70 to 8.5 per cent in 1970-71, and gross returns (profits plus interest) on capital employed increased from 12.8 per cent to 14.5 per cent. It would seem that the better record of profitability, despite higher costs of raw materials and higher incidence of wages, was possible

due to better price realisation in the case of a number of industries. The contribution by value-added as percentage of fixed assets and inventories increased from 26.9 per cent to 28.6 per cent during the period. Operating assets of the companies also seem to have been better utilised, as evidenced by an improvement in asset-turnover ratios.

There are some important differences in the sales and profit performance of different industry groups. Among industry groups that have contributed relatively more to the better sales performance and better asset turnover are automobiles and cycles, chemicals and petro-chemicals, electricity, gas and steam, electrical equipment, metal products (ferrous and non-ferrous) and sugar. In terms of profitability, chemicals, electrical equipment, glass, ferrous and non-ferrous metal products, paper, shipping and wood, cork and hardboard industries showed profit rates over sales (net of excise) of over 10 per cent, while automobiles, food products, machinery manufacture, sugar and textiles showed profit rates of five per cent or lower.

In terms of return (interest plus profits) on total capital employed, there was a decrease in the number of companies showing negative returns; their number decreased from 58 in 1969-70 to 48 in 1970-71. Among companies showing positive returns, a large number (143) showed returns of between 10 and 15 per cent. There were also some companies with exceptionally high returns; 139 companies had rates of return of over 20 per cent in 1970-71 (against 121 companies in 1969-70).

The pattern of appropriation of profits (as between taxes, dividends and retained earnings) seems to have changed in favour of taxes, and the dividend payout was lower during 1970-71. This is in conformity with the findings of the RBI study of 290 large companies. The profits appropriation pattern for the

ICICI sample for 1969-70 and 1970-71 was as follows :

	(% of operating profits) 1969-70 1970-71	
Taxes	37	39
Dividends	30	28
Retained earnings	33	33

Asset Formation

Gross fixed assets of the 543 companies increased from Rs 3115 crores in 1969-70 to Rs 3351 crores in 1970-71. The rate of asset expansion was thus 7.6 per cent (compared with seven per cent in the case of RBI 290 company sample). There has also been an increase in inventories of the order of Rs 107 crores from Rs 855 crores in 1969-70 to Rs 962 crores in 1970-71. The rate of inventory expansion was thus higher at 12.5 per cent. Gross capital formation (fixed assets and inventories) has been of the order of Rs 343 crores (8.6 per cent).

In terms of gross capital formation, sugar industry stands at one extreme with no expansion during the year. The other industries with relatively low rates of expansion were cement, paper and electricity, gas and steam. Highest expansion (19.3 per cent) was recorded in the case of rubber goods industry, followed by machinery manufacture, shipping, electrical equipment, woods, cork and hardboard, and food products (other than sugar).

Means of Financing

It will be noted that internal generation of funds, comprising depreciation and retained earnings, was considerably

larger than additional investment in fixed assets. As a result, the companies were able to reduce somewhat their liability on long-term loans. It is interesting that for the RBI 290 large company sample, internal cash generation was even higher (70 per cent of total).

The following is a summary of sources and uses of funds for the ICICI sample :

As a result of a better record of profits coupled with lower dividend payout, the equity-debt ratio improved somewhat from 64 : 36 in 1969-70 to 67 : 33 in 1970-71 for the sample companies. An overwhelming number of sample companies (443) had equity-debt ratio better than 50 : 50. As many as 291 of them had equity-debt ratio of more than 70 : 30. At the other end were 40 companies which had equity debt ratio for less than 26 : 74.

All industries (except rubber products and wood, cork and hard-board) conform to the board pattern as regards improvement in their equity-debt ratio. Industries with relatively lower equity base (less than 60 per cent) are chemicals and petro-chemicals, and shipping, which are capital intensive and, therefore, rely more on borrowed funds. Industries with high equity base (more than 75 per cent) are food products, glass and pottery, metal products (ferrous), and miscellaneous industries.

Liquidity

Judging from the behaviour of quick ratio and current ratio, it seems that the companies in the sample maintained their liquid position in

TABLE IV
Sources and Uses of Funds

Sources	Rs crores	% of Total	Uses	Rs crores	% of Total
Internal	294	60	Gross Fixed Assets	236	49
External	189	40	Inventories & Stores	142	29
			Liquid Asset	105	22
	483	100		483	100

1970-71; current ratio was 56 : 44 and quick ratio was 39 : 61 for both the years. However, in 1970-71, 300 companies had current ratio lower than the average (as against 308 in 1969-70). Of the liquid assets, the year-end cash and the bank balances held by the sample companies were Rs 172

crores in 1970-71 (against Rs 147 crores in 1969-70). The most significant increase in cash and bank balance was in respect of chemical group of companies.

Industry-wise, 13 industry groups seem to have either maintained or improved their

liquidity position, while for four industry groups there was a marginal fall in the current ratio. Chemicals and petrochemicals, electrical equipment, glass and pottery, non-ferrous metal products, rubber products and shipping industries had a better than average current ratio in 1970-

71. Inter-industry differences in the current ratio are, however, not very large. Depending on the conditions prevailing in different industries, the quick ratio, on the other hand, shows wide divergence; thus for shipping industry the quick ratio was 63 : 37 as against 18 : 82 for the sugar industry.

Appendix I Product Coverage of Industry Groups

Industry Group	ISIC Code	Main Products
1. Automobiles and Cycles	383	Manufacture and assembly of motor vehicles, manufacture of motor vehicle parts and accessories (excluding tyres and tubes); repair of motor vehicles, etc., manufacture of motor cycles, scooters and bicycles and parts thereof.
2. Cement	334	Manufacture of all types of cement.
3. Chemicals and Petro-Chemicals	311 313 319 321 329	Basic industrial chemicals, including fertilizers, synthetic fibres, dyestuffs, plastics, etc.; manufacture of paints, varnishes and lacquers; manufacture of miscellaneous products of petroleum and coal; manufacture of miscellaneous chemicals products such as medicinal and pharmaceutical preparations, cosmetics, soaps and detergents, pesticides etc.
4. Electrical Equipment	370	Manufacture of machinery, apparatus and supplies for the generation, storage and transmission and transformation of electric energy, such as electrical appliances such as fans; insulated wire and cables, electric lamps, radios, storage and dry cell batteries, etc.
5. Electricity, Gas and Steam	511	Generation, transmission and distribution of electrical energy.
6. Food Products (other than sugar)	202 203 204 205 206 208 209 214	Manufacture of dairy products; canning and preserving of fruits and vegetables, fish and other sea foods; manufacture of grain mill products; manufacture of bakery products, cocoa, chocolate, sugar confectionery, soft drinks and carbonated water.
7. Glass and Pottery	331 332 333 339	Manufacture of structural clay products such as bricks and refractories; manufacture of glass and glass products; manufacture of pottery, china and earthenware; manufacture of some non-metallic mineral products like abrasives.
8. Machinery Manufacture	360	Manufacture of machinery and prime-movers other than electrical equipment. Included also are agricultural and industrial tractors and conveyers, refrigerator, air conditioning units, machine tool etc. The group also includes machine shops engaged in producing and repairing machine and equipment parts and the production of ball bearings, etc.
9. Metal Products, Ferrous	341 350 (partly)	Iron and steel basic industries consisting of all processes from smelting in blast furnaces to the semi-finished stage in rolling mills and foundaries, that is the production of billets, blooms, slabs or bars, rerolling, and drawing into basic forms; rough castings and forgings etc.; manufacture of basic metal forms (ferrous) into finished products such as hand tools, steel spring wire rods and bars, wire ropes, etc.
10. Metal Products, Non-Ferrous	342 350 (Partly)	Non-ferrous metal basic industries such as aluminium and consisting of all processes from smelting, alloying and refining, rolling and drawing; manufacture of basic metal forms (non-ferrous) into finished products such as tin cans, etc.
11. Pulp, paper and paper products	271 272	Manufacture of pulp, paper and paper board; coating, glazing and laminating of paper and paper board; manufacture paper products like paper bags, stationery, etc.
12. Rubber products	300	Manufacture of all kinds of rubber products such as tubes and tyres, footwear, etc.; reclaiming of rubber; rebuilding, retraining and vulcanizing of tyres; etc.
13. Shipping	715	Ocean transport of freight and passengers including in coastal waters.
14. Sugar	206	Manufacture and refining of raw sugar.
15. Textiles	231 239	Spinning, weaving and finishing textiles (cotton, jute as well as woollen) including manufacture of carpets and rugs, etc; manufacture of linoleum and other hard surfaced floor coverings, etc. Not included are manufacture of man-made fibre yarns.
16. Wood, Cork and Hardboard	251	Saw mills, planning and other wood mills manufacturing ply-wood, veneers, etc
17. Other Miscellaneous Industries	—	Included here and several industries such as printing and publishing, coal mining etc

Wholesale Prices

THE WHOLESALE PRICES as measured by the official index (with the year ended March, 1962=100) advanced by 0.5 per cent to 192.1 in March, 1972 as against 191.2 for February, 1972. The index for March, 1972 was higher by 5.8 per cent when compared to March, 1971. During the month under review 'food articles' moved up by 1.4 per cent to 216.1 as against 213.2 for the earlier month, Fuel, Power Light and Lubricants and chemicals by 0.4 per cent each to 175.9 and 198.7 respectively, machinery and transport Equipment by 0.1 per cent to 162.6 and 'manufacture's by 0.2 per cent to 172.8 while liquor and tobacco group declined by 0.2 per cent to 202.6 and industrial raw materials by 1.9 per cent to 182.2 as against 185.8 for the previous month.

Food Articles

The index for 'cereals' sub-group rose by 1.2 per cent to 208.5 due to an increase in the prices of rice, jowar and maize. The prices of bajra however, fell. 'Pulses' recorded a fall of 2.1 per cent to 286.1 on account of lower prices of arhar and masur. The prices of gram, however, rose. Other items which showed significant variations under this group are: Potatoes (+10 per cent), Oranges (+16 per cent), Cashewnuts (+8 per cent), Sugar (+7 per cent), Gur (+7 per cent) Khandasari (+6 per cent), Cummin (+11 per cent). Onions (-7 per cent), bananas (-13 per cent), eggs (-7 per cent), turmeric (-6 per cent) Carda-

moms (-12 per cent) and Salt (-9) per cent.

Liquor and Tobacco

The prices of tobacco raw declined, while the prices of tobacco manufactured advanced and consequently the index for this group declined by 0.2 per cent to 202.6.

Fuel, Power, Light & Lubricants

The index for this group

rose by 0.4 per cent to 175.9 due higher prices of kerosene oil.

Industrial Raw Materials

Among the sub-group of fibres the prices of cotton raw declined by 11 per cent while silk raw moved up by 6 per cent and the index for this sub-group receded by 6.8 per cent to 164.2 as against 176.2

for the previous month. The index for oil seed's sub-group advanced by 0.5 per cent to 202.4. The sub-group index for other industrial raw materials stood at 174.8 as against 174.6 for the last month.

Chemicals

The index for 'chemical's' group recorded a rise of 0.5 per cent to 198.7 due to a slight

Index Number of Wholesale Prices by Groups & Sub-groups of Commodities

rise in the prices sulphuric acid.

Machinery and Transport Equipment

The index for this group worked out to 162.6 as against 162.4 for the previous month due to a fractional rise in the prices of electrical machinery

and non-electrical machinery sub-groups.

Intermediate Products

The index for intermediate products moved up slightly by 0.7 per cent to 206.6 due to higher prices of semis.

Finished Products

The index for textiles sub-

group declined by 0.9 per cent to 170.9 due to lower prices of jute manufactures (—4.7 per cent). The prices of cotton manufactures and silk and rayon manufactures, however rose by 0.4 per cent and 0.2 per cent respectively. The subgroup index for (metal product) advanced by 2.5 per cent to

187.4 due to higher prices of iron and steel manufacture. The indices for non-metalli. products and misc. products recorded a fractional rise. Oilcakes declined by 1.0 per cent to 177.6. On the whole, the index for finished products stood at 164.6 as against 164.5 for the previous month.

Index Numbers of Industrial Production

Bhutto on Trial

THE PRIME Minister of India has taken Mr Bhutto on trust. By agreeing to the proposition that the Indian and Pakistani forces are to be withdrawn to their respective sides of the international border (the Jammu and Kashmir frontier, which is a cease-fire line, being excepted), she has very considerably strengthened the hands of the President of Pakistan in dealing with his domestic front. Mr Bhutto was in no position to return to Islamabad empty-handed; his hold on power is still too provisional. It is now open to him to tell his people that he has succeeded in persuading the Prime Minister of India not to insist on an Indo-Pakistan agreement on Kashmir being a precondition for India withdrawing its troops from the territory they have occupied in the Sind and Punjab parts of Pakistan. Whether Mr Bhutto uses this argument merely to buy time for himself for consolidating his authority as President or whether he will also employ it to reinforce a policy of constructively negotiating with India and normalising relations thereby realistically resolving Pakistan's problems with our country, most of which are of Pakistan's own making, remains to be seen. It is in this sense that Mrs Gandhi must be held to have taken Mr Bhutto on trust.

It follows that Mr Bhutto is now on trial. It is up to him to capitalise on the readiness shown by the Prime Minister on behalf of this country and its people to go more than half way to facilitate Pakistan giving up its tactics of confrontation or conflict in trying to force its will on India in respect of Kashmir. The agreement signed in Simla is replete with generalisations about the two countries sticking to peaceful bilateral negotiations, or "other peaceful means mutually agreed upon between them" in seeking a settlement of outstanding issues. The onus for lending reality to this broad undertaking rests mainly on Pakistan and more specifically on Mr Bhutto himself since he claims that his country is behind him almost to a man.

It was obvious all the time that the Simla summit, irrespective of the way it might end, would be the first of a series of such meetings between the heads of the governments of India and Pakistan. At the next meeting, however, Mr Bhutto must be prepared for getting closer to the hard core of a peace settlement; the margin which India has for making concessions is not inexhaustible. It is possible, however, that Mr Bhutto's next big task would be not so much of preparing himself for another meeting with Mrs Gandhi, but that of coming to terms with the fact of Bangladesh and its implications. If the President of Pakistan had learnt anything at all in Simla it must have been the elementary truth that the government of Bangladesh must necessarily be a party to discussions on the repatriation of Pakistan's military men taken prisoner in Bangladesh. A Pakistan Foreign Office spokesman was reported to have disclosed in Simla that his government was likely to recognise Bangladesh in August. While the Simla talks should have helped Mr Bhutto to realise that this would be the right course of action, the liberal Indian attitude informing the Simla agreement has undoubtedly made it easier for him to do the right thing. Pakistan's normalisation of its relations with India depends very much on its success in normalising its relations with Bangladesh. In this sense peace in the sub-continent is clearly one and indivisible.

As we have pointed out earlier, Pakistan and Mr Bhutto especially have been the major gainer from the fact that the Simla talks have not failed. At the same time India need not go entirely unrewarded for having gone more than half way to make things easier for the President of Pakistan. Apart from the fact that the Prime Minister, by taking Mr Bhutto on faith, has placed him on trial, the people of Pakistan have been given proof of this country's willingness not only to be reasonable but also liberal in helping to create conditions making for good neighbourliness. In the degree in which the people of Pakistan are able to appreciate this gesture and respond to it they stand to gain, as also the people of India. The Simla agreement has made it clear to all the world that this country and its government are generally responsive to opportunities of promoting peaceful relations with Pakistan. This should make it less easy for the governments of certain countries to persist in their negative and unhelpful attitudes towards New Delhi. Whether the wilful and vindictive man in the White House will now be having second thoughts on his vendetta, it is too soon to say. Nevertheless President Nixon's emissary, Mr John Connally, who is visiting India and has met Mrs Gandhi, cannot be entirely insensitive to the post-Simla atmosphere in this subcontinent.

Trading with Australia

THE DELEGATION of Indian industrialists which visited Australia recently under the leadership of Lala Charat Ram (co-leader : Mr D. C. Kothari) came away immensely impressed with possibilities of increased trade between the two countries. Australia, with a population of about 13 millions—nearly equivalent to net addition to this country's population every year—has a standard of living (as measured by per capita income) which is more than thirty times that of our country. It is this high level of purchasing power of the Australian people which generates every year demand for a large variety of goods which that country has to import from foreign lands. Our country can undoubtedly take its rightful place among the leading trading partners of Australia provided the government, the state trading agencies and the exporters collectively make a determined effort to study the Australian market and take all possible steps in order to meet the sophisticated requirements of the population of that country. Our share in Australia's total foreign trade is hardly one per cent while even a country such as Indonesia accounts for more than two per cent of Australia's trade. At the top of the list is Japan with more than one-fourth of Australia's trade followed by the USA and the UK.

During the 1950s the exports from this country to Australia usually exceeded imports but in recent years the balance of trade has been adverse year after year because we have continued to increase our imports of non-ferrous metals and wool without making any determined efforts to increase the value of exports of both traditional and non-traditional commodities. As the table below shows, the adverse balance of trade with Australia totalled Rs 56.3 million in the four-year period ending in 1970-71. Surely this gap could have been reduced if our

India's Trade with Australia (Rs million)

	Exports	Imports	Balance of Trade
1951-52	476	176	+300
1960-61	224	178	+ 46
1967-68	280	650	-370
1968-69	255	258	— 3
1969-70	244	313	— 69
1970-71	245	366	-121

(All figures are in terms of post-devaluation rupees).

Mr John Kenneth

Galbraith who had been enjoying himself hugely as the licensed court jester in the all too short-lived Kennedy version of Camelot, has irreverently said that, if heads of state or heads of government travel so much these days, it is simply because they like to travel. Our much-travelled Prime Minister is unlikely to agree. As for the President of Pakistan, his journey to Simla may not exactly be a pleasure trip. Simla is too close to Calvary for his comfort. Bluster as he may, he knows well enough that, somewhere among those lavish courses of dinner or lunch served to him at this hill station of Himachal, there is also a dish of humble pie even if it is not overtly specified in the menu.

State visits and summit conferences have become popular among the politicians in power not only because they make occasions for prestigious or pleasurable travel. They also help immensely

members in the delegations clearly augment the importance which the delegation leaders wish to attach to themselves. In the same manner all those exciting stories of moves or manoeuvres over the agenda of the conference are nicely calculated to impress the world with the magnitude of the herculean labours in which Mrs Gandhi and Mr Bhutto have engaged themselves for the benefit of their respective countries. If, after all this, the talks turn out to have been only talks, the summit pair itself has no cause to lose cheer. On the contrary. For, there will have to be more summits.

Again, results or no results, the summit would still not have been in vain so far as the Prime Minister or the President is concerned. It would have helped Mr Bhutto to pass through some critical months by keeping the people of his country employed on talking or wondering about what all grand exertions he may be making to solve to their

WITHOUT CHARITY

in building up the political or even the private personalities of the VIP travellers. See, for instance, what a big man the very ordinary Mr Richard Nixon has managed to make himself out to be merely by eating a few meals in the Great Hall of the People or the Kremlin. Both Mrs Gandhi and Mr Bhutto naturally appreciate fully what the summit could do for their egos or political avoidrupois. The mere publicity must be meat and drink to them and everything that has been happening lately surely shows very clearly that the two protagonists are quite capable of extracting the last milligram of personal publicity or political dividend.

Writing this as the talks begin, I suspect that neither the Prime Minister of India nor the President of Pakistan may really expect much from the elaborately staged meeting in terms of true significance for the respective countries. It is true that each has taken to Simla an impressive retinue of colleagues and officials, but this is essentially a part of the lavishly organized stage-play. Num-

satisfaction Pakistan's problems with India. As for Mrs Indira Gandhi, nothing has been more useful to her than these loose ends of Indo-Pakistan relations the tying up of which seems to call for such heroic but unending efforts. "Garibi hatao" may now patiently await its turn. Thank God for the rains—they should at least help the people to feed themselves after a fashion. Meanwhile industrial production may falter because, among other things, so much of organized labour, factory or white collar, seeks to work less and less for more and more money. It is not wholly to blame of course, for money itself is coming to buy less and less. The price level is going up steadily creating week after week more poverty and more poor people than the pitiful make-work schemes of the Minister for Planning can hope to reduce or redeem. Industrial investment or business activity, which must produce the industrial expansion, which in turn has to generate the resources for the Prime Minister's "garibi hatao", is kicking no doubt, but not because it is exuberantly alive; it is only throwing fits. This, however, does

not prevent the Minister for Industrial development from hopefully formulating grand designs for a brighter tomorrow for industrial growth, even if he may be a little uncertain about what that tomorrow may bring forth for himself. This minister, it is obvious, need not be taken too seriously; his portfolio is not relevant to the Simla summit here, right now, Mrs Gandhi is trying to discharge her supreme obligation to solve Mr Bhutto's problems for him and, in the process, perhaps India's problems with Pakistan as well. Has he not become the *de facto* Prime Minister of the Indian sub-continent after all?

Let us, then, be grateful for the diversions. The big diversion which has taken our eyes off "garibi hatao" and turned them towards Simla, and also the smaller distractions. Miss Benazir Bhutto, for instance. The President of Pakistan may be a male chauvinist where the Prime Minister of India is concerned, but he does not seem to rule out altogether women's presence in politics. As a matter of fact, he had recently sent his wife to Kabul on what was reported to be a political mission. To Simla he has brought with him not Mrs Nusrat Bhutto, but the daughter. This pretty and apparently pleasant teenager has been performing her assignment, stated or unstated, to perfection. She has channelled the attention and curiosity of the Simla crowds towards herself, for which her father may well be grateful.

The President of Pakistan has had another large bonus too. Large, that is, in every sense of the word. The newly elected chairman of the Swatantra party, the massive Mr Piloo Mody, has lumbered into the forbidden territory of the summit theatre and been having long sessions with Mr Bhutto. Both were at Berkley together and are even otherwise cronies of long standing. Mr Mody has stated repeatedly that Mr Bhutto and himself have been talking on this occasion about everything except summit affairs. Mr Mody certainly is an honourable man. In any case, though a politician, he has never taken politics, his or others', too seriously. It is just possible that, taking legitimate advantage of his matey relationship with Mr Bhutto, he might have merely told him "You, so-and-so, do try and behave yourself", which may be one reason why the President of Pakistan has not staged any walk-out.

TOUCHSTONE

export of traditional goods such as jute manufactures, tea, fabrics, cashews and marine products and of non-traditional items such as iron and steel products and engineering goods was stepped up.

The State Trading Corporation of India (STC) has a branch in Sydney and its research staff has conducted some market surveys regarding products which have possibilities of export to Australia. The list of commodities which according to these surveys could be exported to Australia includes such agricultural products as jute goods, coffee, castor oil, fresh fruits, flowers, vegetables, spices, castor seeds, tobacco and lemongrass oil. A large variety of chemicals, consumer goods, leatherware, canned products and industrial products can also be sold in Australia. It is the view of Mr D.C. Kothari that the trade between the two countries can be raised from the present level of about \$75 million to about \$200 million. Surely, trade is a two-way traffic and co-operation from Australian industrialists will be needed in good measure if this goal is to be reached.

After wool, non-ferrous metals—zinc and lead in particular—take a place of pride among our imports from Australia. More than half of our needs of lead (of 99.99 per cent purity) will be imported by our country this year from Australia. Such industries as battery making, dry cells and cables need large quantities of lead of high purity which can be had at relatively cheaper prices from Australia (because of nearness to this country) than from the USA, Canada, and Mexico. As we come to rely increasingly on Australia for our requirements of non-ferrous metals, we must see to it that our export agencies make relentless efforts for raising our exports to that country.

One encouraging outcome of the Indian delegation's recent visit to Australia has been the hopeful response which it has been able to evoke in that country in the sense that Australia is also thinking in terms of sending out next year a high-power study team to consider the question of Indo-Australian joint ventures. What is more, the industrialists from both the countries have now felt the necessity of specialised delegations visiting both the countries in order to identify areas where mutual co-operation is possible. The inflow of massive foreign investments on which no restrictions are put in Australia has no doubt taken its industry to a high level of development and it has specialised in such sophisticated industries as automobiles, electronics, metals etc. Our country also has attained capabilities of a high order in a number of industries and there is substantial scope for starting joint

venture not only in this country but also in African and south-east Asian countries.

British goods have enjoyed preferential treatment in Australia for the last so many years. This factor alone explains the relatively high proportion of trade between Australia and the United Kingdom though Japan and the USA have taken precedence over the UK in their shares of the Australian trade. The latest figures indicate that about 30 per cent of Australian exports are made to Japan followed by 12 per cent to the USA and nine per cent to Britain. The UK's share is likely to fall further after Britain becomes a member of the European Economic Community. It will result in the abolition of the traditional imperial preferences and even though Australia has put up a cheerful face, it is known that the initial impact of Britain's entry into the Community might not be very pleasing for it. While imports from Britain will become more expensive for Australia, its exports to the United Kingdom will also become more costly. The researchers are not quite clear as to the cumulative effect of these changes in the prices of exports and imports. That is why Australia is keen on making alternative arrangements and is seeking new partners in trade and strengthening its commercial bonds with countries such as India. Here is a golden opportunity for our country to grasp the possibilities which are being offered. Surely the success of any such effort will be assessed in terms of what we are able to offer to Australia and at what prices.

The central point to be considered in all our efforts for increased exports to Australia is the tariff policy of that country which is harsh to subsidised exports. It means that if an industry in our country receives a subsidy on exports, the customs duty on that product in Australia will attract an increased charge. Consequently, it is necessary that the products and commodities proposed to be exported to Australia should be such as can absorb high Australian imposts. Some of the products which the STC has indicated after market surveys in Australia can certainly stand up to this disadvantage.

The export of textiles has renewed possibilities in the context of a bumper cotton harvest in this country and the reduced prices of this fibre. The delegation found sufficient interest in Australia in so far as our textiles are concerned. Perhaps it will be more advantageous to market our textile fabrics in that country. Similarly our engineering goods which have made a mark in European markets will also find ready acceptance in Australia.

The Australian market for tea is limited

in scope because of the small size of the population. Even in this small market, we have not fared well in competition with Ceylon and Indonesia. Nearly 40 per cent of Australia's imports of tea originate in Ceylon followed by Indonesia at 30 per cent and India at 10 per cent. By offering competitive prices, we can certainly improve our position in this regard.

Australia is the only developed country which had decided as long ago as in 1965 to proceed on its own with a system of tariff preferences in favour of specified manufactures and semi-manufactures from developing countries. By the middle of last year, 240 groups (about 400 items) of manufactures and semi-manufactures were eligible for the generalised system of tariff preferences (GSP). At the recent Santa-

go meeting of UNCTAD the Australian spokesman had indicated that this list had been further extended this year by the addition of 200 items. While Australian imports of quota products and handicraft goods under the GSP from developing countries have been increasing in recent years, our country has not availed of this opportunity. It is high time that the exporters in our country turned their attention to Australia and took advantage of the unique opportunities awaiting them there. There is genuine disappointment in Australia that with the exception of Japan, other Asian countries are "far less active themselves in seeking to promote their exports to Australia". It is to be hoped that the meetings between the Indian and Australian businessmen will result in some concrete results.

The noteworthy feature of the latest budget estimates of Mysore is their tidy look. Mr M. Y. Ghorpade, the state's Finance Minister is in a position to know how the resources will be found in the current year for Plan and non-Plan expenditure and how there can be nearly an overall balanced budget. The unauthorised overdraft of Rs 71 crores as on April 29, 1972 has been wiped out with a special loan of Rs 62 crores from the centre. It has been represented to the latter by Mysore that the special loan should have covered the whole of the unauthorised overdrafts as the increase from the level of March 1971 by Rs nine crores was due to payments in respect of 1971-72.

There will however be an uncovered overall deficit of only Rs 3.45 crores against the overall deficit of Rs 30.52 crores in the interim budget. The surplus on revenue account has increased to Rs 7.30 crores in the final budget from Rs 1.21 crores in the interim budget. There will be a deficit of only Rs 11.80 crores in the capital budget against Rs 31.73 crores and the overall deficit in the final budget without taking into account the additional commitment arising out of increased dearness allowances to government employees and pensioners and taxation measures will be Rs 4.50 crores against Rs 30.52 crores as stated already. The deficit will rise to Rs 6.10 crores after giving effect to the new dearness allowances. Fresh taxation in the form of higher irrigation charges, a heavier burden on commercial vehicles and revised sales tax rates will fetch Rs 2.65 crores in the current year and Rs 3.90 crores in a full year. The net deficit will thus be Rs 3.45 crores and Mr Ghorpade has indicated that fresh efforts might be made to fill this gap and even secure additional resources through taxation of agricultural incomes

in the light of the recommendations of the Raj Committee.

The centre has been showing a better understanding of the special problems of Mysore and apart from wiping out the unauthorised overdraft, with a special loan, it has been agreed that the Kalinadhi project will be implemented completely with central assistance. The total outlay is expected to be Rs 164 crores on present estimates and the whole project is scheduled to be completed by 1980-81. It is now recognised that power from this source should be made available without delay and the aggregate generating capacity will be 640 mw by 1980-81. The anticipated expenditure in the current year will be Rs 13 crores and in the next year Rs 25 crores. This gesture of the centre has enabled the Mysore government to release the funds earmarked for Kalinadhi to be used for other schemes, the advantages gained being Rs seven crores. What is more important is the opportunity available for hastening the tempo of construction work on this vital project with full central assistance. Aggregate Plan outlay will be

Our monthly feature 'Books Briefly' will appear in Eastern Economist dated July 14.

Rs 76.28 crores in 1972-73 excluding that on Kalinadhi. This however is only slightly more than the outlay of Rs 74 crores for 1971-72. The Finance Minister has therefore stated that there should be a further rescheduling of debt repayments and interest charges though even for sustaining a Plan outlay of the order indicated above special assistance of Rs 11.50 crores has to be provided by the centre.

The Andhra Pradesh government is probably in a worse plight as on the basis of the interim budget, there would have been a minus cash balance of Rs 118.32 crores. The budget estimates finally presented by Mr A. Bhagavantha Rao to the state legislature recently clearly indicate that no significant progress can be made in the implementation of Plan schemes without a higher level of central assistance and institutional support. The unauthorised overdraft has been reduced significantly with a special loan of Rs 70.86 crores. Taking into account the revenue surplus of Rs 9.81 crores and assistance from the centre there will be a minus cash balance of Rs 40.15 crores against an opening minus cash balance of Rs 79.76 crores. The surplus of Rs 29.80 crores in the capital budget is however misleading as it is due to the special loan for wiping out the unauthorised overdrafts. It has therefore been explained by Mr Bhagavantha Rao that Plan schemes can be implemented only with further special central assistance and measures

for raising additional resources. Unlike in the case of other budgets, no new taxes have been proposed though it has been stated that there will have to be heavy taxation. The Finance Minister has probably adopted this course in order to know what will be the actual gap after getting special central assistance.

The recommendations of the Raj Committee may be available in the next few weeks. It has however to be pointed out that even with a big gap of over Rs 40 crores, Plan outlay in 1972-73 will be only Rs 96.04 crores against Rs 105 crores assumed in the interim budget. Even the latest allocation is in excess of the allocation of Rs 77.95 crores which should have been made having regard to resources in sight. But it is felt that even the spillover schemes cannot be implemented with an outlay of this order and economic development of Andhra Pradesh will be held up seriously.

The state has vast irrigation potential while it has compulsion to create additional generating capacity, thermal and hydel, in a big way in order to boost agricultural and industrial production. It is highly backward in rural electrification while no serious attention

has been paid so far to the energisation of pumpsets for agricultural purposes. The constraint on resources has been responsible for a reduction in the outlay on irrigation and power schemes. If the Pochampad, Nagarjunasagar, Vamsadhara and other projects have to be implemented vigorously much larger resources will have to be found. The Chairman of the Electricity Board has also stated that the completion of the lower Sileru and Srisailem hydel schemes and creation of large thermal capacity at Kothagudem and Vijayawada would be possible only if there is liberal help from the centre and financial institutions. Andhra Pradesh is therefore in an awkward predicament and unless some schemes are financed entirely by the centre, there is no chance of faster economic development in the coming years. It was legitimately complained in the past that the Nagarjunasagar project should have been treated as a central project. The obsession with the implementation of this project in the earlier Plan periods and incorrect planning on the power front have been the main factors for the tardy growth of Andhra Pradesh's economy so far. It has now no dearth of schemes but has an acute dearth of resources.

Dantwala enters a caveat

AFTER THE IDBI (Industrial Development Bank of India) many thought, not unjustifiably though, it was only a matter of time for an ADBI (Agricultural Development Bank of India) to make its appearance. It was a certainty, they felt, after reading the recommendation, made by the National Commission on Agriculture in its interim report on agricultural credit, suggesting the setting up of an ADBI "to consolidate the expertise and experience of agencies like the Agricultural Credit Department of the Reserve Bank of India, Agricultural Refinance Corporation (ARC) and the Agricultural Finance Corporation (AFC) into a single national organisation". The Banking Commission also wanted the merging of the ARC and the AFC to subserve the same end. But those who entertained these expectations or those that nursed fond hopes of such a dream coming true, it seems, were counting their chicken before they are hatched. They were reckoning without the reaction of the AFC chairman, Prof M. L. Dantwala.

Although Prof. Dantwala qualified his remarks by saying that they were purely his own views and that he would not

like to express any categorical views on the weighty recommendations of the two commissions, he left no room for doubt that, in his opinion, any such move was quite premature. "Any radical restructuring of the banking system in so far as it pertains to agricultural finance is not necessary at this juncture", he said in the course of his statement to the shareholders of the AFC at its fourth annual general meeting, held in Bombay recently. He went on to add, and very pertinently: "The process of development and diversification set forth by the nationalisation of commercial banks has not had enough time to settle down. A reshuffling at this stage would only prolong the process of consolidation".

Prof. Dantwala also availed himself of the occasion to drive home to the public what precisely the AFC is, and this was necessary. According to him, "the AFC is somewhat like a Research and Development wing servicing the commercial banks, rather than an independent financial institution. It seeks to do collectively for the member banks what each of them would have been required to do individually". . . the AFC tries to explore and identify fresh avenues of financing agricultural development, test the technical and financial viability of new ventures, remove the procedural road blocks and legal hurdles, provide encouragement and assistance to

new entrepreneurs, acquaint the bank personnel with complexities of new proposals and even make its services available to the member banks to supervise implementation and check performance. The approach and the technical expertise which an organisation like this builds up is somewhat different from the one required by an apex financial institution".

This is only to be expected from Prof Dantwala who, unlike most careerists, is not keen to build an empire for himself to rule over. His interest and concern is to make AFC really useful to member banks and those member banks who are imbued with the same spirit of service and selflessness are bound to endorse his views. Whether his frank views will be equally well relished in other concerned circles is doubtful, but that, as everyone knows, does not bother this professor.

For the rest, the AFC chairman's speech is an answer to two criticisms levelled against the working of the corporation and the member banks, namely that they sought easier avenues of agricultural lending (e.g. loans to electricity boards) and that they were not able to reach the backward regions in a significant manner. Critics of AFC would do well to ponder over these answers, if only to be able to appreciate the tremendous handicaps under which any really useful and constructive work could be carried out by an outside agency in the backward regions of our country. A case in point is the AFC's 1969 proposal involving a loan of Rs 49 crores for minor irrigation and crop finance for multiple cropping in 19 centres located in 14 districts of Bihar. It would be hard to visualise better agency, better teamwork, better understanding of the problem than were vouchsafed for this proposal. And, yet an expert evaluation had some errors to point out, all of which goes to emphasise one unmistakable point, that is, that, where new ground is to be broken, no single agency, much less a commercial bank, can effectively tackle the entire job. As the AFC chairman put it, economic feasibility by itself is not a sufficient condition for undertaking private investment, nor is lack of finance the only inhibiting factor. This is not to say that the AFC's record has been devoid of any worthwhile effort or achievement so far. The scheme in Vaishali area is an example of what any outside agency could do, given the imagination on the part of the agency itself and the receptivity of those for whom such schemes are intended. In all these experiments, the AFC has established what a useful role voluntary agencies could play, given the right guidance. But one must be careful in selecting agencies that are not vitiated by the whims and vagaries of political busybodies.

In our little way...

we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front, Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals

essential for the pharmaceuticals, paints, textiles, iron and steel and rubber industries. On the export front, Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts!

sowing the seeds of progress

POINTS OF VIEW

The game of numbers

S. P. Chopra

THE FINAL tabulation of census data by the Registrar General and Census Commissioner of India indicated an increase of 24.80 per cent in population — from 439.07 million to 547.90 million — in the decade 1961-71 as against a rise of 21.64 per cent in 1951-61. The small increase in the percentage growth of our population has been seen by many a leader writer in the daily press as a grievous failure of the family planning programme. Lamented *The Statesman*: "The population growth indicated by the final figure of the 1971 census does little credit to the birth control programme". *The Times of India* remarked: "What is more, this increase has taken place despite the family planning campaign which has supposedly been picking up momentum in recent years".

unnecessary criticism

Both these newspapers have been unnecessarily critical of the family planning programme as the Department of Family Planning (in the Ministry of Health and Family Planning) had never made the claim that the rate of growth in population would be reduced in the decade 1961-71. All that it claimed was that through its various campaigns, only 7.4 million births had been prevented in the decade 1961-71 (see table). Is there any indication in the final figure of India's population to show that this was an unjustified claim? In fact, the demographers in the government of India had forecast this country's population at 461 million in 1971 much before the census operations were started after taking into account the expected fall in births due to the family planning programme and the anticipated drop in death rate following large-scale investment in health services and widespread use of antibiotics.

The truth of the matter is that this country had no effective family planning programme till 1966. This is apparent from the fact that the family planners claimed prevention of births of no more than one million between 1961 and 1966. The campaign gathered momentum from 1968 onwards and, here again, the failure on the IUCD (loop) front gave a rude shock to the programme. The family planning programme was in full operation only for the last two years of the de-

cade under review. It is therefore unjust to brand the family planning campaign as failure simply because the rate of growth in population was not arrested in the decade 1961-71.

Commenting on the explanation offered by the Census Commissioner that the upturn in the rate of rise in population was due to a steep fall in the death rate, *The Statesman* opined: "The death rate may have fallen during the past decade but the family planning programme was presumed to have brought about at least a matching, if not larger, fall in the birth rate. Here again *The Statesman* has been unfair to the Department of Family Planning because with the resources at its command and the late start of the programme, the family planning campaign could not reduce the number of births equivalent to the addition to the population resulting from the fall in the death rate. The limitations of the programme had been fully listed in the annual reports of the department. The fall in the birth rate to about 32 per thousand population is expected to be achieved in 1973-74 as against 39 per thousand population at present. Never had the Department of Family Planning claimed that the fall in birth rate would match the drop in death rate.

drop in death rate

If for the sake of argument, it is assumed that the family planning programme had no impact on the birth rate and that it remained unchanged at 41.7 per thousand population in 1961-71 (as in 1961), the death rate works out at 16.9 per thousand population in 1971 as against 22.8 per thousand population in 1961. Surely, the drop in death rate has been sufficiently steep, thanks to the efforts made in the past decade to improve the health services and increase the use of medicines, particularly antibiotics. Let us not forget that the death rate in this country was as high as 48.6 per thousand population in 1921 and during the last half century it has been cut to nearly one-third its level. According to the latest calculations made by the Ministry of Health and Family Planning, the birth rate was reduced to 39.0 per thousand population in 1971. With population rise at 24.8 per cent in 1961-71, the death rate is supposed

to have dropped to 14.2 per thousand population in 1971. This is the central reason for the rise in population in the decade 1961-71 and the anger of the daily press against the family planning campaign is unwarranted. If anything, the Ministry of Health deserves praise for the drop in the death rate.

growth of minorities

The tabulation of population data according to religion has shown that the minorities have grown — with the exception of the Buddhists — at rates which are higher than that of the majority community, i.e. the Hindus. As against the decennial rate of growth for the Hindus at 23.69 per cent, the Muslims increased by 30.85 per cent, the Christians by 32.60 per cent, the Sikhs by 32.28 per cent, the Buddhists by 17.20 per cent and the Jains by 28.48 per cent. These figures have been interpreted in different ways by various political groups. The Census Commissioner has, however, taken the increased rates of growth in population of the minorities as a measure of the freedom (and secularism)

Family Planning: 1961-71

POINTS OF VIEW

which prevails in this country. Some sections of the Hindus community have been reminded of 1947 when nearly 75 million Muslim forced a partition of the sub-continent. The present population of the Muslims is around 67 million and within three to four years, it is bound to rise to 80 million. Whether the Muslims will then succeed or not in forcing this country to carve out another homeland for them is debatable but what is obvious is that the minorities are politically motivated and in their rising population they see a hope for increased leverage in political affairs in the coming years. For this reason

alone, there is every likelihood of their continuing to ignore the family planning programme.

The relatively faster rate of growth in population of the minorities can also be seen as a measure of their backwardness. An unabated rise in the growth of population of the minorities may continue to worsen their economic status, making them disgruntled with their place in the body-politic of the country. The census figures should, therefore, be taken as an index demonstrating the need for increased efforts at family planning opera-

tions among these communities. The religion-wise break-up of the 7.4 million births prevented by the family planning programme in 1961-71 is not available but surely the share of the minorities would be negligible. If anything, the census enjoins the need for more vigorous efforts for communicating the message of family planning to the minorities. Improved modes of communication will have to be found in order to impress upon these communities the benefits which are likely to accrue to them from planned parenthood which alone, in the long run, can bring prosperity to them.

Problems of Indian tobacco

H. P. Singh

INDIA PRODUCES about nine per cent of the total world output of tobacco and is the third largest producer after US and China. The tobacco grown in 434,000 hectares by 50,000 farmers in the country not only provides employment to nearly 300,000 farm labourers in the tobacco fields and 120,000 workers in the tobacco processing and packaging industry but also earns foreign exchange worth Rs 37 crores. In addition, the tobacco industry processes about 30 per cent of the total production to meet the domestic demand of about 70 million tobacco consumers in our country who consume tobacco in various forms worth about Rs 150 crores annually.

Of the total production of 350 million kgs of tobacco in the country, Andhra Pradesh accounts for nearly 93 per cent of the flue cured virginia production, over 44 per cent of other types of tobacco and 90 per cent of the foreign exchange earnings from tobacco. But due to production of tobacco in black cotton soil which does not stand irrigation and the cultivation in low soil PH areas in Andhra Pradesh, a serious problem of producing quality tobacco has emerged in recent years due to adverse factors of production and stagnant per acre yield. The per acre yield of tobacco in our country is depressingly low at barely 755 lbs compared to 2191 lbs in Japan, 1913 lbs in US, 2652 lbs in Belgium, 2112 lbs in France and 2064 lbs in West Germany. While the yield per unit of crop area in these countries has been continuously increasing during the last 10 years, the yield in our country has actually declined from

876 kgs per acre in 1964-65 to 865 kgs in 1967-68.

Recently a number of varieties of cigarette type tobacco like virginia gold, delcrest, white gold, 402, Hicks special, Kutsaga special, HR 62-3 and HR-62-7 have been introduced with a view to increasing the yield and improving the quality of cigarette tobacco. The cigar type variety mainly Olour and Havana 381 and cheroot type namely 1-737 and OK-1 have been introduced to produce

quality cigar and cheroot tobacco, to meet the needs of trade and to develop new export markets. In addition, two varieties of natu tobacco DG-3 and DG-4 and bidi tobacco varieties namely K-46, K-20, Anand 2, 23 and 119 have been introduced for better production and to meet the growing demand of bidi industry. These varieties however have not yet created confidence in farmers for adoption for cultivation. Surprisingly even for growing the recommended and approved varieties, the farmer is required to give an under-

Eastern Economist 25 Years Ago

July 11, 1947

With the appointment of Mrs Vijayalakshmi Pandit to the ambassadorship of Russia and the establishment of diplomatic relations with that country is ushered in a new phase in India's foreign policy and in Indo-Soviet relations. For the first time in modern times the real India emerging independent after a long freedom struggle is making contact with Russia which, having patiently consolidated her revolution, has come out of World War II with a power and influence in international affairs so patently crucial to the maintenance of world peace. It is all-important, therefore, that the new contact is made and Indo-Soviet affairs—as indeed those with every other country—are conducted in such a manner as to promote sympathetic understanding and friendship and to make that friend-

ship a weighty factor in world counsels.

It is not as if India and Russia had not known one another in ancient and medieval times. The Himalayas have not doubt been an almost impregnable barrier which cut off India from her northern Asiatic continental countries, but within the limitations imposed by nature there have been trading and cultural relations between India and Russia. According to Academician Barannikov, India is mentioned in some of the ancient Russian epics. In the medieval times Indian merchants visited Russia and Russian merchants also visited India, the outstanding among the latter being Nikitin who came in the 1460s. Nikitin's travel notes are said to be a useful source of information on the conditions of the Deccan in the fifteenth century.

POINTS OF VIEW

taking of risk-bearing. Unless research is carried out on a large scale at the farmer's field, the adoption of these varieties may continue to be hampered.

The majority of tobacco growers are small farmers who dispose of their produce immediately after harvest due to poor retainability, inadequate storage facility and market finance. The bulk of tobacco is sold by the farmer in the village by private negotiation with the buyers or their agents. The tobacco markets are actually secondary markets where merchants and warehousemen collect the tobacco purchased by their agents from the producing areas. The tobacco markets have been monopolised by the Indian Leaf Tobacco Co., the British India Tobacco and National Tobacco who purchase tobacco not only for internal cigarette production but also for export. The NCAER report on tobacco reveals that if the export price of one kg of tobacco is fixed at Rs 10, the farmer in Andhra Pradesh gets only Rs 4.70, hardly 47 per cent of the consumer's rupee.

problem of glut

The periodic gluts due to non-responsiveness of supply to the changing price and demand condition is another major marketing problems distressing the farmers. The harvesting season of tobacco commences about the end of December and continues till late in March. The first four pickings account for 30 to 53 per cent of total output and 65 to 70 per cent of the total value of the crop. The last two pickings accounting for 55 to 60 per cent of the total output of the crop, yield poor quality leaf. The low grade tobacco of the last two pickings create glut in the markets under unfavourable demand conditions. The low grade stock of flue cured virginia has increased sharply from one million kg in 1965 to 36 million kg in 1969. The problem of glut can be solved by planning the production and acreage under tobacco on advance assessment of domestic and export demand, the effective regulation of tobacco markets, fixation of export price and sale of tobacco on the basis of Agmark grades. The marketing co-operatives should be organised with adequate arrangements of grading, pooling, processing, storage facilities and market finance. Co-operatives should run the bidi and cigarette factories for utilising the tobacco raw material.

Hardly 20 per cent of tobacco produced in the country is exported after redrying

(cigarette type) and Agmark grading to some 50 countries all over the world. The main grading, processing, and exporting centre is Guntur in Andhra Pradesh.

virginia tobacco

India is second largest exporter of flue cured virginia. The main importing country till recently was United Kingdom which accounted for 40 per cent in volume and about 60 per cent in terms of value of the total export of tobacco from India. The share of UK has come down considerably to 30 per cent in terms of volume and 40 per cent in terms of value and the unit value realised has also declined due to increasing proportion of by-products (stems and stem-bits). However, the increased take off by the USSR and Japan in 1971 has improved the export situation. Other important importing countries are German Democratic Republic, Egypt, Belgium, Singapore and Nepal.

The unit value realised in respect of all unmanufactured tobacco has declined to Rs 6.02 per kg during 1969-70 from Rs 6.09 per kg in 1968-69. The unit value of flue cured virginia tobacco, which accounted for 41.4 million kg valued at Rs 28.96 crores, also declined from Rs 7.26 per kg in 1968-69 to Rs 6.99 per kg in 1969-70. A comparative study of average prices realised by major exporting countries in respect of flue cured virginia tobacco is disturbing. While the unit value per pound in US cents realised by India increased from 28.6 in 1955 to 44.4 in 1968 the unit value of Canadian tobacco increased impressively from 57.3 to 107.2 and the average price realised by the US increased from 67.3 to 96.2 cents per pound during the same period. Similarly the FCV tobacco exported from India in 1968 could realise only 53.1 cents per pound in the UK compared to 114 cents per pound realised by the Canadian tobacco.

The unit value realised by India is declining because of our inability to export tobacco to meet the changing consumer preferences and pressure on export markets. The tobacco consumers are highly conscious of quality and developing countries in Asia and Africa should offer quality tobacco at low export prices. A pointed reference may be made here regarding the neglect of export markets from the quality point of view. Of the

superior grades of tobacco production, the domestic market consume about 40 million kgs, leaving hardly 25 million kgs for export markets.

Despite the spectacular growth of tobacco and its contribution to Indian economy, it is confronted with many new problems and serious challenges. The recent announcement by the government of India regarding the setting up of a Tobacco Board is a step in the right direction. The organisations concerned with the production, marketing and exports, namely the Tobacco Development Council, the Central Tobacco Research Institute, the Directorate of Marketing and Inspection and the Export Promotion Council must be included in the proposed tobacco board for consultative purposes. The Tobacco Board should be able to help in achieving the targets of production and exports and in promoting, supporting, protecting and maintaining planned production, strict quality control and export promotional activities in our country also.

Growth in Perspective

R. V. Murthy

THE PRIME Minister, Mrs Indira Gandhi, is to be more pitied than pilloried for allowing herself to be taken in by the so-called new approach to development planning of the much publicised Pakistan Professor Dr Mahabub ul Haque. But, to say the least, it was naive of her to assume that any one could talk the language of economics with the same levity as one could talk the language of ideology. Unlike ideology, economics demands a degree of precision, apart from a clear understanding of the different schools. Less seldom, therefore, does one hear of claims by people of having evolved a new theory in economics than in other sciences. Invariably, experience shows that what passes for a new theory in economics is at best no more than the variation of a fugue of the same theme, shorn of some flashes here and there. For the basic theories of economics are inexorable and the familiar concepts to measure economic growth based thereon, such as GNP, cannot be dismissed cavalierly by all and sundry as being inconsequential.

no suitable guide

Incidentally, Dr Haque is by no means the first to point out that a high growth rate of the GNP, *taken singly*, is not a suitable guide for planning economic development, especially for the poorer countries. More eminent people have done so, (Colin Clark, P.T. Buaer, Simon Kuznets, Gunnar Myrdal and Dudley Seers, to name a few), but they have not pooh-poohed the GNP test. They accept that it is a tolerably reasonable barometer of development performance. It is not that they have ignored the shortcomings of GNP. If GNP has continued to be in vogue, it is only because of the obvious difficulty of devising a more satisfactory alternative. Dr Haque has not suggested a useful alternative either; nor has he made any contribution to a new development policy. His thesis that anti-poverty schemes must simultaneously be part of economic growth, even if some increase in GNP has to be sacrificed by the diversion of financial and physical resources from investments into such socially-oriented anti-poverty schemes, apart from being not tenable (in the sense that sacrificing increase in GNP is not only called for to achieve the

objective in view, but may prove detrimental to it) has more a psychological appeal than an economic ring. Could this perhaps be the explanation for its so readily catching the imagination of Mrs Indira Gandhi?

Be that as it may, public interest has been aroused in what has been described as "the new economics of growth", especially since the Prime Minister's address at the last annual session of the Federation of Indian Chambers of Commerce and Industry (FICCI), and some interesting comments have been made on the subject which deserve to be noticed. Two comments in particular are interesting and instructive, one by "Martial" in the latest issue of *Freedom First*, and the other in the form of two articles in *Financial Express* by Dr F. A. Mehta, who heads the economic section of Tatas.

main aspects

"Martial" first refers to four aspects of Dr Haque's thesis in particular. First, according to the Pakistan Professor, "the problem of development must be defined as a selective attack on the worst forms of poverty". Secondly, he has argued that "the developing countries should define minimum consumption standards that they must reach in a manageable period of time." Thirdly, Dr Haque has opined that the concern for more production and better distribution should be brought together in defining the pattern of development. And, fourthly, he has suggested that employment must become a primary objective of economic planning and that it should no longer be treated as only a secondary objective. Dealing with each of these four, "Martial" has said:

(1) "Dr Haque does not tell us how we distinguish between these worst forms of poverty and other relatively innocuous forms. Neither does he tell us the criteria of selection on which the alleged 'selective attack' should be based".

(2) "How these minimum needs (consumption standards) are to be fixed is not specified. We are only told that they must not depend in the ability to pay. But it is unclear as to what this means. If the poor group's incomes do not rise

enough to enable them to pay for their minimum material needs, it means that they will have to be maintained on the dole. Does Dr Haque really comprehend the consequences of putting about 40 per cent of the population on the dole? If he does not, what is the meaning of the phrase that the ability to pay should not be considered at all?"

(3) "Bravo!" But what about the cases where the two concerns (for more production and better distribution) do not match? What to do about farmers, who, in the process of generating the green revolution, are also becoming a newly-emergent high income class? Should they or should they not be heavily taxed? No comment from Dr Haque!

(4) This means that we must "treat the pool of labour as given at any particular time which has to be combined with the existing stock irrespective of how low the productivity of labour or capital may be". In other words, "the state must create jobs for everybody, no matter at what earnings and under what conditions of work and guarantee for everybody a minimum income defined by itself. This is, of course, an old idea and has been practised, among others, by Comrade Mao Tse-Tung. But why present this as something original?"

difficult to conceal

"Martial" has also his explanation as to why propaganda of this sort has suddenly become popular with all crypto-collectivists. He says: "As long as the GNP criterion is retained, the failure of the government to promote economic growth remains measurable and cannot be concealed from the public. It is also difficult to conceal the fact that countries which follow liberal economic policies (like Malaysia and Thailand) make a better job of promoting growth than do 'well planned countries' like India or Burma. Thus, since the failure of collectivism is so very important, let us by all means change the rules of the game! We must no longer be interested in the GNP". But, as "Martial" adds: "what Dr Haque and his comrades forget is that dropping the GNP criterion does not make the world

safe for collectivist economic planning" itself.

Dr Mehta's comments, however, are in a different vein. After briefly recapitulating the basic assertions of "the new economics of growth", he examines their implications and poses a number of pertinent questions. First, he wonders if "the new economics of growth" approach will not result in a slowing down of India's already low rate of economic growth, due to a further diversion of financial resources away from investment into schemes of social welfare. On the other hand, according to him, the Indian situation calls for a substantive speed-up in the rate of economic growth in the GNP, if only to ensure the basic minimum standards of living to at least 30 per cent of the people below the poverty line. (Even if India's current rate of growth in GNP can be doubled—from five per cent to 10 per cent—the additional financial and physical resources generated will not suffice to meet the needs of a mass anti-poverty programme). Also he is for specific anti-poverty programmes (e.g. those suggested recently by the NCAER and Mr J. R. D. Tata) being initiated forthwith, "even if they do involve, in the initial stages, a departure from pure economic considerations".

Secondly, like "Martial" in *Freedom First* Dr Mehta also finds "the new economics of growth" far from being original. Taking one of the fundamental tenets or "the new economics"—that the investment pattern should be biased at the very outset in favour of basic necessities for the masses instead of catering for the luxuries of the classes—he rightly regards it as a revised version of the wage-goods thesis of economic development, used way back in the fifties by Dr P.R. Brahmananda and others to attack the then popular model of economic growth. "The new economics", therefore, is but "a renewed plea for a right ordering of priorities in which investment shall be earmarked towards the mass-production of 'mass' consumption goods".

narrow base

Next, Dr Mehta demolishes the contention of the protagonists of "the new economics" that "the fiscal systems of nearly all developing countries have a narrow base and cannot, therefore, by itself serve, as an important mechanism of redistribution" or, in other words, "that the tax resources generated will be small in relation to the resources required to make a dent on poverty", and argues that, in the case of India at any rate, the tax effort

has not only been enormous but that it does not lack an automatic built-in mechanism for the distribution of the gains of economic growth. To make his point, he has cited Raja J. Chelliah ("Trends in Taxation in Developing Countries") and the latest Economic Survey, and given figures of tax-revenues of just the government of India alone to show how these have grown from Rs 573 crores in 1956-57 to Rs 3,850 crores in 1971-72 and to perhaps Rs 4,400 crores by the end of 1972-73. But Dr Mehta also admits there were circumstances why the government could not use these growing resources for the purpose of redistributing income, e.g. investment in huge long gestation-period projects in the public sector and diversion of a substantial part of the growing tax revenues to defence effort.

"The tragedy of India's continued poverty has not been the lack of a redistributive mechanism planted into India's production-apparatus" either, according to this economist. How can that be, he asks, "when every one per cent increase in industrial production has repaid the exchequer in the last fifteen years with a 1.65 per cent increase in its tax revenues, and when every rupee earned by a shareholder of the corporate sector has immediately brought at least Rs 4.30 to the government?" But Dr Mehta is not content to cry over spilt milk. Forward-looking as he is, he says that we have now at least an opportunity to make a specific move in the desired direction, albeit only in a modest way.

wrong perspective

Dr Mehta blames both the leftists and the rightists for their "totally wrong perspective". While the leftist circles in India refuse to recognise the fact of the built-in distributive mechanism planted into the Indian industrial system, he says, spokesmen of industry continue to harp on the old theme: "we cannot distribute the slice of the cake before we bake the cake". This "ignores the very substance of democracy in which the competitive pressure—groups will necessarily demand at once as much as possible". Apart from being "a wrong perspective" thus, "it is also a wrong depiction of the actual situation". He goes on: "In nine out of ten cases, the captains of industry themselves are the first to introduce 'incentive schemes' to maximise production in their industrial plants, proclaiming thereby that in the very hour of increased production not only is there taking place increased distribution, but that this increased distri-

bution is, in an important sense, a precondition of increased production".

Lastly—and this is seldom recognised, whether deliberately or otherwise, no one can say—Dr Mehta convincingly counters "the new economics" thesis that "the luxury consumption sector not only steals a substantial volume of the scarce resources of a developing economy, but saddles it with patterns of production and investment from which it is very difficult later on to extricate itself".

complicated issues

Conceding an element of truth in the proposition, Dr Mehta points out how the concerned issues are very complicated by reason of the fact that "the standard of living" is not merely an economic concept but a socio-psychological one. To quote him, this sector is "really not important or worrisome from the economic angle, it is, however, a political menace because of its psychological implications in a society in which, on the one side, the bottom layers are without even their elementary necessities of life and, on the other side, the 'medium' layers keep on (through the demonstration-effect) initiating the consumption standards of the higher groups so that *psychological discontent is the result in both the cases*". Dr Mehta's counsel—a counsel that never seems to be heeded—accordingly is that there is urgent need on the part of the governing and the rich classes to display "an enormous maturity" in their standards of living. Dr Mehta concludes by saying that the rat-race is not for economic growth as such, but for the gains of economic growth.

It is necessary to add here that Dr Mehta, while being critical of "the new economics of growth", is not slow to recognise its psychological appeal to a developing country believing in democratic approach such as ours, and has postulated his own strategy of economic growth in which he seeks to incorporate the very features of the new economics of growth which, as he says, "demands from every layer of the Indian economic society a degree of self-discipline and self-denial". All agree that a degree of self-discipline and a degree of self-denial are called for, but the question is: who will bell the cat? So long as we continue to expect someone else to do this, as we have been doing all along and ourselves not volunteer to take on the task, the stalemate is bound to last for some more time or, if we are unfortunate, to explode into something really unpleasant to all.

The world money outlook

Josselyn Hennessey

London

I Tour of the Horizon

HERE is a summary of the latest six monthly report on the world monetary outlook issued by the Société Financière Européenne, the multi-national Company formed in 1962 to aid in the modernisation and expansion of European companies by long and medium term loans, equity financing, and advisory services. The Société is owned by the Algemeine Bank Nederland NV, the Banca Nazionale del Lavoro, the Banque de Bruxelles SA, the Banque Nationale de Paris, the Bank of America NT and SA, Barclays Bank Ltd and the Dresden Bank Ltd.

During the six months since our last review, the major industrial countries

than the USA are expected to increase production of goods and services by about 4½ per cent this year while the USA's GNP in real terms should grow at least a percentage point higher.

Generally the industrial world is recovering from slow growth and recession.

The other major industrial countries, however, lag 6-18 months behind the US cycle. In some cases, notably West Germany and France, the downturns in economic activity have been less serious than expected. In others, e.g. Italy, the period of slow growth will be more extended. Generally, recovery is being prompted by fiscal measures and easy monetary policies.

The easing of monetary policy in coun-

more difficult to regulate without inflation and unemployment. The reasons include: widespread uncertainty; the lessened effectiveness of national monetary policies increasingly internationally intermingled, and political fears inhibiting fiscal policies. As a consequence, the slowing of economic activity in all the major industrial countries, while less serious than it might have been, has been unusually prolonged. Recovery to full capacity is still at least a year ahead for the USA and Canada, and more than that for Europe and Japan.

Anticipated movements in interest rates reflect this pattern of recovery; levels will probably remain generally low during coming months, with further but relatively slight declines in local markets in France, Italy and Japan. Gradually rising rates, already underway in the USA, will become evident later in 1972 in Belgium, the Netherlands, the UK and possibly West Germany. In international markets, particularly Eurodollars, rates are expected to continue to be weak, in part because demand is inhibited by special national measures. Consequently, the premium of domestic dollar rates over Eurodollars will narrow.

widespread inflation

The gradual recovery of the industrial economies will promote somewhat faster rates of expansion in world trade but persisting widespread inflation will bedevil the prices of internationally traded commodities.

The faster rate of expansion in the USA, and the resultant rise in security prices there, would ordinarily attract an increasing volume of foreign investment. Offsetting factors will be measures designed to promote domestic investment in the recovering economies elsewhere, and the persisting concern about the dollar. Japan, however, is taking steps to promote an outflow of long-term capital, in large part to hold back the increase in its international reserves. Such outflows are expected to influence international investment in the years ahead.

Under pressure of events, the monetary authorities of the major industrial countries have taken a rather less rigid approach

In recent years, economies have been

to exchange rate variations than previously. The narrowing of permissible variation of the cross rates between the currencies of the EEC and prospects of further narrowing in the future, along with various more closely co-ordinated monetary conditions do, however, at least point to a more rigid pattern of intra-European rates. The April agreements between the EEC monetary authorities (subsequently extended to the prospective members as well) in the immediate future have the main effect of restoring something similar to the pre-1971 situation. Then, given intervention limits against the dollar of ¾ per cent either side of parity, the EEC cross rates could vary by no more than three per cent. The current agreements provide for variable margins between Community currencies of up to 2½ per cent. The real test of EEC monetary co-ordination will probably not have to be faced until the cross rate bands are narrowed further, when it might be necessary to remove the limits of intervention against the dollar for the EEC currencies.

II

The Dollar

Sustained economic recovery supported by, and at the same time encouraging, a rise in business confidence will be confirmed during 1972, despite considerable election year uncertainties and the problems of the second phase of the prices and incomes policy.

A real growth of at least 5½ per cent now appears more feasible. Business investment plans have been revised upwards; plant and equipment spending may rise by as much as 10½ per cent this year and should continue into 1973. Corporate performance is expected to be reflected in a rise in profits after tax of as much as 15 per cent over 1971, thus moving closer to their historical share of national income.

The pace of the economic recovery in the USA, inevitably accompanied by a continuing albeit fairly moderate inflation, foreshadows a rise in both long-term and short-term interest rates during the remainder of 1972, if not into next year. During the early months of 1972, the level of short-term rates was contained by an easy monetary policy, and failed to take into account the possibility of renewed inflation.

Upward pressures will also result from offerings of US securities from foreign official holdings and from sizeable Treasury issues stemming from large budget deficits. However, long-term rates will show more resistance to upward pressure,

both because of policies to effect a flatter yield curve and because of the greater possibilities of internal financing of capital spending, which bypasses and thus does not fully reflect market forces. The higher levels of demand for goods and money probably mean that short-term money market rates will settle at 5½ per cent by the end of 1972. Long-term rates should range from, say 6½ per cent for five-year Treasuries to about 8½ per cent for dollar Eurobonds.

reducing inflation

The rise in both US interest rates and external dollar rates—and contrary tendencies among major foreign currencies—will help to preclude excessive speculative pressure in foreign exchange markets. The strong reflow of funds into the US widely, though naively, expected earlier will occur gradually and with occasional reverses during most of 1972; this will exercise much less influence on US monetary policy than anticipated. Progress against inflation will eventually support the effects of devaluation in strengthening the balance of payments on current account, although this is unlikely before the final quarter of 1972 and probably later.

On the domestic front, the US economy has so far reacted as well as might have been expected to its recent experiment with direct controls on prices and incomes. The test has, however, yet to come, primarily from the anticipated large budget deficits which will create a highly liquid financial system. Inflation will probably be closer to four per cent for 1972 than the official goal of between 2½ per cent and three per cent. Nevertheless, consumer confidence, damaged by inflation and unemployment, appears to be recovering along with retail sales. The high savings rate (eight per cent of disposable income), the result of consumer uncertainty in the face of a rapid rise in personal income, is, however, not expected to decline significantly until early in 1973. Unemployment will fall only slowly, partly because of the large number of women and adolescents who have entered the labour market and who find work less easily than older men.

The performance of the US economy, in brief, is improving, and 1972 will in retrospect appear a better year than some conventional indicators may imply. There will be an underlying improvement, both in domestic activity and in the balance of international transactions, though official statistics may be slow to reveal this. The misleading signals are an inevitable consequence of a period of rapid reorientation of policies, including the introduction of some novel experiments. By early 1973 the

data should reflect more clearly the actual performance.

III

The French Franc

The slight downturn expected in economic activity during 1972 will probably be somewhat less marked than seemed likely a few months ago. The international currency agreements of December and March have made business leaders more optimistic; in addition, the government has introduced cautious reflationary measures. However, no dynamic expansion is to be expected and growing unemployment is causing concern. Nor is the situation in the labour market likely to improve; for this to happen industrial production would have to increase by about seven per cent per annum. Nevertheless consumer demand should be sustained although the increase in production could slow because of the high level of stocks. The increase in private investment will be small so that production of capital goods will grow mainly in the public sector, particularly in building.

During the closing months of 1971 the increase in available money became more pronounced: it rose 11 per cent. The growth in liquid savings, which also went up during the last quarter, was far more marked, and reached 21 per cent. However, the tendency of households to expand personal savings is likely to flatten because of persisting inflation. The marked upturn in long-term savings, reflected in a substantial rise in the issue of stocks, is also likely to fall. The stock exchange has recovered since the start of the year, mainly because of foreign buying.

Despite persisting inflation, the Banque de France shows no signs of deciding to restrict its monetary policy further. On the contrary, it reduced the coefficient of the banks' reserves in December and March to force down the cost of credit. For the same reason interest rates on savings deposits were reduced. Two reductions in the discount rate, in January and April, also signified cautious support for the trend towards reduced rates. There is little likelihood, however, that this will take on larger proportions so long as inflation continues.

The inflationary tendencies weakened slightly during the closing months of 1971, a slowing which should be confirmed in 1972. Similarly the rise in the cost of living slowed to an annual rate of 4.5 per cent based on the last three months, compared with an annual rate of 5.7 per cent over the year. Nevertheless, persisting inflation remains a cause for concern. Pressure on prices is particularly marked

WINDOW ON THE WORLD

have introduced reforms in the international monetary system. Although by no means subject to the fears of the last half of 1971, world money markets remain clouded by uncertainties during what must be a period of experiments in policies, national and international, following the Smithsonian Agreement of December and the steps taken in April toward closer monetary union among the present and future members of the European Economic Community.

Prospects for the major countries have changed surprisingly little in the past half year, possibly because the optimists have, on the whole, been vindicated and the worst of the expected consequences of the 1971 currency crises have not been realised. The industrial economies other

tries other than the USA has also been prompted by concern to discourage a further inflow of dollars into their reserves. Monetary conditions in Europe have not been as easy as would have been warranted by high unemployment and excess industrial capacity, mainly because of concern about persistent inflation. Further, because monetary conditions in the USA have not been as restrictive as desirable from balance of payments considerations, and because forward exchange markets have continued to reflect speculative pressures more than interest differentials, the easy monetary policies have in most countries had to be supplemented by additional measures including exchange controls.

in food, following the application of a common EEC policy. As against this, official restrictions on industrial prices have kept increases to 1.5 per cent in six months. In future the rise could be greater, even though the official target is to hold it down to an annual three per cent.

In 1971, the trade balance showed a surplus of Frs. 4,500 million compared with less than Frs. 1,000 million in 1970. This is the more encouraging as the growth in economic activity was restrained in France's leading markets. It was helped by increased competitiveness of French products resulting from the revaluation or floating of certain currencies, a competitiveness little affected by December's currency realignments. However, a flattening in exports evident at the start of 1972 has probably continued: the backlog of foreign orders in industry is currently low.

The balance of payments showed a surplus of over \$2,000 million in 1971. Including the banking sector's increased loans abroad, the state's exchange holdings rose by \$3,300 million. Note, however, that the unwelcome inflow of capital almost ceased after last August following regulation of the external position of the banks and the institution of the double exchange market. In particular, official currency reserves during the first quarter rose by only a few million dollars. The balance of current payments could show a deficit, but this would be offset by an inflow of long-term capital.

IV

The West German Mark

The December Washington agreement resulted in a revaluation of the DM by 6.5 per cent. After a short period of weakness, however, the demand for D-Marks again rose and the Bundesbank had to step in in order to avoid the dollar reaching its lower intervention point. Monetary reserves of the Bundesbank rose by more than \$1,000 million within the first quarter of 1972. No major changes are likely in the near future provided that new pressures from abroad can be avoided. If there are further dollar inflows the government would be ready for rigid exchange controls jointly with other EEC member countries.

The renewed capital inflow earlier this year was largely induced by the relatively high interest levels in West Germany and possibly also by new speculative expectations. As West German banks are still prohibited from paying interest on deposits from abroad, foreign investors mainly bought substantial amounts of DM-denominated bonds and West German stocks. This brought bond yields down

from eight to about seven per cent and stock prices rose by more than 30 per cent within a few months.

To counteract this flow of hot money, the Bundesbank lowered its discount rate on February 25 from four to three per cent which also eased money market rates. In addition, on March 1, the authorities applied the Cash Deposit Law. With a few exceptions, 40 per cent of loans raised abroad by West German companies now have to be deposited on special non-interest-bearing accounts with the Bundesbank. This reduces the interest differentials between domestic and international financed markets. The new law seems successfully to have stopped West German borrowing abroad.

slack in imports

The DM revaluation has so far only moderated the growth of West German exports. In the first quarter of 1972 they rose six per cent, compared with 15 per cent in the first quarter of 1971. On the other hand, slackening domestic demand has resulted in a rise in imports of only four per cent so that the trade surplus was substantially higher than in 1971. The current account balance however, remained near equilibrium because services and other transactions continued in deficit. The business situation still suggests some uncertainty. GNP in the first quarter achieved real growth, but results in some industries have improved. A recession similar to that of 1966-67 is not on. However, investment is still weak, and prospects will depend mainly on whether and by how much earnings improve. With recent wage settlements more in line with gains in productivity, pressures on costs have abated so that some optimism is justified both for earnings and for improved international competitiveness.

At present, the main problem is that inflation is still strong. With the cost of living currently rising at about 5.5 per cent the government and the Bundesbank hesitate to introduce reflationary policies. The Bundesbank says that it will keep bank liquidity as tight as is compatible with its endeavour to keep foreign money out of the country. Although some DM 6,000 million collected in 1970 and 1971 as an anti-cyclical surcharge on income tax (covering both companies and individuals) will have to be rebated in June, compensating restrictions may be imposed to prevent further credit expansion. The most recent reduction in Bank rate was accompanied by an increase in minimum reserve requirements.

In the capital market, international DM-bond issues were floated in large amounts early this year, with yields up to 0.5 per cent below interest rates for domestic issues. Buyers were foreign investors buy-

ing because interest on such bonds are tax free. The decrease in interest rates ended in March and was followed by a rise of bond yields to eight per cent. New issues have been stopped and the Bundesbank has welcomed the higher interest rates in the hope they will help to control an over-expansion in private building.

V

The Pound Sterling

A noticeable feature of British monetary conditions in the past six months has been the resistance of short-term interest rates to the downward trend in Europe.

This arises in part from the uncertainties emerging about the balance-of-payments in the second half of 1972; such doubts arise partly from an expectation in some quarters that the recent Budget will stimulate the economy to the extent that the current balance-of-payments will move into deficit and that this change would by itself lead to an outflow of short-term funds. The degree of stimulation achieved remains to be seen.

At present Bank rate stands at five per cent and the clearing banks' base rate at 4½ per cent. Apart from published rates, borrowers have been called upon to pay significantly more over the past twelve months because the margins charged above base rate have been widened, and there can be little expectation that this will be reversed in 1972. The blue chip, or prime, rate, is now about one per cent over base rate but personal borrowers for unsecured advances can go to over five per cent; rates charged on credit cards and by hire purchase firms are naturally substantially higher because of the built-in service element. The change-over from Bank rate as an anchor rate to base rate was made in September, 1971, by all the London clearing banks.

There has been a lack of demand from industry for bank loans although demand from personal borrowers for consumer finance has been good; some of this borrowing however reflects business attracted away from the hire purchase companies. Nevertheless, apart from motor cars, the retail trade has not shown the buoyancy hoped for that would get the economy out of its relative stagnation.

Despite the four per cent level of unemployment and rising savings, now approaching a tenth of disposal income, equity prices have been giving a remarkably good performance although there have been some spectacular setbacks in the older established blue chips.

Since this report was written, threats of railway and dock strikes and industrial unrest have led to a shake-out in the bull market. Prices have fallen all round by

about 20 per cent. The optimists regard this as temporary and believe that as soon as we have industrial peace, the bulls will come stampeding back. The pessimists believe that this is the end of the long bull market which began in 1970.

The economy is certainly in a shake-out phase and is becoming increasingly cost controlled; the financial officer is coming to the fore in corporate administration.

In general, however, company finances have become stronger over the past year, partly because the labour force has been cut back sharply with a consequent improvement in productivity and partly because of improved profit margins where it has been possible to raise prices significantly.

The better tone of many company reports has stimulated the rise in equity prices over the past year and the improvement has also been stimulated by merger activity, but even so prices are not substantially above earlier peak levels.

The main concern now is how long it will be before firms begin to increase their capital expenditure and the extent to

which they will require outside finance.

signs of improvement

The direct incentives given by the Chancellor to stimulate investment are about £300 million a year but some time will elapse before this boost can bring unemployment down. There are, indeed, signs that some improvement is on the way but this comes mainly from sample surveys which, in the past, have been notoriously over-optimistic. However, the impact of the recent budget will strengthen corporate liquidity and this fortunately is coming at a time when company finances may be coming under some strain, largely because they will be unable to gain so much benefit in 1972 from a further pruning of the labour force and further running down of stocks. All in all it may be expected that there will be no great demand from industry on the banks during 1972.

One of the significant moves touching on financial policy has been that since May 1, the £ is not to fluctuate by more than 2.25 per cent against any of the EEC currencies, and this does mean that UK financial policy will have to be tighter.

I can perhaps best summarise this sum-

mary by paraphrasing the cry of Samuel Taylor Coleridge's Ancient Mariner :

Inflation, inflation everywhere

Nor any stop to think !

I must remind my readers that in so far as the foregoing report refers to the future, and proclaims that something "will" happen, it is crystal gazing. A few minutes after drafting it, I was myself forcibly reminded of this by hearing the BBC News announce pressure on the £ following the recent fall in the balance of trade figures, which, taken in conjunction with the situation outlined above, have started speculation that the £ is due for a devaluation. Dennis Healey, the Shadow Chancellor, gave this speculation a boost by announcing that he did not see how a devaluation could be avoided, to which the Chancellor replied that devaluation only occurred when a currency was over-valued and he stressed that all available statistics contained no suggestions that the £ was over-valued. I myself do not pretend to know whether the £ is over or under valued. Anyone who is certain on this point could make his fortune by judicious speculation in the foreign exchange market, but mind your fingers !

JUST OUT !!!

TRADING WITH THE WORLD : COUNTRY PROFILES

(Revised & Enlarged Edition)

Pages VIII+722+XXXV

Cloth-bound

Rs 40/- (post free)

The publication includes economic and trade profiles of 109 countries with enlarged coverage. Each country profile provides information of practical interest on

- * Economic Perspectives
- * Monetary Policies and Banking
- * Import Policy
- * Exchange Systems
- * Trade Agreements
- * Trade Prospects
- * Investment Opportunities
- * Tariff Concessions Under GSP

An absolute MUST for those interested in furthering their business with countries abroad. Is particularly useful to exporters, importers, chambers of commerce, trading bodies, embassies, researchers and universities.

Mechanism of aid

Hardev Singh

DURING THE last few years, in India we have been watching the mechanism of aid from the receiving end. We have talked about the quantity of aid and the sources from which India will draw her requirements. It was therefore an interesting exercise to listen to the other side of the story: the process of dispensing aid from the angle of some aid-givers.

At a recent meeting Mr Francis Wells, Head of the Economic Development Division, Development Assistance Committee of the OECD, Paris, gave an illuminating first-hand account of the mechanism of development assistance from the point of view of the major donors.

The Development Assistance Committee is a kind of high-powered body of the donor members of the OECD countries aimed to 'secure an expansion of the aggregate volume of resources made available to less developed countries and to improve their effectiveness'. The members of the committee are Australia, Austria, Belgium, Canada, Denmark, France, Germany, Italy, Japan, the Netherlands, Norway, Portugal, Sweden, Switzerland, the United Kingdom, the United States and the Commission of the European Economic Communities.

important activity

Perhaps the most important continuing activity of the Development Assistance Committee (DAC), as described by Mr Wells was its annual review sessions, which normally started around February each year. At these annual meetings each donor country is expected to discuss and defend its policy before the committee, where the representatives of the IMF and the IBRD are also present as observers. The broad technique of these meetings has been perfected over the years. In the first instance the DAC secretariat receives from a particular donor country appearing before the committee, a memorandum which spells out the general policy and objectives of the country's aid programme. The secretariat then prepares a report on the memorandum, and it also sets out a series of questions for the convenience of the members of the committee. On the basis of these three papers—the memorandum, the report by the secretariat and the questions—there follows a full-fledged discussion at the meeting.

The delegation of a donor country is usually made up of six to ten persons, depending upon a particular country's desire to defend its policies and the extent of criticism it expects. The delegation

is usually headed by a senior member of the government; it may be the minister in charge of aid or the head of the aid-giving institution. In the case of the UK for instance it may be the Secretary of State for Commonwealth Affairs or the head of Overseas Development Administration.

Mr Wells pointed out that the discussions are usually quite frank and open and the chairman is there to see that the discussion does not become sloppy. He gave an interesting instance of a British representative who tried to be too brief and curt, when a question was posed to him: Did he not think that the UK's policies of local costs required a reassessment? His answer was 'No'. The chairman intervened and insisted that the representative should elaborate his answer with precise instances. The chairman, therefore, ensures that no country gets away with vague answers. He poses the questions more firmly and demands the answers more precisely.

positive objective

Mr Wells stressed the fact that such discussions have positive objectives. In the first instance the meetings provide an opportunity for examining the figures of assistance promised by a particular country. It is a way of keeping the countries up-to-date in respect of their commitments. In general terms they are reminded of the agreements arrived at, and are required to translate them into hard practical terms.

Perhaps the most important objective of these meetings is to strengthen the hands of that part of opinion in every country which is in favour of more aid. Each country's representative explains the reasons why aid did not materialise, to the extent it was expected. He listens to the arguments in favour of more aid and then he goes back home strengthened in his approach to demand more aid. The meeting in a way reinforces the representative in his own private battle against the hardliners at home. Mr Wells considered this aspect of great significance because no country, he thought, was completely monolithic in its structure. In the UK, for instance, there are battles going on, up and down Whitehall. The final position adopted by the country in question emerges after a fairly long discussion. In this manner the DAC is able to strengthen the hands of the aid administrations in the donor countries. In fact the DAC secretariat knows the lobby in favour of aid and tries to provide it with facts and

figures.

Apart from these meetings the DAC is continuously gathering facts and figures concerning aid, which it needs for its working. It is able to keep a constant watch over the progress of aid by looking at these figures provided by each member country. In the process of aid review the DAC is able to examine the figures and can question their validity. It is also able to ask for details and explanations which other agencies such as the UN and the IMF are not able to secure. In this manner it has some advantage over other institutions. Consequently agencies such as the UN rely upon the DAC for basic statistics in this sphere.

allied issues

The DAC is also constantly involved in the examination of certain other allied issues such as technical assistance and private investment. Its secretariat has a permanent staff which examines these subjects and prepares statements on the latest situation for the information of the committee. Mr Wells added that there are certain casual subjects too which though not continuously examined are discussed during the inter-session period. For instance, some years ago, the DAC assessed the significance of agricultural aid in Asia, and prepared a paper. This paper led to a major meeting on aid in Asia in the context of agriculture. Similarly, subjects such as unemployment in developing countries and rural development were taken up by the secretariat.

In reply to my question on the motives of donors when giving aid, Mr Wells observed that during his ten years with the DAC he has felt that motives of donors are a mixture of broadly four elements. The first is the humanitarian motive. He said: "Although it may sound hollow, I don't think it would be acceptable in our countries, that the government should sit quiet when there is starvation in some other country. Secondly, the commercial benefit out of investment accompanied by aid is definitely a motive which can be examined in various instances. It is possible that this commercial benefit is accompanied by a positive benefit for the recipient country. In the third place political motives are an element in aid. Economic aid is definitely used as a political tool in advancing better relations between two countries. In the fourth place, a view is largely held that a world of extremes of poverty and riches can explode in an ugly manner. Aid is considered to be an instrument for reducing the areas of conflict.

When the Prime Mini-

ster landed at Palam after her European tour, there was the usual crowd of obliging pressmen at the airport, all keyed up to convey to the world her latest thoughts on matters national or international. One of the questions put to her was, naturally enough, about her plans for the President of India as told in *The Statesman* by its Resident Editor, Mr Kuldip Nayar. Mrs Gandhi made it clear that she was not at all amused and declared that "it is totally fantastic nonsense and probably mischief-making as well". This was on June 24. Three days later *The Statesman* in its 'Letters to the Editor' column published a communication from the Press Secretary to the President which said, in part, "he (the President) has authorised me to say that the statement (i.e., the Kuldip story) is totally baseless and a deliberate lie". This letter was published without any elucidation by or on behalf of *The Statesman* of its own position, but under the caption "A Regrettable Lapse". The inference must be that the newspaper has attempted an indirect offer of apology for publishing a report which it is in no position, apparently, to substantiate. In circumstances such as these, there are certainly ways of a newspaper making amends in a more open, straightforward and dignified manner. (Since this was written *The Statesman* has tendered a full-throated apology).

Mr Kuldip Nayar's own position is no less unenviable. His professional integrity has been called into question in a clear and direct manner by the President and less emphatically, but not less effectively, by the Prime Minister, both of whom have charged him with intentional mischief-making. Worse, still, his own newspaper has clumsily disowned him by rebuking him publicly for "a regrettable lapse". In the circumstances, if there are any professional standards in journalism, they would seem to demand that Mr Nayar should either state in his own newspaper that he stands by his sources or his story or, if he is not able to do so, confess without mincing words that he has been sold a pup. It would of course be too much to expect even of a Resident Editor that he should resign when he can-

not or does not re-establish his *bona fides* after his professional integrity has been challenged, with his own newspaper conceding that no defence is possible. Our public life is not of that quality these days.

All this reminds me of

an episode in *The Hindustan Times* some years ago. The late Devadas Gandhi was the managing editor of the newspaper then and Mr Durga Das the joint editor. The latter was running a popular weekly political column under the *nom de plume* "Insaf". One week Mr Durga Das wrote to the effect that Dr Radhakrishnan, who was then the President of India, was in the habit of giving recommendation letters rather freely. Dr Radhakrishnan, philosopher by profession though he was, was certainly not the one to take such comments with philosophic indifference. Moreover, the late Devadas Gandhi, who was then in Madras on a visit, happened to have high personal regard for Dr Radhakrishnan. Naturally there were fire-works. I was then an Assistant Editor on the staff of *The Hindustan Times*, but was also doing duty as News Editor. Late in the night, Devadas Gandhi called me on the telephone, dictated a thorough-going apology for the offending observations in the 'Insaf' column, directed me to put it in the next morning's paper and added emphatically that there was no need to inform Mr Durga Das in advance of this. Consequently, there was a rather unpleasant surprise for Mr Durga Das when he got his *Hindustan Times* the next day, but while I am no uncritical admirer of his, I must confess that he did react rather energetically. While agreeing that the managing editor had every right to express regret on behalf of the newspaper for publishing matter which he thought it should not have published, Mr Durga Das declared that, since his journalistic judgment had been questioned, he would not continue with his "Insaf" column. Considering how much he was in love with that feature and how well it used to serve his purposes this was certainly no small sacrifice for Mr Durga Das.

I make no apology for

returning to the fascist capers of the DMK in Tamil Nadu, about which I had a few things to say in the issue of this journal

dated June 23. Cinema theatres in Madras city have been directed to drop a certain portion of the latest Indian News Review which related to the recent attack by a mob on the office of a Tamil evening daily (published in the city) which happens to be critical of DMK politics and politicians. *The Hindu*, perhaps playing safe, has reported this news in a low key, but we in New Delhi have had the advantage of reading more informative accounts carried in newspapers published here. Anyhow, the essence of the matter is that the chief secretary to the state government was able to prevail upon a certain local official of the Films Division to bring about a further censoring of a news reel which has been duly approved for all-India release by competent authorities of the central government's Ministry of Information and Broadcasting. Whether the local official of the Films Division has exceeded his authority in his desire to fall in with the wishes of the state government is only one of the issues that needs to be looked into. A far more important question is whether the state government, through its chief secretary, has acted properly.

According to the report in *The Hindu* the chief secretary had explained his part in the affair by suggesting that the screening of the film of the mob attack "was likely to aggravate the labour situation and result in disharmony". The version put out by *The Times of India* News Service had it that the chief secretary said that "the deletion was made at the instance of the government as it felt the exhibition of only a part of a chain of events could lead to a law and order situation". There is clearly a difference of substance between these two phrasings of this official's observations, but let that pass. What must worry us is that the Tamil Nadu administration is making itself a tool in the hands of the ruling party in a way which threatens the right to freedom of information of the people of that state. It is obvious that the DMK got the newsreel cut because the screening of the mob attack on an opposition newspaper would reveal to the public the true nature of the ugly forces which energise and activate the political muscles of this party. When the chief secretary of the Tamil Nadu government said — as *The Times of India* News Service reports it — that there could be "a law and order situation", was he by any chance implying that the cinema theatres were liable to be attacked by DMK hooligans and that, should this happen, the administration of which he is the executive head would not be in a position to offer normal police protection to the property or lives which may be the targets of mob violence?

MOVING FINGER

TRADE WINDS

Minimum Prices of Raw Jute

THE GOVERNMENT of India has decided that the minimum support price of raw jute should be fixed on a statutory basis. The minimum statutory price has been fixed at Rs 115 per quintal for 1972-73 and will be subject to a review after two months. These decisions are in pursuance of the assurances given by Mr L. N. Mishra, Foreign Trade Minister in the Lok Sabha recently during a discussion on raw jute prices.

The minimum prices have been fixed on a statutory basis. It would henceforth be obligatory on the part of all, including the mills, not to buy raw jute at any level below the minimum prices. It has further been decided that the differentials between the minimum prices in Calcutta and the upcountry prices would be determined by the Jute Corporation of India, taking into full consideration the interests of the jute growers. The Jute Corporation of India will extend its operations quickly to all secondary markets and, later, to primary markets as well in the jute growing areas.

It has also been decided that in order to remove transport bottlenecks with utmost expedition, a special cell will be set up in Calcutta by the Railway Board for co-ordinating transport of raw jute from the producing centres to the mills. The government has also decided to accelerate the pace of progress in respect of setting up regulated markets for raw jute.

The public sector Jute Corporation of India has taken a number of steps to gear up its purchase operations in respect of raw jute. Initially, the

corporation proposes to buy 900,000 bales of raw jute, as against a few thousand bales purchased during the last season. It is envisaged that, later, in stages, the entire trade in raw jute would be taken over by the Jute Corporation. Pending this, it would be the endeavour of the corporation to ensure that large arrivals of raw jute do not depress prices in particular markets, by siphoning off such excess supplies, wherever these might appear.

The corporation's purchases would be made through departmental purchase centres, co-operative societies, wherever viable societies are functioning and where such agencies are not available, through private agents for the time being. It is also proposed to make adequate warehousing arrangements for storing raw jute. Space has already been booked with the state and central warehousing corporations for this purpose.

Gujarat Budget for 1972-73

The Gujarat Finance Minister, Mr Kantilal Ghia, on June 26 presented in the state assembly the budget for 1972-73, which showed an overall deficit of Rs 8.92 crores. The budget contained new taxation proposals to yield Rs 3.43 crores.

The revenue receipts for the year were estimated at Rs 271.44 crores against an expenditure of Rs 251.07 crores. While the revenue surplus was Rs 20.37 crores, expenses earmarked for capital expenditure were Rs 54.79 crores and the debt head, including loans to be received from the central government and from the open market, amounted to Rs 25.47 crores.

Rationalisation of the pre-

sent structure of entertainment duty and advertisement tax in the towns of Nadiad, Porbandar, Junagadh and Broach was estimated to yield one crore of rupees in a full year and Rs 75 lakhs during the current year.

Mr Ghia also announced the withdrawal of certain sales tax exemptions or concessions in respect of chemical fertilisers, loose tea, hardware articles and purchase of certain goods by the textile industry.

New Taxes in Bengal

The state Finance Minister, Mr Shankar Ghosh, on June 26 announced tax measures to raise extra revenue of Rs 10 crores this year. Details of the new measures, he said, would be spelt out in the form of specific bills soon. Besides rationalising, revising and increasing the sales tax on certain commodities, Mr Ghosh announced a tax hike on a number of luxury consumer items such as precious and synthetic stones, gold and silver filigree, furs and articles made of furs and perfumes and on motor vehicles used for hauling goods and passengers. Admission rates in cinema houses will be increased on a progressive scale according to the value of its tickets. Cabaret shows or other entertainment and luxuries provided in hotels and restaurants will be costlier because of a new levy; stamp duty and public works cess are also being increased.

The only item on Mr Ghosh's list of tax proposals, having a direct impact on the rural sector, was a revision of land revenue, the rates of which had been fixed before the World War I.

One significant indication of the government's current thinking on the mobilisation of additional resources was Mr Ghosh's reference to Maharashtra having a cess on crops ranging from Rs 10 to Rs 100 per acre on each crop. Mr Ghosh was hopeful that with this additional revenue of Rs 10 crores, it should be possible to narrow down the current year's deficit to Rs 3.36 crores. The gap might be reduced further with the expected buoyancy in the economy.

Mr Ghosh's estimate show

an overall deficit of about Rs 37 crores. Mr Ghosh said it was "eminently desirable that central assistance should be given to the state on the basis of population" and "no attempt to remove regional disparities should be made in a manner which will retard the economic growth of the country as a whole."

Land Alienation in Orissa

The ordinance prohibiting alienation of land in excess of 10 standard acres held by any "person" was promulgated by the Governor of Orissa on June 27. The preamble to the ordinance explained that the ban was being imposed pending amendment of the Orissa Land Reforms Act to reduce the ceiling area and to secure the principles under clauses B and C of Article 39 of the Constitution.

It also expressed the apprehension that "large-scale transfer of land may take place to defeat the objects in view if it becomes known that such legislation is being undertaken."

The Revenue Minister, Mr Brajamohan Mohanty, who released the ordinance to the Press, said that the government wanted retrospective operation of the ceiling provisions after amendment of the Act. He said transfer of land was taking place and as such the government wanted to prevent "unnecessary harassment" of the people and to maintain *status quo ante*.

The minister did not specify what would be the lowered limit of the ceiling though he said the government wanted to make "radical changes" in the maximum limit of land which could be held by an owner.

Under the present Land Reforms Act the ceiling for any "persons" is 20 acres for best canal irrigated land, the limit going up to 80 acres according to the quality of land, excluding 20 acres permissible for homestead, tanks etc.

The ordinance retains the definition of standard acre. It also retains the definition of "person" in the Act which in-

Where have all the flowers gone?

State Bank opens new LOCAL HEAD OFFICES in PATNA and BHOPAL

Originally erected as a granary in 1786, the Golghar is a prominent feature of Patna even today.

To serve the people better, State Bank has been progressively decentralising its administration. Two new Local Head Offices come into existence today, one in Patna and the other in Bhopal.

The formal inauguration by Shri Kedar Pandey, Chief Minister of Bihar, at Patna on 1st July, and by Shri P.C.Sethi,

Work on the Great Stupa at Sanchi, near Bhopal, was begun by Emperor Ashoka but completed by his successors in the 2nd Century B.C.

Chief Minister of Madhya Pradesh, at Bhopal later in July, will mark the importance of the change for the respective States.

The new Local Head Offices will devote closer attention to the economic problems of these States and help to quicken their pace of progress.

STATE BANK

cludes a company or any other corporate body or Joint Hindu Mitakshara family.

The ordinance, which comes into force with immediate effect, includes within its purview documents relating to land alienation registered on or after the enforcement date but executed earlier.

Improving the Tax System

New legislation intended to improve the taxation system on the basis of the Wanchoo Committee recommendations, and rid the economy of black money is currently under the consideration of the government. Addressing the Mysore Chamber of Commerce on June 24, Mr Y. B. Chavan said that leading economists were invited to Delhi early in June 10 to elicit their views on the Wanchoo Committee report. The government would also study the views of chambers of commerce and federations of trade and industry. Mr Chavan further said that the government was examining what kind of fiscal incentives would be required in the context of priorities in the fifth five-year Plan. The government would like to encourage labour-oriented industries, he added.

The expanding agricultural sector, he said, should also make adequate contribution for national development. The Raj committee was entrusted with the task of suggesting specific measures for taxing incomes and wealth in the agricultural sector.

Sixth Finance Commission

The President has, by a formal order promulgated in the Gazette of India Extraordinary on June 28, constituted a Finance Commission under the chairmanship of Mr K. Brahmananda Reddi, former Chief Minister of Andhra Pradesh, who will have the rank of a cabinet minister. The other members of the commission are:

1. Mr Justice Syed Sadat Abul Masud, Judge, Calcutta High Court (Member).
2. Dr B. S. Minhas, Mem-

ber, Planning Commission (Member, Part-time).

3. Dr I. S. Gulati, Senior Fellow, Centre for Development Studies, Trivandrum (Member, Part-time).

4. Mr G. Ramachandran, Joint Secretary, government of India (Member-Secretary).

The chairman and members of the commission are expected to assume office shortly.

A member of the Planning Commission is associated with the Finance Commission as part-time member for the first time in order to ensure co-ordination between the two bodies.

The commission is the sixth to be constituted after coming into force of the Constitution of India. Under Article 280(3) (a) and (b) of the Constitution the commission is charged with the duty of making recommendations to the President as to—

- (a) distribution between the union and the states and the states *inter-se* of the net proceeds of central taxes like taxes on income other than corporation tax, and union excise duties.
- (b) the principles which should govern the grants-in-aid of the revenues of the states out of the Consolidated Fund of India.

In addition the commission will also determine the amount payable as grants-in-aid to the states in need of assistance under Article 275 of the Constitution. Finance Commission will take cognisance of the present arrangement wherein Plan grants are made on the recommendations of the Planning commission. The commission will also take into account in computing the needs of the states, among other factors, the emoluments of the government employees, teachers and local body employees as obtaining on a specified date, as determined by the commission and the requirements of the backward states to raise the level of their general administration to the levels obtaining in more advanced

states over a period of ten years.

Under Article 280(3) (c) it is open to the President to refer to the commission any other matter in the interests of sound finance. In terms of this provision, as usual, the commission has been asked to recommend the principles for distribution of the net proceeds of estate duty on property other than agricultural land and grants in lieu of tax on railway passenger fares and the net proceeds of additional excise duties on cotton, woollen, rayon and artificial silk fabrics, sugar and tobacco which are levied in replacement of states' sales taxes thereon. The commission will also suggest the basis of allocation of grant on account of wealth tax on agricultural property.

Two issues being referred to the commission for the first time are:—

- (a) the assessment of the non-Plan capital gap of the states on a uniform and comparable basis for the five years ending with 1978-79. In the light of such an assessment the commission may undertake a general review of the states' debt position with particular reference to the central loans advanced to them and likely to be outstanding as at the end of 1973-74 and suggest changes in the existing terms of repayment having regard *inter alia* to the overall non-Plan gap of the states, their relative position and the purposes for which the loans have been utilised and the requirements of the centre; and

- (b) review of the policy and arrangements in regard to the financing of relief expenditure by the states affected by natural calamities. The commission may examine *inter alia* the feasibility of establishing a National Fund to which the central and state governments may contri-

bute a percentage of their revenue receipts.

In making recommendations, the commission shall have regard to the resources of the central government and the demands thereon on account of expenditure on civil administration, defence and border security, debt servicing and other committed expenditure or liabilities.

The award of the Sixth Finance Commission would cover the period of the fifth Plan which is to commence from April 1, 1974. The commission has been asked to submit its report by October 31, 1973 so that its report is available well in time for finalising the financial projections in the fifth Plan and budget 1974-75.

Electric Supply Industry

Dr K. L. Rao, union Minister of Irrigation and Power, stated in Srinagar recently while addressing the conference of state ministers, that the country's power development programme needed to be undertaken on a war footing called for radical reorganisation in the electric supply industry to make it suit the needs of the large magnitude of power development envisaged for the foreseeable future.

He suggested the following four-tier arrangement:

- (1) An Electricity Council at the centre with the union Minister for Irrigation and Power as chairman and about ten ministers from different states for giving direction on major policy issues;
- (2) A National Power Supply Board to deal with planning, financial control, settlement of disputes (arbitration) and dissemination of information etc.;
- (3) A Power Generation Board with regional offices owning and operating power stations and major transmission lines. Integrated operation of power system will also be arranged by these regional boards and
- (4) The state electricit

boards will continue to be responsible for distribution and sale of energy within their respective areas.

He described the progress achieved in the power sector as significant and said that during the Plans and in the last two decades, as much as 15 million KW of generating capacity had been created bringing the total generating capacity at the end of 1971-72 to about 17.2 million KW with an investment of Rs 5,106 crores.

The minister said that without adequate supply of power, the necessary infrastructure in the industrial and agricultural sectors could not be provided. To meet the requirements of all sectors, the present installed generating capacity of about 17 million KW have to be increased three-fold by the end of the decade. He suggested that the seventies be called the Power Decade. With the demand for power increasing almost at the rate of 12 per cent annually in the country, there was need to add generating capacity at a slightly higher rate. The Decade Plan prepared by the Ministry of Irrigation and Power envisaged a target of 52 million KW by 1980-81, raising the present per capita consumption of about 90 KWh to 240 KWh.

Referring to the fifth Plan proposals for power development, Dr Rao said that it was envisaged to add to the generating capacity as much as 21.8 million KW—about 8.6 million KW hydro, 12.4 million KW thermal and about 0.8 million KW nuclear—with an outlay of Rs 7,500 crores.

The minister blamed the indigenous manufacturers for slippages in the supply of plant and equipment which contributed to the shortfall in the fourth Plan target. He wanted a critical study be made of the possibility of supply by the indigenous manufacturers and laying down of time schedules for delivery of equipment.

Suggesting that reasonable prices should be fixed for the indigenous equipment, the minister disclosed that proposals for setting up a revolving fund in the Ministry of Indus-

trial Development covering the amount of advance from year to year for utilisation towards payment to the manufacturing units and reimbursement of these amounts by the state electricity boards when funds were released to them from year to year were under consideration.

Referring to the progress made by the Rural Electrification Corporation, Dr Rao said that during the first three years of its operation, nearly eight lakh additional pumpsets had been energised, bringing the total to 18.84 lakhs. Against 74,466 villages electrified at the beginning of the Plan, 1,20,800 villages had been electrified by the end of March, 1972. He expected that cent per cent electrification of villages would be reached in the states of Kerala and Tamil Nadu and in the union territories of Delhi, Pondicherry, Chandigarh, Goa, Daman and Diu and Laccadive, Minicoy and Amindivi islands, by the end of the current Plan.

Strategy for Sugar Production

Mr R. R. Bahl, Chairman, Development Council for Sugar Industry, defined the objectives of maximising sugar production and meeting the consumer demands at a reasonable price while addressing the 28th meeting of the council.

So far as the sugar industry was concerned, he said, on the basis of an estimated per capita consumption, the country would require 6.0 million tonnes of white sugar and 9.6 million tonnes of gur and khandasari. This could call for a production of 156 million tonnes of the sugarcane.

The problems of sugarcane production would be solved, said Mr Bahl, by improved irrigation, supply of better varieties of sugarcane seeds, adequate use of fertilizers and control of pests and diseases.

The chairman of the council observed that in any programme of improved production and availability of sugarcane the price paid by the factories for sugarcane in comparison with other crops would be of crucial importance. He added, increase or decrease in the area under

sugarcane, and consequently in the production of sugarcane in successive years was mainly due to the expansion or contraction of the area which was regulated by the cultivator, depending upon the relative profitability of sugarcane cultivation of comparison with other competing crops.

As regards the capacity of the sugar industry, Mr Bahl stated, it was decided to raise the licensed capacity to 5.3 million tonnes. The installed annual sugar production capacity of the industry during 1971-72 was 3.91 million tonnes. It was estimated that the installed capacity might increase to about 3.95 million tonnes by the end of 1971-72 season. Thus, there was a gap of about 1.4 million tonnes between installed and the licensed capacities. The chairman warned that unless the licencees took effective steps to implement the licences granted to them, the government might have to review the matter and grant licences to other parties which were more likely to make use of their licences.

The chairman pointed out that the cost of sugar production in India was the highest compared to the major sugar producing countries of the world. He said, this set a limit on the expansion of our export trade in sugar as the Indian sugar would be exported only at a high subsidy. He stressed that there was every need to increase the productivity of our sugar industry by installing modern plants with latest design features, application of research and development, proper maintenance of equipment by suitably trained staff and increasing the labour productivity. Apart from this, he said, there was enough scope for increasing the technical efficiency of the sugar factories by reducing the losses in milling, processing and increasing the fuel efficiency. Economic utilisation of the by-products of the industry, such as bagasse, molasses and press mud would also help in reducing the cost of production, Mr Bahl added.

Birla Research Institute

Mr G. D. Birla founded Birla Research Institute for Applied Sciences in 1965 with the object of serving "Industry through Research". The institute was registered under the MP Societies Registration Act, 1960 with its headquarters at Birlagram, in April, 1965. Later on, the CSIR and the Ministry of Education duly approved the research institute as an institute for scientific research.

Poznan Fair

A record business of Rs 1.25 crores was contracted on the

spot at the India pavilion in the Poznan International Fair, Poland, which ended recently. Additionally, about Rs Three crores worth of business is under negotiation, as a result of the goods displayed at the Indian Exhibition in Poznan. Most of the business contracted and under negotiation is in non-traditional items. According to a report, the Indian Exhibition achieved a breakthrough in pushing up exports of consumer durable goods to Poland. This has also opened up opportunities for the export of a large variety of non-traditional and engineering items.

Besides actual business transacted and negotiated, trade enquiries have been received from Polish buying organisations for a large variety of Indian goods. These include sanitary fittings, automobile ancillaries, shoes and leather garments, hardness testing machines, machine tools and hand tools, industrial valves, refrigeration and air-conditioning equipments, aluminium, stainless steel cutlery and table-ware, carpets, textiles, measuring instruments etc.

Following the participation in the Poznan International Fair, several Polish trade delegations will now be visiting India to further negotiate and conclude agreements for the purchase of several consumer and other products. These purchase delegations are expected here during the later part of this year.

Birla Research Institute

Mr G. D. Birla founded Birla Research Institute for Applied Sciences in 1965 with the object of serving "Industry through Research". The institute was registered under the MP Societies Registration Act, 1960 with its headquarters at Birlagram, in April, 1965. Later on, the CSIR and the Ministry of Education duly approved the research institute as an institute for scientific research.

The institute is managed by a board of governors consisting of a number of industrialists and scientists of international reputation through the

Director-General, the Chief Executive and Academic Officer of the Institute. Mr D. P. Mandelia is the President at present. Dr S. M. Mitra is the Director-General.

The scientists and technologists of Gwalior Rayon developed a process for the manufacture of dissolving grade pulp from bamboo which hitherto was an imported commodity. Based on this process, a pulp plant having 150 tons per day capacity was established in Kerala, which went into production in 1963. This plant is first in the world to manufacture dissolving grade pulp from bamboo.

The Birla Research Institute carried out exhaustive studies on the pulping behaviour of Eucalyptus Mysore Hybrid of different age groups from various dry and wet areas, high and low altitude in south India for the Harihar Polyfibers. This includes the studies of the properties of the Black Liquor with varying pulping conditions with special reference to the recovery of the chemicals.

The above study would serve as a guide to the newly established factory—Harihar Polyfibres, which would be using Eucalyptus MH for the manufacture of dissolving grade pulp in its Harihar plant.

Rayon may become glamourous in the near future unless a technical revolution and new generations of rayon, much superior than the existing one, are brought about. Can this be done? These are the questions whose answers are being sought by the research scientists at Birla Research Institute, which operates modern laboratories and pilot plants for studies in pulp and viscose making.

The institute has undertaken the problem of utilising chlorine of a caustic soda mill which would be producing tons of chlorine per day.

The successful pilot plant trials at the institute to produce Ferric Chloride, Stannous and Stannic Chloride, Calcium Chloride, Barium Chloride and Zinc Chloride will be steadily implemented for the manufac-

ture of the chlorine-based chemicals on a large scale.

Market Loan for Rs 350 Crores

The government of India has announced the floatation of the following three loans aggregating Rs 350 crores:

- 4½ per cent Loan 1979 to be issued at Rs 100.00 per cent and repayable at par on 15th July, 1979.
- 5 per cent Loan 1983 to be issued at Rs 99.50 per cent and repayable at par on 15th July, 1983.
- 5½ per cent Loan 2002 to be issued at Rs 100.00 per cent and repayable at par on 15th July, 2002.

Subscriptions will be received in the form of cash/cheque or securities of 4½ per cent Loan 1972 and/or 4 per cent Loan 1972.

Subscriptions will be received from July 15 to July 18, 1972 (both days inclusive) but the subscription lists may be closed earlier without notice as soon as the total subscription amounts to Rs 350 crores. The government reserves the right to retain subscriptions up to ten per cent in excess of the notified amount.

If the total subscriptions received for the new loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the cash subscriptions received and the balance refunded in cash as soon as possible.

Interest at the rate of 4½ per cent per annum and 4 per cent per annum on the securities of 4½ per cent Loan 1972 and 4 per cent Loan 1972 respectively, tendered for conversion will be paid up to and inclusive of 14th July 1972 at the time of issue of new securities.

Interest on the loans will be paid half-yearly on the January 15 and July 15. Interest on all the loans now issued together with interest on other previous government securities and income from other approved investments will be exempt from income-tax subject to a

limit of Rs 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax up to Rs 1,50,000.

Applications for the new loans will be received at:

- offices of the Reserve Bank of India, at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;
- branches of the subsidiary banks of the State Bank of India conducting government treasury work except at Hyderabad; and
- branches of the State Bank of India at other places in India.

The budget for the current year took credit for gross loan amounting to Rs 515 crores. Loans to the extent of Rs 300.22 crores would be maturing during the current year. Out of this, 4½ per cent Loan 1972 for Rs 100.13 crores would mature on July 15 and 4 per cent Loan 1972 for Rs 154.13 crores would mature on August 1, 1972.

Repayment of 1972 Loans

The outstanding balances of the 4½ per cent Loan, 1972 and the 4 per cent Loan, 1972 are repayable at par on July 15, 1972 and on August 1, 1972 respectively and no interest will accrue thereon from these dates. The holders may tender their securities for conversion into new loans being floated viz. 4½ per cent Loan 1979, 5 per cent Loan 1983 and 5½ per cent Loan 2002 which will bear interest from July 15, 1972. Interest on loans tendered for conversion will be paid up to and inclusive of July 14, 1972, at the time of issue of new securities.

Those who do not desire to convert their securities may to facilitate repayment on the

due dates, tender the securities at the Public Debt Office, Treasury or the branch of the State Bank of India or its subsidiary bank (at which they are entered or registered for payment of interest), on or after July 5, 1972 in the case of 4½ per cent Loan, 1972 and July 22, 1972 in the case of 4 per cent Loan, 1972.

Closed Period for Issue of Securities

On the advice of the Reserve Bank of India, the government issued a gazette notification on January 31, 1972, to the effect that during calendar year 1972 no offer of securities in excess of Rs 249 lakhs (nominal value) (exclusive of amounts to be subscribed by the government and non-residents) by a public limited company shall be made or kept open during the period between July 1, 1972 and September 9, 1972 (both days inclusive) without obtaining prior approval of the central government as to the timing of the offer. Some companies have sought clarification as to whether the figure of Rs 249 lakhs refers to the amount of securities to be issued to the public only or to the total amount of issue of securities to be made by a company. The Reserve Bank of India has been consulted in the matter and it is clarified that the closed period applies to the total amount of securities to be issued by a public company in excess of Rs 249 lakhs.

Names in the News

Mr N. M. Jain, Vice President (Marketing), Century Rayon, Bombay, has been elected President of the Association of Manmade Fibre Industry. He is also chairman of the Tyre Cord Panel for the Silk and Rayon Textiles Export promotion Council.

Prof P. C. Mahalanobis, eminent statistician, died in Calcutta on June 28, 1972. He was 79. He was awarded the Padma Vibhushan in 1968 in recognition of his service to the cause of Indian science. He was founder of the Indian Statistical Institute which has now attained the status of a national research-cum-teaching institute.

Announcement regarding issue of 25,000 9.5% 3rd Redeemable Cumulative Preference Shares of Rs. 100/- each

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

PERSONS INTERESTED IN FULL DETAILS MAY OBTAIN COPIES OF THE PROSPECTUS FROM THE COMPANY'S HEAD OFFICE, BANKERS, BROKERS AND UNDERWRITERS

An application will be made to the Calcutta Stock Exchange for permission to deal in and for an official quotation for the Preference Shares of the Company being issued now. The existing Equity and Preference Shares of the Company are already listed on the said Stock Exchange.

BHARAT COMMERCE AND INDUSTRIES LIMITED

(Incorporated on 11th August, 1945 under the Indian Companies Act, 1913)

(Registered Office: Industries House, 10, Camac Street, Calcutta-17)

(will be shifted to Union Territory of Delhi shortly)

Head Office: 'Surya Kiran', 5th Floor, 19 Kasturba Gandhi Marg, New Delhi-1

HISTORY AND BUSINESS OF THE COMPANY

The Company was incorporated on the 11th August, 1945 under the name of Bharat Airways Limited. The Company obtained the certificate to commence business on the 12th February, 1946 and set up aviation business. Due to the taking over of the aviation business by Indian Airlines Corporation in the year 1953, the Company undertook other business also and consequently took steps to alter the object clause of the Memorandum and also to change the name of the Company. The High Court at Calcutta by its order dated 12th December, 1955, approved alteration of the objects of the Company. The name was changed to its present name i.e. BHARAT COMMERCE AND INDUSTRIES LIMITED from 4th January, 1956. The Company is at present manufacturing staple fibre yarn, polyester/viscose yarn, fancy yarn, cotton yarn etc. The Company owns at present a fleet of three helicopters and five Spinning Mills with 1,16,672 Ring Spindles and 46,004 Doubling Spindles. The Helicopters are engaged in aviation operation.

OBJECTS OF THE ISSUE

The Company has programmes of modernization, renovation, replacement and balancing of plants in some of the units of the Company. Certain machineries are required to be replaced by the improved and latest equipments so as to increase the productivity and profitability of the Company. The present issue is being made to provide for the finance required for the implementation of the aforesaid programmes.

SHARE CAPITAL

AUTHORISED CAPITAL Rs. 5,00,00,000 (Five crores)

ISSUED, SUBSCRIBED AND PAID UP CAPITAL

15,00,000 Equity Shares of Rs. 10/- each	1,50,00,000
30,000 9% Redeemable Cumulative Preference Shares of Rs 100/- each	30,00,000
20,000 9.3% Second Redeemable Cumulative Preference Shares of Rs. 100/- each	20,00,000
Total Rs.	2,00,00,000

PRESENT ISSUE OFFERED FOR PUBLIC SUBSCRIPTION FOR CASH AT PAR:

25,000 9.5% Third Redeemable Cumulative Preference Shares of Rs. 100/- each payable in full on application	Rs. 25,00,000
--	----------------------

The Third Cumulative Preference Shares shall be redeemed by the Company at par at any time after 31st December, 1982 but not later than 30th June 1984 by giving not less than three months notice to the holders of such shares. These shares shall rank for dividend and return of capital and arrears of dividend next after the Redeemable Cumulative Preference Shares and Second Redeemable Cumulative Preference Shares of the Company, but in priority to the Equity Shares.

PROSPECTUS AND APPLICATION FORM

Copies of the Prospectus and Application Form may be obtained from the Head office of the Company and from the Underwriters, Managing Broker and Brokers stated above. They may be obtained also from the bankers to this issue mentioned herein before or from their main offices, if any at the following places:—

Ahmedabad, Bangalore, Bombay, Calcutta,
Hyderabad, Indore, Madras and New Delhi

The full amount of Rs. 100/- per share shall be payable on the application and the applications for shares must be made for a minimum of 5 shares or multiple thereof. No bank collection charges will be payable on cheques or drafts which are drawn on any of the said banks or any scheduled bank at any of the aforesaid places to which the application is sent. Outstation cheques/drafts will not be accepted.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON MONDAY, THE 17TH JULY, 1972, AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY, THE 22ND JULY, 1972 OR EARLIER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON WEDNESDAY, THE 19TH JULY, 1972.

COMPANY AFFAIRS

Madras Aluminium

IN THE context of stagnating prices and mounting cost of production it is felt that technical innovation and increased production with diversification alone can improve the working of Madras Aluminium Company Ltd, in the years to come. Conscious of this objective the management, despite severe handicaps and financial strains, is going ahead full steam with the implementation of its expansion programme. The additional production in the first phase is expected to commence in the course of the next two months while the entire expansion of metal production will be completed by early 1973. Moreover the alumina plant of the expanded capacity will be so designed that it will be able to process even the rejects—bauxite with low alumina content — thereby ensuring maximum utilisation of the bauxite material. In fact the company is having the most technically advanced aluminium plant in the country and is currently enjoying the proud privilege of producing the largest proportion of EC grade metal. This was disclosed by the Managing Director Mr R. Venkataswamy Naidu while addressing the annual general meeting of the company.

Apart from striving to expedite the expansion scheme, the company is also concentrating its efforts at development work. It is gratifying to note that it will be marketing its aluminium circles in the course of this month. It will, soon be producing aluminium alloy rods and it hopes to introduce in the market sheets of larger dimensions in 1973 and extrusions by the end of 1973 or early 1974.

The Managing Director also

urged the government to reconsider its pricing policies and allow more remunerative prices to producers. As even units of 50,000 tonnes capacity are not considered economic or viable in international parlance, Madras Aluminium, which even after expansion will be producing a little over 25,000 tonnes a year can hardly be considered as a very economic unit especially when compared with the giant units planned or in operation in the public and private sectors in the country. Mr Venkataswamy therefore made a strong plea to the government to extend the benefit of excise rebate up to a production of 30,000 tonnes per year.

Mahindra Ugine

In his annual statement circulated to the shareholders of Mahindra Ugine Steel Company Ltd the Chairman Mr Harish Mahindra has dealt with the several aspects of the company's expansion programme. The company, the chairman said, had received sometime back a licence to expand its capacity from 24,000 tonnes to 36,000 tonnes. Since the capital cost of such limited expansion would be disproportionate to the incremental return on the extra output of 12,000 tonnes the company had submitted to the government in June 1970 a proposal to allow expansion from 24,000 tonnes to 60,000 tonnes per annum. This is, however, still pending with the government. Meanwhile the cost of plant and equipment have gone up resulting in an increase of 10 to 15 per cent on the capital outlay. As the expansion scheme was basically in consonance with the government's thinking on the expansion of mild steel plants the chairman hoped that the government

would approve the company's proposal without any further loss of time. Moreover the foreign collaborators have agreed not to charge any additional royalty on any quantity beyond 36,000 tonnes. This advantage too, the chairman said, should enable the government to consider the company's proposal most favourably.

As the present power situation in Maharashtra was not comfortable the chairman urged the government to take immediate steps to augment the power supply. Setting up of fresh capacity for power generation, creation of regional grids and reduction in transmission and distribution, are some of the steps which the chairman felt would go a long way in ensuring adequate supplies of this essential input to the industry.

Referring to the growing shortage of scrap, the chairman suggested the setting up of sponge iron plants and metallised iron pellet plants, as measures to overcome the severity in the shortage of this most essential raw material.

Telco

Tata Engineering and Locomotive Co. Ltd, has reported impressive working results during the year ended March 31, 1971. With an appreciable rise in sales from Rs 136.24 crores to Rs 158.49 crores profit has edged up by 15.8 per cent to Rs 16.43 crores from Rs 14.22 crores in 1970-71. Encouraged by the working results the directors have enhanced the equity dividend from 14 5 to 15 per cent—Rs 14.5 to Rs 15 a share.

Out of the gross profit an amount of Rs 8.87 crores was appropriated to depreciation reserve, Rs 1.22 crores to

development rebate reserve and Rs 3.00 crores towards tax liability as against Rs 7.49 crores, Rs 1.15 crores and Rs 2.70 crores provided respectively in 1970-71. This leaves a higher net profit of Rs 334.11 lakhs against Rs 288.20 lakhs in the preceding year. After earmarking a sum of Rs 20 lakhs to debenture redemption reserve, the balance of Rs 314.11 lakhs was transferred to general reserve and the proposed dividends will be paid out of the general reserve. Equity dividend will absorb Rs 226.64 lakhs — Rs 13.07 lakhs more than in 1970-71 while preference dividend will absorb Rs 45.91 lakhs as against Rs 37.20 lakhs in the previous year.

South India Viscose

South India Viscose Ltd has embarked on an ambitious programme of expansion and diversification. The company has recently received a letter of intent for installing a polynosic staple fibre plant for the manufacture of 20 tons per day. This plant will replace substantially the import of Egyptian cotton which is required for the production of finer varieties of yarn and cloth. It has also taken on hand the expansion of staple fibre plant for trebling the production of staple fibre to 30 tons per day. The contract for the supply of machinery and equipment has been awarded to Gwalior Rayon Silk Mfg. (Wvg) Co. Ltd and for erection and commissioning of the plant to Messrs Birla Consultants Private Ltd on turn-key basis. The capital outlay for this expansion is estimated at Rs 6 crores which will be met entirely from the internal sources of the company. The Plant is expected to be commissioned before the end of 1973. Meanwhile the company is approaching the government seeking its consent for doubling the capacity of pulp plant to 120 tons per day. In view of the expansion proposal the question of utilising other species of wood viz. eucalyptus grandis, Acacia Arabica etc. apart from the bluegum and wattle is under the active consideration of the

company and its collaborators. This was disclosed by the Chairman Mr Venkataswamy Naidu while addressing the annual general meeting of the company.

The company has reported satisfactory working results during the year ended December 31, 1971, Sales soared to

Rs 13.63 crores from Rs 9.77 crores in 1970 while profit, after providing for depreciation, jumped to Rs 2.89 crores from Rs 1.13 crores in the preceding year. After allocating a sum of Rs 90 lakhs each to development rebate reserve and general reserve the directors have recommended an equity dividend of 16 per cent which will

absorb Rs 78.40 lakhs. A sum of Rs 2.2 crores is still to be provided towards development rebate and it is hoped that this sum would be provided before 1974.

Sandur Manganese

The Sandur Manganese and Iron Ores Ltd hopes to stabi-

lise production and shipment of manganese ore at a level of about 3 to 3.5 lakh tonnes by 1973 or by 1974. Apart from maximising manganese ore production, the company is examining the possibility of undertaking large-scale mining of iron ore. For this purpose Smiore has already entrusted the Indian Bureau of

Head Office: Dena Bank Buildings,
Horniman Circle, Bombay 1

Mines to prepare a feasibility report to the production and export of about one to two million tonnes of iron ore per annum from the company's mining areas. Side by side and as a part of its integrated programme the company has planned to expand its electro-metalurgical industry. This was disclosed by the Chairman and Managing Director Mr Y.R. Ghorpade while addressing the annual general meeting of the company.

The company is also going ahead with its programme of further expansion and diversification. It has already received a letter of intent for the manufacture of 24,000 tonnes of ferro-silicon per annum. Two ferro-silicon furnaces each of 20,000 KVA capacity will be installed for this purpose and they are expected to go into production by the middle of 1974. After the commissioning of this project, Smiore will have three electric furnaces in all, including the existing pig iron furnace. The capital cost of the project is estimated at Rs four crores and it will be financed by the issue of fresh capital of Rs 1.5 crores and loan capital of Rs 2.5 crores. The foreign exchange component of the project is placed around Rs 1.07 crores.

The shut down of 15,000 KVA electric pig iron furnace for about eight to nine months during 1971 has adversely affected the operations of the company during the year under review. However advantage was taken of this shut down period to modify the furnace incorporating certain latest developments in furnace technology as a result of which the furnace is now giving a ten per cent higher production as compared to the years 1969 and 1970. During 1971 the company incurred a net loss of Rs 40.3 lakhs before providing for depreciation and taxation as against a profit of Rs 40.4 lakhs in 1970. In spite of this the company repaid loans and deferred payment liabilities in 1971 to the extent of Rs 12.74 lakhs.

Indo-Burma Petroleum

Besides consolidation and progress in oil trade, Indo-

Burma Petroleum Company Ltd is now venturing into new fields of development activities. It has recently entered into a technical collaboration agreement with a Belgian firm for the manufacture of sophisticated bottle filling equipment used in aerated water, soft drinks and beer industries. Hence a significant improvement in the profitability of the engineering division is expected in the coming years. This is revealed in the Chairman, Mr Kamaljit Singh's annual statement to the shareholders of the company.

IBP's association with Indian Oil Corporation has started yielding rich dividends. As compared to 1970 sales of automotive fuels went up by 39 per cent and sales of all products by 32.8 per cent, thus achieving record sales of 371,244 tonnes and a turnover of Rs 31.5 crores during 1971. Profit before tax shot up to Rs 74.66 lakhs from Rs 53.77 lakhs in 1970 while the percentage of profit after tax to capital employed advanced to 16.83 from 10.28 in the preceding year. The encouraging working results have enabled the directors to recommend a higher dividend of 18 per cent as compared to 17 per cent paid in 1970.

The company's investments in Balmer Lawrie and ICICI fetched good returns. During the year the company purchased an additional 3332 shares in ICICI as a result of rights issue made by the ICICI. But the company's investments in Shama Pistons & Rings Ltd, Shama Forge Company Ltd and Assam Sillimanite Ltd did not yield dividends. During the year the company sold its equity holding in Shama Pistons & Rings Ltd worth Rs eight lakhs at par value. As a consequence the IFC has released the loan guarantees executed by the company in respect of loans advanced to Shama Pistons and Rings Ltd. This will reduce the company's contingent liability to the extent of Rs 52.55 lakhs apart from interest charges.

The company which has been holding about 30 per cent

of the equity shares of Messrs Balmer Lawrie over a decade has now entered into an agreement to purchase additionally two large blocks of shares in this company held by Duncan Brothers and Alex Lawrie & Co (India) Ltd. As a result of this acquisition the company will be holding now about 80 per cent of the equity shares of Messrs Balmer Lawrie. Meanwhile the company has taken over the management of the Balmer Lawrie group with effect from June 6, 1972.

Escorts

Escorts Ltd is planning to set up a joint venture in Malaysia for the manufacture of automobile ancillaries. The cost of the project is estimated at around five million Malaysian dollars or about Rs 1.25 crores. Escorts will be investing Rs 30 to 40 lakhs over the next two years in the equity capital of the company. An agreement is expected to be concluded shortly.

Despite green revolution it is ironic that the tractor industry which has rendered yeoman service to agriculture, in spite of severe constraints such as uneconomic prices and stiff competition from duty-free imported tractors, should be in a state of recession. In fact many units have gone into the red, with one undertaking practically remaining closed throughout 1971. But it is no wonder if well-managed and efficiently-run giant enterprises such as Escorts, with its magnificent record in product diversification, continuous expansion in the field of import substitution and excellent training facilities for its personnel, was able to meet the formidable challenges most creditably but even succeed to produce quite encouraging working results. The year in fact turned out to be a saga of solid achievements for the company. A new sports model of Rajdoot motorcycle has been developed and tested and it is now on the threshold of commercial production. The company has also broken new ground in the automotive ancillary market by introducing in April 1972 a new range

quality gears under the brand name 'Transpower'.

The price increase on tractors allowed by government in February 1972 has enabled the company to effect marked improvements in its product range and launch a new tractor—Escort 3036—with water-cooled engine and with the addition of several new features. What is more, the company has recently received the consent of the government to import from Poland engine components to enable the company to manufacture yet another new model of Escorts tractor up to 12,000 numbers during 1972-73. This will put the company on a firm footing to attain better quality production and higher profitability with none or very little increase in tractor prices. It is gratifying to note that the company has bagged the 1971 award for outstanding achievement in agriculture from the Federation of India Chambers of Commerce and Industry.

A peep into the working results reveal that the company has fared extremely well during 1971. Sales climbed to a new peak of Rs 40.44 crores registering a handsome gain of Rs 1.56 crores over 1970. The net profit however declined to Rs 70.97 lakhs as compared to Rs 101.75 lakhs in 1970. The net profit has been arrived at after providing Rs 90.42 lakhs for depreciation, Rs 66.00 lakhs for taxation and Rs 120.01 lakhs towards interest charges as against Rs 88.20 lakhs, Rs 77.00 lakhs and Rs 73.96 lakhs allocated respectively in the previous year. After adjustments a sum of Rs 12.94 lakhs was appropriated to development rebate reserve as against Rs 25.08 lakhs in the preceding year while an amount of Rs 66.84 lakhs was transferred to general reserve as compared to Rs 81.28 lakhs in 1970. The directors have recommended payment of dividend on equity capital amounting to Rs 38.32 lakhs at the rate of 11 per cent. It is anticipated that a part of the dividend will be free from income-tax.

The company continued to

maintain its progress during the current year as well. Sales in the first six months of 1972 have already touched the high level of Rs 21.50 crores recording a substantial expansion of Rs three crores over the same period of 1971. If this trend is maintained a significant improvement in working results can be anticipated during the current year.

Mr H. P. Nanda, the President of Escorts Ltd, deplored the government's decision to import 20,000 tractors during the current financial year. The seven existing units in the country had already a capacity to manufacture 55,000 tractors as against a demand of 35,000 tractors. The president therefore appealed to the government to restrict the import of tractors besides pleading for a reduction in customs duty on foreign components and excise duty in order to bring down the cost of tractors.

News & Notes

Expansion and Diversification
SLM-Maneklal Industries Ltd. proposes to spend about Rs 25 lakhs on its various expansion programmes. The proto-type of Kautex blow moulding machines has been prepared and is undergoing trial tests. Commercial production is expected to start very soon. The company has recently received an industrial licence for the manufacture of plastic injection moulding machines. A technical collaboration arrangement has been entered into by the company with Toshiba (Japan) for the manufacture of this item but the proposal is under the consideration of the government. The company is now going ahead with its scheme for the manufacture of compressors for railways in collaboration with Brown Boveri. The production of this item is expected to commence by the end of this year.

New Issues

Polygas will be approaching the capital market towards the end of this year with a public issue of Rs 15 lakhs,

in equity shares of Rs 10 each at par. The issued capital of the company is of the order of Rs 25 lakhs but shares worth Rs 10 lakhs have been taken up by the promoters, directors and employees. The remaining capital of Rs 15 lakhs is being offered to the public for subscription. The company, which is being converted into a public limited company, proposes to buy from

Indian Oxygen Ltd an oxygen plant and instal the same in the premises of Polysteels (India) Ltd, at Bhavnagar. The plant will have a capacity to produce one million cubic metres of gas—liquid oxygen and nitrogen—annually. It will enter into a long-term contract with Polysteels for the supply of 60 per cent of the production. Another 20 per cent will be taken up

by Saurashtra Iron Foundry and Steel Works (P) Ltd., Bhavnagar and the balance of 20 per cent will be sold in the open market. The gas plant is expected to go into production by the end of 1973. The total outlay on the project is estimated at Rs 50 lakhs which will be met by the share capital of Rs 25 lakhs while an equal amount will be raised through loans.

D.C. MOTORS AND GENERATORS TYPE Q & DY

SALIENT FEATURES

HEIL, pioneers in the manufacture of Heavy Electrical Equipment, offer DC Motors and Generators (Type Q & DY) designed for general as well as specialised applications.

These machines, besides being tested for performance and reliability under extreme conditions, have all the advantages accruing from long experience, ability to engineer sophisticated equipment and extensive research and development.

- Ratings - 10-500 kW and 110-600 Volts.
- Speed variation - 1:30 by combined field and armature control.
- Enclosures - Screen-protected (with or without forced ventilation) and TEFC/CACA Types.
- Easy maintenance - Good accessibility of commutators in all machines and cartridge bearings and split casings in large machines.
- Supply systems - Suitable for operation on static Thyristor controlled and conventional systems.
- Specification & Design - In accordance with BS 2613: 1957 and backed by expert design and project teams.
- Applications - Reversible drives for plano-millers, Cement kiln drives, Blooming mill & Pelletising plant drives for steel mills, sugar diffuser drives, Paper mill drives and Extruder & Calendar drives for rubber factories.

COMPANY MEETINGS

THE INDO-BURMA PETROLEUM COMPANY LIMITED

The following is the text of the statement of Shri Kamaljit Singh, Chairman, The Indo-Burma Petroleum Co. Ltd. delivered at the 64th annual general meeting held at Calcutta on June 29, 1972

Shri Kamaljit Singh

Ladies & Gentlemen,

It gives me great pleasure to welcome you to this meeting today. The Directors' Report, Balance Sheet and Profit and Loss Account for the year ended 31st December 1971 have been in your hands for some time, and with your permission, I take them as read.

As I mentioned to you last year, the association of your company with the Indian Oil Corporation commencing from January 1970 has helped to improve the working results of your company. The following table shows the position for the last three years:—

Year	Sales (Lacs metric tonnes)	Profit before tax (lacs Rs)	Percentage of profit after tax to capital employed
1969	2.04	32.50	6.20
1970	2.79	53.77	10.28
1971	3.71	74.66	16.83

It has been possible to recommend a total dividend of 18% for 1971, as against 17% for 1970. I am glad to say that your company continued to make all round progress in 1971. As compared to 1970, sales of automotive fuels went up by 39% and sales of all products by 32.8% thus achieving record sales of 371,244 tonnes and a turnover of Rs. 31.5 crores. Dur-

ing the first five months of 1972, the sales are estimated to be about 30% more than in the corresponding months of 1971. Besides consolidation and progress in the oil trade, your company has also made plans for development in other fields. I am glad to inform you that your company entered into a technical collaboration agreement with a Belgian firm in March 1972, for the manufacture of sophisticated bottle filling equipment used in aerated water, soft drink and beer industries. As a consequence, it is hoped that the profitability of your company's engineering

division will improve in future years.

Company's investments in Balmer Lawrie and ICICI fetched the same rate of dividend as in previous years. However, your company purchased an additional 3332 shares in ICICI, as a result of "rights issue", made by the ICICI.

Your company's investments in the Shama Piston & Rings

Ltd., Shama Forge Company Ltd and Assam Sillimanite Ltd. did not yield any dividends. However, I would like to inform you that with the efforts of the financial institutions, the Shama Pistons & Rings Ltd. was reorganised in May 1972, and as a part of the overall arrangements, your company has sold its equity holding in Shama Pistons & Rings Ltd. worth Rs. 8 lakhs at par value. I am glad to say that as a consequence the Industrial Finance Corporation of India have agreed to release the guarantee executed by your company in their favour in respect of loans granted by Industrial Finance Corporation of India to Shama Pistons & Rings Ltd. This will reduce your Company's contingent liability to the extent of Rs 52.55 lakhs plus interest.

Your company was holding about 30% of the equity shares of M/s. Balmer Lawrie, Calcutta, for more than a decade. Earlier this month your Company has entered into an agreement to purchase additionally two large blocks of shares in this company held by Duncan Brothers and Alex Lawrie & Co. (India) Ltd. Subject to to your approval, these additional shares will be acquired next month and your company will hold about 80% of the

equity shares of M/s. Balmer Lawrie and thus have control over that company and its subsidiaries, with their varied industrial activities, including barrel making, grease manufacture, engineering and electrical industries. Meanwhile your company has taken over the management of the Balmer Lawrie Group from 6th June, 1972.

Your company's retail outlets have been renovated in 1971 using the new colour scheme and new logo. We hope these outlets now project the new image of your company, viz. the image of an organisation dedicated to service and efficiency. Your company has also initiated a scheme for the rehabilitation of the ex-servicemen and their families by appointing them as dealers at company developed retail outlets and for selling kerosene.

The success achieved during 1971 has been the result of the hard work and devotion of your employees and dealers. I am glad to convey deep felt appreciation to one and all, both on your behalf and on behalf of the Board of Directors.

Note—(This does not purport to be a record of the proceedings of the annual general meeting.)

Shri Y. R. Ghorpade

GENTLEMEN,

The production of manganese ore in the year 1971 increased to 2.61 lakh tonnes from 2.34 lakh tonnes in 1970 and 2.05 lakh tonnes in 1969. In 1972, the production of manganese ore is expected to be still higher and exceed 3 lakh tonnes during 1973. It may be recalled that in my speech last year, I had stated that every effort will be made to stabilise our manganese ore production and exports at a level of about 3 lakh tonnes per annum which is about six times the Company's annual manganese ore production before 1960 and about three times the annual production during 1960-65. Bulk of this ore is exported to Japan and some to Europe. It is being examined whether it would be possible to ultimately aim at a production of about 4 lakh tonnes of all grades of manganese ores in response to the Japanese market. Sandur manganese ore is now as well established in Japan as in Europe.

2. Manganese ore shipped during 1971 is 2.40 lakh tonnes as against a production of 2.61 lakh tonnes. Some shipments had to be postponed to 1972 at the request of our Japanese buyers and as a result of the Indo-Pakistan war. In the year 1972 also our level of production is likely to be somewhat higher than the shipments. This will enable the Company to build up adequate stocks for better co-ordination between production, railing and shipment and quality control.

Every effort is being made to ensure that quality does not suffer as a result of increased production. It is gratifying that the out-turn analysis results of the shipments of manganese ore during the first quarter of 1972 have been well above the guaranteed minimum. The problem of increasing overburden is also being tackled. The two traxcavators commissioned in February 1972 will help in the removal of overburden at a faster rate resulting in higher production. The scope to further strengthen the mining equipment and transport facilities at the mines is being actively considered.

3. In the next year or two both our level of production and shipment of manganese ore will have to be stabilised at a level of about 3 to 3.5 lakh tonnes. Every effort will be made to reach an average of 3 shipments per month. This means not only adequate railings but adequate facilities at the port of Mormugao from which this ore is being shipped. With the development of the Mormugao outer harbour, the present mechanical ore handling plant could be made available for loading manganese ore. This would considerably quicken the pace of manganese ore shipments at Mormugao. Generally speaking, with the growing international competition, better ore handling facilities at ports becomes inevitable to safeguard the competitive position of all Indian ores. The Government of India should

THE SANDUR MANGANESE & IRON ORES LIMITED

Speech by Shri Y. R. Ghorpade

Chairman & Managing Director

The Sandur Manganese & Iron Ores Limited, at the Eighteenth Annual General Meeting held on 30th June 1972

give adequate attention to port development during the 'Fifth Plan' period to enable sufficiently large ships to be loaded at a faster rate, thereby reducing the sea freight for Indian ores to the same level as for ores from other parts of the world.

4. Smiore is conscious of the fact that manganese and iron ore production is and ought to be labour intensive and employment oriented. We are, therefore, determined to do as much manganese and iron ore production as is economically feasible, keeping in mind railing, shipping and other available facilities. Apart from maximising manganese ore production, the Company is examining the possibility of undertaking large-scale mining of iron ore. For this purpose, Smiore has already entrusted the Indian Bureau of Mines to prepare a feasibility report for the production and export of about one to two million tonnes of iron ore per annum from the Company's mining areas. Our friend in Japan are likely to be interested both in our manganese and iron ore development in a big way. This is fully in line with the country's effort to increase exports and earn more foreign exchange. Side by side and as a part of an integrated programme, the Company has planned to expand its electro-metallurgical industry.

5. The 15,000 KVA electric pig iron furnace of the Sandur

Metal and Ferro Alloys Plant near Hospet had to be shut down for about 8 to 9 months during 1971 for the purpose of relining. The furnace had functioned satisfactorily during 1969 and 1970. The requisite refractory material for relining was not readily available. There was great difficulty in this regard. The refractory material required to completely reline the furnace had to be specially manufactured within the country. However, advantage was taken of this extended shut down period to modify the furnace, incorporating certain latest developments in furnace technology, as a result of which the furnace is now giving a 10% higher production compared to the years 1969-70. Production of pig iron in 1972 is expected to be 36,000 tonnes as against 33,991 tonnes in 1970 and 31,604 tonnes in 1969. This amounts to 100% utilisation of licensed capacity. But there has been steep increase in prices of raw materials, particularly coke and electrode paste and this is seriously engaging the attention of the Company. Smiore has developed considerable technical expertise and experience which is now one of its main advantages in launching on further expansion.

6. During 1971, the Company incurred a net loss of Rs. 40.3 lakhs before depreciation and taxation as against a profit of Rs. 40.4 lakhs in 1970. After depreciation and amortisation the loss for the year is Rs 67.2 lakhs. This was

mainly because of the long shut down of the pig iron furnace for about 8 to 9 months upto September 1971. In spite of this, the Company repaid loans and deferred payment liabilities to the extent of Rs. 12.74 lakhs in 1971. The Bank of India and the Industrial Credit & Investment Corporation of India Ltd., have kindly agreed to reschedule loan repayments in view of the plant shut down in 1971. However, the furnace is functioning very satisfactorily from September 1971 and the Company expects to make up by 1974 the loss incurred in 1971.

7. The Company is also going ahead with its programme of further diversification and industrial expansion. It has a Letter of Intent for the production of 24,000 tonnes of ferrosilicon per annum. The ferrosilicon project report, prepared by the Company, for the installation of two 20,000 KVA furnaces for an annual production of 24,000 tonnes of ferro-silicon, has already been submitted to the financial institutions, viz., Industrial Finance Corporation of India, Industrial Credit & Investment Corporation of India, Industrial Development Bank of India, Life Insurance Corporation of India and the Unit Trust of India. The estimated capital cost of the project is Rs. 4 crores and is expected to be financed by the issue of fresh capital of Rs. 1.5 crores and loan finance of Rs. 2.5 crores. Foreign exchange component of the project is Rs. 1.07 crores. The Company has already made applications to the Controller of Capital Issues and the Controller of Imports & Exports in this regard. The Mysore Government have agreed to supply a minimum of four lakh bags of charcoal per annum. The balance of reductants may have to come from other alternative sources. In view of the Company's substantial manganese ore export performance and programme, it may be possible to consider the import of some quantities of metallurgical coke of the best quality, with the approval of the Government of India, in order to maximise technical efficiency and production. The

Mysore State Electricity Board has agreed to supply the necessary power on a long term basis at the present HT-1A tariff. This increased power rate will be economically feasible in view of the higher profitability of ferrosilicon compared to pig iron. Completion of the ferrosilicon project will further diversify the Company's production and make the Metal and Ferro Alloys Plant more broad-based and viable. As per the time schedule drawn up for the implementation of this project, the two ferrosilicon furnaces, each of 20,000 KVA capacity, are expected to go into production by middle of 1974. After the commissioning of this project, Smiore will have three electric furnaces in all, including the existing pig iron furnace, and will no longer suffer from the disadvantage, which it acutely experienced in 1971, of functioning with only one furnace.

8. With regard to labour welfare amenities, the Company has tried to do its utmost. The Life Insurance Corporation of India have sanctioned a loan of Rs. 25 lakhs to the Company towards construction of a modern colony for employees of the Metal & Ferro Alloys Plant. The Company has also applied to the Mysore Housing Board for financial assistance for constructing houses for its mining labour. The Company has a mining force of nearly 3,000. Efforts are also being made to augment the drinking water supply at the mines which gets depleted during summer months. The Company has revised the pay-scales of its employees both at Mines and at the Metal & Ferro Alloys Plant from January 1972 as a result of which the annual wage bill increased by Rs. 6 lakhs.

9. The inauguration of the work on the Vijayanagar Steel Plant by the Prime Minister on 14th October 1971 marks a significant land mark in the economic development of Sandur, Bellary District and the State as a whole. The Government of India have now indicated that this two million tonne steel plant will cost as much

as Rs. 750 crores. I am sure the State Government will take all steps to ensure that this steel plant is completed as expeditiously as possible. Now that the Mysore Government has sanctioned the Taranagar multi-purpose irrigation project, we could reasonably expect the National Mineral Development Corporation to commence work on its proposed two million tonne pelletisation plant costing Rs. 25 to 30 crores in the valley of Sandur. The Mysore Government has agreed to meet the water requirements of this public sector pelletisation plant from the Taranagar project. All this will naturally result in a lot of ancillary development and employment in Sandur and the adjoining areas. This is a matter of great satisfaction to all those who have worked for the modernisation and develop-

ment of Sandur which is destined to play a significant role in the progress and prosperity of our State and the country.

10. Shri M. Y. Ghorpade has resigned as the Joint Managing Director of the Company on his appointment as Finance Minister of Mysore State. The Board of Directors wish to place on record their appreciation of the valuable and signal services rendered by Shri M.Y. Ghorpade to the Company since its inception in 1954 and wish him every success in the discharge of the high responsibilities that he has been called upon to shoulder at this crucial juncture in the service of the State.

Note: This does not purport to be the proceedings of the eighteenth Annual General Meeting of the Company.

SOUTH INDIA VISCOSE LIMITED COIMBATORE.

Speech of the Chairman, Sri R. Venkataswamy Naidu delivered at the Fourteenth Annual General Meeting of the Shareholders held on 28th June, 1972 at 10-30 A. M. at the Registered Office of the Company, "Shanmuga Manram", Race Course, Coimbatore-18.

Ladies & Gentlemen,

I have great pleasure in welcoming you to this Fourteenth Annual General Meeting of the Company and presenting to you the Annual Accounts of the Company and Report of the Board of Directors for the year ended 31-12-1971. The printed copies of the Accounts and the Directors' Report have been circulated to all the shareholders and with your permission I shall take them as read.

Sri R. Venkataswamy Naidu

On this occasion, I would like to refer to the significant event of the year viz. the influx of millions of refugees from the former East Pakistan followed by a 15 days' war with Pakistan; India emerging out of the war victoriously, birth of Bangladesh and the return of the refugees to their Homeland. I am sure that you will join with me in congratulating our Prime Minister, Mrs. Indira Gandhi for steering the country to victory in the crucial period.

The refugee problem and the war with Pakistan placed heavy strain on our economy and still we have the impact of war as some of the levies imposed dur-

ing the emergency have still not been withdrawn. It is of utmost importance that the economy in the country should be stable and the production accelerated to the maximum extent possible to create greater potential for remunerative employment.

The present policy of taxation is not conducive for the development of industries but on the other hand it retards savings and capital formation. In order to help the development of Industry, I hope that the Government of India will reconsider their decision to abolish tax relief to the priority industries, the increase in the surcharge on company profits and the withdrawal of the development rebate concession after 1974.

Review on the Working of the Company

Coming to the affairs of the Company, I am happy to say that the performance of the Company during the year has been very satisfactory and the working results noteworthy. There is a marked rise in the sales and profit of the Company. The sales have totalled to Rs. 13.63 crores as against Rs. 9.77 crores for 1970. The profit amounts to Rs. 2.89 crores as against 1.13 crores for 1970, after providing Rs. 1.59 crores for depreciation. After transferring a sum of Rs. 90 lacs each to the Development Rebate Reserve and General Reserve, your Directors are pleased to recommend a dividend of 16% on the Equity shares absorbing Rs. 78.40 lacs. A sum of Rs. 2.2 crores is still to be provided towards development rebate. I am hopeful that with the continued trend of good profits, it would be possible to provide this sum before 1974. In this

context of good working results of the Company, I also wish to remind you that this is a very highly capital intensive industry. Our sales turnover is of the order of 13.63 crores of Rupees for a total capital investment of 25.53 crores of Rupees.

Raw Materials

The production of the Company is satisfactory but the shortage of raw materials especially Caustic Soda required for the production of Staple Fibre, Rayon Yarn and Pulp still continues. Our regular suppliers of Caustic Soda have reduced the quota considerably due to the shortage of raw materials for the production of caustic soda. The price of Caustic Soda in the open market is very high and even at the enhanced rate the requisite quantity is not available. In this connection, I wish to mention that our Staple Fibre Plant was stopped for a period of about two months during the year under review due to short supply of caustic soda.

The availability of pulp wood—the basic raw material—alotted to us by the Government of Tamil Nadu viz 1,000 acres of Bluegum and 2,500 acres of Wattle are far too short of our demands. We are, therefore, in correspondence with the Government:—

(1) for the increase in allotment of bluegum areas to the maximum extent possible as also to allot to us areas for growing pulp wood either on lease or as a joint venture with the Government.

(2) to allot Eucalyptus Grandis areas in addition to the bluegum areas.

In view of the short fall in supplies from the Government forests, we are also taking pulp

wood from private parties to tide over the shortages.

Negotiations have already been started with the private parties for the acquisition of lands for growing bluegum and other pulp wood to ensure adequate supplies for all time.

In view of the proposal for the expansion of the Pulp Plant from the present 60 tons to 120 tons a day capacity, the question of utilising other species of wood viz. Eucalyptus Grandis, Acacia Arabica (Karuvellam) etc., apart from the bluegum and wattle is under the active consideration and examination by our Collaborators.

Expansion

I am happy to inform you that we have taken up the expansion of Staple Fibre Plant for increasing the production of Staple Fibre from 10 tons to 30 tons per day. In this context, I wish to recall to you that our Company was promoted by a Consortium of Cotton Textile Units in this area with a view to produce staple fibre to relieve the shortage of cotton. Hence, with a view to stabilise the cotton textile industry, we have undertaken substantial expansion of the Staple Fibre Plant. Almost the entire machinery will be fabricated indigenously and the contract for the supply of machinery and equipment has been awarded to Gwalior Rayon Silk Mfg. (Wvg.) Co. Ltd., and for erection and commissioning of the plant to M/s. Birla Consultants Private Ltd., on turn key basis. The capital outlay for this expansion is estimated to be Rs. 6 crores which will be met from the internal resources of the Company. It is expected that all the machinery will be erected and commissioned before the end of 1973.

We have also obtained a Letter of Intent for installing a Polynosic Staple Fibre Plant for the production of 20 tons per day. We deputed two of our Engineers to study the working of the Polynosic Staple Fibre Plant in our Collaborators' Factory in Italy and the orders for the plant and machinery required for this expansion are expected to be placed shortly. the Plant will be indigenously procured or fabricated with the drawings provided by our Collaborators; only highly sophisticated and specialised equipments which cannot be fabricated in India will be imported. The Polynosic Staple Fibre Plant will replace substantially the import of Egyptian cotton which is required for the production of finer varieties of yarn and cloth.

In the past, Rayon grade pulp was imported under U.S. AID Scheme. After the hostilities with Pakistan, America has suspended the aid with the result the import of pulp from America has been stopped. In view of this development, the production of indigenous pulp has to be increased by greater utilisation of existing capacity and also expanding the existing capacity.

The capacity of our Pulp Plant is only 60 tons per day which is not an economic unit in the international parlance. The Management is discussing with the Government of Tamil Nadu the need to increase the area of cultivation of bluegum so as to enable the Company to increase the capacity from 60 to 120 tons per day. In this context, I wish to inform you that we have applied to the Government of India for sanction to increase the capacity accordingly. The Letter of Intent is awaited. It is needless to say that with the implementation of the expansion of the Pulp Plant, not only the production of our Rayon yarn and Staple fibre will be uninterrupted but also a considerable amount of foreign exchange will be saved in the sale of pulp to other spinners in the country.

Labour Welfare

We are anxious not only to increase the growth of the Company but are also keen on providing amenities to workers and staff. It is our earnest desire to provide most modern living conditions to our workers and staff.

We have introduced, in collaboration with the Life Insurance Corporation of India, One-Year Renewable Group Term Insurance Scheme for the benefit of our employees. Under this Scheme, if anything untoward happens to an

employee, his dependants will receive 20 times his monthly salary from the L.I.C. The premium is fully borne by the Company. The minimum benefit to the dependant of a worker in the Company under this policy would exceed Rs. 6,000/-.

For providing accommodation to our workers, we have taken up the construction of 120 modern flats in the first instance under L.I.C. Housing Scheme. In course of time, more flats will be constructed.

The relation between the labour and management continued to be cordial during the year, though there were some disturbances due to inter-union rivalry.

Conclusion

Textile consumption in the world has increased very much over the years. The supply of natural fibre is not adequate to meet the demand of the modern market. So, the gap has to be filled up by the Man-Made fibres either alone or in blends. The Man-Made fibre Industry needs due encouragement and necessary assistance from the Government and a liberal policy of the Government will stimulate the growth of the industry.

At one stage, it was feared that the Viscose fibre and filament yarn would lose popularity and that this industry would not have a bright future. However, today, the world over we see the rayon industry making steady growth while synthetics have been affected by glut in the market with heavily depressed prices. I am confident that the rayon industry will maintain its popularity in India in spite of the growth of the synthetic fibre industry, because, the rayon fabrics are more suited for the climatic conditions of the country.

I am confident that the working results will continue to be good in future years and that the expansion programmes will be carried out by maximising utilisation of indigenous equipments and with minimum borrowings.

The policy of the Company has always been to plough back the profits in the business, after declaring a reasonable dividend to the Shareholders. This will provide increased em-

ployment opportunities in the Factory and in the forests and also contribute to the supply of additional raw materials viz., Pulp, Staple fibre and Rayon yarn, which again go a long way to increase the employment opportunities in the textile mills and among the spinners and weavers.

I request you to join me in expressing our thanks to our Collaborators in agreeing to

assist us in fabricating the equipments for our expansion project indigenously.

I conclude by expressing, on your behalf and on behalf of the Directors, my appreciation to the employees of all cadres for their devoted service to the Company's progress.

(NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting).

SCHEMES THAT ASSURE YOU A ROSY FUTURE

1. Annuity Deposit Scheme :
Pays back double your monthly deposits as monthly pension. Excellent provision for Children's education, insurance premiums, steady income after retirement etc.

Monthly deposits are Rs. 10/- or multiples.
Pay Rs. 10/- every month for 120 months
We pay back Rs. 20/- every month to give you Rs. 2400/-

2. Cumulative Deposit Scheme :
Brings you highest returns on deposits.

Interest is added monthly to your savings and it also earns interest. At maturity you get back your deposit, interest, and interest on interest... higher return than under any simple saving scheme.

Rs. 1000/- in 18 months become Rs. 1100/-
in 69 months Rs. 1500/-

BINNY LIMITED

Statement of the Chairman, Mr. N. S. Bhat

Following is the statement of the Chairman, Mr. N. S. Bhat to the shareholders on the occasion of the 3rd Annual General Meeting of the Company held in Madras on 30th June, 1972.

Ladies and Gentlemen,

I have great pleasure in extending to you a warm welcome to the third Annual General Meeting of the Company.

I consider it a privilege and challenging experience to be able to serve this great Company as Chairman and Managing Director during one of the most difficult periods in the history of the House of Binny. Having worked in the rich traditions of the House of Binny for twentyfive years, I shall endeavour during the rest of my career to maintain those traditions while promoting the immediate and long term objectives of the Company.

The road to success is not always smooth but is often full of difficult and unpredictable problems. Nevertheless with your goodwill and support your Board can and will, I venture to submit, restore your Company to its rightful place on the industrial map of our country.

The Directors' Report and Accounts for the year ended 31st December 1971 have been circulated in the prescribed manner and, with your permission, I shall take them as read.

1971 was a difficult and disappointing year for the Textile Industry in general. For the Company's Mills in particular, which are equipped to manufacture mainly coarse categories of cloth, using Indian cotton, and in which a substantial part of the machinery needs rehabilitation, it was a

very bad year indeed. Mill cloth production in 1971 at less than 4,000 million metres was the lowest on record for the industry since 1951. Cloth production in 1971 in the Madras and Bangalore Mills was also less than in 1970. The main reasons for the fall in production and poor results in 1971 were: (a) unprecedented high prices of cotton (b) inability to realise economic prices on finished cloth due to strong —and quite understandable— consumer resistance (c) collapse of major markets due to severe floods and the India-Pakistan war (d) constraints imposed by old plant and equipment (e) inadequate working capital and (f) strike followed by a lockout for two months in the Bangalore Mills.

The raw cotton price index number in September 1970 was 183 (Base 1961-62=100). It rose to 253 in January 1971, dropped to 220 in May, but rose again in subsequent months to stand at 249 in September. Against the steep rise in the raw cotton price index, the wholesale price index of cotton manufactures went up by only 19 points from 142 in September 1970 to 161 in September 1971. Cost of cotton is, as you are aware, about half the manufacturing cost of cloth. In other words the textile industry, and not the consumer, carried the bulk of the burden.

Coupled with higher cost of cotton, wages and costs of stores, spares, fuel and freight also increased substantially in 1971. These additional costs and the collapse of major markets caused severe

strain on the Company's liquid resources.

In the Interim Report sent to you in November 1971 reference was made to the need to modernise/rehabilitate pre-weaving machinery, much of which is old. Old plant and equipment is a serious handicap and will continue to be so until it is renewed or modernised. This will take time and involve substantial expenditure; nevertheless it has to be done as soon as possible.

If the results for 1970 were disappointing, 1971 proved to be worse. Although the performance of the textile industry generally in 1971 was worse than in 1970, in view of the substantial loss suffered in 1970 and 1971, I am sure you will expect me to give you some indication of the future outlook, especially for the current year. It would be rash for me to make any precise commitment for the future, especially in an environment which is full of socio-economic uncertainties, but I would like to tell you frankly and candidly what we have done so far to restore your Company's fortunes and how far the Company has progressed during the last 8 or 9 months.

Let me start by assuring you that the Company is on the road to recovery and is no longer in the red.

At the last Annual General Meeting my distinguished predecessor said that the most serious problems confronting your Company concerned the Madras Mills and that future profitability lay in improving the working of the Textile Division, especially the Madras

Mills. In financial terms the problem was simply one of revenue falling short of direct manufacturing costs and fixed costs including wages. The only way to resolve the problem quickly was to reduce manufacturing costs by strict economies; to improve efficiencies and to find cloths which could be produced and sold at economic prices. Substantial reduction in fixed costs was not considered a short term possibility and in any event much of the fixed costs are beyond the control of the Company.

In the third quarter of 1971 your Board was faced with a heavy loss of Rs. 144 lakhs for the first half of that year close on the heels of a substantial loss suffered in 1970. To add to our problems the Company's sales were affected by severe floods and the threat of the India-Pakistan war. The situation was serious indeed, but by then the malady in the Textile Division had been diagnosed and, bearing in mind the national interest and the interests of shareholders, employees and the trade, your Board had accepted the challenge and initiated a determined effort to regain the lost ground. In doing so the Board relied on the goodwill and assistance of shareholders, the Textile Commissioner and other concerned Government authorities, employees, guarantors, distributors, customers, suppliers, the Company's bankers and all others who have been associated with the Company in one form or another over its long history. Some of our fibre suppliers in particular give us

a measure of steadfast support for which we shall always be grateful. I am happy to acknowledge here the unstinted help we received from all these people and institutions.

The battle for recovery has been stiff and will continue to be so but the spirit with which everyone concerned responded has demonstrated that our greatest asset at this critical juncture was, and is, high morale among our own staff and labour and their determination to work together to lift the Company out of its difficulties. In the Binny tradition we found courage in adversity at all levels among the Company's personnel. I would like to express my deep appreciation of their excellent work and my confidence that it will continue.

Our first task was to reduce manufacturing costs in the Textile Division, to which end we consulted the South India Textile Research Association. Their very helpful and valuable recommendations were received in May 1971 in respect of the Madras Mills and in September 1971 in respect of the Bangalore Mills. The recommendations were implemented as quickly as possible and the benefits derived have been substantial. Special attention was also given to improving mill working efficiencies and significant results have been achieved. Organisational changes were made to manage the Company by what are known as Profit Centres—each Profit Centre coming under a single Profit Centre Director/Manager with responsibility to attain the target set for that Centre. This important organisational change, which involved decentralisation of certain functions, such as selling and some purchasing, has proved to be beneficial.

The South India Textile Research Association's recommendations aside, a determined drive on cost reduction has been initiated and this has already produced beneficial effects. This too, will be a continuing process since in this way we can to some extent combat inflationary trends.

The pattern of production

was changed where practicable to produce more of what can be sold at economic prices and the search for more profitable cloths will be a continuing process. Distribution outlets are being expanded at wholesale and retail levels; this process will continue until we are assured of our essential share of the market. A Marketing Research Cell has been organised to improve feed-back of information from the market. Advertising has been made more creative and purposeful, emphasising that Binny Textiles, apart from being durable and providing value for money, also provide variety for men and women. Steps have been and are continuously being taken to improve our service to dealers.

We have also sought advice from the Indian Institute of Management, Ahmedabad on marketing and our organisational structure. Their first reports are presently receiving the attention of the Board.

In brief your Board's short term goal was to make current operations economically sound and the cost reduction programme involved will continue. Our medium and long term objectives must include re-equipment of the Mills to produce economically what the market will want in future.

In the Interim Report of November 1971 hope was expressed that the Textile Division would return to profitable working before long. In particular, it was stated that, barring circumstances beyond the Directors' control, the results for the second half year of 1971 would be significantly better than those of the first half year. The hope expressed in the Interim Report has materialised.

I would like to tell you now in financial terms what has been achieved so far by the various measures taken by us.

In the second half of 1971 the loss was contained at Rs. 63 lakh as against a loss of Rs. 144 lakhs for the first half. It should be appreciated that this improvement was achieved des-

pite increased manufacturing costs, especially in the Textile Division, due to rise in the price of raw materials, stores, etc., higher dearness allowance and other emoluments following the Arbitration Award on the Textile Wage Board's recommendations and difficult market conditions.

The progress made in the second half of 1971 has continued in 1972. We have stopped making losses and the first five months show a small profit after providing for depreciation and statutory minimum bonus. June working has also been satisfactory. The first half year of 1972 should, therefore, result in a modest profit. I am especially pleased to be able to inform you that the Madras Mills are again working satisfactorily, notwithstanding the constraints of poor layout and over-age of a substantial part of the plant which needs renovation/modernisation.

I expect the progress made so far to be maintained provided (a) good quality raw material is available at reasonable prices and at the right time; (b) full co-operation by labour and uninterrupted working of all units are forthcoming; and (c) additional heavy financial burdens do not fall on the Company through legislation, Government executive action or labour demands. In this connection you may be interested to know that the Company's operations generated in 1971, directly or indirectly, revenues to the State and Central Governments to the extent of Rs. 5.3 crores besides providing direct employment opportunities sufficient to support 24,000 families.

Notwithstanding the above heavy burden of taxation the 1972 Finance Act has imposed additional excise duty on polyester fibre, polyester blended yarn, wool blended yarn and polyester blended cloth which will cost approximately Rs. 30 lakhs in 1972. The increase in excise duty on wool blended yarn for Cotswol is of the order of 344% and will, as far as I know, affect in a significant way only our Bangalore

Mills as no other mill produces similar cloth in substantial quantities.

The rate of excise duty on polyester fibre has progressively increased to a level at which the price of the fibre is abnormally high. If it is Government's desire to popularise polyester blended fabrics, as evidenced by the new polyester plants coming on stream, our current taxation policy may not promote this objective.

I feel that revenue currently derived by Government from this source can be protected and may even be augmented by suitably reducing the burden at the fibre point and spindle point. This should improve the offtake of the fibre and eventually of the blended fabric resulting in increased revenues from an enlarged source.

It is also relevant to mention that the Arbitration Award on the Second Textile Wage Board's recommendations will cast on the Company an additional burden of Rs. 30 lakhs per annum.

Cotton

During the past few years my predecessors have been devoting a good part of their statement to problems mainly arising out of low yield per acre of Indian Cotton. I will not cover that ground again except to say that the cotton crisis last year has induced the Central and State Governments to see the need earnestly to promote schemes to improve yields and quality. The programme announced by the Union Minister for Agriculture for intensifying cotton development in certain irrigated and rain-fed districts is welcome.

I feel the current season's crop, estimated at 64/66 lakhs standard bales, should be attributed partly to a favourable monsoon in most cotton growing areas and partly to research and development work carried out by the Indian Council of Agricultural Research. A disquieting feature this year, however, is that with a larger crop

there are reports that the quality has deteriorated. It would be worthwhile for the Department of Agriculture to take steps to ensure that an increase in quantity does not entail a fall in the quality of the cotton crop.

The impact of a low cotton crop and abnormally high prices on production and employment can be appreciated from the following facts.

On 31st December 1970, 69 mills with 1.50 million spindles and 17,000 looms employing 75,000 workers were closed. By 30th June 1971, 88 mills with 2.03 million spindles and 24,000 looms employing 96,000 workers were closed. By 31st December 1971, partly as a result of take over of some mills by the public sector under the auspices of the National Textile Corporation, the biggest Mill Management in India, the number of closed mills came down to 76 with 1.61 million spindles and 17,000 looms employing 76,000 workers. According to official estimates cloth and yarn production in 1971 was the lowest in the last 20 years.

With the experience of 1971, I would suggest that Government, while taking appropriate measures to encourage growers to increase cotton production by ensuring a stable and fair price, should also enable the industry to operate economically without losing sight of the interests of the consumer. This means that the growers' interests must be promoted by higher yields and not merely by higher prices.

The steps already taken by Government to relax credit restrictions and to remove stock limits are welcome. However, I am not altogether happy with the move to take over the marketing of cotton through monopoly agencies. Cotton marketing involves specialist skills not quickly acquired. I would therefore suggest that, until the required know-how is acquired outside the cotton trade, the large and reputable cotton traders, whose long experience and considerable expertise is of the

utmost value to the community, be used fully in the interests of the growers, the industry and ultimately the consumers.

I will now briefly review the operations of the various divisions of the Company in 1971.

Textile Division

I have already given you an indication of the result of the various measures taken to improve the working of the Textile Division.

Notwithstanding the strain on liquid resources improvements have been made to the Carding and Spinning Departments in the Madras Mills partly by overhauling and partly by re-equipment. Conversion of ring frames to the top arm drafting system, overhauling of blowroom machinery and the re-clothing of cards are progressing.

The Bangalore Mills suffered a loss of profit as indicated in the Interim Report, due to a strike followed by a lock-out for two months. In addition, the expectation that the wool supply position in 1971 would be better than in 1970 did not materialise. Large quantities of wool purchased by paying a heavy premium had to be used in 1971. The reasons for this were delays in the issue of licences for the import of wool tops for defence orders and to combing bottlenecks in India for combing greasy wool imported with Actual User Licences.

The Finance Act, 1971 imposed a 40% Import Duty on wool and wool tops in addition to an increase in excise duty on wool tops and yarn. The additional burden had to be borne partly by the Company.

62 BAZ 110 cm. looms were installed in the Bangalore Mills in 1971. An additional boiler was commissioned and helped in meeting the increased demand for steam required for processing Angola Shirting for Defence Supply.

During the India-Pakistan

war the Company at short notice accepted and executed substantial additional orders for Olive Green drill and Cellular shirting (the Madras Mills) and for Angola Shirting (the Bangalore Mills). Our efforts in this regard were appreciated by Government.

Exports

Last year my predecessor expressed the view that unless prices of Indian Cotton came down to reasonable levels or improved supplies were made available, exports were likely to decline steeply in 1971 despite the increase in export incentives. Mainly on account of the steep rise in the cost of cotton, exports in 1971 from the two Mills did decline steeply. Indian cotton prices have since come down but imported cotton prices are higher than before due to the incidence of enhanced premiums and other levies. Nevertheless the outlook for 1972 is better.

There are reports current that Government have decided in principle to canalise the export of textiles through Public Sector Agencies on the ground that the textile industry had failed to meet its export obligation.

I have referred to the main reason for the drop in exports in 1971, and it was certainly no fault of the industry. If the industry's export performance is viewed over a period of 5 or 10 years, it will be seen consistently one of the major foreign exchange earners. As a major exporting Company for many years past, and what is more exporter of finished, not grey, goods, I can assure Government that building up and maintaining the level of exports we have achieved has not been easy. In doing so we have gained valuable experience and have developed contacts and earned goodwill all over the world. This is no doubt true of all major exporting mills and export houses.

In recent years the chief impediment to maintaining or increasing exports has been the ever-rising price of Indian

cotton which, in turn, was mainly due to the very low yields per acre of the Indian crop. As a result Indian cotton prices have stood at levels substantially higher than equivalent cottons available to our principal competitors overseas. For several years the industry has done its best to overcome this problem through cotton extension schemes. I am sure Government, who have recognised the need to deploy substantial resources to improve farm output of cotton, appreciate that all the blame cannot be placed on the industry if export levels are lower than they might be.

If Government are, however, dissatisfied with the level of exports achieved by the industry, I would suggest that they set up their own export house and supplement the efforts of the industry. By this means Government will gain the experience, expertise and goodwill which they must have if they are to be a successful export agency. At the same time the country will continue to benefit from the very substantial volume of exports which the industry already achieves.

GARMENT FACTORY

The Garment industry as a whole is passing through a very difficult period. The excise duty imposed by the Finance Act, 1971 and the increase in the cost of cloth and other items of manufacturing costs, coupled with consumer resistance to higher prices, have caused serious problems. Notwithstanding these adverse factors, exports in 1971 increased by 33.24% over 1970 which, I believe, is more than the increase achieved by the industry as a whole. The factory is at present engaged almost entirely on export orders.

ENGINEERING DIVISION

Madras Works

The Directors' Report gives a review of the operations of this Unit in 1971. Although the turnover, as stated in the Directors' Report, increased

from Rs 122 lakhs in 1970 to Rs 156 lakhs in 1971, production in 1971 was lower than in the previous year by Rs. 6 lakhs. It is worth mentioning that notwithstanding the drop in production, wages and other cash emoluments in this Unit increased by about Rs. 3 lakhs from the previous year.

In 1971 this Unit accepted and executed at short notice orders for additional Bailey Bridges. The use to which this type of equipment was put during the India-Pakistan war, especially in Bangla Desh, is well known.

Shortage of steel continues to be a problem with this Unit. I hope we shall soon see the steel plants in India meeting the Country's demand for steel in the required quantities.

Giovanola-Binny Ltd.,—Subsidiary

The working results of the Company, though not yet satisfactory, improved upon the results for 1970, notwithstanding several adverse factors beyond the control of the Management. Against a loss of Rs. 22 lakhs in 1970, the loss in 1971 was contained at Rs. 7 lakhs.

There was a serious set back in the production of penstocks and pressure vessels for about three months during the year due to delays in the receipts of imported steel plates and interrupted supply of industrial X-ray films. Non-availability of seamless steel tubes with test certificates and steel of shipbuilding quality affected the production of pressure vessels and barges.

I am glad to say, however, that this year most of the steel required for the fabrication programme is in stock and that the supply position of X-ray films has improved due to bulk imports arranged by the State Trading Corporation of India.

The Order Book improved considerably during the year under report and is at a satisfactory level now. For the first time the Company se-

cured two penstock contracts in North India, one in Bihar and a second in Himachal Pradesh. The Company has also two penstock export orders on hand one of which will be completed this year.

Grant of an Industrial Licence for the manufacture of pressure vessels, referred to at previous Annual General Meetings, will provide further opportunities for the Company to achieve satisfactory results. The Company's application made in 1969 is still pending with Government. I hope favourable orders will be received in the near future, having regard to the fact that this is the only company in Kerala that has facilities and experience to manufacture pressure vessels of all sizes.

TRADING AND AGENCY DIVISION

The Directors' Report provides a review of the operations of this division which has made a valuable contribution to the profits of the Company.

LABOUR

Industrial relations during the year were generally satisfactory.

I said earlier that the improvements made so far in the working of the Company should be maintained provided additional heavy burdens do not fall on the Company through labour demands. I would like to add that labour demands for higher emoluments will not be resisted provided such demands are adequately linked to higher output or productivity. We would welcome any proposals based on sharing the gains of higher productivity.

Last year my predecessor referred to the intractable problem of high absenteeism and the additional dearness allowance paid in 1970 to the tune of Rs. 63 lakhs without any return in the form of better work or otherwise. In 1971 the dearness allowance increased further by Rs. 30 lakhs.

My predecessor suggested that all wages including dearness allowance should, in some form or other, be linked to productivity—a view with which I entirely agree. Increasing the wages of a section of the community without a corresponding increase in productivity is not a sound economic proposition. Additional wages by themselves will not increase the real income of the workers. I would therefore, strongly appeal to our Labour Union Leaders and to Government that they examine this problem objectively and support Management in its endeavour to increase productivity. I would also appeal to our Labour Union Leaders to advise labour to resist the temptation to stay away from work without sufficient cause, especially by abusing the facilities of the Employees State Insurance Scheme.

I have personally requested the Labour Union Leaders in all our major undertakings to urge their members to stand by the Company in fighting the battle of 1972, and I have been encouraged by their response. I am, therefore, hopefully looking forward to a period of industrial peace and harmony, especially as we do not have the misfortune of suffering from serious inter-union rivalry in any of our Units. I have in this context offered to settle all reasonable grievances of the workers, as far as possible, by a process of bipartite negotiations and, if necessary, by the institution of an internal machinery similar to the Industrial Relations Commission recommended by the National Commission on Labour. In 1971 our workers generally co-operated with us during a difficult year, especially during the recent India-Pakistan war. I believe they will continue to support us in our endeavours to reverse the ill-fortune of the last two years.

FINANCE DIVISION

Financial Information

The Gross loss of Rs 106 lakhs in 1971, as against a Gross profit of Rs. 3 lakhs in

1970, and higher raw material and other costs placed a considerable strain on the Company's liquid resources during the year. Selective control on Bank credit and higher interest rates aggravated the difficult situation. It was not, therefore, possible to go ahead with plans for diversification and development on the scale indicated by my predecessor last year. However, despite the strain on liquid resources, we found it possible to spend Rs. 72 lakhs on re-habilitating/modernising the two mills. Arrears of wages for 1969 and 1970, which became payable in June 1971 under the terms of the Second Textile Wage Board's recommendations, amounted to Rs. 45.75 lakhs in respect of both mills.

Dividends

Since the accumulated losses exceed the sum available in General Reserve, your Directors have been compelled to pass the dividend on Preference Share Capital for the year. The question of paying dividend on the Equity Share Capital can be considered only after the loss carried forward from 1971 has been wiped out and the Company's obligation under the Debenture Trust Deeds have been met.

FUTURE PROSPECTS

We have made an encouraging start to 1972. The improvements in working which started in the last quarter of 1971 have been maintained so far this year. Cotton prices are expected to remain at reasonable levels and provided all the Units work uninterruptedly and we are not burdened with heavy additional levies, there is reason to expect that the results for 1972 will be satisfactory.

The Company has built its strengths over a long period, and I believe we enjoy the confidence and goodwill of our customers, bankers, Financial Institutions, Government and the public. We have a team of loyal, dedicated and technically competent Management Staff and an experienced and self-disciplined labour force. We are fortunate to

have a single strong trade union in each Unit to represent labour and another to represent staff. Our distribution system has, in the past, worked well even in difficult times. We are also aware of our weaknesses and are receptive to new and constructive ideas. Our products enjoy a reputation for quality and durability and we now offer a wider variety than in the past. Above all, the Company's financial position is basically sound.

Relying on all these strengths we should be able to restore the Company's fortunes in the near future. Indeed I am hopeful that we will turn the corner this year. But there is no room whatever for complacency. We have a difficult task to perform; but with the continued support of all those associated with the Company I believe we shall accomplish what is expected from us.

ACKNOWLEDGEMENTS

Mr. M.K. Vellodi retired as Chairman of the Board of Directors with effect from 1st January 1972 as forecast by him last year. I would like to say on behalf of my colleagues and myself how much we appreciated his guidance and wisdom during the last two years of his Chairmanship. I am happy that we will continue to have the benefit of his advice as he has very kindly agreed to remain on our Board.

Mr. M.A. Sreenivasan resigned from the Board on 17th March 1972. Mr. Sreenivasan joined the Board of The Buckingham & Carnatic Co. Ltd., on 3rd March 1949 and was one of the first seven Directors of Binny Limited at the time of its incorporation. During the past twenty-three years Mr. Sreenivasan has taken a very keen interest in the Company's affairs. I would like to express on behalf of my colleagues and myself our high appreciation of his services.

Mr. A.M.M. Arunachalam and Mr. K. Sreenivasan were appointed as Additional Directors after the last Annual General Meeting. Their appointment will come up for

your approval at this meeting. Mr. Arunachalam and Mr. Sreenivasan are well known in industrial circles and need no introduction to you.

In conclusion I would express my deep appreciation of the help and support I received from all my colleagues on the Board throughout the year and

thank them for their valuable advice.

Note: This does not purport to be a report of the proceedings of the General Meeting.

- Cadmium sulphide photo conductive cell
- Lead sulphide infrared detector
- Improved process for garlic powder
- Speciality papers (filter papers etc.)
- Monochloro acetic acid
- Fatty alcohols
- Chloroscope
- Bimetallic powder
- Extra fine metal powder
- All round moving cum oscillating table fan
- Sealing wax melting and dispensing device
- Electrical strain gauges

(A GOVT. OF INDIA UNDERTAKING)

day 778 (1)/72

THE MADRAS ALUMINIUM COMPANY LIMITED

'JAYALAKSHMI', RACE COURSE, COIMBATORE 18.

The following is the address to the Members of the Company delivered by Shri R. Venkataswamy Naidu, Managing Director, at the 12th Annual General Meeting of The Madras Aluminium Company Limited held at the Registered Office at 'Jayalakshmi', Race Course, Coimbatore - 18 on Wednesday the 28th June 1972.

I have great pleasure in welcoming you all to the 12th Annual General Meeting of the Company.

Before discussing the affairs of the Company, I would like to dwell on the eventful period through which the country has passed recently. Nearly 10 million refugees poured into the country from the former East Pakistan. India had to bear the heavy burden of caring for the refugees. This caused a very heavy strain on the economy of the country. International Organisations had only lip sympathy for India's predicament and they were either unwilling or were unable to create conditions for the return of refugees. India had no alternative but to take necessary steps to solve this issue. The people stood united under the dynamic leadership of the Prime Minister. India's successful military operation in the former East Pakistan took only 14 days and the refugees were able to return back to their homelands. This successful operation has enhanced the image of the country internationally as a military power of consequence.

Your Board of Directors' Annual Report, Balance Sheet as on 31st December 71 with the Profit and Loss Account and Auditors' Report have been with you for sometime. You would have noted that our turnover and gross profit have come down when compared to the previous year. You will recall that this was anticipated in the last Annual Meeting itself. The Government of India notified the prices of Aluminium and its products from 25th May 71. Though the Government offered a rebate in Excise Duty to small Producers like

us, our net realisation has come down by nearly Rs 400/- per tonne. This has affected our working results. Secondly, the cost of production has gone up considerably due to increases in the costs of all raw materials and services mainly due to governmental imports. The increased cost of production has eroded into our gross profit considerably. In addition, we did not have the benefit of the Tax Credit (Excise Duty on Excess Clearance) Scheme for the year 1971, as the scheme lapsed on 31st March 1970. You will recall that under this Scheme about Rs. 22 lakhs accrued to the Company in the previous accounting year. It is most unfortunate that the benefit of this scheme was available to the Aluminium Industry for only three years.

As we have a large quantum of unabsorbed development rebate, your Board of Directors have decided to transfer Rs. 84 lakhs (practically the entire net profit) to development rebate reserve and to pay the Dividend on Preference as well as Equity shares out of General Reserve.

It has been the policy of this Company to plough back its profits after paying reasonable dividends to the shareholders. The profits have not been frittered away in any manner. The ploughed back profits have been utilised to bring the industry to international standards and to increase its productive capacity, resulting in the manufacture of industrial raw materials required by the nation and in creating remunerative employment potential.

We have made strong representations to the Government of India that they should reconsider their decision on the

pricing and allow us more remunerative prices. Though the Government order stipulated that any increase in the prices of Synthetic Cryolite and Aluminium Fluoride would be neutralised by sanctioning increase in the price of Aluminium and its products, so far, the Government of India have not deemed fit to sanction the increase in spite of the prices of these chemicals having gone up. In addition, the prices of all raw materials like Calcined Petroleum Coke, Pitch, Caustic Soda etc., have gone up considerably. Moreover, the cost of raising steam is higher for us when compared to the other Aluminium Producers, as we use a costly fuel like furnace oil unlike other producers, who use coal for steam raising. We are also operating under a handicap of having a small plant producing less than 13,500 tonnes per year without the advantage of fabrication facilities. As I have indicated on an earlier occasion, in international parlance, even units of 50,000 tonnes capacity are not considered economic or viable. Even with our expansion, we will be producing only, probably, a little over 25,000 tonnes per year which, by no means, can be considered a very economic unit specially when compared to the huge production capacities executed and planned for the two private sector and the public sector projects. I request you to join me to appeal to the Government of India to extend the benefit of excise rebate upto a production of 30,000 tonnes per year.

From the working results, you will notice that we have increased the sale of our intermediary products like Alu-

mina Hydrate, Calcined Alumina and Carbon Electrode Paste from Rs. 49 lakhs to Rs. 61 lakhs. This is a matter of gratification to us and I am hopeful that we would maintain the sales during this year also.

Based on the working results, I am quite sure that you will agree with me that only technical innovation and increased production with the diversification alone can improve the working of your Company in the years to come. Conscious of this objective, your Board of Directors have been pushing ahead with the expansion programme and in spite of various difficulties, we are trying to complete the expansion programme as per schedule. Due to the delay in the financial institutions' making available the term loans, the Company has been put to severe financial strain in its efforts to complete the expansion project. The physical progress is quite satisfactory and I am confident that additional production in the first phase will start in the course of the next month or two and that the entire expansion of metal production will be completed by early 1973.

In this connection, I wish to place on record the help rendered by our Collaborators M/s. Montecatini Edison, who have been assisting us with the relevant data, drawings and engineering services, even without receiving in advance the fees that have been sanctioned to them. As indicated earlier, the electrolytic pots of our expansion will operate at more than 100,000 Amps. Moreover, the Alumina Plant of the expanded capacity will be so designed that it will be able to process even Bauxite with low alumina content—literally the rejects from the Bauxite Mines. This will enable us to maximise the utilisation of our Bauxite, thereby, providing for the longevity of our Mines.

I may be pardoned, if I once again take pride in the fact, that as on date, we are the most technically advanced Aluminium unit in the country, as we operate our present electrolytic pot room at higher amper-

age. Moreover, we produce the largest proportion of E.C. grade metal in the country.

As a matter of policy, at the initial stage, we decide not to employ engineers from other companies. We decided to recruit young engineers and develop them to take positions of responsibility. Our Collaborators have assisted us in training several of our technical personnel. This policy has paid rich dividends in that our young engineers under the leadership of the technically qualified management have been able to reduce the imports for expansion to barely 5 per cent as against the local fabrication and utilisation of local machinery up to 95 per cent. The reverse was the case when the original plant was erected and commissioned. I believe that India cannot afford to go on importing machinery for developing her industries. But she must develop her indigenous talent for designing and fabricating machinery. Only by such a policy, the country can progress without the burden of foreign exchange loans. We, in this Company, being alive fully to our responsibility in this direction, have utilised the services of our young engineers in designing and fabricating of our indigenous equipments for our expansion. We are also willing to share our knowledge and experience with the Public Sector units also in the manufacture of specialised equipments to avoid imports.

As mentioned earlier, only technical innovation, increased production and diversification can help your Company to maintain its working against stagnating prices at uneconomic levels and against rising cost of production. With this objective, we have continuously given our attention for developmental work, apart from striving to complete the expansion project expeditiously. I am glad to inform you that from July onwards, we expect to market aluminium circles, which will come into production out of equipments designed, fabricated and commissioned by us. We are also in the process producing Aluminium Alloy Rods for eventual manufacture of alloy conductors for use in specialised fields.

We have also undertaken necessary steps for manufacturing sheets and extrusions. I expect that we will be marketing sheets of larger dimensions in 1973 and possibly extrusions by end of 1973 or early 1974.

I am glad to inform you that labour relations during 1971 were smooth and cordial, though there has been labour unrest for the last two months due to inter-union rivalry unconnected with relations between management and labour. I wish to take this opportunity to assure our workers and staff that their welfare is of paramount importance to us. We are conscious of our social responsibility to our workers. I hope that our workers will identify themselves with the interests of the Company and share in its progress.

I am confident that your Company has a great future in view of its expansion and diversification programme. Moreover, the demand for Aluminium in the country is continuously growing. The production is not keeping pace with the growing demand. Your Company, being conscious of its responsibility to the Nation, is willing to extend its co-operation to the public sector units in sharing its experience in fabricating equipments indigenously. However, I wish to utter a word of caution that the Government should be very careful in allowing imports of Aluminium in order to avoid a situation like 1967-68 being repeated in the country, when due to depressed demand, Aluminium was exported from the country at low prices, while importing Aluminium at higher prices—the country losing foreign exchange both ways.

I also wish to appeal to the Government of India to reconsider the decision to abolish tax relief to the priority industries, the increase in the surcharge on the company profits and the withdrawal of development rebate concession after 1974.

I wish to thank Government of Tamilnadu, M/s. Mediocredito of Italy, Industrial Finance Corporation of India, Industrial Development Bank of India, Industrial Credit and Investment Corporation of India Limited, Unit Trust of

India, Life Insurance Corporation of India, Punjab National Bank and Indian Bank and my colleagues on the Board and all our Senior Executives for their help and co-operation.

In conclusion, I request you to join me in paying tributes

to our employees at all levels for their unstinted co-operation and loyal service.

NOTE : This does not purport to be a record of the proceedings of the Annual General Meeting.

Income TAX

DEDUCTIONS ON PAYMENTS TO contractors

While making payments to contractors, for carrying out any work, tax at 2% will be deducted from the payment made after May 31, 1972. This applies to contracts with—

- ☐ Government Departments and Corporations.
- ☐ Local authorities.
- ☐ Companies

Contractors will, in turn, deduct 1% tax on all payments to sub-contractors for such contracts.

Exemptions :-

- ☐ No deduction will be required to be made if the consideration for the contract does not exceed Rs. 5,000/-
- ☐ Contracts for sale of goods and for rendering professional services by engineers and architects, etc., will not be subject to deduction of tax.

For further clarification :-
PLEASE CONTACT INCOME TAX OFFICER,
CENTRAL BOARD OF DIRECT TAXES.
MINISTRY OF FINANCE, GOVERNMENT OF INDIA

INDIAN SUGAR MILLS ASSOCIATION

Extract of Presidential Address of Lala Bansidhar delivered at the 39th Annual General Meeting of Indian Sugar Mills Association held at New Delhi on 3rd July, 1972.

Problems and Prospects of Sugar Industry by Bansidhar

During the last two years the sugar output has come down precipitously from a record output of 42.6 lakh tonnes in 1969-70 to 37.4 lakh tonnes in 1970-71. During the current season, 1971-72, it has dropped further to a bare 31 lakh tonnes. Such a sharp drop in output was paradoxical, specially when the installed capacity in the industry has been going up annually to the tune of about 1.5 to 2 lakh tonnes. The fall was basically due to sharp decline in cane acreage, which during the last two years has come down by eight per cent in factory areas. Besides excessive rains and floods in some areas and drought in others also affected the cane yields.

Despite a very sharp drop in the sugar output in the last season, Government continued to maintain the monthly releases at the current level of 3.25 lakh tonnes which was possible only due to large carry-forward stock of 14 lakh tonnes from the preceding season. But at the end of this sugar year, the carry-forward stock is not expected to be more than 5 lakh tonnes which is not sufficient even to maintain the present monthly supplies for the next two months when normally new production is not available. To maintain the present level of consumption, Government will have to draw from the new season's production during the months of October and November. But, in the next season i.e. 1973-74, we would be starting from scratch with no stocks to fall back upon.

On Government's own reckoning the country would need about 52 lakh tonnes sugar i.e. by the end of the Fourth Plan

Period (1973-74) and 60 lakh tonnes by the end of the Fifth Plan Period (1978-79) taking into account the requirements for export and buffer stock. These estimates seem to be quite realistic. But their achievement is, by no means, easy.

No doubt, higher cane prices paid by the factories in the last season has induced larger cane plantings. According to the initial survey made by the Indian Sugar Mills Association, there is an overall increase of 5.6 per cent in the cane acreage in factory areas. The unfavourable weather conditions, more particularly the recent heat wave, have adversely affected the cane crop. The monsoon will, of course, play a dominant role in the conditioning of the crop.

The new levy prices announced by the Government effective from July, 1972 which have been fixed without due regard for the actual costs obtaining in the industry are highly unrealistic. Besides, there are certain apparent lacunae in the Tariff Commission cost schedules based on which the levy prices have been fixed. The Commission, as a package deal, had recommended a lower rate of depreciation but a uniform allowance of rehabilitation. While the Government did not accept the recommendation to provide rehabilitation in the price, they did not enhance the depreciation allowance so as to conform it to the provisions of the Income Tax Rules. The industry has thus suffered on both the counts.

SURPLUS TO SHORTAGE:

Sugar was decontrolled in May, 1971 by Government as an alternative to increase the

levy prices. The decision came as a surprise to the industry as sugar policy for any season is normally announced at the start of the season and is expected to hold good for that season at least. By that time the declining trend in cane acreage and production had become quite clear. It was also apparent that internal consumption was picking up at a fast rate and to maintain supplies we shall have to draw substantially from the carry forward stocks. Despite this apparent tight statistical position following decontrol, Government continued to release sugar far in excess of quantities actually needed by the markets. Moreover Government did not create buffer stocks in 1969-70, when stocks were plentiful. Thus, due to excessive releases and the absence of buffer stocks a tight supply position has now emerged.

ESSENTIALS OF A LONG TERM POLICY:

For planning a steady increase in sugar output, it is apparent that a long term policy needs to be devised, which should comprehensively deal with all the relevant aspects of the working of the industry. If any significant aspect is left out of consideration, the policy will soon run into rough weather, needing a change. The policy has to be a production oriented policy and the first and foremost consideration which should go into its making is the determination of a remunerative cane price which would ensure the desired level of sugarcane output. The existing statutory minimum cane price of Rs 7.37 per quintal is

not remunerative to the cultivators.

Also extension of cane acreage would be inevitable. Happily, with the advent of 'Green Revolution', food yields have shown substantial rise and it is imperative to divert some of the cultivated land to sugarcane. As it is, sugarcane accounts for a very small portion of the cultivated land, being only about 1.8 per cent. Even if it is doubled, sugarcane will not account for more than 3.5 percent of the gross cultivated areas.

It must be pointed out here that a uniform increase in the statutory minimum cane price for all the regions may not be practical. Government may have to fix regional cane prices depending on the actual conditions obtaining in different regions in the matter of yields and parity realisation from other crops as also competition from gur and khand-sari. The cane growers should, by and large, be assured of similar per acre returns in different regions. The, Cost disparities arising from different regional cane prices will have to be equalised through appropriate adjustments in the sugar excise. For this, if it is necessary to amend the Excise Act and Rules, this should be done in the larger interest of cane growers in different regions.

NEED FOR AN INTEGRATED APPROACH:

The sugar policy should also ensure a uniform treatment to all the three sweetening agents. The Government's approach should be integrated one. In the absence of this, sugar output has invariably suffered far more severe variations than gur and khand-sari. In the last 10 years, while in the case of gur and khand-sari the variations around 6.3 per cent have been modest, in the case of sugar they were as high as 22.1 percent. In the recent past, the cane production in 1971-72 came down by 11 per cent as compared to the previous year. Against this, the sugar output has dropped by 27 per cent to 31 lakh tonnes in 1971-72. Thus, the shortfall in cane production has not affected uniformly all

the three sweetening agents, and the brunt has been felt mainly by sugar.

With the rate of extraction of available sugar in gur and khand-sari being only about 50 to 60 percent against well over 90 percent in a vacuum pan sugar factory, it stands to reason that even if the sugar factories do not get any preference they should not be at a disadvantage in the matter of cane supplies. Here lies the clue to a long term stable sugar policy. It has to be an integrated policy embracing equally the three sweetening agents. For every stick of sugarcane which is diverted from factory areas to power crushers and khand-sars, the country loses valuable sugar which it can ill-afford. Besides, Government also loses in excise, cess and other taxes.

BUFFER STOCKS:

Sugar, being an agrobased industry, its output has been subject to a four-year cyclic variation which can not be entirely eliminated. Hence, there is a need for creation of buffer stocks to minimise the hardship to consumers, cane growers and the industry. It has to be an integral part of the long term sugar policy.

Government should draw upon such stocks only in periods of shortages. It should not happen, as in the past, that efforts are made to liquidate surplus stocks through excessive releases regardless of future prospects of cane area, crop and market conditions. Such excessive releases, which amounted to as much as 5/6 lakh tonnes during certain months, have undermined stability and the industry's financial position which has affected production. The stocks earmarked as buffer stocks should be released only when required in the interest of the consumer.

MONTHLY RELEASES:

During the last two years, the Government's policy of monthly releases had been somewhat unsteady. Very often excessive releases have been made without proper consideration of the market condition. The industry has to sell sugar at a loss and conse-

quently has to face financial difficulties. Such variations could be avoided through a policy of planned and judicious releases.

EARLY & LATE CRUSHING:

Depending on the size of the crop and the requirements of sugar, factories may have to start early and also continue crushing late in hot summer months. Late crushing becomes necessary when the prices of gur and khand-sari come down and farmers divert their cane to sugar factories. This excess supply of cane has to be crushed in the interest of cane growers. Early and late crushing is highly uneconomical and factories need to be compensated through adequate rebate in sugar excise duty. This has a special significance for the ensuing season when factories should start early to secure maximum output during the months of October and November.

BANK FINANCE:

Equally significant for the stability of the industry is the provision for adequate bank finance. The non-availability of bank finance commensurate with the stocks in the past has been primarily responsible for the accumulation of cane price arrears. When adequate finance is not available from banks, the factories are helpless, although, unfortunately, it is they who face the public criticism. It is necessary that the policy decision should also govern the bank advances to this industry. When factories don't, receive adequate bank finance they have two clear alternatives. They should either suspend working and leave the cane uncrushed to dry up in the fields or to crush it by deferring the cane payments. It would be disastrous for growers to pursue the first alternative. The cane, which is highly perishable, must be crushed in the larger interest of cane growers. If the factories, responding to the needs of the situation, opt for the second alternative, should they be blamed for delayed cane payments?

In order to find a solution to the problem of cane price arrears on the Association's

suggestion, with the Food Ministry's approval and blessings, the Reserve Bank of India has directed all the nationalised commercial banks to segregate the bank accounts of the mills into two separate accounts—the cane account and general account. All the drawings from the bank are first credited to the cane account to provide for the cane dues and it is only the balance that is credited to the general account of the mills.

INCREASE IN SUGAR PRODUCTION FROM GUR SENSITIVE AREAS:

Due consideration must be given to the peculiar problems of gur sensitive areas especially in the context of the need for an immediate increase in sugar output. For, it is in these areas that production can be stepped up within the shortest period without any further capital investment. Factories in these areas, through appropriate measures, should be enabled to prevent diversion of cane from their areas to gur and khand-sari by paying competitive cane prices. In the present situation, it is essential that the capacity of such factories is fully utilised and this would depend mainly on the policy decision of the Government with regard to these areas.

LICENSING OF CAPACITY:

For achieving higher sugar output, Government have already licensed adequate capacity. The licensed capacity currently stands at 53.04 lakh tonnes, against the planned production target of 52 lakh tonnes. The installed capacity achieved during the season 1971-72 is only 39.5 lakh tonnes and it is expected to go up to 41 lakh tonnes during the ensuing season 1972-73. But according to the present trend, it is not likely to exceed 43 lakh tonnes by the end of the season 1973-74, the last season of the Fourth Plan Period. We would thus be left with a gap of 9 lakh tonnes between the capacity actually achieved and the planned target of production of the 4th Plan.

CANE DEVELOPMENT:

The essentials of an ambitious cane development programme are quite well-known

and have received a wide measure of support, from all concerned. The need has been recognised for provision of assured and adequate irrigation, drainage facilities, supply of manures and fertilizers, good cane varieties and above all for sufficient availability of disease free seed material. Hitherto, however, availability of adequate finance has been one of the limiting factors resulting in a slow rate of progress in this behalf. While there is need for all the State Governments to utilise the entire proceeds of cane cess/purchase tax on cane for cane development work, effective participation of the Central Government in the matter through allocation of adequate funds is also very necessary.

Here, it may be mentioned that much better and more tangible results can be achieved provided a direct link between the cane growers and the sugar factories can be established. The Pasricha Committee which has recently submitted its Report to Government has also recognised the need for direct link between the sugar factories and the cane growers. This Committee has also made other valuable recommendation for accelerating cane development work. These should be implemented expeditiously.

SUGAR EXPORTS:

A well defined export policy particularly with regard to meeting of export loss, should also form an integral part of a long term sugar policy.

Through sugar exports the country earns valuable foreign exchange. If we export our full quota of 3.5 lakh tonnes we could earn foreign exchange worth over Rs. 30 crores annually. Sugar is one item of export where hundred per cent of the foreign exchange earned is retained by the Government. Keeping this in view, earnest efforts should be made to increase our export quota to at least 5 lakh tonnes when the present International Sugar Agreement comes up for revision in the International Sugar Conference to be held in early 1973.

ALUMINIUM CAN MAKE YOUR HOME LOVELIER AND LIVELIER

Sleek, elegant, light, bright, strong, durable, rust-proof, hygienic...one could go on listing the virtues of the wonder metal, ALUMINIUM. Every modern home uses versatile aluminium furniture, fixtures, utensils and appliances. Join the modern trend—use aluminium in your home too. Make sure that your furniture is made of Hindalco Aluminium. Hindalco does not make these finished goods but it supplies the much-needed aluminium (in primary & Semi-fabricated forms) for their manufacture.

RECORDS AND STATISTICS

World Economy in 1971

THE WORLD economy made unspectacular progress in 1971—a year overshadowed by the international monetary crisis. Output rose only about 4 per cent, slightly better than 1970 but well below the 5.3 per cent average of the 1960s. These are among major economic developments highlighted in the World Economic survey, 1971, published by the United Nations. It notes that a world-wide recession, which at times seemed a possibility, was averted in 1971, but many developed market economies are still struggling to find a policy to tackle the twin problems of unemployment and inflation. The year saw the end of the international monetary crisis, but a viable new international monetary system is yet to be constructed.

The survey, twenty-third in a series of annual reviews of world economic trends and conditions, also contains a brief, policy-oriented analysis of the main economic issues facing the international community. It concludes that steps taken now in the monetary, trade and financial spheres will lay the foundation needed for a more efficient and human system.

Among key developments detailed in the survey:

—The developed Market Economies increased output by an average 3.4

per cent, but a combination of inflation, unemployment and external monetary imbalance continue to pose policy problems for a number of countries.

—Developing countries expanded economically at an average 5.4 per cent, an encouraging performance, above the target set for the 1960s but short of the 6 per cent target of the United Nations Second Development Decade.

—Centrally Planned Economies of Europe and USSR recorded a 6.4 per cent increase, with trends evident towards greater investment in consumer goods and more employment in services.

—The first official figures from China released in more than a decade show that industrial and agricultural production expanded by 10 per cent.

—The volume of world trade was up 6 per cent below the 1960's average, although its value rose in line with the decade's performance. But in neither case was performance as good as 1970.

—Petroleum prices rose a dramatic 18 per cent in 1971, reflecting the increased bargaining power of producer nations.

A New Economic Order?

The issues facing the international economic community, the survey says, are too important to be left to a few countries. A long-term solution requires much broader representation of countries and interests.

The main monetary issues

requiring urgent international negotiation, the survey says, are: the future international currency unit—including the precise role of gold, the dollar, the SDRs and the adjustment mechanism for deficit and surplus countries.

There is a real danger that progress on the international monetary front will not be matched by commensurate progress in the trading arena. In effect, the basic premises of postwar trade liberalization have been questioned. Protectionist sentiments are on the rise in some developed countries; the principle of the most-favoured nation treatment has been seriously eroded by regional groupings, and with the impending enlargement of the European Economic Community a major portion of world trade in manufactures will take place under preferential arrangements. Non-tariff restrictions are also becoming a serious obstacle to trade and their orderly elimination must be high on the agenda of future trade negotiations. An international code of conduct for capital movements may be needed.

The survey notes that in the past domestic policies designed to promote growth have often neglected or aggravated unemployment and social problems. Commenting on the new emphasis on social objectives and the quality of life embodied in some current development programmes, the survey says that a proper perspective is emerging. But it states that this redirection of priorities is not the same as an unqualified endorsement of alarmist views about economic growth. The central aim for most countries is, and rightly so, growth with quality rather than quantity with zero growth. The concern about the environment has focused attention on the fact that mankind shares a common fate on a small planet, the survey adds.

Developed Market Economies

Another year of slow growth was experienced by the Developed Market Economies. Total output of goods and services in 1971 rose by only 3.4

per cent, up from the 2.6 per cent increase recorded in 1970, but below the long-term growth average.

Economic performance, however, varied from region to region. North America entered a recovery phase during the year, while Western Europe and Japan had yet to work themselves out of a period of deceleration. The recovery period was somewhat slower than expected, the survey says, and the degree of slowdown surprisingly severe in some major countries.

The growth of gross domestic product in 1971 for a range of developed market economies was: United States, 2.7 per cent (compared with -0.7 per cent in 1970); Canada, 5.4 (3.2); France, 5.5 (5.9); Federal Republic of Germany, 3.5 (5.6); Italy, 0.5 (5.3); Netherlands, 5.6 (6.0); Sweden, 0.3 (4.6); Turkey, 7.9 (5.6); United Kingdom, 1.0 (2.0); Japan, 6.1 (10.5); and Australia, 4.3 (5.7). Despite the slowdown in Italy and the Republic of Germany, overall output increased in the European Economic Community by 3.7 per cent in 1971, compared with 5.7 per cent the previous year. Thirteen of the 27 Developed Market Economies had growth rates of 5 per cent or more in 1971, compared with 16 in 1970.

The threat of inflation was a major factor in the slow growth rate; policies to combat it contributed to the international monetary crisis, the survey says. For the countries as a group, the rate of inflation—as measured by the rise in consumer prices—was more than 5 per cent, considerably more than the 1960s annual average of 3.4 per cent. Restraints on demand were widespread and the economies were considerably dampened, sometimes beyond what was intended. Then a relaxation of the restraints and even active stimulation of demand had to be introduced. This was coupled with a strengthening of measures to control prices and incomes.

Commenting on the outlook for Developed Market Economies, the survey says that

1972 started with some signs of renewed, though moderate, expansion. For the group it suggests that the growth rate may be about 4.6 per cent, up from the 3.4 per cent in 1971. But it notes that as the expansion follows several years of slow growth it will not be enough to absorb the unemployed and new entrants into the labour force and reach potential capacity.

The Centrally Planned Economies: Eastern Europe and the USSR

The year 1971 was the beginning of a five-year plan period for the centrally planned economies of eastern Europe and the USSR. In that year, national income in these countries grew at an average 6.4 per cent. In the previous year, the group averaged 8.0 per cent growth in national income. Apart from the persistent problems of investment efficiency and industrial productivity, no major setbacks seem to have occurred in 1971, the survey says.

Growth figures recorded for the countries in 1971 were: Bulgaria, 9.4 per cent (compared with 7 per cent in 1970); Czechoslovakia, 5.3 (5.1); German Democratic Republic, 4.5 (5.2); Hungary, 7.5 (4.9); Poland, 7.5 (5.2); Romania, 12.5 (7.1); USSR, (6.0) (9.0).

Unfavourable weather conditions caused a decline in agricultural production, particularly in potatoes and sugar beet output. Most affected was the USSR, which stepped up sugar purchases on the world market, and the German Democratic Republic. Sugar buying by the USSR contributed to steep rise in world sugar prices during the last quarter of 1971.

The survey also notes a shift in priorities towards consumption in the countries of the group, in line with most of the five-year plans. This was reflected in an increase in consumption's share of national income, a greater emphasis on investment in consumer products and a redeployment of labour in favour of services.

Looking to the future, the

survey concludes that for the centrally planned economies of Europe and the USSR, the years, 1971 and 1972 may be regarded as a period of consolidation, preceding an expected new wave of accelerated growth.

Asian Centrally Planned Economies

A new section in the survey, Centrally Planned Economies in Asia, discusses the People's Republic of China, Mongolia, the Democratic People's Republic of Korea and the Democratic Republic of Vietnam. It notes that despite adverse weather, agricultural output increased satisfactorily in the region, except in the Democratic Republic of Vietnam where heavy autumn floods affected the rice harvest and necessitated large import, although efforts to achieve self-sufficiency through use of high-yield grains continue.

Mongolia and China were the two countries in the group to make available some statistical data. Mongolia's grain crop increased by 44 per cent in 1970 to a record 410,000 tons while livestock production increased quite satisfactorily. Industrial output rose 8.5 per cent, the average wage rose 2.3 per cent and foreign trade was up 19 per cent.

The first official figures on China's economic performance released in more than a decade and published in the survey, show that the world's most populous country is sustaining high rates of growth on its farms and in its factories. Aggregate industrial and agricultural production increased by 10 per cent in 1971.

Despite bad weather, agriculture in the People's Republic of China had a good year in 1971 with grain production up 2.5 per cent, and yields per hectare reaching new record levels. Growth averaged 10 per cent in the industrial sector with iron ore output up 26 per cent, pig iron production 23 per cent, and crude steel 18 per cent. During 1971 China became the world's largest producer of cotton cloth. Among other basic industrial materials,

communication the vital link

Whether it is to produce a daily newspaper, or to keep trains running on time, or conduct business through far-flung offices, or defend the country against aggression, instant communication is an absolute necessity.

Hindustan Teleprinters manufacture teleprinters, teleprinter switching equipment and a wide variety of other electronic communication equipment that help the P & T, Railways, Defence Services, Daily Newspapers and a number of business enterprises to do their jobs quickly and efficiently. Hindustan Teleprinters help build better communication systems to build a better India.

national-247

JULY 7, 1972

crude oil output increased by 27 per cent, chemical fertilizer production rose 20 per cent, and coal output was boosted by 8 per cent. After a 10 per cent rise in 1970, China's foreign trade increased by 4 to 5 per cent in 1971 to about \$4.5 billion. Japan continued to be largest trading partner, accounting for 20 per cent of the total.

The developing countries were in general not seriously affected by the difficulties that confronted the Developed Market Economies, says the survey. The year 1971 saw a trend towards greater self-reliance in the developing world and an average 5.4 per cent growth rate. Although this was slightly below the 6 per cent target of the Second United Nations Development Decade, it followed two good years of growth and was better than the average for the 1960s. This fact, the survey believes, "augurs well" for the long process of narrowing the gap between the rich and poor nations.

A slackening in agricultural growth, despite, in some cases, progress in the green revolution, makes the 1971 performance all the more noteworthy. But group averages were affected by substantial improvements in a few countries. These included some of the largest, with a corresponding impact on the overall figures.

Developing countries in the Western Hemisphere stepped up total output by 6.5 per cent in 1971 (compared with 6.8 per cent the previous year), while in Africa the increase was 4.5 (4.5); West Asia, 7.7 (6.7); and Southern and South-Eastern Asia, 4.5 (5.3).

The volume of goods exported by the developing countries increased by about 5 per cent in 1971. This was below the 8.2 per cent increase in 1970 and also short of the 1960s average of 6.5 per cent. The slackening was largely a reflection of reduced demand in the developed market economies, the survey says, with the slowdown most pronounced in Africa, where a 10 per cent expansion in 1970 was followed by a decline in 1971, and West Asia where annual growth decelerated

from 12 per cent in 1970 to 3.3 per cent in 1971.

World trade by volume expanded at the relatively high rate of 6 per cent in 1971, although this was well below the average of the 1960s and the 1970 increase of 9 per cent. The dollar value increase in trade was 11 per cent in 1971, down slightly from the 1970 figure of 14 per cent but in line with the average increase in the 1960s. Export price increased by about 6 per cent in the case of manufactured goods and an average 5 per cent for primary commodities, resulting in the relatively high increase in the dollar value of world trade.

The weakness in prices of some agricultural commodities and base metals moderated the dollar value rise but petroleum and petroleum products recorded a dramatic price increase. The price index for petroleum rose from 100 in 1970 to 118 in 1971. This increase largely reflects the improved bargaining position of the producers, the survey notes.

The 1971 crisis, the survey says, signalled a transition from one era to another and put at stake the whole international monetary and trade system.

Until then, the Bretton Woods Agreement had served the needs of an expanding world economy. The relative stability of major currency exchange rates facilitated international commerce. Outside the United States, world liquidity—not including the IMF Special Drawing Rights—tripled between 1950 and 1970.

This liberal supply of liquidity formed a basis for domestic expansion in most parts of the world and for steady liberalization of exchange controls and trade.

But the very success of the system also revealed its basic weakness since the increase in world liquidity was made possible only by a steady decline in the liquidity of the United States. And this in turn weakened the dollar—the key currency of the entire system.

The currency realignment negotiated among the major trading nations at the Smith-

sonian Institute in December 1971 brought the immediate crisis to an end. But says the survey, this was clearly a transitional arrangement. It must now be followed by a more durable arrangement with many fundamental issues going for beyond payments equilibrium demanding simultaneous solution.

Only if the longer-term issues are settled, says the survey, will the uncertainty of the international monetary situation be removed.

The survey makes the point that such issues are too important to the world community as a whole to be left to a few countries. A long-term solution requires much broader representation of countries and interests.

But, before large-scale negotiations can be fruitful, it is essential that there be careful preparation by the specialized international institutions dealing with monetary or trade matters.

On the monetary issue, the survey points out that:

- The precise role of gold in the future international monetary system remains to be settled;
- The role of the dollar in the future system—including arrangements concerning the \$50 billion or more at present held by governments outside the United States—has yet to be determined; and
- A new international reserve unit has to be created; creation of the IMF's special Drawing Rights (SDRs) has established the principle that international reserves can be deliberately created by an international institution.

But international reserve creation depends on the willingness of nations to delegate responsibility to an international monetary institution.

The survey notes important differences between money creation within a nation and internationally. Since SDRs are allocated to individual countries the formula for allocation, at present based on existing quotas in the

IMF, could be rearranged so that developing countries would be treated more favourably, the survey says.

But it adds that the creation of a truly strong international monetary authority has to be balanced by the diffusion of power to control it among many countries.

To do this, the survey suggests the international community plan for a series of stages during which a progressive process of integration takes place quite rapidly within "fairly homogeneous" groups of countries.

Inter-group integration would then take place more gradually, eventually forming a global superstructure.

The survey acknowledges the need for some degree of exchange rate flexibility and for "stronger international supervision of surplus as well as deficit countries". Flexibility could be more readily achieved if the international reserve unit became less dependent on a single national currency.

But the survey warns of a "real danger" that progress on the international monetary front will not be matched by commensurate progress on the trade front. Recent developments and the crisis of 1971, it says, have led to a reappraisal of the basic premises of the post-war advances in trade liberalization and to an upsurge of protectionist sentiments in some developed countries.

The principle of most-favoured-nation treatment has been seriously eroded by regional groupings. With the impending enlargement of the European Economic Community, it is expected that a major portion of world trade in manufactures will in fact take place under preferential arrangements.

The decline in the relative economic pre-eminence of the United States as a result of improvements in the position of other countries should form a basis for true equality and competition. A movement towards freer trade among the main developed nations may make more sense now that

competition among equals has virtually become a reality.

The elimination of tariffs will automatically render preferential tariffs arrangements ineffective. But, says the survey, while trade relations among the developed countries will there by improve, the benefits of preferences in favour of developing countries will evaporate unless new schemes are introduced to compensate for the loss.

Pervasive non-tariff restrictions are becoming increasingly serious in the face of shrinking tariffs. International scrutiny and, in some cases, orderly elimination of non-tariff restrictions must be high on the agenda of future trade negotiations.

During the monetary crises the unsettling effects of massive movement of short-term capital also have caused great concern, the survey adds.

An international code of conduct and a mechanism for surveillance may be needed to avert disequilibrating measures and unilateral restrictions. And such measures are no less necessary in the matter of long-term capital movements to allay fears of foreign domination or "take over" on the one hand and of arbitrary expropriation on the other.

These issues are closely related to the future disposition of dollar balances; and what the survey calls "a most useful way of funding dollar balances" could be found in either liquidation of a portion of the vast United States investment abroad or, alternatively, by the holders of excess dollars investing in United States assets.

The issues are also related to the operations of multinational corporations which have played an increasingly important part in both short-term and long-term capital movements. While these corporations are frequently effective agents for the transfer of technology as well as capital to developing countries, their role says the survey, is "sometimes viewed with awe since their size and power may surpass the host country's entire economy".

The survey notes that the

international community has yet to formulate a positive policy and establish effective machinery for dealing with the issues raised by the activities of these corporations.

China

The first official figures on China's economic performance released in more than a decade show that the world's most populous country is sustaining high rates of growth on its farms and in its factories. It increased aggregate industrial and agricultural production by 10 per cent in 1971.

Among highlights of China's economic performance in 1971:

—Despite bad weather, agriculture had a good year rising an implied 10 per cent with grain production up 2.5 per cent, and yields per hectare reaching new record levels;

—Growth averaged 10 per cent in the industrial sector with iron ore output up 26 per cent, pig iron production 23 per cent, and crude steel 18 per cent. During 1971 China became the world's largest producer of cotton cloth;

—Among other basic industrial materials, crude oil output increased by 27.2 per cent, chemical fertilizer production rose 20.2 per cent, and coal output was boosted by 8 per cent;

—After a 10 per cent rise in 1970, China's foreign trade increased 4 to 5 per cent in 1971 to about \$4.5 billion. Japan continued to be the largest trading partner accounting for 20 per cent of the total.

The survey's discussion of China's economic performance is detailed in a new section in the publication, Centrally Planned Economies in Asia, which also includes Mongolia, the Democratic People's Republic of Korea and the Democratic Republic of Vietnam. It notes that despite adverse weather, agricultural output increased satis-

factorily in the region, except in the Democratic Republic of Vietnam where heavy autumn floods affected the rice harvest and resulted in large imports although efforts to achieve self-sufficiency through use of high-yield grains continue.

Mongolia and China were the two countries in the group to make available detailed statistics. These show that Mongolia's grain crop increased 44 per cent in 1970 to a record 410,000 tons and livestock population seems to have increased satisfactorily. Industrial output rose 8.5 per cent, the average wage rose 2.3 per cent and foreign trade was up 19 per cent.

"The combined production of industry and agriculture" in China increased 10 per cent in 1971, says the survey. The same growth rate is given for industry, which implies, the survey adds, a similar 10 per cent increase in agricultural output.

Despite bad weather in some provinces, the country's grain output rose by 2.5 per cent to reach 246 million tons. This figure includes a grain equivalent of potato production computed on the basis of four tons of potato to one ton of grain. At the same time grain yields per hectare reached new record levels. National targets for grain yields, exceeded in 1971, were 3 tons for the north and 6 tons for the south. Non-grain output, including livestock and poultry production, vegetables and industrial crops must by, implication, also have grown very rapidly, the survey says.

Other developments in the agricultural sector in 1971 include a 13 per cent boost in the supply of chemical fertilizer and substantial increase in the supply of drainage and irrigation appliances, insecticides, oil for farm machinery, and farm tools. Meanwhile, prices paid by farmers for fertilizers, insecticides, diesel oil, kerosene and all farm machinery were substantially reduced. At the same time prices paid to farmers for some industrial crops including oil-seed and sugar cane, were increased.

Very high growth rates were

achieved in the iron and steel industry during 1971 in China, says the survey. Iron ore production rose 26 per cent, pig iron output was up 23 per cent, with crude steel and rolled steel increasing by 18 per cent and 15 per cent respectively. Crude Steel output reached 15 million tons a year in 1971—placing China between France and Italy in the list of world producers.

Production of other basic industrial materials also increased considerably. Among the rises: coal up 8 per cent (reaching about 300 to 350 million tons annually); crude oil up 27.3 per cent to reach 25.5 million tons; and chemical fertilizer production 20.2 per cent to nearly 17 million tons. In 1971, according to official statements, China became the world's largest producer of cotton cloth, the main manufactured consumer item.

A concentration on establishing small and medium-sized mines and factories based on local supplies, characterized China's industrialization process, the survey notes. About 60 per cent of the country's fertilizer and 40 per cent of its cement production came from local plants. As part of the programme for mechanizing agriculture, considerable importance was placed on factories and workshops to make and maintain farm machinery. Noting that little is known about the fixed asset investment process in China, the survey states that one very important aspect was irrigation and water conservancy schemes in which tens of millions of peasants participated.

After a rapid expansion of about 10 per cent in foreign trade in 1970, trade rose a more modest 4 to 5 per cent during 1971. It reached about \$4.4 to \$4.6 million with China's main partner, Japan accounting for about \$900 million or 20 per cent of the total compared with some \$825 million in 1970. Trade also increased with some of the Eastern European centrally planned economies. Trade with this group of countries is now approaching 25 per cent of the total.

Would the PM listen ?

SOMEBODY OUGHT to tell the Prime Minister before it is too late that she is taking unacceptable risks with the economic stability of our country. Since no one among those who are surrounding her and in fact crowding upon her seems to have either the guts or the wits to tell her this, *Eastern Economist* takes it upon itself to do so. For the better part of the last four years Mrs Gandhi's preoccupation has been primarily with securing for herself a dominant position in her party, the government and the country, in that order. With the scoring of that famous victory in the last general election to the Lok Sabha, mainly through her political entrepreneurship, she had completed successfully most of this process.

Followed Pakistan's moment of truth in what was then its eastern region and is now the independent state of Bangladesh. The flight of a million refugees into our country, the call for our assistance from the freedom movement of Bangladesh and our confrontation with Pakistan, which developed into a military conflict, combined to dictate to the Prime Minister, the government of India and India itself their own logic of responses and reactions. The vindication of the Bangladesh movement and India's association with it, so impressively recorded through the military defeat of Pakistan on all the fronts and the total and final collapse of the authority of Islamabad in what was its eastern territory, further strengthened the Prime Minister's personal ascendancy and the political stature of her party on which Mrs Gandhi promptly capitalized by calling for elections to the state assemblies and ensuring that her followers were returned firmly to power in various state capitals.

Since almost all of this period was one of intense political activity, the Prime Minister had some justification for asking the country to bear with her until she was a little more free to attend to its economic affairs. Although the nation did not say 'no' to her, it must be conceded that these four years, during which the economic problems and the needs of the country have been grievously neglected, had clearly been storing up difficulties for the future. This future is not a distant one; on the contrary, it has for all practical purposes arrived well and truly and is with us here and now.

Meanwhile there has been far too much complacency all round. During the short war with Pakistan and immediately after, there was exultation in the country that our national economy had been able to meet the demands of the nation's defence efforts without showing serious strains at any point. It was conveniently forgotten then that the war had not lasted long enough to test the extent of the flexibility of our resources and, worse still, no concern was shown at the fact that, even this short war did exert excessive pressure on certain strategic resources such as rail transport. In any case, if the economy showed a certain capacity to rise to the occasion then, it was essentially because of the industrial and other investments which had been undertaken in the earlier years dating back to the early sixties.

Our problem, however, is that, even from the middle of the sixties onwards, the tempo of industrial production or investment has not been kept up at a level which is necessary for maintaining the growing population at least in slowly improving conditions of living. The country and its people are now becoming uneasily aware of the widening gap between their needs on the one hand and their activated resources or capacities on the other. Unfortunately, the Prime Minister does not dispose of either an adequate political group of ministers or a sufficiently dynamic administrative team of officials to cope with the situation. It is probably true that Mr C. Subramaniam is the only one among the cabinet ministers who may lay claim to some ability as well as experience in high level policy-making and administration in the economic field. He lacks, however, the wisdom and the stamina to think big or act big. Mr Mohan Kumaramangalam, who has reportedly risen high among the Prime Minister's economic counsellors, such as they are, is no doubt an activist but he is also an adventurist with not enough experience of government, but with a political background which must necessarily be suspect. As for the rest of the cabinet, its knowledge or skills in the economic field may not add up to much more than what the Prime Minister may carry in her vanity bag when she goes abroad. Given this quality of ministerial leadership in economic matters, the function of the bureaucracy has settled down to a course which is at once mediocre, unenthusiastic and plainly opportunist. The question is whether, with only such feeble instruments in her hands, the Prime Minister can at all attempt anything sufficient or significant by way of those positive economic directions which the country needs.

This is assuming that the Prime Minister herself has the wisdom and the will to want to do the things which need to be done if economic stability is to be saved and economic progress maintained. On this point, it is not even possible to give Mrs

Gandhi the benefit of the doubt. The recent actions or decisions of herself, her government or her party plainly show that all the three are blissfully ignorant, for instance, of the gathering storm of inflation. Even as the rate of economic growth is becoming more and more depressed, the rate of increase in prices is gathering momentum. This means that less and less of real resources are or can be released for investment or development, while more purchasing power is being injected into the economy than there are additions to its

Sugar : search for a long-term policy

MR FAKHRUDDIN Ali Ahmed, the union Food and Agriculture Minister, appealed to the sugar industry at the 39th annual general meeting of the Indian Sugar Mills Association (ISMA) held recently in the capital, not to raise mill delivery prices of sugar "on market sentiments". By asking the mills not to be influenced by "market sentiments" does Mr Ahmed mean that they should sell sugar at below market prices so as to allow increased profit to the middlemen? Surely, this is not his intention. The minister was perhaps only playing to the gallery when he made this pointless appeal.

Mr Ahmed cannot be unaware of the basic rules governing partial control of sugar which had been hailed five years ago both by the industry and the government as the best solution which had been worked out for the smooth growth of this industry. That the government did not abide by the rules set down by itself is now a part of history. After complete decontrol in May last year and voluntary partial control with effect from January 1 this year in the wake of the emergency, the industry is back in the grip of statutory partial control since July 1. Each sugar mill is now under statutory obligation to surrender 60 per cent of its production at levy price for distribution through fair price shops and 3.5 per cent of its output at fixed price for exports while it is free to unload the remaining 36.5 per cent of its production in the market at prevailing prices. This free sugar under partial control has hitherto acted as a safety valve. If market prices went up, it not only allowed the mills to realise increased prices on the free quota but also enabled them to offer higher prices for sugarcane in a bid to compete with gur and khandsari manufacturers. A part of the losses incurred by the sugar mills on levy sugar was recovered

stream of goods and services. As a result poverty is acquiring a new edge for the poor while the socio-economic pressures on the middle class are becoming increasingly harder to live with. The economy needs an immediate programme for stepping up current production as well as a short-term programme for stimulating investment in industrial and allied expansion. What it has is a government which has other interests and purposes still to pursue. Which is a misfortune, which could be a tragedy.

ed from these free sales. This is how the system had worked to the satisfaction of the industry, the cane grower and the consumer for two to three years.

The production of sugar in this country had been steadily increasing under partial control and it attained an all-time peak at 4.26 million tonnes in 1969-70. There was, however, a sharp fall in the subsequent two years to 3.74 million tonnes in 1970-71 and to 3.10 million tonnes in 1971-72 despite the fact that the installed capacity had continued to increase every year by 150,000 to 200,000 tonnes. The fall in acreage under sugarcane coupled with floods in some areas and droughts in others was partly responsible for reduced production. If declining output did not bring about any scarcity of sugar in the country despite a steady rise in consumption from year to year, it was the easy stock position which had kept prices under control through normal monthly releases. Since the stocks of sugar at the beginning of next season (in October 1972) would be around 500,000 tonnes as against 1.4 million tonnes at the start of the current season, it is feared that prices of free sugar will shoot up once again in the last quar-

ter of the current year unless the government decides to draw upon the production of this season right from the beginning.

A crisis may somehow be averted this year, but 1973-74 would be a truly bad year with no stocks to fall back upon. It is in this context that the advice of the Sen Commission and the Estimates Committee in Parliament that the government should eschew *ad hocism* and evolve a long-term policy, gains pertinent relevance. But what should this long-term policy be? Lala Bansi Dhar, the outgoing President of ISMA, has listed no less than nine points which in his view should be the necessary constituents of a long-term sugar policy. They are: remunerative cane prices, integrated approach to growth, building up of adequate buffer stocks, regulated monthly releases, prolongation of the crushing season, easy bank finance, steady increase in licensing of capacity, genuine efforts at cane development and increased exports. The first important element of this policy — production-oriented policy, as indicated by Lala Bansi Dhar — would be a remunerative cane price so as to ensure the desired level of output. In 1969-70 and 1970-71, the uneconomical free sugar prices did not permit the sugar mills to pay for cane such prices as were significantly higher than the statutory minimum prices. Consequently, the acreage under sugarcane fell and this hurt the sugar mills more than the diversion of cane to the manufacture of gur or khandsari. Lala Bansi Dhar cited figures to show that between 1961-62 and 1970-71, the average annual variation in the output of sugar was as high as 22.1 per cent while it was relatively modest at 6.3 per cent in the case of gur and khandsari (see table below). In other words, the shortages of sugarcane in difficult years have tended

to hurt the sugar mills more than the manufacturers of gur and khandsari.

It follows that in formulating its sugar policy, the government should adopt an integrated approach which takes into account, as Lala Bansi Dhar puts it, "the future prospects of cane acreage, gur and khandsari stocks and their price trends."

The question of buffer stocks is related to monthly releases since sugar is a seasonal industry. The manufacture of sugar takes place within four to five months while its consumption is spread over the whole year. Sometimes the releases of sugar by the government have depleted the buffer stocks at such a fast rate that it has hurt the sugar industry by a crash in prices. This again causes strain on the financial resources of the sugar mills resulting in reduced prices for sugarcane and consequent reduced cane production.

The output of sugar can also be increased by extending the season i.e. by starting the crushing operations early and continuing them till late in the season, even though recovery is much below average. The sugar mills which prolong the crushing season deserve some incentive by way of compensation such as a rebate in excise duty; then alone will they be prompted to increase the output of sugar. Even after all these hurdles have been overcome, the sugar mills face the formidable problem of bank finance. If adequate bank finance is not made available at the right time the factories become helpless. Their requirements of finance also vary from season to season. Unless the mills are assured of ready finance for increased production, they will hesitate to crush additional cane even if it is available at their gates.

As the capacity of the industry is not increasing at the anticipated pace due to a number of factors, it will be helpful if the emphasis is shifted from new units to expansion of the existing ones. This is a less costly process and can be put into practice speedily. Lala Bansi Dhar has rightly advocated that expansion schemes should not continue to be subject to licensing. The question of cane development also has received scant attention in the past; though the states continue to realise substantial sums by way of cess, precious little seems to have been attained in this regard. The sucrose content in cane in certain states is much higher than in Uttar Pradesh and Bihar despite continuous demands by industry in these states that some concrete measures should be taken in this regard.

Alarmed by the drop in production of sugar in the current season, Mr Ahmed has assured the industry that a sugar policy would be evolved which would "hold good for at least three to five years". He has promised the fixation

of an appropriate cane price for the 1972-73 season and special measures for cane development. He has also promised to announce well in time such incentives as are necessary for stimulating production. A rebate in excise duty for prolongation of the season either through early start in crushing or late crushing has

New taxes in West Bengal

MR SANKER Ghose, the Finance Minister of West Bengal, has shown courage in resorting to fresh taxation of about Rs 10 crores during 1972-73 in spite of the difficult situation confronting the state's economy. He disclosed, in his budget speech on the June 26, that an unprecedented draught has hit West Bengal this year, resulting in the total loss of agricultural production, including the loss on account of vegetables, estimated at Rs 80 crores. Industrial activity in the state also continues to be sluggish. The overall deficit in the current year, excluding the negative opening balance of Rs 23.59 crores, is placed at Rs 13.36 crores; and Mr Ghose has decided to reduce it to Rs 3.36 crores by raising additional taxation of Rs 10 crores. The Finance Minister has said that in a budget of Rs 576 crores, this deficit is not large and he has expressed the hope that with the revival of the state's economy, it will be possible to augment the revenues.

Mr Ghose has chosen his new levies rather judiciously. The rates of admission to the cinematographic exhibition have been raised on a progressive scale, according to the value of the admission tickets. Cabaret shows and other entertainment as well as the luxuries provided in hotels and restaurants have been taxed. On many luxury items such as precious and synthetic stones, real, artificial or cultured, golden and silver filigree, furs and articles made of furs and perfumes, the sales tax has been increased. Besides, the sales tax on certain commodities has been revised and rationalised. The rates of stamp duty have been enhanced. The taxes on goods vehicles have been revised on a slab basis in terms of laden weight and the bigger passenger cars have been taxed more.

Another important proposal is the revision of the rates of land revenue. The significance of this step lies in the fact that the existing rates were last settled before the first world war. Table I compares the rates of land revenue in West Bengal and some other states.

Mr Ghose has assured that the re-

also been assured. The minister said that the suggestions made by Lala Bansi Dhar in regard to the formulation of the long-term policy had already been considered by the Development Council for Sugar Industry. It is to be hoped that the government will live up to the assurances that the minister has held out to the industry.

sources to be raised by revising the land revenue will generally be ploughed back for investment in the rural economy in the form of agricultural inputs and for providing irrigation and other facilities. Similarly, the proceeds from the enhanced rate of the Public Works Cess will be used to improve the communication in the districts.

With the additional resources to be raised from the above levies, West Bengal hopes to have a Plan outlay of Rs 73.5 crores during 1972-73.

In regard to central assistance, Mr Ghose made some suggestions for the consideration by the Sixth Finance Commission. He pointed out that the devolutions recommended by the Fifth Finance Commission did not meet the non-Plan gap on revenue account of many states, including West Bengal. The government of India therefore gave special loan assistance to such states to bridge their non-Plan gaps on revenue account. But Mr Ghose said that while such central loans are given to meet the revenue expenditure, no income accrues from it and so the states are unable to repay such loans. He said that the Finance Commissions are expected to make recommendations to meet only the non-Plan gap on revenue account

TABLE I

Comparison of Land Revenue in Various States for Average Quality of Land

	Basic land revenue	Sur-charge or cess on land revenue	Total
	Rs	Rs	Rs
Maharashtra	7.90	8.80	16.70
Tamil Nadu	8.18	2.08	11.78
		1.52	
Andhra	13.00	2.86	18.33
		2.47	
West Bengal	3.87	0.08	4.55

(In Maharashtra there is also a cess varying from Rs 10 to Rs 100 per acre on each crop).

Sugarcane Acreage, Cane, Sugar and Gur Output : 1960-61—1970-71

Year	Cane acreage (in 000 acres)	% Variation	Cane output (in million tonnes)	% Variation	Sugar output (in lakh tonnes)	% Variation	Gur & khand-sari output (in lakh tonnes)	% Variation
1960-61	5789	—	111	—	30.28	—	65.3	—
1961-62	5988	+3.4	104	-6.3	27.30	-9.8	62.7	-4.0
1962-63	5635	-5.9	94	-9.6	21.35	-21.8	61.5	-1.9
1963-64	5577	-1.3	105	+11.7	25.62	+20.0	65.8	+6.9
1964-65	6328	+13.5	120	+14.3	32.32	+26.1	72.5	+10.2
1965-66	6867	+8.5	120	—	35.32	+9.3	70.0	-3.5
1966-67	5687	-17.2	93	-22.5	21.51	-39.1	60.1	-14.2
1967-68	5033	-11.5	96	+3.2	22.48	+4.5	61.8	+2.8
1968-69	6257	+24.3	125	+30.2	35.59	+58.3	72.2	+16.8
1969-70	6792	+8.5	135	+8.0	42.62	+19.8	72.9	+0.9
1970-71	6565	-3.3	129	-4.4	37.40	-12.2	73.9	+1.4

and not with respect to the overall budgetary needs of the states.

Mr Ghosh also suggested that the Planning Commission should have some link with the Finance Commission so that the transfer of federal resources to the states for meeting the Plan and non-Plan gaps are made in an integrated manner. Another proposal by West Bengal's Finance Minister was that there should be some machinery for assessing and meeting the liabilities imposed on the state governments after the award of the Finance Commission. For example, since Fifth Finance Commission gave its award, the West Bengal government had to undertake substantial commitments in respect of dearness allowance and revision of pay scales of government servants and on other items. But such expenditures have been left uncovered since there was no machinery to deal with the liabilities that arose after the Fifth Finance Commission gave its award.

Mr Ghose's suggestions deserve consideration from the government of India especially in relation to West Bengal which has been faced with various difficult problems one after another in the recent years. At the same time, the government of West Bengal should take energetic steps

to revive its economy rapidly so that even on the basis of the existing rates of taxation, the revenues can be sizeably increased. There is enormous scope for effecting economies in expenditure but Mr Ghose has not given any hint as to whether he is going to consider them. On the other hand, there is likelihood of unproductive expenditure going up sharply because of the government's anxiety to create somehow new employment opportunities.

In his budget speech Mr Ghose took credit for the fact that in the sphere of wages and earnings of workers, his government has been able to make 'significant improvement' within a short time. He referred particularly to the increase in the wages of jute workers by 30 per cent. But such 'improvements' were brought about solely by exercising government pressure on the managements concerned without any regard being given to their capacity to pay and labour productivity. While West Bengal has a right to expect New Delhi to listen sympathetically to its suggestions and grievances, the state government has also a responsibility to ensure that the resources are used with the utmost efficiency and economy and that appropriate conditions are created to enable industries to produce and prosper.

Unfulfilled expectations

HOPES of the engineering industry about raising its exports to Rs 175 crores in 1971-72 have proved to be misplaced. Although the final tally is not yet available, these exports last year did not exceed Rs 130 crores. In the previous year, we exported engineering goods worth Rs 117 crores. The increase last year, thus, was only of the order of Rs 13 crores, as against the envisaged step-up of Rs 58 crores.

The year 1971-72 was not a very encouraging one for exports of engineering products. Apart from the stringent raw materials position, it witnessed a good deal of dislocation in the working of the industry, first because of labour unrest in east India and then owing to the Bangladesh liberation movement. But even if due allowance is made for these two factors, it would appear that the target of raising exports to Rs 175 crores was pitched substantially higher than what was warranted by the normal working of the industry.

The surveys of industrial production and export trends conducted by the Indian

as Rs 200 crores would seem to be out of reach, unless very concerted attempts are made to expeditiously break the bottlenecks wherever they are or likely to occur.

The April survey of trends in industrial production suggests that there are three major problems that need immediate attention. These are: (i) shortages of raw materials and components; (ii) inadequacy of credit; and (iii) capacity constraints. The first is the most serious problem. Of the 11 companies which responded to this survey, 42 per cent felt that shortages of materials and components would be the limiting factor to their output. This percentage was only 36 in the October survey.

The position in regard to credit was expected to improve slightly according to the April survey, as only 14 per cent of the 111 companies responding to this survey felt that credit was a serious limiting factor to their production. This percentage was 18 for the 109 respondents to the October survey. Similarly, capacity constraints were anticipated to ease a little, as only 10 per cent of the respondents to the April survey thought it to be a limiting factor, as against 12 per cent in the October survey.

The three major limiting factors to exports, which according to the survey of export trends are likely to become more serious this year, are (i) overseas competition, particularly in regard to prices; (ii) import licence restrictions, and (iii) political and economic conditions abroad. The number of respondents to this survey in April who thought that these limiting factors would operate in a more serious manner this year was much higher than in the October survey.

The need for concerted action in respect of engineering goods exports arises out of the fact that this line of exports is not only imperative to boost our foreign exchange earnings but also holds good promise of growth. There can be no denying the fact that our engineering goods are finding increasing acceptability abroad — both in the developing and the developed countries. Further, we are today exporting not merely industrial and agricultural machinery and consumer durables, but have as well established a market abroad, though a modest one, for research-intensive equipment, automobile parts and heavy transport equipment. A beginning has also been made in undertaking turn-key jobs in foreign countries. This has been on the pattern of the development of engineering goods exports in the highly advanced countries.

With labour unrest subsiding, the time

appears to be opportune for giving a push to production in the engineering industries. As suggested by the Indian Engineering Association's April survey on trends in industrial production, the foremost task to be tackled on the production front is the augmenting of the supplies of raw materials, particularly steel. The steel supply situation, of course, may not be as acute this year as it was last year, for even though the domestic supply cannot be envisaged to improve very materially, the increased imports authorised last year, which are coming in now, should stand in good stead. The union government has further taken some bold decisions recently. The most important of these is the decision to make available steel for export production either from indigenous sources or from imports at Joint Plant Committee (JPC) prices plus two per cent thereof. Some exporters, however, have complained about the lengthy procedure involved in making use of this scheme. They have suggested that those exporters who have stocks of materials to be used for domestic production, should be allowed to go ahead with the execution of export orders and get the materials replenished at JPC prices plus two per cent from Hindustan Steel when the required steel has been imported. This is a sensible suggestion as while the scrutiny of orders, categories and the sizes required may take its own time, exports can go on.

Another important aspect of the problem of raw material supplies that needs consideration by the government is the inclusion of high carbon wire rods, stainless steel and certain other categories of medium and high carbon steel in the JPC Engineering Goods Export Assistance Fund Scheme. This scheme at present does not allow reimbursement to exporters of the difference between the domestic and international prices of the above types of steel even though they might have been used in the exported products. Since the availability of these materials from indigenous sources is limited, the additional financial involvement should not be large.

The problem of capacity constraints in the engineering industries included in the priority list may not be there now as the government has allowed them to raise additional production up to 110 per cent their installed capacities through working more than one shift. In cases in which some balancing equipment is required, that may be allowed to be installed. The problem of inadequacy of funds can be resolved to a great extent by expediting the settlement of the claims of exporters for the reimbursement to them of the difference between the domestic and international prices of steel. Some improvement,

indeed, is reported to have been effected by the government in this reimbursement scheme, but still, it is understood, nearly 200 old claims would have remained pending with the authorities at the end of May. The industry's plea that not only these old cases may be settled without further loss of time but also the processing and settlement of the claims submitted during the current year taken up immediately deserves sympathetic consideration.

The anticipated increase in the competition abroad in respect of the prices of engineering products at a time when our production costs are going up calls for a fresh look at the export assistance policy. The policy, it may further be suggested, ought to be for a fairly long period, say five years, so that confidence is instilled among exporters, especially those whose export contracts take time to be fulfilled. If the exports of long delivery engineering products, such as industrial plants and machinery, heavy transport, power generation equipment, etc., are to be built up — and that is necessary if the global ex-

perience of pushing up engineering goods exports is any indication — some thought also needs to be bestowed on how to mitigate the problems of exporters arising out of political instability in the importing countries, fluctuations in exchange rates, etc.

Our entrepreneurs joining hands with local interests abroad for setting up joint ventures there can help in raising our engineering goods exports considerably. But sometimes they are required to participate in the equity capital of these ventures not only to the extent of the export value of their equipment but also to a larger extent so as to facilitate import of some machinery from a third country. They have as well to follow the international purchase policies. All this necessitates a modification of or policy towards participation in joint ventures abroad. Agreements with those countries where there is good scope for setting up joint ventures, for the avoidance of double taxation should be of considerable help in raising our exports of engineering products.

Govt could borrow more

THE STRATEGY for the first stage of the borrowing programme of the central government for the current financial year has been revealed by the Reserve Bank of India and the lists for three new loans calling for subscriptions for an aggregate amount of Rs 350 crores will be opened on July 15. It had been generally expected that there would be no major change in the terms of the new loans as it was only last year that the yield basis was raised in respect of all loans because of an increase in the bank rate by one per cent to six per cent in January, 1971. There was, however, scope for effecting changes in the terms in favour of the borrower as conditions in the money market had improved considerably since the loans were floated last year and banks and other institutions were seeking reserves for investing their surplus resources. The government too has been anxious to keep down interest charges as far as possible by effecting conversion operations in a manner which would secure for it an average interest rate which would be lower than that available on the long dated loan. This was the reason why on the last occasion conversion applications were spread between the three loans, short, medium and long dated.

On the present occasion, too, a similar policy may be pursued as there are again

maturing loans outstanding for fairly large amounts. However, a direct attempt has also been made to reduce the average cost of borrowing because a short-medium-dated loan is being issued in place of the medium-dated loan 1971. The terms of the short-dated loan are unchanged, the interest rate being 4½ per cent with maturity date in 1979 and the issue price at par. The long-dated loan will carry interest at 5½ per cent, mature in 2002 and have an issue price at par. Only the short-medium-dated loan will have a lower interest rate of 5 per cent against 5½ per cent for the medium-dated loan. The duration will be 11 years against 15 years while the issue price has been fixed at a discount of ¼ per cent against 100 per cent.

The maturing loans 4½ per cent 1972 and 4 per cent 1972, have been offered conversion terms at par. The former loan is outstanding to the extent of Rs 100.13 crores and falls due for repayment on July 15. The latter loan has to be repaid to the extent of Rs 154.71 crores on August 1. As these two loans will account for the major portion of the amount that will have to be paid out in respect of four loans, it has been considered desirable to offer conversion terms on an attractive basis. Though the 4 per cent 1972 loan will have to be redeemed only on August 1, the government is agreeable to the payment of a higher rate of interest on the converted portion of this loan for a fortnight. This procedure will greatly facilitate the funding operation for this year. There are two other maturing loans,

4½ per cent 1972 outstanding to the extent of Rs. 28.22 crores and falling due for repayment on October 27, 1972 and 4½ per cent National Defence Bonds for Rs 17.16 crores on November 10, 1972. The two small loans can be repaid even in cash on the respective maturity dates. Alternatively, the government may adopt the same method as now and offer conversion terms when it comes again on the market later in the year for raising additional amounts.

The pattern of new loans has been conceived correctly as also the funding operation. The Reserve Bank, however, could have decided to fix the notified amount at a higher figure than Rs 350 crores. It may of course be contended that net borrowing even in the first stage will be much more at Rs 130 crores against only Rs 73 crores in the first stage last year. The figure of net borrowing for the first tranche this year could have been easily Rs 200 crores as conditions in the money market are quite comfortable. The borrowings of the scheduled commercial banks are much less than those at this time last year, the actual amount outstanding during the week ended June 23 being only Rs 34 crores, Rs 173 crores less than in the corresponding week last year. Also, an analysis of the data relating to the scheduled banks for a 12-month period ended June 16 shows that only about 50 per cent of the additions to deposits could be used for increasing advances and the balance of over Rs 600 crores was available for reducing borrowings and increasing investments in government and approved securities. After repaying substantially borrowings to the Reserve Bank, investments in government securities and treasury bills alone have increased by over Rs 200 crores during the period under reference. The additions to holdings of bonds and debentures of approved categories should have been at the same time sizable.

Some time back it was anticipated that the scheduled commercial banks might have to borrow on a fairly large scale for financing heavy procurement operations. These anticipations have not, however, materialised, not because there was no sharp rise in advances but because the growth in deposits was more impressive than expected. It can be safely reckoned that by the time the lists for the new loans open on July 15 there would have been further additions to deposits with a contraction in advances. With loans from the central banking institutions virtually wiped out, the lists for all the three loans are bound to be heavily oversubscribed even on the opening day. There may be need for member banks to borrow to a certain extent for meeting a diversion of funds from the organised credit structure

to the Exchequer. But these borrowings may not exceed Rs 75 crores and with fresh additions to deposits in the subsequent weeks they could again be repaid without difficulty.

Even allowing for the fact that the state loans have to be floated in the first week of September and an attempt may be made to raise a larger net amount of Rs 125 crores, the banking system alone can hope to earmark out of the fresh additions to deposits of Rs 500 crores in a four-month period July-October, as much as Rs 400 crores for being invested in new loans. As the growth in deposits in July-August alone may be of the order of Rs 250 crores and there will also be a contraction in advances due to declining sugar and cotton stocks, even if the central government had sought to borrow a net amount of Rs 200 crores, the money market would not have been strained to any great extent. With the balance of new deposits and the funds released on account of a contraction in advances, the support needed for the state government loans could be easily extended in the first week of September.

The central government was not perhaps too keen on raising a large net amount through open market loans immediately as its ways and means position is now comfortable and a good part of the unauthorised state overdrafts taken over by it from the Reserve Bank would be wiped out by the profits of the Reserve Bank derived by the government as its share and other adjustments. Even if there was an unadjusted balance in respect of state overdrafts taken over by the centre, it would be advantageous from its point of view to cancel the identifiable ad hoc securities after some time as the rate of interest on them is lower than that on terminable loans. This explanation is perhaps responsible for the absence of any great anxiety on the part of the central government to borrow a large net amount even in the first stage.

While there may be agreement with this line of reasoning in knowledgeable cir-

cles, there is no doubt that the government can and should borrow on a larger scale than that assumed in the budget estimate for the current year. Net borrowing at Rs 215 crores is Rs 79 crores less than the amount mobilised in 1971-72 under less propitious circumstances. In 1972-73, the additions to deposits of the scheduled commercial banks alone can be easily Rs 1,400 crores, if not more.

On the basis of the experience of the past twelve months, not more than 50 per cent of the new additions to deposits can be utilised for expanding credit for different purposes. The balance of Rs 700 crores will have to be utilised for maintaining a higher level of cash balances and a larger investment portfolio. It can be easily expected that about Rs 650 crores will be available for investment purposes. Even allowing for net borrowing by the state governments for Rs 125 crores and the issues of bonds and debentures by the state electricity boards, the statutory financial corporations and public bodies of Rs 175 crores, the member banks alone will be in a position to invest in new central loans around Rs 350 crores.

Having regard to the more impressive growth in assets of the Life Insurance Corporation and the scope for subscriptions from other directions, net borrowing of the central government can exceed comfortably the performance of 1971-72. As about Rs 130 crores will be raised in the first stage, another Rs 120 crores can be mobilised in October, after the state loans are out of the way. Later there can be reissues of the new loans for being handed over to the Reserve Bank in order to effect tap sales or open market sales as the case may be. Whatever may be the approach adopted by the Reserve Bank, the central government is in a position to exceed comfortably the target for net borrowing in the current year even after the states and public bodies have raised larger amounts through their loans and bonds. It can be said that the scope for borrowing through open market loans was never so good as now in recent years.

Eastern Economist 25 Years Ago

July 18, 1947

The Marshall Plan so-called is in fact no plan at all, but only an offer of American assistance to Europe in the latter's economic recovery on certain conditions. On the grave economic deterioration in Europe's condition and the collapse with which it is threatened, it is needless to dwell. Mr Marshall in his speech highlighted the main features—the dislocation of the entire fabric of European economy, the danger of the breakdown of the system of division of labour on which the exchange of products is based, the failure of European currencies, and the need for external, particularly, U.S., assistance. The dimensions of the dollar crisis confronting Europe are dealt with in another

article in this issue. Mr Marshall's condition of 'United States' assistance was that such assistance could not be on a piecemeal basis as various cases developed, that the programme should be a joint one agreed to by a number of if not all European countries, and that the role of America should consist of friendly aid in the drafting of the programme so far as it may be practical for them to do so. Obviously, the United States wanted Europe to take the initiative in the matter of its own reconstruction and felt rightly that for the United States to draw up a plan unilaterally would be neither efficacious nor fitting.

POINTS OF VIEW

Import & export control: legal aspects

N. N. Chaudhary

THE IMPORT and Export Control Law has been a Cinderella of jurisprudence. And yet it affects a vast body of the trading community. An attempt has been made in this article to wade through the maze of more important legal judgments to cull from them the guiding principles of law.

The object of the import and export control restrictions is conservation of scarce foreign exchange, natural resources and their planned deployment in the best interest of the country. It is an annual exercise to balance the supply and demand of foreign exchange; and licences are allowed only for import or export of items that are permissible in terms of the policy in force at the time of issue of such licences. In other words, if an item does not exist on the list of importable articles at a particular time when the application is made, normally the import licence for the item in question is not issued.¹

An applicant has no absolute right to an import licence in terms of the policy in force at the time of his application because from the very nature of the things at the time of granting the licence, the licensing authority concerned may often be in a better position to have a clearer over-all picture of the various factors having an important impact on the final decision on the allotment of import quota to the various applicants.²

registered exporters

The position in regard to the import policy for registered exporters is that for exports made under an export promotion scheme, a registered exporter becomes entitled to claim the export assistance benefits as promised by the government; and the government is not exempt from its liability to carry out the commitments.³

The power to frame import and export policy and procedures is vested in the central government by section 3 of the Imports & Exports (Control) Act, 1947, which authorises it to prohibit or control imports and exports by issue of orders in the official gazette. The orders so issued have the force of law or, at any rate,

are laws within the meaning of Article 13 of the Constitution of India; and for any refusal of licence to an applicant if otherwise admissible under the government's announced policy, he is entitled to a writ.

The licensing authorities have to discharge their functions of grant of import and export licences in such a manner as not to deny to any person equality before the law. This right to equality or rule of law is guaranteed to citizens under Article 14 of the Constitution of India. It is intended to prevent arbitrary discrimination between persons similarly circumstanced; and if it is found that in any given case there has been unfair discrimination against a particular applicant, that is justiciable in writ proceedings.⁴

right of equality

The vigilance branches of the import and export control organisation of the government ensure that this right of equality before law is not denied to applicants.

An import or export licence is merely a permission to import or export. This permission is non-transferable, conditional and limited for a policy period. It is neither saleable, nor transferable, nor attachable for satisfaction of a decretal amount, nor even assignable, though under certain conditions transfer of quota rights, with the approval of licensing authority is permissible. There is no vested right to the grant of import licences; they are not property. Therefore, non-grant of a licence does not attract the provisions of fundamental right to property, under Article 19 (1) (f) of the Constitution.⁵

The power of the government to prohibit or control imports and exports is held to be in the interest of general public and the state. As such that power cannot be questioned and no challenge to such an action can be entertained by the courts on the basis of the fundamental right to practise any profession or to

carry on any occupation, trade or business as laid down in Article 19(1)(g) of the Constitution.⁶

The government has the power to canalise imports or exports through a state agency, to the exclusion or partial exclusion of citizens or otherwise in import or export trade, under section 3 of the Imports & Exports (Control) Act.

public interest

Canalisation of imports *per se* is not unreasonable as it supplants policy of import in the interest of general public. As such, it cannot be challenged in a court of law.

The executive functions of the licensing authorities have been likened to those of special tribunals by the law courts; as they derive their power from Section 7 of the Imports & Exports (Control) Act, which reads as follows:

"No order made or deemed to have been made under this act shall be called in question in any court, and no suit, prosecution or other legal proceeding shall lie against any person for anything in good faith done or intended to be done under this act, or any order made or deemed to have been made thereunder".

In the face of the said section, orders or decisions of the import control authorities cannot be challenged in a court of law i.e. they are not justiciable.⁷

The courts, therefore, advise that in case of a factually or technically erroneous decision, if passed by a competent licensing authority within the framework of policy in force, the affected party should take recourse to appeals to the appropriate departmental authorities, to get the error rectified.⁸

While making those appeals, the appellant should see that he makes them in time; as dismissal of an appeal as time barred is correct and upheld in law. De-

lay in seeking relief by appropriate writ is also fatal to petitioner's case. Rejections of appeals/writs on grounds of delay are justified by the law courts on the ground that since the issue of a licence depends upon the import trade policy which is made from year to year, it is impossible to excuse delays.⁹

The doctrine of merger means that when a superior authority decides a case on appeal, that decision prevails; and the order of the lower authority becomes extinct by its merger in the order passed by the superior authority. As such a writ can be against the order passed by the superior or appellate authority, and not against the lower or subordinate authority.¹⁰

Section 5 of the Imports and Exports (Control) Act, provides for penalties for violation or contravention of the conditions imposed on licences, and it reads as follows:

"If any person contravenes or attempts to contravene, or abets a contravention of, any order made or deemed to have been made under this Act or any condition of a licence granted under any such order, he shall, without prejudice to any confiscation or penalty

to which he may be liable under the provisions of the Customs Act, 1962 (52 of 1962) be punishable with imprisonment for a term which may extend to two years and also with fine:

Provided that in the absence of special and adequate reasons to the contrary to be recorded in the judgment of the court, such imprisonment shall not be for less than six months".

Thus not only the actual contravention but attempts to contravene any conditions as well are intended to be punished; and circumstances leading to the violation of the conditions of licences may not help the licensees to escape imposition of a punishment under the Impex Act.¹¹

In fine, import and export licences are admissible in terms of the policy in force at the time of issue of licences; the control policy and procedures have the force of law and the applicants have the right of equality before law; non-grant of licences does not attract the fundamental rights to property or profession; licensing authorities function like special tribunals and their orders cannot be challenged in courts so long as there is no charge of discrimination; delays on the part of petitioners are fatal to their appeals/

POINTS OF VIEW

wr. petitions; the order passed by the subordinate authority merges in the order passed by the appellate authority; contravention of the conditions of licences are punishable under the Impex Act.

New horizons of development banking

THE POST-world war II era witnessed the setting up of development banks, almost throughout the world, for the purpose of reconstructing the war-damaged economies or the development of backward economies. These banks are to be found at different levels — provincial, national, continental and inter-continental. At the international level, there are three important institutions in this sphere namely, the International Bank for Reconstruction and Development (IBRD), the International Finance Corporation (IFC), and the International Development Association (IDA). In fact, these international institutions took the initiative, in many cases, for the promotion of development banks in underdeveloped countries. At the continental level, there is also the Asian Development Bank

(ADB). In India there are a host of development banks functioning at different levels over different periods of time. An attempt is made here to study the operations of the Indian development banks in the context of the new industrial policy of the government of India which, *inter alia*, demands active participation of these institutions in the management of concerns assisted by them.

The banking function of a development bank usually takes the following forms: provision of long-term loans with or without security; guaranteeing loans; participation in shares and debentures; guaranteeing deferred payments; underwriting the issue of stocks, shares, bonds and debentures; and any other activity incidental to these functions. It must be noted that

in discharging these financial functions, the development banks are required to supplement and not supplant the role of the capital market.

The development function embraces the following activities: development of the capital market; promotion of industries management of industrial enterprises undertaking of techno-economic research including feasibility studies; industrial consultancy services; and training technical, managerial and entrepreneurial personnel. The stress on these two functions namely banking and development, varies from country to country and even within a country from time to time depending upon the needs and circumstances. It is the combination of these two functions that distinguishes a development bank

from that of a commercial bank, mortgage bank or a purely development corporation.

Details of the different all-India industrial finance and development corporations are given in an appendix. All of these institutions cannot be termed as development banks because they do not combine more or less equally the banking and the developmental functions. Some of them (the Life Insurance Corporation of India and the Unit Trust of India) are purely financial (or investment) institutions while the others (National Industrial Development Corporation and the National Small-scale Industries Corporation) are predominantly promotional agencies. The rest of the institutions (IFCI, ICICI, IDBI and IRCI) may be characterised as development banks even though some of them started functioning as purely term-lending institutions. At the state-level, there are the state financial corporations and the state industrial development corporations which fulfil the characteristics of a development bank. The emergence of these institutions at different levels with varying degrees of emphasis on their financial and non-financial functions has brought about the necessary institutional infrastructure for accelerating the pace of industrial growth in India.

IFC's function

The Industrial Finance Corporation of India (1948) provides financial assistance to large-scale industrial concerns particularly in circumstances where normal banking accommodation is inappropriate or recourse to capital issue method is impracticable. Its scope is limited to the public limited companies and co-operative societies. The state financial corporations provide financial assistance to the small-scale and medium-scale industries and their operations cover not only public-limited companies, but also private limited companies, partnership firms and proprietary concerns.

Since 1960, many of the states have taken steps to establish industrial development (or investment) corporations for the promotion, expansion and development of industries in the states. These corporations are authorised to give financial assistance to industrial concerns in the form of direct loans, extension of guarantee for loans and deferred payment, underwriting and subscriptions to shares, bonds and debentures.

The Industrial Credit and Investment Corporation (1955) was set up for the

specific purpose of assisting the industrial enterprises within the private sector. The Industrial Development Bank of India (IDBI) (1964) was set up to co-ordinate the activities of other financial institutions, including the commercial banks, providing term finance as well as to provide direct financial assistance to industrial units. The table below gives the details of the financial operations of the development banks of India.

The financial operations include direct loans, refinance to banks and rediscounts as well as refinance to SFCs by the national institutions in addition to underwriting and direct subscription to shares and debentures. The role of the development banks in financing investment in the private sector of Indian industry is slowly but steadily evolving.

The deceleration in investment activity during the years 1967-68 reflects the recession that characterised industry during this period. It is also seen from the table that recovery in financial operations in the last two years has been rapid and sharp.

All the development banks included here together accounted for more than 25 per cent of the total fixed investment in the private corporate sector of industry during 1970-71. The IDBI alone was responsible for financing a little more than 10 per cent of the total fixed investment in the private corporate sector of industry and about one-fifth of the exports of capital and engineering goods during the year.

The IRCI has been set up by the initiative of the IDBI in order to meet the

financial needs of the 'sick' industrial unit in the eastern region of India. Its charter enables it to undertake both financial and developmental functions. Doubts have also been expressed regarding the need for the creation of this corporation when there are SFCs and SIDCs in almost all the states. In several respects the IRC resembles the FCI and the ICFC of Britain. It is intended to fortify the institutional structure for development finance by specialising in reconstruction and rehabilitation work. In the context of the recent political developments, i.e. Indo Pak conflict, the growing co-operation and friendship between India and Bangladesh, this corporation has a significant role to play in rehabilitating the industrial economy of the eastern region in general and West Bengal in particular. The IRCI has started functioning from April 1971 and has sanctioned assistance amounting to Rs 1.05 crores within a period of three months.

The charters of the development bank of India (except IFC and SFCs) make specific reference to the promotional functions that they have to undertake. However, the role and functions of the bank in the sphere of development are slowly evolving. In pursuance of its objectives the ICICI has set up the Institute of Financial Management at Madras. The term-financing institutions have been criticised in the past for not paying sufficient attention to their promotional activities. However, as the latest annual report of the IDBI reveals some progress has already been made in this direction. Surveys of industrial possibilities in backward areas have been carried out in most of the state

Trends in the Financial Operations of Development Banks*
1964-65—1970-71 (April-March)

(Rupees in crores)				
Year	Rupee assistance disbursed	Foreign currency loans disbursed	Total assistance disbursed	Percentage change over previous year
(1)	(2)	(3)	(4)	(5)
1964-65	60.8	10.5	71.3	—
1965-66	82.9	22.9	105.8	+48.4
1966-67	104.0	21.5	125.5	+18.7
1967-68	90.8	14.2	105.0	-16.4
1968-69	74.8	11.1	85.9	-18.3
1969-70	102.6	13.7	116.3	+35.5
1970-71	124.3	24.1	148.4	+27.6

POINTS OF VIEW

and union territories. The preparation of feasibility studies is also under progress. Technical consultancy service centres (TCSCs) are likely to be set up soon by these banks in all the states. Training programmes for entrepreneurs and managers are also envisaged. Projects in industrially backward districts/areas and sponsored by new entrepreneurs and technologists are given preferential treatment over the others.

This way, the development banks have been shouldering the promotional functions via their financial activities. For instance, of the total assistance of the order of Rs 365.67 crores sanctioned by the IFCI for 527 projects up to June 30, 1971, roughly 33.3 per cent of the assistance, i.e. Rs 121.80 crores, spread over 149 industrial units was accounted for by Andhra Pradesh, Assam, Bihar, Madhya Pradesh, Meghalaya, Orissa, Rajasthan, Uttar Pradesh, Andaman and Nicobar Islands and Goa which have been classified as less developed or backward states/areas.

licensing enquiry

The Industrial Licensing Policy Enquiry Committee was appointed in July 1967 to go into the functioning of the licensing system. One of the terms of reference of this committee (popularly known as the Dutt Committee) was to enquire whether the policies followed by public financial institutions had resulted in any undue preference being given to the larger industrial houses. The committee took the view that there was concentration of financial assistance in favour of larger industrial houses. It found that, of the total assistance of Rs 808 crores in different forms sanctioned by all the different term-financing agencies during 1956-66, an amount of Rs 341 crores went to 73 large industrial houses out of which an amount of Rs 183 crores went to the 20 larger houses. The committee also learnt that, in all, 971 applications were rejected by all the public financial institutions during the period 1956-66. These institutions did not have clear-cut guidelines as to the priorities in granting loans nor did they have any regular practices. It appears that the possession of an industrial licence was taken as the first criterion for granting financial assistance to a company. As regards the assessment of interest charges, the committee suggested that the directors of some of the financial institutions have played an important role guided by their own business interests rather than the interest of these banks.

The Dutt Committee made several re-

commendations regarding the reorientation of licensing policy in general and the investment policy of public financial institutions. Pursuant to these recommendations the government of India announced its new industrial policy in February, 1970. This policy envisages a 'core sector', a 'joint sector' and a 'middle sector' in addition to the reservation of certain industries to the small scale sector. The 'joint sector' concept is being applied in the case of projects taken up by private entrepreneurs in the 'core' and 'heavy investment' sectors in the light of their proved performance in relation to earlier licences. As has been stated in the fourth five-year Plan, it may be desirable to stipulate that in the case of the large industrial houses, their own contribution in a project should be proportionately higher than the medium-scale or new entrepreneurs and funds should not be made available to them for non-priority industries. The government has also decided that in future there would be a greater degree of participation in management, particularly at policy levels: in the case of major projects involving substantial assistance from public financial institutions it is proposed that where public financial establishments, including the LIC have substantial shareholding in a company, they may preferably exercise their full rights including the appointment of representatives to the board of Directors.

In order to achieve this end, namely,

greater degree of participation in management of assisted industrial units by the term-financing institutions, the government issued guidelines on May 1, 1971 to the all-India term financing institutions for the conversion of loans given by them into equity and for nomination of directors to the boards of directors of their assisted concerns. In terms of these guidelines the financial institutions, while sanctioning rupee loans of Rs 50 lakhs and more to one company, would normally provide in the loan covenant for the option of converting loan into equity consistent with the maintenance of a reasonable debt equity ratio. In respect of loans ranging between Rs 25 lakhs and Rs 50 lakhs, the financial institutions may use their discretion. In cases where the aggregate financial assistance does not exceed Rs 25 lakhs, the condition for conversion need not be written as a measure of policy, unless the financial institutions themselves so decide on commercial grounds. As for loans and debentures given in the past, the financial institutions should have discretion to negotiate conversion in cases of default. During the financial year of the IFCI ended June 30, 1971, the terms and conditions of the conversion have been finalised for 16 concerns. In terms of the guidelines the all-India financial institutions are required to nominate their representatives, officials or non-officials, to the boards of directors of all assisted concerns where substantial financial assistance has been sanctioned

and where the convertibility clause has been incorporated in the agreements for financial assistance. A panel of persons suitable for appointment as such directors is being prepared by the IDBI in consultation with other term financing institutions.

Industrial management is the new challenge that is facing the development banks of India. They have to undertake banking as well as promotional functions including management. Development banks, in many cases, do not undertake managerial functions. However, they have to shoulder managerial functions where they are required to undertake them either by the statute or by the directives of the state or the central bank which has sponsored them. They have to gain experience in the field of industrial management just as they are gaining experience in the field of promotion of enterprises. There is a feeling in some quarters that the active participation of development banks in industrial management will not serve their

own interests as they have to face additional risks and uncertainties. Also, it is argued that this is a new method of nationalisation of private enterprise. It cannot be denied that there is some truth in these arguments.

The new industrial policy of the government of India (1970) demands that industrial enterprises—public or private as well as development banks—should discharge their functions with a sense of social responsibility. The objectives of planned development cannot be achieved if these undertakings do not function in conformity with the policies of the plans. Hence the rationale of this new policy of associating development banks with the management of industrial units assisted by them. This is in fact, not a challenge but an opportunity both for the development banks and the industrial units to prove their efficiency and worth and thereby discharge their social responsibility to the community at large. Mutual suspicion should give way for co-operation between these banks

POINTS OF VIEW

and industrial units in the true spirit of 'joint sector' concept which must be given a fair trial for accelerating the industrial growth of the country without sacrificing the social objectives.

MY SUCCESS STORY ! THE CHARTERED BANK SET ME ON MY WAY

I was just another young man, fed up with a ten-to-five job and wanting to go into some sort of small scale industry. My plans were perfect, but the capital? That was where THE CHARTERED BANK came in. They gave me the financial assistance I needed plus advice, help and confidence for the future. Now I provide employment for others as I expand. If you have a promising plan for starting a small scale industrial unit, why not visit your nearest Chartered Bank branch—as I did?

WELL SPOKEN OF MODI STEEL WIRES

Ask any manufacturer. Modi Steel Wires are the first and finest choice for all wire products—from clips to bicycle spokes to high tension cables. Modi Steels is the only plant in India to have Electric Arc Furnaces for Steel melting, a Wire Rod Rolling Mill and a Wire-Drawing plant all under one roof. This facilitates the production of special kinds of steel for specific end products of wire, according to customer's specific requirements, as well as ensures rigid quality control at all stages. Modi Steel Wires are available in a wide range of forms, all conforming to ISI specifications. Modi Steels are licensee for IS/280/1962—the highest guarantee of quality.

Who is Spinelli?

Josselyn Hennessy

London.

His Background

MEMBERS OF the European Commission are of three kinds:

(1) those who are frankly not up to the job;

(2) those who have or acquire the necessary technical mastery in their allotted field of responsibility; and

(3) those who bring to their role a political vision. Altiero Spinelli, ex-communist and "Minister for Industry" in the present Commission, indisputably is of the third kind.

Spinelli may never have held elective office like some of his colleagues on the Commission, but none of them have ever suffered for their political beliefs. Spinelli

colleagues, of taking not just one but three or four. Those years have also left their mark on his character. Behind the outward charm and bonhomie and willingness to talk to all and sundry, he remains a solitary and self-reliant person who pursues his ideals without much concern for what those about him may be thinking.

Throughout most of his political life Spinelli seems to have been swimming against the tide. In his youth a communist, he left the party partly in protest against the Moscow trials of 1936, partly because he could no longer accept the Marxist analysis of fascism as a product of the capitalist system because he had come to see it as a pathological form of nationalism. His decision to leave the party nevertheless meant isolating himself politically from his fellow prisoners.

From his release in 1943 till the end of

even if this was not immediately apparent in 1948.

For the next 15 years Spinelli was to give his main attention to the European Federalist Movement. He was secretary general of the movement in Italy and also a member of the Executive Committee of the European Union of Federalists in Paris. Throughout most of this period the Federalists were fighting a losing battle for the calling of a European Constituent assembly to draw up a constitution for the United States of Europe and were bitterly opposed to any institutions set up by the states. But the process of European integration, which has been one of the great achievements of the post-war period, owed little or nothing to Federalist ideas. The European Communities were inspired by the different approach of Jean Monnet, based on functional integration through institutions set up by, and responsible to, national governments. The years 1955-57 which saw the birth of the European Economic Community and the revival of European integration after the collapse of the European Defence Community in 1954, came to Spinelli as a political defeat, not as a great leap forward.

hostile observer

For most of the 1960s Spinelli withdrew from active politics to concentrate on writing and teaching. From 1962 to 1966 he was visiting professor at the Bologna Centre of the John Hopkins University where he gave courses on European integration. In 1966 he founded the Institute of International Affairs in Rome, of which he became director, and launched *lo Spettatore Internazionale*. He became a member of the Italian radical review *Il Mulino*, a member of the Olivetti Foundation Study Centre and a member of the Council of the Institute for Strategic Studies in London. Throughout this period he remained a sceptical, even hostile, observer of the Community scene. He published books with titles such as "Europe does not fall like manna from Heaven" and "The Eurocrats", in which he analysed with gusto the shortcomings of the Community method of achieving the unification of Europe which, in his view, could only result in a Europe of bureaucrats.

Yet in July, 1970 Spinelli himself became a Eurocrat: he was appointed to the EEC Commission by the Italian government and took over responsibility for industrial

WINDOW ON THE WORLD

li has. He started his political career while still a student in Rome as a member of the illegal Communist Party during the Mussolini era. While still less than 20 he became deputy secretary of the party's youth movement, and engaged in clandestine anti-fascist activities. In 1927 he was arrested and convicted by a special tribunal of conspiring against the authority of the state. He spent the next sixteen years first in prison, then in exile with other political prisoners on the island of Ventotene in the Adriatic. It was there that he wrote his famous federalist manifesto in 1943.

The years of prison and exile have left their mark. This can be seen in little idiosyncracies, like the way he used to smoke his cigarettes to the very end so as not to waste any tobacco (nowadays he has gone over to filter-tips), or his habit, when offered a cigarette by friends or

the war Spinelli found himself for once in the centre of events. He was active in the Resistance in northern Italy, became a member of the political secretariat of the *partito d'azione*, and launched the European Federalist Movement — he organised the first international federalist conference at Geneva in July, 1944, and in Paris in February, 1945.

Yet within two or three years he found himself once more on the fringe.

The revolutionary social crisis which he and his friends had expected to engulf the discredited national states of the old continent failed to materialise. The national governments and the traditional ruling classes climbed back into the saddle, while a new status quo, based on the division of Europe into American and Soviet spheres of influence, ushered in a prolonged period of international stability,

policy and scientific research. Like many others before him who have started their careers as rebels, he has ended up by embracing the system and taking office in the governments which he had so long criticised. In Spindelli's case the contradiction is a double one. An ex-communist, he is now responsible for persuading the Community's industrialists to form large European groups through the merger of national firms in order to enable private industry to exploit the opportunities opened up by the creation of the Common Market. Still a convinced federalist, he has to try to make the Community's institutions work on the basis of the present system with a Commission that can only make proposals, a Council which is supposed to take all the decisions and a Parliament with purely consultative powers.

II

Vested Interests

The contradiction is, however, more apparent than real. It is a question of realism more than anything else. Spinelli is still convinced that the idea, dear to Monnet and the functionalists, that a European bureaucratic apparatus with a minimum of leadership at the top, independent of the governments (though to give him his due Monnet provided more than a minimum of leadership when he was head of the High Authority) could provide a driving force strong enough to carry the rest along, was and is an illusion. But the hard fact is that the Communities are all that exists in the way of a united Europe. At a certain moment this fact had to be recognised and the federalist strategy adapted accordingly.

In fact, Spinelli remains as critical as ever of the way in which the Community institutions work, though his analysis is now backed by practical experience of the weaknesses of the present system, where each minister arrives at Council meetings with (as Spinelli sees him) his hands tied by the national decision-making process that has already taken place, so that the Council is increasingly incapable of taking decisions or arbitrating between competing national vested interests. Yet he resists the temptation into which many commentators fall of attributing the present partial paralysis of the Community's decision-making process to accidental factors such as de Gaulle's offensive against the Hallstein Commission from 1965 onwards or the alleged lack of leadership provided by Jean Rey, the Belgian who succeeded Hallstein, and Malfatti, the current president.

The weakness of the present Commission, in Spinelli's view, is a direct result

of the policy adopted by the Hallstein Commission. Even in the early sixties the days of its greatest prestige, the Commission relied essentially on working with, and trying to influence, the national administrations. The Commission never tried, assuming it even knew how, to mobilise political support and ensure the involvement of the political parties and social forces in the member states. Instead it established contacts and sought support in business circles and in industry.

Yet Spinelli's criticism of the Community institutions is not just the back-biting of a disappointed man trying to salve his conscience. He has still not given up hope of achieving the kind of Europe that the federalists were dreaming of in the 1940s and 1950s. Spinelli's political philosophy is based on the conviction that the chances of a leap forward will depend on a critical situation developing. Most of the time the scope for changing existing institutions is extremely limited, but tensions and contradictions develop until they can no longer be contained, and then suddenly real changes become possible.

Spinelli is convinced that a critical situation of this kind will develop in Europe in the next couple of years; indeed one of the reasons why he came to Brussels in 1970 was in order to be present when it occurred. On the one hand, the governments are caught in a mass of hesitations and contradictions, caught between the system that makes them merely national governments, prisoners of their national traditions and vested interests, and a mass of problems like economic and monetary unification, the protection of the environment, and the development and location of European industry, which force them to go beyond the national framework. On the other hand, the Community lacks the institutions capable of establishing priorities and taking the necessary decisions.

crucial event

The crucial event on which Spinelli has pinned his hopes is the summit meetings of heads of governments of the ten member states of the enlarged Community to be held in Paris in October. If the governments content themselves with declarations of good intentions, leaving the implementation to the competent ministers and officials, then nothing essential will change.

The only chance lies in entrusting the next stage of integration to an elected European Parliament.

The battle for European unity would not be won but at least there would be an

arena in which to fight. It is in fact the old idea of a European Constituent Assembly, but adapted to the reality of the European Communities.

As for the Commission itself, Spinelli criticises the present system whereby the members are appointed by national governments without any prior discussion. The result is a Commission without political unity, made up of men with different backgrounds and ideas and no common view of what they should do together. Ideally, Spinelli would like the Council and Parliament to agree on the name of the person who would be charged with forming the Commission. The President would then present his Commission and an agreed programme to the Parliament for approval. The Commission would remain a coalition, but with an agreed set of objectives. Even so, it would only indicate certain major options: what actually happened would depend on the balance of social and political forces and how well organised they were within the Community.

III

More Balance

Behind his obsession with institutions, Spinelli's ideas on the sort of policies which the Commission should be advocating are hardly revolutionary. He favours the plans for economic and monetary union while insisting on the need for more balanced regional development, greater social justice and the subordination of economic development to the protection of the environment. As regards industrial policy and scientific research, which are his special responsibility within the Commission, he has left most of the thinking on what kind of industrial structures will be required and how they should be promoted to the staff of his directorate under the leadership of the French Director General, Robert Toulemon, and his Luxembourg deputy, Ferdinand Braun. He has never claimed to possess the same understanding of the problems of industrial policy as his colleague Raymond Barre shows in the monetary field, nor has he stamped his personality on the Community's industrial policy as Sicco Mansholt has on the common agricultural policy. Ironically, the Commission's programme for industry is currently held up by a procedural dispute with the French over a proposal made by Spinelli's directorate, which he was persuaded to accept, to set up a committee of senior national officials which would advise the Commission on matters of industrial policy. The French want the committee attached to the Council, thus cutting the Commission out altogether.

In other words, Spinelli has remained

practice a prisoner of the tradition of king the co-operation of national administrations.

It is uncertain whether Spinelli will be appointed to the Commission of the enlarged Community which will take office in January 1, 1973 — this will depend among other things on the result of the forthcoming elections in Italy.

About that supersonic bird

ONE leaves the London-Wales highway take the narrow road to Filton, the headquarters of Concorde in Britain, one soon aware of being in an area of elaborate technology. A large part of the road is lined on both sides with structures housing institutions connected with aeronautic engineering.

Among the first buildings to be seen is the Rolls Royce College of Aeronautic technology, followed by several buildings where Rolls Royce manufactures engines, and other aeronautic and space equipment. Rolls Royce is a 20 per cent shareholder of the British Aircraft Corporation (BAC).

A huge area adjoining the Bristol airport has been cordoned off by barbed wire, tangible proof of the security arrangements made by BAC in its Concorde operation. Within the cordoned area are a large number of workshops around a spacious hall in which four Concorde can be assembled simultaneously.

These workshops carry out a variety of operations such as the manufacture, testing and storage of components. Most of these workshops dealing with hydraulics, metal chemistry, fuel management power plants and air-conditioning have been fitted with electronic devices. Even the components received from other centres in Britain and France are electronically tested here before use.

expansive works

It is not easy to walk from one section to another, so one has to make use of a vehicle. Mr Millson Allen, Assistant Chief Executive at the Filton plant arranged a round of the various departments and I spent considerable time in the assembly plant where two Concorde were in the process of being assembled, one nearly complete.

The assembly plant looks more like

At 65, he could retire with honour to his former life of writing and teaching.

But a man like that never gives up.

He remains a symbol of the idea that European unification can only be achieved through popular involvement not through inter-governmental agreements. Whether or not the man stays, the message

Hardev Singh, Assistant Editor, *Eastern Economist*, now in the UK for a Thomson Foundation Course in Development Journalism, has sent this despatch.

a huge operation theatre in a hospital with its clean, dust-proof air-conditioned corridors, white overalled engineers, instruments lined neatly on tables and lights focussed skillfully for perfect visibility.

Filton, near Bristol has been selected as the site where Concorde is assembled in Britain. In France it is assembled in Toulouse. This is the arrangement arrived at between the two collaborators, British Aircraft Corporation and Aerospatiale of France. In fact assembly is the only duplication between France and Britain because both countries wanted to retain the right to give the final shape to the aircraft.

manufacturing process

Apart from overall assembly, the Filton plant also manufactures some components of Concorde such as radar and nacelles under BAC. The part of the engine manufactured in Britain is undertaken by Rolls Royce. The remaining sections of Concorde are manufactured partly in France at Toulouse, St Nazaire, Bougenais, Marignane Bourges and at Weybridge in Britain.

Broadly speaking the nozzle and the tail are manufactured in Britain and the middle of the plane in France. Various parts received at Filton from other centres are in the shape of vertical slices which are welded together electronically.

The collaboration between Britain and France is 50:50 and the manufacture of 25,000 parts is roughly equal in value between the two countries. The frame is

will go on.

Sources and acknowledgements: This profile is summarised from a special sample edition of *New Europe* (Chandos House, Buckingham Gate, London S.W.1.), a new review, editorially independent and politically unaffiliated, which, under the chairmanship of Lord George-Brown, will start publication in September.

Hardev Singh

Bristol

manufactured to the extent of 53 per cent in France and 47 per cent in Britain; the engine on the other hand to the extent of 60 per cent in Britain and 40 per cent in France.

It is now 12 years since Concorde was first conceived as a supersonic plane. The agreement between the British and French companies to launch Concorde will be ten years old next November. All these years the collaboration has worked successfully. In fact both countries form a network of collaboration with other European countries for the manufacture of highly specialised defence equipment.

international collaboration

This is quite understandable because the BAC could not have borne so much expenditure on the Concorde without having other profitable projects on hand. For instance BAC has collaborated with German and Italian firms to manufacture military planes, with Belgian companies to manufacture anti-tank guided weapons. It was able to earn a profit and declare a dividend of seven per cent last year. It has been able to spend part of its funds continuously on the Concorde project.

Before the first prototype of Concorde was produced, modified versions of Mirage in France and Vulcan in Britain provided patterns for research. By 1964 the first version of the engine for Concorde was ready at Bristol. In December 1967 the first prototype at Toulouse rolled out and after elaborate tests was able to make its maiden flight by March 1969. That year the company received authority for building nine Concorde (two prototype, two pre-production, two ground test and three production aircraft).

It was in September, 1970 that Concorde 002, the first prototype built in Britain, appeared at the Farnborough airshow and then made its maiden landing at the Lon-

Mon airport. By November 1970 the prototype achieved the designed speed of 1450 mph, twice the speed of sound. Early in 1972 Prince Philip piloted the Concorde 002 himself in a two hour supersonic mission and in April the plane made its appearance at the Hanover Air Show. Concorde 002 has recently gone round to Manila, Adelaide and Bombay.

In terms of acceptability, both the French and British governments have confirmed their commitments to buy it. Both President Pompidou and Prime Minister Heath have flown in it to lend it the required prestige. All option-holding airlines have renewed their desire to buy it, sixteen airlines that between them carry 70 per cent of the world scheduled air traffic have optioned 74 Concorde worth a potential 2.4 billion dollars without spares.

These potential buyers are: Air Canada (4), Air France (8), Air India (2), American Airlines (6), BOAC (8), Braniff International (3), Continental Airlines (3), Eastern Airlines (6), Japan Airlines (3), Lufthansa (3), Middle East Airlines (2), Pan American (8), Qantas (4), Sabena (2), TWA (6) and United Air Lines (6).

The production programme of Concorde at Toulouse and at Filton has been planned from early 1969. It involves eight planes to be completed by 1974, 30 by 1975, 62 by 1976, 95 by 1977, and 139 by 1978. Mr Allen confirmed that BOAC, Air France and a US air company (which is likely to announce its decision shortly) have already decided to place firm orders for two planes each, which will be delivered by 1974. One plane will start rolling out every month at Toulouse and another at Filton. And soon, according to demand, the capacity could be doubled.

progress in manufacture

At Filton the production of aircraft of was already nearing completion and various components were being tested and installed. At other workshops in Filton components for the fourth aircraft were in the final stage of join-up. The third aircraft I was told, was being completed at Toulouse and built to Air France specifications on seating etc. At various centres in Britain and France work was in progress for the manufacture of components for the first ten Concorde to be assembled, five each at Toulouse and Filton.

"The Concorde is meant to be a small plane for diplomats and businessmen who have more value for time than for money". This is how Mr Allen described Concorde in a nutshell, while pointing towards the elegant plane nearly complete on the assembly line.

Perched gently on tyres, this shapely,

thin, 204-ft plane looks like an elegant bird with an exquisite beak. In flight it looked majestic as shown on film.

It appears almost as large as a 707 jet and has a seating capacity of around 120. That way it is smaller than the Boeing 747. It can land at airports which can take in 747 and can be serviced by ground handling equipment at the same level. The distinctive feature of the Concorde is its speed, roughly 1350 mph. With this speed it can make it possible for a resident in London to visit New York, attend a meeting and return to London before nightfall. A senior executive need not disturb his previous appointments in London while he spends the day in New York.

I asked Mr Allen about the likely operational costs of the plane in relation to other planes. He agreed that operating costs will be higher than the existing planes. He argued that people tend to compare the operational costs of this new plane with that of planes which were bought some years ago. He spoke of the distinct advantages of the plane and said that these have to be exploited to make it profitable; the plane can run more flights in the same time and earn more money.

profitable operation

British Aircraft Corporation estimates that an air fare of the level of the present first class in scheduled flights can make the Concorde operations profitable if the plane is booked to the extent of 60 per cent of seats. The makers hope that with the unique service it will offer Concorde will not find it difficult to attract enough passengers on fares even ten per cent higher than the present first class. Besides, they do not anticipate a disturbance of the operations of subsonic planes owned by the world's airlines because these will be catering for increased traffic in economy class and charter flights.

"At what level would the Concorde manufacture be profitable to the company?"

According to the present production programme the sale of 200 aircraft will make the proposition profitable for the company. The Concorde project has cost roughly £1,000 million between France and Britain. This being a unique plane with practically no competition, the company already has hopes of selling around 220 to 400 aircraft.

I reminded Mr Allen about the recent spate of criticism against the Concorde.

He smiled and said: "I was wondering why this question had not been asked so far."

He added a little seriously: "Let me remind you, the aeronautical industry is today plagued with people who know nothing about it, but pass off as specialists."

The criticism, however, has been too widespread to be brushed aside as some kind of partisan campaign. For instance at the recent UN conference on human environment, Mr Jens Kampmann, Denmark's Minister of Environmental Protection, stated that the problem of 'sonic boom', the explosive sound which an aircraft generates as it attains, supersonic speed, required world solution.

areas of concern

Mr Allen first pinpointed three areas of public concern. He then offered counter arguments against world criticism. He referred to airport noise, sonic boom and high altitude atmospheric effect. From calculations based on actual readings from the prototype aircraft, it is clear that on entry into service, the airfield noise level of the Concorde will be comparable with, and in some cases lower than, those of many subsonic aircraft.

Concorde's developers have recognised that further reduction in noise is likely to be achieved in the new subsonic aircraft that are being made. Consequently a priority research programme is under way covering Concorde's engine and exhaust nozzle systems as well as approach and take off profiles. The new type of nozzle is being designed to reduce airport noise.

Sonic boom is the audible effect of the sudden rise and fall in atmospheric pressure at ground level caused by the passage of shock waves created by an aircraft in supersonic flight. Commercially the Concorde programme has always assumed a worldwide ban on supersonic flight over populated areas and such a ban is reflected in route analysis and economic studies carried out for potential customers.

Today some 73 per cent of intercontinental services fly over unpopulated areas such as oceans and deserts and with minor re-routing this can be increased to 80 per cent. Moreover, from takeoff the Concorde takes nearly 100 miles to reach supersonic speed at an altitude of 36,000 feet. Distance consumed in deceleration and descent for landing is even greater. So a Concorde operating from a major coastal airport such as Bombay

will be well away from land, yachts and motorboats when a boom is produced.

A sonic boom of moderate intensity produced by Concorde—two pounds per square foot—may not have any physical ill effect on fish and other sea life. Neither will it cause material damage to any building that will withstand the level of vibration encountered in everyday life by a truck passing on a nearby freeway. But the sonic boom is a sudden and startling noise, and the makers of Concorde have assumed in their market surveys that only subsonic operations would be permissible over the populated territories.

A number of alarming prophesies have been made about the possible effects that commercial supersonic operations might have on the atmospheric balance in the stratosphere. These forecasts include

suggestions that supersonic flights might affect world climate by setting up a permanent cloud barrier in the stratosphere or that water vapours from a supersonic engine might erode the ozone layer in the stratosphere and so let through harmful ultraviolet rays.

Concorde offers the argument that the circulation and cleansing mechanism of the atmosphere has demonstrated its ability to cope with the effect of such natural phenomena as major volcanic eruptions which suddenly inject into the stratosphere vast quantities of pollutants. In the Krakatoa explosion in Central America for instance, the destruction of an island containing 14 cubic miles of rock is considered to have placed on the stratosphere its greatest burden in recent times. The altitude attained by the debris was 150,000 feet. The residue circled the earth

for nearly one year. In this case the disturbance created by several cubic miles of water, chemicals and solids interacting with sunlight for more than a year, caused no noticeable effect on long term temperature cycles, world weather or life on earth.

Concorde estimates that 1,000 years of supersonic flights would be required to match the adverse effect in the stratosphere of the Krakatoa explosion, which in turn was not even noticed.

In respect of smoke, the final form of the Concorde is not expected to generate smoke, nor will it dump unwanted fuel from the drain tanks. Mr Allen asserted: "The company will offer the plane to the world airlines on the specific understanding that any possible environmental problem it might create would be our responsibility and we will resolve it."

The pound in W. Europe

E. B. Brook

Vienna.

WESTERN EUROPE is, at the moment, in almost as unsettled a frame of mind as it has experienced for a long time. Just when it should be settling down for its summer holidays till mid-September the British, threatened again, by a flight from their currency, allow the pound to float and the French, by their well-tryed technique of a political sulk, put the immediate future of fixing details for the Common Market's enlargement in doubt.

The most significant reaction has been the almost universal effort for self-reassurance; apart from the Danes who have also floated their kroner and the Italians who had to ask help to keep their lire within the agreed currency exchange limits, everyone has been saying the floating pound will not hurt them. Several nations, notably the French and the Spanish, took hurried opportunity to be nasty to the unfortunate British tourists in their midst; others, notably the Austrians whose economy is sizeably tourist, took pains to make the tourists' loss as small as possible. But, these national reactions apart, no one is really deceived — even by favourable OECD reports on their economies — that the marked and sustained weakness of two leading world currencies, the pound and the US dollar, cannot but effect their own well-being in the short or the long run. As behind the universal reassured smiles there is equally universal anxiety.

The extent of the British float has still to be seen in its full extent. Keeping their traditional stiff upper

lip, which must by this time be feeling somewhat strained, the British take their favourite effective devaluation number at 2.40 US dollars to the £, which was the value they should have insisted on in Washington last December, or approximately a 10 per cent devaluation. But this spartanly cheerful evaluation overlooks the fact that since the last British devaluation of 15 per cent in 1967 the dollar has been devalued against the rest of the world so that, allowing also for a small British revaluation of less than 2 per cent in December 1971, a further 10 per cent devaluation of the £ would mean a decrease in its value of at least 18 per cent compared with the pre-devaluation rate in 1967, only five years ago.

bleak outlook

When to this distressing fact is added the uncertain further strain on the pound when Britain joins the Common Market in six months' time the outlook for Britain is a good deal less than reassuring and a good deal less than certain also for all the other west Europeans.

The most encouraging development, apart from the spitefulnesses and meanesses that always show up on these occasions (and the British must remember that they were hated in France during the 1920s when the franc was having such serious and sustained trouble that their neighbours could actually take a short holiday with them and make a small profit on it) was that Europe did not

panic and was, at least officially, uncritical and cooperative.

This was the first time in west Europe when a major currency crisis did not lead to some very nasty wrangling. This time instead of falling apart, several European states — the Germans, Belgians and a few Frenchmen — rallied to support the pound by keeping to their contractual obligation to accept Britain's unwanted dollars as eventual payment for their support of sterling. This mandatory aid by central bank intervention has been used with intelligent flexibility and has set a very valuable precedent for a truer European integration. The avoidance of wrangling and recrimination at the Luxembourg meetings, also, was a big advance on last year's disagreements between that standard-bearer of Common Market financial policy Professor Schiller of Germany, and M. Giscard of France. Herr Schiller by accepting French insistence that the European central banks support the lira, keep the narrow margin allowed for official fluctuations in being and preserve European financial harmony has helped fend off what could have been a very threatening extension of the British float. Statesmen have, in fact, been very far ahead of many commentators in their understanding and helpfulness in an unsettled situation.

The biggest area for encouragement is that the British and the French have officially passed the first test of their policy friendship within the framework of the Common Market and have at least

prevented a step back from the prospect of a common monetary policy.

But each State is naturally and properly self-protective. West Germany's clear political objective must be to try to keep its own exchange rate undervalued and to maintain its balance of payments in considerable excess surplus. It is the more certain to take this line because in less than five months West Germany will have a general election with uncommonly sharp political contention and an almost vicious challenge to the present socialist government. The French interest will certainly concentrate on protecting French exports and a protective import policy — especially against the challenge of a cheaper pound — and on checking an inflow of investment from the United States. The Japanese have already clamped down with inward exchange controls and will try every means to maintain their almost miraculously large export surplus. The Italians, who will have a heavy bill to pay their colleagues for their support, have taken immediate steps to stop any more fugitive lira crossing the Alps into financially more secure Switzerland. The Swiss have stolidly refused to buy US dollars at their proper rate and have so diverted a still larger flood of them to Frankfurt.

ending uncertainty

With continuing uncertainty and an almost certain further floating downwards of the pound, with the added uncertainties implied by coming elections in the United States, in Federal Germany and, later, in France, many in west Europe fear that the early show of solidarity may not last, that the measures of mutual support may not be sufficient and that, in any case, it would have been healthier, if even more nerve racking, to allow the exchange market freely to indicate real values. Many German bankers are disturbed by the imposition of yet more exchange controls; they and many other bankers would have preferred to see a joint upward Common Market float against the US dollar.

The basic danger is in Europe, and elsewhere, that people after so many changes of exchange rates, bank rates, control measures and international monetary schemes, have lost confidence in the prevailing pattern of international exchange rates and see in floating the currencies the only way left to discover what they are really worth. A strong dose of reassurance is badly needed by the public, by investors and by banks themselves and, at the moment, it is by no means clear where it is to come from. The more reassuring talk, without reassuring action, there is from the British and others, the less will the public and the banks feel secure.

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

Stain-proof, easy to clean and polish, Linoleum comes in a wide range of colours and designs. Choose yours.

ASPL-5

What is this man, Mr

Zulfikar Ali Bhutto? Is he a fantasist or a congenital liar? He told a crowd in Lahore that during his stay in Simla he chose to sleep on the floor and not on a cot because of his agonized awareness of the sufferings of the Pakistani prisoners of war in Indian camps. It appears, however, that Mr Bhutto did not in fact undergo any such self-imposed penance. On the contrary, his bed in his suite at Himachal Bhavan was duly slept in. This was as it should have been. So much care, after all, had been lavished by his hosts (and hostess) on the decor of his room.

The Jana Sangh has

taken a view which is critical of the Simla agreement. As a political party functioning in a democratic political set-up it has every right to express its point of view through all legitimate forms of protest or demonstration against this agreement. I do not see what justification there is for Congressmen in the capital to take it upon themselves to stage a violent confrontation with the Jana Sangh on this issue. The ruling party is free to support the government on the Simla agreement and mobilise public opinion in favour of the government's policy. This it could certainly have done without its local bosses and their followers going to the office of the Jana Sangh in New Delhi and demonstrating in front of it. The Simla agreement is not a sacred text. Nor is it self-evident that those who are in its favour can uphold its divinity only by making it impossible for unbelievers to have their say. The attitude of the Congress party in the capital becomes all the more objectionable when it is related to the fact that its ruling party status gives it unusual, extraordinary and unjustified advantages in terms of the liberties it may take with law and order.

Writing in this column

on June 23 I referred to Rajaji's demand that the central government should publish the report allegedly drawn up by the CBI about the Tamil Nadu chief minister if only to allay, as Rajaji put it, "the strong public suspicions that Sri Karunanidhi cannot defend himself against what

that report brings up". One of the popular Tamil weeklies, commenting on Rajaji's observations, was tactless enough to suggest that Rajaji would not have made such a statement without justification. As was only to be expected, the chief minister vehemently took issue with both Rajaji and the journal and he demanded reasonably enough that his detractors should not trade in insinuations but boldly come forward and spell out the charges against him so that he might proceed against them in a court of law for defamation. Unnerved obviously by the ferocious blasts of his fury, the journal concerned promptly published what some may consider a grovelling apology. Rajaji, however, has remained unrepentant and has cryptically written in *Swarajya* (of July 1) that "I repeat what I wrote some time ago that it would be in the public interest for the central government to publish the CBI report about Tamil Nadu affairs instead of leaving people to guess what it contains".

While speaking of 'Swa-

rajya' of July 1, I would like to share a delightful vignette, also from Rajaji's column in that issue, which relates to the election of Mr Piloo Mody as the President of the Swatantra Party on June 24. Writes Rajaji:

"When I tendered my blessings and good wishes not only on my behalf but also on behalf of his father, Sir Homy Mody, who was a great friend of mine, Shri Piloo Mody came up at once and bowed to me seeking my blessings. No camera took the picture but the charming scene will ever remain vivid in my memory".

It had not occurred to me before that Mr Piloo Mody's posterior was particularly photogenic, but then, handsome is as handsome does.

Among the advantages

of reminiscing is the opportunity it gives one of being selective and recounting only such anecdotes as are flattering to oneself. Mr P. L. Bhandari, formerly of the Indian Foreign Service, who writes entertaining pieces in the magazine section of *The Sunday Statesman* about the days he had spent abroad as a diplomat lying for his country, tells us in the issue of that newspaper dated July 2 of the fun and games

he had with a go-getting businessman of Indian origin in Lagos where Mr Bhandari was serving a term as Our Man in Nigeria. It appears that this businessman was caught by Nigerian customs in an attempt to smuggle an expensive diamond ring into Nigeria while returning from London where he had gone on a visit and that, having by then struck up a nice and useful acquaintance with Ambassador Bhandari, he more or less naturally made a bee-line to him and requested him to intercede on his behalf with the Nigerian authorities. Let Mr Bhandari tell the rest of the story in his own words:

"I told him I would see what I could do, and as I was calling on the Chief Justice that morning, I mentioned the matter, pointing out that Motilal was one of our community's leading lights, that he was a generous contributor to all charities and worthwhile causes, and that, so far as I was aware, he was a law-abiding citizen and a person deserving of the benefit of the doubt. The C.J. merely nodded his head but when I learned later that Motilal had been let off with a small fine, it was clear that my recommendation had had the desired effect."

This, of course, was not the end of the affair. Some time later Mr Motilal, not wanting to sleep too long on a favour received, went to Mr Bhandari with two return air tickets to Las Palmas where Mr Motilal happened to have a villa. The suggestion that the ambassador might take a holiday, all paid, was duly and sternly spurned and this, I presume, is the point of Mr Bhandari reminiscing about the misadventures of Mr Motilal. What intrigues me, however, is at what point exactly propriety begins. Is it, for instance, all right for an ambassador to plead for a suspected smuggler with the chief justice of the country to which he is accredited?

A cause becomes merely

a case when, it is argued out of selfishness. What repels me in the protests of rich newspapers against newsprint restrictions is the stench of greed that goes with it. Recently *The Hindu* notified its readers that it was not publishing some of the university examination results because of page restrictions. In the same issue, however, there appeared quite a few display advertisements. *The Hindu* is affluent enough to have forgone such advertisements for a few days in order to spare space for maintaining what is after all an essential service to the student community. I suppose that the public interest always comes first — i.e., in the sense, that it is invariably the first casualty.

The fourth volume of *Surveys of African Economies* contains surveys of the economies of the Democratic Republic of Congo, the Malagasy Republic (Madagascar), Malawi, Mauritius and Zambia. They are all developing countries and are illustrative of the different types of economies found in Africa.

All these countries attained independence in the early 1960s, except Mauritius which became independent in 1968. These countries experienced varying rates of economic development during 1960s. The expansion of real income exceeded the growth of population in Zambia, Malawi and Madagascar, but not in Congo and Mauritius. Available data suggest that there are marked differences in per capita income in these countries, ranging from roughly \$ 50 a year in Malawi to over \$ 200 in Zambia.

structural similarity

The five countries surveyed have certain broad structural similarities. Agriculture, chiefly of the subsistence type, constitutes the principal means of livelihood. While the contribution of manufacturing industries to gross domestic product varies, it is nonetheless small and consists largely of primary processing of agricultural or mineral products and the production of simple consumer goods and import-substitute variety. Each country is an exporter largely of primary products which is mainly mineral in origin in

Congo and Zambia and agricultural in origin in Madagascar, Malawi and Mauritius. The export sector is the single most important factor determining the developments in the economy.

significant differences

These similarities however cloak significant differences in the kinds of problems faced by each country as well as its prospects for future growth. Thus, while each country's economy is heavily dependant upon the export of primary products, there are sharp differences in the extent of product diversification. Although Zambia and Congo are both primarily exporters of minerals, in 1969 copper accounted for 95 per cent of Zambia's exports compared with 60 per cent for Congo which also exported other minerals such as cobalt, industrial diamonds, tin and zinc as well as agricultural products such as coffee, palm oil and rubber. Therefore, while Zambia is basically a mining economy, its dependance on a single export commodity makes it closer in some respects to Mauritius, an agricultural economy where export of sugar accounts for about 95 per cent of total exports. But Zambia, unlike Mauritius has potential for diversifying the agricultural and mining sectors and possesses an abundant supply of land. Madagascar and Malawi also depend largely upon agricultural exports; unlike Mauritius however their exports are well diversified consisting of coffee, rice, clo-

ver and sugar in Madagascar and tobacco, tea, groundnuts and cotton in Malawi.

The problem of economic development encountered by these five countries differ considerably ranging from the need to strengthen the economic infrastructure in Congo to the need to broaden the production base in Mauritius. In addition, there are problems common to all these economies of expanding the size of the monetized sector, promoting the growth of manufacturing and related activities to help absorb increase in population, developing the agricultural sector and reducing the vulnerability of export earnings through diversification of production and exports. In fact these are the problems encountered by virtually every country on the African continent.

strengthening infrastructure

As regards economic policies pursued by these five countries, the principal thrust of the economic policies of each country has been toward the strengthening of infrastructure, diversification of the export sector, broadening of the production base by encouragement to manufacturing industry and promotion of agricultural diversification. The success attending these efforts so far has varied from country to country, the results reflecting not only differing resource endowments but also such factors as the inflow of foreign capital, fluctuations in export earnings resulting from natural causes or price behaviour on international markets and the difficulties faced in mobilising domestic savings. In implementing their economic policies, these countries have employed a variety of instruments including direct state intervention and joint ventures with private foreign and domestic interests. Reliance on foreign official loans and grants has been substantial in Malagasy Republic, Malawi and Mauritius, not so great in Zambia and relatively little in Congo.

Import and export taxes are the principal sources of government revenue in these five countries. However, the relative importance of the import and export sectors is not the same in all the five countries. Export taxes are of primary importance in the revenue structures of

Reviewed by
Academicus

Congo and Zambia; in addition a significant contribution is made in these two countries by income and corporate taxes levied on the mining sector. Income taxes paid by sugar producers are a major source of revenue in Mauritius. By implication therefore the fiscal situation in these three countries is significantly affected by fluctuations in output and in earnings of the export sector. The revenue structures of the Malagasy Republic and Malawi however are characterised by a much greater dependence on import duties and hence on the level of imports. All the five countries have generally been in deficit as regards overall budgetary operations, though Malawi and Mauritius have made considerable progress in reducing the persistent deficits in their current budgets. The ratio of central government tax receipts to gross domestic product at current prices varies quite markedly, ranging from 10 per cent in Malawi to 34 per cent in Zambia.

With the exception of Congo, the monetary systems of these countries reflect their membership in larger currency areas—the French franc area in the case of the Malagasy Republic and the sterling area in the case of Malawi, Mauritius and Zambia. With the exception of Congo during the period 1960-66, monetary policy in these countries has been fairly successful in keeping the growth of domestic credit within acceptable limits as evidenced by the generally moderate price movements and by the continued maintenance of relatively liberal trade and payments systems.

Commercial banking in all these countries has been concentrated, as a rule, on the financing of trade and commerce and the short-term financing of crops, though there is some short-term lending to other sectors like manufacturing. Most of the commercial banks are foreign owned, but in Malawi and Zambia the government has a substantial participation in the banks.

colonial ties

The international trading pattern of each country continues to reflect its ties with the country that administered it before independence. The only countries of this group that have generally enjoyed a surplus in the balance of payments, both in goods and services account and overall, are Congo and Zambia. The other three have usually had a deficit on goods and services account. All the five countries are participants in the Special Drawing Rights (SDR) facility established by the IMF.

In general, the prospects for the continued economic development of these

countries appear to be promising. This is particularly so in the case of Congo which has vast and varied resources, both agricultural and mineral and low density of population which is only 18 to the square mile. Although Mauritius is burdened with severe population pressure (1100 to the square mile) and heavy dependence on production and export of sugar, there is potential for the development of other sectors, especially the tourist industry. The Malagasy Republic has varied agricultural and livestock resources and there is active prospecting for petroleum, bauxite and nickel. Zambia is well endowed with mineral resources and possesses an agricultural sector which has good potential. Malawi, though considerably smaller and with a greater density of population, has the advantage of varied agricultural resources. All in all, in all these countries except Congo, the small size of the domestic market has been acting as the main constraint on the expansion of manufacturing industries.

Like the other three volumes of *Surveys of African Economies* (which have all been already reviewed in these columns), this volume also contains excellent analysis and account of the five countries in Africa giving the readers a comprehensive picture of these developing economies. The reading of this volume will certainly broaden our understanding of the African continent which is now awake and has been experiencing the new winds of economic change.

CO-OPERATIVES IN AGRICULTURE

A satisfactory rate of expansion in agricultural output is essential to achieve the ideal of growth with stability aimed at in the fourth five-year Plan of India. With this end in view, High-Yielding Varieties Programme (HYVP) marks a turning point in the modernisation of Indian agriculture. But HYVP in cereals should be taken only as the forerunner of a more comprehensive green revolution for which the country has been preparing for so long. On the basis of present experience, it has become necessary to tone-up especially the organisational side of the programme and this is precisely what this small but excellent book deals with. Dr Tewari in his *Agricultural Planning And Co-operatives* has made an attempt to study the suitability of the process of planning and the mechanism for implementing a co-ordinated High-Yielding Varieties Programme in Rajasthan, to examine the validity of the co-operative structure in the state at the primary level, to assess the role of viable co-operatives in HYVP and to elaborate the deficiencies in the existing planning procedures of HYVP in Rajasthan. The

problem has been studied with reference to the three districts of Alwar, Bundi and Udaipur in Rajasthan, the author concentrating his attention on 30 co-operatives for intensive study.

Dr Tewari has arrived at some very significant conclusions. According to him, the study establishes that the whole process of HYVP planning is, by and large one-way traffic originating at the top and percolating to the bottom, even the target for additional agricultural production in the state being decided by the central government! The breakdown of the target to lower levels is a mechanical process being accepted by subordinate agencies as a matter of routine. In more than one ways, the HYVP is basically a seed-fertiliser revolution in which water management and multiple cropping has received low priority. This tendency is visible at all levels.

scarcity conditions

The author has emphasised that the agricultural policy in the state has hindered the growth of private trading in inputs like seed and fertilisers and in effect this public sector monopoly has created more often than not a scarcity condition within a plentiful supply position at certain locales. Creation of suitable sale depots for agricultural inputs in the rural areas has thus been neglected. The existing co-operative agencies have no motivation to go to the consumer. Very recently the state has permitted private trading in these inputs, the effects of which can be assessed only after some time.

As regards the implementation of HYVP, the multiplicity of departments which are zealous to maintain their separate identity have hindered co-operative efforts at the field level. The organisational set-up and the technical staff, particularly at the panchayat samiti and village levels, are thoroughly inadequate. The author is of the opinion that these officials should be put through a regular in-job training programme in agriculture with a strong practical bias. According to him the existing multi-purpose orientation and training deserve to be substituted by specialised work.

According to the author, in the implementation of HYVP, pressure points emerge really at the village level. Actual distribution of seed and fertilisers with supervision at the field level remains the most neglected part of the programme. Pinpointing specific responsibility for various failures has eluded the administration, the general tendency being to blame the bottom level worker, as if he

was the one person entirely responsible for the failure!

As regards credit operations it was found by the author that a major portion of the requirements of the HYVP was met by the farmers out of their own resources. Borrowing per acre from co-operatives under HYVP was too low compared to the scale of finances recommended as the minimum to obtain the 'package of inputs' for cash crops. The financing arrangements under HYVP was not popular with the borrowers. This underutilisation of the sanctioned credit limit indicates that the credit policy could not be geared to the level that HYVP required. This speaks poorly of the institutional financing arrangements. Since 1966 attempts are being made in Rajasthan to reorganise co-operatives and make them economically viable. It was estimated that the potential loss due to the non-fulfilment of credit business target in the three districts alone in 1968-69 amounted to Rs 5.21 crores. Keeping in view the scarcity of resources in the state and the demands of the growing agricultural sector, these losses and failures are truly staggering.

inefficient organisation

The author is of the opinion that for long the agricultural sector has lived with an inefficient form of economic organisation. Realism demands that the policy should be positive and dynamic. It should be realised that the problems of small farmers cannot be solved solely by resorting to co-operativisation. Attempts will have to be made to build-up an infrastructure more favourable to small farmers and open up economic alternatives beyond their farm operations.

On the basis of his analysis and findings Dr Tewari has put forward some very practical suggestions. He is of the opinion that at the district level there should be a district production board with a full-time senior officer at its head and the departmental identity of development department, district agricultural office, assistant registrar of co-operatives, minor and medium irrigation works department and district industrial office should be completely submerged in this board which alone should be held responsible for failure or success in agriculture and allied activities. HYVP planning and implementation should be one of its duties. State level officials and respective directorates should act only as supervisory establishments and for maintaining co-ordination of inter-district working. The board should have the expertise and autonomy to work out its programmes in conformity with the commitment of the state.

As regards the co-operative structure,

the author is of the opinion that after fixing the individual credit limit, the member should be given a negotiable voucher for kind inputs with the option to exchange these with any licensed dealer in the region. Regarding the actual utilisation of inputs, suitable checks and balances should be worked out with particular emphasis on inspection at the farm level. This arrangement will greatly facilitate input supply and encourage its use while at the same time develop free trade based on consumption. Also co-operatives should have an aggressive policy to weed out defaulting members. This step will induce farmers to be prompt and regular in repayment which also will promote productivity. The author has made a novel suggestion that a purpose-oriented interest rate policy charging a lower rate of interest on loans for productive purposes favouring farmers up to 15 acres of land and a higher rate for others should be thought of.

There is no doubt that HYVP has been functioning in most of the states in a haphazard manner and if the programme continues in its present form, it will soon exhaust itself away. And therefore to exploit its vast potentialities, a critical assessment of the programme was called for. Dr Tewari has done full justice to the problem and what he has suggested for Rajasthan is equally applicable to other states with local adaptation. Dr Tewari by this book has made significant contribution to our knowledge of agricultural problems and practices in India and therefore deserves compliments. Similar studies in other states are urgently called for to strengthen the foundations of the green revolution.

PUBLIC ENTERPRISES

As the title indicates, *Performance of Public Enterprises* contains the papers regarding the performance of public enterprises in India read at the Indian Economic Conference held at Gauhati in 1970. There are 23 papers in all dealing with various aspects of the problem. Here it is possible to draw attention to some of the more important papers only.

M. M. Khullar tries to answer the criticism about the poor performance by the public sector. He emphasises the social costs and benefits and not merely private costs and benefits and therefore would like to eliminate the profit criterion. S. N. Sinha on the other hand makes an attempt to calculate the total returns to the public exchequer by way of dividends, interest and taxes from investments made by government in these enterprises and concludes that the performance of the undertakings is very disappointing.

M. Balasubramaniam, using the data

for 1967-68, analyses the results by main categories such as engineering, chemicals and so on, but is unable to point out why different types of public enterprises show varying results. According to him, possible factors responsible for this are low utilisation capacity, inadequate attention to preventive maintenance and ineffective control over consumption materials.

limitations of profitability

S. C. Nandvani points out the limitations of profitability as a criterion of performance and yet emphasises the importance of profit-making in spite of these limitations. He takes a summary look at the performance of some of the public enterprises and emphasises the importance of shadow prices as an indispensable tool of analysis. R. K. Sinha gives data about the investment and financial results of various public enterprises and concludes that it will be difficult to generalise about public enterprises as many of them are functioning well and have made a tremendous impact in strengthening the foundations of our economy. R. L. Pitale thinks that it is necessary to lay down basic principles for the evaluation of the performance of the public sector enterprises. His main point seems to be that the products of public enterprises and other government activities affect the level of profitability in the private sector and therefore analysis of public sector enterprises by themselves may not be logical and correct.

According to P. K. Bhargava the reasons for low productivity in the case of public enterprises are the rigidity of rules, low salary, over-capitalisation, over-employment and functioning in fields many of which are characterised by relatively poor returns. S. C. Patnaik has analysed the working of six large government companies in Orissa and has discussed the problem of price policy and has suggested full cost pricing for public sector undertakings.

A. C. Minocha attempting a case study of Heavy Electricals from the point of capital formation has pointed out that material management has been poor and there has not been enough attention to economising the use of capital. B. Prasad assessing the performance of Hindustan Steel has emphasised that "If products of sophisticated capital intensive steel plants are to cost more than those of comparatively obsolete plants in the private sector, there appears to be no justification for imposing these white elephants on a poor country like India." The author maintains that HSL has failed to utilise the installed capacity, its output per worker has been showing a progressive decline and that there seems to be poor

discipline as indicated by the fact that in spite of over-staffing, overtime payments are the highest in HSL.

S. C. Patnaik examining the question of pricing of the irrigational projects in Orissa has suggested the idea of a two parts tariff—a basic rate imposed on landholders of the commanded area adequate to cover the overhead cost and a volumetric rate levied on the users of water adequate to cover the running expenses. He states that "it is necessary to proceed towards a volumetric rate based on marginal cost as a long-term objective to be realised by stages relating to the stages of agricultural development in the state." In his paper on the performance of state electricity boards, S. Chandrasekhar notes that in a number of states, the average price charged per unit of electricity has been lower than the average cost of production and yet the capacity has not been fully utilised. He emphasises the importance of running these undertakings on business lines. K. K. Sinha has pointed out that in his view the scope for capital formation through public enterprises is limited in a mixed economy.

As a rapporteur, H. K. Paranjpe has raised some very interesting questions which he wants the social scientists to consider. He has pointed out that the basic question in attempting to assess the performance of public undertakings is: what is the objective of the government in setting up the enterprise? What is that the government expects from it? Unless this is clearly defined, proper evaluation of the undertaking is obviously difficult.

major difficulty

The major difficulty in assessing the performance of public enterprises in India has been that "the objectives of public enterprises have been defined by different authorities and at different times in different terms." The result is that nobody is clear about the criteria by which their performance is to be judged. If the electricity board is expected to electrify as many villages as possible in a given period, should the performance be judged on the basis of profits or losses made by that board?

The same is true of the housing boards, the state transport, state trading corporation, commercial banks and other public undertakings. This is a just an appropriate approach and different criteria should be evolved by the government and social scientists to judge the performance of different types of public enterprises instead of just employing the criterion of profit to all of them. And yet even H. K. Paranjpe cannot deny, in view

of the vast unused capacity, over-staffing, heavy inventory and unsatisfactory labour-management relations, that the public enterprises in India could have produced things and services more cheaply than what they have been doing at present. In a poor developing economy, resources are necessarily scarce and must therefore be made the maximum use of. And therefore though a standard profit criterion may not be acceptable as a test of the performance of different public sector enterprises, the fact remains that there is enormous wastage of resources involved in most of the public enterprises in India.

This small book gives a fairly comprehensive picture of the different issues involved in judging the performance of public enterprise though the reader gets no definite answer to the problem of measuring their performance.

BANGLADESH

The emergence of Bangladesh has been an event of the greatest significance in the recent history of India. It has naturally stimulated a series of discussions and studies on various aspects of Bangladesh such as its economic viability, its economic prospects and future and its possible economic relations with the neighbouring countries, notably India.

Bangla Desh Economy—Problems and Prospects is the first book of its kind on the subject examining critically some of the basic issues such as reconstruction of Bangladesh economy, its industrialisation, food problem, trade and aid prospects, its economic co-operation with India and several other issues. The essays have been contributed by several eminent scholars in India and the book contains a masterly introduction by Dr V. K. R. V. Rao who has done well to bring out this volume at this opportune moment.

A. Sengupta and P. L. Verma have dealt with the economic history of Bangladesh when it was part of Pakistan and the manner in which its differential treatment brought about disparity and laid the foundation for economic despair which was partly the cause of the movement that finally brought about the separation and liberation of Bangladesh. According to the authors the initial position did not present any significant differences which at best were only marginal. The differences in treatment of the two wings began almost from the inception of Pakistan. With a system of import licensing and foreign exchange allocation, much depended upon government policy in determining both location and growth of industries in Pakistan.

Apart from the direct absorption of

East Pakistan's foreign exchange surplus for the development of West Pakistan, a part of this surplus was also drained off to West Pakistan by the sale of its manufactures to East Pakistan. In addition almost the whole of the foreign aid received by Pakistan in the earlier years and a major portion in subsequent years was used for the development of West Pakistan. Further, out of Rs 346.6 crores spent during ten years ending with 1959-60 on planned economic development of the country, the share of East Pakistan was only Rs 105.6 crores or less than 31 per cent and per capita expenditure about one-third of that in West Pakistan.

Another point of significance is the larger volume of private investment in West Pakistan which was due to discrimination in infrastructure facilities, commercial and industrial licenses, foreign exchange allocation and general government support including public expenditure. Thus private investment in West Pakistan during this period was Rs 537 crores as against Rs 237 crores in East Pakistan, in addition to 79 per cent of government expenditure in that wing.

The consequence of all this was that between 1949-50 and 1959-60 per capita income in East Pakistan rose only by 0.7 per cent a year as against two per cent in West Pakistan. In 1969-70, the per capita income in East Pakistan was Rs 339 as against Rs 500 in West Pakistan. The authors are of the opinion that East Pakistan was treated more or less like a colonial appendage of West Pakistan and thus in addition to cultural and other discrimination, suffered at the hands of the rulers of West Pakistan.

suggested measures

Other essays in the book deal with the problems which independent Bangladesh faces and the possible measures that could be adopted to deal with them.

Dr P. C. Joshi deals with the problem of agrarian relations and the need for giving priority to the implementation of suitable land reforms. Dr Ganguli emphasises the need to give immediate attention to agriculture, fisheries, poultry farming, animal husbandry and plantation agriculture in Bangladesh as also the importance of devising new agricultural varieties to suit climatic and other special features of the state and the possibilities of joint work by India and Bangladesh on the development of inland waterways.

Dr B. B. Bhattacharya has contributed a well documented paper on the external trade of Bangladesh. He has pointed out the difficult nature of the jute problem

that will now emerge with India and Bangladesh functioning in their new relationship of mutual regard and co-operation and suggests the possibility of the two countries setting up a jute community to handle their common problems of jute export. He has also discussed the possibility of India providing an alternative market and an alternative source of supply for the change that may take place in the exports and imports of Bangladesh in view of its strained relations with West Pakistan.

Dr A. M. Khusro has analysed the criteria that should be followed by India in developing its trade and investment relations with Bangladesh rather than the details of its trade and investment projects. He wants India to help promotion of exports from Bangladesh and has warned India against trying to replace its imports of manufactures from West Pakistan by Indian supplies, except to that extent that they cannot be produced in Bangladesh. While he is not against resuming the pre-partition trade with Bangladesh, he would put in a strong qualification that this should be done 'only if comparative advantages still lie in that direction'. Also taking in view our experience with foreign investments, he has suggested that lines of credit should be on government-to-government basis rather than through private sources. He has warned that whatever financial or technical aid is to be given to Bangladesh it should be only at the request of Bangladesh and in no case should India create the impression of extending Indian influence over that country.

suggested programme

Prof Sengupta begins by cautioning that India's own potential is limited and her ability to help Bangladesh reconstruction is small. He has therefore suggested a substantial programme of imports, a big programme of domestic procurement and immediate introduction of rationing throughout Bangladesh. He has also traced the problems that will arise with the attempts at reconstruction and points out the special need for preventing private trade from profiteering. He has also advocated nationalisation of banks. He deals with the immediate needs of agriculture in Bangladesh in term of fertilisers, pesticides and credit. Referring to manufacture, he points out that the immediate problem is one of getting production activities moving again and the need for immediate repairs to damaged plants, imports of destroyed items and giving credit and confidence to those in charge of production. He hopes that Bangladesh with its newly won independence would generate the sacrifice and dedicated efforts necessary to solve its

problems of economic reconstruction and regeneration.

Prof Chattopadhyay deals with the subject of not only the reconstruction of Bangladesh but also the related reconstruction of India. The author is in favour of mutual co-operation and integrated action for mutual benefit such as in the development of hydel power, development of inland waterways, flood control and setting up of jute community and possibly a tea community as well, if Ceylon is agreeable. He favours a perspective plan for the whole of the Lower Brahmaputra-Ganges basin that includes both Bangladesh and neighbouring parts of India.

Dr V. K. R. V. Rao has expressed his opinion that a bright future awaits both Bangladesh and India especially in the eastern region, if there is mutual understanding, mutual faith and mutually beneficial but co-operative and integrated action on the part of both the countries. Nature has given a certain identity of interests which political boundaries need not prevent full advantage being taken of for the lasting welfare and mutual benefit of the peoples of the two countries.

comprehensive idea

The book gives the general readers a fairly comprehensive idea of the nature of the economy and of the problems being faced by Bangladesh. Many essays however smack of superficiality as they are couched in very general terms. As regards policy prescriptions, most authors have tried to see things in Bangladesh in their own image which is a common human failing. Because certain policies failed in India, the authors assume that those policies will be inapplicable to Bangladesh. When an author speaks of establishing the economies of the eastern region of India and Bangladesh on the basis of comparative advantage, he clearly betrays immaturity.

Most of the authors while proclaiming that we must allow Bangladesh to shape its own policies and its destiny and that Indians must not impose their own views and will on them or even create that impression, have been presumptuous enough to advise Bangladesh on all matters including the policies which it should follow. Who are these people to tell Bangladesh to nationalise their banks, introduce land reforms and rationing and prohibit private trading? Giving gratuitous advice to the world at large seems to be in our blood and it is this trait that is likely to embitter our relations with Bangladesh in the long run. The authors seem to be even unaware of the

contradiction in which they have been indulging.

While welcoming events of 1971 in Bangladesh and hoping for bright future for the entire eastern region of the Indian subcontinent, our thoughts must be sobered by the events that took place in the latter part of 1940s in the same area.

FARM FINANCE

In view of the high hopes placed in the new strategy of agricultural development for achieving food self-sufficiency in India, there is the urgency to increase the area under irrigation and double cropping. Intensive efforts will have to be made to step up investment in private lift irrigation projects to achieve the above objectives and adequate and satisfactory arrangements will have to be made for the provision of finance to farmers with necessary long term capital to create facilities for irrigation. It is pointed out in *Some Aspects of Long Term Co-operative Agricultural Finance* that to this end, land development banks (formerly known as land mortgage banks in Gujarat and other states) can make a significant contribution.

The land development banks (LDB) in the country have been advancing long term loans to farmers for these and other developmental purposes for a considerable time. It is known that the effectiveness of these banks has not been uniform in different states. Also, little is known about the pattern of utilisation of loans taken by farmers from the LDBs. The present study is an attempt to throw light on these two aspects so far as they relate to Gujarat. The study was carried by Dr N. S. Jodha and Mr M. L. Bhat.

The present study focusses attention on the factors that have enabled the LDB in Gujarat to function effectively. For example, the study points out that the unitary structure of the LDB in Gujarat which is rather uncommon in the country has proved to be eminently suited for carrying out the programme of LDB in an effective manner. Other factors responsible for the successful working of the LDB in Gujarat are largeness of resources, uniformity of policy, appointment of competent and adequate staff and financial incentives that the staff were provided. The study however has revealed that the major factor has been the dynamic and forward looking leadership at the various levels of administration of the LDB in Gujarat.

The long term advances of the LDB in Gujarat have expanded considerably over the years. Between 1956-57 and 1967-68 the advances of the LDB increased about 14 times, the advances in

1967-68 standing at Rs 16.70 crores and the regular membership of the bank in the same year being 3.9 lakhs. It is to be specially noted that the benefits of these loans have been received by small as well as big farmers, though on account of the special criteria adopted for determining credit limits, the advances received by small farmers form relatively smaller proportion of the total loans granted.

It is to be noted that the LDB in Gujarat has been fairly successful in floating rural debentures. But as the study shows the success of LDB in this sphere appears striking only in contrast to the poor performance in this regard by LDBs in other states. The study has emphasised that the LDB needs to make more intensive and imaginative efforts to further popularise rural debentures.

As regards loaning procedures of the LDB, they are found to be cumbersome and in some respects superfluous. The study has emphasised that if these procedures are simplified and shortened, the benefits of long term loans will perhaps be taken by many more farmers.

Another important suggestion which the study makes is the setting up of a cell in the LDB for techno-economic surveys. This cell should conduct feasibility surveys in different areas of the state of Gujarat, as such technical studies would be helpful in properly assessing repaying capacity of borrowers which at present is determined rather unscientifically. The study has further shown that the extent of diversion of loans to other purposes than the one for which loans were taken is happily small.

Easily this is one of the finest studies the reviewer has come across on long term co-operative agricultural finance and should prove extremely useful not only to policy-makers but also to academic researchers who get here an excellent model for search on this subject in different states. Co-operation appears to be in doldrums and especially LDBs in most of the states are in a hopeless condition. It is a happy thought that LDB in Gujarat is an exception. This critical study of this bank should therefore provide answers to problems faced by LDBs in other states.

SPIRALLING PRICES

India's economic development during the last one and half decade has been characterised by rapidly rising prices. It is well-known that the erosion in the value of Indian rupee which commenced since 1955 has destroyed approximately three-fifth of its value. In spite of the completion of two decades of economic planning,

our monetary and fiscal policies have completely failed to tackle the problem of rising prices. The present book by Dr Suraj Bhan Agrawal in his *Price Trends in India* aims at highlighting the inflationary trends in the Indian economy and their impact on the structure and growth of Indian economy up to the first half of the fourth Plan period.

The analysis of price trends during the period of planning in India suggests two distinct trends: the one downward starting in April 1951 and continuing till May 1955 and the other upturn which commenced since June 1955 and continued throughout the second, third and fourth Plan period. Broadly speaking the prices tended to be downward during the first Plan period, but registered an average annual rise of 9.7 per cent between 1955-56 to 1970-71, the compound rate of price rise being 6.2 per cent annually.

It is to be noted that the contribution of 'food articles' and 'industrial raw materials group' to the total price change was more than the weight assigned to each one of them. According to the author, the two groups which together command a weight of only 65.9 per cent in the old series (base: 1952-53=100) and 53.4 per cent in the new series of wholesale price general index contributed to it more than nine-tenth of the decline during the first Plan period and were responsible for more than three-fourth of the rise between 1955-56 and 1970-71. This incidentally shows the importance of the agricultural sector in the Indian economy.

fluctuating trend

According to the author, the study of price trends during the planning period does not convincingly prove that there is any positive and definite correlation between commodity prices and growth in net national output. Economic growth in India during the first Plan period was not only unaccompanied by inflation but was actually associated with downward trend. On the other hand, the second and third Plan periods saw pronounced up-trend in the price level, but the domestic savings were much lower than anticipated. The rate of growth of national product (compound) of 4.0 per cent and 2.7 per cent per annum respectively during the second and third Plan were also lower than the targeted growth rates of five per cent and 5.4 per cent, respectively.

Surprisingly enough it has been found that there was no correspondence between the changes in foodgrain prices and changes in the area under foodgrain crops over the planning period. The sharp declining

trends in foodgrain prices were followed by substantial rise in the area under foodgrain production, while the up-trends were followed by little or negative changes in the area under foodgrains.

An analysis of index number of industrial production and prices also does not show any relationship between changes in prices and in the production of certain important groups of manufactured articles. Thus a negative inference may be drawn that the trends in industrial production and prices were independent and generally one did not motivate the other.

Also, though both prices and imports recorded sharp rises during the last decade, according to the author, no causal relationship between the two could be established.

effective policy

There is no doubt that an effective price policy is needed for successful implementation of planning and to ensure that further devaluations are not forced upon the country due to continuous up-trend in prices. The panacea for inflationary pressures is increase in internal production of all types of goods, agricultural and manufacturing. Merely trying to meet shortages through controls will not check inflation. To curb inflationary pressures efforts should be made to bring about proportionate rise in productivity with every wage increase in the industrial sector. Emphasis should be laid on small and medium projects to bring about quick and favourable results. At the same time, concerted efforts to keep down population growth are also essential.

The author has rightly insisted that there should be a reorientation in our planning techniques so that 'our planning becomes resource based instead of target based' as it has been so far. The inflationary pressures can be subdued if resort to deficit financing is avoided and the tax structure is reconstituted to include tax on agricultural incomes. What is more, there should also be economy in government expenditure. The author opines that the dismantling of all the non-essential controls may result in considerable savings in expenditure and may stimulate economic development.

On the basis of his analysis and findings, the author has concluded that to ensure satisfactory rate of growth of the economy and of national and per capita income, the use of appropriate monetary and fiscal policies along with efforts to increase production is necessary so that monetary stability is rendered possible and infla-

ionary trends which are in evidence since June 1955 may be effectively checked.

There is nothing original or new in this book dealing with the problem of prices

in India and yet it contains a neat and fairly comprehensive summary of the material spread over a number of books. The study should therefore be of great use to students of graduate classes.

Books Received

The Inter Governmental Group on Indonesia (I.G.G.I.): G. A. Posthumus; Rotterdam University Press; Distributors: Academic Book Services Holland, P.O. Box 66, Groningen, Netherlands; Pp 68.

TRADE WINDS

British Loan to India

BRITAIN is making available to India a loan of £5,042,000 for the purchase of a 25,000 ton tanker for the Great Eastern Shipping Company of India. The ship is scheduled for delivery in 1973. The loan will be entirely free of interest or any other service charge and will be repaid over a period of 25 years including a grace period of seven years. Last year Britain extended to India two loans of over £17 million for the purchase of two bulk carriers of 75,000 DWT each by the Shipping Corporation of India and one bulk carrier of the same size by the Scindia Steam Navigation Company. At the end of the fourth Plan, the Indian Merchant Fleet is expected to carry about 40 per cent of her overseas trade.

India and Poland

India and Poland agreed to abolish visa fees for travel between the two countries. This decision was taken on July 7 at Warsaw at the opening session of the formal talks between Mr Swaran Singh, our Minister for External Affairs and his counterpart Mr Stefan Olszowski. In order to strengthen its ties with India, Poland has agreed to advance the delivery date for a 55,000-ton bulk carrier ordered by this country. The ship will now be made available to India two years ahead of schedule in 1975 in response to this country's request.

Nepal's Budget

Nepal's budget for 1972-73 shows a deficit of Rs 37.55 crores. The budget proposals have raised the revenue by Rs 34 crores over last year's revised estimates. The emphasis,

according to Mr Kirtinidhi Bista, the Finance Minister, was on taxing the rich and checking their increasing consumption of luxury goods. The yield from direct taxes on urban property worth Rs 50,000 will be around Rs 25 lakhs. The new excise duty on some of the industrial products will fetch about Rs 25 lakhs while the revision and imposition of sales tax on items hitherto exempted will yield about Rs 30 lakhs. A new tax on cars, jeeps and minibuses will bring in Rs 25 lakhs. The budget proposals indicate Nepal's heavy dependence on foreign aid. Nepal is expecting to get Rs 29.10 crores by way of aid, India topping the list of donors with a little over Rs 11 crores.

Hindustan Steel

Aggregate production from the three mild steel plants was 279,900 tonnes of ingots and 202,600 tonnes of saleable steel in June as compared to 288,100 tonnes of ingots and 222,600 tonnes of saleable steel in May, 1972.

Despatches continued to suffer mainly due to inadequate availability of wagons. In Bhilai, especially heavy stocks of more than 76,000 tonnes of pig iron have resulted in restricted operation of blast furnaces during part of the month. Total movable stocks of saleable steel at the three plants increased during the month from 97,000 tonnes on June 1, 1972 to 117,000 tonnes on July 1, 1972. Similarly movable stocks of pig iron also went up from 69,200 tonnes to 91,000 tonnes during the month. (See table alongside)

Expansion of Bhilai

A protocol for the expansion of the Bhilai Steel Plant was

signed in Moscow on July 3, 1972, by Mr V.A. Sergeev, Deputy Chairman of the State Committee for Foreign Economic Relations of the Council of Ministers of the USSR and Mr Ambadi Demodaran, Minister-Counsellor in the Embassy of India. The agreement provides for the increase of the capacity of the plant to four million tonnes of steel per year.

Import of Dry Fruit

The government of India is planning to take over the entire dry fruit import trade, eliminating private traders who have over the years made huge profits by charging exorbitant rates. The decision to set up a Fruit Trading Corporation (FTC) was announced recently by Foreign Trade Minister, Mr L.N. Mishra, at the meeting of the Parliamentary Consultative Committee attached to his ministry.

Mr Mishra also announced the government's decision to canalise the entire coir export trade through the State Trading Corporation. This was being done, he said, to safeguard the interests of coir goods manufacturers and the workers employed in this vital and labour-intensive industry so as to put it on a sound footing.

Dakar International Fair

India will participate in the forthcoming International Fair scheduled to be held in Dakar (Senegal) from February 15 to March 4, 1973. The participation is aimed at projecting India's industrial and export

capabilities and technological advancement. India's trade with Senegal has been negligible at present. Considerable scope, however, exists for expanding trade between the two countries to their mutual benefit.

Laws on Boilers

A twelve-man committee has been setup for a comprehensive review of existing laws on boilers and unfired pressure vessels and to make recommendations for their improvement. Mr K.B. Rao, Director-General of Technical Development, Ministry of Industrial Development, will be the chairman of the committee.

The committee will enquire whether the existing machinery for inspection of boiler, under manufacture and under use, is adequate to ensure satisfactory inspection and, if not, to recommend steps to improve inspecting machinery including amendment of the existing law. The committee will also consider whether the existing legal provisions are adequate to resolve expeditiously interstate differences of opinion among the inspecting organisations and differences between the manufacturers and inspecting authorities and, if not, to recommend steps to be taken for the purpose including amendment of the existing laws.

Transmitter at Gorakhpur

A 100 KW medium-wave transmitter of All India Radio costing about Rs 42 lakhs is ready to be commissioned at

Hindustan Steel : Plantwise Performance (in '000 tonnes)

Plant	June 1972		May 1972	
	Ingots steel	Saleable steel	Ingots steel	Saleable steel
Production				
Bhilai	145.0	131.0	153.0	135.0
Durgapur	49.4	25.3	54.7	42.9
Rourkela	85.5	46.3	80.3	44.7
Total	279.9	202.6	288.0	222.6
ASP	3.156	1.308	4.662	2.319

Gorakhpur shortly. The transmitter is located in an area of about 20 acres on the Gorakhpur-Maharajganj Road, and has a 115 metre high tower as its antenna. With the commissioning of this transmitter, which will operate on a frequency of 910 KHz and a wave length of 329.7 metres, an area of 80 per cent and a population of 92 per cent, in the eastern districts of Uttar Pradesh, would be covered. At present, only 74 per cent of the area and 82 per cent of its population is covered. During late evenings, adjacent parts of Nepal are also expected to be served by this transmitter.

Irrigation and Power

The following are a few important resolutions passed by the Irrigation and Power Ministers Conference which concluded in Srinagar on July 1, 1972.

The conference notes with satisfaction that as a result of the various steps taken in the last decade, the national average of utilisation of potential from major and medium irrigation projects is as high as 88 per cent. There are, however, areas and regions where utilisation is much below the national average and offers scope for accelerating the utilisation of the potential. The conference recommends that the state governments should undertake a special study to identify such areas and to ascertain the reasons for the shortfall and take necessary action to improve the utilisation.

The Conference appointed a six-man committee with Mr Vasant Rao Patil, Minister of Irrigation, Maharashtra, to look into the reasons for this under-utilisation and suggest remedial measures.

The conference notes that preliminary studies made by the Ministry of Irrigation and Power envisage the creation of an additional irrigation potential of 6.5 million hectares with an outlay of Rs 2,230 crores during the fifth five-year Plan period. The conference recommends that the state governments should make detailed studies and for-

mulate specific schemes for implementation during the fifth Plan period.

Special note has to be taken of the recommendation made by the commission that projects should be constructed at an optimum pace determined by technical considerations and that adequate funds must be provided for the purpose. Further if a scheme is too large for timely financing from the state's own resources, the union government, at the request of state governments may make special financial arrangements. The conference recommends that the government of India should keep a part of the central assistance during the fifth Plan in reserve for assistance to complete selected irrigation projects which are in an advanced stage of completion and to reduce the imbalance in the level of irrigation.

The conference having noted the studies made and proposals framed by the Ministry of Irrigation and Power in regard to the power development programme resolves that targets of 41 million KW of installed generating capacity by the end of the fifth Plan and 52 million KW by the end of the decade (1971-81) and the corresponding expansion in the capacity of the transmission and distribution systems, including inter-state and inter-regional transmission lines may be set for the power sector in the country. Advance action for timely achievement of the targets may be initiated immediately.

Arbitration

The National Arbitration Promotion Board in its fifth meeting held in the Capital on July 3, 1972, endorsed the suggestion made by Mr R.K. Khadilkar, Minister for Labour and Rehabilitation that arbitration should normally be accepted as the next step for resolving industrial disputes, when efforts of negotiations and conciliation fail. The members however urged that the government should bear the arbitration costs to facilitate acceptance of voluntary arbitration as a speedier

method of settling industrial disputes.

The representatives of the state government on the board, however, found it difficult to support this proposal unless the matter had been thoroughly gone into by the state governments in all its aspects. The union Labour Minister promised to have the matter examined as quickly as possible.

Expressing his satisfaction with the progress already made by the National Arbitration Promotion Board, in propagating the idea of Voluntary Arbitration, the minister was happy to note that some state governments had already set up such boards at state levels and response from other state governments to his appeal for setting up such boards was also encouraging.

The board took a number of other important decisions to give an impetus to the institution of voluntary arbitration. It finalised an aide memoire of guidelines for arbitrators so that they could function in a manner which would inspire confidence in the institution of Voluntary Arbitration.

Handicrafts

The All India Handicrafts Board has fixed the export target for handicrafts in the fifth five-year Plan at Rs 200 crores. This was decided by the All India Handicrafts Board at its fourth meeting held in New Delhi on July 4, 1972. Speaking at the meeting, Mr Y.T. Shah, Additional Secretary in the Ministry of Foreign Trade emphasised that the export strategy for achieving the Rs 200 crore target should be evolved in relation to the resources of raw materials and production capacity in the country. Structural facilities such as expansion of design centres' activities, holding of design exhibitions, Mr Shah said, should be carefully examined so that the total production of handicrafts goes up.

Speaking on the strategy of internal marketing of handicrafts, the Development Commissioner for Handicrafts, Mr D.N. Saraf, brought out the need for setting up a National Handicrafts Marketing Cor-

poration which could co-ordinate the activities of the state handicrafts marketing corporations generally and also identify the raw material requirements of every craft and ensure proper distribution to the manufacturers. The central corporation would also arrange credit facilities for craftsmen and marketing organisations in co-operation with the banks and state financial corporations.

Banspani-Jhakapura Rail Line

Work on the engineering survey for the proposed Banspani-Jhakapura rail line in Orissa is likely to be taken up soon after the monsoons. An assurance to this effect was given recently by Mr K. Hanumanthaiya, Minister of Railways, to Mrs. Nandini Satpathy, Chief Minister of Orissa. The new link when ready will be used for transporting ore from Malangtoli deposits to Paradip. The construction of the new rail line is linked with the development of Malangtoli ore deposits. A working group is now examining the ore and mining potential there. The clearance for mining the area will, however, await the working group's report. The proposed link will have to synchronise with production from the Malangtoli deposits. The estimated cost of the new link, including line capacity works to connect existing East Coast line, will be about Rs 43.5 crores. The period of construction will be about four years.

Mass media

Stressing the need for a deliberate development orientation in the working of mass media and in the attitudes of information, publicity and journalistic people, Mr C. Subramaniam, Minister of Planning, Science

CORRECTION

In the article 'The Game of Numbers' on page 9 of *Eastern Economist* dated July 7, in the 16th line of second para in first column, please read 561 for 461. The error is regretted.

and Technology said in New Delhi on July 3, 1972, that "we do not wish to bring about any contraction or concentration of sources of news and of the varied ways of expressing opinion". Mr Subramaniam was speaking at the first meeting of the Steering Group on Information Activities and Plan Publicity Schemes, set up by the Planning Commission in connection with the preparation of the fifth five-year Plan.

The Steering Group has been set up to provide a publicity perspective and guidance to the central and state governments in the formulation of fifth Plan schemes with regard to information activities, publicity programmes and also schemes relating to public co-operation for planning activities.

Thompson Rural Market Index

Which is the top-ranking rural market in India? According to the rating by *Thompson Rural Market Index*, this distinction goes to the Midnapore district of West Bengal out of all the 355 districts in the country. Though not all these 355 districts are covered, the Index is fully representative, in that no less than 334 districts, for which all the relevant authentic indicators — 11 in all, including human, animal and physical factors — are available, have been surveyed. (why 21 districts have had to be excluded is also explained in the publication). Meticulous care has been taken in selecting the data and allotting due weightage to the different factors which have gone into the making up of the Index.

As in the case of their Urban Market Study, Hindustan Thompson Associates have also been pioneers in their Rural Market study. The Green Revolution which has put more money into the pockets of the villagers and the steadily increasing stress on rural development by government which has appreciably increased the outlays on projects in these areas, the market potential of these areas has acquired signi-

ficance. Some idea of the addition to farm incomes can be had from the sharp rise in the estimate of additional income generated in the rural sector from Rs 1500 crores in 1967-68 to Rs 4600 crores in 1974-75. Coupled with higher education and the growing degree of sophistication accompanying it, these areas have steadily gained prominence and no marketing agency can afford to ignore them any longer. *Thompson Rural Market Index* (Pp. 67; price Rs 100; Hindustan Thompson Associates Ltd., Express Towers, Nariman point Bombay-20) comes in handy, for the compilation has followed a careful analysis of all the factors relevant to the scientific exploration of the rural market potential.

Bharat Electronics

The state-owned Bharat Electronics Limited (BEL) has shown an increase of one crore of rupees in its pre-tax profit in 1971-72. BEL had recommended a dividend of 12 per cent same as last year to the government.

BEL increased its production from Rs 29.40 crores in 1970-71 to Rs 32.82 crores in 1971-72. The production target was Rs 31.88 crores. BEL has no intention to produce TV receivers. It will concentrate on the production of TV transmitters and picture tubes.

The factory at Ghaziabad was expected to commence production at the end of 1973. The gross profit was Rs 623 lakhs against Rs 520 lakhs in the previous year. At present, BEL has been working on a subcontract for International Computers Limited.

Production in 1971-72 reached an all-time high at Rs 33.33 crores. The company manufactured this year for the first time a 100 Kw transmitter. It also produced new items of equipment in the HF and VHF ranges. The important items introduced during the year included hybrid micro circuits, vacuum capacitors, barriers layer type of ceramic capacitors, ceramic and vapotron tubes. BEL has plans to manufacture antennas and

masts, the demand for which is of the order of Rs 75 lakhs per year.

Indo-British Air Charter

Air Charter services between India and the UK have been given a fresh lease of life for three months. The BOAC and Air-India, under a bilateral agreement, can continue to operate a weekly charter service between the two countries till September, 1972. The existing agreement, which expired on June 30 was itself a three month extension of the earlier agreement.

Literacy Rate

In the past decade, the literacy rate in the country has increased from 24.03 to 29.34 per cent. Kerala leads the rest of the country with a rate of 60.16 per cent followed by Tamilnadu. Among union territories, Chandigarh has the highest number of literates followed by Delhi, Goa, Daman and Diu. Literacy among females has increased from 12.95 per cent in 1961 to 18.44 per cent in 1971. The percentage of male literates has also increased from 34.45 in 1961 to 39.51 in 1971.

Joint Workshop on Employment

The Expert Committee on Unemployment set up by the government of India is organising in the capital a workshop on Employment Generation in collaboration with ILO from August 2 to August 7, 1972. The ILO will provide technical consultancy and experts for actively participating in the workshop. The workshop will be held under the chairmanship of Mr B. Bhagavati who is also the Chairman of the Expert Committee on Unemployment and it will be inaugurated by Mr R. K. Khadilkar, union Minister of Labour and Rehabilitation. About 50 experts are expected to participate in the workshop—35 from India and about 15 from the ILO.

This joint workshop will focus attention on some aspects

of the current unemployment problem and elicit views and practical suggestions from a knowledgeable body of persons including experts of the ILO and devise programmes, both long-term and short-term, of employment generation so that the current deterioration in unemployment position might be stemmed and the problem tackled in an effective way.

Companies Act

Mr K. V. Raghunatha Reddy, Minister of Company Affairs, recently told the Consultative Committee of Members of Parliament attached to the Department of Company Affairs that draft bill to amend the companies act had been approved by a cabinet committee and it would go now to the cabinet for approval. Mr. Reddy also stated that a proposal to give statutory recognition to small shareholders' organisations could be actively considered and certain obligations to be cast on them so that they could act as watchdogs on behalf of the public. Mr C. C. Desai, raised the need for reforms in company disclosures. He expressed the view that companies with different units, geographically separated and some times producing different kinds of products, did not disclose unit-wise profitability or performance. As a result, the shareholder is at a loss to understand the unit-wise performance. This should be rectified.

The plea for reform of company disclosures also covered the need for uniformity in the mode of evaluation of stocks, complete information relating to payments to auditors for not only audit service but also other services rendered such as advice on taxation, management, etc.

The appointment of auditors as it obtains now came in for severe criticism. Mr Ramakrishna Reddy who had raised this subject demanded the takeover of the audit functions by the government.

The erstwhile managing agencies which had converted themselves into various mana-

gerial, commercial or other services to be employed by companies which they were managing previously was discussed. The minister said that several such instances to continue the managing agents association and clandestine control of companies had come to the government's notice. A close watch is being maintained over these attempts to circumvent the law and legislative action is in progress.

ADB Survey

An Asian Development Bank (ADB) survey of seven countries has come to the conclusion that South-east Asia's long-term economic outlook has become generally favourable because of rising demand for its resources. The seven nations covered in the survey were Indonesia, Laos, Malaysia, the Philippines, Singapore, Vietnam and Thailand.

The South-east Asian picture over the next 18 years, as seen by the ADB, is determined by metals, petroleum and tourism coming to the fore. There will be dramatic gains, too, for vegetable oils, rubber and food-grains. But overall, agriculture will remain static and gradually decline from the mid-1980s. Annual population growth of well over 2.7 per cent will also eat into much of the economic gains.

"The favourable outlook for South-east Asia is based in large part on the fact that many of its resources are becoming increasingly scarce in the world," the ADB report said. "The entire structure of the region's economy can be expected to change."

Japan will be South-east Asia's main market for metallic minerals. By 1990, Japan's requirements for copper, aluminium, iron and nickel alone may exceed more than \$35,000 m. Thus there will be more Japanese offers of financial and technical aid in return for long-term supply contracts in the future.

The ADB predicts copper, nickel and tin will be the most important metallic minerals and metals for export from the region during the next two decades, with Indonesia and

the Philippines as major producers. Iron ore, alumina, columbium and tantalum are likely to remain small but Indonesia and Thailand will join Malaysia as significant tin exporters by 1990.

Vanaspatti Prices

The prices of vanaspatti have been increased by 20 paise per Kg. in all the four zones, with effect from June 23, 1972. A press note issued by the Ministry of Agriculture says that the price hike has been allowed in view of the increase in prices of groundnut oil during recent weeks. The maximum retail prices of vanaspatti in different pack-sizes, and when sold loose, exclusive of sales tax and other local taxes, will be as given in table alongside.

National Awards for Exports

The second set of National Awards for Exports for the period 1968-69 were presented in the capital at a special function held in Vigyan Bhavan recently. Mr A.C. George, union Deputy Minister for Foreign Trade, presided over the function and gave away the awards.

Following were the winners of awards with field of export (in brackets):

M/s The Bombay Dyeing & Manufacturing Co. Ltd., Neville House, Graham Road, Ballard Estate, Bombay-1. (Cotton textiles).

M/s The All India Handloom Fabrics Marketing Co-operative Society Ltd., 10, Sunkurama Chetty Road, Madras-1. (Handloom fabrics)

M/s Hindustan Steel Ltd., P.O. Hinoo, Ranchi. (Iron & Steel)

M/s T.I. Cycles of India, Ambattur, Madras-53. (Cycles)

M/s Hindustan Aluminium Corporation Ltd., 10-Camac Street, Calcutta-17. (Aluminium) (Primary metal, rolled products etc.)

M/s Bhor Industries Pvt. Ltd., 392-Veer Savarkar Marg, Bombay-25 DD. (PVC leather cloth, sheeting and allied products).

M/s Mahendra Brothers,

7-Dahanji Street, Naranidhan Bhuvan, Bombay-3: (Cut & polished diamonds).

The Engineering Export Promotion Council World Trade Centre, 14/1B, Ezra Street, (3rd floor), Calcutta-1: (Engineering goods.)

Zone	16.5 Kg (Rs)	4 Kg (Rs)	2Kg (Rs)	Loose per Kg (Rs)
North	84.26	22.44	11.74	5.11
South	81.55	21.78	11.41	4.94
East	84.65	22.54	11.78	5.13
West	83.08	22.15	11.59	5.04

M/s Tata Exports Ltd., Block, A, Shivsagar Estate, Dr. Annie Besant Road, Worli, Bombay-18: (Engineering textiles, chemical and other products.)

Twenty-seven other firms and Export Promotion Councils received Certificates of Merit.

Speaking on the occasion Mr A.C. George said that the country's ambition of self-sustained growth cannot be fulfilled without a progressive

increase in our exports. This situation, he said, has been even more acutely clarified by the uncertainty now enveloping the future receipt of foreign aid. Mr George called upon the exporting houses to introduce a greater degree of research and expertise in a sys-

tematic exploitation of overseas markets and to keep abreast of modern developments in a rapidly moving age, both in respect of changes taking place here in India and abroad. Greater sophistication and greater utilisation of the available tools and facilities must be introduced

Self-Reliance

Mr H. Lal, Secretary, Ministry of Foreign Trade, stated in the capital recently that the pace of economic progress in

our country would be determined by efficiency, sense of discipline and the capacity to mobilise domestic resources. Inaugurating the 67th annual general meeting of the Punjab, Haryana and Delhi Chamber of Commerce, Mr Lal said: "The deliberations at UNCTAD-III should convince us that development cannot be imported from abroad". Stressing the need for achievement of a self-reliant economy through exports, Mr Lal said that India's export earnings must at least be doubled in the present decade to enable it to dispense with foreign aid. Industry must learn to discipline itself for quality and cost consciousness and should regard export as a national duty. It should not succumb to the temptations of large and easy profits in the domestic market for its entire production. Mr Lal added that the capacity to export required, among other things, much greater attention to research and development in Indian industry than had been the case in the past. On its part, he said, the government was committed to do everything in its power to facilitate expansion of the export sector.

"We recognise that a stable policy framework is essential for enabling entrepreneurs to take a long view of export ventures", Mr Lal added. Welcoming the idea of a joint sector given by the chamber, Mr Lal said he was convinced that the concept of joint-sector could make valuable contribution in combining efficiency and fair distribution of income and wealth. "I fully agree that the ground rules for the operation of a joint sector must be unambiguous enough to enable managements to take business decisions," he added.

Mr Man Phool Chopra, chairman of Punjab, Haryana and Delhi Chamber of Commerce and Industry, in his speech said the main hurdle to rapid growth and creation of adequate employment opportunities was the failure to adopt a "systems approach" in the country's Plan and policies. The government had yet to give a management orientation to the decision-making units, as well as executive agen-

cies, with the result that a gap had developed between Plan and performances, he added. He wanted the state trading agencies to pattern their operations on accepted commercial principles. The present supply of canalised items of raw materials was inadequate and high priced, Mr Chopra said. There should be continuous consultation with the users and the import-export authorities, added Mr Chopra.

Faster Economic Growth

That the economy is poised for faster growth and the government, industry, managers, technocrats and workmen should join hands to achieve this task was the theme of the speeches of Mr Y.B. Chavan and Mr K.N. Modi, president of the All-India Manufacturers' Organization, in Bombay recently. Opening the organization's 32nd annual general meeting Mr Chavan said (the speech was read in his absence by Dr Rafiq Zakaria, Maharashtra's Health Minister); "The Indian economy is endowed enough for us to think in terms of faster growth and complete eradication of poverty and unemployment within the foreseeable future".

Mr Chavan said he was aware of the shortcomings of the fiscal system which needed to be streamlined and rationalised to ensure success of development plans. The government intended to introduce legislation to improve the system of taxation after examining the Wanchoo Committee's report, he added. The government had already appointed a committee headed by Dr K.N. Raj to suggest measures for taxation on incomes and wealth in the farm sector, Mr Chavan pointed out.

In his presidential speech, Mr K.N. Modi said that the assault on poverty needed immense resources which could be had only through faster growth of the economy. The aim should be to increase the overall GNP by 10 per cent and industrial production by 12 to 15 per cent per annum during the fifth five-year Plan period. Mr Modi added: "We have not had a better atmosphere than the present one

for faster development...the industrialists and businessmen in the country would willingly co-operate with the government in this effort."

Electric Typewriters

The Hindustan Teleprinters Ltd. has been registered for manufacture of 500 electric typewriters annually. According to present assessment the company, a public sector enterprise, will be able to manufacture the first batch of electric typewriters with indigenous design by the end of this year or yearly next year. The manufacturing capacity of 500 will be increased substantially in due course to meet, along with other manufacturers, the entire demand of electric typewriters in the country.

The Hindustan Teleprinters Ltd is at present manufacturing teleprinters and other ancillary equipment and proposes to manufacture electric typewriters, out of its own internal resources, entirely indigenously by utilising the machinery and technical skill developed for manufacture of printers.

The first prototype of electric typewriter developed by the Hindustan Teleprinters Ltd. has been successfully tried out and the factory is assembling the second prototype of this machine.

Names in the News

Mr N. Mahalingam of Sakthi Group has been elected chairman of the Tamilnadu branch of the South Indian Sugar Mills Association for the year 1972-73. Mr P. Maruthai Pillai of Aruna Sugars was the former chairman. Mr V. S. Tyagaraja Mudaliar of Thiru Arooran Sugars Ltd., is the vice-chairman.

Mr K. M. Mammen Mappiah, Managing Director, Madras Rubber Factory Ltd, Madras has been elected the President of Hindustan Chamber of Commerce, Madras in place of Mr K. D. Shah, who expired suddenly on 22nd June 1972.

Mr O. S. Murthi relinquished charge of the post of Chairman, Bharat Heavy Electricals Ltd, Heavy Electricals

(India) Ltd and Indian Consortium for Powers Projects on June 30, 1972. Mr Murthy was incharge of the Heavy Electricals complex for a period of three years, during which BHEL made substantial progress. The financial position of the company has improved from a loss of Rs 3.4 crores to a profit of Rs 3.2 crores.

The General Manager, Eastern Railway, Calcutta, Mr G. P. Warrier, has been transferred to Bombay as General Manager, Central Railway. Mr Warrier succeeds Mr V. P. Sawhney, General Manager, Central Railway, who replaces Mr Warrier in the Eastern Railway. Mr Sawhney, who was appointed General Manager, Central Railway, a few months ago, was formerly Secretary, Railway Board.

Mr P. L. Tandon, Chairman, State Trading Corporation has been appointed Custodian of Punjab National Bank in succession to Mr E. C. Trikha. Mr Tandon is expected to take up the new assignment on August 1.

Mr P. N. Kapur took charge as Textile Commissioner, Bombay, in place of Mr K. Kishore who has been posted as Joint Secretary in the Ministry of Foreign Trade. Mr Kapur was till recently the Commissioner, Meerut division, in the UP government administrative cadre. He has besides held various other positions in the state government's departments.

Mr A. N. Haksar Chairman of India Tobacco Co Ltd, has been unanimously re-elected Chairman of the Indian Society of Advertisers. Besides being a director of several companies, he is the Chairman of the Associated Chambers of Commerce and a Member of the Direct Taxation Advisory Committee.

Mr G. S. Agrawal has been re-elected unanimously President of the Association of Small Tool Manufacturers for a second term. He is the President of the Indian Tool Manufacturers Ltd, Bombay and a member of the Development Council for Machine Tools.

In May, 1962 Hindalco started production of aluminium with a smelter capacity of 20,000 tonnes a year. The capacity was raised to 40,000 tonnes in November, 1965, 60,000 tonnes in August, 1967 and to 80,000 tonnes in May, 1969. Plans are in hand to expand the plant further to 120,000 tonnes by end-1973.

As a substitute for imported copper in the electrical industries, the above output represents a much larger foreign exchange saving, since one tonne of aluminium is replacing two tonnes of copper and as imported copper is several times costlier than indigenous aluminium.

water), Containers & Packaging (in both rigid & flexible forms), Building & Construction, Furniture, Paints, Surface Coatings, Explosives and Rocket Fuels, Industrial Castings, Steel Deoxidizing, Ordnance, Missiles, Rockets, Satellites, Sophisticated Consumer Durables (like air-conditioners, Refrigerators, electric fans), Business Machines, Typewriters, etc), Irrigation Piping. Bins, Drainage Culverts, Water Mains and countless other applications, HINDALCO aluminium is helping to build a new India...With its almost limitless variety of forms and shapes and its versatile properties, HINDALCO aluminium is sure to play a crucial role in meeting industrial India's challenge today and tomorrow...

COMPANY AFFAIRS

THE UNIT Trust of India has raised the dividend for the fourth year in succession with a payment of 8.25 per cent for the year ended June 30, 1972 as against eight per cent declared for 1970-71, 7.2 per cent or 1969-70 and 7.1 per cent for 1968-69. The decision to enhance the dividend, though welcome, seems to have been influenced in no small measure by the Trustee's anxiety to maintain the attractiveness of units as a medium of investment. This is, in fact, a part of its three-pronged drive to boost sales of units and also to reverse the trend of falling unit sales which have come down by Rs three crores to, Rs 15 crores in 1971-72. The Trust has also decided to reduce the margin between the sale and repurchase prices of units from four per cent to three per cent with effect from August 1. This apart UTI is also offering units at a special price of Rs 10.45 during this month as against Rs 10.60 in July 1971. Besides it has been decided to move away from fixed income bearing securities and operate actively in the stock market. Over the next five years the Unit Trust proposes to enlarge its share of equities to 55-60 per cent from the present level of about 44 per cent.

The Trusts' aggregate income during 1971-72 was higher at Rs 9.62 crores as compared with Rs 8.41 crores in the preceding year. After the allocation of this income between the initial capital contributors and the unit holders and allowing for expenses chargeable to unit capital, the net income allocated to unit holders amounted to Rs 8.72 crores as against Rs

Aggregate sales of units by the Trust during 1971-72 amounted to Rs 15.00 crores under 58,558 applications as against Rs 18.00 crores under 61,500 applications for the previous year. There were 9,990 applications for the repurchase of units during the year for the aggregate value of Rs 2.59 crores as against Rs 3.19 crores under 12,700 applications last year. As on June 30, 1972, units sold and outstanding with the public amounted to Rs 104.65 crores, the number of units holders registered with the Trust being over 4.25,000.

The reinvestment plans of the Trust made further progress during the year. The total amount reinvested under the Plan was Rs 69.30 lakhs by 18,000 unit holders as against Rs 50.44 lakhs by 15,700 unit holders in 1970-71. Sales of units under the Children's Gift Plan stood at Rs 46.28 lakhs as against Rs 56.32 lakhs in 1970-71.

The directors of Standard Batteries Ltd have proposed to maintain the equity dividend at 10 per cent for the year ended June 30, 1971. Net sales during the year increased by about 13.5 per cent to Rs 6.14 crores from Rs 5.41 crores in 1969-70. Gross profit too recorded an almost matching improvement from Rs 25.63 lakhs to Rs 29.45 lakhs. Out of the gross profit, a sum of Rs 16.64 lakhs was appropriated to depreciation, Rs 2.14 lakhs to development rebate reserve and Rs 6.50 lakhs to taxation as against Rs 18.11 lakhs and Rs 4.08 lakhs and Rs 1.50 lakhs provided respectively in 1969-70. This leaves a

At the 17th annual general meeting of the shareholders of the Uttar Pradesh Financial Corporation convened recently at Kanpur, Mr Rajeshwar Prasad, the Chairman, stated that the performance of the corporation had recorded considerable improvement in 1971-72 in relation to the preceding year. The gross increase in its income was Rs 80.99 lakhs in 1971-72 as against Rs 57.39 lakhs in 1970-71. The total reserves rose from Rs 30.61 lakhs in 1970-71 to Rs 40.31 lakhs in the year under report. The profit before tax showed a smart rise from Rs 20.65 lakhs in 1970-71 to Rs 28.48 lakhs in 1971-72.

During the year under review, no less than 827 applications for the value of Rs 11.29 crores were sanctioned and as much as Rs 4.94 crores were disbursed in 348 new accounts. In the backward areas, 101 units for Rs 81.69 lakhs have been financed in the year under review. The corporation is paying adequate attention to the recovery of overdues.

Late deliveries of vital equipments due to astirke in the USA, disruption in supply of machinery and equipments due to Indo-Pakistan war and other difficulties which

There are still many hurdles to be crossed so that the plan can function on a sound, smooth and uninterrupted basis. The company is currently faced with a series of problems such as shortage of water supply and want of special facilities at the Marmugao port for handling the massive quantities of imported phosphoric acid. As a consequence of the delay in the dredging work at the port, the company will be compelled to receive the first few shipments starting from December in smaller lots, since present indications are that dredging to the required depth of 10 metres will be completed by late 1973. Water supply is yet another area which is causing serious concern to the company. Although the Goa government has agreed to make available five million gallons of water per day, based on the current progress it is feared that water cannot be expected before the end of October instead of July as originally scheduled. The company however hopes to overcome this shortfall by using water from its own reservoirs. At the same time the company is maintaining a tight check on project costs. Barring major upsets the company hopes to complete the project within the estimate of Rs 56.55 crores.

The company's marketing division completed yet another year of successful operations with turnover increasing from Rs 89 lakhs in 1970 to Rs 902 lakhs in 1971. Six regional offices have been established at Bangalore, Delhi, Hubli, Nag-

pur, Poona and Secunderabad and they now service a network of over 625 dealers.

Binny Ltd

Several measures were initiated by Binny Ltd during 1971 to pull the company out of the red and judging from the current performance it can be safely said that the company is on the road of recovery. With a view to reducing manufacturing costs the company sought the advice of South India Textile Research Association. Their recommendations were implemented as quickly as possible and the benefits derived have been substantial. This apart a determined drive was made by the company on cost reduction and it has started yielding fruitful results. Special attention was also given to improving mill working efficiencies and significant results have been achieved. Organisational changes were made to manage the company by what are known as profit centres — each profit centre coming under a single profit centre director or manager with responsibility to attain the target set for that centre. This structural change, which involved decentralisation of certain functions, such as selling and some purchasing, has proved to be beneficial. The impact of all these measures on the working of the company, in financial terms, was that the loss in the second half of 1971 was contained at Rs 63 lakhs as against a loss of Rs 144 lakhs for the first half. The company has maintained its progress during the current year and hence there is every reason to expect that the working results for 1972 will be far better than 1971. These observations are contained in the Chairman, Mr N.S. Bhat's statement circulated to the shareholders of the company.

Notwithstanding the strain on liquid resources improvements were made to the carding and spinning departments in the Madras Mills partly by overhauling and partly by re-equipping. Conversion of ring frames to the top arm drafting system, overhauling of blowroom machinery and

the re-clothing of cards are making satisfactory progress. Sixty-two BAZ 110 cm. looms were installed in Bangalore mills in 1971. An additional boiler was commissioned and this helped in meeting the increased demand for steam required for processing Angola shirting for defence supply.

The Giovanola-Binny Ltd., the subsidiary company, reported further progress during the year. As against a loss of Rs 22 lakhs in 1970, the loss in 1971 was reduced to Rs seven lakhs. For the first time the company secured two penstock contracts, one in Bihar and another in Himachal Pradesh. It has also two penstock export orders on hand one of which will be completed this year. Grant of an industrial licence for the manufacture of pressure vessels will provide further opportunities to the company for achieving highly satisfactory working results.

Southern Petrochemical

Apart from going ahead with the implementation of its chemical and fertilizer project at Tuticorin, Southern Petrochemical Industries Corporation Ltd of late has also started paying equal attention towards engineering and marketing training programmes. It has now established a Regional Agro Service and Extension Centre at Madurai and it was inaugurated early this month by Mr T. Fujimoto, Executive Vice-President of Messrs Toyo Engineering Corporation, Japan. This centre will offer advice and services to farmers regarding distribution of fertilizers in time and at reasonable price and as close to the farmer as possible; soil testing harvesting techniques and marketing of produce, farm management, soil and water conservation, crop rotation and live-stock raising; credit requirements and sources of availability; advice regarding proper and timely use of farm inputs; requirements and sources of inputs such as quality pesticides and machinery and servicing of implements

and their maintenance.

Warner Hindustan

The performance of Warner Hindustan Ltd during 1971 and the prospects for the current year were dealt with by the Chairman, Mr N. B. Vakil in the annual address to the shareholders of the company. Net sales during 1971, the chairman said, recorded an increase of 35 per cent over 1970. But the net profit after taxes increased only by five per cent on account of Drug Prices Control Order, increase in operating costs, rise in the cost of raw materials, particularly these substituted indigenously, increase in fares and transportation charges and higher tax burdens. As regards prospects for 1972 Mr Vakil said that in spite of constraints such as shortage of essential raw materials, sales during the first five months had been about 22 per cent more than in the corresponding period of last year. He, however, added that the profits of the company were under constant pressure on account of the increases in materials price, operating costs, import substitution programmes and the need to subsidise the company's exports of non-traditional goods.

Calico

The Ahmedabad Manufacturing and Calico Printing Co. Ltd, popularly known as Calico, has maintained the equity dividend at Rs 18 per share of Rs 125 each for the year ended March 31, 1972, but it is payable on an enlarged capital. The 4,44,664 ordinary shares of Rs 125 each will be entitled to a dividend of Rs 18 a share and the 19,033 'A' ordinary shares of Rs 25 each to a pro-rata dividend of Rs 3.60 per share as per the scheme of amalgamation of the Bank of India Ltd with the company. The proposed dividend will require an amount of Rs 80.72 lakhs for distribution—Rs 8.72 lakhs more than in 1970-71. The directors have also proposed a bonus issue on a one-for-four basis, the 'A' ordinary shares being entitled to bonus issue on a pro-rata basis.

The company has suffered a

slight setback in its working during the year under review. Although the turnover moved up from Rs 35.64 crores to Rs 39.25 crores the gross profit after providing for interest, bonus to employees and managerial remuneration has declined to Rs 2.92 crores from Rs 3.42 crores in 1970-71. The directors have enhanced the allocation to depreciation reserve from Rs 114.91 lakhs to Rs 150.24 lakhs while the appropriation to development rebate reserve was reduced by Rs 18 lakhs to Rs 31 lakhs. No provision has been made for taxation as against Rs 60 lakhs allotted in 1970-71. This leaves a lower net profit of Rs 110.81 lakhs as against 118.50 lakhs in 1970-71. After adjustment a sum of Rs 103.97 lakhs was transferred to general reserve as against Rs 90.04 lakhs in 1970-71 and the proposed dividends will be paid out of the general reserve.

The company's research centre at Bombay has developed several new products and processes which have been taken up for production.

News and Notes

Expansion and Diversification

Indian Metals and Ferro Alloy's expansion scheme to add a 24,000 KVA furnace to the existing 10,000 KVA unit is progressing satisfactorily. The new unit is expected to be commissioned by the end of 1972, about six months ahead of schedule. The new unit is designed to produce besides ferrosilicon, silicon metal to the extent of 3,000 tonnes per annum. With the commissioning of this unit, it would be possible for the company to enter the export market after completely meeting the demands at home. The third phase of the expansion scheme envisaging a capacity of 50,000 tonnes per annum — an export oriented project — is scheduled to be taken up after commissioning of the 24,000 KVA furnace.

Britelite Carbons Ltd is setting up a project at Halol near Baroda in Gujarat for the manufacture of cinema arc

carbons, photo process carbons and other types of carbon and carbon products. The capacity of the proposed plant for cinema arc carbons alone will be of the order of three million pairs. The new plant is expected to commence commercial production in the first quarter of 1973 and full production is expected to be achieved within two years. Meanwhile the company will be putting up its dry battery carbon plant and if all goes well the management hopes to install this plant sometime in the second half of 1973. To raise part of the resources required for the implementation of this project the company will soon be entering the capital market with a public issue of Rs 14 lakhs comprising 90,000 equity shares of Rs 10 each and 5,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each at par. The capital outlay on the project is estimated at Rs 50 lakhs which will be financed through the public issue of Rs 14 lakhs, subsidy from the government of Rs five lakhs, a loan from the Gujarat State Finance Corporation of Rs 20 lakhs and another loan of Rs 10.5 lakhs from the Gujarat Industrial Investment Corporation.

New Venture

Messrs Harbans Lal Malhotra and Sons (P) Ltd, proposes to start manufacturing 500 million stainless steel blades at its Bellur factory in West Bengal in collaboration with Wilkinson Sword Ltd of the UK. The new blades, it is claimed, will be comparable in quality to those of Wilkinson and it will be marketed under the brand name 'Bharat'. The foreign collaborator will provide technical expertise for a period of five years to the company to enable it to compete effectively in export markets. A notable feature of the collaboration agreement is that Wilkinson Sword Ltd will be paid four per cent royalty out of the foreign exchange earnings arising out of exports. Further it is interesting to note that no royalty will be paid on production excess of 500 million blades. Initially 25

per cent of the production will be exported. Barring the United Kingdom, West Germany, Poland and Morocco where Wilkinson Sword Ltd has its licensees, the company has the liberty to export its products to any part of the world.

New Issues

Bharat Commerce and Industries Ltd is issuing to the public for subscription for cash at par 25,000 third redeemable cumulative preference shares of Rs 100 each carrying a dividend of 9.5 per cent per annum. The full amount of Rs 100 per share is payable on application and applications for shares must be for a minimum of five shares or multiples thereof. The subscription list opens on July 17 and will close on July 22 or earlier at the discretion of the directors of the company but not before July 19. Messrs Harkisondass Lukhmidass of Bombay has underwritten the entire public issue.

The preference shares now offered for public subscription will be redeemed by the company at par at any time after December 31, 1982, but not later than June 30, 1984 by giving not less than three months notice to the holders of such shares. These shares shall rank for dividend and return on capital and arrears of dividend next after the redeemable cumulative preference shares and second redeemable cumulative preference shares of the company but in priority to the equity shares.

The company has programmes of modernisation, renovation, replacement and balancing of plants in some of its units and the proceeds of this issue will be utilised for financing these schemes.

Jotindra Steel and Tubes Ltd is entering the capital market on July 17 with a public issue of Rs 31 lakhs consisting of 230,000 equity shares of Rs 10 each and 80,000 redeemable cumulative preference shares of Rs 10 each carrying a dividend of 9.5 per cent per annum. The subscription list for this fully underwritten issue will close on July 31 or earlier but not be-

fore July 20.

The company holds an industrial licence for the manufacture of black steel and galvanised pipes and tubes with a capacity of 16,000 tonnes per annum. Its factory located at Faridabad has been completed and commercial production of the first line of manufacture for black pipes of diameters 2.5 inches to six inches has commenced since April 1971. The implementation of the second phase involving the manufacture of black pipes of diameters 0.5 inch to 2.5 inches, galvanising facilities, testing facilities and other facilities of work-shop threading and handling have been taken on hand and it is expected to be completed during the current year. The total cost of the project is estimated at Rs one crore and it will be met through the share capital already issued of Rs 14 lakhs, proposed issue of Rs 31 lakhs and long-term loan from IFC of Rs 55 lakhs. The company hopes to pay a maiden dividend of 10 per cent for the year ending March 31, 1973 and raise it progressively in the subsequent years.

Capital and Bonus Issues

Consent has been accorded to seven companies to raise capital of over Rs 7.22 crores. Two of them are to issue bonus shares totalling over Rs 51.66 lakhs. Following are the details:

Mahindra & Mahindra Ltd, Bombay, has been accorded consent to capitalise Rs 200 lakhs (Rs 125 lakhs in equity shares of Rs 10 each and Rs 75 lakhs in convertible bonds of Rs 6 each carrying interest @ eight per cent per annum) to the shareholders of the Union Bank of India credited as fully paid-up in terms of the scheme of amalgamation as approved by the High Court of Judicature at Bombay. The consent is valid for 12 months.

Larsen & Toubro Ltd, Bombay, has been given permission to capitalise Rs 1,32,490 in fully paid up equity shares of Rs 10 each to shareholders of Willcox Buckwell India Ltd,

in terms of the scheme of amalgamation.

Forbes, Forbes Campbell & Co. Ltd, Bombay, has been granted permission, valid for 3 months, to capitalise Rs 39,66,480 out of its general reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of seven bonus shares for every 10 equity shares held.

Shriram Fibres Ltd, Delhi, has communicated to government of its proposal to issue capital under Clause 5 of the Capital Issues (Exemption) Order, 1969, to the extent of Rs 320 lakhs (including Rs 700 already raised) divided into 28,00,000 equity shares of Rs 10 each and 40,000 — 9.5 per cent cumulative redeemable preference shares of Rs 100 each for cash at par out of which equity shares worth Rs 137.20 lakhs and the entire preference capital will be offered to the public through issue of a prospectus. This capital will be utilised for the establishment of the project for the manufacture of nylon tyre cord at Madras.

Dunlop India Ltd, Calcutta, has been accorded consent for issue of capital of Rs 100 lakhs (nominal) in 10,00,000 equity shares of Rs 10 each as rights shares at a premium of Rs 11 per share. The proceeds will be utilised for financing a portion of the company's expanding programme. The consent is valid for 12 months.

The Mysore Kirloskar Ltd, Harihar, has been accorded consent, valid for 12 months, to issue capital of Rs 50 lakhs in equity shares of Rs 100 each as right shares for cash at a premium of Rs 20 per share. The proceeds of the issue will be utilised to meet the increasing requirements of working capital.

Coffee Lands Ltd, Bangalore, has been accorded consent valid for 3 months to capitalise Rs 12 lakhs out of its general reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one bonus share for every three equity shares held.

The Traders' Bank Ltd., New Delhi.

Auditors' Report

We have audited the annexed Balance Sheet of the Traders' Bank Ltd., New Delhi, as at 31st December, 1971 and also the annexed Profit and Loss account for the year ended on that date, in which are incorporated the last available unaudited return from the Lahore (Pakistan) Branch dated 16th July, 1965 and also the unaudited return pertaining to the Closed Fund after revaluation by the Directors of all the assets and liabilities in 1968. Exemption has been granted by the Central Government under Rule IV of Companies (Branch audit exemption Rule 1961) from the provisions of sub-section (i) and (3) of section 228 of the Companies Act, 1956, in respect of the Lahore Branch in Pakistan.

We report that :-

- We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- The transactions of the Bank which have come to our notice have been within the powers of the Bank;
- In our opinion, proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books and proper return adequate for the purpose of our audit have not been received from the Lahore (Pakistan) Branch;
- The Bank's Balance Sheet and Profit and Loss account dealt with by this are in agreement with the books of account and return;
- In our opinion and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis, read along-with the notes appearing thereon the said Balance Sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1971 and the Profit and Loss account gives a true and fair view of the loss for the year ended on that date.

NEW DELHI
Dated : 28-6-72

SOUTH INDIA SHIPPING CORPORATION LIMITED

Speech delivered by Sri J. H. Tarapore, Chairman, at the Eighth Annual General Meeting held on the 28th June, 1972.

Sri J. H. Tarapore

Gentlemen,

I have great pleasure in welcoming you to the Eighth Annual General Meeting of your Company.

Financial results of 1971

The Audited Statement of Accounts for 1971, the Directors' Report and the Auditors' Report to the members were forwarded to you in the beginning of this month and, with your permission, I shall take them as read.

The year 1971 saw the international dry bulk tramping trade, particularly for vessels of the size and type your Company owns, in the throes of the worst depression in living memory. And yet, your Company has shown the disposable surplus at a little over Rs. 181 lakhs. This surplus is thanks to the foresight of the management of your Company, whilst the going was very good on the spot market, in securing a timely contract, in the second half of 1970, for carriage of about 350,000 tons of iron ore, from India to Rumania and, the very efficient and the judicious scheduling of your Company's vessels, right round the world, to position them, from time to time, in India, for lifting the said ore cargoes. Incidentally, in May, 1969, we loaded our first cargo of Iron Ore on m.v. "CHENNAI JAYAM" for Rumania, and since then, we have been doing business with the Romanian Charterer regularly, and I am glad to advise that, over these years,

a sound business relationship has been built up with this Charterer, to the mutual advantage of the Charterer and ourselves.

Capitalization of reserves and dividend

As of the 31st of December, 1971, your Company extinguished the entire uncalled liability of the shareholders, in respect of the issued and subscribed capital, to the extent of Rs. 1 crore, through part capitalization of the General Reserve. I wonder how many instances there are, of companies having conferred such a benefit on their shareholders, within a short span of 5 years' of full operation.

Turning to dividends, the members will recall that, at the time of the 7th Annual General Meeting, I had advised you, on behalf of the Management, that we were hopeful of also maintaining for 1971, the same percentage of dividend, as was proposed for the year 1970, namely, 15% on the expanded equity capital. You will be glad to note that, the final dividend, as recommended by the Directors, if declared, would amount to total distribution at the rate of Rs. 15/- per share or 15% on the expanded equity capital, i.e., a distribution of Rs. 30 lakhs, as compared to Rs. 15 lakhs, in the previous year.

Political and economic conditions—General

World-wide tramping being very susceptible to inter-

national events, as in the past, I would like to dwell briefly upon important political and economic events and consequent changes in the International and the Indian scenes.

With the state visit to the People's Republic of China, by the U.S. President, we have witnessed an extension to a third Super Power of a process, clearly evident since the crushing of the popular uprisings in Czechoslovakia and Hungary in 1956, with the intervention of one Super Power, while the other indulged in holy protests and condemnations. In fact, a process which has been going on ever since the end of World War II, of agreements between the two Super Powers, U.S.A., and the U.S.S.R., not to get directly entangled with one another and to divide out spheres of influence in the world, between themselves, totally ignoring the regional and national interests of all the other countries. Such accords between the Super Powers of the world, of diametrically opposite political philosophies, based on self-interest, does not spell out an era of world peace and progress. Complex political moves, followed by planned announcements, comprising vague and general platitudes or condemnations, normally reveal very little of the actual intent of the parties. All one can glean, after the last two summit meetings, between the three Super Powers, is that, there still appears to be some areas of conflicting interests, unresolved, but that, these

Super Powers, are not prepared to embroil themselves directly over the same.

However, this is not to imply that, a confrontation between the Super Powers is good for humanity, nay, it could be the total destruction of our civilization. My purport is to emphasise, the importance to small countries to settle their differences among themselves and not become pawns in the game of Super Power politics. Pakistan's ignominious total defeat in the then called East Pakistan, despite the incursion of a part of the U.S. Seventh Fleet, from the South China Seas, into the Bay of Bengal, the escalation of the war in Vietnam and the mining of North Vietnamese coast, by one Super Power, while now, the two other Super Powers are indulging in holy protests, and condemnations, are lessons, we can ignore only at our grave peril.

One hopes and prays, neighbour countries of contiguous areas, particularly Pakistan, will be alive to the inherent danger spelt out by the concept of the Super Powers' divide and rule policy and sink their mutual differences and come closer to each other, converting the whole region into a harmonious area politically and a viable unit economically as has been achieved in a substantial measure by the West European countries.

The issue of Britain's entry into the European Common Market, which was one of the

unsolved problems ever since E.C.M. was formed, reached the penultimate stage, with the signing of the agreement between the E.C.M. countries and the Prime Minister of Great Britain, in Brussels. Norway, Sweden and Ireland have also likewise signed an agreement with the E.C.M. countries. However, this is not the end of the story, for, the House of Commons, is yet to pass the European Communities Bill, though it has already passed a resolution in favour of legislation to bring Britain into the E.C.M. The Bill is presently in the House Committee stage and the narrow margin by which some of the clauses of the Bill have been adopted, indicates it is obviously having a rough passage. However, though one cannot state with certainty, it appears now that, Britain's entry into Common Market, is more or less assured. The close co-operation in the economic sphere as envisaged, would assure these affluent and prosperous European nations of an enviable position, even in comparison with the United States of America.

In Europe, the process of political thaw between the eastern and western countries started in 1970 and earlier, continues to date. The major political event, was the Four Power Accord over Berlin. The conclusion of the traffic agreement between the Federal Republic of Germany and the German Democratic Republic on the 26th of last month, paves the way to the acceptance of a present reality, existence of two Germanys, a very complicated issue indeed. Further, this agreement lays the foundation for improved contacts between the people and further opens the door for agreements between the two countries, on a wide range of subjects. The other meaningful and positive achievements of the Federal Republic of Germany, were the conclusion of treaties between that country and the U.S.S.R. and Poland, both of which, have recently been ratified by the German Parliament. Besides, purposeful dialogues have also been initiated with Czechoslovakia, Hungary and

Bulgaria. While the Federal Republic of Germany is fully conscious of her need for alignment on substantial matters, with the West European countries and the U.S.A., the above steps indicate that, this country is not unmindful of the importance of also normalising her relations with the countries in the communist orbit.

The process of Communist Nations, trying to establish closer trade relations with the West European countries, Japan and the United States, continues to date. Most significant of these moves is, the growth of Japanese exports to the Soviet Union and the discussions now being carried on between the U.S.S.R. and the Japanese Governments, for Japanese investments to develop Siberia, such as, an Oil Pipe Line, from Irkutsk to Nakhodka, which would facilitate shipment of low sulphur content West Siberian Crude Oil, to Japan.

After a delay of over 20 years, due to blocking the entry of the People's Republic of China, by a group of Nations led by the United States, this country was eventually seated in the United Nations, in 1971. It is to be hoped that, with her admission into the International Community of nations, this giant nation will voluntarily subject herself, to some of the norms and restrictions, which govern conduct of nations towards each other.

Let me turn now to the financial scene. The inevitability of parity realignments about which I had expressed my fears when I last addressed you, have since come about, as stated in the Directors Report.

While it is held by some that, the agreement reached between the Group of Ten countries at the Washington meeting on 20th December, 1971 constitutes the first serious attempt since the Bretton Woods Conference, to reform the international monetary system, I agree with others, in their view that, this agreement is a compromise to placate some and will not bring about a permanent and enduring solution to the problem. The principal beneficiary is obviously the United States. The Washington

meeting has once again ignored the interest of developing nations, which are nothing but helpless onlookers.

On the home front, 1971 is, in my view, the most momentous year since we achieved independence. The most important event was, of course, the 3rd short war waged on us by our neighbour Pakistan. Thanks to the inspired leadership of our great Prime Minister, the excellence and valour of our defence services and the complete identity of the nation with the objectives of our Government, in the hour of crisis, we emerged not only victorious, but the victory was also decisive, Pakistan having lost nearly half of its territories and over half of its population. The two major consequences of this victory were, of course, the birth of another secular nation in the Indian sub-continent, Bangla Desh, pledged to live in peace and harmony with her neighbours and the swift and orderly return to the new Nation, of almost 10 million refugees, whom our country had been feeding, clothing and sheltering for about a year.

Another major political event was the enormous majority secured by the ruling party in the Lok Sabha, paving the way for a swift series of legislation for implementing their manifesto. While one may look askance at some of the subjects proposed for legislation, the implementation of which, are fraught with immense complexities one silver lining would appear to be that, the leaders of the ruling party, seem to prefer the pragmatic approach to problems despite some legislation being based on ideological considerations. While no one can decry the call to equitable distribution of wealth, such distribution should not be sought at the cost of reducing the pace of our economic growth. In fact, an accelerated development, would substantially reduce the problems of ensuring equitable distribution of wealth. Only through huge useful new Central and State Governments' labour intensive projects, of which there is no dearth, could the problem of under employment, be suc-

cessfully solved and not by redistributing the existing wealth, of which there is an acute dearth.

On the economic front, it is a matter of gratification that, we have been blessed with successive good monsoons in recent years. 1971/72 grain harvest was of the order of about 112 million tons, registering an increase of nearly 5 million tons over the previous year. The increased agricultural production, however, has not led to stabilization of price levels. In view of the green revolution, the Government of India have decided to dispense with import of food grains and other agricultural products after June this year. In the current year, the heat wave over many parts of India and the delayed setting in of the monsoon, is a matter of concern, both for industry and agriculture, but it is too early yet to assess the adverse effects thereof.

One of the effects of the war with Pakistan, was the marked deterioration in our relations with the U.S.A. Economic aid has been suspended by the U.S. Government and it is heartening to note that, this has not unduly perturbed our Government. This is a mixed blessing, placing emphasis on self-reliance and elimination of foreign aid, in as short a time as possible. In my opinion, the blessings of self-reliance, can only be fully and fruitfully realised, if we were to place the accent less on import substitution and more on efforts to increase production and on exports.

Under-utilization of the installed capacity in the various spheres of the industrial sector and the poor out-put per man-hour, continue to be the major factors for the sluggishness of our economy. Such under utilization is due to inadequacies in regard to transport, power supply, shortage of component parts, raw materials and of course, the chronic labour trouble.

As regards investments in industry, the public sector investment was lower than planned and in the private sector, while investment in small enterprises and projects

howed improvement, investments in large scale industries were inhibited by Governmental policies and restrictions, particularly, the Monopolies and Restrictive Trade Practices Act.

One would have expected a judicious combination of tax incidence and incentives in the current Central Budget, so essential to enliven the ailing investment climate. On the contrary, there seems to be a tendency to step up the rates of taxation together with a whittling down of the incentives. In the current Budget, we have had the case of the surcharge on corporate tax being stepped up from 2½% to 5% and the abolition of the concession available to priority industries, under Sec. 80-I of the Income Tax Act.

Labour

Over 13.5 million man-days were lost in the past year, as a result of industrial disputes. The vanquished Germany and Japan, literally rose from the ashes of their destroyed cities and industries and have become today, after the United States, the two most economically advanced countries in the world, thanks mainly to their disciplined labour force and virtual absence of senseless strikes and lockouts. So meteoric has been their advance that, under pressure of the highly developed countries of the world, particularly the U.S.A., these countries have been forced to substantially revalue their currencies. The victors, the U.K., U.S.A., and France, thanks to labour indiscipline, and regular increases in labour costs, without corresponding rise in production, are in the economic doldrums, and even have been forced to devalue their currencies. Further devaluation of the Pound Sterling and a revaluation of the Japanese Yen, appear to be imminent. How can a poor country like India, afford such loss of man-days and regular increases in labour and material costs, without corresponding rise in production, other than, at the cost of dragging down the already shaky economy, inhibiting the badly needed growth and denying job opportunities to the fast growing unemployed work

force? A statistical study by two British Economists, shows that, each time the going rate of wage inflation is pushed up by 1%, without corresponding demand-reflationary measures, the employment potential drops by over 300,000.

The capacity of an industry should be taken into consideration in determining a fair and reasonable wage structure and since one cannot expect prosperity without productivity, incentives should be linked with productivity of labour. Lack of harmonious relations between the employer and the employees and demands for increased wages, without corresponding increase in productivity, spell ruination for our country. The entire nation now prays that the efforts of the working party of employers and workers set up by the Union Labour Ministry, to evolve an effective machinery for the settlement of industrial disputes speedily and to avert wasteful work stoppages in future, is crowned with success. Even our great leader, Prime Minister, Mrs. Indira Gandhi, and our revered President, Mr. V.V. Giri, champions of labour welfare over the decades, have appealed for a moratorium on strikes for three years, in order to strengthen our national security, to rout out poverty among the millions and to increase production and create more jobs. There is no escape from the Universal law, "first deserve and then desire." So, let us dedicate our lives to selfless efforts to produce more, to create more jobs, to strengthen the country in all respects and, God will take care of the rest.

A silver lining, in the otherwise bleak horizon, is the decision of the three leading Central Trade Union Organisations, namely, Indian National Trade Union Congress, All India Trade Union Congress and Hind Mazdoor Sabha, to form a National Trade Union Council to root out the evils of inter-Union rivalry, one of the main causes of senseless stoppage of work. In order to achieve harmonious employer-employee relationship, proper guidelines should be laid down for identifying the union's genuine membership. Similarly,

a code of conduct for settlement of disputes should be evolved and adhered to, so as to eliminate sporadic lightning strikes and go-slows.

Trading Prospects

Your Directors in their report, have dealt with the trading conditions obtaining during 1971 and till early May this year. We have not seen any appreciable change since then, except for slight recovery in the Far East Timecharter section, due to prolonged Japanese Seamen's strike, which again, is a temporary feature, restricted only to prompt tonnage. However, the Japanese steel industry, has not yet been significantly affected, it being well over stocked with its requirement for iron ore and coal. The running down of the Japanese iron ore and coal stocks, is welcome indeed.

With the decline in the rate of world trade expansion and with the unsettled international monetary situation and with nearly two-thirds of the dry cargo newbuilding tonnage entering the market without any long-term contracts, tonnage available for employment, continues to remain in excess of demand and the figures of laid-up tonnage, are increasing. However, the range and variety of enquiry is so diverse in the dry cargo market, that, despite some over-tonnaging, one can still have a somewhat better freight market, as compared to the tanker market, under similar circumstances.

The world seaborne trade was projected to increase at an annual rate of 8 to 10%, against which, 1971 registered an increase of only 4.5%, the lowest in the last decade. During the current year, it is expected to increase by only about 5% and during 1973, by about 6%. To aggravate matters, in the intervening period, some 36 million dwt. of newbuilding Combine Carriers and Bulk Carriers would be added to the existing fleets.

Historically, booms and slumps are as old as Shipping itself, and while forecasting freight rates one cannot rule out the possibilities of sudden changes in world demands or unforeseen happenings, which

may bring about an unpredictable rise in demand for tonnage, even as it happened in 1967 and 1970. What is regrettable is that in a profitable market, speculators place orders for new buildings, anticipating continuous rise in rates and laid-up tonnage comes into service, and the supply soon exceeds the demand and a downward trend sets in, orders for new-buildings get slackened off and when rates reach uneconomical levels owners begin selling and laying up tonnage. The irony of it all, however, is that, to predict the duration of any boom or slump is a guess and no past analysis can enlighten us as to the present slump. In order to restore equilibrium between supply and demand, the obvious answer lies in substantial increase in the world-trade and/or, massive withdrawals of tonnage from the market.

Fortunes of bulk carrier owners, are mainly linked with the Japanese economy. The Japanese steel production figures for 1972 have been revised from 125 million tons to 95 million tons, which means a reduction of nearly 48 million tons of Iron Ore and about 20 million tons of Coal, to be transported by sea on their account. While some encouraging signs have appeared that the Japanese Steel Industry is beginning to recover, it is not possible to forecast the steel output beyond 1972. Japan would, perhaps, step up its purchase of raw materials by end of 1972, but considering the widespread belief of another Yen revaluation, it is very unlikely that they would embark on any large scale purchase programme. The prospects of Japanese stepping up their exports to U.S.A. and E.E.C. appear rather dim, and the Chinese are not showing any interest in any large scale Japanese imports. However, Japan's efforts to enter the U.S.S.R. market, appear to be bearing fruit.

With no apparent sign of any reasonable increase in the volume of international seaborne trade, the lay-up and scrapping figures, are likely to mount at a faster rate. However, prudent

shipowners, who have competitive units in their fleets, bought at the right price and the right time, have nothing to fear in the long run. Likely increased exports to Soviet Union, East European countries, China and Japan, may contribute to some extent, in bringing about some recovery in the freight market.

As I said last year, since times immemorial, it is a field day for either the Charterer or the Shipowner, the Charterer has an edge on it and it is his day today, your day shall soon come next, and make you grow from strength to strength, ready for yet another battle.

Operating and Voyage costs

The never-ending spiralling of operating and voyage costs, continued throughout 1971 and into 1972. Under the latest agreement arrived at between the Maritime Union of India and the Indian National Shipowner's Association, the salaries and benefits of your floating staff officers, show an increase of about 50%. In the year under review, the bunker costs went up by about 52%. Each year, costs of ships stores and spares are steadily going up by about 15%, and repairs by about 20%. Negotiations are at present afoot, between the National Union of Seafarers of India and the Indian National Shipowners' Association, for determining the revised salaries and benefits of Petty Officers. The National Union of Seafarers of India has pitched its demand for an increase of over 100%.

Fleet Expansion

We have been thought rather conservative about our views on fleet expansion. We have considered it wise to diversify our fleet and hence, since over four years, had been concentrating on securing of contracts for the carriage of highly specialised cargoes, such as, ammonia and phosphoric acid, and crude oil, from Iran to India, on account of The Fertilizer Corporation of India Limited and the Indian Farmers Fertilizer Co-operative Limited and the Madras Refineries, respectively. We have considered it essential to have cargo contracts over adequately long periods, backing the

acquisition of super tankers or specialised carriers, hence, our expansion in these fields, is restricted to first obtaining adequate cargo coverage.

We had tendered, on behalf of an associate company, whose operational management is to be entrusted to us, for the transportation of ammonia and phosphoric acid and were the only Indian Company, whose offers were found acceptable. It is regretted that, the purchase contract of ammonia, has now been decided, to be made on a C & F basis. However, as the purchase contract has not yet been finalised between the Iranians and the Fertilizer Corporation of India Limited, your management is still working to secure this contract, though now the Charterer would be a foreign party. The Indian Farmers Fertilizer Co-operative Limited purchase contract, has also not yet been finalised.

We had also actively worked for the acquisition of tankers and had tendered for the transportation of 2.5 million tons of crude oil from Iran to India. Your Company's tender was the lowest. However, as the Shipping Corporation of India, was able to acquire the tanker on Rupee payment, they secured this business, though tenders had been called for, on a worldwide basis. This apart, the costs for conventional type of ships, over the last 2/3 years, have shot up to such an extent, it is our opinion, that, acquisition of ships, at present costs, would not be a remunerative proposition over the life of the ship. Looking back, we do not feel we have erred in not rushing into ship purchases at very high prices. With the unprecedented slump in the market and consequent fall in orders, prices for new buildings should come down. But the best bet, would be purchase of new buildings and second-hand tonnage, which some Owners would be compelled to sell at distress prices and which costs, are more likely to be such that, the acquisition of such ships, should be remunerative at reasonable average freight rates over an adequately long period. The cost of ships has not yet sufficiently dropped and your

management is very closely watching the market and feels, sometime end 1972-73, second-hand ships and new buildings for re-sale, may be available at reasonable prices.

Shipping and Shipbuilding

The world shipbuilding industry completed nearly 24 million GRT of newbuildings during 1971, out of which, Japan alone launched nearly 50%. By the end of 1971, the world Shipyards had about 83½ million GRT on order for delivery until about 1975. Since last quarter of 1971, however, with the decline in shipbuilding orders and quite a few cancellations of orders for new buildings, the Shipyards have begun to feel the effects of the slump in Shipping. As the order books shrink, the Yards may be short of work around 1974-75. It is estimated that, 90 berths are available, for building very large crude carriers, for delivery in 1975. Leading shipbuilding countries, especially Japan, have already expanded their facilities and even set up new-building yards at heavy expense. Governments in U.K., Italy, Holland, Spain and Sweden, have had to pump large amounts of money directly or indirectly, to support many ailing Yards. The Yards are now finding it rather difficult to sell ships and a price reduction for new buildings, is not ruled out in the near future.

During 1971, India acquired only 13 vessels, totalling 1.42 lakh GRT. Taking into account vessels scrapped/sold during this period, the net addition to Indian tonnage, amounted to only 1.02 lakh GRT. The number of ships increased from 250 to 255, with a total GRT of nearly 2.5 million. The Fourth Plan target of 3.5 million tons in operation, it appears, shall not be achieved, with the total tonnage unexceeding 3 million GRT mark. This shortfall is partly due to the fact that ship prices rose suddenly and sharply over the last 2/3 years and also, the Shipyards were unable to deliver new orders by March, 1974 — the end of Fourth Plan period.

Although the setting up of Cochin Shipyard and increasing the capacity of Hindustan

Shipyard, Visakhapatnam, are positive steps in the right direction. However, in view of the pace at which we are progressing, the type of ships proposed to be built and their dependence purely on the Indian market, I am afraid, we will, for quite some time to come, lag far behind the leading shipbuilding countries of the world, where technological developments, are fast taking place. The Government should also give due attention to the development of ancillary industries and designing and research cells. Undoubtedly, our men possess the necessary skill, evidencing which, the recent delivery of I.N.S. "NILGIRI", is a standing tribute to their ability.

Ports

While it is heartening to note our Government's keen desire to develop our major and minor ports, where ambitious plans are being put into shape, it is depressing to note that, the progress made, is not laudable. If greater effort is not applied with immediate effect, I do not think the Ore Handling Plants being put up at Mormugao, Madras and Vizagapatam Outer Harbour, would be operational by the end of Fourth Plan period.

Delays in implementation not only results in a steep rise in costs of development projects, but also result in heavy loss to the country, particularly the users of the port. The delay in completion of Madras Outer Harbour Oil Jetty, is a glaring example. Due to this delay, the freight bill alone, of Madras Refineries, shot up by nearly Rs. 6 crores in 1970-71.

Considering even a modest saving/earning of Rs. 10 per ton on Iron Ore to be exported out of Mormugao, Madras and Vizagapatam, after the Iron Ore Loading Plants commence operations, every year of delay, would deprive the country of about Rs. 15 crores in foreign exchange.

At the time of formulating our port development programmes, I feel, we should look a little further into the future. Our Ore Handling Plants at Madras and Mormugao are being designed for berthing

ships of 60,000 dwt. with provisions for developing to berth vessels of a size of 100,000 dwt. eventually. Australia, India's main competitor in the Iron Ore export trade, is already completing developments for berthing Ore Carriers of 150,000 dwt. size, as this size has already entered the market. In order, therefore, to ensure our place as one of the leading Iron Ore exporters in the world, I would recommend taking a second look at our port projects and making necessary changes where possible.

Government Policies

At the last Annual General Meeting, when I addressed the members, you would also recall, I had stated that, we have yet to learn, Indian Merchant Shipping can never hold its own, unassisted, against the heavily assisted fleets of the leading maritime nations of the world, such as, those of the U.S.A., Japan, the Scandinavian and European countries, the U.K. and Greece.

To encourage development of Indian Shipping, I again reiterate and appeal to the authorities for continuance of Development Rebate, proposed to be withdrawn from May 1974, and restoration of the terms, conditions and rate of interest for Shipping Development Fund Committee loans, as were existing prior to 1st February, 1971. Ships, unlike many other industries, are highly capital intensive, with irregular and uneven inflows and ever increasing outflows of cash. Further, the sharp increase in the acquisition and operational costs, in the face of current uneconomical freight market conditions, has dampened the enthusiasm of Shipowners. The authorities are well aware of attractive incentive being given to Shipowners in highly developed countries. By withdrawing or reducing incentives, Indian Shipowners, especially those engaged in international tramp trading alone, will lose their competitiveness. As it is, one finds it extremely difficult to compete with tonnage belonging to the aforementioned countries, or those plying under flags of convenience.

Moreover, I do not think that

we have reached such a state of self-sufficiency, as to warrant cessation or reduction of the existing incentives. On the contrary, I feel that, further relaxations and incentives should be offered in order to help attain a quicker rate of expansion. Our last conflict with Pakistan, is a pointer, as to value of a national fleet in time of crisis, where Indian mer-

chant ships available on the scene, played a vital strategic role.

It is my privilege and pleasure, before I conclude my address to you, on behalf of the Board and on your behalf, to extend our grateful thanks and deep appreciation to the Company's Management and the staff, ashore and afloat, owing to whose ceaseless, sin-

cere, loyal and efficient efforts, your Company, despite a very depressed market prevailing throughout the year under review, has achieved such an outstanding result, as is evidenced by the disposable surplus of over Rs. 181 lakhs.

N.B. This does not purport to be a record of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

Report of the Committee on Land Reforms

THE REPORT of the nine-member committee on land reforms was discussed by the Congress Working Committee in the capital on July 6. Some of the members felt that further scrutiny of the proposals of the committee needed to be made because it had gone beyond its scope on certain matters. Also, it was felt that was necessary to seek the views of all the chief ministers who ultimately would be required to implement these proposals. It was therefore decided that the Congress Working Committee should meet again on July 22 and 23 for a thorough discussion of the various aspects of the scheme.

The Committee had recommended an additional 15 per cent of land within the 10 to 18 acre range of ceiling for land irrigated by private sources. It means that if for the land irrigated from government sources the ceiling is 10 acres, the corresponding ceiling for the land irrigated by a private source will be 11.5 acres. The report of the committee follows:—

The need for comprehensive land reforms with a view to redistributing available land more equitably among different sections of the rural community as an essential step in the creation of an egalitarian society, within the overall objective of improving and modernising our agriculture has for long been part of our

party's socio-economic thinking and was recognised as such from the beginning of our planning process. The changed political climate and the awakening of the masses in recent years make it imperative that the government put through the required reforms—legal, organisational and administrative—with speed and determination.

There is wide acceptance of the concept of imposing a ceiling on individual land holdings and distributing the surplus among the vulnerable sections. The main consideration here is this: for millions in the rural areas for a fairly long time to come there may be no alternative to dependence on land, in one form or another, for earning their livelihood. The pressure of a growing population makes the situation more acute. While we have added to the cropped area by something like 20 per cent over two decades, this has come about mostly through extension of irrigation and conversion of single-crop into double-crop lands. There still is potential for such expansion in future. But quantitatively the area that we might be able to add is likely to be limited. In short, the pressure on land will grow and land will continue to be in absolute shortage for a long time to come.

Improvement of yield

The introduction of the new technology in agriculture has served to increase our cereal output, particularly that of wheat, significantly in the past five years. The improvement in yields in areas where the new technology has made good progress has tended to enhance land values. This has given rise to certain socially undesir-

able trends, such as eviction on some pretexts of tenants of long-standing by the landowners and the appropriation of lands of small holders by the bigger ones by offering very attractive prices or by other means. It is not surprising that recent studies of the state of our rural polity indicate that tensions between the big landlords and the smaller ones, between land-owners and tenants and between land owners and landless labourers have tended to become sharper and widespread. This has been particularly noticed in areas where the yield breakthrough has been significant. Public policy has to take note of these emerging trends. Corrective action has to follow without delay so that the fabric of rural society may not be violently torn as under by economic pulls and political compulsions.

Personal attention

Fortunately, the new technology is, by and large insensitive to farm-size. It has, without doubt lowered the threshold of viability for the cultivator in terms of size of the holding. In fact it can be argued that intensive agriculture based on the best that science and technology have to offer is facilitated under conditions where the farmer is able to devote personal attention to every facet of cultivation and has the incentive to invest in the land for its long-term regeneration and improvement. It is within this overall technoeconomic framework that we have to work out measures which will encourage farmers to maximise their output, aided by appropriate technology, extension and supply of inputs on the one hand, and also advance our social objective of removing disparities in income and property.

We hold, therefore, that as a first step in the institutional reform of land-ownership and cultivation, ceilings should be imposed and enforced on holdings in such a manner as leads to a meaningful redistribution of land in favour of the weaker and vulnerable sections of the rural community. Such a policy should be accompanied

by measures for the new owners of land to take full advantage of modern technology by creation, for their special benefit, of agencies for supply of the required inputs, technical, advice and marketing and processing facilities.

Irradiation of poverty

In this connection, the committee would like to quote from the Planning Commission paper circulated at the meeting of the National Development Council on May 30 and 31. In this paper, land reform has been emphasised as one of the essential programmes for eradication of poverty among the rural masses and for tackling the problem of unemployment and under-employment.

“As indicated earlier, unemployment, under-employment and low resources has of a multitude of producers, particularly in agriculture, are the principal causes of poverty. An expanded programme of employment generation will, therefore, have to be supplemented by redistributing the means of production in favour of the poor, in part by providing the self-employed with the wherewithal to achieve greater productivity from land and also through a programme of land redistribution and other transfers. Profiting from past experience, land policy decisions on the nature of the legislation and the process of implementation will be necessary. The problem of an appropriate balance in the redistribution of available surpluses as between farmers with small holdings and landless labour is also an issue which will have to be faced. An assessment will have to be made during the current year of the impact of the envisaged land reform measures on the problem of rural poverty. The employment programme for the rural areas will have to be so designed that it can meet the requirements of the small and marginal farmers and the landless labour after allowing for the effect of the land reform measures as finally decided upon.”

Many states already have ceiling legislation of varying

scope and effectiveness on their statute books. In analysing the impact of such legislation on the pattern of land ownership and cultivation one is struck by the loopholes and escape-clauses that were built into the laws on one consideration or the other. All this has considerably diluted the effectiveness of ceiling laws. These lacunae have provided to the more influential and the rich the means and the opportunity to evade the law. In such an appraisal one is also equally struck by the tardiness of implementation of the provisions, such as they were, by the administrative machinery in the states. It is unnecessary to catalogue in this report the whole series of exemptions, benami transfers and partitioning of holdings or the substitution of crops that have proved so effective as camouflage weapons at the disposal of the more privileged minority to frustrate the rightful needs and hopes of the deprived majority.

Two Aspects

On the provisions of law as they stand presently on the statute books, we would like to draw attention to two aspects in particular. One relates to the level of the ceilings and the second to the unit of application. The ceilings laid down in some states are high by any standard. Their application in terms of the individual meant that a family of five could retain in some states as much as 1620 acres of land within the four corners of the ceiling law. Surely, the path towards a radical redistribution of land in favour of the poor and the deprived does not lie through such apology for reform, making a mockery of the entire concept of land redistribution. Exemptions from ceilings allowed in the legislation are numerous and far-reaching. They included plantations, sugar-cane farms, cattle breeding farms, orchards and groves, grazing lands, 'efficient' farms, mechanised farms, lands owned by religious and charitable institutions and trusts and some other lands. These provide an infinite source of evasion for the rich and the powerful. A substantial part of whatever

emerged as surplus was often found to be uncultivable. Progress in the distribution of such surplus land has also been, by and large, poor, thanks again to administrative apathy.

There is no escaping the conclusion that we are nowhere near achieving the objective for which we initially conceived the ceiling laws, namely, a meaningful redistribution of land and a more diffused and equitable pattern of ownership by the farming community as such, of this scarce natural asset. The time has come for recasting the legislation in terms of our original objective and for an effective and time-bound effort to enforce this legislation.

Social Compulsions

Ineffectiveness of the land ceilings legislation so far as well as the social and political compulsions in the current situation has been recognised by the Central Land Reforms Committee which is the highest advisory body in government on this subject. Its recommendations made in 1971 run as follows:

"The ceiling for a family of five members may be fixed within the range of 10 to 18 acres of perennially irrigated land or irrigated land capable of growing two crops. As soil conditions, productivity of land, nature of crop grown etc. vary from state to state and within the same state from region to region, the Committee considered it desirable simply to indicate a range within which the ceiling should be fixed instead of suggesting any rigid ceiling for the whole country. For various other categories of land conversions, ratios should be fixed taking into account availability of water, productivity soil classification, crops grown, etc. The absolute ceiling for a family of five, even in the case of dry lands, should be put at 54 acres. This limit would be relaxable if there is special justification for doing so on account of the nature of soil, rainfall, chronic drought conditions, etc."

We would like to draw attention to three aspects which

distinguish this recommendation from our earlier thinking:

In the first place, a lowering of the ceilings as such has been felt necessary. Secondly, the family rather than the individual is deemed to be a better unit for application of the ceilings in the light of the experience gained in enforcing earlier legislation. Finally, it is proposed to do away with many of the far-reaching exemptions from ceiling laws allowed in the past. We fully endorse the basic thinking of the Central Land Reforms Committee on these three issues.

We are in agreement with the recommendation of the Central Land Reforms Committee that the range of ceilings should be between 10 acres of the best land and 54 acres of the worst land. The relative worth of land in different holdings and areas will have to be assessed with reference to the fertility of soil, availability of water, facilities for drainage, access to road and such relevant factors. The scheme of ceiling that we adopt will have to lay down the principles on which an equivalence for various types and categories of lands is to be worked out.

"Perennially Irrigated"

We feel that the phrase "perennially irrigated land" capable of growing two crops adopted by the Central Land Reforms Committee is liable to varying interpretations. We are not sure whether there is, in fact, such "perennial". The question, in our view, is not whether water is available for irrigation to a given plot of land all through the year, but whether there is assured irrigation for growing two crops or for one crop. We have also taken note of the controversy that has developed on a question whether a distinction should be made while fixing ceiling between lands irrigated from public sources and those irrigated from private sources.

Taking into account all relevant factors and keeping in mind the views expressed at the Leaders' Conference, we wish to make the following recommendations on arriving at appropriate ceilings:

(i) The best category of land in a State with assured irrigation and capable of yielding at least two crops a year should have a ceiling of 10 acres. This ceiling may increase upto 18 acres taking into account the fertility of the soil and other conditions.

(ii) In the case of land having assured irrigation for only one crop in a year, the ceiling shall not exceed 27 acres.

(iii) For all other types of land, the ceiling shall not exceed 54 acres.

NOTE: In view of desert conditions existing on a wide scale in Rajasthan, the state has got some special problem regarding the fixation of ceilings under this head. The state government will discuss this with the Ministry of Agriculture and take appropriate decisions.

(iv) In the case of owners with holdings consisting of different types of land, the total holding, after converting the irrigated or better category of land into the lowest category shall not exceed 54 acres.

(v) The above ceiling shall be fixed in terms of physical acres and not in terms of so-called "standard acres."

Allowance for Initiative

We have carefully considered the arguments for and against a differential ceiling as between lands irrigated from public and from private sources. We are of the view that to the extent private irrigation has been provided by the private investment and initiative, allowance should be made by giving an advantage of 1 : 1.15, i.e. if for land irrigated from government sources the ceiling is 10 acres, the corresponding ceiling for land irrigated by a private source will be 11.5 acres. We wish to make it amply clear, however, that under no circumstance any land falling within this category of irrigated land shall have a ceiling of more than 18 acres.

It is necessary to spell out

the manner in which different categories of land will be evaluated for purposes of comparability and equivalence. Comparability on the basis of old classifications done at the time of land settlements or on the basis of existing land revenue is not likely to prove satisfactory. Settlement operations have not covered the entire country or on any kind of uniform basis. The present rates of land revenue are the resultant of a wide variety of factors and considerations, not always related to the productivity of the land. Nor can the cropping pattern or the market value provide an acceptable index as they are subject to constant changes and are affected by speculative considerations.

Rational Method

We are, therefore, of the view that the suggestion made by the Working Group set up by the National Commission on Agriculture to classify lands according to distinct agro-climatic factors is more rational. Within each identified tract of given agro climatic conditions, the number of further gradations should be kept to the minimum. We agree with the Working Group that within a homogeneous tract it might suffice to distinguish between two tracts of wet land, viz., single-crop and double-crop, and two tracts of dry lands. On theoretical grounds, there will be scope for making a more detailed and finer classification. But taking into account the corresponding administrative difficulties and the scope for varying interpretations by different authorities, we have come to the conclusion that the balance of advantage lies in keeping these gradations to the very minimum.

We fully recognise the conditions with regard to agro-climatic factors, productivity, accessibility, etc. for holdings of land very considerably as between states and even within States. There is, however, no escapes from a broad classification and formula for mutual equivalence. This is essential in the interest of equity as between persons owing widely

different types of land and of removing scope for regional grievances.

In the case of irrigated lands what should matter as we have stated already, is the assuredness of irrigation, and not whether the source of irrigation is publicly or privately owned. A distinction might however, be made between lands irrigated with tubewells on the one hand, and dug wells on the other with reference to regularity in the availability of water.

The adoption of the family rather than the individual as a unit for fixing ceilings will itself mark a distinct improvement over what has been attempted in the past. It will plug a major loop-hole by which provisions relating to ceilings have been evaded. The Central Land Reforms Committee favoured the ceiling being applied to a family of five—husband, wife and minor children.

Family as Unit

We have devoted careful thought to the manner in which "family" should be defined for purposes of land ceiling. We have taken note of the legal and practical difficulties in adopting the definition suggested by the Central Land Reforms Committee and the discrimination that it will carry between majors and minors. We are of the view that ceiling is best applied to the family of five as a unit, consisting of husband, wife and three children, whether major or minor. In making this suggestion we also agree with the suggestion of the working group of the National Commission on Agriculture that to the extent that the actual number of members in a family is less than five the ceiling should be reduced by a fifth per person. A minimum of two thirds of the family ceiling can also be allowed irrespective of the size of the family. Similarly, where the family consists of more than five members one fifth of the ceiling may be added for each additional member, subject to an overall maximum of double the ceiling. We further recommend that where both husband and

wife own lands and the ceiling is applied in respect of the combined properties, the two will have rights in the ceilings property in proportion to the original ownership of land by each before the application of the ceiling. We also hold the view that for purposes of ceiling no distinction should be made on the basis of personal laws applicable to the family, whether it be Mitakshara, Dayabhaga, Muslim or Christian.

Purpose Nullified

We have already noted that the exemptions incorporated in the ceiling laws have operated in such a way as virtually to nullify the basic purposes of the Acts. We feel it necessary that a clear cut all-India policy should be laid-down in this regard without delay. The Central Land Reforms Committee has recommended that exemptions provided in favour of so-called well-managed and mechanised farms should be withdrawn. In respect of the other exemptions, the committee has merely suggested that Chief Ministers could be consulted for evolving a national policy. We feel that it would be better for the government of India to lay down specific guidelines straight-away to provide a framework of action by state governments.

As such we recommend:

(i) Exemptions already granted for plantations in relation to the actual area planted with a margin for replacement plantings may continue. We would, however, urge that the definition of 'plantation' should be such that in the name of plantations, lands used for other crops but interspersed with some plantation crops or merely kept fallow do not enjoy this exemption. It might also be advisable to undertake a scientific study of the management of plantations as also of farms for government to evolve a suitable policy in treating lands utilised for these purposes under the ceiling programme.

(ii) The case of lands held by trusts, institutions, etc., requires detailed and careful consideration. Any blanket exemption is uncalled for and

is likely to be misused. There is strong reason to suspect that many of the so-called trusts have been created deliberately to evade ceiling or other laws. As a rule, therefore, no distinction need be made between lands held by individuals, or families on the one hand and institutions including trusts on the other. In the case of properties of institutions which serve a genuine public purpose, suitable financial arrangements may be worked out by state governments concerned while determining the compensation, so that the service may continue to be performed even after the surplus lands have been taken over.

(iii) Lands owned and operated in the name of cooperative farming societies will need to be exempted from ceiling laws. This should not, however, enable an individual member of the society to possess more than the ceiling area. The principles governing the ceiling for a family should be applied for members of the same family in the cooperative farming societies concerned.

(iv) Lands held by cooperative banks and banking companies on mortgage will also require exemption from ceiling.

Withdraw Exemptions

We are firmly of the view that all other exemptions provided for in the earlier Acts should be totally withdrawn and no new exemptions contemplated. This will mean that there will be no exemption in the case of 'well-managed' farms or 'mechanised' farms; land given as gallantry awards and sugarcane farms operated by sugar factories, lands held by ex-rulers, orchards and the like.

In determining the date with effect from which ceiling laws, as now formulated, should apply we have to take note of the fact that taking advantage of the considerable period over which this matter has been debated and anticipating many of their likely provisions large-scale partitions, transfers gifts and sales have been affected by many owners of large

holdings. The aim has been to defeat the purposes behind the laws and to create records by which it will be impossible for government to undertake any worthwhile scheme of re-distribution. There is an overwhelming case for giving retrospective effect to the proposed legislation in order to nullify such ruses by vested interests.

Ceiling Law recommended

We have noted that some states propose to give effect to the new legislation with effect from January 1, 1972. We are, however, convinced that this will largely dilute the effectiveness of the proposed legislation since evasive action had been taken by big landlords much earlier than this date. In the light of the relevant developments, we would strongly recommend that the ceiling law should be applied retrospectively from September 26, 1970 on which date the Chief Ministers' Conference referred the entire issue of land ceilings to the Central Land Reforms Committee and opinion began to take shape in favour of the kind of provisions discussed here.

As a first step in checking such fraudulent transactions and distinguishing them from bona fide ones; special tribunals with quasi-judicial powers will have to be set up. It will be desirable to bar the jurisdiction of civil courts in these matters.

There are diverse views on the basis for determining the compensation amount for the surplus land taken over under the ceiling laws and the manner of its payment. These range from payment of full market value in cash in one lump sum to the other extreme of denying all compensation. The policy we adopt should not put too great a strain on the exchequer or on the allottees and permit a reasonable compensation to be paid over a period of time to the persons who are deprived of their property. We agree with the view of the Working Group set up by the National Commission on Agriculture that the very purpose of breaking concentration of economic power by a programme of land re-

distribution will be defeated if rich land owners who lose their power by the application of ceiling laws, are provided with the financial resources to gain it in other sectors. In the interest of equality there should be different slabs of compensation, the rate going down with an increase in the size of the holding. The amount itself can be related to land revenue payable per acre and a graded slab system worked out on this basis. Questions relating to payment in bond or in cash, the number of instalments etc., should be solved with reference to the circumstances in each state, the needs of the persons concerned and other relevant factors.

We also feel that because of their far-reaching consequences land reforms laws should be included in the Ninth Schedule of the Constitution to give them protection against vexations or unnecessary litigation.

Programme of redistribution

It has not been possible for us to make an assessment of the likely extent of land that will be rendered surplus under the scheme of legislation proposed by us. That this will be appreciably larger than what has been available within the framework of previous legislation goes without saying. Nor should it be thought that a ceiling on the size of holding is the only means of acquiring land for re-distribution in favour of the vulnerable section. Later in this report, we draw attention to the possibilities of limiting ownership of land only to those who reside in the village to cultivate their land. Progressively, a combination of such measures should enable government to secure control over sizeable areas of land that alone can form the basis of a meaningful programme of redistribution.

In redistributing available lands, however, it is necessary to consider the relative priorities as between the landless labour and the small peasants owning land less than the economic size. There are valid economic arguments for giving preference to those who al-

ready have some farming experience with holdings below the viable level. But this is not merely a problem of farm management and productivity in the short run. We have to face the grim realities of the evergrowing mass of restive landless labourers, non-availability of alternative employment opportunities and the abject poverty of a majority of the landless. We therefore feel that first priority should be given in the matter of distribution, of surplus land to the landless agricultural population particularly Harijans, the tribals and backward communities. As a rule 50 per cent of the surplus land available in the state should be set apart for members of the Scheduled Castes and Scheduled Tribes and other notified tribes. Within a given class of people priority can be given to those landless persons who in some capacity or the other are already cultivating given portions of land that is declared surplus. Similarly, the interests of existing tenants should not be disturbed in the process of implementing the ceiling legislation.

Where surplus land is available in large blocks, the formation of cooperative societies should be encouraged.

Compensation to beneficiaries

We attach great importance to the manner in which government sets out to help the allottees to make the best use of their new possession. Both positive and negative measures are called for in order that our programme may achieve the designed results. Negatively, we should prohibit lease, sale or mortgage of the allotted land except to public or cooperative institutions. By such prohibition, it should be possible to prevent the tendency that has been noted in the past for the bigger landlords to regain possession of the land, after paying some nominal compensation to the beneficiaries. More positively, we should confer hereditary rights in the lands concerned to the allottees as long as they cultivate that lands themselves. It will also be necessary to set up special institutions through

which adequate and timely credit, inputs in kind, and other facilities are made available to the cultivators for developing and properly utilising the lands assigned to them.

In planning the activities of such institutions the age-old handicaps under which these beneficiaries have suffered and their relative inexperience in taking independent management decisions should be specially kept in view. A special orientation will have to be injected to these agencies so that they help the allottees to blossom into efficient managers of their farms within as short a time as possible. The fullest advantage should be taken of the new psychological climate created in the countryside by a government led but mass-based operation to provide to the landless and small holders a more secure source of employment and livelihood.

Rule of Law

A crucial element in determining the outcome of our entire effort will be the type of implementation machinery we evolve for this programme. As the Working Group set up by the National Commission on Agriculture has pointed out, our effort is unique in so far as it attempts to initiate fundamental reform without peasant revolution as in China or under the edict of a occupying power as in Japan or Taiwan. The implementation machinery that we contemplate will have to function within the framework of our parliamentary democracy and the rule of law. We agree with the view of the working group that under our conditions a programme of effective implementation should include the following elements

(i) Watchdog committee: may be formed at the central state and district levels, and consist of representatives of the main political parties committed to the idea of land ceilings. These committees should provide the main political impetus and direction to the process of reform by creating awareness about what it stands for and why it is being undertaken. We attach spe-

cial importance to the education of the poorer classes and their involvement in order to create a proper climate for reform. Political rallies and conventions may provide the platform and the instrument by which the redistribution programme is given the character of a mass movement. We would like to emphasise in this connection the need for disciplined and devoted work by party cadres at various levels.

(ii) The administrative structure will also require a fresh review and reorganisation, so that those entrusted with the enforcement of the ceiling legislation have both the administrative skill and then necessary faith in and commitment to this programme. A process of careful selection of officers and staff of this purpose and a specially designed programme of field-training will have to precede any purposeful implementation of the kind of reform that we contemplate.

Special Mobile Court

We also agree with the recommendation of the working Group that in adjudicating on judicial or quasi-judicial issues that will arise from the implementation of the ceiling legislation, it will be better to set up special mobile court to hear cases in villages and give quick decisions after on-the-spot investigations than to consign such cases to the regular district civil or revenue courts which already have more than their due share of work. The procedures to be adopted for the filling of claims, their examination and disposal should take special note of the disabilities from which the landless and backward communities suffer. Government, in particular, should examine methods by which expert technical and legal assistance could be provided either free of cost or on subsidy to the weaker sections in order that they are not denied their legitimate rights. This committee concurs with the assessment of the Working Group of the National Commission on Agriculture that administrative and judicial agencies have in the

past been designed more to preserve the status quo than to promote fundamental socio-economic change. A restructuring of the administrative and judicial apparatus and a simplification of the procedures are therefore a necessary condition for the effective implementation of the land ceiling legislation.

We also endorse the other recommendations of the Working Group to form representative committees of beneficiaries at the village level to be actively associated with the preparation of land records and the work of redistribution.

We wish to emphasise once again that ceiling legislation should be regarded as part of a more comprehensive programme of reform, which will cover questions relating to tenancy and rents and deal with institutions responsible for credit, supply of inputs, marketing and processing of the agricultural produce. Our rural community cannot be transformed into an economically prosperous and socially equitable reality in our national life unless we mount such a comprehensive programme

of change and improvement.

Given the acute and growing pressure of population, it is necessary to consider whether it will not be justifiable to bar persons with assured non-farm income above a certain level from competing with others, less fortunately placed for ownership of land that is in such short supply. One way of doing this will be to prohibit directly land ownership by persons with assured incomes above a minimum level from other sources. In such a scheme of action, Rs 12000 and above a year from occupations that are of a permanent nature might be considered a reasonable disqualification to possess land simply as a piece of property. There may, however, be problems in defining "permanent occupations."

Another approach will be to prohibit private leasing of land for cultivation purposes and to lay down that personal cultivation will be a prior condition for land ownership. By such a stipulation we can ensure that persons with permanent non-farm occupation do not appropriate land simply

as rentiers. The approach suggested there is indeed in conformity with the principle of "land to the tiller" which we have accepted all along. Much will, however depend on how 'personal cultivation' is defined, interpreted and enforced. The Law Minister has been requested to have the definitions aoped in various statutes scrutinised and to suggest a suitable formulation.

We would, however, recommend that it should be laid down that the process of legislation in regard to ceilings is completed in all states by December 31, 1972. We would also suggest that the existing cell in the Ministry of Agriculture to monitor progress in land reform be strengthened suitably and meetings of the Central Land Reforms Committee convened at regular intervals.

The following were the members of the committee: Fakhruddin Ali Ahmed, C Subramaniam, Mohan Kumarangalam, H.R. Gokhale-V.P. Naik, Barkatullah Khan, Dr Rajendra Kumar Bajpai, Dev Raj Urs and K. Karunakaran.

Fall in prices forecast

Hindustan Times Correspondent
NEW DELHI, July 12—While
admitting that industrial produc-
tion was lagging, Prime Minister
Indira Gandhi today held out the
hope that the economy would
regain its momentum as a result
of the steps taken by the Govern-
ment.

also in Burundi and how the people in Rwanda have learnt to love it and the people in Burundi to lump it. The important thing, as the Rwandans are telling the Burundis, is to have development in which case you may also have this inflation just to add spice to the whole thing.

But are we having development? Is not the economy sliding back?

Again I must ask you and other journalists to get out of your offices and go about the country and see things for yourself, or, better still, keep to your offices but read the World Bank or IMF reports about what we have achieved; Japan is not the only country in Asia to have worked economic miracles.

In which case, Prime Minister, why should we have any anxiety about the rupee? Surely, with so many economic miracles to buoy it up, it should manage to keep floating nicely for as long as it finds it is fun. Can't you tell poor I.G. that he need not do any more waiting so that he may go home and attend to the packing. Chavan, too, could be freed to concentrate on Jagjivan Ram now that inflation also is not a problem.

[The Prime Minister does not reply; she raises an eye-brow, throws a quizzical look and smiles that smile—Ed.]

Eastern Economist

25 Years Ago

July 25, 1947

Events in India during the past one week have been vastly more cheering in comparison. It is clear that the sense of frustration is already disappearing. The national flag has been adopted by the Indian Constituent Assembly with unprecedented enthusiasm—a hopeful sign because this means that the bitterness and/or resignation with which the political settlement was accepted by several people will disappear much sooner than was at one time expected. Chaudhry Khaliq-uz-Zaman's speech pledging the loyalty of Indian Muslims to the flag was itself evidence of this change. The League has apparently not welcomed joint electorates with the same enthusiasm, but the principle is likely to be accepted all the same. At least the other minorities are now unanimous in desiring a change. A major reform is thus being carried out without any fuss, and even without advertisement since more important and sensational news are crowding it off the headlines. If the ease with which this change is being accomplished does not prove the old thesis that a settlement becomes very easy when the third party is no longer in control, no other proof is possible.

In an editorial in its

issue of July 13, *The Hindustan Times* has described the Prime Minister's latest press conference as "a wasted occasion". The complaint or protest is altogether just. This newspaper, however, has come down on Mrs Gandhi rather too gently for her share of the discredit. It has let her off with a mild admonition that "the Prime Minister is not always forthcoming". This may well prove to be the prize understatement of the year.

The truth is that Mrs Gandhi seems to regard her press conferences merely as possible opportunities for an ego trip for herself. Her father, of course, was different. Jawaharlal Nehru really enjoyed a press conference just as he enjoyed other occasions for communicating with people. It is not merely that his daughter lacks this warmth. She positively freezes. The temperature goes down when she enters the place and it falls further when she puts on that smile. The

ficial and not infrequently they are downright childish. The editorial in *The Hindustan Times* is, therefore, justified in blaming as it does, the capital's newsmen as well for the barrenness of the Prime Minister's press conferences. It could be assumed that Mrs Gandhi will have no difficulty in endorsing this assessment. It has been said that President Nixon does not think much of the White House correspondents' corps as such and that this is the reason why he is also sparing of press conferences. Could there be a similar reason for Mrs Gandhi practising a like austerity?

It may be some consolation for the journalists of New Delhi that President Nixon does not rate particularly highly the performances of Washington's newsmen at his press conferences. But I am sure that my colleagues will agree that *The Hindustan Times* has a valid point when it suggests that, leaving aside Mrs Gandhi's own approach or attitude, there is need for the journalists themselves taking her press conferences

WITHOUT CHARITY

way she conducts her press conferences suggests that she regards them essentially as a means of testing her capacity for refusing to be drawn out or resisting being drawn into saying anything but insignificant nothings. To put it bluntly she just does not want to communicate. Whether this is some sort of defence mechanism or it reflects a proprietary attitude on her part towards the government of the country or its functioning is a matter which will no doubt reward scholarly investigation. Meanwhile it must be said in her favour, however, that she holds fewer press conferences at longer intervals than could be the case. This at least helps to save some of her time, also the time of the press and above all the time of the nation.

The Prime Minister's lack of responsiveness or genuine interest in the proceedings of her press conferences naturally tells on the quality of the journalists' performance. The questions put to her are generally wanting in both substance and style. Quite often they are super-

much more seriously than they tend to do. This newspaper, in its editorial, has helpfully listed some of the steps that could be taken to rationalize the conduct of the P.M.'s press conferences and thereby making them more informative and productive. It has pleaded for self-regulation on the part of the press and recommended that questions could be grouped together around a few topics or even submitted in advance with liberty to correspondents to pursue the answers with relevant supplementaries. It has also favoured press conferences of short duration, limited to 30 or 45 minutes and it has expressed the view that these conferences could be "chaired by someone with the authority, discretion and tact to sift the grain from the chaff—if the Prime Minister would rather not do it herself".

The last part of the prescription does not seem very practicable or even reasonable, but there is certainly a great deal to be said in favour of there being a little more forethought in

the framing of questions by press correspondents. Pending the scheme of the press conference itself being reorganized by the PIB in consultation with the Prime Minister's secretariat, it should be surely possible for editors of newspapers to do a bit of organizing on their own. Since they receive advance information about the holding of these press conferences they could certainly discuss with their special correspondents what information could be usefully sought and decide what questions consequently were to be asked on behalf of their respective newspapers.

There is also another detail which could reward attention. The bigger newspapers naturally have generous contingents of special correspondents. Even if it is considered necessary that all of them should go to the P.M.'s press conferences for their education, it does not follow that as many of them as possible should also weigh in with questions. There will surely be an obvious advantage in a newspaper nominating a special correspondent or, at the most, two from among its staff who could frame a question properly and present it effectively.

Part of the explanation for the unbusinesslike manner in which the P.M.'s press conferences are coming to be conducted is that this affair is partaking more and more of the features of a *mela* with far more men (including women) collecting on the scene than there are places for them to be seated. An unlovely corollary is that the journalists start pouring in a full hour before conference time as if they or their newspapers could easily afford to make a day of it. The whole business becomes needlessly disorganized further by the misplaced enthusiasm shown by almost the entire staff of the Press Information Bureau which takes it upon itself to grace the P.M.'s press conferences with its profligate presence. The Prime Minister has so many legitimate opportunities for holding mass meetings that it is hardly necessary that her press conferences should also be made to assume the appearance or character of one of those meetings. This brings me to my final reflection on the subject which is that, whereas planning or regulation would have robbed a spontaneous performance like that of Jawaharlal Nehru of its charm, only planning and regulation might save his daughter's press conferences from being 'wasted' occasions.

TOUCHSTONE

Vicious geometry of steel

THE TAKING over of the management of the Indian Iron & Steel Company by the government for a period of two years is less arbitrary than some of the other decisions of New Delhi which have lately affected the place and role of the private sector in our economy. This company has unfortunately been victimised by certain predatory speculative activities in its shares which have resulted in paralysing its management and higher direction. It is because the interests involved in this conflict over its control have not had the wisdom or the integrity to settle their differences in the larger interests of the institution that IISCO has fallen a prey to the carnivores of our political jungle. Whether Mr Mohan Kumaramangalam has effected an entry into the central cabinet to capture the government of the country for a communist party of his choice or not, he certainly seems to have got into the Ministry of Steel in order to preside over the liquidation of the mixed economy in the steel industry. It is part of the irony of the current national situation that Mr Ramnath Goenka and Mr Biren Mukherjee have so obligingly provided Mr Kumaramangalam with the provocation as well as the temptation for the seige and seizure of Burnpur.

The Minister for Steel is generally regarded as a very clever man. He himself seems to regard people generally as fools. The ordinance taking over the management of IISCO gives as the main reason for his action the steady decline in production at the steel works. Mr Mohan Kumaramangalam seems to be extraordinarily confident that the public will be taken in by this tongue-in-the-cheek argument. As the Federation of Indian Chambers of Commerce and Industry and others have pointed out, the performance of the state-owned steel plant at Durgapur, which is an appropriate object of comparison with the IISCO plant since both are in West Bengal, has been much worse, whether in terms of utilisation of capacity or maintenance of plant and equipment. Even otherwise, public sector steel has certainly not shown much evidence over the years of being blessed with the qualities of managerial or technical efficiency. It is indeed outrageous that an extension of the public sector in steel, whatever the form this extension may take, can at all be justified on the ground that the know-how of the state's steel industry could thereby be better deployed or employed.

As a matter of fact, if operational inefficiency is the justification, there is at least as much firm ground for the management or ownership of the public sector steel plants being taken out of the jurisdiction of the government of India as for effecting any change in the control or management of IISCO. Quite seriously the suggestion could be made that India's state steel plants should be placed under, say, the mandate of the United Nations and managed by some international agency created for the purpose.

Ministers are assumed to be honourable men. Mr Kumaramangalam appears to be a honest man of sorts as well. He has gleefully indicated that, even after the expiry of the two years mentioned in the ordinance, the control of IISCO may not be returned to its present management. In the circumstances the action now taken by the government with regard to IISCO would seem to amount to effective nationalization of the undertaking. Only the i's remain to be dotted and t's crossed. The present Minister for Steel, aided and abetted ably by the present Minister of Law may be depended upon to ensure that the public sector in steel gets the Burnpur and Kulti works at a knocked-down price. For putting through the slick operations that may be called for in this connection Mr Kumaramangalam ought to need much less time than two years.

The efficient running of the steel works itself is a different proposition altogether. Whether Mr Kumaramangalam could do very much in this matter in 20 years, let alone two, remains to be seen. The men who have allowed Durgapur to decay are hardly likely to become the saviours of Burnpur. Hindustan Steel has a particularly bad record in industrial relations. Its miserable history is even more unfortunate in terms of production performance or plant maintenance. Mr Kumaramangalam has had ample time to do something to improve the situation. But the man whose chairmanship of Indian Airlines was distinguished by continuous industrial strife and operational losses is hardly the minister to succeed in cleaning the Augean stables of Hindustan Steel. Since, however, Mr Kumaramangalam is a clever man he has reasonably been successful in diverting attention from his failure.

For some months now he has been talking of a holding company for steel and allied fields in the public sector. Mr Kumaramangalam has not been the first Steel Minister to reorganize the public sector steel industry, nor will he be the last. Every minister who has held this portfolio for any length of time has muddled or monkeyed with the organizational problem—every minister that is except the easy-going Mr Swaran Singh or Mr Sanjeeva Reddi who, fortunately, was

more interested in Andhra politics than in steel politics. An interesting common feature of all these reorganization schemes has been that, while everyone of them was announced or inaugurated with a fanfare, nothing very much was heard of any of them subsequently. It remains to be seen whether the holding company is going to fare differently. Meanwhile it would be premature and even pointless to discuss the scheme in detail or even seriously at all. It is obvious that Mr Kumaramangalam is following the step-by-step approach made famous at the Simla summit. He will no doubt let the public have a look at the full picture in due course. Meanwhile the mere fact that he has inducted a successful executive from the private sector to head the holding company is not enough in itself to sell the scheme to the country. This is not the first time after all when reputations made in the private sector have been dragged like sacrificial lambs to the altar of the public sector generally or the public sector in steel in particular. Mr Wadud Khan is entitled to our sympathy in generous measure.

BHEL does better

COMPARED TO the Bhopal complex of Heavy Electricals India Limited (HEIL), Bharat Heavy Electricals Limited (BHEL), which has three units at Hardwar, Hyderabad and Tiruchy, has been putting up a much better performance. Whereas the former complex had accumulated since 1956, the year of its incorporation, losses to the tune of Rs 58.97 crores till the end of 1970-71 — Rs 8.97 crores more than its paid-up capital of Rs 50 crores — the aggregate losses of BHEL, which was incorporated in 1964, were Rs 17.69 crores against paid-up capital on March 31, 1971, of Rs 65 crores. The cumulative loss of BHEL now stands reduced to Rs 14.50 crores, as this undertaking has made a profit of Rs 3.19 crores in 1971-72. The Bhopal complex, on the other hand, is not anticipated to make any profit in 1971-72 also. Its cumulative loss, thus, should go up further.

If the retiring chairman of BHEL, Mr O.S. Murthy, therefore, feels satisfied with his tenure with this undertaking, it is not unjustified. During the three and a half years he has been at the helm of affairs of BHEL, it has shown profit — though modest — in two years. The 1971-72 profit was nearly five times the nominal profit of Rs 65 lakhs in the previous year. Two

So also is the business house of Tata from whose employ Mr Khan has been drafted to the greater glory of Mr Kumaramangalam's holding company. This is for the reason that, with the taking over of the management of IISCO by the government, the Tata Iron and Steel Co. has gained the dubious distinction of being the last sentinel of free enterprise in the steel industry. The ordinance on IISCO states that part of the reason for the government take-over of the company is that its present management has allowed plant modernization or expansion to fall into arrears. It would be interesting to know how the management of TISCO rates the prospects of further large investments in its own works particularly in the light of Mr Kumaramangalam's plans for the steel industry in this country. In the years immediately after independence Mr J.R.D. Tata was questioning the very need for the state setting up steel plants to expand steel capacity. The wheel has turned full circle. How vicious the resulting geometry can be would depend on Mr Kumaramangalam's skills in scheming for the steel industry.

years earlier, it had shown a loss of Rs 3.4 crores.

To appreciate correctly the financial performance of the two public sector heavy electricals projects, it has to be noted, however, that the profit of BHEL in 1971-72 received a boost of Rs 1.05 crores by the decision of the government to convert loans to it worth Rs 15 crores into its equity capital with effect from April 1, 1971, so that the equity loan ratio, which went out of line with the customary standard of 1:1 three years earlier, could be restored to the standard norm. If this relief had been granted soon after the equity loan ratio was disturbed, BHEL would not have been required to provide for interest on excess loans. To that extent, the balance sheet of the undertaking would have shown improvement. The Bhopal complex, similarly, has been incurring unduly heavy interest charges. Its equity loan ratio at the end of 1970-71 was 1:1.5. It is however understood that in the case of this complex too interest on excess loans is being waived for 1971-72.

The above, of course, does not imply that all is well with BHEL. Even last year, as the table alongside shows, only two of its units — Tiruchy and Hyderabad — showed profit, after providing for interest and depreciation charges and Rs 7 lakhs development rebate in the case of the Tiruchy unit. The third unit at Hardwar continued to incur a sizeable loss.

Even though the total output of the three units of BHEL this year is expected

to go up to Rs 82 crores from Rs 59.33 crores in 1971-72 and Rs 48.26 crores in 1970-71 — this should help in improving further the profitability of the undertaking as a whole — the Hardwar unit is not likely to enter the profit stage as, according to Mr Murthy, the thin pipeline of orders till mid-1970 will continue to adversely affect the working of this unit in 1972-73 also, as it did in 1971-72. The sizeable orders received by the Hardwar unit in the second half of 1970, of course, should result in better utilisation of its installed capacity from next year onwards.

The performance of the Hyderabad unit, it is stated, would have been much better in 1971-72 than what it has been had the supplies of critical steel castings and forgings from both the indigenous and foreign sources been according to the stipulated schedules of delivery. The major indigenous supplier of these castings and forgings being the Heavy Engineering Corporation, Ranchi, the domestic supply may not show any marked improvement this year too. The proposal of BHEL to have a captive foundry for complicated alloy steel castings and medium size forgings at Hardwar has been revived and is said to be under the consideration of the government. This when set up would ensure regular supplies of castings and forgings to BHEL, but it raises the pertinent question: how far is it justified to multiply production facilities through further investment when the existing facilities in the country are not being fully utilized? Our resources for development admittedly are very scarce. They obviously have to be judiciously utilised and not frittered away in just duplicating the existing facilities. Efforts need to be made to utilise the existing facilities fully.

It is encouraging to note that BHEL is not afflicted with that much labour unrest as the Bhopal complex is. Further, its product pattern is not as diversified as that of the Bhopal project. The availability of trained personnel in the country at the time of its incorporation gave BHEL an additional advantage, compared to the Bhopal unit. With the production techniques now more or less mastered, BHEL's performance ought to improve markedly, provided, of course, the critical shortages of castings and forgings are overcome ex-

Unit-wise Profitability of BHEL

Unit	(Rs crores)

Hyderabad	..	0.55	1.93	..
Hardwar	..	4.26	..	2.86

peditionously and the flow of orders is adequate and regular.

Timely placement of adequate orders on heavy electrical manufacturers, as a matter of fact, is imperative if their capacities are to be fully utilised. It is, indeed, uncharitable to assail the working of a heavy electrical project if the flow of orders to it is inadequate and irregular. The case of BHEL is no different. With our power requirements expected to go up to over 40 million kws by the end of the fifth Plan, there should not be any dearth of orders for the two heavy electricals plants in the country. But care has to be taken that at least about 50 per cent of the new power generation schemes are finalised soon so that orders can be placed on the manufacturers well in time. The two main reasons for the irregular and inadequate flow of orders to manufacturers are the protracted delays in firming up power generation programmes and the weak financial position of most of the state electricity boards which are the main customers of this equipment.

If power shortages are to be obviated by the end of the fifth Plan period, it is necessary that a realistic estimate is prepared of the likely availability of indigenous supplies vis-a-vis the needs. Mr Murthy has claimed that BHEL and the Bhopal complex between them can cater for the full requirements of power generation during the fifth Plan period, provided the placement of orders is well in time and properly phased out. This view, however, is not shared by the state electricity boards whose chairmen met here in early May. The preparation of a realistic estimate of the likely supply of power generation equipment from domestic sources should help in finalising the import programme of this equipment. Any undue delay in the completion of this task will have a very adverse effect on the implementation of the development programmes, both in industry and agriculture.

In the interest of better utilisation of their capacities, the two manufacturers of heavy electrical equipment themselves ought to do some advance planning on their own instead of waiting for firm orders being placed on them. The broad dimensions of the power development programme of the fifth Plan are already available to them. Nearly 50 per cent of the work on the manufacture of equipment for a power station is said to be such which can be completed in advance, especially when standardisation of generation capacity is being attempted. The remaining 50 per cent work is said to depend on the knowledge of the exact location of a power plant and the characteristics of the source of power generation. This can await the placement of firm orders. It should, of course, be possible to reduce

the time taken for this work also if impetuous orders are placed on the manufacturers, as suggested by Mr Murthy.

Better utilisation of capacity should go a long way in reducing the costs of production of the two heavy electricals projects. The present levels of prices quoted by HEIL/BHEL are said to be far higher than the landed costs of comparable equipments, which according to government's policy, should generally be the ceiling for the pricing of products of public sector undertakings operating under monopolistic or semi-monopolistic conditions. In cases in which pricing on the basis of landed cost

Costly lapses

THE MISCALCULATIONS on the steel and fertiliser fronts are proving to be very costly for the country's economy. While the bungling in regard to the creation of capacity for steel making and the inefficient running of the public sector plants compelled imports of over Rs 200 crores of different categories of steel in 1971-72 and it may be necessary to import again steel for the same value if not more in the current year, it had been hoped that a breakthrough would be established at least in respect of fertiliser production. These hopes however are now being belied and with the emergence of new trends in consumption of nitrogenous and phosphatic fertilisers, a similar compulsion is arising in respect of fertiliser imports as well.

For a time, there was needless delay in finalising arrangements for the promotion of new giant fertiliser units in the public and private sectors. But after a particular stage many projects were cleared and it was expected that there would be a big rise in the output of fertilisers in 1971-74 and it would not be difficult to reduce imports of different types of fertilisers substantially. The actual developments however have come about in a different way. If the data released by the union Ministry of Petroleum and Chemicals recently are any guide, an alarming situation may arise in 1973-75. Apart from the costly delays in creating new capacity the inefficient functioning of the public sector units particularly has been responsible for the latest decision of the government to double imports of fertilisers in the current year. As these had a value of around Rs 120 crores, in 1971-72 it may become necessary to increase these imports to Rs 240 crores in 1972-73.

It is indeed a sad commentary on the per-

formance of the union Ministry of Petroleum and Chemicals that indigenous production in 1971-72 amounted to only 12.43 lakh tonnes of nitrogen and phosphoric acid against a total consumption of 27.52 lakh tonnes. As imports were only nine lakh tonnes, available stocks had to be utilised to the extent of 6.09 lakh tonnes. This process of eating into stock in order to conserve foreign exchange and the efforts to correct the impression that earlier imports were excessive, have resulted in base stocks being reduced to dangerous levels. Because it is necessary to maintain sizable stocks in different parts of the country in order to meet the need of farmers without delay, it would be inadvisable to reduce these stocks to below the existing level. Already there are loud complaints about a serious shortage of urea, ammonium sulphate and other fertilisers in some states and it is even apprehended that agricultural operations may be adversely affected due to the inadequacy of fertilisers.

On the basis of the trends in consumption in the past two years, availability in 1972-73 will have to be of the order of 3.3 million tonnes. On the other hand even with the full functioning of the giant Madras Fertiliser unit and the commissioning of the Cochin and Goa units, output may not increase to more than 1.6 million tonnes, requiring imports of 1.7 million tonnes. This tallies with the suggestion that imports would have to be doubled to 1.8 million tonnes. Looking further ahead there may be a further rise in consumption to 4 million tonnes in 1973-74 while internal production even with the efficient functioning of the Cochin and Goa unit and the commissioning of the Durgapur unit may not increase to more than 1.1 million tonnes. Under the best conditions this figure may be raised to two million tonnes. In any case, 50 per cent of current consumption will have to be met by imports and it will be possible to prevent a net increase in the quantum of imports.

only if additional capacity can be created on a phased basis, for taking care of further increase in consumption. On the basis of the schemes already under implementation and consideration an aggregate capacity of only 4.38 million tonnes will be created by 1975-76 in respect of nitrogenous fertilisers and 1.48 million tonnes relating to phosphoric acid or an aggregate capacity of 5.86 million tonnes of nitrogen and phosphoric acid. Assuming that the industry would be able to function at least at 75 per cent of its rated capacity the availability from indigenous sources can be estimated at 4.41 million tonnes. The calculations in this regard may be upset if there is a delay in the construction of the coal-based units at Talcher, Ramagundem and Korba, as it is likely, with an aggregate capacity of 6.87 lakh tonnes. Some projects like those of Tata Chemicals and Coromandel Fertilisers are yet to take shape.

Even assuming that an output of around 4.5 million tonnes will be available in 1975-76, consumption would have risen to nearly six million tonnes assuming that there would be an annual growth in off-take of at least 20 per cent. It will be clear therefore that the dependence on imports cannot be eliminated and at best these will come down to 1.2 million tonnes after rising to two million tonnes. What is however distressing is the fact that nearly seven million tonnes of fertilisers will have to be imported in four years and the value might be easily Rs 850 crores if not more. Serious efforts have therefore to be made to improve the operating efficiency of the existing and new units. With-increasing capacity, even an improvement of 10 per cent in the operating ratio may be helpful in saving foreign exchange expenditure of Rs 50 crores annually. The saving can be very much more if all the plants can function at least at 80 per cent of capacity and unnecessary delays also in implementing new schemes are avoided.

The schedule of construction of the Cochin and Durgapur plants has been seriously prolonged because of the difficulties in obtaining indigenous equipment and other factors. Also on present indications the coal-based units may not come into being before 1976-77. Only in respect of

the Tuticorin and Mangalore projects a tight schedule of construction has been drawn up and it is quite likely that these two units may go on stream in 1974. The same cannot be said however of many other schemes which are still in their very early stages. In view of the continuing drain of foreign exchange on fertiliser imports, it will be worthwhile to examine whether critical items of equipment can be imported and new projects started on a standardised basis. There has been too much proliferation of manufacturing techniques and dependence on know-how from many directions. This has made it difficult for Indian technicians to plan ahead boldly and fabricate equipment in a big way.

There has of course been a revolutionary change in the design and operation of giant units but it is now possible to take decisions which will hold good at least for a decade and create additional capacity on a well planned basis. Since it is likely that there will be an increase in consumption by one million tonnes annually, in the fifth Plan and by 1978-79 the total requirements

will be over 10 million tonnes, there will have to be continuous planning for creating capacity of this order progressively. Unless there is advance planning for erecting new units and implementing expansion schemes in the public and private sectors, the situation will become unmanageable.

It may be asked whether it will be correct to proceed on the assumption of an average growth of 20 per cent in consumption in the current decade. The actual growth rate may even be higher as it is only now that there is fertiliser consciousness in several parts of the country though it is pointed out by experts that the consumption levels are very low in some states like Bihar and Orissa. With the efforts to increase the area under irrigation and use also underground water resources wherever possible the above estimates of consumption may prove to be conservative. In any case there is no justification for the avoidable heavy expenditure now being incurred on imports when the existing units can be made to produce more and the new schemes also completed expeditiously.

UTI tries hard

A HIGHER dividend, a reduction of the margin between the sale and the repurchase prices and a lower special offer price were the three outstanding achievements of the Unit Trust of India (UTI), according to the latest results of working (for the year ended June 30, 1972) which Mr James S. Raj, the new UTI chairman, announced to newsmen in Bombay a few days ago. It remains to be seen how this triple benefit would add to the popularity of units in the country.

Meanwhile, for the second year in succession, there was a decline in both the total number of applications and the aggregate sales. Thus, the number of fresh applications in 1971-72 was only 58,558 accounting for Rs 15 crores worth of units, as against 59,000 applications accounting for Rs 17.99 crores in 1970-71 and 61,000 applications accounting for Rs 22.45 crores in 1969-70. But the number of applications for repurchase of units dec-

lined from 12,691 to 9,900, the respective aggregate values being Rs 2.59 crores and Rs 3.19 crores. Total units sold and outstanding at the end of June last with the public crossed the Rs 100-crore mark (Rs 104.65 crores to be exact) as had been anticipated by us in these columns last year, while the total number of unit holders touched the 4.25 lakh level.

The financial results of the UTI in 1971-72 were fairly satisfactory. The UTI's aggregate income for the year at Rs 9.62 crores was higher than that for the previous year of Rs 8.41 crores. So also the net income allocated to unit holders as per the formula under the Unit Trust of India Act, 1963 for allocations as between the initial capital contributors and the unit holders. At Rs 8.72 crores, this figure was Rs 1.14 crores higher than that for 1970-71.

As a result of the higher net income available thus, the UTI has declared a higher dividend of 82.5 per cent as against eight per cent for 1970-71. For the second

year in succession, the dividend has been stepped up. Together with the tax exemption (though not exclusive as was the case two years ago) the gross yield would be actually even higher than 8.25 per cent., which is certainly attractive enough.

Unit holders have the satisfaction of having got two other benefits besides. These are, as stated earlier, a reduction in the margin between the sale and the repurchase prices, (which this journal has been urging repeatedly) and also a reduction in the special offer period price. It may be recalled that the margin between the sale and the repurchase prices of units used to be as high as five per cent in the early years of the UTI. The first reduction was effected in the sixth year of the UTI (1969) when it was made four per cent. This year, again, that is in the ninth year, a further reduction to three per cent has been effected, evidently to make the units more attractive. They should come down, together with the reduction in the special offer period price from the last year's level of Rs 10.60 to Rs 10.45.

One index of the UTI's popularity is the

progress made in its Reinvestment Plan. It is heartening to note that there has been a steady rise in the number of unit holders opting for this plan. The total amount of Rs 69.30 lakhs was reinvested by 18,000 unit holders in 1971-72 compared with Rs 50.44 lakhs reinvested by 15,700 unit holders in 1970-71. (Last year, this latter figure appeared as more than 20,000; presumably, the amended figure is accurate, being the latest one). Unfortunately, the same cannot be said of the Children's Gift Plan. Sales in this case during 1971-72 were lower at Rs 46.28 lakhs compared to sales in 1970-71 of Rs 56.32 lakhs. How the new Unit-linked Insurance Plan will fare still remains to be seen, but there is no gainsaying the fact that it has its own attraction, in that contributions to this plan rank for income-tax rebate in the same manner as premia paid on life insurance policies.

Units as a form of investment have begun to make a modest appeal to investors in this country. Progress in this direction is decisively dependent on the bearing the government's economic policies have or

will have on the growth of the corporate sector. Presently, the composition of the UTI's investments is 44 per cent in equities, 43 per cent in debentures and 13 per cent in preference shares. The UTI management is believed to be recasting this composition so as to increase the percentage share of equities from the present 44 to anywhere up to 55-60, over the next five years. This is as it should be, because it is only then that the earnings of the UTI would be buoyant. It is, however, doubtful whether this condition would be allowed if ideological considerations were to be imported even into the market purchases policy of the UTI. As it is, out of the 325 companies in the equities of which the UTI has invested, about half the number at least would be companies fully under the MRTP Act. So, then, the future prospects of the UTI it seems must be judged by the pace of nationalisation of industries in the country and the possibility of a ban on the UTI's purchase of equities in companies attracting the provisions of the MRTP Act—not so much by the pragmatic policy of the UTI management.

RECORDS AND STATISTICS

Editor: R. V. MURTHY

A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.

The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.

Inquiries regarding subscription and advertisements may be addressed to:

POINTS OF VIEW

Nationalised banks in 1971 : some aspects

R. V. Murthy

CONSIDERING that the economy of the country was severely strained towards the close of the year 1971, thanks to Bangladesh, and the fact that there was not any worthwhile expansion in the rate of industrial growth in that year as a whole, the results of working of the fourteen nationalised banks for that period cannot be regarded as unsatisfactory, certainly not in quantitative terms. There was an increase in total deposits, total advances, investments in government securities and in cash and balances. Qualitatively, however, it is debatable whether the trends can be considered equally satisfactory, although the blame must lie mainly with factors beyond the control of banks. For instance, on the basis of the experience of the latest busy season, it has been evident that the expected rise in demand for bank credit did not materialise, despite one more comfortable harvest. Surely this would not have happened, had the rate of industrial growth come up to the expectations of our planners, but indications presently would appear to be that the worst is yet to come. The effects of the faulty industrial licensing policy initiated over two years ago are now beginning to be felt in dead earnest.

brief assessment

Meanwhile, on the basis of the published figures of the results of working of the 14 nationalised banks, (summarised in the table on p. 119) a brief assessment of their performance during the year 1971 may be attempted.

In terms of deposit mobilisation by the 14 nationalised banks, the year 1971 was truly notable. Total deposits of these banks rose from 13.7 per cent, the lowest, to 21.3 per cent, the highest. The record of nearly all the big five was particularly satisfactory, the range of increase in deposits in their case being from Rs 41 crores in respect of United Commercial Bank to Rs 120 crores in the case of the Central Bank of India. Among the medium-sized banks, Canara Bank registered an impressive increase

in deposits of Rs 54 crores in 1971, taking the fifth place among the 14 units. The sixth and the seventh places also went to medium-sized banks—Syndicate Bank (+Rs 52 crores) and United Bank of India (+Rs 44 crores).

percentage declines

Although, in absolute terms, advances by the 14 nationalised banks in 1971 showed an improvement over 1970, as a percentage to total deposits, those of 11 banks showed slight declines. (Bank of Baroda, United Commercial Bank, Canara Bank, United Bank of India, Syndicate Bank, Dena Bank, Allahabad Bank, Indian Overseas Bank, Bank of Maharashtra, all showed declines ranging from three per cent to six per cent). Only in respect of Bank of India, Union Bank of India and Indian Bank were these percentages higher. At 69.84 per cent of total deposits, advances of Central Bank registered the highest percentage among the 14 nationalised banks. Central Bank also showed the biggest percentage rise in deposits. Of all the 14 banks, only one, viz., Union Bank of India, showed a rise in advances higher than that in deposits, the respective figures being + Rs 23 crores and + Rs 21 crores. Actually, the increases in advances in respect of Punjab National Bank, Bank of Baroda, United Commercial Bank, Canara Bank, United Bank of India, Dena Bank, Allahabad Bank and Indian Overseas Bank, were less than 50 per cent of the respective increases in their total deposits. How else then were the increases in total deposits employed? The investments portfolios of all the banks provide the obvious explanation; in the case of every bank, there was an increase in investments in government securities, the range extending from Rs 9.24 crores to nearly Rs 25 crores.

The slow pace of increase in advances, a reflection of the slack in the economy, coupled with the increase in advances being mostly, if not solely, to the priority sectors, on the one hand, and the sizeable

rise in investments in government securities, on the other, perhaps explains the small rise in both net profits and returns to government. (The total amount of profits transferred to the central government by the 14 units in 1971 was only Rs 4.44 crores, that is a rise of a mere Rs 27 lakhs over 1970 and of only Rs eight lakhs more than what the shareholders received during 1968). Three banks (Central, Indian Overseas and Indian) yielded to government a lower return than what shareholders got as dividend in 1968. If the other banks managed to maintain or increase their share of returns to government, this must be attributed largely to the increase in the bank rate which enabled these banks to step up their rates of interest on their advances to customers (offset, of course, to some extent, by the increase in deposit rates also).

mixed progress

Of the 14 units, compared to the previous year, ten units gave a better percentage yield on their respective compensation amounts to government, three the same yield, and one a lower yield. It may be noted that the Indian Bank, despite the percentage of its advances to total deposits having been higher, gave a much lower return to government in 1971 than in 1970.

The published net profits of the 14 nationalised banks for 1971 aggregated Rs 17.26 crores, compared to Rs 13.34 crores for 1970. In the pre-nationalisation year, the total published net profit of these 14 banks was Rs 8.47 crores. Of these 14 banks, only one bank gave a return (on the compensation money) to the government of India of more than seven per cent; two gave a return of more than six per cent; six more than five per cent; two more than four per cent; one more than three per cent and two less than three per cent. Whereas Canara Bank gave the highest return (7.7 per cent), Central Bank of India accounted for the lowest return of (1.8 per cent).

JULY 21, 1972

Tax on state lotteries

L. G. Bapat

WHILE MOVING the Finance Bill 1972 on May 15, the union Finance Minister refused to reconsider the tax of 34.5 per cent levied on the winnings from state lotteries. It was argued that the tax would reduce the attraction of the lotteries and affect their revenue-earning capacity adversely. It is the purpose of this article to examine this complaint in the light of the performance of the state lotteries during the period from 1969-70 to 1971-72. Consolidated state budget figures for 1972-73 would be available some time in September, 1972. Hence, data up to 1971-72 only are analysed here.

The net receipts from state lotteries were Rs 13.28 crores in 1969-70. The state budgets for 1970-71 placed these net receipts at Rs 15.40 crores. However, the revised estimates show that the net receipts are likely to be only marginally higher at Rs 14.08 crores in that year. These receipts were expected to be Rs 14.12 crores in 1971-72. If the past experience is any guide, then the net receipts in 1971-72 may turn out to be actually lower when accounts figures for that year would be prepared after about a year. Even if the 1971-72 budget figures are taken as depicting a fairly accurate picture about the net receipts, it gives us a paltry increase of six per cent in net receipts in 1971-72 over 1969-70, i.e. three per cent per annum *prima facie*. A closer look, however, reveals a different picture.

factors of increase

Table I gives full details of the net receipts of each state lottery during 1969-70 to 1971-72. It will be seen that the increase of six per cent in net receipts in 1971-72 over 1969-70 was not the result of the states, which had started lotteries in 1969-70, experiencing as a whole an increase in their receipts. The improvement in the net receipts was the result of two factors. Firstly, Haryana and Himachal Pradesh started their lotteries after 1969-70. These two new lotteries were expected to earn Rs 1.22 crores in 1971-72. For a strict comparison of 1969-70 net receipts with those in 1971-72, we should neglect the receipts from these two new lotteries.

Secondly, the 1969-70 accounts figures of Punjab state lottery are shown as "not available" in the Reserve Bank publica-

tion. Hence, the net receipts of that lottery in 1971-72 (Rs 0.76 crore) also need to be overlooked. If this is done, then the net receipts in 1971-72 would be found to be actually lower than those in 1969-70 by Rs 1.14 crores or by nine per cent. Also public's initial enthusiasm appears to be slowly receding.

At present, there are four states — Andhra Pradesh, Gujarat, Meghalaya and Nagaland, — which have not started their own lotteries. Out of the remaining 15 states as many as seven states—Kerala, Madhya Pradesh, Maharashtra, Orissa, Tamil Nadu, Uttar Pradesh and West Bengal — expect a fall in their net receipts in 1971-72 as compared to those in 1969-70.

These seven states estimate a fall of Rs 4.04 crores in their net receipts during this period. Their net receipts in 1969-70 were Rs 11.91 crores, whereas they feel that these receipts would be only Rs 7.87 crores in 1971-72. So the last three years' experience of these seven states about the possibilities of mobilising larger and larger revenues through the lotteries cannot be said to be encouraging.

The other five states — Assam, Bihar, Jammu and Kashmir, Mysore and Rajasthan — hope to obtain a larger net revenue through the lotteries in 1971-72 than what they did in 1969-70. Their combined net revenue was Rs 1.43 crores in 1969-70 and is expected to be Rs 4.27

TABLE I

Net Receipts from State Lotteries

(Rs in crores)

NOTES:

- Four states — Andhra Pradesh, Gujarat, Meghalaya, and Nagaland — have not started their lotteries as yet.
- Receipts of Orissa state lottery exclude Rs 15 lakhs earmarked by the state as additional resource mobilisation for the fourth five-year Plan.
- NA—not available.
- States of Haryana and Himachal Pradesh started their lotteries only in 1970-71.

Source: Reserve Bank of India Bulletin: August, 1971: Page 1161, Table 6.

crores in 1971-72. In the case of Assam lottery, the estimated net revenue for 1971-72 appears to be quite on the high side. In 1969-70, this state lottery obtained a net revenue of Rs seven lakhs. In 1970-71 budget, its estimated net receipts were Rs 23 lakhs. However, this estimate was later on revised downwards to Rs 14 lakhs. Still, in 1971-72 budget, a 350 per cent higher net revenue of Rs 48 lakhs is again estimated. Such a large increase in net receipts in only one year looks quite impossible. The same argument applies to the estimates of net receipts from Rajasthan state lottery. Thus, these states' expectations about higher net revenues in future appear doubtful.

We may now discuss the trends in expenditure on the state lotteries. In 1969-70, Jammu and Kashmir, and Bihar were two "very high spending states". In that year, their total expenditure on lotteries was higher than their gross receipts. As a result of this, they incurred losses in 1969-70, as stated already. These two states have managed to bring down their expenditure by 1971-72, if their estimates are relied upon. Anyway, their expenditure on lotteries is still on the high side, being more than 50 per cent of the gross receipts (Table II).

high-cost servicing

In 1969-70, there were two other "high spending states" spending more than 50 per cent of their gross receipts, viz., Assam and Rajasthan. They too hope to bring down their expenditure to 40 per cent and 48 per cent of the gross receipts respectively, by 1971-72. In the case of other states, the proportion of total expenditure on lotteries to the gross receipts was less than 50 per cent, in 1969-70. In the case of Madhya Pradesh, it was as low as 11 per cent in 1969-70, which was commendable. But in 1971-72, it was expected to go up steeply to 78 per cent. In the case of all states except Madhya Pradesh, the costs were not less than 33 per cent in 1969-70, the average costs for all states being 46 per cent.

If the cost conditions were bad in 1969-70, they were expected to be worse in 1971-72. The number of "high spending states", i.e. spending more than 50 per cent of gross receipts was expected to increase from two to 12. Only three states would be spending less than 50 per cent of their gross receipts, though all three would be spending more than 40 per cent. Though "very high-spending states" (spending more than their gross receipts) were expected to disappear by 1971-72,

six states expect to spend more than 70 per cent of their gross receipts on their lotteries. The average cost of obtaining revenue for all states through lotteries was expected to go up steeply from 46 per cent in 1969-70 to 61 per cent in 1971-72. This is certainly a very large increase in costs, in only three years.

As is well-known, the state lotteries were started in order to obtain more funds for economic development. As such, it must be said that the society is paying too high

a price for obtaining these funds. Out of every Rs 100 paid by the society only Rs 39 were expected to be available for economic development, whereas as much as Rs 61 would be utilised for financing non-developmental expenditure such as the cost of administration, advertising, prizes etc. It is necessary to bring down the total expenditure on lotteries to render them as a meaningful means of obtaining funds.

A word about the prize money. Com-

Reserve Bank : too reserved ?

parative data are available in respect of only four states. Other states have supplied this information in their annual budgets for 1971-72 but not in their 1969-70 accounts figures. Hence, comparison is not possible for these states. The available information is given in Table III (p. 121). It is seen that Kerala government intends to spend a larger proportion of its gross receipts on the prize money in 1971-72 as compared to 1969-70. Still, it does not hope to get a much larger gross revenue. In the case of Maharashtra, it actually hopes to get a smaller gross revenue in 1971-72 than that in 1969-70 by spending more on the prize money in terms of percentage. West Bengal's expectations are still more revealing. It seems that

West Bengal government intends to increase the prize money from 30 per cent of the gross receipts to 56 per cent and still expects to get a much smaller revenue from its lottery in 1971-72. Mysore government's expectations are just the opposite. It intends to reduce the percentage of prize money to the gross receipts from 46 per cent in 1969-70 to 40 per cent in 1971-72. Still, it expects to get as much as 172 per cent more revenue in 1971-72 as compared with that in 1969-70. Thus, on the whole the gross receipts from lotteries are not expected to be prize-elastic.

To conclude, the receipts from the lotteries were already showing a downward

POINTS OF VIEW

trend even when there was no tax. Further, a deduction of Rs 5,000 plus 50 per cent of the balance is allowed in respect of state lottery prizes only. In the case of crossword puzzles and other lotteries, such deductions are not permissible. Hence, there should be no diversion of funds from state lotteries to other competing substitutes. If anything, the funds are likely to be diverted towards the state lotteries. No doubt, the new tax would reduce the net value of lottery prizes. But as shown above, the states do not expect the lottery revenue to be prize-elastic. The state lotteries are already in poor shape. Their incomes are low and expenses high. They are not likely to be any worse as a result of the new impost.

Review of the Bonus Act

Pawan Chaudhary

AN EIGHT-MEMBER Bonus Review Committee has been set up by the union government to review the working of the Payment of Bonus Act, 1965 and in particular to recommend suitable modifications in respect of such issues as: (i) Whether establishments (other than factories) employing less than 20 workers may be covered by the Act and if so, up to what limit of employment? Should there be a separate formula for payment of bonus in these small establishments? (ii) Is there a case for raising the minimum bonus of four per cent and, if so, to what level? (iii) whether the present upper limit on payment of bonus and system of 'set-on' and 'set-off' require any alteration and if so, on what lines? (iv) Whether the entire bonus payment should be related in some way to production/productivity in the undertaking? (v) Whether the present minimum bonus of four per cent may continue but a provision be made for its being supplemented through suitable schemes of production/productivity? The committee is also expected to make a careful assessment of the likely impact of its recommendations on the national economy before finalising them. The committee consists of, besides a chairman, Dr B.K. Madan, former Deputy Governor of the Reserve Bank and till recently Executive Director of the International Monetary Fund, Mr N.S. Bhatt, Mr Harish Mahindra, Mr R.P. Bilimoria, Mr G. Ramanujam, Mr Satish Loomba, Mr Mahesh Desai and Dr S.D. Punekar, and a Member-Secretary to be appointed by the government.

About three years ago in 1969, the Na-

tional Commission on Labour had recommended in its report that, in all fairness, the Bonus Act should be given a "longer period" of trial. That the government should have convinced itself of the necessity of reviewing the functioning of the Act after such a short interval is, on the face of it, not very commendable. It appears that the government has failed to resist the pressure of trade union leaders any longer for making the statutory provisions more favourable to them than hitherto. Public opposition by the workers' organisations and their leadership to the functioning of the Act as it emerged after the Supreme Court judgment is already recorded in the National Commission on Labour's Report. Also, on record, are their objections to the coverage and quantum of available surplus.

suspect intentions

In these circumstances, opinions might differ on the possible intentions of the government and few would readily accept its decision setting up the committee as a genuine effort on its part to effect necessary improvements in the Act. In any case, the labours of the committee may not be productive of impressive results if only because not enough data has been collected on the actual working of the Act. There is, moreover, not much case law on it. In these circumstances, the committee is not very favourably situated to arrive at worthwhile conclusions on such issues as the extension of the statutory bonus-benefit to shops and establishments engaging less than 20 persons, raising the minimum rate of bonus to almost double

the present four per cent, removing the limit on the maximum bonus payable to employees as presently prescribed under the Act, or the concepts of "available surplus" and "allocable surplus" or the problems of "set-on" and "set-off".

Meanwhile, it is worth asking whether the committee realises that where it could be more useful is in giving the right lead on the issue of delinking the concept of "bonus" from the concept of "wages" and linking it, instead, with production and productivity. As the scheme of the Act stands, the term 'bonus' is held to be synonymous with wages. Bonus has to be calculated under the Act on the basis of the amount of wages received, rather than the quantum of work a workman puts in or his efficiency.

Although the Bonus Act contains in detail provisions regarding compulsory payment of bonus, it affords freedom to workers to resort to strike after raising an industrial dispute over the quantum of bonus. Since the passage of the bonus legislation in 1965, bonus has come to occupy the third position in the percentage distribution of disputes by causes, next to wages and allowances and personnel and retrenchment, the percentage of disputes arising on bonus being 13.2 in 1966, 10.9 in 1967, 9.4 in 1968 and 10.1 in 1969 as against 6.9 in 1961. How to avoid this loss of production is another serious issue which deserves consideration by the committee.

IN HIS memorandum of evidence submitted to the Radcliffe Committee on the Working of the Monetary System of the United Kingdom, the Governor of the Reserve Bank of India stated that the Reserve Bank "has organised the largest economic research unit in the country and gives the fullest information about its banking system".

While it is undoubtedly true that the Reserve Bank's Economic Research Department is conducting and publishing the results of a systematic study of the country's economy in its various aspects, it is a remarkable feature about the Bank that it reveals nothing about its own Issue Department — what its functions are, how it works, what its portfolio of assets consist of and so on, except issuing a bald weekly statement showing on the liabilities side the notes held in the Banking Department and the notes in circulation, both together making up the total notes issued, and on the assets side, the value of assets held in the form of gold, foreign securities, rupee coin and government of India rupee securities, the total figures on both sides balancing each other as given in table below.

It may be noted that, while gold coin and bullion and foreign securities and

rupee coin all together constitute but 10 per cent of the assets, the entire balance of assets consists of government of India rupee securities, as backing for the note issue. No information is given to the public as to the nature and value of these securities, their classes or groupings according to maturities or otherwise, whether any and what portion consists of Treasury Bills, how deficiencies in their market value are made good and accretions adjusted or credited, how the Issue Department has been handling the deficit financing of the central government, what role it is playing in the management of the public debt and so on. There is not a word about the Issue Department's functions or performances either in the Bank's annual report or the other special publication entitled 'Report on Currency and Finance' which is claimed to contain "a comprehensive review of the Indian economy with particular reference to monetary and financial trends and contain a wealth of statistical information".

When the Reserve Bank of India Act was passed in 1934, entrusting the Bank with the power of note issue, certain conditions were imposed on the exercise of such power in order to prevent its abuse by the Bank whether on its own initiative or under the directions of the government of India, namely, that the

total notes issued should be covered by assets of equal value, that at least 40 per cent of the cover should consist of gold and foreign securities and that the amount of assets held in government of India rupee securities should at no time exceed one-fourth of the total assets. These safeguards which had to be suspended during emergency conditions created by the second world war, were subsequently completely removed, so that the Bank was enabled to issue notes without limit as against rupee securities of the government of India from time to time. The result of this was that, unlike in the UK, where the Currency & Bank Notes Act of 1954 has provided a statutory limit to the fiduciary note issue, thereby giving Parliament a right of intervention whenever the limit has to be expanded, in India after nationalisation of the Reserve Bank, there has been no statutory control over the note issue; and this has enabled the government whenever it needs money, to resort to the simple device of creating securities (including within that term Treasury bills also), sending them to the Reserve Bank and getting notes in return. The way in which the Issue Department of the Bank is supplying the needs of the central government, the strategy and technique of the operations of the Bank in this connection are shrouded in mystery and have never been disclosed to the public.

During the past 22 years, after the Bank came under the control of a national government, the total of the bank notes issued by the Bank has increased from Rs 1217.62 crores in 1950-51 to Rs 4839.98 crores as on May 5, 1972, a fourfold expansion a good portion of which was certainly not necessitated by the monetary needs of the community as the gross national product had not commensurately increased, but because of the governments deficit financing. It was easy for the government to create securities, and obtain legal tender bank notes in exchange for them by simply directing the Bank under Section 7 of the Reserve Bank Act to take the securities in the portfolio of the Issue Department's assets and issue notes in return. If, as in the UK there was some sort of

Reserve Bank of India Issue Department

May 5, 1972

(in crores of rupees)

Notes in circulation	4825.88	Foreign securities	221.65
Total Notes issued	4839.98	Rupee coin	31.51
		Govt. of India rupee Securities	4404.29
Total liabilities	4839.98	Total Assets	4839.98

POINTS OF VIEW

provision fixing an upper limit for the Bank's note issue and requiring approval by parliamentary debate or resolution of Parliament for any further expansion, that would have afforded periodical opportunities of knowing what the government and the Bank were doing and probably acted as a check on inflationary policies and perhaps also unravelled to some extent the 'mystique' of the Issue Department's operational tactics.

Under present conditions as regards the Issue Department's working, there is no knowing whether the statutory requirements of the Act are being complied with at all. Section 23 of the Act enjoins that the Issue Department "shall be separated and kept wholly distinct from the Banking Department", and Section 33 (4) requires that the securities of the Issue Department "shall be valued at rates not exceeding the market rates for the time being", that is to say, they should not be valued at their face value but should be constantly revalued every week with reference to the market prices then ruling. Again Section 34 insists that the liabilities of the Issue Department shall always be an amount equal to the total of the amounts of the notes for the time being in circulation.

The public has no means of knowing whether these requirements of the Act are being complied with. In fact it is very doubtful that they are complied with. The annual balance sheet of the Bank shows that the mandate that the Issue Department "shall be kept wholly distinct from the Banking Department" is not carried out at all, as there is only a consolidated statement of the Bank's financial position as a whole unit.

distinction obliterated

That the Reserve Bank authorities are not inclined to maintain the distinction between the two departments is also evident from certain statements in a recent publication on the history of the Bank issued under its authority, where in it is said that "the distinction between the Issue Department and the Banking Department which was modelled on the Bank of England pattern is quite artificial" and that informed opinion in the UK supports this view. This, however, is not quite correct, and would seem to be only wishful thinking, as Governor Cobbold of the Bank of England himself categorically stated before the Radcliffe Committee that "the assets of the two Departments are managed on different principles; their

profits, although all within the public sphere, are ascertained and disposed of in different ways" (Evidence Vol. IV page 44 Q. 748).

Further any obsession that the distinction between the departments is artificial cannot be a valid excuse for not complying with the requirements of the provision of the Act that the Issue Department should be separated and kept wholly distinct from the Banking Department. If really the distinction is not material, why, when there have been several amendments of the Act during the past 23 years after the Bank's nationalisation, should Parliament have thought fit to retain the provision?

Again, having regard to day-to-day variations in the market prices of government securities of different maturities carrying different rates of interest, there are no means of knowing whether the several kinds of securities in the Issue Department are valued as required by the Act "at rates not exceeding the market rates for the time being", and if they are so valued, how and from what Fund or source any deficiencies due to fall in prices and surpluses due to rise in prices are made good or credited as the circumstances may require. Neither the report of the central board of directors nor the report of the auditors throws any light on this subject.

UK's example

In the UK, as per Section 3 (2) of the Currency and Bank Notes Act, 1939, the profits of the Issue Department are separately ascertained by a system of cost accounts and they are paid in to fund called the Exchange Equalisation Account whose function, among other functions is to serve as a reserve to be drawn on week by week to cover any depreciation in the value of the securities of the Issue Department and into which all receipts from appreciation in their value are also paid, so that the value of the securities is always maintained and the department is not from the balance sheet point of view insolvent.

On the other hand, in India, after nationalisation of the Reserve Bank, while the profits of the Issue Department are not separately ascertained, the entire profits of the Bank after making the usual deductions for depreciation, bad debts etc, are as per Section 47 of the Act paid to the central government. Having regard to the fact that the assets of the Issue Department are mostly interest-yielding

securities, the net profits of the department during the past more than 20 years, on a modest estimate, must have been not less than Rs 1000 crores; and if, instead of the profits having been paid to the central government, they had been kept as a separate fund on the lines of UK Exchange Equalisation Account, there would probably have been no necessity to devalue the Rupee, at any rate to the extent it has been done.

The Reserve Bank Act says in its preamble that one of the objects for which the Bank was constituted was to secure monetary stability in India. If the profits of the Issue Department had been kept in a separate fund for achieving the objectives for which it was constituted, instead of being utilised by the government as part of its general revenues the monetary system of the country could possibly have been more efficiently handled and the inflationary rise in prices kept in check to some extent.

created a mystery

By keeping the functions and working of Issue Department completely out of knowledge of the people, the Bank has made its operations relating to that department a mystery. Of course the Bank would say that in this it is simply following the policy of the Bank of England on whose pattern the dichotomy of the Bank into the two departments — the Issue Department and Banking Department — has been modelled. But there is no reason why the Reserve Bank of India, now that it is functioning in a democratic republic, should continue to follow the conservative practices of the Old Lady of Threadneedle Street as regards the withholding of information from the public rather than pursue the better course adopted by the Federal Reserve System of the USA of giving all reasonable information about its policies and operations.

The question of publishing adequate information about the Issue Department was raised in several memoranda of evidence tendered before the Radcliffe Committee on the Working of the Monetary System in the UK, and when the Committee itself took up the matter with the Governor of the Bank of England in the course of his oral evidence before them, Governor Cobbold expressed his views as follows:—

I have always felt that the Bank should not be obscurantist. It should educate public opinion and facilitate informed comment, seek public support

and approval for monetary action and remove from the public mind the idea that high finance is a sinister mystery. As regards the portfolio of assets of the Issue Department, we have been thinking of putting something in the Annual Report on the lines of Paper No. 9 which, though not giving details of actual holdings, would give a good deal of information about movements over a period some way back. We should be very reluctant to issue a list of actual securities held, on operational grounds, but I should be very ready to disclose the spread between maturities, say, under five, between five and ten and over ten years and so on, so long as the figures, could on operational grounds, relate to periods some way back (Evidence Vol. IV QQ 1773 and 1777 et seq.)

As regards the extent to which information could be given to the public the following forthright statement given to the Radcliffe Committee by Mr Winfield Riefler, Adviser to the Federal Reserve Board of USA clinches the issue:—

As regards monetary operations, confidence in the motives of those managing the system is most important.

necessary actions

Though central banking is a mystery, it is necessary to do two things:—

(1) To let everybody know that the System is anxious to explain what it is about, its motivations and principles of action, so that whether people have time to study it or not, they have the assurance that it is prepared to explain; (2) To make sure that those people who do take the trouble to become expert on these matters (as some of the dealers and some of the banks do) find the explanations adequate and complete, find in them a complete rationalisation for past action and therefore a fair basis of comprehension of future action.

While as regards future operations about which it is not possible to give advance information, for reasons of operational efficiency we do have a detailed discussion of past operations in the Annual Report which comes out some time after the end of the year. The interval is long enough so that people cannot interpret from the explanation of an action taken, say, in December, the logical succeeding action that would have to be taken, say, in February next. If the reasons for an action were published immediately, a very clever business operator might have a basis to forecast future action. We think we

escape that hazard by publishing only once a year.

We do make policy statements during the year also, but that is at our discretion.

The weekly statements published on Wednesdays contain a classification of the securities in the portfolio of assets, as bills, certificates, bonds and then there is also a further classification of maturities within 15 days, within 90 days, within a year, within five years etc, so that observers can inform themselves as to the maturities if they want to. (Evidence Vol. IV QQ 9551, 9554 and 9559).

As regards disclosure of information, the Radcliffe Committee Report itself observes as follows:—

"The public is entitled as a matter of principle to fuller information about the operations of the Issue Department. Where information is not available, people are not content to remain in a condition of ignorance. They will always guess and more often than not, guess incorrectly, sometimes to the prejudice of the policy objectives of the monetary authorities. The risks of disclosure are on balance far less than the risks arising from wrong guesses...."

An important item will be the market valuation of the securities in the assets side. This will improve public confidence in the monetary system."

POINTS OF VIEW

It is clear from the foregoing that there is no justification for the Reserve Bank of India not disclosing at least in its Annual Report particulars about the securities in the portfolio of the assets of the Issue Department and a general account of the policies followed by the department in the year that has passed. What is wanted is a more revealing account of the department's activities so that the air of mystery that surrounds its operations may be removed. There is no reason why the annual report should not contain an analytical statement of the several classes of securities with their maturities, which formed part of the assets of the Issue Department, comments on the variations in the market value of the securities and a general survey of the operations of the department during the year under report.

One other matter for consideration is whether, having regard to the objects contained in the preamble to the Reserve Bank Act, viz. the 'securing of monetary stability' in India and 'operating the monetary system to the country to its advantage', it is not desirable that the profits of the Issue Department of the Bank, instead of being paid to the central government should not be set apart as a Monetary Stabilisation Fund, for protecting the value of the rupee both internally and externally.

New ideas on economic growth

Josselyn Hennessy

London.

Britain's Postwar Record

THERE is a widely held view that British economic growth since the war has been slow relative to past rates of expansion, slow relative to those enjoyed by competitors, and considerably slower than should have been possible. This article seeks, first, to investigate the evidence for this dissatisfaction: secondly, to determine whether it is realistic to assume that a substantially higher rate of growth than that currently enjoyed is within reach, or is even desirable; and, lastly, to outline possible future policies towards economic growth that may be adopted in the light of the environmental considerations on which

one of fluctuating growth in total national product that reached a peak in the last quarter of the nineteenth century. Subsequently the rate of growth declined, but remained positive even during troubled interwar period, and since the war it can be seen to have recovered to levels at least comparable with those obtained during all but the three decades in the previous century.

If, on this evidence, one is prepared to accept that, viewed in historical perspective, the growth of the economy in aggregate terms since 1950 has been relatively satisfactory, then in per head terms its performance must be considered unequivocally good; the figures indicate that in only one decade previously (1881-90) has the rate of increase substantially ex-

ceeded that since the war, a result following from the slower rate of population growth seen in the last two decades. Moreover, if the recent rate of increase in the nation's output can give cause for satisfaction, so also must the stability of that growth. Not only do the figures in the table show that in no two previous decades has there been such a consistent gain in terms of income per head, but also that the range of fluctuations in the level of activity, as measured by the rise and fall in unemployment, has never been smaller. Merely casual inspection of the unemployment figures shows clearly how effective has been the application of Keynesian demand management techniques in converting a devastating series of booms and slumps into a

International Comparison

Britain's more recent growth record presents a different picture when looked at alongside the performance of other industrialised countries, as shown in Table II (p. 128). In the early postwar years it was widely suggested that Britain's low relative position would be improved when the economies of war-torn western Europe had completed their initial rebuilding and recovery. However in more recent years, while the West German rate of growth has indeed slowed, the divergence between Britain and her principal competitors has in fact widened.

The long-term effect of such a differential is illustrated by comparisons of GNP per head. In these terms, Britain was in 1900 the richest country in the world; in contrast, in 1970 she was, except for Italy, 'least rich' country in industrial Europe. The uncertainties involved in projecting past trends hardly need stressing, but the figures (based on OECD estimates) given for 1980 show the extent of Britain's lag and the effectiveness of compound rates of expansion in widening existing differentials.

Before going on to look at the reasons for the differences in individual countries' growth performances, we must consider a qualification to the judgments already made, i.e. that Britain's recent growth record is good in historical terms but bad in terms of international comparison. These have been based on direct comparison of actual performance, between (a) different time periods and (b) different countries, no allowance being made either for changes in an economy's growth potential over time or for differences in growth potential between different economies.

The assessment of a country's potential for growth offers scope for endless controversy. Leaving aside the more academic debate concerning past and present potential, on a contemporary international level

it can be argued plausibly that for various reasons Britain is not endowed with the same growth potential as its competitors and that, when the performance of each is related to its potential, Britain may in fact be doing just as well as some of those nominally in front on the charts. In our present state of knowledge, it is impossible to reach any firm quantitative judgment on the relationship between actual and potential growth; there is, however, considerable evidence, discussed below, to suggest that crude comparisons of actual growth rates may overstate the divergence between Britain's performance and that of other industrial countries and, by implication, may also overstate the scope that exists for raising its current rate of growth.

monocausal answers

Over the years many have sought the reasons for Britain's lacklustre showing since the war. The search for monocausal answers — among which insufficient investment, 'stop-go' economic management and lack of incentive stemming from high taxation have been frequent — has been largely discredited by the path-breaking research of Edward F. Denison who, in his book *Why Growth Rates Differ: Post-war Experience in Nine Western Countries*, published in 1967, shifted the tenor of the analysis of comparative performance by attempting to quantify individual sources of growth in each of the nine countries (those shown in Table II except Japan). The survey covers 1950 to 1962; while the analysis is, therefore, somewhat dated the interpretation that the study of Britain's performance relative to the other countries, while altered in some respects, would probably be little changed in substance by subsequent years' figures.

The results of Denison's research support the view that no single factor, but rather a combination of factors, has caused Britain's relatively slow rate of growth. It is apparent that it was not the case that other countries secured greater advantage from every potential source of growth; on the contrary, the benefit derived by individual countries from particular sources was in several instances less than that derived by the United Kingdom.

The real difference is that the UK found no outstanding source of growth in the same way as did the other countries. The United States, for example, gained particular advantage from a greater increase in labour inputs, West Germany from both labour and capital inputs, France from the application of more modern technology, and all member countries from the foundation of the Common Market. The most important single source of growth however, from which Britain derived significantly less benefit than its competitors, was

the improvement effected in the allocation of resources, particularly by contracting the relatively inefficient agricultural sector. Each country gained over Britain in this respect, Italy, West Germany and France especially. Opportunity for such allocative changes was much smaller in Britain; indeed, the major part of the benefit to growth obtainable through moving people from low productivity employment in agriculture to higher productivity employment in manufacturing had been largely exhausted before 1939. The analysis supports the impression that Britain may have a lower potential for growth than its competitors. "To a considerable extent", says Denison, "conditions beyond the control of the United Kingdom were responsible for higher growth rates in other countries. The most general cause concerns gains from reducing waste in the use of resources in agriculture and self-employment. The smallness of the contribution to British growth had little or nothing to do with British policy, but rather was associated with the amount of waste to be eliminated". He adds, however, that "the low growth rate of the United Kingdom cannot be ascribed entirely to built-in handicaps; other countries were also more successful in securing growth from sources where the United Kingdom had no apparent advantage".

(E.F. Denison in *Britain's Economic Prospects*, ed R.E. Cave).

III

Policy Measures and Conflicts

The increasing sophistication of the analysis applied to Britain's growth problem led during the 1960s to the development of a range of measures designed to raise the contribution of these several sources to the rate of economic growth.

The theme running throughout these years, a decade of "consensus politics", was that of government intervention and planning. Thus successive governments, as well as broadening long-standing investment and regional policies, established a range of institutions designed to promote faster growth through better resource utilisation, through the development and employment of improved technology, through mergers and greater economies of scale and through better economic management.

These new bodies included the National Economic Development Council (NEDC), the Industrial Reorganisation Corporation (IRC), the Ministry of Technology (Mintech) and the Department of Econo-

TABLE I
Economic Indicators : 1800-1970

	National product increase per decade (per cent)		Unemployment rate per decade (per cent)		Population increase per decade (per cent)	
	Total	Per head	Average*	Range*

WINDOW ON THE WORLD

so much emphasis is rightly laid today.

The process of sustained economic growth began in Britain, fifty years before any other country, in the second half of the eighteenth century. Some idea of the pace of that development is given by the left-hand columns of Table I (p. 127), which show the percentage increase per decade in real national product, in both total and per head terms, recorded since the beginning of the nineteenth century. While the estimates for the earlier years must be treated with caution and while measurement over single decades may give a distorted picture owing to the uneven incidence of boom and slump, the final impression is

ceeded that since the war, a result following from the slower rate of population growth seen in the last two decades. Moreover, if the recent rate of increase in the nation's output can give cause for satisfaction, so also must the stability of that growth. Not only do the figures in the table show that in no two previous decades has there been such a consistent gain in terms of income per head, but also that the range of fluctuations in the level of activity, as measured by the rise and fall in unemployment, has never been smaller. Merely casual inspection of the unemployment figures shows clearly how effective has been the application of Keynesian demand management techniques in converting a devastating series of booms and slumps into a

mic Affairs (DEA), out of the latter coming the ill-fated National Plan of 1965. Mainly as a result of recurrent balance of payments troubles and a deteriorating global economic situation these measures failed to achieve the desired result, and when the present Conservative government took office in 1970 there was a radical change of policy. Gone was the idea of a close-knit partnership between government and industry in the quest for growth; instead the Tories renewed emphasis on the bracing effects of competition, reflected both in policies designed to expose companies to more competitive pressures, and in measures intended to restore incentives to greater personal effort.

It remains to be seen, however, whether reliance on market forces, together with membership of the EEC, can be any more successful than a more directly interventionist approach.

social cost

The difficulties experience in recent years in raising the level of economic growth have undoubtedly helped to create greater awareness of the many conflicts that arise from the pursuit of such an objective. In the future the benefits of higher growth are going to be weighed much more closely against the parallel costs involved. To take an example from the supply side, it is apparent that a sure way of raising growth is to increase labour inputs. This could be achieved for instance by allowing greater immigration (as West Germany has relied heavily on south European labour), by increasing the geographical mobility of labour, by raising female activity rates or by working longer hours. Each, however, may have a social cost such that the welfare of the country is reduced rather than increased by raising the marketable output of the nation.

Similarly, demand policies favourable to stronger growth have to be considered in the light of their costs; a prolonged period of high demand may raise business optimism and hence investment but it is also likely to be accompanied by greater inflationary pressures and balance of payments problems, while a spell of weak demand, on the other hand, favourable to long-term growth through its effects on labour utilisation, will be reflected in increased unemployment.

It is not only the policy objective of increasing the material output of the economy that has come under critical review over the last few years but also the process of economic growth itself.

There are several fields in which it is apparent that welfare, in the broad sense of "the quality of life", has suffered be-

cause of, rather than despite, the pace of economic development. The problems, by no means confined to Britain, are basically those of imbalances caused and aggravated by economic change, and are found from whatever view point one looks at economic activity.

At a structural level, for instance, it has long been apparent that economic development is inseparable from the rise of new industries and the eclipse of others; while in a situation of perfect mobility of capital and labour such processes could take place easily, in our imperfect world they cause disruption and waste. The rise and fall of individual industries is related to the problems of regional imbalance, where whole areas become economically and socially deprived through changing industrial patterns.

Britain is not alone in facing the twin problems of over-population and congestion in economically "favoured" regions and of the population and dereliction in those with an ageing industrial structure. Again, it is easily appreciated that the forces of economic growth, while opening many new areas of opportunity, have also produced serious social strains in bringing about the revolution of rising expectations.

The most important challenge to the growth philosophy has, however, undoubtedly come from the environmental lobby, a group whose members range from those merely expressing concern at loss of personal amenity to those who preach impending doom that the world's resources are being used up.

Since the protest is, for the most part, both serious and justified, it has won support from governments throughout

the industrialised world. While it may prove premature to be talking of the exhaustion of the world's finest resources of raw materials, it is painfully apparent that the world is becoming increasingly despoiled by uncontrolled economic development: the land has become disfigured by the motor car and its attendant roads, the rivers and seas polluted by industrial and nuclear effluents and the air filled with fumes and, perhaps worse, with noise.

Left to market forces alone, it is clear that economic growth is not synonymous with increasing welfare.

It is unlikely that the strictures of the environmentalists will succeed in stopping the growth process. For one thing, the whole structure of western industrial civilisation, built as it is on free enterprise, competition and the profit motive, is in its present state of development irretrievably wedded to technological and organisational progress.

Not only that but official policies are for a long time — at least while population continues to increase — likely to remain pro-growth, first as a means of preventing excessive unemployment and secondly because the extra wealth created by growth can, if properly handled, provide the means to meet the legitimate aspirations both of the individual and of society, and thus to raise the nation's quality of life.

We began with the suggestion that Britain's growth record in historical terms is in reality good and that while the results are poor on an international level there are grounds for thinking that this may reflect policy failures only to a limited extent.

TABLE II
International Comparisons : 1950-1970

	National product average annual percentage growth			G.N.P. per head £'s (1970 prices)	
	1950-60	1960-65	1965-70	1970	1980
Japan	8.9*	10.1	12.4	795	1,835
Germany	7.6	5.0	4.4	1,265	1,925
Italy	5.9	5.2	6.3	710	1,165
Netherlands	4.9	5.0	4.7	1,000	1,370
France	4.4	5.3	5.4	1,215	1,995
Norway	3.5	5.4	4.4	1,225	1,705
Denmark	3.3	5.1	4.1	1,315	1,750
United States	3.2	4.5	3.1	2,020	2,770
Belgium	2.9	5.1	4.2	1,115	1,695
United Kingdom	2.6	3.4	2.4	895	1,175

*1952-1960

Recognition of these facts, by freeing Britain of its inferiority complex on this score, may, together with the wider aspects of the growth argument mentioned above, already be bringing a more rational approach to growth policy. Only in an underdeveloped country where the majority of the population lives in poverty is growth properly an overwhelming objective; despite its relative decline, Britain is still an immensely rich country and can afford to give proper consideration to wider issues.

During the remainder of this century a

more thoughtful approach to economic growth is likely to evolve both in Britain and in the rest of the industrial world, expansion being sought only to the extent that it conforms to more widely defined welfare criteria. If the much stricter controls that will come to be introduced at both national and international levels, to counter the unwanted side-effects of growth, are successful in containing the threat to the environment, the rate of desirable growth will be that much higher. Regardless of that rate, however, governments' industrial, regional, manpower and

social policies must be developed strongly, representing but part of a complex of measures helping to solve the dilemmas involved in growth, amenity and welfare.

Tibetans in Wales

THE VAST undulating landscape of hills and valleys in the country of Breconshire in Wales is green and beautiful in spring. Narrow roads wind their way among large enclosed farmlands where sheep and cows graze placidly and farm houses spread out at intervals to make the entire scene look like a picture postcard.

In this setting of unpredictable summers and cold chilly winters, in the village of Coity Mawr in Talyont-on-Usk is sited the Tibetan farm school managed by Major S.B.I. Sweeny, a retired army officer who counts twenty years of service. The farm looks like any other farm found all over Wales. But Major Sweeny calls it the Tibetan Farm School.

The school is run by the Tibetan Farm School (Strive) Ltd, a company without any share capital but limited by guarantee. It has a board of five directors and its present Chairman is E.F. Schumacher. Major Sweeny is project manager and his wife is on the board of directors.

close co-operation

Among its contributors are commercial concerns, a charity organisation and voluntary associations. It is in fact listed in the handbook as a project of the Society for Training in Rural Industries and Villages Enterprises (Overseas) and operates in close co-operation with the Soil Association, the McLaren Foundation (a charity organisation) and Intermediate Technology Group Ltd.

Six years ago Major Sweeny and his wife sold their farm, which they were running, joined the Save the Children Fund and went to India. There they met the Dalai Lama and some of the Tibetans in exile. Towards them the Sweeny couple

developed an attitude which may be characterised as a combination of sentimental affection and genuine respect.

In the Tibetans they saw a capacity for hard work, toughness, perseverance, a desire to learn, optimism and stoicism in the face of great suffering. This was what, Major Sweeny told me, led to his desire to help them and 'preserve these great qualities'. The Tibetan Farm School was the direct result of this endeavour.

aim of the school

The stated aim of the school is best described in the manner in which it is set out in the brochure: "The aim of the school is to provide training in the principles of good subsistence husbandry for young people from developing countries, based on family small holdings and village crafts. For the first four years the school will train young Tibetan refugees, after which it is planned to start further schools in India, Africa and elsewhere, while the school in Wales will become a training centre for instructors."

Explaining this idea further Major Sweeny said that the project was based on the principle of helping these young farmers to organise their small holdings on a family or co-operative basis and on a subsistence level with small surpluses. The students would be taught the elements of what was considered simple, tough farming with the definite aim of self-sufficiency. They would be taught, he said, the use of equipment intermediate between the highly developed agricultural technology and the very primitive equipment used in some parts of India or Africa.

Major Sweeny visualised these young men as farmers, millers, blacksmiths

and weavers who would be village leaders. He expected them to help organise small holdings in their villages into viable economic units, though at a subsistence level. He summed up the rationale behind his enterprise, rather romantically I thought, as an attempt to protect and insulate the small farmer against the onslaught of a highly monetised cash economy.

With this patently laudable purpose in mind the school has taken in seven Tibetan students — five boys and two girls. It has employed two British instructors and three Tibetans, one of whom is a priest and the other two a middle-age couple who act as parents to the students and provide them with some kind of community life in a home away from home.

Major Sweeny told me that he had originally bought the farm himself. It is 200 acres in extent, and has 'another thousand acre as grazing land along the hillside'. He then sold the land to the McLaren Foundation which in turn has leased it out to the Tibetan Farm School.

real estate and livestock

The school purchased cottages and livestock during 1971 and 1972 to the extent of £12,000, spent £1500 on additions and alterations and £1500 on farm and household equipment. The project has been able to raise £8000 for each of the two years 1971 and 1972. This includes £2000 for travel for the boys, £2500 as maintenance of students and £3500 as wages of the teaching staff. The school is at present running an appeal to finance the students. The two-year course would cost every sponsor £650 in maintenance and £250 on return travel.

The Tibetan boys, all school-leavers,

looked very cheerful. They were excited to see an Indian among a group of foreign journalists. As a race the Tibetans smile easily, and sometimes this could be misleading. From the conversations I had with three of the students I gathered a reluctant admission of frustration and an openly stated confession of homesickness.

What have they learnt here? "About everything," there is to learn in three months. They have taken in the daily routine of milking cows and feeding cattle, handling sheep, making butter and cheese growing vegetables, and poultry keeping. The girls learn weaving, baking, domestic economy and other farm tasks generally performed by women.

Phuntsok Sonam, Lobsang Ngodob, Tsering Chopkel and the two other boys have had an expensive education at Mussoori. They speak Hindi and English fluently. They come from families that have been given land for settlement at Orissa and Maharashtra. This incidentally is one of the requirements of the course — that the boys should belong to families who own or have access to land. They work in a roughly built workshop which is part carpentry shed, part blacksmithery and the rest is a kind of museum for agricultural equipment gathered mainly from all parts of Wales. Major Sweeny said that he got most of it from Welsh farmers who had no use for them any more.

old fashioned tools

Among the implements were old fashioned ploughs of several types, some of them rather heavy. There were ridgers, potato lifters, cultivators and a slightly sophisticated haymaker. Ranged against the wall on one side were an array of mammoth rakes, diggers etc reminiscent of the most primitive type of farming. A number of Welsh carts served as no more than models while the centre of the shed contained a crudely built slipcart, without wheels. This Major Sweeny explained was built by the boys and was the prototype for an easily manoeuvrable vehicle for transporting hay in difficult terrain.

Major Sweeny explained that these implements were being used as models from which ideas could be adapted to suit particular geographical conditions. I found that most of these implements were not new to India or the Tibetans. The ideas

they could extract from this collection seemed to me rather limited. For centuries similar implements have been made in India.

However, one corner contained a collection of agricultural equipment supplied by Project Equipment Ltd. These were simple and unsophisticated, easy to copy because they do not require highly complicated knowhow and are easy to reproduce. Technically they are simple and any blacksmith could reproduce them. The collection which included a plough and other agricultural implements was quoted as costing only £100. As against these Major Sweeny quoted the high cost of tractors which a small farmer would not be able to afford.

carpentry workshop

The Tibetan boys were working in a carpentry workshop making large gates for enclosures to herd sheep and cattle. One of them was at an old fashioned forge learning to repair or fashion farm equipment.

The boys had been selected by Mr Wangdu Dorjee, a senior associate of the Dalai Lama. Mr Dorjee lives in Dharmasala. The next group is being selected by Jigme Taring another associate of the Dalai Lama.

The school is a recently acquired hillside and even by Welsh standards it is inferior land. Very marginal, it is good enough for grazing. Besides, it faces north and suffers from the cruelties of the weather. It does not get enough sunshine and the snows do not melt fast enough.

The farm has about 300 sheep and cattle and the boys look after them. They get free board and lodging but they are not paid a stipend for the work they do. Out of the vegetables they grow they do make some pocket money.

What the boys can learn from a project such as this seems to me somewhat limited. They come from areas where they will be required to grow crops on flat land where the climate is temperate to hot. The pattern of cropping is different, and there is hardly any sheep farming in these regions.

The equipment which Major Sweeny calls intermediate technology is similar to the equipment we see on any medium-farm in India. One could stop to question

the benefit of a course which does not seem to offer anything so very new to the students. For this kind of instruction which any Indian extension officer would readily give them, was it necessary to bring educated Tibetan boys, from families in which educated boys are few? The agricultural universities of India or the state agricultural farms could teach these boys farming methods suited to the conditions in their country and in keeping with the needs of their holdings. They could then learn wheat and maize farming, cattle rearing, poultry farming and they could be paid a stipend for the work they do.

Despite these criticisms one could still have an open mind on the ultimate outcome of a project of this nature. This is the first course of its kind in a series. Its development has to be watched and it has to be assessed whether the boys actually benefit from their stay here, gather enough useful knowledge and practical experience. And whether it is of any use in India when they return. Or whether the school is only a camouflaged device to bring in English-speaking labour from India nearly free. Only time will tell.

The Prime Minister held

a press conference in New Delhi on July 12. The newspapers announced this event a day or two in advance of the happening. This is a relatively new practice. As a matter of fact, the Press Information Bureau, while informing newspapers or journalists, of a press conference due to be held, used to stipulate that the information was not for publication. Nowadays this condition is not made. This, however, does not quite explain why the press should be so keen on publishing in advance the mere fact that the Prime Minister will hold a press conference. What she says at the conference may be news, but why should her going to meet the press itself be considered to be of news value? Could there be a method in all this madness? The late de Gaulle utilized his press conferences deliberately and most successfully to build up his image. In his case too the fact that he was going to hold the press conference on some future date would be duly advertised in the international as well as the national press. Our Prime Minister has always shown that she is quick to learn the tricks of the trade. It is possible therefore that all this advance trumpeting about her press conferences has more than an element of thoughtful arrangement.

The Prime Minister is

becoming unduly sensitive about the 'gharibi hatao' slogan of her party. Nothing is more calculated to make her hackles rise than even the most innocent question seeking information about the present stage of her government's anti-poverty plans. Mrs Gandhi has sternly told the country that 'gharibi hatao' is not a stage play on which the curtain goes up formally at a stated moment. According to her the anti-poverty measures of her government are already in full swing. She also believes and would like the nation too to believe that these efforts are making good progress and have started achieving results. We must now wait for the Planning Commission and the Finance Ministry to give us the relevant statistics. They would be well advised not to do their sums separately, for, then there is every risk of their

respective sets of figures conflicting or contradicting each other. It is good to be warned by the embarrassing experience of the Ministry of Foreign Trade and the Reserve Bank in the matter of export trade statistics.

The Prime Minister made

an interesting admission about the nature of the current industrial unrest. She attributed it—in the main, rightly—to inter-union rivalries. I wonder whether Mrs Gandhi realizes the implications of this statement of hers. What she said really amounted to a confession that much of the industrial unrest in our country today is political in its origin and motivation. The bad, old capitalist is not so much to blame after all. If this is so, what has Mrs Gandhi to say about the role of her own political party which, as she is never tired of asserting, is the most potent and pervasive political force in the country, at present? Has she done anything at all to ensure that her party does not foment or participate in inter-union rivalries? If she has had any serious discussion on this subject with her colleagues in the government or the party hierarchy the public knows nothing about it. If, again, she has conferred with the leaders of the INTUC or, other labour leaders who owe allegiance to her party, on the need for reducing the intrusion of the political element into trade unionism, her establishment has successfully kept this an official secret. I am not suggesting that the Prime Minister knows enough or has sufficient time to attend to all the aspects of the government's management of the economy of the country. But she is certainly under an obligation to lend actively her political influence and official authority to an effort by her government to deal with the chaos on the industrial front at a time when rising prices, growing shortages of essential commodities and inflation generally are threatening economic stability and aggravating particularly the distress of the poorer sections of the community.

The Sharavathy Project

in Mysore state was born and bred in scandals. Recent revelations of the serious

structural damage or deterioration suffered by strategic parts of the works have lit up ancient grudges and allegations and fanned them into a raging controversy in state politics. A demand has been made by Mr Veerendra Patil, a former chief minister of the state, for a high-level technical investigation of the present state of the works to be followed, if necessary, by an inquiry by a judicial tribunal into the conduct of the politicians and the officials who were concerned with the execution of the project. An intriguing feature of the ruckus is that the present Minister for Public Works was also the Minister in charge of this portfolio during certain stages of the execution of the Sharavathy works. The question is how far he or the present ministry of which he is a member is keen on holding a judicial inquiry.

As the debate rages in Bangalore, the government of India has kept its own counsel. It is however clear that the central government has a definite responsibility to intervene. The Sharavathy project is inter-state in its scope and significance. In addition it has been built with aid from the US government and where there is this kind of foreign collaboration, New Delhi is clearly involved. It is possible that a probe into the past of Sharavathy may result in more than mere embarrassment to some of Mrs Gandhi's political foes in Mysore state, although the most prominent among them, viz., Mr Nijalingappa is reported to be keen on a judicial inquiry. On the other hand, the present ministry which belongs to Mrs Gandhi's party may not also be entirely happy about raking up matters; skeletons have a way of being discovered in all kinds of inconvenient cupboards. The Prime Minister may therefore have to make her own political calculations. Whatever Mr Bhutto may think of the quality of the schooling which Mrs Gandhi has received, she seldom gets her sums wrong on such occasions.

Sex might have arrived

at Wimbledon years ago with Gorgeous Gussie's lace panties, but sex on the tennis court seems to have truly come of age only now. Here, for instance, is a description of an encounter on the centre court at Wimbledon as published in *The Indian Express* of July 6 (by arrangement with the *Daily Express*, London): "Miss Cassals, 23, in her eye-catching purple and white dress, hummed with activity and energy and her legs worked like pistons as she tried to run down a super-charged attack which Mrs King projected at her".

Harold Robbins, I am afraid, must look to his laurels.

MOVING FINGER

TRADE WINDS

IISCO Take-Over

THROUGH A presidential ordinance issued on July 14, the union government has taken over the management of Indian Iron and steel Company (IISCO)—one of the two private sector mild steel manufacturers in the country—for a period of two years. According to a press release issued soon after the decision was taken at a cabinet meeting, the management of IISCO has been taken over by the government owing to the neglect of maintenance by Martin Burn—the concern which managed the company—and the persistent fall in its production. IISCO's output had been going down progressively since 1965 with the result that early this year, it was just about 60 per cent of its rated capacity of one million tonnes per annum. Since March this year, its production has registered a further sharp setback—about 30 per cent according to some sources.

Talking to newsmen soon after the announcement of the above decision, the union Minister for Steel and Mines, Mr Mohan Kumaramanglam, indicated that although the presidential ordinance stipulated that the government would relinquish the control over the management of IISCO in two years, if it was satisfied that the purpose of the take-over had been achieved, but the possibility of the management being returned to Martin Burn was remote, as 49.35 per cent of the share of the undertaking were held by such public sector enterprises as the Life Insurance Corporation, the Unit Trust of India and general insurance companies (which have been recently nationalised). Another about 4.5 per cent of

the shares were pledged with the nationalised banks.

Contrary to the practice adopted in the case of the take-over of the managements of the Indian Copper Corporation, coking coal mines and general insurance companies in the past 1½ years, the presidential order in respect of IISCO does not provide for the payment of any management compensation to the hitherto managing concern. The other agreements with Martin Burn, however, would be fully honoured by the new management. Requested to explain the position why a different criterion had been adopted in the case of IISCO, the Minister for Steel and Mines observed that "Under the Constitution, there was no need to do this". This presumably is owing to the fact that the management of IISCO has been taken over for a specified period.

Mr M.P. Wadhwan, Financial Director of Hindustan Steel, has been appointed the custodian of IISCO. Mr N.R. Dutt, one of the Directors of IISCO, has been asked to perform the functions of the Chief General Manager of the steelworks as also of the Chasnara colliery and the iron ore mines owned by the company. Mr Mohan Kumaramanglam indicated that the government eventually intended to expand the capacity of IISCO.

Socialisation of Urban Land

The conference of state housing ministers held recently in the capital, has unanimously recommended socialisation of urban land which implies that private owners will continue to hold land but tenures will be leasehold and permission

to develop land will be given by the government against payment of fee. A working group of experts is proposed to be set up at the centre to work out various schemes for socialisation of urban land.

The socialisation of urban land will form a part of a new land policy which would require action at the levels of the centre, the states and the local bodies. At the centre, it is proposed to enact a Housing and Development Act defining a national policy for urbanisation. The states will be assisted in implementing the national policy in specific priority areas. The states will also be asked to prepare comprehensive district, city and town plans to achieve optimum social use. The local development authorities will be urged to implement the development plans chalked out by the states. They will be urged to mobilise resources through property tax, betterment levies and commercial tax. In all this, the centre's role will be that of promotion and setting up of standards.

Public Enterprises

The two-day conference of the chief executives of the 18 public enterprises under the union Ministry of Industrial Development, which was held here recently, identified six major causes for the unsatisfactory performance of these undertakings. Most participants in the conference were of the view that raw material difficulties, particularly of iron and steel, were affecting the working of their enterprises adversely. There was also not sufficient delegation of power to the managements of these undertakings even though they had been granted some autonomy in their operations. The personnel policy too left much to be desired. Many a time, the public sector undertakings were put in the hands of deputationists who did not have any previous experience of running business and industrial concerns. By the time they gained experience, their tenure of deputation was over. The system of recruitment of senior personnel through the Bureau of Public

Enterprises could not meet the requirements of individual plants. The industrial relations in most of the public undertakings were not healthy. It was pointed out by the government spokesmen in this conference that the plant managements also ought to look into the bottlenecks in their own spheres. It was complained that usually the plant managements did not quickly bring to the notice of the union government their problems so that remedial measures could be initiated by the concerned ministry.

Addressing newsmen at the conclusion of the conference, the union Minister for Industrial Development, Mr Moinul Haque Choudhury disclosed that the personnel policy for public sector enterprises might undergo a radical change in the near future. The question was being looked into by a committee of ministers. Mr Choudhury expressed himself in favour of linking incentives to labour with productivity and also felt that the problem of multiplicity of unions would have to be tackled in a concerted manner. As a result of the measures already thought of—for instance, change in the personnel policy—or which would be devised in the light of the discussions at the conference, Mr Choudhury hoped that the 18 public enterprises under his ministry would start showing an overall surplus in about 18 to 24 months.

Earlier, inaugurating the conference, Mr Choudhury revealed that trouble-shooting squads, consisting of officials from the Industrial Development and other ministries, as well as the public sector undertakings concerned would be constituted soon. They would go into the specific problems of individual undertakings and suggest appropriate steps to overcome their difficulties. He called upon the managements of public sector undertakings to fix realistic targets for their operations.

Committee of Twenty

GWALIOR SUITING

draft resolution providing for establishment of a committee of the Board of Governors on Reform of the International Monetary System and Related Issues. The vote will be completed by the end of this month, with a simple majority of the voting power in the Fund sufficient for adoption. The first meeting of the new committee is expected to be held at the time of the September annual meeting of the Fund's Governors.

The Executive Directors of the Fund approved the text of the resolution on June 26 for submission to the Governors. It was a day on which many exchange markets were closed, following announcement by the United Kingdom authorities that, for a temporary period, the exchange rate for the pound sterling would not be confined to limits previously maintained with respect to the United States dollar and the Common Market currencies. The Fund on June 30 noted the circumstances which had led to the action by the United Kingdom, and welcomed its expressed intention to resume as soon as conditions permit the observance of the margins around parity.

By June 28, a number of major industrial countries, including the members of the European Economic Community, had decided to take action to maintain the structure of exchange rates established under the Smithsonian Agreement at the end of 1971. This decision was welcomed in a statement by the Managing Director of the Fund. He emphasised that the Fund calls on all member countries to pursue policies that will preserve a stable structure of exchange rates adjustable by orderly processes. The Fund would collaborate with members for this purpose, especially in seeking progress toward reform of the international monetary system. He said the committee proposed to the Board of Governors would be an important element in this.

The new "Committee of Twenty" will consist of representatives of both developed and developing countries.

members of the committee will be appointed by each of the countries or groups of countries that appoints or elects an Executive Director of the Fund. Since the members will be Governors of the Fund, cabinet ministers or others of comparable rank, the committee will provide a forum in which momentum can be maintained at a high policy-making level for all aspects of reform of the international monetary system.

Income-Tax Act

The President has promulgated an ordinance amending the Income-tax Act, 1961, retrospectively from April 1, 1962, to provide that wealth tax payable by the taxpayer will not be allowed as a deduction in computing the taxable income.

The ordinance also makes an independent provision to secure that wealth tax is not allowed as a deduction in computing the taxable income under the Indian Income-tax Act, 1922 (since repealed) for the assessment years 1957-58 to 1961-62. For the purposes of these provisions, the term "wealth tax" means wealth tax chargeable under the Wealth-tax Act, 1957, or any tax of a similar character chargeable under any law in force in any foreign country or any tax chargeable under such law with reference to the value of the assets of, or the capital employed in, a business or profession carried on by the taxpayer.

The ordinance specifically provides that the above provisions will not apply to any case where the Supreme Court has, on an appeal preferred by the taxpayer in respect of the assessment for any assessment year, held before the date of promulgation of the ordinance that wealth tax paid in respect of that assessment year should be allowed as deduction in computing the taxable income.

Holding Company for Steel

The government of India has announced its decision to set up a Holding Company for steel

and associated input industries such as coking coal, iron ore and manganese ore.

This company will own all the shares in public sector corporations dealing with these industries, own all government shares in the relevant joint sector companies and will act as the nominee of public sector financial institutions which possess shares in private sector units in the sphere of iron and steel and associated inputs, refractory units and small steel producing organisations. The following public sector organisations under the Ministry of Steel & Mines will be brought within the ambit of the Holding Company:

(a) Department of Steel

(i) Hindustan Steel Limited; (ii) Bokaro Steel Limited; (iii) Central Engineering and Design Bureau; (iv) The companies to be formed for the new steel plants from the time they are set up.

(b) Department of Mines

(i) Bharat Coking Coal Limited; (ii) National Mineral Development Corporation; (iii) Manganese Ores (India) Ltd; (iv) Bolani Ores (India) Ltd.

The Holding Company will also be responsible for the working of the steel plants in the private sector, in which the public financial institutions have a substantial share.

The Holding Company will formulate long-term programmes of development, arrange for effective channelling of surpluses into further expansion of the industries, finance, necessary technological changes and innovations and co-ordinate and supervise the operations of the various companies under it. It would thus achieve economies of vertical integration and ensure co-ordinated growth at least cost.

The details relating to the formation of the company are presently being worked out. It is intended to ensure that the Holding Company is not just, another link in the chain of decision making and is able to carry out its duties and func-

tions in the most efficient manner with only the minimum amount of regulation and guidance from the government. This is sought to be achieved by making the chairman of the Holding Company also the Secretary to government in so far as items of work dealt with by the Holding Company are concerned.

Mr M.A. Wadud Khan, at present Managing Director, Tata Oil Mills Company, has been selected for appointment as chairman of the Holding Company when it is constituted. For the present he will be Secretary to the government and chairman-designate of the Holding Company. He will work out the plan for the formation of the Holding Company. In doing so, he will assess the problems it is likely to face, the exact nature of the powers it will exercise and its relationship with the government on the one hand and its subsidiary companies on the other.

Australian Pavilion in Asian Fair

The Australian pavilion being built for the third Asian International Fair will be a mixture of Australian and Indian motifs. The pavilion's central feature will be a 12-ft. diameter lotus-shaped fountain. Explaining the important features of the pavilion to the Press on July 13, Mr Ilbert Walker, architect, said that he had made a close study of Indian people and their cultural background which he had translated into physical terms symbolising development, both Australian and Asian. A section has been reserved for showing how Australia was transformed from an agricultural country to a modern, manufacturing nation.

Reservation In Railways

The Ministry of Railways has appointed a four-member committee to look into all aspects of the problem concerning malpractices of unauthorised agencies and other anti-social elements in obtaining rail reservations of seats and berths. The committee has been asked to suggest appropriate mea-

asures to deal with the problem. Mr Krishan Kant, MP, will be the Chairman of the committee. Other members are Mrs Sumitra Gandhi Kulkarni, MP; Mr Narsingh Narain Pandey, MP and Mr Salebhoy Abdul Kadar, MP.

A railway officer will function as Secretary of the committee.

The terms of reference of the committee will be:

(i) To examine the rules and procedures in vogue on Railways in respect of sale of tickets and reservation of seats/berths and suggest proposals;

(a) To minimise inconvenience to passengers in the matter of obtaining tickets and reservations;

(b) To remove the lacunae in the procedures which permit commission of irregularities;

(ii) To identify the nature of malpractices and irregularities committed by outsiders including unrecognised travel agencies in securing unauthorised reservations and to suggest measures to stop the same;

(iii) To study the adequacy of the existing provisions of law to deal effectively with the offenders and to make recommendations in this regard.

Indian Tax Delegation

An Indian Tax Delegation has left for Malaysia in the course of a tour which will cover two other countries, Japan and Singapore.

In Malaysia and Singapore, the delegation will negotiate agreements for the avoidance of double taxation of income, while in Japan the discussions will be for the review of some of the articles in the existing Indo-Japanese agreement.

The delegation is led by Mr R.D. Shah, Chairman of the Central Board of Direct Taxes, Ministry of Finance

Lanka Devalues Rupee

The Sri Lanka rupee was devalued in July 10 against the pound by a government decision to fix sterling-rupee parity at 15.60 rupees to one pound. A central bank spokesman said recently that the rupee, which

was allowed to float with the dollar from last November, was now being allowed to float with the pound.

Rights of Shareholders

The National Forum of Shareholders (4, Synagogue Street, Calcutta-1) has recently submitted a memorandum to Mr. K. V. Raghunatha Reddy, Central Minister for Company Affairs, for amending the Companies Act to protect the interests of shareholders. Regarding compensation payable to shareholders after the nationalisation of an industry, the memorandum states that the compensation received by the company should be refunded proportionately to those shareholders who would like to have it. It further states that the management should not have any right to detain the compensation allocable to shareholders.

Regarding remuneration payable to directors and the managing director, it states that the perquisites should be considerably curtailed. Broadly it has been suggested that the remuneration to a director or any officer of the company should not exceed the maximum permissible under the Income-tax Act as deductible expenditure. It has also been recommended that the system of appointment of directors should be made on proportional representation basis in the case of public companies and their subsidiaries. There must at least be 10 persons on the board so that any minority shareholder group holding 10 per cent or more shares in the company could be entitled to nominate one of its representatives on the Board of Directors. Regarding rights of shareholders, the memorandum has suggested that a proxy appointed by a shareholder should be given a right to speak at any general meeting of the company. A special resolution, it has been suggested, should require the consent of 90 per cent shareholders in the general meeting in place of 75 per cent as at present.

The memorandum has made a number of suggestions for eliciting the maximum possible information regarding the ope-

ration of a company. It has suggested that a company should be required to publish unit-wise balance sheet and profit and loss account in the case of all its units where it has more than one self-contained unit. The practice of lumping together different types of expenditure under one head—miscellaneous expenditure—should be stopped. The expenditure exceeding one per cent of net sale or turnover or Rs 10,000, whichever is higher, should be separately disclosed in the profit and loss account. Various other suggestions relating to installed capacity, actual production etc. have been made in order to elicit increased information about the operations of the company.

Regarding the auditing of accounts, the memorandum has suggested that it should be made more purposeful and helpful to shareholders. In particular it has been suggested that auditors should not hold any other office of profit in the same company in which they are holding the office of an auditor. In order to minimise the mis-application of funds of a company, it has been suggested that no company should be permitted to make any loan or make any investment if it has borrowed funds from public or from any financial or banking institution. Also no company should be permitted by the government to invest in loans or shares of other companies beyond the prescribed limits unless the loan is properly secured and the return on loan or investment is guaranteed at least equal to eight per cent per annum.

Railways Act

A committee will be appointed to go into the issue of amendment of the Indian Railways Act wherever necessary. This was stated by the Minister for Railways, Mr K. Hanumanthaiya, at the Consultative Committee of Members of Parliament for the Ministry of Railways which met recently.

The availability of wagons and their allotment engaged the attention of the members. The minister, while admitting the shortage of wagons, stated that the Railways have taken seve-

ral steps to cope with the present situation. In addition to the normal orders placed with the wagon manufacturers, he had ordered for the manufacture of 8,000 extra wagons. The departmental workshops had also been asked to step up their wagon production as much as possible. However, paucity of the required raw material and other causes had affected wagon production, he said.

On the members' complaints of alleged corruption in the allotment of wagons, the Minister gave details of some of the steps he had initiated to combat it. He said that the punishment procedure in the government needed simplification so that those who were corrupt could be dealt with expeditiously and effectively.

Railway Wagons

The Railways plan to order an additional 8,000 wagons with various manufacturers, the bulk of which are located in West Bengal and are complaining of unutilised capacity.

The slow lifting of goods is attributed by the Railways to the bad law and order situation in the eastern region, the need to provide Bangladesh with wagons and locomotives and the slow loading and unloading of goods by traders. The current shortage of wagons, it is claimed, is the result of the unusual conditions in the last 12 months. Indo-Pakistan hostilities upset normal railway movement because of such special arrangements as movement of troops, refugees, prisoners of war and foodgrains on a large scale for the millions in Bangladesh and in camps.

In addition, the Railways claim that wagons were not released at important terminals in the eastern sector owing to slow loading and unloading. Though the matter was taken up with the concerned chambers of commerce and trade associations, an average of 500 to 600 wagons were not available daily as compared with previous years.

Railway Wagon Industry

The Wagon Building Industry however is deeply concerned over the recent pronoun-

ments of the Railway Minister, holding the industry responsible for the poor output of wagons in the country. According to the industry, it has been desperately drawing the attention of the Railway Ministry to its pathetic condition—a condition brought about by lack of adequate orders and for lack of adequate steel to execute even the paltry orders meted out. All its appeals have unfortunately gone unheeded and the industry has been allowed to languish till several firms have been obliged to close down and others are on the verge of liquidation.

A Wagon Builders' Delegation called on the West Bengal Chief Minister, Mr Siddhartha Shankar Ray, on July 11, and Industries Minister, Mr Tarun Kanti Ghosh, to apprise them of their problems, particularly in the context of the acute scarcity of matching steel which was a severe constraint in the production of whatever small orders were placed on them by the Railway Board. Also, they discussed the question of uneconomic prices awarded by the Railway Board which in itself was a major disincentive to wagon production. The Industry reiterated its earlier pleas for the appointment of a Tariff Commission to determine a fair price.

Joint Ventures

Addressing a Press Conference in Calcutta on July 10, after the return of the Engineering Association of India's Delegation from a two week tour of S-E Asia and Japan, Mr M. K. Jhavar, the association's president, who led the team, expressed his optimism about the vast potentialities for joint ventures in a number of engineering fields in Malaysia, Singapore, Thailand and Hong Kong. In Malaysia a number of Indo-Malay joint ventures are already operating to the great satisfaction of the Malaysians and their government. The emphasis then is on labour-intensive industries as great employment opportunities are sought to be created

for the population of the country. So is the case with Thailand. However, in Singapore and Hong Kong the emphasis is on high technology oriented industries as land area is limited and the population is small. Mr Jhavar said that the government of India should draw up a programme of training of personnel from developing countries of South-east Asia in Indian technical institutes and engineering workshops to make up for the shortage of technical personnel in these countries. This would go a long way in projecting a correct image of our skill in manufacturing engineering products. Mr Jhavar referred to two important developments in the region: Firstly, Thailand, Malaysia, Singapore, Indonesia and the Philippines are seriously considering to form a common market on the lines of the European Economic Community. As and when this proposal was implemented it would have far reaching consequences on the export trade of India. Secondly a South-east Asia Iron and Steel Institute with headquarters at Singapore of six countries—Singapore, Malaysia, Indonesia, the Philippines, Thailand and Taiwan,—has been established under the aegis of the ECAFE by Japan and Australia. The aim of the institute is to consider ways and means of promoting the steel industry in the region. Mr Jhavar observed that these developments must be carefully watched by India.

Transistorised TV Sets

The Electronics Systems Division of the Indian Space Research Organisation has developed transistorised television sets. The Electronics Corporation of India under the Department of Atomic Energy has also developed transistorised TV sets and has put on trial a few sets from its first pilot production. The Central Electronics Engineering Research Institute, Pilani and other manufacturers of TV sets are also engaged in developing transistorised TV sets. It is expected that transistorised TV sets completely developed in the country will be avail-

If MSSIDC won't help start a small scale industry

What on earth does

MSSIDC

do?

Almost everything else! MSSIDC does not bring about development by starting its own production units. Its object is to offer services and facilities so as to spur on the development of small scale industries.

The potential entrepreneur is helped with technical guidance, registration, and finance through other organisations. MSSIDC appears on the scene thereafter, to make available a number of facilities such as supplying machinery and raw materials, offering marketing assistance and helping in exports and imports.

Its specialised schemes such as Capital Participation, Sole Selling Agency, Bank Credit Assistance, the Forum of Industrial Technologists and its latest schemes like Unit Development and Warehousing are all designed to help put the small scale industrialist firmly on his feet.

Through its Head Office and six branch offices, MSSIDC is geared to meet the growing needs of the small industrialist. MSSIDC has a large stockyard in Bombay and seven depots located in important industrial zones. It is also a recognised export house

able to consumers by the end of 1972.

Vikram Sarabhai Space Centre

In recognition of Late Dr Vikram Sarabhai's outstanding contributions to the Indian Space Programme, the Space Commission decided at its first meeting held in the capital recently that the complex of activities relating to space in the Thumba-Veli area near Trivandrum be constituted as one single complex and that the complex be named as the Vikram Sarabhai Space Centre. Dr Brahm Prakash, Director Space Science & Technology Centre and member Space Commission will be Director of the Vikram Sarabhai Space Centre.

Low Interest Loans for Housing

Provision of long-term loans repayable after 25 years with low interest rates for implementing social housing schemes for the economically weaker sections of the society has been recommended by the conference of the chairmen of the state housing boards, municipal corporations and improvement trusts, which met in the capital recently. The conference, which was convened by the Housing and Urban Development Corporation also recommended that wherever the schemes of developing commercial centres with higher return of capital were feasible, they should be accepted by the corporation. Excess profits from these schemes should be utilised for housing projects for the low-income groups.

Another resolution recommended guarantees by the state governments by way of security in respect of loans made at an effective rate of interest of up to 7½ per cent per annum. Inaugurating the Conference Mr I. K. Gujral, union Minister of State for Works and Housing suggested that the HUDCO should expand its activities to cover not only housing schemes but also comprehensive urban development programmes on a scientific basis. He also

announced that in future the HUDCO would not sanction any loans for any urban housing schemes unless the city had prepared a scientific Master Plan.

Exporting from India

The Bank of America has brought out a booklet which anticipates and answers some of the questions a small-scale manufacturer might have about becoming established in the export field. While exports by large manufacturing units play a substantial role in our country's overall export programme, there are hundreds of small and medium size manufacturers whose products would be readily accepted overseas if the efforts were made. It is for these small-scale manufacturers that the Bank of America's new booklet on exporting would be particularly useful.

The booklet details the Bank of America's international services that are available at its branches throughout the world. These services include commercial letters of credit, direct remittances, foreign drafts, foreign credit information, foreign trade service and financing for import-export and overseas operations. In particular, Bank of America's branches in India can assist in developing export contacts at home and abroad, develop credit information on foreign firms and data on business climate abroad, develop data regarding arrangements for licensing and provide technical assistance and guidance regarding documents and procedures. The booklet also includes useful reference material such as uniform customs and practices for documentary credits, uniform rules for the collection of commercial paper and checklist for export letters of credit. The booklet is available free to interested customers who wish to explore export markets.

Machine Tool Corporation

The Machine Tool Corporation, a public sector undertaking under the Ministry of Industrial Development, has

achieved more than four times increase in output in 1971-72. This was its second year of production.

The company produced grinders and other equipment valued at nearly Rs 1.20 crores last year as against Rs 28.71 lakhs in 1970-71. The company at present produces tool and cutter grinders, vertical surface grinders, internal grinders and crankshaft grinders. Production of internal grinders was started last year. The plant was set up in collaboration with Czechoslovakia and went into production in 1970-71. It is designed to produce ultimately 680 grinding machines of various types in a year. The estimated total output in terms of money would be Rs 4.4 crores per year.

Self-Sufficiency in Steel

Mr S. Mohan Kumaramangalam, Minister for Steel and Mines, said in the capital on July 10 that the first blast furnace of the Bokaro steel plant was expected to be commissioned by next month. The minister who was presiding over the meeting of the Consultative Committee of Members of Parliament attached to the Ministry, said that the construction work was going on at a fast pace and despite many difficulties energetic measures were being taken to clear the backlog.

About the Salem, Vishakhapatnam and Vijayanagar steel plants, Mr Kumaramangalam said that according to the consultants these projects would be commissioned by 1978-79. He said that all efforts were being made to shorten the time of completion of these projects.

Enumerating the causes for short fall in production in the steel plants in the period April-June 1972, the minister said the main reasons were power restrictions and unusually large absenteeism due to exceptionally hot May and June this year. In the case of Durgapur, industrial relations had continued to be unsatisfactory. However, thanks to the efforts of the

State administration, there was noticeable improvement recently and there is every hope that production in Durgapur will now pick up.

Stressing the need for ensuring total self-sufficiency in steel production in the country, Mr Kumaramangalam said that the main measures comprised efforts directed towards stepping up of production in the five main steel plants and speeding up of the construction of the Bokaro steel plant.

Mr Kumaramangalam hoped that near self-sufficiency in steel production could be reached in about two years.

Names in the News

Mr M.A. Wadud Khan, Managing Director of the Tata Oil Mills, will shortly take over as the chairman of the giant public sector Holding Company for iron and steel complex. His appointment has been approved by the union cabinet. He is expected to take charge of his new post by the middle of next month.

At the 10th Annual General Meeting of the Institute of Internal Auditors, Bombay Chapter, held recently Mr S.T.B. Daruwala, Finance Director of Cadbury-Fry (India) Private Ltd, was elected President for 1972-73. Mr A.K. Bahl of Boehringer-Knoll Ltd., was elected Vice-President and Mr R.S.M. Kurve of Glaxo Laboratories (India) Ltd, was elected Secretary.

Mr S.T. Raja, who headed a string of public sector undertakings before he became managing director of Premier Automobile last year, died in Bombay on July 8 after a stroke of cerebral haemorrhage. He was 58. Mr Raja was with the union Ministry of Food after which he took charge of Hindustan Antibiotics at Pimpri from 1957 to 1961. He was General Manager of the Rourkela steel plant from 1961 to 1964 and was later Chairman of the National Coal Development Corporation at Ranchi.

COMPANY AFFAIRS

Century

THE UNION government has cleared the proposal of Century Spinning and Manufacturing Company Ltd for setting up a paper and chemical pulp plant at Nainital in Uttar Pradesh. The project is estimated to cost Rs 20.95 crores and it will be manufacturing 30,000 tonnes of chemical pulp, 20,000 tonnes of dissolving grade pulp, 10,000 tonnes of speciality pulp and 30,000 tonnes of writing and printing paper per annum on the basis of maximum utilisation of plant and machinery. It has been decided that the project will be in the joint sector. For this purpose a separate public limited company will be formed in which the equity participation by Century together with interconnected undertakings and those of the relations of the company will not exceed 40 per cent. The public sector and public financial institutions will hold 40 per cent out of which 26 per cent will be taken by Hindustan Paper Corporation and/or the union government and 14 per cent will be offered to the LIC or other public financial institutions. The remaining 20 per cent will be offered to the general public.

The project has been approved subject to certain conditions. The government has laid down that public financial institutions would have the right of insertion of convertibility clause in agreements relating to loans taken from them by Century. Moreover it has stipulated that the company should ensure simultaneous progress in the manufacture of the three projects, namely paper, rayon grade pulp and speciality pulp and not relegate the less profitable items to the background. Further it has imposed that at least 60 per

cent of the paper produced should be the writing paper of the range of 50 to 60 gsm. Above all it has placed the stiff condition that no foreign collaboration will be allowed for the setting up of this project.

Jay Shree Tea

The directors of Jay Shree Tea and Industries Ltd have recommended payment of an equity dividend of 14 per cent, including three per cent by way of bonus for the 15 months ended March 31, 1972 as against 11 per cent paid for the period of 12 months ended December 31, 1970. Despite a smart rise in gross sales from Rs 10.35 crores to Rs 13.64 crores, gross profit during the year has declined to Rs 121.14 lakhs from Rs 165.02 lakhs in 1970. Out of the gross profit, the directors have allocated a sum of Rs 51.70 lakhs to depreciation reserve, Rs 4.52 lakhs to development rebate reserve, Rs 4.10 lakhs to development allowance reserve and Rs 20.00 lakhs towards tax liability as against Rs 41.04 lakhs, Rs 4.68 lakhs, Rs 2.75 lakhs and Rs 58.50 lakhs provided respectively in the preceding year. Besides an amount of Rs 32.50 lakhs was earmarked for gratuity as against no allotment in the earlier year. This leaves a lower net profit of Rs 8.32 lakhs as against Rs 58.05 lakhs in 1970. The proposed equity dividend will absorb Rs 22.96 lakhs, Rs 4.92 lakhs more than in 1970, while preference dividend will claim Rs 6.30 lakhs as against Rs 5.04 lakhs in the previous year.

South India Shipping

The highly imaginative and pragmatic policies pursued by the management has enabled South India Shipping Corpora-

tion Ltd to earn a disposable surplus of over Rs 181 lakhs during 1971. This is a remarkable feat indeed for a shipping company especially when the year 1971 witnessed the international dry bulk tramping trade, particularly for vessels of the size and type such as South India Shipping Corporation, in the throes of worst depression in living memory. Despite much depressed state of conditions the timely steps taken by the management such as entering into a contract, in the second half of 1970, to move about 350,000 tons of Indian iron ore to Rumania has helped the company to push up its earnings to record levels during the year. The steady progress maintained by the company has enabled it to extinguish, as on December 31, 1971, the entire uncalled liability of the shareholders in respect of the issued and subscribed capital to the extent of Rs one crore through part capitalization of the general reserve. What is more that the forecast made by the chairman last year regarding maintenance of dividend for 1971 — the same percentage of dividend as was proposed for the year 1970 — namely 15 per cent on the expanded equity paid-up capital of Rs two crores has been realised. Thus the quantum of dividend that will be distributed would amount to Rs 30 lakhs as compared to Rs 15 lakhs in the preceding year. This was revealed by the chairman, Mr J. H. Tarapore while addressing the annual general meeting of the company.

Apart from making efficient and judicious use of its fleet, opportunities for buying new and second hand ships are being actively explored by the company. At the same time the company is making vigo-

rous efforts to conclude long-term contracts for carrying crude oil, ammonia, phosphoric acid, iron ore and other items and this is expected to yield rich dividends to the company in the coming years.

The chairman expressed dissatisfaction with the government's progress in the implementation of its policy for the development of major and minor ports. Moreover delays in execution, the chairman said, would result not only in a steep rise in costs of development projects but also result in heavy loss of foreign exchange to the country. The chairman therefore appealed to the government to make greater efforts so as to complete the development schemes within the targetted schedule.

Referring to other aspects of port development programmes the chairman said that the ore handling plants at Madras and Mormugao are being designed for berthing ships of 60,000 dwt, with provision for berthing vessels of 100,000 dwt eventually whereas Australia, our country's main competitor, is already completing arrangements for berthing carriers of 150,000 dwt. The chairman therefore suggested to the government to have a second look at its port development schemes and make the necessary changes wherever possible.

To encourage development of shipping the chairman also made a strong plea to the government for the continuance of the development rebate and restoration of the terms, conditions and rate of interest for Shipping Development Fund Committee loans, as were existing prior to February 1, 1971.

Larsen and Toubro

Larsen and Toubro Ltd has reported excellent working results during the year ended March 31, 1972, with sales, profits and margins recording significant improvements over the previous year's impressive performance. Equity dividend which had been stepped up from 10 per cent for 1969-70

to 12.5 per cent for 1970-71 is being enhanced further to 14 per cent for 1971-72. About half of the proposed dividend is expected to be tax-free in the hands of the shareholders. What is more the higher dividend is being paid on the enlarged share capital.

Sales during the year soared to Rs 30.87 crores from Rs 28.78 crores while gross profit jumped to Rs 330.83 lakhs from Rs 252.38 lakhs in 1970-71. The directors have enhanced the allocations to all the reserves. The appropriation to depreciation reserve raised from Rs 56.70 lakhs in 1970-71 to Rs 58.06 lakhs during year while the allotment to development rebate reserve was increased by Rs one lakh to Rs 11.50 lakhs. A larger provision of Rs 102.00 lakhs was made for taxation as compared to Rs 69.00 lakhs in the preceding year. This leaves a higher net profit of Rs 159.27 lakhs as compared to Rs 116.18 lakhs in 1970-71. The company's net profit in 1969-70 amounted to Rs 69.48 lakhs. Thus the company's net profit has more than doubled in two years. The proposed equity dividend will absorb Rs 59.66 lakhs, Rs 9.75 lakhs more than in 1970-71 while preference dividends will claim Rs 5.53 lakhs as compared to Rs 0.98 lakh in 1970-71.

India Tobacco

Following handsome improvements in its working results the directors of India Tobacco Company Ltd have enhanced the equity dividend to 14.5 per cent for the year ended March 31, 1972 as against 14.0 per cent declared for the preceding year. Sales climbed to a new peak of Rs 199.91 crores from Rs 167.63 crores in 1970-71 while gross profit recorded a smart rise to Rs 8.55 from Rs 8.35 crores in the previous year. Out of the gross profit the directors have allocated a sum of Rs 95.64 lakhs to depreciation reserve Rs 3.56 crores towards tax liability and Rs 23.41 lakhs to development rebate reserve as against Rs 93.27 lakhs, Rs 3.84 crores,

and Rs 10.67 lakhs provided respectively in 1970-71. This leaves a substantially higher net profit Rs 3.80 crores as compared to Rs 3.47 crores in the preceding year. The proposed dividend will absorb Rs 2.75 crores as against Rs 2.65 crores in 1970-71.

Finding difficulty in a competitive market the company intensified its scheme for exports of non-traditional items which increased significantly to Rs 2.30 crores during the year under review as compared to a mere Rs 17 lakhs in the earlier year.

Apart from fulfilling a large order from the USSR for supply of cigarettes, the company has also secured a sizeable order for supply of cigarettes to Hungary. A breakthrough has also been made in Sudan by entering into a contract for the supply of Rs 50 lakhs worth of manufactured cut rag and printed packaging hitherto imported into that country from the UK. The company has also amended the Memorandum of Association to enable it to enter into new lines of business. The main aim has been to diversify into areas showing a potential for large foreign exchange earnings.

Kothari Sugars

Kothari Sugars and Chemicals has received an industrial licence for setting up a sugar factory at Siruguppa in Mysore state. The factory will have a daily crushing capacity of 1500 to 2000 tonnes and is expected to go into production around October-November 1973. The company has been successful in raising an equity capital of Rs 80 lakhs and in finalising a long-term loan of Rs 205 lakhs for the project. In connection with the raising of capital the directors have adopted a new method by going to villages and contacting agriculturists and others interested in subscribing to the share capital of the company. This has resulted in the share capital being on a very widespread basis and enabled the local population and others interested in a sugar

factory in general to participate in the venture.

Traders' Bank

The Traders' Bank Ltd has maintained its record of progress during 1971, with deposits, advances, and cash in hand registering handsome improvements over 1970. Deposits under current accounts, claiming a major share of the aggregate deposits, shot up to Rs 5.95 lakhs from Rs 4.15 lakhs while fixed deposits rose to Rs 2.55 lakhs from Rs 2.51 lakhs in 1970. Deposits under savings account amounted to Rs 2.16 lakhs as compared to Rs 3.21 lakhs in the preceding year. Deposits on the whole climbed to a new peak and stood at the high level of Rs 10.66 lakhs as compared to Rs 9.87 lakhs in 1970. Cash in hand with the bank, including those with the Reserve Bank and State Bank of India, was strengthened during the year by Rs 1.38 lakhs to Rs 3.84 lakhs. To meet the increasing demand for credit the bank expanded its advances portfolio by Rs 0.29 lakh to Rs 6.99 lakhs. The bank's investments in government securities, equities, debentures and others amounted Rs 86,612 as compared to Rs 95,492 a year ago.

The outgo by way of interest paid on deposits was higher at Rs 26,779, an increase of Rs 2,406 over the preceding year while salaries and allowances absorbed Rs 40,668 as against Rs 47,250 in the earlier year. The income earned from interest and discount amounted to Rs 70,544 as compared to Rs 73,501 in 1970, while the revenue from commission, exchange and brokerage suffered a slight setback by Rs 3,471 to Rs 11,314. There was a marked expansion in income from miscellaneous sources and the revenue under this head nearly doubled to Rs 35,415, recording an increase of as much as Rs 16,048 over the previous year. The satisfactory working results have enabled the bank to effect a sizable reduction in the loss carried forward to Rs 4.728 as

compared to Rs 15,877 in 1970.

News and Notes

Expansion and Diversification

Tata Engineering and Locomotive Company Ltd has received a letter of intent to expand its capacity for manufacturing commercial vehicles from 24,000 to 36,000 units. The expansion scheme is to be completed before the end of March 1978 and is estimated cost Rs 58.70 crores. The company will not be raising any funds from external sources except for a loan in foreign currencies for Rs 10.50 crores for financing the import of plant and machinery. The merger of Central Bank of India Ltd with Telco will, of course, be making available to the latter a handsome amount of Rs 15 crores. The balance of Rs 33.20 crores is expected to be secured from internal sources. There is, therefore, no compulsion for Telco to borrow on a large-scale from statutory financial corporations and subject itself to the terms that might be stipulated by them for converting part of the loan into equity shares.

The centre has, however, imposed stiff profit, pricing, quality and export conditions in sanctioning the expansion scheme. The order stipulates that the ratio of gross profit to net sales during the period of expansion and a year afterwards should not exceed the 11.85 per cent level attained in the years 1968-69 and 1970-71. This condition is imposed so that the company adjusts the pricing policy of its products in such a way that the economies of scale achieved through expansion are passed on to the consumers. There is also a condition that over and above the exports now being effected, 20 per cent of the additional production after the expansion scheme has been completed should be exported for earning foreign exchange for an aggregate amount of Rs 20 crores.

Premier Tyres Ltd has received an industrial licence to expand its capacity to six lakh automo-

bile tyres and tubes per annum. This is in addition to the licence received in 1970 for the manufacture of two million bicycle tyres and tubes annually. The cost of these two projects is estimated at Rs 5.5 crores including a foreign exchange component of Rs 3.25 crores. Import licence has already been received by the company for the bicycle tyre project but certain applications for this project are still pending with the government. If all goes well this project is expected to be commissioned in the next two years. These project will be financed from foreign exchange loans to be obtained from the ICICI, borrowings from banks and other financial institutions and internal sources. At present the management does not contemplate issuing of rights shares.

New Issue

Indo-Lowenbrau Breweries Ltd is setting up a new plant at Faridabad with a capacity of 50,000 hectolitres per annum. Four internationally well-known giants in the brewery field namely, Anton Steinecker and Pressure Fermentation Institute of West Germany, international consulting engineers for breweries ICEB, Switzerland and Lowenbrau NU, W. Germany, have joined together to give their best technical know-how for setting up this brewery. Apart from lager and pilsner beers, the company has plans to produce a wide range of special varieties such as non-alcoholic beer for teetotalers; lager and pilsner beer from roasted malt; sweet beer for ladies; high protein beer for radiant health fortified with L. lycine; dietetic beer for keeping the waist-line trim; special beer for diabetic patients; curative beer for jaundice patients; clear flowing beer for kidney troubles and a host of other types of beers. The capital outlay on the project is estimated at Rs 129.55 lakhs and it will be financed through the share capital of Rs 66 lakhs, (Rs 56 lakhs in equity and Rs 10 lakhs in preference shares), loans from banks to the tune of Rs 60 lakhs, and deferred payment for foreign technical do-

cumentation of Rs 3.55 lakhs. The promoters will subscribe to equity shares worth Rs 25 lakhs. The balance of the capital of Rs 31 lakhs in equity

and Rs 10 lakhs in preference shares will be offered to the public for subscription shortly. Land has been acquired and the brew house and machinery will

be ready early next year. The brewery is planned in such a way that with a minimum additional cost the production capacity can be easily tripled.

Simulation of a real dynamic system circumscribed by linear and non-linear equations with constant and variable factors, can be well performed by **ANALOG COMPUTER, model MN-18M.**

The order of equations done by one computer is up to 10.

The MN-18M control system is suitably employed in an analog-digital system, as well as in a complex of ten MN-18M computers handling multiplex problems.

Space occupied by the computer is mere 0.63 sq.m.

EXPORTED BY
V/O "Elektronorgtekhnik"
MOSCOW G-200 (USSR)
Cable: ELORG MOSCOW 200
Tel. 251-39-46.

An MN-18M can be coupled, if necessary for supervision or recording of computer findings, to tube digital voltmeter, loop oscillograph, electronic beam indicator, DPR-5 bico-ordinate recorder, or a section of SUSS21-type follow-up system.

V/O ELEKTRONORGTEKHNIKA render assistance to buyers in assembly, alignment and launching of the equipment, in establishing and running the maintenance services as well as in training the personnel.

TATA ENGINEERING AND LOCOMOTIVE COMPANY LIMITED

Chairman's Statement

Following is the statement for 1971-72 of Mr. J.R.D. Tata, Chairman, Tata Engineering and Locomotive Company Limited :

The past year was one of the most eventful years in the country's history, in which a great human crisis was successfully overcome, thanks to the outstanding leadership of our Prime Minister and the efficiency of our armed forces.

Production

2. The Company continued to make good progress during the past year. Production, which had already exceeded rated capacity last year, was marginally higher at 25,075 vehicles while the production and sale of spare parts rose by 30% over the previous year. As a result of the latter, as well as of the introduction of the new direct injection engine, which, although higher priced, has been well received by operators because of its greater operating economy, the turnover at Rs. 158.49 crores was Rs. 22.25 crores or 16.3% higher than in the previous year. However, the continuing inflation in costs from which we, along with all industry suffered, prevented the ratio of profit to turnover from improving.

3. Production in excess of rated capacity and the highest turnover on record was achieved in spite of many difficulties, including irregular supplies, sporadic though minor labour troubles and repeated failures in power supply. The latter are, incidentally, becoming more and more frequent in Bihar, as elsewhere in the country, and are making the smooth operation of industries increasingly difficult.

4. Quite apart from such

specific handicaps, the operation of large and complex industries involving the mass production of sophisticated products such as ours, containing about seven thousand separate parts, entails problems and strain on management personnel which are almost totally absent in other countries. In Germany and the U.S.A. for instance, the task of the truck manufacturer is made immeasurably simpler than our own by the easy, prompt and regular availability of raw materials, brought-out equipment, electric power, rail and road transport, foreign exchange, and by the freedom of decision enjoyed by management, all of which are a source of perpetual worry in our country, aggravated by the need for licences, permits or Government approval in some form or other in respect of every need of industry. In the circumstances, the fact that production at Jamshedpur was maintained in excess of rated capacity for the second year in succession, reflects great credit on our management and staff at Jamshedpur.

Inflation

5. Apart from operational difficulties, we have to function under unrelenting inflationary pressures which increase the cost to us of raw materials, bought-out items and wages. Thus, since 1965, the price of our principal steel raw materials has increased by an average of 16% per year, materials and items bought from ancillary industries including tyres, have risen by over 10% per year, and so has the level

of our wages. We have always attached special importance to the interests of the users of our vehicles and the fact that our price for them has increased over the same period by an average of less than 6% per year, despite the constant introduction of improvements or new features incorporated in our trucks, often at considerable cost, indicates the extent to which we have been able to absorb cost increases beyond our control. This has been achieved mainly through an increase in production year after year. Now that our production has reached, and even exceeded, our rated capacity, little or no savings can be made from increased production, except in respect of spare parts.

6. It is true that the customer pays today a higher price for our vehicle than he did a few years back, but it still gives the transport operator the best value for his money, as evidenced by the overwhelming preference for it, and the improvements incorporated in it year after year compensate him for the increase in purchase price because of the longer life and the lower operating costs which they make possible.

7. Our sustained efforts to satisfy our customers and compensate them for higher costs do not end with the delivery to them of better vehicles. We realise that the large investment they have made and the crushing initial and recurring burden of tax they have to bear as road transport operators, require that their trucks

or buses be kept operating and earning continuously if they are to be operated at a profit. We have therefore set up the finest service organisation in the country which we are constantly extending and improving. We go out of our way to train our dealers' representatives in the repair and maintenance of our vehicles and assist them in other ways. We have extended the warranty period from 10,000 to 32,000 kilometers, and we are increasing as rapidly as we can the production of critical spare parts at our Works in order to reduce the down-time of our vehicles. Had Government not taken two years to sanction the urgent expansion of our spare parts capacity, our customers would have been saved the delays and loss to which they are still subjected.

Expansion Programme

8. As stated in the Directors' Report, the Government of India have approved of the Company's project, mentioned in the Directors' Report and my statement to the shareholders last year, and issued to us on the 29th of June a Letter of Intent the main terms and conditions of which have been mentioned in the Report. If all goes well, the industrial licence for the project may be expected within, say, the next six or eight months, i.e. some two years after the application was made. In a free economy, or even under the conditions in which industry was allowed to operate in India only a few years ago, we would by now have

been half way through completing the programme. While we are grateful to Government for having approved our project in what may be considered under our licensing system, a reasonably short period of time, I cannot say that we are entirely happy with all the conditions that Government have chosen to impose on the issue of a licence, the most important of which is the requirement that 20% of the added production should be exported over and above our present level of exports so that our total exports reach a minimum of Rs. 20 crores per annum. While we appreciate Government's desire to specify a certain minimum volume of exports to be achieved many years hence, I wonder if they are fully aware of the uncertainties and difficulties involved in exporting sophisticated engineering products in competition with the largest and most efficient producers in the world, who can, whenever it suits them, cut prices without seriously affecting their overall financial health, and who have substantial inherent advantages over us, arising from their much larger volume of production, and freedom from onerous conditions and handicaps under which industry has to operate in India.

9. Apart from international, political, economic and monetary factors over which neither we nor the Government of India can have any control but which can drastically affect exports from India, there are also, nearer home, major hindrances to exports. For instance, we do not have, as exporters from more advanced countries do, the assured and reliable port facilities which are essential to meeting tight export schedules and ensuring low costs. This requires not only well equipped ports, but also a high degree of efficiency and reliability in their operation, qualities notoriously lacking at Indian ports, and particularly at Calcutta. The delays occurring at India's major ports are often so serious and unpredictable as to make shipping a nightmare for Indian exporters. Furthermore, the delays and extra

costs caused by the longer turn-round time of ships at our ports, and other factors, have resulted in freight rates from India to other countries being much higher than they are from foreign ports to the same destination. Shareholders may be interested to know, for instance, that shipping freight rates from India to Australia are higher than the rates from England to Australia!

10. We shall point out that the export target can only be achieved provided conditions prevailing in India and abroad at the time will be such that our efforts, however strong and sustained, are not frustrated by causes beyond our control.

11. Another important condition imposed by Government and mentioned in the Report is that the full production of 12,000 additional vehicles at Jamshedpur and Poona must be reached not later than the 31st March, 1978. Assuming that the necessary industrial licence will be issued to us by December this year, this will give us about five years in which to achieve the rated output. Assuming again that it will take a couple of years from the beginning of manufacturing operations to overcome initial difficulties and build up regular production, we shall have a tight schedule time of three years for the construction and installation of the plant and the recruitment and training of personnel. Based on our past experience, and on the highly competent and enthusiastic organisation we have built up over the years, we are confident of our ability to adhere to it barring unforeseen circumstances, and are, therefore, accepting this condition.

12. We shall, however, point out to Government that the completion, in time, of our own programme alone cannot by itself ensure production of the necessary number of trucks by the stipulated date. About 45% of the vehicles will consist of items bought out from ancillary sources which, incidentally, we

ourselves have been largely responsible in developing over the years. These ancillary manufacturers will, naturally, have to undertake a substantial expansion of their own capacities in order to meet our own expanded requirements. At the moment they are able to deliver the requisite products of the quality specified by us for our present levels of production. Whether they will be able to expand their capacities and production in time to ensure the specified output of additional vehicles by March, 1978 is a matter that will be largely outside our control. They have their own licensing difficulties and their own financial, labour, import and other problems which could prevent them from meeting our requirements in time and therefore affect our own ability to meet the dead line. We are drawing Government's attention to this important factor and urging them to minimise uncertainties and delays by expeditiously granting to ancillary manufacturers the licences they might require for their own expansion and also by encouraging the development of such new sources of supply.

13. The third important condition imposed by Government in their Letter of Intent is that the economies of scale achieved by this expansion programme should be passed on to the consumer. Actually, the main economies of scale which can arise from the programme will be in the modest increase of production at Jamshedpur of 3,000 vehicles of the type that are being currently made there. The manufacture of 9,000 vehicles of a heavier and altogether new type at Poona cannot be considered a large scale operation. Economies of scale in their production will only be achieved if and when the output is increased under some later expansion project.

14. In their interpretation of this clause, Government have specified that the pricing of the products made under the programme should be such that the rate of gross profit, after allowing interest but be-

fore depreciation, development rebate and taxation, should not exceed the base rate of 11.85% of gross profit to net sales achieved in the years 1968-69 and 1970-71.

15. Subject to clarification on some points, the conditions as proposed by Government are acceptable to us, and we expect that an industrial licence will be issued to us in due course. On that assumption, we are taking all preliminary steps required to launch the project thereafter as quickly and efficiently as possible.

Jamshedpur and Poona

16. On the completion of this programme, the Company will have powerful centres of production at both Jamshedpur and Poona, in two factories equipped with the most modern plant and machinery available for the type of products made in them. While Jamshedpur will remain the larger producer of the two, Poona will also play a powerful role in the total production programme of the Company. It will not only make 9,000 new heavy vehicles but will continue, as it has already begun, to make equipments for Jamshedpur including the production of special purpose machine and press tools and spare parts for our vehicles, the total number of which on the road today is over 250,000.

17. The fact that manufacturing, research and training facilities are spread over two such production centres has added great strength to the Company as a whole. It will not only diminish its vulnerability to any unforeseen events or incidents which might interrupt production at one centre, but will ensure that production at each place is on a scale and of the nature best suited to it.

18. There is a practical limit beyond which an increase in size of a plant in the Auto industry not only fails to provide real economies of scale but makes operations and managements more difficult and burdensome. We believe that, with the present limited programme of expansion at Jam-

shedpur, we shall have reached such a situation there. Thereafter, Poona will provide the necessary scope for being built up ultimately to more or less the same size as Jamshedpur.

State Government Policies

19. Conditions for creating and operating a modern industry in Maharashtra are particularly favourable because of that State Government's wisdom and understanding of industry's requirements and problems. I am glad that the Government of Bihar have realised that the industrial climate in their State has in recent years offered less inducement to private enterprise to establish new industries or expand old ones, than that of other States into which, as a result, industries have flocked, and have shown willingness to extend special facilities and inducements to new industries established in Bihar. In contrast with this new spirit, however, the Bihar Land Reforms (Amendment) Bill, 1972, which has chosen to treat as if they were agricultural lands the area covered by the Works and Township of Tisco and Telco, and other Companies at Jamshedpur, is a most unfortunate and disturbing legislative enactment. As a result, we shall, once the Bill has received the President's assent, become tenants of the Government of Bihar instead of being tenants of the Tata Iron and Steel Company as at present, and control over the area of the works and township we have created there will be subject to such conditions as Government may choose to impose. We shall do our very best to cooperate in every way with the authorities and hope that they will themselves want to see that the beautiful city of Jamshedpur to the development and maintenance of which we have ourselves contributed much, will remain unspoilt and not be allowed to turn into the kind of slums which Government have allowed to develop all around the city.

20. Bihar is blessed with magnificent mineral and other resources and ample labour. It could, and should, become one of the great industrial cen-

tres of the world bringing widespread employment and prosperity to its people. This, however, will require, over the years, massive investments by both the public and private sectors.

21. With the great majority, in value, of Tata and associated enterprises centred in Bihar, I have a special feeling of loyalty towards the State, and am distressed at the fact that its 56 million under-privileged people have been denied the benefits which much larger scale industrial development could have brought them. I can only hope that the Government of Bihar will realise that their State is today a far less attractive part of the country in which to establish new industries or expand old ones than many other States which have seen the light and into which, as a result, industries have flocked in recent years.

22. So far as we are concerned, we certainly have no intention of forsaking Bihar and, over the next six years, during which we shall implement our expansion programme, we shall spend at Jamshedpur some Rs. 25 crores on expansion, improvements and replacements.

The future

23. On the completion of our expansion programme the country will have at its service an engineering complex unparalleled in the country in its layout, equipment, organisation, skills and managerial talents.

24. During the many years of hard work and effort it took us to reach such a stage of development those in charge of the venture steadfastly adhered to the basic principle of Modern Industry so often ignored in our country. They knew that success in establishing a complex Industrial enterprise is not achieved merely by providing money, land, buildings and machinery and recruiting labour, but rather by the human skills and expertise invested in it. This requires, amongst many other factors, a vigorous and continuous programme of training at all levels, the use of the most modern planning and management techniques, a relentless pursuit of excellence, the highest standards of supervision and maintenance, the nurturing of the design and other creative talents required for fruitful research and development, the maintenance of

high morale and good human relations.

25. If your Company has achieved so much in its relatively short history, it is because your Vice-Chairman and Managing Director, who has been the chief architect and builder of this great enterprise during the past twenty years, has ensured from the start that these all-important human inputs were adequately and constantly provided and has devoted so much care and effort in building up a young, able and dedicated management team imbued with his own ideas and traditions. In them lies the great strength of the Company today and in the years to come.

26. In closing, may I on your behalf and mine, express to our Management, staff and workers at Jamshedpur, Poona and elsewhere, our thanks for the hard work they put in during the past year and the excellent results they have achieved. We are also grateful to our dealers, suppliers and customers whose support and loyalty is a source of continuing strength to the Company.

J.R.D.TATA
Chairman

Bombay, 7th July, 1972.

Air France, Alitalia and Lufthansa.

RECORDS AND STATISTICS

Public Sector Undertakings : Performance in 1971-72

THE MINISTRY of Industrial Development has under its administrative control 17 public sector undertakings. One of these, namely, National Instruments and Ophthalmic Glass Ltd., has recently been split into two companies and from April 1, 1972, the number has gone to 18. A statement giving some basic information regarding each of these 17 undertakings is given in Table II.

In November, 1971, the Minister of Industrial Development had convened a meeting of the chairmen and chief executives of all Public Sector Undertakings under the control of this ministry in order to review their performance and to suggest measures to overcome their shortcomings with a view to achieve better operational results. This get together produced certain positive results and the performance of many of the undertakings has shown a substantial improvement both in relation to production and profitability during the year 1971-72. The position of each of the 17 undertakings under the control of this ministry, is briefly explained below :—

The Public Sector Undertakings under this ministry fall broadly under three categories—(a) manufacturing concerns

which have been in production for some time (b) manufacturing concerns which are still in the construction stage or have recently gone into production, and (c) units which are primarily for consultancy trading or are promotional in nature.

Of the ten public sector manufacturing concerns of this ministry which have been in production for some time the following six units have shown profits during 1971-72 :—

1. Bharat Heavy Electricals Ltd.
2. Instrumentation Ltd.
3. Hindustan Machine Tools.
4. Hindustan Salts Ltd.
5. NEPA Mills Ltd.
6. Cement Corporation of India.

There has been substantial improvement in the performance of Bharat Heavy Electricals Ltd during 1971-72. Its production has gone up from Rs 49.47 crores in 1970-71 to Rs 59.33 crores in 1971-72. It has also considerably improved its profitability and the net profit in 1971-72 amounted to Rs 3.19 crores against Rs 65 lakhs in 1970-71. The performance of the Hyderabad unit of the company was particularly satisfactory during the year and for the first time it showed a profit of Rs 1.93 crores after showing losses over the previous years. While the Hardwar unit of the company continues to incur losses, its production has also increased considerably during the year and it is hoped that this unit would also turn the corner shortly.

The performance of Instrumentation Ltd has also shown

an improvement in 1971-72 over the previous year. Its sales have gone up from Rs 532.50 lakhs in 1970-71 to Rs 726 lakhs in 1971-72 and its profits have gone up from Rs 155 lakhs to Rs 200 lakhs. After having been in the red for several years, Hindustan Machine Tools had made a net profit of Rs 30.78 lakhs in 1970-71. During 1971-72, the company has increased its production to Rs 25.19 crores and sales to Rs 26.67 crores as against a production of Rs

20.37 crores and sales of Rs 20.43 crores in 1970-71. Its net profit has also increased to Rs 100 lakhs. During the year ending September, 1971 Hindustan Salts also turned the corner and showed a small profit of Rs 3,700. During 1971-72, the production and sales of the National Newsprint and Paper Mills Ltd, have shown a substantial improvement over the previous year. The production of newsprint increased from 37,270 tonnes to 40,040 tonnes and the sales

		1971-72	3235.00	3235.00
7.	Bharat Heavy Electricals Ltd.	1969-70	3722.00	4514.00
		1970-71	3900.00	4947.00
		1971-72	4258.00	5933.00
8.	Hindustan Cables Ltd	1969-70	709.89	711.18
		1970-71	746.30	735.70
		1971-72	653.15	659.63
9.	Hindustan Photo Films	1969-70	362.44	374.72
		1970-71	365.71	414.56
		1971-72	436.36	524.35
10.	Cement Corpn. of India Ltd.	1969-70	—	—
		1970-71	239.50	169.71
		1971-72	227.44	239.59
11.	Tannery & Footwear Corpn. of India Ltd.	1969-70	45.82	79.75
		1970-71	156.54	193.45
		1971-72	200.00	182.85
12.	(a) Hindustan Salts Ltd.	1968-69	27.47	21.09
		1969-70	28.29	25.64
		1970-71	41.67	17.66
	(b) Sambhar Salts Ltd.	1968-69	27.75	41.25
		1969-70	33.79	28.72
		1970-71	34.14	60.55

went up from Rs 419.65 lakhs to Rs 511.80 lakhs. The performance of the company has improved considerably and as against a loss of Rs 52.25 lakhs in 1970-71, it has earned a profit of Rs 4.83 lakhs during 1971-72 for the first time after several years.

Although the Cement Corporation of India has been able to complete only one of its projects so far and the other projects are still in the implementation stage, it has been able to show a small profit of Rs 1.00 lakh (Provisional) during 1971-72 against a loss of Rs 34.19 lakhs during the previous year. During 1971-72 work on the second project was completed and trial

runs have started. It is hoped that with the commissioning of this project in the current year the profitability of the company would improve considerably.

The following manufacturing units continued to incur losses during 1971-72 :

1. Heavy Electricals (India) Ltd.
2. Hindustan Photo Films.
3. National Instruments & Ophthalmic Glass Ltd.
4. Tannery & Footwear Corpn. of India Ltd.

The losses suffered by Heavy Electricals during the past years

have been particularly heavy owing to variety of reasons, including unsatisfactory labour management relations. However, during 1971-72, the company has made substantial progress towards reaching a break-even level. Its sales have increased from Rs 26.69 crores to Rs 32.35 crores and the losses during 1971-72 were reduced to Rs 4.5 crores as against the Rs 6.11 crores in the previous year. If this improvement is maintained in the current year, it is hoped that the company would reach the break-even by 1974-75.

Similarly the Hindustan Photo Films has also been suffering substantial losses in the previous years mainly due

to the poor quality of the indigenous raw material. The percentage of its rejections was particularly high resulting in substantial losses. Vigorous efforts were made during 1971-72 to improve the performance of this company and this have borne substantial results. The rejection percentage of its various products has been considerably reduced and its sales have increased from Rs 365.71 lakhs in 1970-71 to Rs 436.36 lakhs in 1971-72 and consequently it has been able to reduce its loss to Rs 248 lakhs as compared to Rs 284 lakhs during the previous year. With the breakthrough which has been achieved by reducing the rejections in this company, there is every reason to hope that it

TABLE II
Total Central Government Investment as on March 31, 1972 and Profit/Loss during the years 1969-70, 1970-71 and 1971-72 in respect of each of the Public Sector Undertakings.

(Rs in lakhs)

*There is no investment by the Central Government in this Company. It has an authorised Share Capital of Rs. 30 lakhs. The Issued Capital as on March 31, 1971 was Rs. 15 lakhs which is held by the five Public Sector member companies, viz BHEL, HEIL, Instrumentation Ltd, Mining & Allied Machinery Corporation Ltd and Triveni Structurals Ltd.

would reach the break even level shortly. The Jadavpur unit of the National Instruments and Ophthalmic Glass Ltd continued to maintain steady progress during 1971-72 and its turnover has increased to Rs 106 lakhs as compared to Rs 68 lakhs in the previous year. The unit was therefore able to reduce loss from Rs 55 lakhs in 1970-71 to Rs 44 lakhs in 1971-72.

The Ophthalmic Glass Project at Durgapur has now been separated from this company and has been constituted into asepa rate company from April 1, 1972. The performance of this unit in 1971-72 continued to remain unsatisfactory mainly because of labour difficulty. The Tannery and Footwear Corporation has increased its sales from Rs 157 lakhs in 1970-71 to Rs 200 lakhs in 1971-72. However, due to an increase in operating costs there was only a marginal improvement in the profitability of the company during 1971-72. The company is however increasing its sales level and hopes to come very near to the break even level in the near future.

Hindustan Cables, which has consistently been showing profits over the past years received a setback during 1971-72 largely due to labour trouble. The sales of the company received a setback and it ended the year with a loss of Rs 28 lakhs against a profit of Rs 4.47 lakhs in the previous year. The unit has now been able to push up its production and it is hoped that it would show better results during the current year.

The projects which continue to be at the construction stage or which have not reached the full rated capacity are the Machine Tool Corporation of India, the Bharat Pumps and Compressors and the Hindustan Paper Corporation. The Machine Tool Corporation went into production only in 1970-71 and it is hoped that it would take another two to three years before it reaches its full rated capacity. However during 1971-72 it was able to

increase its production to Rs 72 lakhs against only Rs 16 lakhs in the previous year. Bharat Pumps and Compressors have commenced construction of factory building at Naini and have completed some other preliminaries including finalisation of some of their foreign collaboration agreements. The Paper Corporation is still in its early stages but a decision has been taken regarding implementation of the paper mill projects at Nagaland, Nowgong (Assam) and Cachar as well as a newsprint plant in Kerala.

The public sector units, which are either promotional, trading or consultancy, are National Industrial Development Corporation, National Small Industries Corporation and the Indian Consortium of Power Projects. Of these, (NIDC) has continued to maintain profitability during 1971-72 as in the past. It has also obtained a considerable foothold in consultancy in Middle-east countries. The National Small Industries Corporation is a promotional unit which is catering to the needs of small scale industries. The Indian Consortium for Power Projects is a consortium of several Public Sector Undertakings and was formed sometime back for the purpose of taking up turn-key jobs for power generation and transmission both in the country and abroad. It is mainly concentrating its attention on export orders of heavy electrical equipment.

To sum up, the over-all performance of Public Sector Undertakings under the administrative control of this ministry has been steadily improving during the last two years or so. While in 1969-70, only three undertakings had shown profits, in 1971-72 as many as seven undertakings have shown profits. Out of these, three undertakings have turned the corner only in 1971-72. Even the undertakings which continue to show losses have also considerably improved their performance in 1971-72 and are well on way to reach the break-even level in the near future.

"You don't look as if you've spent a long hard day at the office," said my wife.

(Suspicious, that's what women are!)

Why doesn't somebody tell her about Blue Star Packaged Climate Systems?

Understandable. A working woman would know better but the housewife seems to take it for granted that a day in the office ought to make a wreck of any man. Obviously, nobody's told her about highly productive modern offices and Blue Star Packaged Climate Systems!

The result of 30 years' experience and know-how these Packaged Climate Systems are designed to give you perfect working climate throughout the year. So that you work better... harder. And still have energy left to confuse your wife after a long hard day at work!

India's first and finest:

Blue Star Packaged Climate Systems

- Ideal for Banks, Offices, Showrooms, Department Stores, Restaurants, Hotels, Clubs, Canteens, Hospitals, Beauty Parlours.
- Reasonably priced and quality-built to work with amazing efficiency, economy, flexibility.
- Available in 3 capacities—5, 7.5 and 10 H.P.
- Choice of water or air cooled models.
- Dependable and trouble-free in performance; backed by Blue Star's warranty and free service for one year, and a countrywide network of service centres.

Foreign Collaborations

THE GOVERNMENT of India approved 44 technical/financial collaborations in the first quarter of this year. There were 11 cases of collaboration with the USA, 10 with the UK, eight with West Germany, five with Switzerland, four with Japan, two with Italy and one each with France, Sweden, Belgium and East Germany. Five cases involved financial participation also.

Mrs Gandhi 'at play

A PRIME Minister makes changes in the cabinet or council of ministers primarily for one or more of the following reasons: (a) to strengthen the authority of the Prime Minister in the ruling party of the government; (b) to improve the efficiency of the political leadership of her administration; and (c) to promote a feeling of hope or confidence among the people that public life and the public services may become cleaner. So far as Mrs Gandhi is concerned, she is already so well-entrenched in both party and government that she does not have to drop a minister or ministers or induct one or more new men into the cabinet merely to strengthen her political position. There has, however, been always much scope for improvement in the competence as well as the character and integrity of her council of ministers. It is therefore logical to examine whether and to what extent the changes that she has now made in the cabinet are designed to serve either or both of these two purposes.

To take competence first, as replacements for Mr Hanumanthaiya and Mr Moinul Haque Choudhury, Mr D.P. Dhar and Mr T.A. Pai would certainly be added assets to the ministerial team. When Mr Hanumanthaiya was taken into the central cabinet by Mrs Gandhi as Railway Minister it was only because he happened to be in a position to serve certain temporary political purposes of the Prime Minister. This meant that, in the nature of things, he would outlive his utility to her sooner or later. The Prime Minister would have been more honest to herself and the country had she quietly dropped him when she reconstituted her government after the last general election. One of the minimum qualifications for a minister is that he should be capable of being taken seriously at least by the officials who have to work closely with him. Poor Mr Hanumanthaiya could never meet this condition.

At the same time it is possible to be too harsh to him now. It could perhaps be even said of him that nothing became his ministership so well as his leaving of it. He has been blamed for having been too obviously reluctant to leave the flesh-pots of New Delhi. But then it has to be taken into account that there are other ministers who have not only been equally reluctant but have also been more successful than Mr Hanumanthaiya in resisting the Prime Minister's attempts to dislodge them. With Mr Fakhrudin Ali Ahmed, for instance, so much in the picture in this connection, what right has anybody to accuse Mr Hanumanthaiya of being overkeen on being a minister unto death? It could at least be said to the credit of the ex-Railway Minister that he has declined to be consoled with a governorship. For all his faults he has a certain pride and it is good to see that he made Mrs Gandhi see this.

In contrast Mr Moinul Haque Choudhury has cut a very sorry figure indeed. It is true that he has the disadvantage of being a younger man than Mr Hanumanthaiya and therefore more to lose in terms of the future. Even so the way he has been bargaining for compensation for the loss of ministerial office has exposed the Prime Minister as well as Mr Choudhury to public ridicule. Already our ambassadors, as a body, command very little prestige or respect abroad, because it is only too well known that so many of them are selected on grounds other than those of even mere eligibility. It is surprising that Mrs Gandhi, who seems to have such a high opinion of her international personality, should be so ready to debase it by allowing such wide publicity to the fact that, so far as she is concerned, lamp posts could be sent to represent her government in foreign countries.

From the point of view of the efficiency of the government, the exit of Mr Hanumanthaiya and Mr Moinul Haque Choudhury, both of whom have been poor and clumsy performers at their respective portfolios, is no doubt a gain to the government of the country. But their disappearance merely emphasises the fact that there are still so many other ministers, equally or even more inefficient at their respective charges, who have managed to avoid the axe. We have already referred to Mr Fakhruddin Ali Ahmed. Is there any good reason why Mr Gokhale should be permitted to continue to drift and dither at the important Ministry of Petroleum and Chemicals? For months now this minister has shown himself to be quite incapable of taking the initiatives and decisions which have to be taken urgently for the defence of the strategic interests of the economy.

Hardly less culpable have been the lapses and defaults of Mr Uma Shankar Dixit in the Ministry of Health and Family Planning. Not only has the administration of public hospitals been deteriorating without any sufficient effort being made by the minister to check the rot, but the important programme of national family planning is being allowed to lose itself in the wastes of misused public funds and the wilds of bad planning and worse administration. We are prepared to concede that Mr Dixit's political usefulness to the Prime Minister being what it is, she is entitled to have him in the convenient position of a cabinet minister. But is there any compelling reason why this conservative and backward-looking elder in his early seventies should be foisted on the national family planning programme as its ministerial leader or

director? Has not Mrs Gandhi heard of an arrangement called minister without portfolio? To the extent that the Prime Minister has failed to deal with the other misfits in the council of ministers, the two men whom she has picked upon for their unsuitability or incompetence have every reason to nurse a grievance that they have been unfairly treated.

If the Prime Minister has not dealt adequately with the problem of incompetence in the council of ministers, she has failed even more signally to sort out the issue of integrity or clean government. There is no gainsaying the fact that there are now in the cabinet or the council of ministers politicians whose names are mud. We have just had the example of Mr Reginald Maudling resigning from his post of Home Secretary in Britain because certain business associations of his have been questioned or considered suspect. In New Delhi, however, a different set of values has come to prevail. The authority or the prestige of a minister has come to be in direct proportion to his ability or unscrupulousness in using his political or official position to extract money of all colours or complexions from all kinds of sources for all kinds of purposes. Because private citizens are not in a position to denounce the guilty men by their names or spell out their objectionable transactions in a court of law, those among them who are concerned with morality in government or public life have to be content with generalized condemnation of corruption in politics. But this does not mean that the identity of the guilty people is unknown to the public or even vague. The basic truth is that there are corrupt men in the government and this is one reason why there are other corrupt men, naturally many more in number, at all levels of the administration or the public services. It is clear from the Prime Minister's latest performance that she has absolutely no interest whatsoever in recasting the council of ministers so that the people may be able to repose more confidence in the integrity of her government or the administration.

As we have noted earlier, the induction of Mr Dhar and Mr Pai should raise the average quality of the council of ministers. At the same time it would be easy to exaggerate the significance of the new entrants. Mr Dhar is undoubtedly a man of parts and he has lately won acclaim as a diplomat of nimble wit and a persuasive tongue. All this, however, does not automatically constitute sufficient credentials for a minister of planning. As at present he is therefore entitled only to be hopefully and sympathetically regarded as he goes about learning his new business. The critical issue in planning today is the achievement of the effective coordination of the government's economic policies and relating them intelligently and dyna-

mically to the real needs of faster economic growth.

As for Mr T.A. Pai, those who have been talking him up and up are really doing no service to him. It has to be placed on record that he comes to the Railway Ministry with a somewhat less impressive background than he had when he switched over from banking to state trading in foodgrains and subsequently nationalised insurance. Mr Pai has been billed as a great organizer but it is only fair to say that his performance at the LIC has been of the order of the curate's egg. It certainly cannot be denied that he has not been over-successful in controlling either the cost of life insurance administration or lowering the price of life insurance policies. The policyholders, as a body, have no particular reason to be grateful to him. This is particularly so because he has been able to do very little in terms of arresting the progressive deterioration in the quality of the services rendered by nationalized life insurance to its policyholders.

To suggest that Mr Pai had started a number of new schemes in the LIC is not to refute this complaint. On the contrary every new scheme has only meant a further worsening of the administration of all schemes, whether old or new. Mr Pai's record particularly in dealing with staff discipline and staff demands has been about the poorest even in terms of the indifferent history of nationalized life insurance. His crowning folly was the appeasement of the officers' union, on the eve of his leaving the LIC to enter politics, by concluding an agreement which bore all the marks of being drafted in a hurry and hustled to suit the deadline of the departing chairman. One consequence of this arrangement of convenience is that Mr Pai's successor in the chairmanship of the LIC is being called upon to cope with a thankless job of an avoidable complexity.

It is to be hoped that this judgment of Mr Pai's custodianship of LIC will not be considered to be too harsh. We are aware that a certain general impression highly favourable to him has been built up. This only makes it all the more necessary that a more objective appraisal should be attempted. The relevance of this evaluation of Mr Pai's career at the LIC to his inclusion in the cabinet is to impress on him more than others that he should not take his new responsibilities for granted. The Railways face a crisis of management. If this crisis is not properly assessed and got over, the next most serious bottleneck to economic development might be inability of the Railways to move goods on a sufficient scale sufficiently faster. *Eastern Economist* believes that it is doing a service both to Mr Pai personally and to the country when it refuses to join the drum-beating about his

entry into the government. The new Railway Minister must be content to be judged by results. What could now be reasonably said in his favour is that he is certainly of a quality superior to that of many of the entrenched members of Mrs Gandhi's ministerial team.

As for Mr C. Subramaniam, the question whether he has been demoted in status or not is not of any importance. It is true that as Minister for Planning he enjoyed at least on paper certain degree of coordinating authority which does not automatically attach itself to the portfolio of industrial development. There is, however, no reason why the Minister for Industrial Development cannot develop some coordinating influence, even if not authority, in the course of discharging his legitimate responsibilities. The ministry to which he has been transferred is or ought to be essentially a policy-formulating rather than an administrative ministry. If Mr Subramaniam needs to boost his morale, he may usefully tell himself that he is now being sent to the Ministry of Industrial Development when industrial development has become a high national priority just as he was given the agriculture portfolio when agricultural expansion was of such great importance to the elementary wellbeing of the people. For some time now there has been a feeling that Mr Subramaniam has been losing his *elan* as an organizer of economic strategies or administrator of economic programmes. He has now an opportunity to test whether this is so. Since it is in the country's interest that there should be a recovery in industrial progress, its good wishes will certainly be with him.

Finally we must ask the question what Mrs Gandhi was really up to? It is clear that the present cabinet changes do not amount to very much by way of dispelling the general impression that the country can do with a lot more impressive ministerial team than the Prime Minister has been able or willing to give it. It has been said, however, that she is planning to do great things in this respect later in the year. It is not easy to comprehend why she could not have done in July what she could or might in October or November. Could it be that some of her colleagues, for whom she has a soft place in her heart, had astrologers set for them auspicious dates for giving up their ministerships? There has been a suspicion that one reason why Mr Hanumanthaiya wanted to delay his resignation by a couple of days was that he desired to start the next phase in his public life under a particular conjunction of planets. As is only befitting a secular state, our council of ministers is composed of persons professing various faiths. It appears, however, that astrology cuts across religious frontiers. This is a pity since some of the deserving ministers of state have the cruel stars to thank for being kept painfully waiting.

International oil scene

ANY DEVELOPMENT on the oil front in West Asia vitally concerns us. This is because for nearly two-thirds of our present requirements of crude oil we are dependent on west Asian sources. The indigenous supply of crude is not expected to improve very materially in the next decade by the end of which our consumption of petroleum products is likely to go up to more than 40 million tonnes per annum — approximately double the quantity we consume today. So our dependence on West Asian crude, instead of diminishing, should increase.

Events of great significance are taking place in West Asia. The international oil companies and the governments of the major oil producing states in this area have been engaged in negotiations over the future development of the oil industry there for quite some time. They have been joined in these negotiations by two more countries of north Africa — Libya and Nigeria. Among them, the oil producing countries of West Asia and North Africa account for an overwhelming percentage of exportable oil.

Apparently conscious of the vital role oil plays in our life today and its strategic importance in the defence of a country as well as for running a modern economy, the oil producing nations have been demanding two things: (i) a better yield for their exchequers from this natural endowment to them, and (ii) participation in the existing as well as future concessions to the oil companies. Increased revenue from oil resources, they feel — and legitimately so — will help them in diversifying their development programmes. The national urge in these countries to get out of the stranglehold of the powerful international oil giants is another factor which has prompted them to take their present posture. The persistent doses of taxation on petroleum products in the consuming countries and the global inflationary trends too are no less responsible for the stiffening of their attitude.

As a sequel to these major crude oil exporting countries coming together, which led to the reversal of the downward trend in crude oil prices following an agreement by them with the international oil companies in February, 1971, the industrially advanced nations of western Europe and Japan, which are the most important consumers of west Asian and north African crude oil have joined hands to resist increases in crude prices. They have also stepped up their efforts at having access to alternative sources of crude oil. The spectacular discoveries of crude in Australia in the recent past and the concerted at-

tempts currently being made to find oil in the North Sea and Alaska — where some moderate successes are reported to have been achieved — have their genesis in this desire of the major consuming countries. Japan and a couple of west European nations have even shown interest in oil exploration in Siberia.

Sandwiched between the contending pressures of the oil exporting nations and those which account for the bulk consumption of this oil, the international oil companies have started feeling the squeeze. They are no longer in a position to dictate terms; their profits are, therefore, dwindling. Some of them are said to have even started pondering over their very future. The forward looking among them are understood to be thinking of diversifying their growth pattern, besides, of course, progressively going into the more difficult areas of oil exploration. A few are reported to have already initiated diversification programmes in the allied mining and manufacturing fields.

In the developing countries such as India, where the demand for petroleum products continues to grow at a fairly rapid rate, notwithstanding the progressive step-up in the taxes on these products in an effort to curb the growth in demand, one discerns a slightly different trend. To the extent they consider it feasible, they are trying to raise their domestic production of crude oil, ensuring their own ownership over it. Like the developed countries, they are also showing interest in exploration of oil abroad. The difference in their approach and the approach of the developed countries is that in anticipation of the direct participation of the governments of the major oil exporting countries in the exploitation of their resources, the former are endeavouring to have direct dealings with the producing nations.

The participation move of the major oil exporting countries, which implies that their governments will share with the licensee companies the cost of exploration and production of crude oil, with some arrangement with the companies for the sale of crude which would accrue to their share but which might not be disposed of by them directly, appears to have come under shadow by two recent developments in Iraq and Iran. In Iraq, the government has nationalised the Iraq Petroleum Company (IPC). In the case of Iran, the Shah has decided to have an independent arrangement with the international giants under which not only the output of crude oil there is to be raised to 400 million tonnes in course of time double the present output in Iran — but the National Iranian Oil Company will also have access to part of the crude extracted from the leased out concession areas, which it would use in downstream operations in the country itself as well as abroad.

Since Iran nationalised its oil industry and paid out compensation to the oil companies as far back as 1951, it is now having partnership arrangements with oil companies. The oil companies, under the latest proposal now being negotiated with Iran, will make all investment in exploration and production of oil in that country, leaving the Iranian government free to use its own resources and revenue from oil for the development of the economy in other ways. Under this arrangement, the Shah is even thinking of partnership with oil companies in the marketing of oil abroad, including through retail outlets, so that it can derive the maximum benefit. Exploration by British Petroleum in the North Sea too is being partnered by Iran on an equal footing. This arrangement may appeal to some other oil producing countries, for if the proposal of participation is pursued, they will have to share the cost of exploration as well as production, which of course, may be less than the total benefit accruing to them. The confusion that prevailed at the recent Vienna conference of the oil producing nations can be attributed to this. There appears to be a rethinking on the part of some oil producing countries to the effect that if they are left free to utilise their resources for the development of their countries otherwise — the oil companies making the total investment in oil exploration and production with a guarantee for better yield to the exchequers of the oil producing countries — it might be a better proposition for them.

The nationalisation of its oil resources by Iraq has no doubt created some problems for it in the marketing of oil; Iraq is now reported to be seeking government-to-government deals. But this position may not last long once the issue of compensation to the IPC is resolved. It will, however, take some time for the picture about the arrangements which Iraq would then have with the oil companies as well as with the consuming countries, to clear up.

Against the above backdrop, particularly the negotiations between Iran and the international oil companies, the expectations in some circles that the role of international oil companies, as a buffer or intermediary between the oil producing and consuming countries will be drastically curtailed in the very near future appears to be presumptuous. The very fact that the more difficult areas of oil exploration even in west Asia and north Africa will require assistance in one form or the other from the international oil companies should suggest that these companies cannot be completely squeezed out of the oil exporting countries. The political overtones of direct dealings between the oil producing and consuming countries may also inhibit many a bulk

oil consuming nation from interfering into indiscriminate direct bargains with the producing nations.

What should then be the correct policy for countries such as ours to follow? Oil today admittedly is a highly strategic commodity. We, therefore, have to safeguard ourselves against stoppage of supplies of this essential material in all eventualities. This calls for the maximisation of efforts at finding crude oil indigenously. Since self-sufficiency in this field is not likely to be achieved by us in the near future, we will have to continue to import sizeable quantities of crude oil. The anticipated sharp increase in the foreign exchange expenditure on account of crude oil imports can, of course, be obviated to a considerable extent if we venture into oil exploration abroad. It is a pity that we have let some good offers in this regard slip by.

Jute is not for juggling

THE GOVERNMENT OF India has been showing a great deal of concern in recent months for improving the lot of the jute growers but it is not clear to what extent its efforts will actually help them to increase their income and stimulate them to produce more. The statutory minimum support price of Rs 115 per quintal for the current season is only a little higher than the prevailing prices. The Minister of Foreign Trade, has stated that the price will be reviewed after two months and will be increased if necessary to make it remunerative to the grower. He has also announced that the Jute Corporation will buy at least a minimum of 900,000 bales this year and that the private trade in raw jute would end in about two years.

Jute circles in Calcutta, however, have expressed doubts as to whether the government's policy will really and substantially benefit the growers. For example, Mr S.N. Kanodia, in his presidential address at the annual general meeting of the East India Jute and Hessian Exchange Limited on June 28 this year, said that if the Jute Corporation's activity was to be limited to secondary markets only and if it worked just as another link in the chain of middlemen without recourse to direct purchase from growers in "adequate quantity and at adequate prices", the very purpose for which the corporation had been established would be defeated. He also pointed out that inadequate and irregular supply of railway wagons during the jute season hit the growers most on the price front. As a result, the growers are compelled to resort to distressed sales.

Direct deals with the oil producing countries also cannot be ruled out in view of the development on the oil front in west Asia and north Africa. But this need not shut out completely supply arrangements with international oil companies. In the near future, when the current uptrend in the prices of crude oil can be expected to persist, it should be to our advantage to keep the international companies in the picture. Anxious to exploit the situation to their own advantage, the oil producing countries may even try to accelerate the uptrend in crude prices. Competition in that event can come only from the oil companies. Even today, the oil companies are being paid for the crude supplies they bring to their refineries in our country much less than what we are obliged to pay for the supplies from the National Iranian Oil Company in the case of Madras refinery.

The inability of the railways to arrange for the prompt and efficient movement of raw jute has been highlighted year after year but the problem continues to occur during the jute season.

Meanwhile, the Jute Brokers' Association has expressed the view that the complete take-over of the raw jute trade will prove "disastrous" since the Jute Corporation lacks expertise and experience. The association has said that in the absence of free trade there is likelihood of favouritism and other malpractices on the part of the official machinery. The association has complained that recently while granting export licences for three lakh bales of raw jute, two lakh bales were allotted to the Jute Corporation and the State Trading Corporation and one lakh bales to a private firm which was "hardly conversant with the trade" while excluding well-established firms who had been in this business for decades. Mr Mishra may be inclined to dismiss such allegations as emanating from the vested interests. But unless the government of India handles the problem with considerable caution, both the jute trade and industry are likely to suffer. The government of India therefore should formulate its jute policy realistically which, while providing the growers with the incentives to produce more and improve the quality, will also enable the industry to secure its raw material at prices that will enable it to compete effectively in the foreign markets.

Mr Mishra has expressed the view that the real threat to India's jute goods exports comes not from Bangladesh but from the synthetic packing material. He has therefore suggested that it is necessary to evolve a new range of jute goods. But meanwhile what is the government of India doing to help the industry to maintain its export markets? The govern-

ment seems to have no intention to withdraw the export duty on the jute manufactures nor is it in a position to improve the productivity of labour in the jute mills. The wages of the jute workers were recently increased by 30 per cent. But this has not resulted in any improvement in labour productivity; on the other hand, it is said to have deteriorated.

The West Bengal government, again, has been doing little to improve the competitive strength of the jute industry. It has been unable to ensure power supply to the mills without interruption. Since June 5 this year, there has been a daily loss of production of jute goods of the order of 252 tonnes valued at over Rs nine lakhs. Neither New Delhi nor the government of West Bengal seems to appreciate the implications of this kind of load-shedding. As Mr Kanodia has pointed out, "interruption of the industry's production process in season and out of season seems, firstly, rendering the labour idle; secondly, increase in wages without return; thirdly, increase in the cost of jute goods; and, finally, decrease in the total output of the industry with consequent decrease in exports".

The state government has also been indifferent to the jute trade's plea to reconsider the multi-point sales tax. The jute trade has been suggesting that in place of the multi-point sales tax, there should be a single point tax at source on the goods meant for internal consumption. The levy can be linked with the central excise and thereby exports can be excluded from its incidence.

It is pointed out that this will not in any way affect the revenues of the state government. The multi-point sales tax is levied on each transaction of jute goods and this has hit the dealers in jute goods. Mr Kanodia has explained that with its inflationary effect on prices, the multi-point sales tax has been rendering Indian jute goods more and more uncompetitive in world markets; and, as a result, the investment in the jute goods trade has been considerably diminishing, leading to a gradual decrease in the liquidity of the market.

The export target for jute goods for 1972-73 has been placed at 750,000 tonnes, estimated to yield about Rs 270 crores. It is however doubtful if this target will be reached in view of the disruption in production due to the power cut, and the increasing competition from Bangladesh and synthetics. In this background New Delhi should carefully consider all the relevant factors while implementing its proposals to eliminate the private trade in jute, revise the minimum prices for raw jute or set up new jute mills outside West Bengal.

POINTS OF VIEW

Storm signals on prices

S. P. Chopra

DESPITE THE rather insensitive character of the Economic Adviser's Index of Wholesale Prices, there was an increase of more than six per cent in prices between the week-ended July 3, 1971 and the week-ended July 1, 1972. (see Table I). There is no seasonal element involved in this comparison because prices in two corresponding weeks in 1971 and 1972 have been set side by side. The price index for food articles, which has a weightage of more than 50 per cent in the overall index, has spearheaded this rise with an upshot of more than 10 per cent. The increase in the prices of food articles has been shared by all the sub-groups except for "fruits and vegetables" which rather intriguingly, shows a fall. The prices of cereals have risen by more than 11 per cent mostly because of the sharp upturn in rice prices. Spectacular rises have been recorded in the case of "sugar and allied products" and pulses. The only major group of the index which has failed to register a rise is that of industrial raw materials because of the crash, in raw cotton prices.

national in sweep

The latest data for consumer price index numbers for industrial workers are available for the month of March this year. These index numbers are no doubt available for later months for a few centres but for purposes of comparison for all the major industrial centres, figures for the months of March 1971 and March 1972 have been put together (see Table II). What hits the eye in this comparison is that the indices have risen all along the line without any exception implying that the current inflationary spell is truly national in its sweep. True that the rates of rise in consumer prices differ from centre to centre but by and large the increase has been of the order of five to six per cent in the year. Thus, a look at the wholesale and consumer prices suggests that our economy is once again in the grip of inflationary pressures.

Wherein lies the root cause for the current spurt in the prices? What is now patent is that the overall production of foodgrains and other items of consumption has received a setback. In the agricultural year ended June 30, 1972, the total

production of foodgrains in this country is estimated to be lower by two million tonnes than the all-time peak recorded at 107.8 million tonnes in 1970-71. Granted that the government of India has eight to nine million tonnes of foodgrains in its

warehouses, prices of food articles have risen by varying degrees all over the country despite this comfortable position in inventories. The prices of sugar have come under great pressure because of the continuous decline in the production of

cane. Sugar prices have recorded a rise of more than 27 per cent in one year as a result of falling production for the last two years in succession. Gur prices have remained high in sympathy. Coarse grains such as barley, jowar and maize have all recorded substantial increases in prices and so also pulses, partly because of stagnation or decline in output.

The drop in the output of foodgrains and certain other commercial crops has been accompanied by a lag in industrial production. The supply of consumer goods has not kept pace with the demand and has led to a spurt in the prices of manufactured goods. Between November 1970 and November 1971, the index of industrial production rose by a niggardly seven percentage points (see Table III). The largest rise had taken place in the case of basic industries, but the consumer goods—especially non-durable ones such as sugar, vanaspathi cotton cloth, paper, drugs, soaps, matches and glass products—have fared very badly with a rise of 1.4 percentage points only. If the index of wholesale prices for manufactures has shown a rise of a little more than five per cent, it has certainly underestimated the degree of increase in prices of industrial goods. A glaring instance is provided by the index for the prices of shoes. If the Economic Adviser's index were to be believed, the prices of shoes in the wholesale markets of our country are today a shade lower than the level they had attained in 1961-62. How fantastic!

loose talk

In a way the present situation can be described as a rather belated effect of our massive expenditure on refugees from Bangla 'esh last year and earlier this year and also the cost of the Indo-Pakistan war in December last year. The economy could have tolerated this burden if the productive machinery both in agriculture and industry had been in truly dynamic shape. Unfortunately the loose talk initiated regarding the distribution of land among the landless under the proposed land reforms has dampened the spirit of those very progressive forces which had brought about the green revolution. In the case of industry, the ban on the activities of big business houses which possess both managerial and financial capabilities to expand industrial capacities slowed down the tempo of work. The emphasis on small-scale industries has yet to show any concrete results in terms of substantial increased production. Thus, it is this basic imbalance caused by increased money supply due to liberal deficit financ-

ing and the stagnation in production of consumer goods which has once again pushed up prices.

While the production of a majority of consumer goods has either been stagnant or declining, the pressure from increasing money supply has been unrelenting. Expansion in the supply of money in itself is not unhealthy provided it is accompanied by a proportionate increase in the

POINTS OF VIEW

availability of a majority of items constituting the housewife's shopping basket. This is exactly what has not happened. Money supply with the public rose by Rs 1,008 crores between June 25, 1971 and June 23, 1972 (see Table IV) which is unparalleled in the monetary history of this country. Money supply had risen by Rs 429 crores in 1968-69, Rs 607 crores in 1969-70, Rs 750 crores in 1970-71 and Rs 929 crores in 1971-72. The chief reason

for this rapid expansion of money supply has been the inordinate growth in "net bank credit to the government sector" which rose by as much as Rs 1,207 crores during the year under reference. The reason for this is not far to seek. The mounting demand for funds to support the Bangladesh refugees and to sustain Indo-Pak war operations of December last is the main reason for the government being forced to draw so heavily on credit from the Reserve Bank of India. Between May and September last year, the credit to the government sector ruled between Rs 5,711 crores and Rs 5,771 crores with negligible variations from month to month but from October onwards it started rising at the average rate of about Rs 150 crores a month. Between September 1971 and April 1972, it had risen by Rs 1,053 crores.

The obvious conclusion is that the government has gone in for much larger deficit financing than it had anticipated in the budget for this year. It may be recalled that the Finance Minister had indicated an overall deficit of Rs 385 crores in 1971-72 (revised estimates) in his budget speech this year. Since the government sector drew more than Rs 1,000 crores from the Reserve Bank by way of credit in 1971-72, it certainly overshoot the limits it had set for itself in this regard. A part of the increase in the credit of the government sector is due no doubt to the overdrafts of the states but the centre, surely, should accept the greater part of the blame.

The steel in his future

A Correspondent

THE DECISION of the central government to take over the management of the Indian Iron and Steel Co. Ltd, on the plea that there has been a gradual deterioration in the operating efficiency of the main steel plant and that there has been considerable loss of production, sounds ironic when the government itself has been trying to explain away the miserable performance of the three major units in the public sector in the first quarter of 1972-73. The union Minister for Steel and Mines, Mr Mohan Kumaramangalam indicated to members of the Parliamentary Consultative Committee recently that the decline in production of the three units in April-May was due to power shortage, a high level of absenteeism and extremely hot weather in the summer months. It looks as if these factors have no relevance for the working of IISCO as even after the

protest of the Committee of the Federation of Indian Chambers of Commerce and Industry, Mr. Kumaramangalam has observed that the poor performance of IISCO had been due to poor maintenance of plant and machinery and inefficient management and immediately fresh capital expenditure will have to be incurred for raising the operating ratio to the former levels.

There is of course no justification for the extremely disappointing output figures of IISCO for June when saleable steel production was less than 10,000 tonnes which does not work out to even 20 per cent of the rated capability. There was however a higher level of production of pig iron and steel ingots which compared more favourably with the operating ratio of Durgapur for the same month. Even in

1971-72 IISCO utilised nearly 62 per cent of its rated capacity and was hoping to raise it to 70 per cent or higher with greater cooperation between management and labour. The loss of production is certainly to be deplored and in the absence of an increase in internal availability heavy expenditure in foreign exchange will have to be incurred for permitting liberal imports of steel.

While the controversy about the decision of the government regarding the take over of the management will not subside for many months and there will be genuine doubts about the capability of the new management to bring about the desired improvement, it is astounding that Mr Kumaramangalam can put forward a claim that self-sufficiency in steel production can be achieved in the next two years even

in the face of increasing consumption. In 1971-72 the internal production of steel was 4.5 million tonnes and imports 800,000 tonnes. As there were exports of steel in the form of engineering goods and heavy structurals, indigenous availability was of the order of 5.1 million tonnes. With a larger Plan outlay and the normal growth in consumption, aggregate supplies will have to be at least six million tonnes of steel or over eight million tonnes of ingots. The government has fixed a target of 7.2 million tonnes of ingots for 1972-73, the share of the major steel plants alone being 6.7 million tonnes. As the output of the major units in 1971-72 was 5.8 million tonnes, it was assumed that these units alone could produce additionally 900,000 tonnes.

In the light of the developments in the first quarter of 1972-73 this target is unlikely to be reached even granting that the Rourkela plant will function continuously and there would be no loss of production as it happened in the latter half of 1971 when there was a roof col-

lapse in the steel melting shop at Rourkela and output was lost to the extent of 300,000 tonnes of ingots. Taking into account the production of 874,000 tonnes of ingots in April-May this year, it follows that in the remaining three quarters of 1972-73 roughly the same quantity of steel ingots of 5.8 million tonnes produced in the whole of 1971-72 would have to be produced in nine months. Even assuming that there will be the advantage of uninterrupted production at Rourkela the balance of 600,000 tonnes of ingots will have to be secured by improving the operating efficiency of Rourkela and Durgapur. The operating ratio of Durgapur in the first quarter was not even at the level of the corresponding quarter in 1971-72 and it would be a great achievement if total production was in the region of one million tonnes. Rourkela may probably account for an output of one million tonnes under the most favourable circumstances and Bhilai for 2.1 million tonnes giving a total of 4.1 million tonnes. With the share of Tata Iron and Steel Co. Ltd at 1.8 million tonnes and Indian

POINTS OF VIEW

Iron at 500,000 tonnes, total production of the major plants will be 6.4 million tonnes under the most optimistic expectations. It is quite likely that actual production may not be more than 6.8 million tonnes including the output of mini steel plants and other units which would mean that steel imports will have to be equivalent of 1.2 million tonnes or roughly of the dimensions of 1971-72. Any talk of pruning of exports with an increase in internal production is untenable.

What will be the position in 1973-74? It is being assumed, perhaps, that there can be a substantial increase in output with a higher level of efficiency and the commissioning of the Bokaro steel plant in all its divisions. There would technically be an installed capacity 10.6 million tonnes of ingots in respect of six plants including Bokaro and a little over 11 million tonnes if the capacity of smaller units is taken into consideration. The consumption of steel in 1973-74 would have risen to 9.5 million tonnes of ingots and Mr Mohan Kumaramangalam believes that

this level of demand can be easily met by operating all the units at 90 per cent of their capacity. But it is unlikely that this jump in efficiency will take place as the average operating ratio for 1972-73 will not be much more than 70 per cent. As Bokaro also will be encountering teething troubles, and on the minister's own reckoning it will be difficult to tune up the efficiency of IISCO in a short period, it will be a miracle if an average ratio of 80 per cent is achieved in 1973-74 yielding a total output of 8.8 million tonnes of ingots. Thus it will again be necessary to import sizable quantities of steel and as no large new capacity may be brought into being in 1974-75, a critical situation may arise in respect of steel availability in that year unless imports are doubled. It has of course been assumed that the capacity of Bokaro would be raised to 2.5 million tonnes even by the end of the current Plan period with a crash programme. While this will be extremely difficult it will be well-nigh impossible to use even 50 per cent of the aggregate capacity of

Bokaro in that year after over-coming teething troubles. It has also been stated that there should be an increase in the capacity of Bhilai to 4.8 million tonnes in the second stage of expansion the earlier target of four million tonnes being revised upward. This decision is to be welcomed as new capacity can be created in a short period only with the implementation of expansion schemes of the existing units and a rapid growth of Bokaro to four million tonnes.

However, with a known gap of about 1½ million tonnes of ingots in 1974-75 which will increase to 2.5 million tonnes in 1975-76, there can be self-sufficiency only if at least additional capacity of three million tonnes is brought into being in that year. In this context the expansion scheme of Bhilai has therefore considerable importance and only if there is a staggered execution of this scheme and a steady growth in production is achieved, there is hope of catching up with demand for steel in the current decade. This is because the new

POINTS OF VIEW

steel units in the southern region are unlikely to be ready before 1980 even with the pious hopes expressed latterly that their period of construction should be shortened. With the prospect of only 4.6 million tonnes of additional capacity being installed in the current decade on the basis of existing schemes, and an increase in capacity of the mini-steel plants by about four lakh tonnes the country will have to make-do with an aggregate capacity of 15 million tonnes upto 1980. Even at that level the availability will be only 13.5 million tonnes while steel consumption may have risen to at least 16 million tonnes if not 17 million tonnes of ingots. Mr Mohan Kumaramangalam will therefore be deluding himself that there can be self-sufficiency in steel in the next two years and the state of self-sufficiency continued in the subsequent years. This will be possible only if Hindustan Steel acquitted itself creditably and expansion schemes are implemented early and efficiently at Rourkela and Durgapur and at IISCO and TISCO.

Aid and Bonn

FROM THE very start of planning in this country, the role of external aid in development was duly recognised and foreign capital requirements identified with the need for additional real resources over and above what could be provided by domestic savings. As a consequence, external assistance was utilised during the first five-year Plan to the tune of 5.8 per cent of the total outlay. During this period most of the aid was given by the international agencies. West Germany's share in the total aid received during the period was, however, negligible.

West Germany, in fact, emerged as one of the important donor countries from 1956 onwards. By the end of 1967, it had authorised Rs 20 billion of official bilateral credits and about Rs 2.3 billion by way of technical assistance to various developing countries. Out of this total assistance given by West Germany, India's share was 10 per cent in the case of technical assistance and 28 per cent in the case of financial assistance.

The heavy industrial programme during the second Plan generated a large demand

* The author, a UGC Research Fellow in the University School of Commerce, is obliged to his Supervisor, Dr Om Prakash, Senior Professor and Dean, University Studies in Commerce, Jaipur, for guidance in writing this article.

for external assistance. In this period, the utilised external assistance was 13.1 per cent of the total investment outlay. It was during this time that American aid became impressive and effective. Among the major aid-giving countries, West Germany also emerged as a substantial donor, contributing 8.7 per cent of the total external assistance authorised to India. It was only during the year 1958, that the first loan agreement for Rs 1,237 million towards financing the Rourkela steel plant was signed and since then West German interest in India's developmental effort has continued to increase.

The third five-year Plan brought considerable change when the Kennedy administration was almost prepared to underwrite development in this country and Prof. Galbraith, the then American Ambassador to India, promised massive American aid to India for financing the public sector projects as well. During the third Plan, 19.4 per cent of the total investment outlay was met from the authorised external assistance and West Germany's share at 16.5 per cent was almost double of what it was in the second Plan period. During the three annual Plan periods (1966-1969), the external assistance utilised amounted to 34.2 per cent of the total investment in the public sector. It has

been estimated that West Germany's share was 5.3 per cent of the total authorised assistance.

Details of external assistance authorised during the Plan periods with that of West Germany's share in the total authorised aid are given in Table I.

The aid received so far from West Germany has been allocated in the following

Period	Total loans, grants etc. authorised	Loans, grants authorised by W. Germany	% share of W. Germany in total assistance
First Plan (1951-56)	3,817	Nil	Nil
Second Plan (1956-61)	25,313	2,206	8.1
Third Plan (1961-66)	29,363	4,831	16.5
1966-67	14,541	472	3.2
1967-68	7,158	469	6.6
1968-69	8,858	469	5.3

proportions : steel 25 per cent; industrial development 73 per cent and technical assistance 2 per cent. Steel loans have been concentrated entirely on the Rourkela project. Loans in the industrial sector have been made for the development of all other industrial fields and for the capitalisation of government lending institutions. The rest has been concentrated as technical assistance to the Indian Institute of Technology, Madras, Prototype Production cum Training Centre at Okhla and the agricultural projects in Himachal Pradesh, Tamil Nadu and Uttar Pradesh. The major portion of the aid from West Germany which has been directed towards specific projects accounts for 71.0 per cent of the total assistance, 17 per cent of it is for non-projects' form and the remaining 12 per cent is meant for semi-projects.

Table II gives the detailed analysis of allocation of development assistance received from West Germany, project-wise :

It is clear from Table II that West Germany has given assistance not only for the development projects but also for meeting debt repayment obligations and for balance of payments support.

short maturity period

So far as the terms and conditions of West German aid are concerned, not only were the interest rates high in the beginning but the maturity periods were also short when compared with the other developed countries of the world.

During the second five-year Plan, development assistance amounting to Rs 2,206 million was authorised by West Germany and out of this amount a loan of Rs 1,238 million was for a very short period i.e., for three years only with an interest rate of 6.5 per cent per annum, a loan of Rs 184 million was for four years with an interest rate of 5.25 per cent and the remaining loan of Rs 784 million bearing an interest rate between 5.25 per cent to 6.5 per cent was for a period of 20 years. As against this, nearly all the loans from the UK were for twenty-year periods with interest rates ranging between 3.5 per cent and 6.5 per cent. Some West European countries and the U.S.R. gave loans for twelve-year periods at 2.5 per cent interest to be repaid in rupees and settled through bilateral trade.

During the third Plan period, the rates of interest on West German loans came down along with an increase in the maturity period as well. Loans sanctioned were in the range of maturities of from 3 to 25 years, bearing interest rates between three per cent and 6.75 per cent. Not only the terms of loans were liberalised

but cash credits in the form of direct balance of payments support, which could be utilised for the purchase of any commodity from any country in the world, were also sanctioned. Commodity assistance and debt relief were given considerable attention. Interestingly enough, during this period, Japan's loan terms were less favourable than those of West Germany. Japanese loans were for maturity periods of from 10 to 18 years, with interest rates varying between 5.75 per cent and 6.25 per cent. The terms of US loans, however, were softer than those of West Germany. The interest rate, however, rose from 3 per cent per annum applicable to US loans authorised before December 16, 1963 to one per cent per annum for the first 10 years of the total maturity period and 2½ per cent for the remaining periods of 30 years for the loans extended after October 7, 1964. (The US generally sanctioned loans for longer periods between

30 and 50 years). The Canadian terms have been the most liberal, with repayment being after 50 years or more, apart from a grace period of 10 years. The loans are generally interest-free.

The terms of West German aid were further liberalised in the years preceding the third Plan period. Now most of the assistance is in the form of loans with maturity periods, bearing an interest of 25 or 30 years and carrying interest varying between one and three per cent. West German foreign aid policy for the second Development Decade will be increasingly on the basis of country-related aid programmes which would "make it possible to take greater account of differentiation among the developing countries, to determine priorities for projects, to grow the numerous isolated individual projects into a consistent programme and to co-ordinate better the efforts of the industrial and developing countries."

Eastern Economist 25 Years Ago

August 1, 1947

American economy in 1946 showed a record production, the transition from war to peace time production being accomplished at a break-neck speed, which many have characterised as miraculous. American firms and factories produced 50% greater in terms of physical output than in 1939. Employment did better with 58 million in job. Americans broke all previous records the number employed being several millions more than in the war years. This post-war boom has continued during the first months

of the current year. Presenting his report on the U.S. economic situation at the mid-point of 1947, President Truman catalogued the "magnificent record" of achievement. American output of goods and services is now running at a rate of \$225 billions. Total civilian employment has passed the sixty million jobs set as a target by Henry Wallace and regarded by many as a fantasy. The crucial question now being asked both in the United States, and abroad, is whether this level of employment and production can be stabilised and maintained.

Visit the world of KLM - go East or West

Fly the difference on luxurious 747B

The jumbo jet—so smooth in flight, you may forget it's an aeroplane. You'd like it for its added comfort and sophistication. But more than that you would like KLM's inimitable personalised service, starting right from the time you plan your journey to the time you are back home again. That's why so many passengers the world over fly KLM.

KLM operates 4 Boeing 747B flights a week from Delhi. To Holland via Beirut and Athens on Tuesdays and Saturdays (convenient connections from Amsterdam to 43 major

cities in Europe). To Japan on Mondays and Fridays via Bangkok and Manila.

From Bombay, KLM's pool partners, Garuda Indonesian Airways, offer direct flights to Holland on Tuesdays and Saturdays and to Indonesia on Mondays and Wednesdays.

So, next time you fly, call KLM or your Travel Agent. Or any of KLM's

General Sales Agents at Ahmedabad, Indore, Goa, Madras or Patna for details about KLM's multi-stopover and pay later plans, students' concessions and other facilities.

ROYAL DUTCH AIRLINES

What can a team of young engineers and workmen do in 6 weeks with just Rs. 35 lakhs in foreign exchange?

Save the country Rs. 2.5 crores in foreign exchange every year

Just Rs. 35 lakhs in foreign exchange for a Ring Rolling Mill which will be saving the country imports worth Rs. 2.5 crores in every year of full production when it will roll two million pieces of rings ranging from 90mm to 200mm and weighing upto 6 kg, for anti-friction bearings,

automobile and other engineering industries.

The first of its kind in India, this Mill was erected and commissioned within six weeks of getting the equipment at site. Without any foreign expert. By a team of engineers with an average age of 26.

Our strength is in our people as much as in our steel.

Trade unions on the eve

Josselyn
Hennessy

London.

WITH THE prospect of British entry into the European Economic Community now practically assured, the trade union movement, despite its opposition to the terms of entry, is reconciled to, and preparing for, January 1, 1973, and the subsequent tightening of links with its counterparts in Europe. It is, however, a reluctant partner whose lack of enthusiasm for the Community, and marked nationalistic tendency, contrasts with the consistent support for further integration within the Community of European organised labour's democratic socialist unions. Doubtless these organisations welcome the accretion of a further ten million British members. Equally, they are conscious that, as the current president of the European Commission, Mr Mansholt, has

a Community pressure group. On the union side, the impetus towards finding common viewpoints to put before the Community institutions is less than that of the farmers, because most matters important to organised labour are settled at a national rather than a European level. Divisive tendencies within the labour movement are thus partially shrouded. It is true, nonetheless, that as economic integration in the European Community proceeds, the institutions in Brussels become more enmeshed in the daily life of the six countries. The trade unions have therefore had to cultivate the habit of consultation throughout the Brussels apparatus. It is, however, important to distinguish between consultation and decision-making. The major decisions in the EEC are taken

principal problems initiated between the Commissioners and the trade unions.

Formal trade union representation is assured on a network of committees throughout the Commission. The most immediately significant is the permanent Committee on Employment, a fairly recent innovation designed to align national employment policies within the Community. Here trade unionists meet employers and EEC government representatives. Because national ministers of labour attend the meetings, and are unlikely to adopt a different stand from that which they might adopt at Council level, the trade unions are here possibly nearest to the Community decision-making process. As the Committee on Employment is the sole committee on which ministers are represented, the recommendations that it hands down have more weight than the policies enunciated at other committees working on a lower level.

committee on employment

The only European committee which formally provides for labour representation mentioned in the Treaty of Rome is the Economic and Social Committee. Trade unionists constitute approximately one third of its 101 members, who are obliged by the treaty to be consulted by the Council on matters such as social security. The power that might have arisen from this obligation has not been fully realised partly because the Council has drawn into its hands more and more of the policy making, thus reducing the role of the Commission and its associated bodies, partly because the committee itself has striven towards unanimity in its views and has suffered a watering down of its recommendations in the process. There are further committees on which trade unions are represented with employers and Commission representatives operating within the social function. They deal with the movement of labour within the Community at large, professional training and the working of the European Social Fund. This fund is responsible for aiding financially workers in the process of resettlement and retraining. Additionally, trade unionists take their place on Commission committees dealing with farm workers transport and other industrial problems.

Although this list represents an impressive involvement in the work of the Commission, it is by no means sure that committee participation is the most effective

pointed out, socialism is an international movement.

Our object in this article is to examine how the European trade unions cooperate in Europe, i.e., their methods of influence at Community level; to measure this influence against their own demands for a voice in the making and execution of European policy; to survey the nature of the national union organisations on which the success of influence at a European level ultimately depends; to discuss the question of "participation" as exemplified by different national practices, and as an indication of the balance of power within European organised labour; finally, to cover briefly some of the wider problems that the Europeans must face in common with other trade unions working in an environment of relative affluence.

The first point about European organised labour is that it is second only to the agricultural interest in its effectiveness as

by the Council of Ministers, with which the trade unions do not have close working relations. The Council, indeed, is not open to the same sort of pressures that can be brought to bear at various levels throughout the Commission. Certainly, the unions can make representations to the Council and meetings have taken place with the Council chairman, but there is no statutory obligation for the Council to meet union representatives, who remain in the same position as any other powerful body with substantial grassroots support.

The main channels of influence open to the unions exist in the EEC's bureaucracy. In 1967, the unions were successful in having a trade unionist, Wilhelm Haferkamp, appointed to the Commission, although he was given areas of responsibility — energy policy and harmonisation of laws — which do not have an immediate effect on the narrow trade union interest. His is a voice at the highest level, which adds substance to the consultation on

channel of trade union influence in the Community. Informal contact in the usual process of lobbying through personal advocacy is more persuasive. It allows the direct representation of views unencumbered by the compromise that tends to flow from committees. To this end, the trade unions have established in Brussels secretariats to engage in this process. The independent unions of Social Democrat persuasion, affiliates of the International Confederation of Trade Unions, have set up the European Confederation of Free Trade Unions in the Community (ECFTUC), while Christian unions, affiliates of the World Council of Labour, have created a European Confederation of Christian Trade Unions (ECCTU). Communist trade unions in Italy and France, affiliated of the primarily eastern orientated World Federation of Trade Unions, have created a liaison bureau in Brussels. Numerically by far the most important of all these organisations is the ECFTUC.

value of informal contacts

Successful as the ECFTUC has been in spreading its viewpoint on matters of substance, the trade union role at the Community level remains limited. Collective bargaining is still a national or industrial prerogative and is likely to remain so. Admittedly, a limited start has been made on bargaining at Community level with an agreement between the unions (excluding the communists) and agricultural employers for certain farm labourers to work a 5-day, 45-hour week. The agreement, however, reached in 1968, was a recommendation, not an obligation. Precisely because the individual union centres still exercise their major influence on national governments, the unions' European secretariats are anxious to see a European structure of institutions that would enable them to exercise a comparable power at Community level. Dissatisfied with "the lip service given to consultation and concertation", the ECFTUC desires a more fully integrated Europe to undertake the type of social and economic reform that national governments have hitherto often been reluctant to undertake. This means increasing the power of institutions where the unions are well-entrenched and diminishing those where their potential grasp of influence is more restricted. "The Community", declares Theo Rasschaert, general secretary of the ECFTUC, "must move towards democracy through a properly (popularly) elected European Parliament; the individual union confederations work a great deal through the pressure they can bring to bear on their national legislatures, and we could do the same at European level. A more immediately realistic way of dealing with our communication problem

would be, first, to create a special section in the Commission with the specific job of organising consultation with the unions; and secondly... to redefine the Commission's real role. At the moment it spends an enormous amount of time defending its supposed prerogatives over a very broad spectrum to the detriment of its most important activity, which is suggesting and starting new initiatives. In limiting the Commission's role to essentials we could paradoxically strengthen its impact. At the same time, the Council of Ministers should take back its job of decision-making and the influence of the European Parliament and the Economic and Social Committee should be greater. One of the... most dangerous tendencies of the past few years has been the growing importance of the committee of permanent representatives. Their position is nebulous and in practice they are tending more and more to negotiate *faits accomplis* far away from any control or democratic

supervision. This tendency should be firmly checked."

Mr. Rasschaert's clear statement is scarcely likely to produce immediate results. The earliest occasion when any changes can be expected is the summit meetings of the potentially enlarged Community of Ten next October. But change is by no means certain and could easily be thwarted by national hesitations. A report by Professor Georges Vedel of Paris University, at present under consideration by Commission and governments, tries to devise ways of making the European Parliament more democratically responsible and powerful, but the French government is against increasing its powers, and all the major countries of the enlarged Community have accepted the Council of Ministers as the supreme body for decision-making. At this stage the political ambitions of the unions have outrun their capacity to engineer change.

PRAGA

What's in a name?

A great deal when it's Praga.

May we spell it out for you? We started nearly three decades ago, with a limited programme to manufacture high speed cutting tools and measuring instruments in India. This was in 1943 and since then our growth has been impressive, to say the least. Our manufacturing activities now cover a wide range of machine tools, accessories and forgings. Not to mention the several items that we manufacture for the Defence Department. We are also famous for the company we keep! Technical collaborations with such world-renowned organizations as Jones & Shipman of the U.K. to manufacture our Cutter & Tool Grinder and Surface Grinder; Gambin SA of France to

produce the Praga Gambin Milling Machine; Escosier & Co., also of France, for the Thread Rolling Machines; George Fisher of Switzerland for Copying Lathes; Kearney & Trecker CVA and Pratt & Co., both of the U.K., to produce drill chucks and lathe chucks respectively. Incidentally, we are the largest producers of lathe and drill chucks in the country. It is not surprising therefore that Praga (a public sector undertaking) is in the best-selling forefront at home and is finding ready and willing markets abroad. Our associates are world famous and their names speak for themselves. Need we say more?

For Precision Machine Tools the name is **Praga**

at Community level than its panoply of contacts with the Commission suggests. The existence of the EEC has stimulated a European sense among the unions that is still in its infancy, and one reason why the most important aspects of union activity remain at a national level is the failure of organised labour to submerge internal differences internationally. West European trade unionism is less an organisation and more a movement; the major cause of its difficulties is a lack of homogeneity, reflected in the existence of the three union organisations in Brussels.

The three persuasions that these organisations represent—the social democrat, the communist and the Christian—indicate the vertical lines of West European trade unionism. Two strands of dispute running from the nineteenth century into the cold war period explain this division. The first is the question of balance in relations between church and state. The early unions were socialist and resentful of church involvement in right wing politics. They sought secular states, an aim that could be countered by the church, not only by its political involvement, but by the creation of its own trade unions in order to control the faithful. Both types of unions were extensions of political philosophies, in contradistinction to the British social democrat tradition, where the Labour party emerged from the trade union movement. The result on the continent has been the existence of parallel social democrat and Christian, or confessional, trade unions in Belgium, the Netherlands, Luxemburg, France and Italy. Only in West Germany has there been a unified social democrat trade union organisation, a result of the allied occupation after the Second World War, which caused the formation of a sixteen union federation as a safeguard against any resurgence of Nazi ideas.

no co-operation with communists

The second strand is the ideological difference between the communists and the socialists. During the interwar years, when social stress was acute, the communists were able to draw off socialist trade union members, but the immediate post-war years brought a rapprochement which was only to be nullified by the increasing anger of the cold war years. Now, communist trade unions are a force only where Communist party is a force, i.e. in Italy and France. Communist influence in the rest of the EEC countries is small.

At the Community level, there is ready co-operation between the ECFTUC (see Table on p. 168) and ECCTU, which secularised itself in 1968, but this has not spread to embrace the liaison bureau of

the two national communist confederations, the French Confederation Generale du Travail (CGT) and the Italian Confederazione Generale Italiana del Lavoro (CGIL). There remains, indeed, a fundamental difference of approach to the EEC, because while the ECFTUC and the ECCTU have consistently worked for an integrated Europe, the communist confederations have only recently muted their criticism of the EEC as reactionary, capitalistic and monopolistic. The gradual shift in attitude has been dictated by a rising standard of living throughout the EEC, due more to the functioning of a liberal economy than to the pressures exercised by the trade unions at their national levels. CGT and CGIL representatives have therefore sought and received seats on bodies like the EEC Economic and Social Committee. Their position, however, remains delicate, as they are forced to temper their ideological criticism of the EEC by the necessity to work within it.

For the present it is difficult to foresee any bridging of the ideological gap between socialist and Christian from communist. It is a weakness in west European organised labour, in an EEC context, which is overlaid and compounded by the disparity of strength and quality of organisation among the national unions centres.

West Germany

The sixteen German unions, under the umbrella of the Gewerkschaftsbund (GDB), are the dominant force within the ECFTUC. Their strength lies partly in their lack of fragmentation, partly in the factors that have induced their growth. Cohesion necessary to negotiate with strong employer organisations created the need for an expert union bureaucracy. Collective bargaining on the basis of contact between union and employers' association has encouraged centralisation within a union, and the presence of active unionists on the legally-constituted works councils, which have supervisory function over the agreements in addition to welfare responsibilities, has meant the spread of union activity down to the plant level. The union presence is reinforced by members on company supervisory boards in line with the principles of co-determination.

Belgium

The West German experience is nowhere duplicated within the EEC, although organised labour is strong in both Belgium and the Netherlands. In Belgium, the socialist Christian division is made more complex by the existence of linguistic divisions and a shifting balance of power between the confederations themselves. The Socialist Federation Generale de Travail

Belgique (FGTB) membership is split fairly evenly over the language barrier, but the Christian organisation, the Confederation des Syndicats Chrétiens (CSC) is concentrated in the Flemish-speaking north, the growth area of the country, and is benefiting more than the FGTB from the reservoir of unorganised labour there. Union organisation has been assisted by welfare benefits paid only to members, coupled with government use of the unions as an agency for the disbursement of unemployment benefits. In addition, a system of delegates syndicales, an equivalent of the British shop steward, represents the workers at plant level. At a national level, negotiating boards cover the broad range of Belgian industry, and employers' recognition of the unions is the Rule—the union rates providing the minimum in most employments.

Netherlands

In one respect, the situation in the Netherlands is similar to that in Belgium. The confessional unions have increased their strength in comparison with the socialist Nederland Verbond van Vakverenigingen (NVV). This, however, has not stopped the three confederations from undertaking global wage-bargaining, a procedure that would have been impossible had not the union bureaucracies been largely independent of the rank-and-file at plant level, where branch meetings are rare, and consequently ill-attended. National congresses act only as a limited restraint, meeting but once every three years. Plant organisation is scanty and what there is centres on works councils. The observance of the 1950 law decreeing the councils has been honoured more often in the breach. This is likely to change with the imposition of further laws in 1971 compelling all companies with more than 1,000 employees to establish the councils and consult them on the major issues of plant policy that affect the workers.

France and Italy

In contrast to the relative order of trade unionism in West Germany, Belgium and the Netherlands, organised labour in France and Italy is weak and dependent upon political manifestations for a considerable portion of its gains. Membership is unreliable and individual dues not easily collected. The union split it down vertical lines—socialist, Christian and communist—and this has been perpetuated in France by collective bargaining legislation which does not require one agent to represent labour, but which provides for signature on agreements by "the most representative organisation". Further, French employers' organisations

Bishan Lal has secured a large order

Who cares? PNB does!

Bishan Lal is a successful entrepreneur. He runs a small workshop.

Just two years ago he was an unemployed engineer. PNB helped him set up the workshop by giving him both financial and techno-economic assistance. His penchant for quality and punctuality has paid off. He has just secured a large order.

A large order calls for a relatively large working capital. Normally, Bishan Lal should be worried. But he is not, because he knows that, as usual, he can fall back upon his friend in need — PNB. At PNB

his needs are met quickly and he can repay such short-term loans out of the cash inflow from sales.

Bishan Lal also knows that whenever he decides to renovate, modernise or expand his existing unit, he can rely upon PNB for a medium-term loan repayable in convenient instalments.

Indeed, PNB has various lending schemes to suit everybody: small-scale industrialists, exporters, transport operators, agriculturists, doctors, artisans and self-employed, retailers, students, etc.

PUNJAB NATIONAL BANK

In the service of the nation since 1895

Interpub/PNB - 8

have been consistently more cohesive and better staffed than the unions, usually managing to keep wage bargaining out of the plants. Union structure at the plant level, indeed, is lacking to the extent that, for example, only 20 per cent of the workers at Renault's Boulogne-Billancourt plant are organised. A source of influence has been neglected by the failure to activate a large proportion of the works councils which, since the end of the Second World War, could have been set up in firms with more than fifty employees.

A similar situation exists in Italy, where the employers have managed to keep negotiating procedures away from the plants, and only since 1970 have the unions begun to receive any large-scale recognition from the employers at plant level. Instead a system of works councils, the *commission interne*, has been set up, from which the unions have been excluded. The workers elect these councils but their role has been largely relegated to welfare matters. Highly centralised bargaining at national level, with allowance for regional variations, has been the norm which the unions have been trying to break down. Their internal divisions, which there had been hopes of healing, have been fuelled by the political vituperation of the recent election campaign, and the possibility of a confederal unity between the communist CGIL and its Christian and socialist counterparts, the Confederazione Italiana dei Sindacati Lavoratori (CISL) and the Unione Italiana del Lavoro (UIL), has been severely damaged by the close association of the confederations with competing political parties.

attitude to 'participation'

The way in which this plethora of union organisations, with their varied strengths and capabilities, interact with the politics of the European Commission and the Community governments can be illustrated by one of labour's current preoccupations, the issue of "participation". The word itself is vague, indicating anything from a minor decision on the shop-floor, arranged jointly by workers and management, to an advanced form of profit-sharing and labour representation at the highest levels of management.

Participation has, however, reached its most legally-entrenched form in West Germany under the title of *Mitbestimmung*, or co-determination. There companies work under a three-tier structure: the shareholders, who appoint a supervisory board, which in its turn appoints a board of management. In the coal and steel industries, the workers have the right to 50 per cent representation on the supervisory board, while in other industries where

companies have more than 500 employees, they have the right to a one-third representation. In the board of management there must be a labour director whose appointment needs the approval of the labour representatives on the supervisory board. None of this in any way pre-empts the role of the workers' councils already mentioned above.

law under consideration

At present the Community is considering a company law to encourage the growth of trans-European industry. A draft was published by the Commission in 1970. This embraced the principle of *Mitbestimmung* to the extent that the European company would have one workers' representative on the supervisory board to every two appointed by the shareholders. Works councils, the Commission also suggested, would have a veto right on recruitment and dismissal, and on matters governing pay. This is a weaker version of what the DGB would like. Its aim in West Germany is to extend the one-third supervisory board representation to the level achieved in the coal and steel industries.

What had happened prior to the publication of the Commission draft was the imposition of DGB dominance on the ECFTUC: the DGB had used its role as the most powerful of the West European union groups in the councils of the secretariat which makes allowances for the differing strengths of its affiliates. The ECFTUC in its turn had presented proposals to the Commission. The Commission, in its role as a catalyst for new policies, then published the proposals within its suggestions for a European company law.

Talks have taken place under the aegis of the Commission between governments, employers and trade unions but agreement has not been reached, nor is it likely in the near future. West German employers have come to accept the one-third ruling under *Mitbestimmung*, but this has not spread throughout the Community. Nor, indeed, have the DGB ideas accepted among the national union centres.

In the Netherlands, the extension of the workers' council system blunts the envy for other systems of participation, while in Belgium the unions prefer a system of high-level consultation, which gives them a voice in dictating change without the fears of challenged autonomy. It is fear of company unions that has impelled the opposition in France of the Confederation Française Démocratique du Travail (CFDT) not only to limited profit-sharing and labour representatives on public sec-

tor boards, but also to the extension of this that *Mitbestimmung* would imply. In Italy, there is emphasis on gaining union recognition at plant level, as already pointed out. For the communist unions, *Mitbestimmung* cuts across even diluted Marxist principle.

Such a mass of conflicting viewpoints within the European union movement on a significant issue points up the perplexity of defining a common policy which can be carried out by the European trade unions working in unison. It is because there are so many built-in divergences between the national centres that the immediate prospects for European trade union co-operation at the practical level where employers might be immediately affected seem to concentrate on industrial groupings. It is true that the unions have been able to define areas of aim at which their collective bargaining could be directed: the first steps on a common action programme on issues like a shorter working week were taken as far back as 1965. This does not invalidate the basic point that national action is the predominant concern. Industrial groupings, however, will become increasingly significant as the unions take steps to protect their interests in the face of the rapidly-spreading multinational companies. For the present

the following sectors are represented at EEC level: metalworkers, agricultural workers, employees from the food, tobacco and hotel industries, building trade and woodworkers, employees of the textile and clothing industry, and postal, telegraph and telephone workers. But like national cooperation at the Community level, industrial union co-operation across frontiers has scarcely begun. There are examples of successful action nevertheless which provide a foretaste of what can be achieved by the unions if they co-ordinate their activities. The inability of the Ford Motor Company to switch production when a strike took place at Genk resulted in the Genk workers progressing towards parity of pay with workers in other Ford plants. The Philips company has entered into talks with the unions. Amsterdam shipyard workers on strike have been sustain-

ed by West German metalworkers.

The problems of the multinational companies, of participation, even co-operation at Community level are, in effect, extensions of traditional trade union activity, the protection of the labour interest in changing circumstances. Nonetheless, it may be that traditional trade unionism is becoming less adequate. Organised labour represents a minority of European workers, and the union bureaucracies are in danger of failing to attract the uninterested, and of cutting themselves off from their grass-roots by a remoteness that makes them appear as much a part of the governmental process as the employers have traditionally been assumed to be. As increasing affluence spreads through Europe, the problem of simple physical survival is eliminated to be replaced by

the higher expectation of job satisfaction and control over the environment in which the job is situated. Money for working beside a conveyor belt becomes an unsatisfactory exchange. The wildcat strikes since 1968 are a warning to the unions that they should not alienate their policies from the desires of the workers. The strident appeal of the 1930s and 1940s is the bored sigh of the 1970s and 1980s.

The Community in flux

E. B. Brook

Vienna.

THE YEAR is moving towards late summer and autumn and west Europe has still very little decided. Target dates are probably necessary tactics in international politics but they have the great inconvenience and drawback of either forcing decisions before governments are fully ready to take them or of leading to such artificial devices which deceive no one of "putting the clock back" which means that agreement is as far off as ever.

In a sense, it is remarkable that the Common Market has survived a series of such devices and a series of all-night sessions when exhausted politicians have reached a formula which, if it does not satisfy, does not actually vitally offend anyone. If the device has succeeded so far it must remain open to question whether bullying politicians in to agreement by sheer physical exhaustion is really the best or most sensible way of running half the European continent. By comparison, the eastern half takes these matters much more easily and representatives at Comecon sessions, such as that held recently in Moscow, so far from arguing through the night, end their talks in good time and spend much of the night dining quite regally.

Western Europe still has a formidable tally of unsolved problems. They include the terms on which the remaining EFTA states may have economic association with the Common Market, agreements over tariffs on such items as paper and sugar, details of the common agricultural policy when Britain adopts it one month after joining the Market, i.e. on February

1, methods of curbing "hot money" flows, whether or not to have a joint Common Market float, whether or not to tighten international monetary controls, methods — if they are to be adopted — to step up pressure against the US "disc" system of export promotion which permits US companies to defer paying taxes on half the earnings of specially constituted export subsidiaries which the Common Market contends amounts to an export subsidy, and, not least, the prospects and date of the Common Market "summit" (provisionally fixed for October 19 in Paris) which both the French and Germans now appear anxious to postpone *sine die*.

For a world organisation that is supposed to be setting fuller sail at the year's end — although it will not be certain whether Denmark and Norway are actually coming in until early in October — this is quite a formidable list of unresolved problems, nor is it the full gambit of its uncertainties. As far as the remaining EFTA states are concerned the long-drawn negotiations with the Market's Commission in Brussels resemble the children's game of "He loves me, he loves me not" as reports emerge of near full agreement to be followed the very next day by near breakdown in the discussions. This has happened time and again and Austria, from where I write, is not alone in irritation, anxiety and uncertainty.

The wealthier Swiss next door have adopted a do-nothing investment policy, certain only of one thing — that the present is no time to sell or switch and that investments decisions taken in cooler mo-

ments should be maintained in moments of crisis. The Swiss are convinced that another monetary crisis is on its way. As one Zurich "gnome" (a term better left unused when one visits Zurich — the Swiss can be quite cross) put it the other day — "We are on the merry round to hell where one restrictionist control leads to another and we'll end up enmeshed in a cocoon of controls which the politicians will call 'European unity'".

West Europe is moving not very slowly to as tightly controlled a economic system as they have for long derided in east Europe. The west, in the wider sense of western Europe and north America will, if the dollar glut lasts long enough, split into two monetary blocs, one on each side of the Atlantic. In this rush back to controls and divisions and agonising uncertainties for the individual the pace is being set not by west Europe but by the USA. The effect for the average small individual is that all the good habits he learnt in his youth — to save, to insure — are returning to him now with the fruits of his carefulness and foresight removed by the effects of inflation. The smart operator now is he who runs into debt if he can and lets the trusting lender take the loss of repayment in currency that has lost its value by anything between five and 30 per cent.

This scarcely moral fact is probably one reason why west Europe's leading bankers in France, Switzerland and federal Germany unitedly oppose the idea of a joint float of Common Market currencies. The British pound has sunk rather than

floated and the central bank governors who met at Basle on July 9 showed alarm that the £ would sink below the exchange rate agreed on in Washington last December of 2.40 dollars to the £. If this was allowed to happen other European currencies would also be obliged to devalue and the pressure on the British to prevent this collapse from occurring is continuous. So long as the Washington December values are maintained the bankers see hope of an improvement in the American payments position, which lies near the root of the whole problem.

Italian plan

While the Swiss and the Germans are certain that the best thing to do when you cannot see clearly ahead is to stand still the Italians plan to press for a "European monetary co-operation fund". The new Italian Prime Minister, Signor Andreotti, will discuss this plan when he meets President Pompidou of France in the Italian town of Lucca on July 27-28. Pompidou, who set the tone at Bonn on July 4 when Chancellor Brandt agreed with him that the Common Market summit meeting should be delayed and who almost immediately afterwards dis-

missed his prime minister for a far more strongly nationalist one in M. Messmer, appears at the moment very much to be calling the tune in western Europe, although the British, whom he appears to have dropped as his first love, are trying to make themselves as assertive as possible in Brussels and Luxembourg. There remains a wide gulf between the French insistence that the economies and exchange rates should be rigidly fixed — their concept of "dirigisme" — and the Germans who insist on free marketry. The Italians want their special fund and the money-wise Swiss insist on doing nothing except attend to technical current business.

The Germans are convinced that a joint Common Market currency "float" against the US dollar would do nothing to help either the Europeans or the Americans and feel that the crisis arises not from the dollar but from the weakness of sterling and the increasing worthlessness of the lira. In the German view there is no alternative to the US dollar as the world's major reserve currency and that the world should wait with as much patience as possible and making as little change as possible for another year for matters to right themselves.

The British, who have just seen their currency, with a strong current surplus in the balance of payments and backed by high reserves, hit so hard that it is compelled to "float" to an extent that amounts to a six to seven per cent devaluation, are not so sure. The menace of "hot money" flows remains a far more urgent subject than any Market enlargement or economic "summits". The British, unlike the Germans and rather more like the Italians, see need for early international discussion to forestall and remedy in future the sort of movements of money in bulk that has precipitated once again a pound crisis.

More to the point, still, would be to discover why these immense money flows from one currency to others take place at all. It seems fairly certain they do not take place because a sudden prospect of greater profit arises so much as from a determination to move funds for self-preservation. In other words, the pound and the lira should look at home rather than to international conferences and "monetary cooperation funds" for means to avoid still more crises. These crises are crises of faith, not of monetary mischievousness.

Foreign capital in Canada

M. M. Malhotra

OVER THE last few years, there have been a number of studies which have analysed the role that foreign capital has played in Canada's economic development and the problems it has created. It will be useful at this point of time to study the benefits and problems that foreign capital has brought to the Canadian economy, as the same may provide useful guidelines to India.

Canada's economic growth since World War II has been mainly fueled by the inflow of large amounts of US capital, and apart from the benefits that this inflow has brought, the Canadians have felt that a number of problems have been created. Initial public discussion on the effects of foreign capital in Canada started in 1957 when Mr Walter Gordon submitted the Royal Commission's Report on "Canada's Economic Prospect" and this was followed by the Watkins Report of February 1968. Later the Wahn Report covered the same ground and the most recent report on the subject is known as the Herb Gray Report and is titled "Domestic Control of the National Economic Environment: The Problems of Foreign Ownership and Control." This report was submitted to the Canadian govern-

ment in May 1971 and a leaked version has appeared in *The Canadian Forum*.

A study of these reports show the important role that foreign capital has played in increasing the rate of growth of the national income of Canada, thereby giving the Canadians one of the highest standards of living in the world. This inflow of capital has helped in developing the backward regions of the country; it has helped in making the Canadian industry more cost and quality conscious and thereby made its goods more competitive in world markets; and finally it has opened up certain export markets, thereby these industries have been able to reap the benefits of mass production and achieve the economies of scale.

One of the problems that the Canadian economy has to face is that the development of these industries took place in Canada which reflected the priorities of the capital exporting country, and in this case it was of the United States. Other problems are that R & D and entrepreneurial talent in Canada are not developed to the desired extent.

Foreign investment in Canada has increased very rapidly from \$6.4 billion (Rs 4672.0 crores) in 1926, to \$46.9 billion (Rs

34,237 crores in 1969, that is by just over seven times in 43 years. The main growth has been in long term direct investment, thus during the period 1950 to 1960 the investment increased by \$8.9 billion (Rs 6497.0 crores) which means an annual average compound growth rate of about 12.5 per cent. This growth rate was high during the next nine years, that is up to 1969. The pattern of foreign investment between portfolio and direct investment has undergone a remarkable change over the period 1926 to 1969. Thus in 1926, portfolio investment accounted for 66 per cent of the total investment, whereas in 1969 this figure fell sharply to 37 per cent.

Taking the world as a whole, during the post-World War II period, the US has been the main source of private long-term capital. For instance, in 1960 the flow of private long term capital from the US amounted to \$31.9 billion (Rs 23287.0 crores) which increased by 2.2 times to \$70.8 billion (Rs 51684.0 crores) in 1969. In 1960, 65 per cent of this amount went to developed countries and the balance of 35 per cent to the developing countries. Of the total investment that went to developed countries, the Canadian investment

accounted for 58 per cent, and in absolute terms this has meant a foreign exchange inflow of \$11,179 million (Rs 8160.7 crores). In comparison, it is of interest to note that in 1960 all the developing countries received practically as much as Canada received, which was \$11,129 million. Further, of the amount received by the developing countries, as much as 68 per cent went to the Latin American countries. This pattern did not change in 1969, even though the quantities increased by as much as 2.2 times. Thus in 1969, the developed countries took 67 per cent and 33 per cent went to the developing countries, however the share of Canada fell marginally from 58 to 44 per cent. In absolute terms Canada took \$21,075 million (Rs 15,384.8 crores) whereas the developing countries as a whole took about the same amount of \$20,000 million.

The pattern of investment, industry-wise for all areas in 1969, showed that the manufacturing industry accounted for 42 per cent, that petroleum accounted for 28 per cent; and mining and smelting eight per cent. In the case of the developed countries, the manufacturing industry was significantly higher at 51 per cent, whereas in the case of the developing countries the figure was only 26 per cent.

It has been roughly estimated that during the period 1956 to 1965 foreign capital financed about 33 per cent of the Canadian gross capital formation.

multinational corporations

Most of the foreign long term capital went into Canada through the giant multinational corporations. Initially, these corporations established overseas subsidiaries, but later entered the export markets by setting up local assembly plants which was mainly done to avoid high tariffs and trade barriers. The multinational corporation has a number of advantages compared with the local firm and includes, on the production side of achieving economies of scale on a global basis, by specialising each plant on a particular line of production. A typical case is the Canadian-US Automotive Agreement of 1965, which reduced the cost of production of the Canadian vehicle by 10 to 18 per cent by enlarging the scale of operations through exports. Further advantages to the multinational corporation are on the R & D side where the company can spread risks of new innovations on a large turnover, and on the marketing side where the company can experiment with a new product brand, and on the financial side the multinational company can have greater access to international money markets.

The Herb Gray Report of May 1971 pointed out that the Canadian government placed a lot of emphasis on economic

growth, but realised that there were serious gaps in the demand and supply of human and non-human resources; that some lines of technology were not available; that a particular type of finance was not available; and that certain types of entrepreneurial talent was also in short supply. For all these gaps Canada had to look to the US for help.

The entrepreneurial gap was explained by a complex set of psychological and sociological reasons which included such factors as: Canada's colonial status mentality; Canada's educational system which lays more emphasis on a classical curriculum and not on engineering or business.

growth aspirations

Federal and provincial governments have deliberately enacted a farmework of laws to attract foreign capital to meet their growth aspirations. Hence in most sectors of the Canadian economy there has been a large inflow of capital, risk taking entrepreneurial management, technology, and skilled manpower. In a few industries such as the railways, the air transport system and the broadcasting net-work, the Canadian government has set up national corporations such as the Canadian National Railways, Air Canada and the Canadian Broadcasting System. Aside from the benefits that have been enumerated above the report has spelt out the problems which include the truncation of the organisation in the decision making process; export markets being restricted; the foreign investor bringing in capital, usually has a package to sell which includes the purchase of components, payment of managerial fees, and in a number of cases the financing of the project by equity investment. In the case of Canada it has been demonstrated that the resources developed in Canada were determined by the industrial priorities of the US economy.

The non-resident ownership (i.e. 50 per cent and more) as measured by assets, industry-wise has varied as in the table alongside.

The figures above show that over the 14-year period, from 1954 to 1968, the foreign ownership in the case of petroleum and coal, rubber and transport equipment has increased, and by 1968 the ownership was practically entirely in the hands of foreigners. In the case of tobacco, chemicals and machinery, foreigners to a large extent controlled these industries, and even such industries which do not demand a sophisticated technology.

The Herb Gray Report has pointed out that during the period 1960-67, the non-resident firms financed their expansion as follows: inflow of foreign capital 37 per cent; from retained earnings 38 per cent;

and the balance from the Canadian capital market. Over the longer period of 16 years, from 1946 to 1969, foreign capital financed as much as 42 per cent of the capital requirements of these firms.

The report has stressed the need for Canada to develop a strong capability in buying technology, and to bargain for this at the time the investment is being made, so as to obtain the technology through arms length licence agreements.

Because of these considerations, the report suggests that a screening process should be used, as this method would give the greatest flexibility in bargaining for all factors; it would see that the best possible strategy for economic growth is used; and in case a particular type of investment was not required the same could be blocked.

The Herb Gray Report of May 1971 has suggested that there should be a screening authority, which would bargain for the purchase of technology; it would see that a more vigorous R & D programme is implemented; and that the patent laws are modified as far as possible to facilitate the dissemination of technical information.

This discussion has shown that foreign capital has played an important role in quickening the pace of economic development of Canada. By 1969, the longterm foreign investment in Canada amounted to 46.9 billion, or in terms of rupees, at the current rate of exchange Rs 34,237.0 crores, of which direct investment amounted to 57 per cent. By contrast the total foreign investment in India as of March 1968 was Rs 1,542.8 crores, and on a per capita basis, in the case of India the figure works out to be Rs 29, whereas in the case of Canada the figure is Rs 16,303.

Governments of the rich

or powerful countries in the modern world dispose of such enormous power or authority over the lives of men and women in their millions and indeed the fate of the human race that it has become a condition of the survival of civilization that the heads of those governments must, in the last analysis, be men of compassion. It is plain that Mr Richard Nixon does not qualify in this respect. For there is no doubt at all that Mr Nixon is too small, too mean and too unclean a person to be allowed to continue to pollute the politics of the United States or the history of the world. Already, in his three evil-laden years at the White House, he has managed to betray all those ideas and ideals which were proudly his country's to serve and spread.

There is a theory that the next world revolution will take its birth in the United States and that it will do this without benefit of Marx or Jesus. It has also been argued that this could be a revolution effected through the institutions of a liberal democracy primarily by men and women who are too genuinely interested in one another to fight among themselves to the death for the greater glory of some scriptural text. The way Mr George McGovern's candidacy for the Democratic nomination has swept through the body politic of the United States temptingly suggests that this revolution may now be on its way. It is true that only a battle has been fought and that the war is still to be won. Nevertheless the mere fact that prospects of the Nixon administration securing another tenure has shaken the core of the American conscience sufficiently to bring to a stage of ferment new forces in the American demos is proof enough that the aspirations of the ordinary men and women need not for ever remain the small coin of the moneychangers. The time has come, perhaps, to put ideals back into politics and should this process start in the most meaningful democracy in the world so much the better for all of us.

The following news

item from the staff correspondent of *The Statesman* in Siliguri appeared on the

MOVING FINGER

EASTERN ECONOMIST

front page of the Delhi edition of that paper on July 18:

"Mrs Lila Mazumdar, wife of Naxalite leader Charu Mazumdar, appeared uncommunicative when this reporter met her at her residence here this morning. The frail-looking woman who appeared to be ill, said: 'Please spare me. I do not merit any publicity'."

Comment is needless on the professional ethics of a newspaper establishment which finds apparently nothing wrong in this atrocious invasion, on its behalf, of the privacy of a frail and ailing woman in her hour, presumably, of great mental anguish or emotional stress. Mrs Lila Mazumdar's plaintive but futile plea to be spared publicity is a protest against our leading newspapers following the worst practices of the more notorious "populists" abroad.

Mr Bobby Fischer, while

philosophising whether to play or not to play at Reykjavik, the capital of Iceland, was reported to have complained, among other things, that his orange juice was not cold enough and called for more ice. How mistaken can one be about places! Which, incidentally, makes me wonder whether there may not be among us souls which or who, when their time comes, may not find fault with Beelzebub for not tending the fire properly.

In the demonology of

communist China India is reported to have been promoted to the third place as a security risk, with the USSR standing first and Japan second, while the United States has been demoted to the fourth place. If the New Delhi Municipal Committee were to put up a hoarding in Connaught Place claiming this to be yet another triumph for our Prime Minister, this would certainly be one way of looking at the matter. Another would be to infer that Peking is merely trying to fool Mr Bhutto. That India could be a threat to anyone's national security except its own is, of course, a ridiculous proposition. There is, clearly, far more substance in the mental reservations which China may have about Japan. This is not necessarily to the discredit of the latter. Possibly much against its will Japan is gradually but steadily being forced to become a military power

once again. Should this happen, the Japanese people will be entitled to blame Mr Nixon's foreign policy more than anything else.

Having found the sure gains of peace very much more rewarding than the speculative spoils of war, Japan, left to itself, would willingly abide by its collective renunciation of war as an instrument of policy by eschewing militarism in letter and spirit. The pity is that neither the Japanese government nor the Japanese people are being left alone. It remains to be seen whether its new Prime Minister, Mr Kakuei Tanaka will display the highly sophisticated diplomatic skills that will be demanded of him in steering the ship of the Japanese state clear of the Scylla of American entanglements and the Charybdis of Chinese estrangement. He has come to his new office with a reputation linked chiefly to his talent for managing Japanese industry and commerce. That he will continue to serve his country competently in the former areas of his expertise may be assumed; the greater interest, however, will attach to the question whether he has the potential for playing the role of an international statesman who could translate some of Japan's amazing economic prowess into a capacity for enlightened relationships with other countries far and near.

There is a story which

is being eagerly told and retold these days wherever the capital's newsmen gather to drink at the expense of someone or the other. It appears that the editor of one of the national dailies has sent a circular to the members of his editorial staff, including out-station correspondents, drawing their attention to a piece of political gossip which was published in that newspaper some time ago and citing it as a supreme example of what is to be avoided in the area of adventurous reporting. As the saying goes, there are many ways of killing a cat; but, whereas a cat has only nine lives, a resident editor seems to have ten and then some more.

The writ petition filed

in the Supreme Court by a former Chief Secretary of Tamil Nadu alleging *mala fides* against the Chief Minister of that state, is not only replete with news value but is also a document of public interest in view of the situation prevailing under the DMK administration. It is interesting to note that, whereas *The Times of India* has given a substantial summary of the allegations made in the writ petition, *The Hindu* which must be considered to have a more proximate interest in the subject has contented itself with an extremely tactful version notable chiefly for its omissions.

TRADE WINDS

Cabinet Reshuffle

Mr D.P. Dhar and Mr T.A. Pai were sworn in, on July 23, as members of the union cabinet. Mr Dhar will hold the Planning portfolio. Mr Pai will hold charge of the Railway Ministry. Earlier, former Railway Minister, Mr K. Hanumanthaiya and the former Minister for Industrial Development, Mr Moinul Haque Chaudhury, had submitted their resignations to the Prime Minister. Mr C. Subramaniam who was Minister of Planning, has been put in charge of the Ministry for Industrial Development. The other portfolio of Mr C. Subramaniam, namely, the Department of Science and Technology, has been kept with him along with the portfolio of Industrial Development. Mr I.K. Gujral has been shifted from the Ministry of Housing and Urban Development to the Ministry of Information and Broadcasting. Mr Jagan Nath Pahadia, Deputy Minister in the Ministry of Agriculture has been shifted to the Ministry of Communications in the same status.

Land Ceilings

The chief ministers of states who met in the capital on July 3, agreed in principle to implement the recommendations of the Congress Working Committee (CWC) on land reforms by the end of the current year. It was a foregone conclusion at the Congress chief ministers would support the recommendations of the CWC. The decision of Mr Karunanidhi, Tamil Nadu chief minister, was eagerly awaited; he indicated broad acceptance of a formula laid down by the CWC. It was agreed that the ceiling on land with assured irrigation for two crops a year would be between 10 and 18

acres with weightage of 25 per cent for land irrigated by private sources. In the case of areas with assured irrigation for one crop in a year, the ceiling would be 27 acres; no weightage, however, would be given to private water sources. For dry land, the ceiling would be 54 acres. There was room for relaxation specially in the case of desert and hill areas. The ceiling would apply to a family defined as a husband, wife and three minor children. For families of larger sizes, additional land might be allowed but the total holding would not be allowed to be more than twice the ceiling for a standard-sized family. The ceiling laws would be given retrospective effect from January 24, 1971. Those states which wished to fix an early date would be free to do so. Compensation for land in excess of the ceiling would not be paid at the market rate. A slab system is likely to be evolved. A small surplus will be compensated at a proportionately higher rate than a large surplus. The criterion for fixing the compensation has been left to the states.

Tax Executives Confer

At a conference of tax executives convened by the Federation of Indian Chambers of Commerce and Industry (FICCI), the government was urged to accept the Wanchoo Committee's recommendations for reduction in the rates of taxation to check evasion. It was also suggested that the Wanchoo committee recommendations should be accepted "as a package deal" and their implementation should be ensured without offending the spirit behind them. The consensus at the conference was that black money could not be

curbed so long as controls were not simplified or abolished. The underhand dealings could be reduced only by exposing the economy increasingly to the market forces. The reintroduction of the expenditure tax as a measure to curb tax evasion was disfavoured because the tax was "administratively difficult and iniquitous in incidence".

While no reliable estimates of the volume of tax evasion were available, the conference underlined the need for curbing the black money operations. The conference noted that while no sympathy could be shown to a tax dodger, there should be adequate safeguards to protect the honest tax-payer.

The Wanchoo committee has recommended that capital levy should be imposed on owned and borrowed capital of companies along with bringing about uniformity in corporate tax at 55 per cent. The calculations made by some of the participants in the conference showed that the levy would amount to 18 per cent of after-tax profit of companies which would wipe out the marginal companies and would also reduce the volume of ploughed back resources. The conference suggested that as far as possible the scheme of present incentives should not be disturbed in a manner which would make the tax structure more complicated. In regard to wealth tax, it was suggested that the market value of the assets should be taken after allowing deduction for notional capital gains tax liability.

Steel Prices

On a representation by the three main steel producers in the country — Hindustan Steel, Tata Iron and Steel Co. and Indian Iron and Steel Co — the union government has decided to raise the prices of (i) billets, (ii) bars, rods and wire rods, and (iii) structurals and rails by Rs 80, Rs 85 and Rs 50 per tonne. The enhanced prices came into force on July 22. Since the excise duty of steel was raised sharply in two instalments in December, 1971, and April this year, the actual

increase in the prices of the above products comes to much more than the above level — nearly 75 per cent more.

The government, however, has decided to maintain the present prices of other categories of steel. It is of the view that a general increase in the prices of steel at this stage is not advisable.

The three main steel producers had, in a memorandum submitted to the government in April/May this year, urged that steel prices should be raised suitably to compensate them for the increased cost of production. They had pointed out that since December 30, 1969, when steel price were raised last, the cost of production of various categories of steel had gone up on an average by over Rs 100 per tonne. Wages, including dearness allowance, accounted for nearly Rs 30 per tonne increase, raw materials over Rs 20, refractories, rails and fuel oil over Rs 25 and other factors such as railway freight, consumable stores and power over Rs 32.

India and the EEC

The EEC Commission's approval of the conclusion of a Commercial Cooperation Agreement (CCA) between India and the EEC constitutes 'an important breakthrough' in India's relationship with the EEC. The approval has come in the wake of a sustained effort on the part of the Ministry of Foreign Trade and a series of discussions held by the Foreign Trade Minister, Mr L.N. Mishra, in the capitals of the important member states of the EEC. The EEC Commission's proposal would now go to the Council of Ministers of the European Economic Community (EEC) for their approval.

The CCA proposal envisages a mixed Indo-EEC Commission for a continuous dialogue between India and the EEC. Subject to the approval of the Council of Ministers serious negotiations can now begin for a long-term and comprehensive trade agree-

ment covering a wide range of products between India and the EEC. While these negotiations will deal with the totality of Indo-EEC relationship, the solution to the problems arising out of the British accession to the EEC would be a matter of utmost priority.

India has been pressing the European Economic Community for a Comprehensive Trade Agreement for several years. At the moment, India's relationship with the EEC is confined to a limited range of products such as jute and textiles.

Problems of Trade and Industry

At the Northern Regional Meeting of the Federation of Indian Chambers of Commerce and Industry (FICCI), Mr Madanmohan Mangaldas, President, discussed with the office-bearers the problems currently facing both trade and industry. Mr Mangaldas advised businessmen to adjust themselves to the changes in the political and economic environment of the country.

Following were the conclusions arrived at after discussion with the office-bearers:

Sales Tax: The members drew attention to the difficulties and harassment created by the Sales tax laws and regulations. In the case of major commodities, sales tax should be replaced by additional excise duty, as suggested by the Wanchoo committee. There should be, to the extent possible, uniformity in the rates of sales tax and the procedure has to be simplified.

Non-availability of Wagons: Trade and industry have been considerably disrupted by the non-availability of wagons for movement of raw materials and finished goods. Even sanctioned wagons are not allotted and there is mismanagement and favouritism in making allotments. Sudden stoppage of bookings without prior notice, suspension of bookings for indefinite periods, etc. caused serious hardship. The Railways should urgently review the situation and adopt and implement a rational

policy for allotting wagons. At the same time, every effort be made to acquire more wagons as early as possible.

Near Chaotic Condition in Banking Services: The banking services have substantially deteriorated in the last three years. Working of banks and clearing houses has been disrupted by frequent strikes and indifferent attitude on the part of the banking personnel. Clearance of cheques, collection of hundies, etc. take inordinately long time. All this has resulted in near chaotic conditions and bank clients have lost their faith and confidence in the working of the banks. Unless these conditions are improved and banking services put under Essential Services Act, the progress of banking will receive a setback. This will have serious adverse repercussions on the whole of the economy.

Takeover of supply of Essential Commodities: It has been reported that government is thinking of taking over of supply of essential commodities. Undoubtedly, the necessities of life have to be made available to people at reasonable prices. However, looking at the experience in the past, nationalisation or take-over, do not appear to be a solution to this problem. What is necessary is that the supply of essential commodities like foodgrains, cloth, sugar, etc. should be augmented as quickly as possible and produced on a sufficiently economic scale to bring down the cost. Normal trade channels, which historically have been the cheapest mode of distribution, should not be disturbed. It has been seen, that with government takeover, costs of handling, storage and distribution usually go up and impose additional burden on the consumer. Members were seriously concerned about the proposed move and hoped that no such drastic and deleterious measures would be taken.

Electronic Desk-top Calculator

The NSH Business Machines, a new unit in Ghaziabad (UP), has developed an electronic

desk-top calculator with 100 per cent indigenous skill and 95 per cent Indian components. This is a sophisticated desk calculator which uses the latest technology known as LSI (Large-scale Integration). The calculator is priced at Rs 6,000, excluding taxes and is capable of performing the four basic arithmetic functions such as

addition, subtraction, multiplication and division on 16 digit numbers. It has capacity for chain multiplication and division, and for constant multiplication and division. It also possesses memory for mixed calculations. Dr T.R.S. Goel, Managing Director of the NSH Business Machines stated at a press conference in

Your small-scale industry needs capital to grow on.

Where is it going to come from ? UCOBANK

If you are a small-scale industrialist, UCO-BANK offers you top priority for financial assistance. The kind of assistance that helps you get ahead in business. In life.

You need money to invest in your industry to get more out of it.

We help you buy machinery or raw materials. Set up an industry or expand. We even help you with a loan to run your industry or renovate it. All this, and at a reasonable rate of interest too.

At UCOBANK, we help you to help yourself.

For further details and expert advice, visit your nearest UCOBANK branch.

Meeting the needs of the people.

the capital on July 21st that development of small-sized calculators was in hand. Soon a pocket-sized calculator would also be put on the market. The know-how, components, technology and everything attached to the calculators would be indigenous, thus marking the beginning of a new era in self-reliance in this sophisticated field.

Evaluation Teams

The Minister for Foreign Trade, Mr L. N. Mishra, has set up six evaluation teams for assessing the performance of the public sector corporations and commodity boards under his ministry and to suggest action points for improvement. The teams will evaluate the functioning and performance of (i) the State Trading Corporation (ii) the Minerals and Metals Trading Corporation, (iii) the National Textile Corporation, (iv) the Cotton Corporation of India, (v) the Tea Board and (vi) the Coffee Board. They have been directed to complete their task within three weeks in the case of the corporations and within a month in respect of the two boards. The teams comprise senior officials of the Foreign Trade Ministry.

Reactivating Dead Mills

The National Textile Corporation (NTC) has embarked upon a modernisation programme covering 33 of the 50 mills whose management it has taken over. The programme would cost about Rs 14.50 crores. Orders for machinery worth Rs 3.64 crores had already been placed or were being placed. Some of them had already arrived. This information was given on July 19 by Mr K K Dhar, chairman and managing director of the NTC.

Of the 50 mills, 24 had shown gross profits in the latest monthly reports. The NTC was able to reactivate 13 mills within a period of three months from the date of takeover. They were also showing a trend towards profit. In West Bengal three mills had not only been reopened but had broken even. Mr Dhar remarked that the

NTC was given "dead mills" and not "sick mills". Almost all of them had closed down. It was a stupendous task to reactivate them.

The NTC was likely to take over 13 more units. It had recommended the take-over of the management of seven of them, while the reports of the investigating committees were being considered on the other six.

The cotton yarn and cloth production capacity of the 50 mills was valued at about Rs 175 crores annually. They could produce 526 million metres of cloth and about 107 million kg of yarn.

The NTC made a profit of Rs 32.94 lakhs in 1971-72; it had received export orders worth Rs 4.5 crores in that year.

Objectives of the Monetary Reform

The Finance Ministers of the European Economic Community (EEC) and the four acceding countries who met in London on July 17, formally agreed on eight major objectives to be pursued in the forthcoming discussions on international monetary reform. The eight points on which the ministers reached a wide measure of agreement were:

1. The new international monetary system should continue to be based on fixed but adjustable parities.
2. It should be designed to re-establish a general convertibility of currencies.
3. Provision must be made for the effective international regulation of the supply of world liquidity.
4. It should secure the necessary adjustments in the balance of payments of participating countries.
5. It must have regard to the need to reduce the destabilising effects of short-term capital flows.
6. There should be a principle of equal rights and obligations for all countries.
7. The interests of develop-

ing countries must be regarded.

8. Such a system is in no way incompatible with the progressive achievement of economic and monetary union of the enlarged EEC.

Mr Barber, Chancellor of the Exchequer (UK), is reported to have invited the Finance Ministers of more than 30 Commonwealth countries to London for two days of talks in September, immediately before the IMF meeting in Washington. The sterling balances have long been a sore point with the EEC in general and the French in particular. The individual agreements under which Commonwealth countries undertake to keep a certain minimum proportion of their reserves in sterling—in return for an exchange rate guarantee—are due for renegotiation and would have to be looked at in the light of the floating of the pound.

Syndicate Bank's New Scheme

The Syndicate Bank announced a new scheme on July 19 on the occasion of the third anniversary of bank nationalisation to benefit the man-on-the-street financially during illness. Under the scheme, known as the "cumulative-cum-sickness deposit scheme," claimed to be the first of the kind in the country, a depositor will be entitled to a loan of up to twice the amount standing to his credit to meet medical expenses and for the maintenance of his family if he falls sick. The loan would carry an interest of one per cent over the rate of interest applicable to the deposit. Another salient feature of the new scheme is that the loan would be granted without insisting on security other than the amount of the balance in the depositor's credit. The maximum loan under the scheme has been restricted to Rs 5,000.

Farm Research

Mr Fakhruddin Ali Ahmed, union Agriculture Minister, said recently that preparation should be made from now on to accelerate the pace of growth

of research and development in agriculture. Unless this was done, he warned, the country's farm production might "soon be reaching a plateau".

Mr Ahmed who was addressing the annual general meeting of the Indian Council of Agricultural Research (ICAR), said that exploratory research was one of the most critical elements in preparing for the future. He said that the process of reorganization of ICAR had yet to be completed "by giving proper definition to the nature and type of organization which is best suited to the needs of agricultural science and education. We are hoping to take a decision soon in this matter".

He said in pursuance of the policy of self-reliance the ICAR had formulated a project under which the services of Indian scientists and experts could be made available to different agricultural universities to help them in specific tasks. A national training centre for project formulation had also been set up at the Indian Agricultural Research Institute to train senior officials in the technique of project formulation both for national and international support.

Minichuker

Dr S. M. Patil, chairman of Hindustan Machine Tools, said recently that HMT had concluded a 10-year minimum royalty agreement with a British firm for licensing an indigenously designed machine called 'Minichuker'. This was the first time HMT had been able to negotiate an agreement of this kind in Europe.

Mr Patil added that the selling of the designing under a minimum guarantee agreement marked a big step forward for India in the machine tool field. This would bring substantial foreign exchange to the country.

HMT is also contemplating to enter another field—"numerically controlled machines". These machines are electronically controlled and are very valuable tools for defence and aircraft industries. HMT would make mechanical parts of these machines to be sent abroad to fit with the software of the

machines subject to the approval of the central government.

Fall in Grain Output

According to the latest estimates, total production of foodgrains in 1971-72 (year ended June 30, 1972) may have been two million tonnes less than the record of 107.8 million tonnes reached in 1970-71. The drop in grain output is not expected to materially affect grain availability as the centre has a buffer stock of over seven million tonnes. Nevertheless, this trend is very much against the expectations of the central Food and Agriculture Ministry, which in its annual report for 1971-72 had estimated that the combined grain production for the year would be "higher than the level of 107.8 million tonnes" reached in 1970-71. It is learnt that the decline in output is spread over all the crops.

From 95 million tonnes in 1967-68, grain production had touched 99.5 million tonnes in 1969-70. The growth rate was much more in 1970-71—8.4 per cent, compared to the annual growth rate of 5.6 per cent envisaged for the fourth Plan period.

Madhya Pradesh Budget for 1972-73

Fresh taxation measures to the tune of Rs 14.51 crores were proposed in the Madhya Pradesh budget for 1972-73 presented in the Vidhan Sabha on July 11 by the Chief Minister, Mr P.C. Sethi. Since the new budget would be enforced for the remaining eight months of the current financial year, the new taxation proposals are expected to yield only Rs 8 crores leaving an overall deficit of about Rs 10 crores. Mr Sethi expressed the hope that "residual gap" in the resources for the current year would be met by enhanced realization of payments over-due to the state government and by economy in the non-Plan expenditure.

The budget showed a surplus of Rs 10.24 crores on the revenue account. The revenue receipts were estimated at Rs 296.66 crores and revenue expenditure at Rs 268.42 crores. The deficit on account other

than revenue account is placed at Rs 22.69 crores. Taking into account the minus opening balance of Rs 5.54 crores, the overall deficit at the end of the year 1972-73 is estimated at Rs 17.99 crores.

While replying to the debate on the budget, the Chief Minister, Mr P.C. Sethi, announced reliefs totalling Rs 2.20 crores in the budget taxation proposals. This reduced the expected additional yield from Rs 14.51 crores to Rs 12.31 crores. The chief minister said holdings of up to five acres would be exempted from land tax. He also exempted land irrigated from private sources from the proposed irrigation tax of Rs 5 per acre.

The concessions and new rates of taxes are:

Land Revenue: No levy on holdings of up to five acres. Land revenue will be reimposed on holdings of more than five acres but less than 10 acres.

The surcharge on land revenue will be at the following rates: Holdings of 10 acres and above but not exceeding 20 acres—50 per cent of land revenue. Above 20 acres but not exceeding 30 acres—75 per cent of land revenue; Above 30 acres—100 per cent of land revenue.

The additional surcharge of Rs 5 per acre on irrigated land will be levied only on land irrigated from medium and major irrigation projects. The entire proceeds from this levy will be credited to a fund to be utilised for rural development.

Sales tax: No levy will be levied on ghee. There will be no increase in the rate for edible oils. Silver ornaments will be taxed only at the existing rates. Cycle tubes, tyres and other accessories will continue to be taxed at the existing rate of seven per cent. Rubber contraceptives will continue to be exempted from tax and nipples used in feeding bottles will be taxed at the existing rate of seven per cent. On the remaining rubber goods, the tax will be raised from seven to 12 per cent as proposed.

The tax on motor spirit will be at the following *ad valorem*

rates: Petrol 10 per cent; high-speed diesel oil 9 per cent; light diesel oil 12 per cent; aviation spirit and aviation turbine fuel eight per cent, and other motor spirits nine per cent. The existing rate of about 15 per cent on light diesel oil will be reduced to 12 per cent to help cultivators. Lubricants will continue to be taxed at seven per cent.

Motor vehicles, chasses, tyres will now be taxed at 11 per cent instead of the concessional

rate of 10 per cent as at sent. The tax is, however, being increased to 12 per cent to prevent diversion of tax from Madhya Pradesh, partly make good the loss revenue on account of concessions, the registration fees for dealers will be raised from Rs five to Rs 15.

Registration Fee: The registration fees will not be increased on documents of up to Rs 4, in value instead of Rs 1,

LOTTERY OR CROSSWORD

as mentioned in the budget proposals.

Property tax: Property having a rental value of up to Rs 4,000 will continue to be taxed at the existing rate of 10 per cent.

Electricity duty: For small shopkeepers a slab system will be introduced in the rate of duty chargeable on electricity consumed for commerce and trade. The rates are: Up to 50 units a month—eight paise; above 50 units but not exceeding 100 units—10 paise and above 100 units—12 paise.

Toll tax: It has now been decided to exempt tractors, motor-cycles and scooters from payment of toll tax on bridges. The proceeds of this levy will be funded and utilised for construction of bridges.

Entertainment tax: As against the 40 per cent tax proposed on tickets of up to Rs 1.50, the rate will now be 36 per cent. The government will take adequate steps to prevent evasion of entertainment duty.

Central Government Loans

Subscriptions to the three new central government loans totalled Rs 386.61 crores against the notified amount of Rs 350 crores, according to the figures released by the Reserve Bank of India. Subscription by way of cash amounted to Rs 149.70 crores and that by way of conversion of two maturing loans amounted to Rs 236.91 crores. The bulk of the conversion has come from the Reserve Bank of India.

The government usually retains excess subscription up to 10 per cent. This time it is retaining a little more, that is, 10.5 per cent. All subscribers will receive full allotment. Subscriptions to the 4-3/4 per cent loan 1979 amounted to Rs 52.52 crores (Rs 8.41 crores cash and Rs 44.11 crores conversion) and those for 5 per cent issue 1983 amounted to Rs 135.59 crores (Rs 48.03 crores cash and Rs 87.56 crores conversion). The largest subscription was for

5-3/4 per cent issue 2,002 (Rs 93.26 crores cash and Rs 105.24 crores conversion).

Scrap Trade Corporation

The government of India have decided to transfer, with immediate effect, the administrative control of Metal Scrap Trade Corporation from the Ministry of Foreign Trade to the Ministry of Steel and Mines (Department of Steel).

With the fall in export of scrap it became obvious that the corporation could not remain an economically viable unit if it were to function merely as a canalising agency for dwindling exports. It has, therefore, been decided to enlarge and diversify its activities into various other fields such as ship-breaking industry, regulating scrap collection, distribution etc.

The main role of the corporation in the new circumstances will be to maximise collection of scrap. Scrap is generated in small quantities at hundreds of small engineering units all over the country. The collection is usually made by small parties who dispose of their collection to the larger trader when there is a demand. The corporation will, however, provide an assured off-take to these collectors. As a result, the collections are expected to improve substantially.

The corporation will also play a significant role in setting up scrap processing machinery at appropriate places in the country and in standardisation of equipment for this industry. The present scrap processing facilities in the country are considered very meagre.

The authorised capital of the corporation is two crores of rupees and the paid-up capital is six lakhs of rupees. The paid-up capital of the corporation will be raised to enable it to take on these new activities. However, the entire additional capital will be subscribed by the government—the equity holdings of Steel Furnace Association of India and Iron & Steel Scrap Association of India will remain unchanged.

Hitherto the paid-up capital was divided equally between Mineral and Metals Trading Corporation of India Ltd, (on behalf of government of India) and these two associations.

Industries in Backward Areas

The coverage of the Central Subsidy Scheme for promotion of industries in the backward areas has been extended. It has now been agreed to increase the number of districts/areas from two to six in the case of states identified as industrially backward and from one to three in the case of other states. Under the scheme an outright subsidy of 10 per cent of the fixed capital investment is given to industrial units being set up in these areas.

In a letter to the chief ministers of states, Mr C. Subramaniam has suggested that the state governments may forward their proposals to Planning Commission for the selection of additional districts from out of those already approved for the purpose of concessional finance.

The capital subsidy scheme was introduced by the central government in 1970-71 to attract private capital to backward areas and for offsetting the locational disadvantages suffered by backward areas. So far 44 districts/areas have already been selected to qualify for the central scheme. It is expected that the extension of the scheme will provide wider choice to entrepreneurs for setting up industries in backward areas so as to give a further fillip to the scheme.

In regard to the limit of the fixed capital investment for the purpose of the subsidy, the earlier decision was that it should be limited to Rs 50 lakhs and that the question of giving subsidy to units having a fixed investment of more than Rs 50 lakhs might be considered on merits. It has now been agreed that units having a fixed capital investment of more than Rs 50 lakhs may also be ordinarily eligible for the sub-

sidy, subject to a limit of Rs 5 lakhs.

Changes in Foreign Trade Policy

The Foreign Trade Minister, Mr L. N. Mishra, announced in the capital on July 17 that the government had decided to introduce "structural changes" in the country's foreign trade policy with a view to achieving "national objectives". Mr Mishra also said that these changes would be brought about keeping in view the objectives of eliminating economic inequalities and disparities and promotion of social justice.

The Foreign Trade Minister referred to the developments in recent years on India's export front and said that exports showed a continued rise during the first three years of the current (fourth) five-year Plan, although the rate of increase varied from year to year. The growth of exports at the compound rate of seven per cent per annum can be achieved if export earnings from industrial products can be made to increase at a compound growth rate of 15 to 20 per cent per annum. With this end in view, several new measures have been introduced for facilitating the build-up of export production and export capability.

Emphasising the urgency of achieving self-reliance, he said that foreign aid has now to be viewed in the new and realistic perspective. The minister added: "I am aware that the Aid India Consortium has endorsed the World Bank figure of the aid proposed for India for the current financial year. A theoretical commitment has no doubt been made but nothing definite could be said unless there are clear manifestations of a sincere and positive will to implement the promises. This points to only one moral i.e. we have to learn to rely on our own efforts to achieve the objective of accelerated economic growth with social justice and since foreign aid would be limited, a manifold multiplication of effort on the export front is

absolutely essential to ensure speedy growth."

New Oil Find

The Oil and Natural Gas Commission has found encouraging shows of oil in the first well drilled on a new prospect in Gujarat. The new discovery is at Linch, a place about 80 kms from Ahmedabad. Tests have shown that the prospect may turn out to be a commercial oilfield. Linch will then be 20th oil bearing area in the state. The Commission had released the location for drilling in September, 1971, and drilling at Linch had started on February 23, 1972.

Earlier this year, the ONGC had made two new discoveries of oil and gas in Gujarat. Oil was struck on February 11 in a well drilled in the Dabka area. Six days later, on February 17, gas was struck in the first well in the North Balol area. The size of the oil and gas finds in the Dabka and the North Balol areas respectively and their commercial importance will be determined only after a number of wells have been drilled there. However, according to the preliminary data, the oil find at Dabka particularly may be quite encouraging.

Credit From Netherlands

An agreement between the government of India and the Netherlands government for a credit of 58 million guilders, equivalent to Rs 141.67 million, for India's development needs was signed on July 19 at The Hague by the Indian Ambassador, Lt. Gen. Yadavindra Singh and Mr P. C. Mass, President, Netherlands Investment Bank for Developing Countries. The credit forms the financial contribution which the Netherlands government has undertaken to make to India for the year 1972-73. The credit is repayable in 30 years with eight years' grace period and 2.5 per cent interest.

For Tourist

Dr Karan Singh, Minister for Tourism and Civil Aviation, informed the consultative

committee members of Parliament, attached to his Ministry, that plans for the construction of a new terminal building at Dabolim (Panaji) were ready. The construction of the building at a cost of Rs 9.23 lakhs will begin soon. The new terminal which will be ready by March 1974 will have a passengers' lounge, a VIP lounge, booking offices, snack bars etc.

The blue-print for the modification and improvement of the terminal building at Bangalore at a cost of Rs 17 lakhs had been prepared. The modification will be completed by March 1974. The minister said a traffic survey of Gulbarga in Mysore to assess the traffic potential in the area was being undertaken by Indian Airlines. The construction of a new aerodrome at Hubli-Dharwar was proposed to be started during the current Plan period. The work on construction of Hassan aerodrome was progressing satisfactorily. The minister informed the members of the committee that one crore of rupees had been collected during the last three years from airport fee at the four international airports.

The minister informed the members that significant recovery in tourist traffic had taken place during the last six months of the year. Tourist arrivals suffered a heavy setback last winter due to the Indo-Pakistan conflict. During the first six months of 1972 a total of 149,773 tourists had arrived till June, compared to 129,017 during the same period in 1970 and 146,496 in 1971.

Quality Drugs

The need to manufacture quality drugs in the country was recently stressed by Prof. D.P. Chattopadhyaya, Minister of State for Health and Family Planning, while inaugurating the first meeting of the reconstituted Indian Pharmacopoeia Committee. Prof. Chattopadhyaya said that the drug industry in India had taken substantial strides during the past two decades and its annual production was to the tune of Rs 300 crores. Besides, exports of drugs earned Rs 10

crores in foreign exchange each year.

Referring to over-charging, mal-administration and sale of spurious drugs, Prof. Chattopadhyaya stated that it was the combined responsibility of the central and state governments to guarantee the availability of genuine drugs to the people. The Minister was of the view that the Indian Pharmacopoeia Committee was a national effort requiring close liaison between the medical profession, the drug industry and the drug control authorities. The Indian Pharmacopoeia Committee had therefore been broad-based.

Medical Services in Rural Areas

Staffing and operation of Primary Health Centres (PHCS) has improved all over the country. In 1960 one-fifth of these centres were without doctors; today just over two per cent remain unmanned by doctors.

Of the total number of 5131 Primary Health Centres

in 4982 Community Development Blocks in the country, 2041 have the full complement of two doctors each. 2911 have one doctor each while 179 only are without doctors. Steps are being taken to open PHCs in the remaining 250 Community Development Blocks during the current five-year Plan period.

Names in the News

Mr S.B. Velankar has taken over as Senior Member, Posts, in the P & T Board. Till recently he was Member (Administration) in the Board. Earlier, he was Deputy Director General at headquarters in charge of Inspections.

Mr James R. Sankey has been elected Vice-President of Goodyear International Corporation, succeeding Mr Marshall F. Gillespie. Mr Sankey, 51, was production director for Goodyear-India for about three years. His new responsibilities encompass the areas of production and development for the company's various overseas units and facilities.

Readers' Roundtable

Mr MODY'S POSTERIOR

Dear Sir, In your "Moving Finger" Page, (July 14, 1972) while referring to Rajaji's blessing to Mr Pilloo Mody, you have said, "It had never occurred to me before that Mr Pilloo Mody's posterior was particularly photogenic, but then, handsome is as handsome does".

From the passage you have quoted from "Swarajya" I understand that the blessing ceremony could not have been so well-attended that there was no place for photographers even to creep in edge-ways,* and I am inclined to think that even the most unimaginative photographer, however "handsome", "photogenic" Mr Mody's posterior might be, would have bothered to take a picture of that; instead, he would have definitely taken

*unless Mody's posterior had thrust all out, as he bent!

a shot from the rear, in which case the picture would have given us the profiles of both Rajaji and Mr Mody.

When Rajaji says that the "charming scene" will remain vivid in "my memory", he definitely is not referring to Mr Mody's posterior, but to his act of bowing before him for blessing.

Perhaps only editors would find posteriors photogenic! Photographers never will. (I confine my comment to the male posterior only.)

And I gave up my editorship of *Industrial India* only a few months back!

S. Subramanyam
Bombay, July 20, 1972

(Mr Subramanyam, in the postscript, has after all got the point—which is a truly vast one—Ed.)

COMPANY AFFAIRS

Gwalior Rayon

GWALIOR RAYON Silk Mfg. (Wvg) Co. Ltd has raised the equity dividend to 19 per cent for the year ended March 31 1972 as against 18 per cent paid for 1970-71. Although sales have gone up by 6.3 per cent to Rs 63.71 crores from Rs 59.93 crores, gross profit has declined by 22.3 per cent to Rs 8.41 crores from Rs 10.83 crores in 1970-71. Out of the gross profit the directors have provided Rs 178.27 lakhs for depreciation, Rs 19.98 lakhs for development rebate reserve and Rs 392 lakhs for taxation as against Rs 201 lakhs, Rs 15.06 lakhs and Rs 484 lakhs provided respectively in the previous year. This leaves a lower net profit of Rs 250.76 lakhs as compared to Rs 382.46 lakhs in the preceding year. Out of the net profit a sum of Rs 230.76 lakhs was transferred to general reserve as against Rs 352.46 lakhs in 1970-71 while the allocation to preference share redemption reserve was enhanced by Rs 5 lakhs, to Rs 20 lakhs. Contingency reserve was appropriated with Rs 15 lakhs in 1970-71 as against no provision during the year under review. Equity dividends will absorb Rs 125.40 lakhs, Rs 6.60 lakhs more than in 1970-71 while preference dividends will claim Rs 31.52 lakhs, the same as in the previous year.

The directors attributed the setback in profit to the 72-day strike at the company's pulp plant in Kerala and the writing off Rs 127.74 lakhs, being the aggregate value of its industrial plantation at Nilambur following the take-over of the private forests by the Kerala government without paying any compensation. On petitions filed by the private forest owners, the Kerala High court has declared the Kerala Private Forests (Vesting and

Assignment) Act 1971 as unconstitutional and void. The Kerala government has filed an appeal to the Supreme Court.

The engineering division of the company secured an order over Rs 4.0 crores from Messrs South India Viscose Ltd, for the supply of complete plant, machinery and equipment for 20 tonnes per day of staple fibre production including ancillary plants for the manufacture of carbon bisulphide and sulphuric acid on turn-key basis. It has also offered to supply complete plants for the manufacture of normal viscose fibre polynosic fibre and cellophane paper to other leading firms. Besides it continues to supply machinery and equipment to rayon filament and other man-made fibre and allied industries.

The c. o. b. licence for the pulp plant for Harihar Polyfibers has already been received and production of rayon grade pulp has commenced since May 1972 with the commissioning of one digester. The delivery of other digesters and the recovery and auxiliary boilers has been considerably delayed and hence the complete plant is expected to be ready only by about March 1973. The work on the caustic soda project at Nagda is progressing quite satisfactorily. The factory is expected to be ready for trial runs by October 1972. The company's application for an industrial licence for setting up a plant for the manufacture of 150 tonnes per day of paper and 33,000 tonnes per annum of caustic soda in the state of Mysore has been referred by the government to the Monopolies and Restrictive Trade Practices Commission for enquiry. The company's application for establishment of a staple fibre plant including

polynosic fibre at Harihar is still pending with the government and the matter is being actively pursued.

Colour Chem

Colour Chem Ltd besides maintaining the equity dividend at 12 per cent for the year ended March 31, 1972, has proposed a bonus issue in the ratio of four new shares for every 11 shares held. Sales during the year recorded a smart rise from Rs 9.91 crores in 1970-71 to Rs 11.15 crores during the year under review while gross profit moved up from Rs 170.50 lakhs to Rs 181.66 lakhs. Out of the gross profit the directors have allocated a sum of Rs 56.74 lakhs to depreciation reserve, Rs 7.25 lakhs for development rebate reserve and Rs 43.50 lakhs towards tax liabilities as against Rs 58.77 lakhs, Rs 26.58 lakhs, and Rs 46.90 lakhs provided respectively in the previous year. This leaves a higher net profit of Rs 74.17 lakhs as compared to Rs 38.25 lakhs. After some adjustments there is a disposable surplus of Rs 80.57 lakhs as against Rs 51.63 lakhs in the earlier year, and the entire amount has been transferred to the general reserve. The proposed equity dividend will absorb Rs 33 lakhs and it will be paid out of the general reserve.

Modipon

The directors of **Modipon Ltd** have proposed to issue, subject to the consent of the Controller of Capital Issues, bonus shares in the ratio of three shares for every four shares held by capitalising a sum of Rs 1.5 crores out of the company's reserves. They have also recommended a final dividend of 16 per cent for the year ended February 29, 1972. This together with the interim of 17 per cent makes a total

of 33 per cent for 1971-72 as against 27.5 per cent paid for the earlier year. It is indeed creditable that the company which made its debut only a few years ago, has been able to make a handsome bonus issue besides declaring substantial dividends. No wonder the shares are quoted more than six times their paid-up value, the Rs 10 fully paid-up equity shares being currently quoted around Rs 62.

Maharashtra Sugar

Maharashtra Sugar Mills proposes to issue, subject to the consent of the Controller of Capital Issues, bonus shares in the ratio of two shares for every five shares held by capitalising a sum of Rs 37.80 lakhs out of the company's general reserve. While proposing the bonus issue, the directors have indicated that the company will be able to pay a dividend of Rs 8 per share or 16 per cent on the expanded share capital. The company paid dividend of Rs 10 per share or 20 per cent for the year ended September 30, 1971, on a capital of Rs 94.50 lakhs.

Simon-Carves India

Simon-Carves India, an associate of Simon-Carves Ltd, UK, has obtained a contract from Hindustan Steel to build a sulphuric acid plant at Bhilai steel works for over Rs 75 lakhs. The plant will have a daily rated capacity of 55 tonnes and will be based on solid sulphur. This is a turn-key contract and September 1974 has been fixed as the target for the completion of the project. This will be the 30th sulphuric acid plant built in India by Simon-Carves using the Monsanto process. It will also be the second plant supplied to Hindustan Steel, the first order being executed as a part of the Durgapur steel complex in 1960.

Telco

Tata Engineering and Locomotive Company Ltd has received a letter of intent for the expansion of the company's capacity by 12,000 vehicles and it hopes to receive an industrial licence within the

next six or eight months. This is revealed in the Chairman, Mr J. R. D. Tata's statement circulated to the shareholders of the company. Company's expansion scheme has, however, been approved by the government subject to certain terms and conditions. The order stipulates that the additional production of 12,000 vehicles should be reached by March 31, 1978 and that the company must export 20 per cent of the added production over and above the present level of exports so that the total exports reach a minimum of Rs 20 crores per annum. Further the government has specified that the pricing of the products made under the programme should be such that the rate of gross profit, after allowing for interest but before depreciation, development rebate and taxation should not exceed the base rate of 11.85 per cent of gross profit to net sales achieved in the years 1968-69 and 1970-71.

While accepting the conditions the chairman pointed out that the export target could only be achieved provided conditions prevailing in India and abroad at the time would be such that the company's efforts were not frustrated by causes beyond its control. Mr Tata wondered whether the government was fully aware of the uncertainties and difficulties involved in export of sophisticated engineering products in competition with the largest and most efficient producers in the world who have several advantages over the producers in India. Moreover there were several other hindrances to exports such as the absence of reliable port facilities. Referring to the pricing of the company's products the chairman said that the main economies of scale which could arise from the expansion programme would be in the modest increase of production at Jamshedpur of 3,000 vehicles of the type that are being currently made there. The manufacture of 9,000 vehicles of a heavier and altogether new type at Poona, in the chairman's opinion, cannot be considered a large-scale operation. Economies of scale in their produc-

tion, the chairman said, would only be achieved if and when the output was increased under some later expansion project.

On completion of the expansion programme the company will have powerful centres of production at Jamshedpur and Poona.

News and Notes

Expansion and Diversification

Delhi Cloth and General Mills Ltd plans to put on the market by the middle of September a wide range of electronic desk calculators including sophisticated scientific calculators and programmable machines. The first model will have addition, subtraction, multiplication, division, direct squaring, direct square root, constant multiplication and divisions, sequential calculations, negative number entry, an independent dynamic accumulative memory, reversal of registers, and clear entry facility. The company's factory is situated at Najafgarh, Delhi and it has received a licence to manufacture 2000 calculators a year. The DCM is planning to market these machines through its own sales organisation throughout the country and provide at the same time adequate service facilities.

New Issues

The preference issue of **Bharat Commerce and Industries Ltd** had been heavily oversubscribed. The company offered for public subscription for cash at par 25,000 third redeemable cumulative preference shares of Rs 100 each carrying a dividend of 9.5 per cent per annum. The subscription list for this fully underwritten issue opened on July 17.

Omega Locks and Typewriters will soon be approaching the capital market to raise Rs 14.40 lakhs in equity shares to meet a part of the cost of its project for the manufacture of typewriters and locks. The plant will be located at Bhopal and it will have an annual capacity of 8,000 baby traveller

model typewriters, 8,000 portable typewriters, 1,200 standard manually operated typewriters and 1,800 standard electrically operated typewriters in English, Hindi, Tamil, Gujarati and Bengali and 30 lakhs pieces of locks and door and furniture fittings. The company has entered into an arrangement with Messrs A. Ramsayer Albert Rodrian of West Germany for supply of types, certain accessories and tools. Messrs Wilhelm Dresicke and Co. of West Germany has agreed to design, fabricate and supply of all complicated parts and mechanisms in the first instance. These will be manufactured in India in the next three to five years. Most of the raw materials are available indigenously. However some critical items have to be imported in initial years.

The company has an authorised capital of Rs 50 lakhs—Rs 35 lakhs in equity and Rs 15 lakhs in preference. The issued subscribed and paid-up capital of amounts to Rs 61,700. The present issue is for Rs 19.38 lakhs in equity shares of which shares worth Rs. 4.98 lakhs have been reserved for allotment to directors and their friends. The total capital outlay on the project is estimated at Rs 50 lakhs and it will be financed through the share capital of Rs 20 lakhs, loans from MP Audyogic Vikas Nigam of Rs seven lakhs, loan from MPFC of Rs 19 lakhs, loan from the ICICI for import of machinery of Rs 3 lakhs and dealers deposits of Rs one lakh. If all goes well the company is expected to start production before the end of next year.

Capital and Bonus Issues

Consent has been accorded to two companies to raise capital amounting to over Rs 4.46 lakhs. Following are the details:

HTC Diesel Engines Private Ltd, Bombay, has been given consent valid for three months to capitalise Rs 1,56,600 out of its General Reserve and issue fully paid equity shares of Rs 100 each

as bonus shares in the ratio of one bonus share for every one equity share held.

Uni-Distributors Private Ltd, Bombay is granted consent, valid for three months, to capitalise Rs 2,89,700 out of its General Reserve and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of three bonus shares for every 10 equity shares held.

JAY SHREE TEA & INDUSTRIES LIMITED

NOTICE TO THE SHAREHOLDERS

NOTICE is hereby given that the Twenty-sixth Annual General Meeting of the Shareholders of the Company will be held on Friday, the 15th September, 1972 at 3.30 P.M. at "INDUSTRY HOUSE" 10, Camac Street, Calcutta-17, the Registered Office of the Company and its agenda has been/will be circulated to all members of the Company in time along with the relevant explanatory statement thereon.

The Equity and Preference Shares transfer registers will remain closed from 1.9.72 to 15.9.72, (both days inclusive) for the purpose of payment of dividends.

By Order of the Board
for JAY SHREE TEA & INDUSTRIES LIMITED
B. C. Biyani,
President.

Registered Office :
"INDUSTRY HOUSE"
10, Camac Street, Calcutta-17.
Dated, the 10th July, 1972.

THE AMALGAMATED ELECTRICITY COMPANY LIMITED

Registers of Members and Transfer Books of the Company will be closed from 18th August, 1972 to 8th September, 1972, both days inclusive in connection with Dividend.

By Order of the Board,
For The Amalgamated Electricity Company Limited

Kiran N. Javeri
Dy. Managing Director
Registered Office :
17/B, Horniman Circle,
Fort, BOMBAY-1.
Dated 20th July, 1972

COMPANY MEETINGS

THE TATA IRON AND STEEL CO. LTD.

Chairman's Statement

The following is the statement of Mr. J. R. D. Tata,
Chairman of the Tata Iron and Steel Company
Limited, for the year 1971-72.

25 Years of Independence

I have for some years given up the practice of inflicting upon the shareholders at the beginning of my annual statement and earlier, of my speeches at shareholders' meetings, a review of events and developments of general interest to the economy of the country but not directly concerned with our affairs, as I found that these were amply discussed by the Chairmen of most other joint stock companies, large and small, and because, in any case, the views of spokesmen of the private sector seemed to make no impact whatever in official circles. If I make a brief exception this year, it is because it marks the significant completion of the 25th year of India's independence.

2. Tragically, these twenty-five years began and ended not only with a major political transformation of our sub-Continent, but with great human upheavals, including war, which on both occasions compelled some ten million people to flee in terror from their homes to seek refuge in another land, and brought death to thousands and misery to millions. The recent Agreement signed at Simla by our Prime Minister and the President of Pakistan gives hope that this grievous chapter in the relations between our two countries is now closed forever, and that peace, growing understanding and cooperation will henceforth replace the conflict and confrontation which

for twenty-five years caused so much suffering to so many on both sides.

3. In this last of the twenty-five years India bore a burden of refugee relief of a magnitude that no country in the world had ever been called upon to bear; it helped in the liberation of a nation of over 70 million people; it fought a victorious war — mercifully a short one; it bore with remarkable equanimity and success the severe blows which these events inflicted upon its economy; it emerged as a major factor in the Asian power balance, and achieved, under Indira Gandhi, a degree of political integration and stability equalled only by that achieved under Jawaharlal Nehru in the early years of our Independence.

4. It is only right that on such an important occasion we should briefly take stock of our achievements as well as of our failures during these twenty-five momentous years.

Achievements and....

5. Politically, we have emerged from our many trials and tribulations as one of the most stable developing countries in the world, confounding in the process the many in India and abroad who feared, or hoped, that we could not survive as a united and politically strong nation.

6. Militarily, we have achieved a capability in manpower, equipment and expertise of a high order and certainly ade-

quate to our defence needs against all but great powers, as well as a capacity for large-scale production of sophisticated military hardware without parallel in developing countries.

7. Economically, we have more than doubled our food-grains production, more than trebled our industrial production, increased by 25 per cent our real per capita income which had actually fallen in the first fifty years of the century and increased the life-span of our people from 31 to 52 years and their literacy rate from 16.6 per cent to over 29 per cent.

.... Failures

8. We may derive some satisfaction from these significant achievements, but we cannot overlook the fact that with all the growth and sophistication of our industrial apparatus, we are still today a small industrial power with about one per cent of the world's steel output, one half per cent of the world's exports, and producing in one year no more than what Japan produces in one month; nor the fact that the one per cent annual increase in our per capita income is only one-fourth of the target we set before us when we started planning in 1951; that the great majority of our people continue to live in deep poverty and distress; that unemployment or underemployment continues to rise each year and that; despite the expenditure of some sixty-five thousand crores on development during these 25 years, the

standard of living of the bulk of our people continues to be amongst the lowest in the world

9. Last, but by no means least, we have failed to make any real dent in the rate of growth of our population which, in these brief 25 years alone, has increased by a staggering 200 million, almost the total population of the United States, Western Europe or Soviet Russia.

10. Looking ahead, however, there is no reason to be disheartened or pessimistic about the next 25 years. We now have a versatile industrial base capable of rapid expansion, wide-ranging skills and managerial expertise, a basically sound economy which demonstrated its resilience by the manner in which it absorbed the severe shocks of the past year, and, equally important, we now have a united Government under strong and bold leadership. With such a combination of favourable factors, we undoubtedly have the capability of achieving much faster progress than in the past.

11. While the recent realisation that economic growth, to be meaningful, must make the masses of our people its main beneficiaries, is to be welcomed, I am sorry to say that there is still no sign of any realisation in official circles that the industrial and fiscal policies prevailing today contain major deterrents to rapid industrial growth which alone can provide the financial and material resources to pay for the mass employment and welfare

schemes of any anti-poverty programme.

Concentration of Economic Power

12. Government are still obsessed with the largely mythical bogey of concentration of economic power in private hands which protagonists of the extreme Left have so assiduously and successfully propagated for years. Not content with abolishing the managing agency system, Government have followed the general policy of denying to most individual companies, including small ones which previously were grouped under managing agency firms, opportunities of contributing further to the country's industrial growth. No distinction has been made between companies or groups with an impeccable record of efficiency and integrity and those known for serious malpractices. Because the so-called 'larger houses' represented the largest, most resourceful and most efficient part of the Private Sector, the shrinkage of fresh industrial investment caused by such policy has resulted in a significant fall in the rate of industrial growth during the past two years. There is now, however, a hopeful indication of a renewed willingness to make use of the material and managerial resources of some of the larger houses in the development of the country's economy, as evidenced by licences or letters of intent recently granted to some of our own sister companies.

13. I believe there has been a real confusion of thought in regard to the true nature and extent of the economic power about which so much fear and suspicion, genuine or politically convenient, has been expressed. With every aspect of large-scale industrial activity almost totally controlled by Government through an all-embracing panoply of controls and regulations, to which is now added a measure of managerial control by Government's monopolistic lending institutions it is clear that no real economic power is any longer wielded by industrial manage-

ment, if by 'economic power' is meant the power to make one's own economic decisions. Deprived of the right to decide what and how much to produce, what prices to charge, how much to borrow, what shares to issue and at what price, what wages and bonus to pay, what executives to employ and what salaries to pay them and, in some cases, what dividends to distribute, directors and top management from the Chairman down have hardly any economic power in our country. Taking my own case I doubt that there is anywhere in the world outside India any industrial executive in charge of a major enterprise with less real power than I have. In fact, no Government in the world has taken greater precautions to ensure that real economic power is concentrated in their own hands.

14. The confusion, I think, lay in the fact that while Government's restrictive measures have been directed mainly at curbing or destroying managerial freedom, initiative and policy-making powers, thus nullifying the principal advantages of private enterprise management, the real and justifiable target of criticism was, or should have been, the illegitimate accumulation of wealth, particularly in the form of tax-evaded funds in India and abroad and its use for anti-social purposes, including bribery and corruption. I submit that the right policy for a socialist Government such as ours, armed with the immense powers that it has, should be, on the one hand, to take every possible step to curb the acquisition and anti-social use of illegitimate funds and to punish those guilty and, on the other, to release for nation-building purposes all the resources, energies and dedication of those in the private sector whose past record has shown them to be worthy of the nation's trust.

15. I still hope, admittedly somewhat against hope, that this is the policy which Government will one day adopt as being the only one capable of harnessing all available resources to the Common effort

of achieving maximum growth with maximum social justice.

A Disappointing Year

16. Coming to our own affairs, the results of the year under review were disappointing, as they indeed must continue to be so long as our output remains more or less constant, and, at the same time, the unrelenting rise in costs due to the general and continuous inflation in the country, totally beyond the control of management, is not offset by an increase in prices or savings in costs by a combination of both.

17. Under Indian conditions, and particularly in an ageing plant such as ours producing at near maximum, the scope for reducing costs through higher production or greater efficiency is extremely small. Excluding the unlikely possibility of a major technical break-through in the world steel industry which would enable steel to be made much more cheaply, there seems to be no escape from a continuous rise in the cost of producing steel in India, as elsewhere, so long as inflationary forces continue to prevail. Consequently, I can see, over the years, no alternative to a slow but continuous increase in steel prices generally corresponding to that of other industrial products if the health and productivity of this most vital of all industries is to be preserved. That is hardly the case today, if by a healthy and productive plant we mean one maintained at a peak of efficiency by continuously replacing worn out or obsolete parts and incorporating improvements in equipment, processes and techniques as they become available.

18. All this costs far more money than available from allocations to depreciation, in view of the enormous increase in the cost of new equipment over the historical cost of the equipment it replaces. In a sound enterprise, the additional funds required must come mainly from retained earnings, temporarily supplemented in times of peak expenditure by borrowings. In our case, because of

inadequate steel prices, there have been for many years hardly any extra earnings left to plough back into the plant. The development rebate has materially helped to narrow the gap in resources. Its impending abolition will now leave depreciation allocations as virtually the only source of replacement finance unless more reasonable prices are allowed to the industry.

Steel Prices

19. One must surely hope and believe that sooner or later Government will come to realise that the policy they have been following of squeezing more and more out of the steel consumer in the form of excise duties, while maintaining prices to the producers at a level which is not only substantially lower than in other countries but leaves no margin for essential maintenance, let alone expansion, is a self-defeating one which in the long run can only result in dwindling production and rising costs.

20. Iron and steel are basic raw materials to all industries and there can be no justification for Government to enforce uneconomically low prices on producers of steel in both the Public and the Private Sectors, jeopardising their efficiency and health in the process, while extracting an additional 40% from the consumer in the form of excise duties.

21. I am sorry that we have failed upto now in our repeated efforts to convince Government of the unsoundness as well as the unfairness of their steel pricing policies. The situation is now reaching a critical stage. Steel prices allowed to the producers, as distinct from those charged to consumers, were last increased in January 1970, by an average of Rs 71 per tonne on our product-mix. Since then, further increases in costs beyond the control of management have been of the order of Rs 113 per tonne.

22. We, along with the Public Sector, are continuing our efforts to convince Government of the urgent necessity of an upward revision in steel

prices allowed to the producers. If they are anxious to hold the price line for the benefit of steel consumers, the increase to producers could be offset by a corresponding reduction in the excessively heavy excise duties. We can only hope that Government will decide, without delay, to place this most basic of all industries on a strong and safe footing.

Production

23. On the production side, I believe that we have at last reached the stage where we may now expect some real progress from the number of steps we have taken in the past year or two to re-establish full production, including those to increase coke, sinter and pellet availability. We, therefore, hope to do better in the current year, but only in 1973-74 can we expect to reach or approach the rated capacity which we last achieved in 1967-68.

24. Our life is not being made easier by constant interruptions in power supply which play havoc with the operations of continuous process plants. We calculate that directly or indirectly due to such interruptions and shortages during the past year, the Company has lost over 20,000 tonnes of steel.

25. The continuing shortage of wagons is another difficulty which is ever with us, causing not only a certain amount of dislocation but also the need for carrying larger inventories, which in turn involve higher interest charges.

Need for Replacements

26. Even if, as I hope will happen one day, all such problems are overcome, we must, as I said last year, face in the long term the inevitable consequences of the increasing age of our plant, about half of which dates back to the early 1920s and is therefore about fifty years old. We have in the past been able to maintain its productivity, although at an increasing cost each year. But this cannot be done for ever. Any major scheme of modernisation or expansion is a long-drawn affair in a steel plant, which takes five years to ma-

ture fully. A decision on a long-term programme of action, involving major schemes of replacement, cannot be delayed much longer if production is not to fall once again. We are, however, faced with the basic problem that, owing to inadequate steel prices, the resources available to us are wholly inadequate for the task.

Holding Company

27. In this context a coming event of great potential importance to your Company is Government's proposal to create a Holding Company to co-ordinate, control and generally supervise the functions and development of the steel, coking coal and refractories industries of the country.

28. The basic objectives of securing a more rapid and rational growth of the steel industry, of increasing its efficiency by integrated planning and supervision and ensuring that its full requirements in raw materials, fuel, power, replacements and other inputs are met, are to be welcomed.

29. Whether, however, these objectives can best be achieved by concentrating power, functions and authority in a Holding Company, superimposed on, or replacing, the existing decision-making machinery of Government, or whether they are more likely thereby to be frustrated through the complications and delays that such a scheme might add to the present highly cumbersome and time-consuming machinery, is something which only experience will tell.

30. Your Company will, I hope, be represented on the Board of the Holding Company and I can assure Government that, within that Board and outside it, we shall do everything in our power to help in making the working of the Holding Company a success, in our own interests as well as those of the industry as a whole.

Expansion

31. One of the prime tasks of the Holding Company, as it is today that of the Steel Ministry, is to plan and assist the further growth of the steel

industry. References have been made from time to time in the Press to the possibility of an expansion of our own plant at Jamshedpur. I had myself in a previous Statement to the shareholders pointed out that the infrastructure and organisation existing at Jamshedpur could support a considerably larger capacity than the present two million tonnes. If it were proved that additional capacity can be created at Jamshedpur quicker and more cheaply, and operated with greater efficiency than on an entirely new site, and if Government were to require that this be done in the national interest, obviously we should be prepared to respond. In fact, we would have little choice in the matter.

32. There is as yet no specific expansion project for Jamshedpur within our Company or, to the best of my knowledge, within the Steel Ministry. All I can say at this stage is that we are engaged in a detailed study of the possibility of formulating a viable project. I can assure you that any scheme that emanates from us will not overlook the interests of the shareholders.

33. The most important aspect of any possible scheme of expansion of capacity at Jamshedpur is the question of how it could be financed and its impact on the shareholders' interests. The capital cost of a major expansion programme would be so large that, with the monopoly of investible and lendable capital which Government have created for themselves, Government funds in one form or another or Government-guaranteed funds would be virtually the sole source of finance for the project. These would be subject to convertibility rights in accordance with the guidelines recently issued by Government to their financial institutions and now in force.

Joint Sector

34. Considering that, directly or indirectly, Government already control 40% of the voting rights in the Company, it is clear that any appreciable increase in their shareholdings

would automatically convert the Steel Company into a "Government company" as defined in the Companies Act, and into a Joint Sector company under any possible definition of the Joint Sector about which we hear so much today. In fact, with Government as the Company's largest shareholder, with the right to have three representatives on the Board, with veto powers in the hands of Government or of the financial institutions, and with production, sales and prices wholly controlled by Government, the Steel Company is for all practical purposes already in the Joint Sector.

35. This situation, which has gradually crept upon us over a period of years, whereby the control of the Steel Company has virtually passed into Government hands is one which need not arouse excessive concern or despondency amongst shareholders. The very fact that Government have already such a large stake in our Company—a stake which, in a major expansion, would become a majority of ownership—should normally ensure a greater interest in its welfare than if they had no investment in it at all.

36. I realise that this may not be an argument that will greatly impress shareholders who are well aware of the step-motherly treatment in the matter of steel prices which Government have meted out not only to the Private sector of the industry but also to Public Sector plants which, as a result, have operated continuously at a loss. In this business, however, one must take a long-term view and I cannot but believe that the time will come when Government will realise the imperative need, through a fair and rational price policy, of safeguarding the health and economic viability of the country's most vital industry.

37. Recent amendments to the Constitution and the use sought to be made of it to justify a scheme of compensation to the shareholders of the nationalised general insurance industry, which can only be

characterised as confiscatory, would seem to confirm the extremely low value attached to shareholders' legitimate rights and interests by those in power. Shareholders may, therefore, feel some doubt as regards the treatment this Sector may now expect in our country. I believe, however, that it cannot be the real intention of our Government to cause heavy and unjustified loss to those who, over the years, have done so much to build up India's industrial and commercial base, as the Bill for nationalisation of general insurance would seem to indicate, and that the Bill which is now before a Select Committee will be favourably amended. If, on the other hand, the Bill were to go through in its present form, there could be no other interpretation of it than as part of a deliberate programme of extinction by expropriation of private ownership in business and industry. The events of the next few months will clearly show what will be in store for us. Until then, I prefer to believe that private enterprise of the right type, managed with honesty and social consciousness, either by itself or in association with Government, has a large and growing role to play in promoting the economic progress of the country and in serving the interests of its people.

Jamshedpur Land Tenure

38. The shareholders were informed in previous Directors' Reports and Chairman's Statements of the Bihar Government's persistent attempts to treat the Company's rights over the land, acquired many years ago under the Land Acquisition Act for the purpose of establishing a steel plant and allied industries at Jamshedpur as zamindari rights, and to amend the Bihar Land Reforms Act of 1950 so as to bring our lands under the purview of that Act.

39. As mentioned in the Directors' Report, the Bihar Land Reforms (Amendment) Bill, 1972, has been passed by the Bihar Legislature and will become law when it receives the President's assent. The main

object of the Bill is to delete from the Act the amendment introduced in 1961 which expressly provided that the Act would not apply to lands acquired for industrial purposes like those held by our Company. The most objectionable feature of the Bill is that it seeks to give retrospective effect to the amendment. Under the retrospective provision of the Bill, the Company's lands may be deemed to have vested in the State from 1956, when the Bihar Land Reforms Act, 1950 was sought to be made applicable to them by a Notification.

40. It is for the first time in the history of India that lands used for admittedly industrial purposes have been sought to be acquired by the State under agrarian reform law. Again, our plethora of laws affords no parallel to the Bihar Bill, which gives retrospective effect for as many as 16 years in supersession of the earlier law which had expressly declared that the agrarian law could not and did not apply to the lands of the Company. Where the legislature intends to bring about a certain change and the law is found to have missed fire, subsequent validating laws have been passed with retrospective

effect, but there has never been a case like the present one where legislative intention, specifically expressed in the earlier law, has been reversed with so many years' retrospective effect. A measure such as this would serve as a disastrous precedent and have grave consequences on legislative practices and the rule of law.

41. While I have, in this Statement, been critical of certain policies of Government, it is with pleasure and gratitude that I acknowledge the assistance and cooperation we received throughout the past year from Government in the Steel Ministry which was most helpful in tackling some of our current problems and difficulties.

42. A reference has been made in the Directors' Report to the death of Sir Jehangir Ghandy last April. I would like to add my personal tribute to this esteemed colleague and friend of mine with whom I had been closely associated for 45 years in the work of your Company. We propose to perpetuate his memory by naming after him the fine new hospital building that is under construction next to the

Company's old Main Hospital. I am sure the shareholders will wholeheartedly endorse this proposal.

Labour Relations

43. I am glad to be able to report that relations between management and labour at Jamshedpur and elsewhere and with their accredited Unions remained excellent throughout the year. Great credit is due to both the Tata Workers' Union and the management at Jamshedpur for this continuing state of cooperation and cordiality. On behalf of the Board and the shareholders, I take this opportunity of expressing to both our sincere thanks for their cooperation. The relationship established and maintained year after year at Jamshedpur has been a model for the whole country and shows that, with goodwill, sincerity and dedicated effort, there is no reason why conflict and work stoppages resulting in a grievous loss of production should prevail in our country, as it does in so much of Indian industry at so great a cost to the country.

J.R.D. TATA
Chairman.

Bombay, 4th July, 1972.

Making new industries bloom

Thirty years ago, manufacturing cars in India appeared to many like an idle dream. But Hindustan Motors ventured into this new field.

India is now self-sufficient in automobiles largely because of the pioneering efforts of Hindustan Motors. What is equally important, Hindustan Motors have helped to bring into existence a host of new ancillary industries employing tens of thousands of skilled technicians to manufacture the hundreds of components that go into the making of an automobile.

Over the past thirty years, these industries, brought into being by Hindustan Motors, have expanded, diversified and improved their range of manufactures to meet the demands of other automobile manufacturers not only in India but also abroad. Today one of the important items of export of the Indian Engineering industry are automobile components and accessories which bring in more than Rs. 15 crores in foreign exchange every year.

Bringing new ancillary industries into existence—this is one of the ways in which Hindustan Motors keep India's economy moving and growing.

CCI IN 1971/72 - A REVIEW

STATEMENT BY CHAIRMAN MAHESH SARIN
AT THE 2ND ANNUAL GENERAL MEETING

Imports of raw cashewnuts were canalised through CCI from 1st September, 1970, and 1971-72 has been the first full year of CCI's operations. Before I deal with CCI's performance during the year, let me briefly trace the origin and growth of the cashew industry—its strength and its weaknesses.

Few people know that cashew nut, a native of Brazil, was introduced into the western coast of India by Portuguese missionaries in the 16th century—for the purpose of soil erosion.

Organised processing industry is however of recent origin: the first exports of cashew date back to the mid-twenties. By the early fifties cashew had become a major item in Indian exports.

With Kerala as the largest producer of cashewnuts, Quilon became the nerve centre of the labour-intensive processing industry, employing around 75,000 workers, mostly women—unmatched by manual skills elsewhere, nor yet, by machines.

The demand for cashew exports quickly outstripped indigenous availability of raw nuts, and the export-oriented industry began importing raw nuts from East Africa to fill out its own supply base.

This provided a tremendous fillip to cashew cultivation in East Africa and production increased over five-fold—from about 53,000 tonnes to 275,000 tonnes—in the last 20 years.

Ready availability of imported nuts seems to have contributed the most to a near-total neglect of indigenous production which has remained stagnant over the years. Although official estimates place indigenous production at 200,000 tonnes, it would appear that only about 60,000 tonnes become available to the organised processing industry. Over the last 20 years imports of raw nuts have trebled, accounting for roughly 72% of the industry's total requirements.

Heavy dependence on imports—allowed until 31st August, 1970 under the Open General Licence—resulted in fierce competition between Indian importers, and a chain of middle-men to negotiate with the organised selling strength of the State Produce Boards set up in East Africa in the sixties.

In an environment of unhealthy competition, Indian importers began to pay uneconomic prices and—unable to fully recover the differential through export realisations—tended, on the one hand, to depress indigenous nut prices, and cut into statutory labour costs, on the other.

Steady increase in the prices paid for imported nuts and similar increases in kernel prices seems to have provided the impetus for substantial investments in mechanical decortication in East Africa, with Mozambique in the lead. In comparative economic terms the much lower cost of local crop and a two-way freight advantage more than off-set the substantially higher cost of mechanical processing. East Africa thus emerged as a serious competitor in cashew exports, threatening the virtual monopoly held by India for decades.

Thus, while on the one hand, India's share in world trade has been declining steadily—from 99.8% in 1950 to 91.4% in 1965 and down to 66.3% in 1971; on the other hand, this development poses a serious threat to the hitherto assured availability of raw nut supplies to the industry that has come to depend so precariously on imports.

While the Indian cashew industry has grown phenomenally in the last 50 years, its inherent weaknesses

HIGHLIGHTS		1971-72
1970-71		Rupees in crores
Imports	11.48	27.13
Exports	—	0.25
Domestic	—	0.02
Total Sales	11.48	27.40
Expenses	0.03	0.10
Profit before tax	0.73	2.13
Tax	0.48	1.46

Expenses/Sales	0.26	0.36
Profit after tax/Sales	2.18	2.45
Manpower	14	25

too have, of late, become more apparent than ever before.

Fluctuating fortunes of individual trader-entrepreneurs—often through speculative operations and sometimes through protracted labour disputes—have over the years resulted in prolonged closures of processing units as well as migration of units within the State—and outside. Inter-State wage differentials contributed to the latter in no small measure.

Capital investment in a processing unit being nominal, 'installed capacity' in the labour intensive cashew industry is a very flexible term. Also new units have been allowed to come up despite the admitted fact that the 'installed capacity' is far in excess of what can be justified by the total availability of raw nuts—indigenous and imported.

A situation, in consequence, of highly skilled surplus labour lends itself easily to evasion of statutory wages through what is popularly known as *Kudivappu*, i.e. clandestine cottage processing.

Set up in August, 1970 as the canalising agency for the imports of raw cashewnuts, CCI got off the ground quickly and proceeded to dispel the fears of overseas sellers of raw nuts and buyers of kernel, and to establish rapport with the industry that had vehemently opposed canalisation before and after the event.

Judging by the results, 1971-72 was a highly successful year for the industry and a satisfying one for CCI.

The year was marked by numerous crises and uncertainties caused by the prolonged closure of factories due to a heavy carry forward of unsold stocks, the international monetary crisis culminating in the revaluation of Pound Sterling and devaluation of the Dollar—both affecting us adversely—and the imposition, in the wake of the national emergency, of a 2.5% regulatory duty on imports.

CCI met each challenge as it came, and not only maintained the flow of supplies, but held its selling prices around levels fixed in December, 1970 despite increased costs as well as a marked improvement in kernel prices. This policy paid good dividends. A measure of stability in raw nut prices together with a reduction in industry's inventory and operating costs through well regulated imports contributed a great deal both to a spurt in exports and to the profitability of the industry—a fact that is freely acknowledged, especially by the small processor who, in the past, had neither a say in the prices nor access to the better quality nuts, now equitably apportioned to all.

In the long, chequered history of the industry, 1971-

72 witnessed several new records: for the value of exports including CNSL (Rs. 62.35 crores); for the net foreign exchange earnings in absolute terms (Rs. 37.01 crores) as well as a percentage of the value of imports (146%); and foreign exchange earnings from the General Currency Area (Rs. 16.66 crores)—an increase of 237% over the previous year.

As compared to the previous year: imports were down by Rs. 4.07 crores (13.8%); exports were up by Rs. 9.49 crores (18%) and net foreign exchange earnings were up by Rs. 13.56 crores (57.8%).

	1969-70	1970-71	1971-72
	Rupees in crores		
Value of Exports (incl. CNSL)	58.44	52.86	62.35
Less: Value of Imports	27.60	29.41	25.34
Net FE Earnings	30.84	23.45	37.01
From GCA	3.70	4.94	16.66
From RCA	27.14	18.51	20.35
Net FE Earnings as % of Value of Imports	112%	80%	146%

As an incidental fall out of regulated imports, prices of indigenous nuts received a much needed boost taking them to levels higher than CCI's selling prices for imported nuts.

We in CCI have thus had the satisfaction of having served the industry well, with CCI relying for its profits entirely on purchases at reasonable and fair prices, economies in intermediaries' costs, an 18% reduction in ocean freight over the rates prior to canalisation (this alone accounting for a saving in 1971-72 of Rs. 45 lakhs in free foreign exchange), and a shoe-string budget for administrative costs.

We feel that we can take justifiable pride in having set up new staffing norms for the public sector by running a complex Rs. 27-crore business (going up to Rs. 32 crores next year) with no more than 25 persons, at a cost of a mere 0.36% of turnover. An innovation we made in our cash management was the deployment of occasional surplus funds within the STC Group, and Rs. 7.24 lakhs earned by way of interest more than met all our direct administrative expenses for the year.

Set up with a paid up capital of Rs. 50 lakhs, we have, in 1½ years' operations, grossed a return of Rs. 2.86 crores and contributed Rs. 194 lakhs to the exchequer as tax and Rs. 77 lakhs to our own reserves apart from Rs. 15 lakhs to STC, the holding company, by way of dividends. Our Board has, furthermore, proposed the issue of bonus shares to STC of the value of Rs. 25 lakhs, i.e. half the paid up capital.

With a view to the future, we have been paying a lot of attention to finding new sources for supplies of raw nuts and here too our efforts are beginning to bear fruit: we are already negotiating for trial supplies from several new sources—Nigeria, Dahomey, Senegal, Ivory Coast and, nearer home, from Ceylon. Equally, with the net work of STC's overseas offices, we are trying to diversify cashew exports and to establish new markets. We made a modest beginning with exports during the year to the value of Rs. 39 lakhs (including Rs. 13.4 lakhs through STC), and expect to attain a level of over Rs. 3 crores for exports in 1972-73.

THE CASHEW CORPORATION OF INDIA LTD.

RECORDS AND STATISTICS

Report of the Committee for Review of the ONGC

THE APPOINTMENT of a high-powered committee to review certain aspects of the working of the Oil and Natural Gas Commission (ONGC) was announced by Mr P. C. Sethi in the Lok Sabha on July 16, 1971. Mr Sethi was at that time the central minister for Petroleum and Chemicals. The committee was asked to study certain features of the structure, organisation, financing and functioning of the ONGC and to make recommendations for changes and improvements which would strengthen and enable the Commission to achieve the objectives of rapid expansion of its programme or surveys, and exploration and production of gas and oil, both on shore and offshore.

A summary of this report was recently released to the press. The committee has recommended that the ONGC should be raised in status to that of national policy-making body. In this capacity, it should guide the Ministry of Petroleum. The obligation of the ONGC in the new set-up would be to make the country self-sufficient in oil. The committee has put emphasis on the foreign exploration activities of the ONGC. A number of shortcomings in the present working of the Com-

mission have also been listed. Main recommendations of the committee are listed below :-

The status of the Oil and Natural Gas Commission (ONGC) should be raised to that of a national policy body. It is this Commission that should guide the department (i.e. ministry) of petroleum exploration. In the new set-up, ONGC's obligation should be to make the country self-sufficient in oil by suitably combining exploration at home with exploration abroad and by producing synthetic oils.

Much greater emphasis should be laid on foreign exploration. The government should give support at the political level to promote ONGC's ventures abroad.

In consideration of oil's importance to industry and transport as fuel and lubricant and feedstock and also in consideration of its importance for defence, a bold plan for exploration is recommended. Oil prospecting is really an experimental research and deserves to be financed by research grant. Therefore, a generous exploration grant should be given each year until ONGC becomes financially well off.

The basic functions should be differentiated from the service functions.

Greater emphasis should be laid on seismic refraction, CDP (common depth point) techniques and general supervision of seismic data collection. The interpretation group should be strengthened.

The present tendency to save on logging expenses is false economy. It is better to use several types of logs. It is also cheaper to hire foreign expertise for specialised logging services than to leave

queries regarding the interesting subsurface horizons unanswered.

The rigs which have become unserviceable for drilling to depths beyond 2000 meters, as also the old mud pumps and the manually operated blow-out preventers should be changed.

Much greater importance should be attached to drill stem testing. Straddle packer type DST (drill stem testing) units should be used.

Much more importance should be given to laboratories in the projects. Saving on laboratories defeats the main purpose.

A more liberal policy of using cement additives should be adopted.

Some internationally known cementation experts should be invited to place the vital operation of cementation on a sounder footing.

Towards the development of a suitable oil well cement, a collaboration project should be set up involving the Cementation Research Institute, the IITs, few university chemistry departments and the ONGC Institute of Petroleum Exploration (Research Institute).

A similar initiative should be taken for developing cement additives, too.

Government should set a project for well log development, involving the Bhabha Atomic Research Centre, Electronics Corporation of India and National Geophysical Research Institute.

There is no need for a Central Directorate of Administration. It should be abolished. Administration should be a service wing under each of the different project field chiefs.

The present Directorate of Administration comprises both the Secretariat of the Commission and the Personnel Department. These should be separated.

The accounts department should have no power to ask for clarifications or to raise objections to an item of expenditure which forms part of the

approved budget unless there is a flaw in the procedure.

Finance should be involved at the horizontal level. At present the files move up to the head of a department and then it goes to finance, where the junior finance officer examines the proposal. This should be abolished.

The incentive scheme, which has resulted in a un-scientific drilling practices, should be withdrawn.

In ONGC there is over-staffing in certain areas and serious understaffing in certain other areas. This should be remedied.

The inadequate discussion at the budget preparation stage and top management's practice of pruning the budget proposals submitted by a department, even without a proper discussion, should be discontinued.

The ONGC leadership's present emphasis is only on the search for structural closures, in isolation from regional geological considerations. This has led to blind drilling and "hit or miss" tactics. Alternative hypotheses with the geological reasoning should form the basis of ONGC's exploration planning.

Except for some fundamental researchers, there should be a system of rotation between the laboratories, and from field to research and vice versa.

The 15 per cent research allowance given to IPE men should be removed.

ONGC should set up a committee to examine the various alternatives for easing the auto and transport situation.

The Ministry of Defence may be requested to meet the ONGC's minimum requirements of jeeps and trucks from the former's reserve stocks almost in the same manner as the Geological Survey of USA is given the privilege of using the transport facilities of the US Defence Services.

It was not possible for the committee to examine the pros and cons of giving freedom to the workshops to accept private jobs and also to the projects

for getting repairs done by private parties. The committee feels that there is nothing wrong in principle in accepting this proposal provided a periodical review is made to judge the comparative efficiency and cost.

ONGC should adopt a policy to promote specialisation. It should provide incentive for specialisation in terms of higher or special grades.

Collaboration should be developed with the Geological Survey of India as well as with the universities for furtherance of scientific research.

There is very poor use of library in the ONGC. This is an index of the lack of motivation for improvement of knowledge. A fundamental change in this atmosphere should be brought about.

The tendency of subjecting scientific work to mechanical cost analysis should be avoided.

The present system leaves no scope to the field parties for serious exploratory work. This system should be changed.

The responsibility for national policy for oil exploration at the highest level should vest in a body to be known as Oil and Natural Gas Commission.

The role of ONGC as national policy making body be recognised by an amendment of the statute or by a resolution of the government.

A department i.e. Ministry of Oil Exploration should be created as the implementing agency for the Commission's policy, as approved by the minister.

The Chairman of the ONGC should be a person of the Cabinet Minister's status and a member of the ONGC should be the Secretary of the Department of Oil Exploration. For some years, the Prime Minister should take over the oil exploration portfolio.

The operational functions now being performed by the ONGC should be the responsibility of a corporation, which may be called the Oil and Gas Corporation of India (OGCI).

The Board of the OGCI should have a full time Chair-

man, MD (exploration), MD (development and production) MD (off-shore), one Director of Economic Affairs, two part-time directors.

(There is a minute of dissent on the creation of a third MD Offshore).

The three Managing Directors should be Chief Executives in their respective spheres and report to the Chairman.

Although the OGCI will be a composite body to look after exploration, development and production as a whole, there should be a specific budget allocation for oil exploration.

To meet the heavy expenditure on oil exploration, a cess of about two naya paise on an average on every litre of petroleum product sold in the country may be levied by the Government. A National Oil Exploration Fund can be built out of this levy.

The existing system of directorates in ONGC should be abolished. In its place, a system of "line and staff" relationships should be introduced.

Training should be separated from the Institute of Petroleum Exploration, for the latter is essentially meant for research. The committee attaches the greatest importance to training, which should be taken up directly by the top management.

The research set-up in the ONGC should be reorganised. In addition to the research laboratory at Dehra Dun, laboratories should be considerably expanded in the regions to include petrographical, paleontological (including megafossil), palynological studies of the region as a whole.

There should be rotation of personnel between the laboratories as also from laboratory to the fields and vice versa.

An Institute of Basic Research should be set up under the ONGC within the IPE campus to conduct "objective basic" research, which has some longterm relationship with the work of the Commission.

There should be a separate design organisation for the

design and construction of sophisticated and specialised system (i.e. off shore systems and pipelines) as also to organise expertise for the large task of meeting the new transportation responsibilities of the country. The identification of this design organisation and its relationship with various organisations like ONGC, IOC, NMDC and NCDC etc. will need to be defined. A competent technical committee should be constituted by the government, within two months to decide on these issues of identification and definition of the role of HODI.

The country should be divided into 12 regions for the purpose of intensive exploration so that each region may receive due attention. The regions where there are hardly any outcrops (i.e. exposed rocks), would have to be headed by a geophysicist. Everywhere else a geologist should be the Regional Exploration Chief. Where a geologist is the Exploration Chief, a geophysicist should be the Deputy Exploration Chief and vice versa.

Sufficient powers should be delegated to the regional and project levels and a Committee of ONGC functionaries should be set up to examine the delegation of powers.

The government of India should invite the state governments' attention to the need for providing proper facilities to the oil exploration who are engaged in a work of great national importance.

The proposed corporation should set up a special Committee to prescribe the norms for deployment of personnel in a project.

There should be a change in the Central Workshop's Management which should be guided by a council consisting largely of representatives from the projects.

One or two companies to drill for water should be formed as subsidiaries to the proposed Oil and Gas Corporation.

ONGC is burdened with a large army of unproductive or

less productive labour. It is a serious problem. Government should take steps to absorb a part of this surplus labour force in some new industries.

The existing status of Hydrocarbons Indian (P) Ltd. should continue. After the conversion of the present ONGC into a corporation, and a India participates in other exploratory ventures overseas HIPL's status may be taken up for review.

ONGC should take steps to set up a synthetic oil plant for conversion of coal into oil. At present, research for this conversion is being done in the Central Fuel Research Institute, Dhanbad.

The Department of Oil Exploration may set up a geophysical company (tentatively called Geophysics India Ltd) for undertaking the most difficult operations within the country, and another drilling company (tentatively called the Indian Drilling Co) for taking up competitive jobs abroad. These should be outside OGCI but under the Commission.

The government should take up with the Institute of Cost and Works Accountants of India the question of starting a course of cost accounting specific to oil exploration.

There should be greater delegation of powers to all functional levels in the proposed Corporation. For this a special committee should be appointed to study in detail the financial powers required for different types of functionaries.

The present system of budgeting should be so changed that it would reflect the programme for the coming year and also the programme projections for next three years in exploration areas and the next five years in developmental areas.

Government may set up a National Energy and Feedstock Planning Board to dovetail production to requirements as well as to contain demands for petroleum products from sectors which can

use alternative forms of energy or feedstocks.

The nature of oil exploration invests material management with some special features. It is, therefore, necessary to carry heavier inventories of spares and equipment than would be considered optimum in other industries. ONGC's planning for equipment and stores should be far ahead of actual use.

ONGC should give much greater emphasis to forward planning of materials and budgeting towards this end; and the stores and purchase should form part of one comprehensive department of materials management.

A committee of specialists should be set up to examine the questions of procedure and methodology of operation in detail, including financial powers for the various levels.

The senior executives in the ONGC's Materials Management department should preferably be men with engineering background and given courses in materials management.

The Chief Materials Manager should function under the administrative control of the Managing Director, Development and Production but should provide service to all the wings.

The material management should aim at preparing a realistic 3-year plan for purchase of the equipment, and spares and other stores.

A "Stores and Equipment Purchase Committee" consisting of representatives from the Materials Management department, Finance and the various scientific and technical disciplines should be set up at the Centre, and in each of the regions, to screen the tenders (above a minimum value) from both the technical and financial angles and approve of the purchases.

The stores procedures should be changed to make them user-oriented.

As a general rule, the Projects Stores Officers should be freed from the responsibility

of normal purchase. The normal purchase from indigenous sources should be made by the regional offices of the material management department and supplied to the projects.

The project Stores Officer should be empowered to make emergency purchase with a fixed monetary ceiling. The project and regional Chief's financial powers for emergency purchase should be substantially enhanced and the requirement for prior financial concurrence relaxed.

The present practice of stores being "taken off charge" at the time of issue to the user sections should be discontinued. These should be "taken off charge" only when they are actually put to use.

A team should be formed to go round the projects, list the items which are being stocked, and complete their codification immediately.

It should be obligatory for every project store to submit return of every item in stock to the regional and central headquarters every two months. Stocks at all levels should be periodically reviewed and the reasons for surpluses investigated. A study should be made of how the items declared surplus could be put to productive use.

Repairs requiring service from trade, workshop or other agencies should be the responsibility of the Material Management Department. Major repairs should be referred to the regional workshops/ONGC's central workshops/firms specialising in such repairs.

There should be a regular policy of condemnation and replacement of vehicles and transport equipment. This should be done by a survey group consisting of representatives from various departments.

There should be a drive for standardisation of vehicles and transport equipment.

Transportation should be the responsibility of Materials Management Department and the functions of the transportation section should

be clearly differentiated from those of the transport section.

The committee proposed to be set up for examination of stores, purchase and supply procedures should also examine the practice about the safety measures taken in the projects for keeping the stores etc.

The aim of oil exploration efforts should be not only to discover oil accumulations but also to establish that a certain basin or its part has no commercial oil potential. From this it follows that ONGC would have to examine methodically every sedimentary basin, whether offshore or onshore, marine or non-marine, geologically young or old.

ONGC should remove the gaps in the basic data. Towards this end, much more importance should be given to the gravity, magnetic and refraction surveys.

ONGC has neglected regional geological considerations. In other countries, overlooking regional considerations has resulted in too much drilling without oil find. The importance of regional geology should, therefore, be restored.

ONGC should (i) seriously explore the flanks of anticlinal traps, and give full consideration to the geometry of the sand bodies; (ii) undertake a thorough examination of the wedge-edges of each area from the angle of structural geology, stratigraphy and hydrodynamics; (iii) give of fair trial to the possibilities of oil finds in the non-marine sediments. Even the ancient pre-Cambrian basins need not be excluded.

ONGC should make much greater co-ordinated effort for the exploration of the flanks. They should re-examine all the past cases where this aspect was not given due consideration.

A special study group should be formed in the ONGC to develop hydrological studies and to formulate objective planning for exploration of stratigraphic traps after synthesising all the available information.

ONGC should formulate a

bold policy of exploring the oil accumulation in non-marine sediments because hydrocarbons can be expected from both marine and non-marine sediments.

ONGC should also shed its prejudice against paleozoic sediments.

In order to revitalise exploration efforts in the country, ONGC should divide the total area into one whole offshore region and nine offshore regions. Besides, there should be two special study projects for the assessment of hydrocarbon potential in the ancient sedimentary basins and non-marine basins.

ONGC should lay emphasis on the study and application of various recovery techniques which would significantly augment production from the known hydro-carbon accumulations.

ONGC should organise separate conferences of the geo-scientists, the drilling personnel and the production engineers to discuss the postulates for exploration basin-wise.

Exploration plans should be separated from the development and production plans. Exploration plans should be regarded as pre-investment plans and not as investment plans.

OGCI should have a rolling five-year plan for exploration and development.

The accounting procedure in the ONGC is quite involved and does not represent true trends. It therefore requires simplification.

There has been no rational approach in the pattern of financing of ONGC. Borrowed funds have been repaid through further borrowing with increased liability towards interest charges. The present pattern of financing inhibits ONGC's efforts in carrying out exploration activities.

The pre-exploration project reports from the ONGC should not be equated with other project reports submitted by manufacturing units and that they should not be applied

similar yardsticks for appraisal.

The present ONGC or the future OGCI would be able to function effectively and quickly if a bulk amount of, say, Rs five crores per annum is placed at its disposal as foreign exchange instead of each major case being referred for clearance from the foreign exchange angle from DGTD, Department of Economic Affairs, etc. as at present. The nature of work in ONGC is such that it is most essential to have all stand-bys ready for any emergency.

Considering the high risk factors and uncertainties involved in oil exploration, the conventional method of financial exploration needs modification. The expenditure on exploration programme for the next 10 years is estimated to be of the order of Rs 400 crores i.e. Rs 40 crores per year. The committee suggests that the funds should be made available by way of grants from government and not by way of capital, which raises the capital base significantly and makes the ONGC answerable for dividends which, in the present situation, it is not in a position to declare.

A "National Oil Exploration Fund" should be created to finance the oil exploration, which would be operated by the OGCI in accordance with the directives of the ONGC. This fund would be fed by contributions from the Development and Production Wing of the OGCI, grant from government, and other sources, if any.

If government finds it difficult to allocate funds (as grants) every year from the General Revenue for oil exploration, then a cess may be levied for creation of National Fund for oil exploration. This may be on all petroleum products including lubes, bitumen, waxes etc.

For meeting the fluctuating requirements towards working capital of the development and production wing, the OGCI may be permitted to operate a cash credit account with the State Bank of India

upto a limit of say Rs five crores.

The work of preparation of budgets and exercising a continuous and close watch should be entrusted to budget committees—both at the headquarters as well as in the projects. The budget committee should meet at least once a month.

The long-term budget for ONGC should be a five-year budget so drawn up every year that the first year's budget will form the basis of a detailed budget for the next year. With the addition of a forecast for one more year, this will be a cumulative five-year Plan.

Resident cum-concurrent audit should be introduced for the new ONGC and the corporation/companies under it. The government may request the Comptroller and Auditor General to consider the suggestion favourably.

A very large part of the prospective area in the country, the offshore has not been surveyed. This has resulted in a gap in the data and certainly in the interpretation of airborne magnetic data. These gaps should be removed without delay. In addition, a number of basins, in which aeromagnetic surveys were earlier carried out with the now obsolete instruments, should be resurveyed to get a better picture. Some areas in the Ganga Valley, the Bengal Basin and the western Rajasthan deserve to be resurveyed immediately.

Much more attention should be paid to the very important aspect of the composition and array of seismic sensors.

The commission should give the highest priority to bridging the gaps in the acquisition of marine geophysical data so that ONGC can undertake exploration in our vast shelf areas in the quickest possible time.

A group of scientists, mainly geophysicists and mathematicians, from among the best available talents in the Commission and in the country should be organised for the generation and development

of geophysical, specially seismic, softwares.

In the field of ancillary seismic equipment viz. digital grade geophones, hydrophones, CDP cables etc, full efforts should be made to have these indigenously manufactured, in the next three to five year.

Men in geophysical field operations should be given incentives such as reasonable allowance for doing the actual field work.

The development of radio-navigation system, including positioning by the use of satellites, should be undertaken specially when the country has a very large marine area to be explored and exploited for minerals (including petroleum), oceanographic studies, marine biology and for defence.

Design and manufacture of the digital computers tailored to geophysical data processing will have to be taken up. But it is too much to assign this task to ONGC because of its very specialised nature and should be entrusted to an organisation like Electronic Corporation of India Ltd. Geophysicists from ONGC should however be associated with it.

The Commission must urgently set up an apparatus to design and fabricate instruments which are associated with non-explosive sources.

A project should be set up for development of well logging instrumentation.

The Commission's logging technicians should be trained in the methodology of modern data processing and interpretation, and comprehensive well logging evaluation methods in both their qualitative and quantitative aspects.

Expertise for drilling deeper wells with high-pressure conditions should be built up by deputing a few of our drillers abroad. Expertise in turbo-drilling technique may be acquired from the USSR.

The drilling tools must be provided with good coring equipment. Wireline coring methods should be employed wherever practicable.

There should be a review of the costing system.

Some internationally known

experts should be invited to put the high-temperature cementation technology on sound footing. Cementation section should be brought under the control of a Chemist. The Cement Research Institute at Delhi may also be consulted for the cementation problems.

The scientific/technical competence of the senior men of the present directorates and project managers should be revaluated.

ONGC should give top priority for personnel development for the next few years.

ONGC should give immediate attention for the development of indigenous science base. For this, they should recruit best students of geology, physics, mathematics, chemistry, mechanical and production engineering, and give advanced courses/integrated training courses to mould them as exploration scientists.

There should be no recruitment at the lowest entry point for the officers' category without prior training. It would be necessary to set up a committee consisting of broad visioned specialists to prepare the syllabi for each category of trainees.

Refresher courses for employees of different backgrounds and different levels should also be arranged in ONGC's Training Institute.

Vigorous steps should be taken for the training of ONGC's class III and IV employees.

For imparting intensive training to ONGC's personnel, not only the recruitment policy of ONGC should be very cautious in future, but ONGC should also make a careful screening of its existing work strength. The manpower found surplus on the basis of the work strength. The manpower found surplus on the basis of the work study may be absorbed in the new projects which have been recommended. In this connection, the practice of employing people initially as contingent labour and absorbing them after 240 days of continuous work should be stopped.

The importance of promoting

specialisation should be recognised by ONGC.

There should be a rotation of personnel from field to laboratory; from central headquarters to region or project and vice versa.

The ONGC's system of appraisal, selection and promotion should be changed.

Accountability is basic to the functioning of an organizational system and should be strictly enforced.

There should be a systematic intake of fresh blood at all levels. The selection should be based on tests designed to excite the imagination of the candidates and assess their potential.

There should be liaison between ONGC and Indian School of Mines so that the latter can plan its admission to the petroleum engineering course.

In the past there have been lopsided promotional opportunities for different disciplines. To correct this imbalance, the proportion of higher level posts has to be more certain levels of scientific disciplines.

There should be no fixity of sanctioned strength (posts) in the scale of Rs 700-1400. But above this, there has to be a fixity.

If anybody does an outstanding work of merit, no matter what level of posts he may be holding at the time, he may be considered for a much higher post.

The pay scales of functional members of the board of directors of the future OGCI should be brought on par with those of the functional members of the board of directors of other big corporations.

A person joining in the lowest class I officer's grade should be given a rigorous professional test after five years, for promotion to the next higher grade.

There should be a suitability test to cross the Efficiency Bar.

A worker should expect at least two promotions in life which should be based on tests and CRs.

Class I officers should have the right of appeal to the constituted ONGC if there is

any grievance which has not been redressed by the operating body.

There are complaints that fear of CSI inhibits decision making and prevents initiative at the operating levels. Government should have the question examined in detail.

ONGC or OGCI should constitute an internal committee to find a solution of the ageing field men who are becoming unfit for the strenuous work of drilling and field surveying.

A concrete study should be made of the conditions of living in each of the ONGC's producing fields for the purpose of deciding the question of termination or partial continuation of the project allowance.

The special allowance available to the ONGC's employees in the Research Institute (IPE), the Design Organisation (HODI) should be abolished.

The travelling and daily allowances of ONGC employees should be brought on par with those of IOC and FCI.

The Field Establishment Allowance to the ONGC field parties should be enhanced.

The lives of the personnel who have to work in dangerous surroundings should be insured at the cost of the Commission. Compensation policy for disabled officers and staff could be more liberal than that present.

The government should take steps so that loans on easier terms are available for the construction of houses for ONGC's employees. ONGC should pay House Rent Allowance to its employees at enhanced rates.

There is great need of residential schools for the children of exploration personnel in particular, and of the ONGC employees in general.

ONGC should give more serious thought to providing better medical facilities to the personnel of the projects fields. ONGC should adopt the scheme for encashment of leave. ONGC should employ social workers to keep in contact with the families of the ONGC employees and to know their problems.

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

Stain-proof, easy to clean and polish, Linoleum comes in a wide range of colours and designs. Choose yours.

LINOLEUM

The versatile floor-covering ■ For better living

India Linoleums Ltd.,
P.O. Birlapur, 24 Parganas, West Bengal.

ASPUL-S

Wholesale Prices

THE WHOLESALE prices as measured by the official index (with the year ended March 1962 as 100) stood at 192.3 in April 1972 as against 192.2 for March 1972. The general index at 192.3 was however higher by 5.5 per cent when compared to that of a year ago. During the month under review, 'liquor & tobacco' (+6.2 per cent to 216.5), 'fuel, power, light & lubricants' (+1.0 per cent to 177.7) and 'machinery & transport equipment' (+1.6 per cent to 165.2) showed significant advances while 'industrial raw materials' (-3.5 per cent to 175.8) recorded a noticeable fall.

Food Articles

The index for the sub-group 'cereals' moved up slightly by 0.2 per cent to 209.0 owing to an increase in the prices of rice and bajra although the prices of wheat, jowar, maize, barley and ragi declined. Lower prices of gram and masoor brought down the sub-group index for 'pulses' by 2.3 per cent to 279.4. The prices of arhar and moong, however, advanced. On the whole, the index for 'food grains' receded by 0.4 per cent to 221.7 during the month under review. The sub-group index for 'fruits & vegetables' recorded a rise of 2.4 per cent to 193.4 due to an advance in the prices of potatoes, oranges although the prices of onions and bananas recorded a fall. Substantial increase in the prices of milk was responsible for raising the index of 'milk & milk products' by 2.3 per cent to 221.9. The sub-group index for 'edible oils' stood at 196.2 against 197.7 for the earlier month. Prices of groundnut oil and coconut oil fell while those of gingelly oil and mustard oil advanced. A fall of 2.2 per cent to 257.1 in the index for 'fish, eggs & meat' was brought about by a decline in the prices of all the items under this sub-group. The sub-group index for 'sugar &

allied products' worked out at 247.6 as against 248.0 for the preceding month. The sub-group index for 'other food articles' slightly rose by 0.8 to 160.8 because of an increase in the prices of spices and condiments and betelnuts. However, a fall was noticed in the prices of tea, coffee and salt.

Liquor & Tobacco

Higher prices of raw as well as manufactured tobacco

raised the index for this group by 6.2 per cent to 216.5.

Fuel, Power, Light & Lubricants

The index for this group moved up by 1.0 per cent to 177.7 as against 176.0 for the previous month due to an increase in the prices of kerosene oil, petrol and rectified spirit. The price of castor oil, however, showed a fall.

Industrial Raw Materials

Lower prices of raw cotton and raw jute & mesta

brought down the sub-group index for 'fibres' by 6.8 per cent to 153.0 although the prices of raw hemp raw wool and raw silk advanced. A fall of 3.0 per cent to 196.3 in the sub-group index for 'oil-seeds' was caused by a recession in the prices of groundnuts, linseed, castorseed, cotton seed, and copra. However, the prices of gingelly seed and rapeseed moved up. The sub-

Source : Office of the Economic Adviser, Ministry of Industrial Development.

group index for 'minerals' remained unchanged at its last month's level of 141.5. The sub-group index for 'other industrial raw materials' stood at 175.1 as against 174.8 for the earlier month. Prices of raw hides, and raw skins moved up while those of lac fell.

Chemicals

The index for the 'chemicals' group stood at 198.8 as against 198.7 for the earlier month.

Machinery & Transport Equipment

The index for this group rose

by 1.6 per cent to 165.2 due to an increase in the prices of both electrical and non-electrical machinery items.

Intermediate Products

A fall of 0.6 per cent to 205.3 in the index for 'intermediate products' has been caused by lower prices of cotton yarn, rayon, zinc, brass sheets, copper sheets and tin. The prices of coir yarn leather semis, and lead, however, advanced.

Finished Products

Enhanced prices of coir mats and mattings (+4.1 per

cent to 183.0), silk & rayon manufactures (+1.0 per cent to 132.1), jute manufactures (+0.4 per cent to 202.7) and cotton manufactures (+0.1 per cent to 164.6) pushed up the sub-group index for 'textiles' by 0.2 per cent to 171.2. The sub-group index for 'metal products' advanced by 1.9 per cent to 190.9 due to an increase in the prices of iron & steel manufactures and cutlery & hardware items. A rise of 0.6 per cent to 155.7 in the sub-group index for 'non-metallic products' was brought about by an increase in the prices of cement, bricks and tiles. 'Chemicals products' sub-group witnessed an increase

of 1.0 per cent to 153.4 due to an advance in the prices of fertilisers, paints & varnishes and dyeing materials. A fall was, however, noticed in the prices of essential oils. 'Leather products' remained stationary at its earlier month's level of 98.0. The indices for 'rubber products' (+0.6 per cent to 159.3), 'paper products' (+0.2 per cent to 136.3) and 'miscellaneous products' (+0.1 per cent to 124.2) recorded advances. The sub-group index for 'oilcakes' went up by 0.3 per cent to 178.1. On the whole, the index for 'Finished Products' rose by 0.6 per cent to 165.6 during the month under review.

ALUMINIUM IN CONSTRUCTION & STRUCTURAL USES

For Building & Construction, HINDALCO offers Semi-fabricated aluminium products (sheets and extruded shapes) in a wide range to suit diverse jobs. High strength-to-weight ratio and low maintenance costs make Aluminium the ideal choice of modern builders and architects. Besides, for making buildings cool in summer and warm in winter, aluminium panels are being increasingly used today in modern sky-scrapers. HINDALCO Semi-fabricated products are so versatile that they can be used in making almost anything, from landing mat for Aeroplane in an emergency defence purpose to drainage culverts in farms for Agricultural purposes.

MODERN BUILDERS SPECIFY HINDALCO ALUMINIUM.

Cheers to the team spirit

WHETHER THE Prime Minister would be able to reorganize the economic ministries in a more rational manner and man them adequately at the ministerial level later in the year remains to be seen. She has however had the prudence to realize that an effort has to be made in the meantime to achieve some co-ordination of inter-ministerial activity in the economic sphere. Ordinarily the Minister for Planning should essay this task in association with the Finance Minister and under the general guidance or supervision of the Prime Minister. Mr D.P. Dhar, however, is new to his job, while Mr Chavan seems to be sulking in his tent. Mr C. Subramaniam, newly vested with the portfolio of Industrial Development, has therefore been only too ready to deputize for him in the matter. Last week, at his instance, there was an informal meeting attended, apart from himself, by the ministers of Steel, Mines and Metals, Petroleum and Chemicals, Planning, Railways and Foreign Trade.

It appears that such meetings will be held periodically for informal exchange of views in order to facilitate inter-ministerial co-ordination and decision-making. The Minister for Industrial Development would perhaps seek to be *primus inter pares* in this ministerial group of six. This will not be unreasonable because it is desirable that the Industrial Development ministry should become more and more the government's primary operational machinery for formulating or guiding the industrialization processes of the nation. The question, however, is whether the government as a whole is organized properly at present to allow this ministry to function in this manner. For instance, how would the Minister for Planning fit into the picture? It may be expected that Mr D.P. Dhar would seek to be an active and forceful member of the cabinet and since he has the reputation of being a quick learner he may be expected to get over soon enough the disadvantage of being new to his portfolio. It is not unlikely, therefore, that very soon the issue may arise whether the Minister for Planning should do the co-ordinating or the Minister for Industrial Development.

Again, there has been no indication so far of the way the Finance Minister feels about these goings-on. It is improbable indeed that he would agree to join the informal group of economic ministers which has been formed now unless he could be the master of ceremonies. As it is, his ministry was not represented at all at the meeting last week. In view of the fact that Finance must necessarily enter the argument at some stage or the other, there are bound to be occasions when the Subramaniam group might find the need for the Finance Ministry's presence at the discussions.

Rather interestingly the Minister of State for Company Affairs was not present when Mr Subramaniam and the other economic ministers had their meeting. It has been alleged that the motivations or the workings of Mr Raghunatha Reddi's establishment have had much to do with the poor showing of the government in the promotion of industrial growth. The kind of co-ordination which the Prime Minister may have in mind or the Ministry of Industrial Development would like to engineer must surely require the active participation of the Department of Company Affairs and the minister who is now in charge of it. It could perhaps be argued also that, since important industries are under the charge of the Ministry of Food and Agriculture, the Defence Ministry, the Ministry of Transport and Shipping, the Ministry of Communications and other ministries not strictly classed as economic ministries, the group of six would be able to function only in a manner short of complete comprehensiveness. Even so, in practical terms, there are clearly gains to be made by the coming together of as many of the economic ministries as possible for the purpose of holding informal consultations among themselves. Quite possibly this process would get extended in due course to bring under its coverage more and more ministries with economic responsibilities.

Since personalities and personal equations have much to do with the functioning of the government, it is a happy circumstance that the ministers for Industrial Development and Steel, Mines and Metals happen to have good personal relations with each other. Mr Subramaniam and Mr Mohan Kumaramangalam are already known to be working fairly closely with each other in the council of ministers. This applies also to Mr Kumaramangalam and Mr Gokhale, and will be no doubt true of Mr Subramaniam and Mr Pai. While the government cannot afford to have its ministers going about organizing themselves into exclusive coteries, it may certainly be an advantage if a sufficient number of ministers, whose ministries have a great deal to do with one another, do find that official connections could be reinforced by personal associations. In any case it is certainly better that ministers should band together for public purposes rather than for pursuing private goals or interests.

The task that lies immediately ahead of the economic ministries is undoubtedly

one of increasing industrial production all round. Prices are rising while the growth of exports is suffering — both in the context of gathering domestic inflation. There is an urgent need for more goods of almost every description, while there is a special need for an increase in the output of essential consumer goods. If the economic ministries desire to make an impact on the public consciousness, they should make an effort on a grand scale to formulate a series of measures which could individually and collectively help increase industrial production by making it possible for the factories in the land to utilize their installed capacities more intensively.

The problem here is to identify the major bottlenecks and decide what could be done to widen them, so that raw materials could flow more freely into the plants even as finished goods move out of them smoothly towards markets all over the country. In evolving a suitable strategy for this purpose the Minister for Industrial Development will have to rely heavily indeed on ministries such as the Railways which must strive to move more goods faster. The ministry of Foreign Trade, after talking too loud and too long about a breakthrough in exports, has now sobered down and conceded that grand visions of an export drive are bound to be misleading so long as industrial production in the country does not recover, or industrial growth is not accelerated. The Minister for Steel, Mines and Metals, who obviously aspires to be the pacesetter for the economic policies of this government, has to realize first of all that, unless there is an improvement in the efficiency of the steel plants for which his ministry bears a direct responsibility, there will be no brightening prospects either for domestic price stability or for the growth of exports.

Although the ministry of Industrial Development is generally assumed to be primarily responsible for industrial development generally or the progress of various industries individually, the truth is that several important industries, basic or strategic, lie quite outside its direct purview. The cotton textile industry, for instance, is with the ministry of Foreign Trade, while the petroleum, chemical and pharmaceutical industries are with the ministry of Petroleum and Chemicals. It follows that wherever a clear need exists for vigorous promotional measures for increasing the output of industries such as these, the ministry of Industrial Development can make itself effective only by taking the initiative to discuss with the particular ministry concerned the programme or programmes that may be immediately called for.

Apart from this, the most significant contribution that the new Minister for

Industrial Development can make to the industrial well-being of the country is to mobilize support not only among a few economic ministries but in the council of ministers as a whole for rationalizing and liberalizing the broad industrial policies of the government so that the prevailing deterrents to industrial investment or industrial expansion may be removed. If the ministry of Industrial Development is to succeed it must become a policy-oriented ministry, analysing the implications and consequences of current policies and working for the improvement, modification or even the abandonment of such of the features of these policies as are found to come in the way of current production or expansion

of industrial capacity. Prevalent thinking on the fifth Plan gives great importance to the growth of consumer goods industries as a part of the anti-poverty programme. The point is that production, whether of consumer goods or other goods many of which may in fact be needed for the production of consumer goods, is a function necessarily of the general level of economic activity in the country. Poverty can be fought only by the creation of wealth so that more wealth becomes available to be shared more equitably. It is to be hoped that the country will not have to wait long for some indication that the economic ministries can act both individually and collectively to deliver the goods to a waiting nation.

Borrowing is beautiful

THE FIRST tranche of the borrowing programme of the central government for 1972-73 has been completed with the least effort and the money market was in such an extremely comfortable state that a much larger amount could have been raised without creating strain anywhere in the organised sector. The three loans 4½ per cent 1979, 5 per cent 1983, and 5½ per cent 2002 were oversubscribed in less than an hour on July 15 and the lists had to be closed within a short time of their opening. Aggregate subscriptions in the form of conversion and cash applications amounted to Rs 386.61 crores against the notified amount of Rs 350 crores, and all subscribers received full allotment. The government has of course exercised its right to accept subscriptions up to 10 per cent in excess of the notified amount. It could thus borrow a net amount of Rs 131.79 crores as the maturing 4½ per cent 1972 loan was outstanding to the extent of Rs 254.82 crores. The conversion operation has been a greater success on the present occasion than in earlier years as applications from the holders of 4½ per cent 1972 loan were as much as Rs 236.91 crores and only about Rs 18 crores had to be repaid on July 15. In July 1971 against a notified amount of Rs 375 crores aggregate subscriptions for three loans amounted to Rs 405.78 crores. Conversion applications were Rs 298.36 crores against the outstanding amount of Rs 332.09 crores in respect of the maturing 4½ per cent 1971 loan. The funding operation recently completed has therefore meant a smaller outgo of funds and net borrowing also has been on a larger scale.

An analysis of the conversion ap-

plications for the recent loans shows that there were larger subscriptions for the long dated and medium dated loans. Those against 5½ per cent 2002 were Rs 105.24 crores, 5 per cent 1983 Rs 87.56 crores, and 4½ per cent 1979 Rs 44.11 crores. It is also noteworthy that cash applications too showed a similar preference, those for the long dated loan being Rs 93.26 crores, for the medium dated loan Rs 48.03 crores and for the short dated loan only Rs 8.41 crores. This is a clear indication that institutional investors, particularly the Life Insurance Corporation and provident funds, have been anxious to secure a higher average yield on their investments by taking advantage of the more attractive interest rates on loans with longer maturities. This is perhaps due to the difficulty now being experienced in finding remunerative use for funds.

The government could have actually adopted a bolder policy as even with the siphoning away of over Rs 131 crores there is no sign of strain on the money market and the inter bank call rate in Bombay is quoting between 3½ per cent and 4 per cent. It has not even been necessary for the scheduled commercial banks to borrow sizably for a temporary period in order to meet the needs of its constituents and also invest fairly large amounts on their own account in the new loans. This has been due to the fact that a growth in deposits has latterly been very impressive, and advances also have started declining. Since there will be further sizable additions to deposits in the coming weeks, and advances also will tend to contract steadily, the centre could have easily borrowed Rs 175 crores without creating any trouble for the state governments which may not raise a net amount of more than Rs 125 crores.

The difficulties experienced by the scheduled commercial banks in putting to good use available resources will be

clearly borne out by the increase in advances during a twelve month period ended July 14, 1972 being only Rs 530 crores against an increase in deposits in the same period of as much as Rs 1381 crores. It was therefore possible to wipe out more or less completely borrowings from the central banking institution and invest also nearly Rs 300 crores in government securities and treasury bills alone. There should have been also a big increase in holdings of bonds and trustee securities. With fresh additions to deposits at an average of Rs 30 crores every week there would be a growth in deposits of nearly Rs 200 crores before the list for the state governments' loan open on September 4, 1972.

There are maturing loans for over Rs Rs 84 crores and with the known anxiety of many state governments to raise larger net amounts through open market loans, the notified amount can be easily Rs 200 crores. Even if the net amount borrowed was Rs 116 crores there would be surplus cash balances with the banking system. It remains to be seen whether the Reserve Bank would effect sizable open market sales for enabling banks to employ their surplus resources remuneratively. These sales can easily amount to Rs 75 crores even before the state loans are out of the way. Such a state of affairs has not prevailed in the money market in the past decade and the developments in the current slack season have been extremely slack after procurement operations of the Food Corporation and other agencies were completed.

Even allowing for liberal borrowing by the state electricity boards and the statutory financial corporations the central government can exceed substantially its target for net borrowing which has been fixed at Rs 215 crores for 1972-73. Already Rs 131 crores have been raised and it may be necessary to have an unusual funding operation in the next fortnight in order to replenish the holdings of terminal loans of the Reserve Bank on account of large open market sales. The funding of ad hoc securities of about Rs 100 crores usually takes place in February every year. In view of the cautious policy pursued by the central government the first stage of its borrowing programme and the compulsion on the part of the banks to invest their surplus resources in terminable loans, the funding of treasury bills may have to take place earlier than usual, as stated above through re-issues of the recent loans. Already the Reserve Bank has started effecting open market sales of the new loans with the long dated issue being offered at a premium of 10 paise and the medium dated issue at a premium of 5 paise over the issue prices.

The short-dated loan is of course being offered at par.

Member banks might like to invest their surplus resources until the middle of October in terminable loans. As it is likely that there will be fresh additions to deposits in these three months of nearly Rs 400 crores and there may also be a contraction in advances to the extent of Rs 100 crores in all an amount of Rs 500 crores has to be invested in terminable loans and treasury bills. Assuming that the state governments will be raising a net amount of Rs 125 crores and there will be bonds of state electricity boards and others for Rs 100 crores the central loan can absorb Rs 150 crores even allowing for the wiping out of loans that may be temporarily taken. This would mean that even by the middle of October there is scope for raising a net of Rs 280 crores against the target of Rs 215 crores. There will of course have to be fresh investments out of fresh additions to deposits upto the end of the year. On present indications, it will thus be possible to raise easily Rs 300 crores against the net amount of Rs 294 crores borrowed in

1971-72 which is a record for recent years.

Besides the compulsion to invest new deposits in new loans almost concurrently there will also be the unusual feature of sizable purchases of treasury bills out of funds that may start accumulating after the end of September. The investment in treasury bills can be easily Rs 100 crores and for the first time in living memory the 1972-73 busy season will start under extremely comfortable conditions. Apart from there being no borrowing by member banks from the Reserve Bank, the investments in treasury bills can be utilised if there is an aggressive demand for funds in December or January next. There may be need to borrow from the Reserve Bank on a large scale only if there are big additions to sugar stocks and the cotton crop also is again a bumper one. The outlook for borrowing for central and state loans is thus extremely encouraging though it may not be considered a happy development by many experts that there should be a persistent decline in the credit deposit ratio when available resources should be effectively utilised for hastening economic growth in all sectors.

A CLARIFICATION

Arguing for the government on the writ petition filed by several newspaper owners and interests challenging the government's newsprint price control policy, the Additional Solicitor-General made certain submissions on July 28 before the five-member Constitution Bench of the Supreme Court, presided over by the Chief Justice in the course of which he (Mr F.S. Nariman) made a reference to this journal in terms which are inaccurate and misleading. According to the newspaper reports of the relevant proceedings in the Supreme Court, the Additional Solicitor-General, while contending that if any newspaper wanted to use varieties of printing paper other than newsprint they were free to do so, said that one of the petitioners was publishing *Times Weekly* using white printing paper while another was bringing out *The Sunday World* and the weekly journal *Eastern Economist*.

The suggestion here seems to be that *Eastern Economist* is a *Hindustan Times* publication in the same way as

Sunday World is a *Hindustan Times* publication, or, *Times Weekly* is a *Times of India* publication. This is a misreading of the situation on the part of Mr Nariman or those who have briefed him. The true position is that *Eastern Economist* is NOT a *Hindustan Times* publication. It is financially, organisationally and indeed in every respect an independent publication and has no association or link with *The Hindustan Times* in the manner suggested by the Additional Solicitor-General or indeed in any other manner. I may add that, although at one time *Eastern Economist* was being printed at *The Hindustan Times* Press as a commercial arrangement, it is for quite some time now being printed in another private press. To put the record straight, I would once again make it clear that *Eastern Economist* does not belong to any newspaper group or chain, but is an independent publication which is entirely on its own.

—Editor

Slipping on statistics

UNTIL A couple of months ago, the spokesmen of the Ministry of Foreign Trade were confident that the total exports for 1971-72 (data always released with a time-lag of four to five months) would cross the Rs 1600 crore-mark and would keep up the momentum generated in the earlier two years. The final tally of exports has disclosed an increase of only 2.1 per cent in 1971-72 over the previous year. The earlier exuberance was based on faulty statistics, especially those relating to exports from the port of Calcutta which account for nearly two fifths of our total exports. The Director General of Commercial Intelligence had added, instead of subtracting, Rs 2.5 crores every month to the export figure for ten months — April 1971 to January 1972 — in lieu of "short and shut out" shipments. It was this statistical illusion of five crores of rupees per month over a period of ten months which had cheered up the officials of the Ministry of Foreign Trade. When the truth came to light the first action that the ministry took was to ask the Director General of Commercial Intelligence to proceed on forced leave indicating that something was seriously wrong with the statistics-gathering machinery at Calcutta.

As stated above, the value of exports at Rs 1567 crores in 1971-72 showed a marginal rise of about two per cent over 1970-71. The exports of this country were reported to have risen by 8.5 per cent in 1970-71 over 1969-70 and by about four per cent in 1969-70 over 1968-69. Thus for the first three years of the fourth five-year Plan period, the rate of rise in exports worked out at nearly five per cent per annum as against the target of 7 per cent per annum fixed by the planners. The value of imports in 1970-71 increased while exports were sluggish; it widened the trade gap. It has naturally caused concern because the drop in our capacity to earn foreign exchange at this juncture can have serious repercussions on the economy in view of the US stoppage of aid and our resolve to be increasingly self-reliant.

It may be recalled that Mr L. N. Misra, the Minister for Foreign Trade, had exhibited great satisfaction last year when exports at Rs 1535 crores in 1970-71 were reported; they indicated a rise of 8.5 per cent over 1969-70. This sharp rise in exports was contested and it was pointed out in March this year by *Eastern Economist* and other newspapers that a part of the increase in the value of exports was

due to inaccurate statistical accounting. A new procedure of recording exports adopted in November 1970 under the advice of a sub-committee headed by Mr P.L. Tandon, Chairman, State Trading Corporation, had inflated these figures giving undeserved credit to the Ministry of Foreign Trade. The minister had to concede, in a statement made in Parliament, that the new procedure was erroneous and had assured the House that the traditional system of listing exports would be adopted. It was the return to the old system of registering exports in 1971-72 minus the accidental error in Calcutta export statistics which had clearly shown that the export picture was not very bright and that the official statisticians had misled the ministry not once but twice.

Assuming that no further statistical errors in the value of exports are likely to be found, the analysis of our export performance shows that some of the significant advantages which we enjoyed in 1971-72 were nearly nullified by the adverse factors which were in operation. Among the favourable factors, the most important was the easy availability of raw jute from Bangladesh which assisted our jute mills to increase their production as well as exports. Because of the virtual absence of competition from Bangladesh the unit prices realised for jute manufactures were surely more favourable than in the preceding years. It is estimated that jute exports in 1971-72 increased by as much as Rs 60 crores over 1970-71. In

the case of tea also, the unit prices realised were higher, though the overall increase was not significant. Other commodities which recorded sizeable increases in exports were sugar, engineering goods, hides and skins, manufactured tobacco, spices, handicrafts, coffee, castor oil, chemicals and allied products.

The advantages accruing from the increased exports of all these commodities were wiped out by the reverses encountered in the case of a number of other commodities such as iron and steel, cotton yarn, iron ore and hides and skins. The drop in the production of iron and steel in the country was responsible for a reduction in their exports. In fact, the imports of steel had to be increased in order to meet the increasing demands of the engineering goods industries. Again, the shortage of cotton in the country brought about paucity of cotton yarn which in turn reflected on our exports. The recession in Japan in the wake of the crisis in the international monetary system last year hurt our exports of iron ore.

Among the adverse factors which our exporters encountered last year, the pride of place must go to the bomb-shell which Mr Nixon threw on August 15 last year by floating the dollar and de-linking the dollar and gold. The crisis which ensued in the international monetary system gave a severe jolt to our exporters because of the uncertainties involved, especially the absence of the fixed exchange parities which caus-

ed gloom in international trade, cutting its growth rate to half. Naturally our country could not escape the painful effects of these trends in international trade.

The persistent shortage of steel too had an unhealthy effect on the engineering industry whose production and export schedules were seriously impaired. Efforts were made, no doubt, to fill the gap through imports but without much success. The engineering industry had plans to increase its exports from Rs 117 crores in 1970-71 to Rs 175 crores in 1971-72, but the total value of these exports did not rise beyond Rs 130 crores. Partly the liberation movement in Bangladesh and the 14-day Indo-Pakistan war were also responsible in slowing down the pace of operations of this industry in eastern India.

The spurt in prices which has been wit-

nessed during the last one year in this country is also partly responsible for slowing down our exports. With fixed exchange parities, inflation at home does make export commodities uncompetitive in markets abroad and thus plays havoc with export capabilities. The impact of rising prices has not been clearly seen by the Ministry of Foreign Trade in reducing our exports in international markets.

Much has been said about the helpful possibilities of the generalised system of preferences (GSP) which is supposed to help our country as well as other developing countries in increasing exports. The total impact of the GSP has been negligible because the bulk of the advantage under this scheme was to accrue from the USA which has so far failed to fall in line with the EEC while even the latter has hedged in the scheme with numerous conditions and restrictions.

mittee which had desired that the problem of ceilings of plantations should be studied further by an expert committee. In the case of orchards, the ceiling is to be 54 acres with the proviso that attempts will not be made to clear orchards to release land for cultivation. The holdings of educational, religious and charitable trusts are not proposed to be brought within the purview of the ceiling laws. The exemption to mechanised farms, seed farms, goshalas, etc., from the above ceilings, however, is to be withdrawn. The proposed legislation is to take retrospective effect from January 24, 1972.

It is, indeed, a pity that in deciding on a ceiling of 18 acres per family of five for land assured of perennial irrigation, the chief ministers and the Congress Working Committee have ignored the pleas of such eminent persons as Mr M.S. Randhawa, Vice-Chancellor of the Punjab Agricultural University, that the optimum size for an agricultural holding is about 22 acres. There can be no denying the fact that all through the past 25 years since independence, neither the central government nor the state governments have been able to come to a sound decision on the minimum economic size for agricultural operations. The raising of the ceiling to 22 acres of perennially irrigated land per family of five would have somewhat reduced the quantum of land available to the state for redistribution. But it may be pointed out here that nearly 50 per cent of the cultivable area which accrued as surplus after the last land reform in the late fifties and early sixties — about 2.5 million acres — is yet to be distributed among the landless. The record of distributing this "surplus" land has been satisfactory only in one state — Jammu and Kashmir.

It is true that the smaller the holding the better attention it gets from the farmer and his family. But the labour of the farmer and his family alone is not the determining factor for the productivity of land. The recent breakthrough on the wheat front and some improvement in the unit-area yields of other crops, however, are clear indications that the application of science and technology in the shape of modern inputs like hybrid seeds, fertilizers, pesticides, etc., is a must for raising unit-area yields. This also is the lesson to be learnt from the post-war experience of Japan and Taiwan where agricultural holdings are roughly between five and eight acres. Unless, therefore, the proposed land ceiling legislation is accompanied by a massive drive for the use of modern farming inputs on small holdings, agricultural development is likely to suffer a setback.

Consensus on land ceilings

At a meeting held here last week, the state chief ministers, including Mr M. Karunanidhi of Tamil Nadu — the only major state which has a non-Congress government — generally endorsed the recommendations of the Congress Working Committee on land ceilings. It was decided that the ceiling on holdings of land with assured irrigation for two crops in a year, whether from government or privately-owned sources, should range between 10 and 18 acres. Within the upper limit of 18 acres, the lands irrigated through private means should get a weightage of 25 per cent. For lands having irrigation facilities for only one crop in a year, the ceiling is to be 27 acres. In this case, however, no weightage is to be given to private irrigated farms. The ceiling for the ownership of dry lands is to be 54 acres. In the case of desert and hilly areas, the ceilings may not conform to the above three-tier system. They will be fixed by the states — of course, in consultation with the union Ministry of Agriculture — taking into consideration the local conditions. The ceilings will be family-wise; the family will consist of husband, wife and three minor children. For larger families, additional land is to be allowed. But in no case, the total holding of a larger family is to exceed twice the ceilings for the standard-sized family of five for the three categories of lands.

In arriving at the above formula, the

chief ministers have tried to strike a balance between contending views. The 'radicals' had been demanding a uniform ceiling of not more than 18 acres on the holdings of the best land in the country. All sorts of arguments were put forth by them for not differentiating between land assured of perennial irrigation from government sources, as suggested last year by the Central Land Reforms Committee, and land which is irrigated by private means. They had argued that most of the investment for creating private irrigation facilities had come in the form of government loans which, in many cases, were not even being repaid. The chief ministers and the Congress Working Committee have attempted to accommodate this point of view to a limited extent by lowering the ceiling for holdings of land which have assured perennial irrigation from government sources.

An important decision of the conference is that plantations of tea, coffee, rubber and cardamom will not be governed by the above ceilings. The leftists had been vociferously demanding the inclusion of these plantations also in the land ceiling laws, completely ignoring the fact that in the interest of keeping the cost of production of these plantations at reasonably low levels, their sizes had to be kept economic according to the global standards, specially when tea, coffee and cardamom are valuable foreign exchange earners and rubber is a commodity the production of which has to be increased steadily for meeting the growing demand. In the case of these plantations, in fact, the chief ministers have gone slightly beyond the suggestion of the Congress Working Com-

Eastern Economist 25 Years Ago

August 8, 1947

"The partition of railways is an integral part of the overall division of assets and liabilities between the dominions of India and Pakistan. It is essential that each dominion should have a clear definition of the extent of its rights over specific portions of the existing railway systems together with the assets attached to them. But the aspect of division which relates to liabilities is no less important. Loans raised for financing the construction of railways form a substantial part of the national debt of our country. However, it will not be difficult to determine the quantum to be apportioned to each dominion on account of railway items. Once the shares of assets and liabilities are ascertained and handed over, the process of parti-

tion must stop at that point. It should not be allowed to be carried to its extreme consequences. Political frontiers do not necessarily correspond with economic frontiers. Where this is the case, as it is bound to be with respect to the frontiers of the two new dominions formed on a communal basis, the trend in modern times is to disregard the political frontiers in the interests of neighbourly co-operation and mutual assistance in matters of rail transport. If, however, the partition of our railways is taken to signify a watertight division barring the door against unimpeded communication, it will operate to the detriment of both the parties. It will be a retrograde measure creating unnecessary obstacles.

POINTS OF VIEW

The gentle art of grabbing

R. V. Murthy

SELDOM DO we hear these days of our economy taking off, though the need for it has become greater now than at any time before, but take-over is the talk of the town everywhere. When solutions elude, slogans seem to come in handy. The ready resort to the most fashionable slogan of today — take-over — is presumably also due to the fact that, following the latest amendment of the Constitution relating to payment of compensation, it is so much easier for the government to nationalise and take-over anything and everything. Mr N.M. Tidke, Maharashtra's Minister for Industries and Labour, admitted this in so many words whilst replying to the debate on the demands of his department in the state assembly recently.

"Following the amendment to the Constitution, Mr Tidke said, in the course of his reply, 'the state government felt that it would be advisable to nationalise these mills'. These mills here refer to the 22 textile mills in Maharashtra being run by the state government under the Industries (Regulation and Development) Act. It is significant that the Maharashtra minister was not even prepared to wait for the normal procedure in this behalf; he wanted the central government straightaway to promulgate an ordinance to enable the state government to nationalise these mills.

old habit

This habit of hustling, however, is nothing new. Even when taking over a mill under the Industries (Regulation and Development) Act, the government has not cared to wait, as it is required to under the Act, for the report of the officer appointed by the authorities to investigate and justify the taking over of a given mill by the government. If such reports have preceded every case of taking over a mill by the government, how is it that no one concerned with the industry e.g. Millowners' Association, is aware of them? Why are these reports not made public?

Evidently Mr Tidke, like his confreres

at the centre and in other states, feels this is the most propitious time to nationalise, because of the latest relatively satisfactory results of the mills and the likely prospects of their maintenance during the current year also, thanks to appreciably lower cotton prices. But it is too premature to take a far-reaching decision such as nationalisation on the basis of these results. One cannot be certain that what the industry has gained by way of lower raw material prices will not be more than offset by higher wages, as witness the demand of textile labour urging the Bonus Review Committee to raise the statutory minimum bonus from the present four per cent to 8.33 per cent without even going into the merits of the case.

case for modernisation

This apart, as Mr K.K. Dhar, Chairman of the National Textile Corporation, told the last annual general meeting of that corporation, to become capable of their optimum production, the mills under the corporation must be first modernised. Although Mr Dhar mentioned that the corporation has already prepared schemes to modernise 33 mills under its charge, involving a total outlay of Rs 14.50 crores, even he may not be able to say by what date precisely this process of modernisation will be completed. True, the Committee of Experts appointed by the government some time ago to go thoroughly into the working of the government-run mills and suggest policy guidelines for making these units economically viable, has laid special stress on modernisation: "Modernisation within two years" is what it has prescribed. But as the same committee has observed, the pace of modernisation so far has been woefully slow and it does not seem it will be accelerated appreciably hereafter. So far, according to this committee, programmes totalling only Rs 9 crores have been approved and the total amount of funds released therefore is just over a crores of rupees.

Mr Dhar spoke of 50 mills being under

the corporation, 23 directly under its management, the rest being under its supervision. He also indicated that 13 more mills would be taken over shortly, raising the total to 63 mills. On March 31, 1972, however, according to the Committee of Experts referred to above, only 47 mills, spread over 12 states, had been taken over under the Industries (Development and Regulation) Act. Presumably, three more mills were taken over between March 31, 1972 and June 30, 1972. Be that as it may, the mills taken over account for over nine per cent of the total spindleage and over 14 per cent of the total loomage in the country and employ about one lakh of workers.

The Textile Corporation may be saddled with more mills, if the goals outlined by the Minister of Foreign Trade viz., maximum cloth production and no throwing out of any worker in a mill, are to be achieved. For, according to a statement made by him in Parliament on January 31, 1972, the number of mills remaining closed was 75, including 23 mills which are considered first to be scrapped. And these 75 mills account for 15.69 lakh spindles and 15,937 looms employing 71,635 workers. If 23 mills are to be scrapped, that would mean throwing out of not only 18,107 workers but throwing out of commission some 4.37 lakh spindles and 6,014 looms also.

himalayan task

It is not known how many of these 75 mills have already been taken over, or are going to be taken over. Even if 52 sick mills are going to be taken over by the corporation, the task ahead of it is going to be Himalayan, and in as much as many, if not all of these, also need to be modernised and require, besides, vast sums by way of working capital, it is not clear how Mr Dhar can afford to be so complacent as he sounded the other day.

The Committee of Experts which reported recently on the working of the government-run mills, by the way, has not stated anything new. Most of its recommendations were made four years ago

by the Cotton Textile Committee (the Kogekar Committee) appointed by the government of Maharashtra. Indeed, the spokesmen of the industry also have been repeatedly drawing attention to the same ills of the industry and the need for early and substantial relief. But these pleas have been consistently ignored. And Mr Dhar, who has had the advantage

of unlimited financial assistance, exemptions from certain statutory obligations, and what not, now claims spectacular achievements by the mills under the charge of his corporation. Maybe, he is entitled to some credit, but the question is: Would he have achieved what he has claimed without these special favours? Or, to put it differently: would the previous owners

themselves not have achieved these results, had they been shown the same consideration? These are not hypothetical questions and the answers thereto would establish where—and not with whom—the fault lies. The spokesmen of the mill industry must be feeling happy that at last the powers-that-be have begun to recognise realities.

Municipal tax structure in Rajasthan

P. L. Bhargava

TAXATION ACCOUNTS for the larger part of municipal revenue in all the states in India, the average tax revenue of municipalities being over 60 per cent of their total receipts. The states, which derive more than the all-India average are Gujarat, Jammu & Kashmir, Madhya Pradesh, Maharashtra, Punjab, Rajasthan, West Bengal and union territory of Delhi. It may be mentioned that these are the states which levied octroi in 1960-61. The states, much below the all-India average in this respect, are Assam, Bihar, Kerala, Orissa and Uttar Pradesh.

There exist significant differences among the states in the degree of exploitation of different taxes. Whereas direct taxes are of great importance in states such as Andhra Pradesh (96 per cent), Assam (95 per cent), Bihar (99 per cent), Kerala (86 per cent), Madras (99 per cent), Orissa (74 per cent), West Bengal (96 per cent) and Delhi (71 per cent), indirect taxes contribute a significant part in Gujarat (79 per cent), Jammu & Kashmir (98 per cent), Madhya Pradesh (71 per cent), Maharashtra (53 per cent), Mysore (52 per cent), Punjab (81 per cent) Rajasthan (87 per cent) and Uttar Pradesh (79 per cent).

growth of indirect tax

Examining the role of direct and indirect taxes in the tax structure of Rajasthan municipalities (Table I) it is evident, that, whereas the revenue from direct taxes during the period ranged between 8.13 to 11.31 per cent of the tax revenue and registered a growth rate of 140.43 per cent giving an annual growth rate of 14.04 per cent, the revenue from indirect taxes ranged between 88.69 to 91.87 per cent,

registering a growth of 135.18 per cent and an annual growth rate of 13.51 per cent.

The ratio of indirect taxes to direct taxes remained stationary, for the beginning and ending of the decade, 89 : 11. Direct taxes contributed 6.68 and 6.31 per cent and indirect taxes 60.43 and 55.80 per cent of the aggregate income in 1956-57 and 1965-66 respectively. Thus during the period, indirect taxes were the mainstay of municipal taxation. In other states, too, indirect taxes are more popular than direct, although the proportion of the indirect taxes is now showing a declining trend.

regressive tax

The relative predominance of indirect over direct taxes make the tax structure continuously regressive. This is because direct taxes are mostly frozen, since neither the house tax rates nor the annual valuations, in spite of increase in rents and prosperity of community—are revised. Moreover, arrears of taxes go on mounting. The entertainment tax is no longer levied by municipalities and the compensation received from the state governments is seldom revised by the latter. All these factors make the direct taxes static and inelastic. On the other hand, indirect taxes increase due to increase in population, expansion of trade, revision of octroi schedules and rates more often than the house tax rates.

The tax revenue of the municipalities at present is usually derived from the following three sources : tax on property; tax on trades; and tax on persons. The tax on property is one of the major sources of tax revenue, which can be levied either

as a general tax on immovable property assessed on the basis of annual or capital value or as a specific tax for rendering specific services to the inhabitants such as water rates, electricity rates, drainage or sanitary cess or conservancy rates, latrine rates, betterment taxes and surcharge on stamp duty.

state-wise breakup

In 1960-61, the yield from this tax on all-India level was 37.6 per cent of the total municipal tax revenue. While on individual states basis where octroi is not levied its yield is very much impressive, 74.9 per cent in Andhra Pradesh; 92.3 per cent in Assam; 89.4 per cent in Bihar; 70.8 per cent in Kerala; 54.8 per cent in Madras; 74.5 per cent in Orissa; 90.6 per cent in West Bengal and 70.6 per cent in Delhi. In the states, where octroi is levied, its importance as tax source is reduced. Octroi contributed a major part in the total tax revenue. The yield through this tax in total tax revenue is, therefore, only 11.3 per cent in Gujarat; 13.3 per cent in Madhya Pradesh; 26.1 per cent in Maharashtra; 35.3 per cent in Mysore, 16.7 per cent in Punjab; 6.7 per cent in Rajasthan and 14.6 per cent in UP.

Taxes on trade comprise octroi, terminal tax, toll tax and tax on animals and vehicles and are another important source of tax revenue, as it contributed 54.3 per cent on all-India basis, and in some states, the proceeds from this tax constituted the major share in the tax revenue. Municipalities in Gujarat derived 81.7 per cent; Jammu & Kashmir, 100 per cent; Madhya Pradesh: 91.5 per cent; Maharashtra, 53.2 per cent; Mysore 52.1 per cent; Punjab 82.2 per cent and

JIYAJEERAO COTTON MILLS LTD. BIRLANAGAR (M.P.)

POINTS OF VIEW

Uttar Pradesh 81.00 per cent of their total tax revenue from taxation on trade.

Taxes on persons is levied in the following three forms:

(1) Tax on circumstances and property of an individual. It is a tax not on income alone, but takes into consideration the economic personality, social position and size of the family of an individual. It is levied in Madhya Pradesh, Uttar Pradesh and Bihar. There is now a tendency among states to substitute separate taxes on property and profession for this composite tax.

(2) Taxes on trade, professions, arts and callings, this tax figures in entry No. 60 of the State List and is permitted by the Article 276 of the Constitution of India to be leviable by the local bodies.

(3) Passenger or visitor or terminal tax is levied by the municipalities receiving visitors. Pilgrimage tax is levied by the municipalities receiving pilgrims. These taxes are permitted by the central government, if these were in existence prior to the transfer of the tax powers to the central government under the Government of India Act, 1935.

three types of tax

Municipalities in Rajasthan impose all the three types of taxes. The revenue derived from each of these sources and their relative importance is shown in Table II. Taxes on trade bring the bulk of total tax revenue; accounting for more than four fifth. Their dominant position not only remained unaltered but also improved during the decade of study. Revenue from these sources improved from 82.24 per cent in 1956-57 to 88.78 per cent in 1965-66 and recorded a growth rate of 154.52 during 10 years of study giving 15.45 per cent as annual growth rate.

The taxes on property comes next in 1965-66; but it was not so in 1956-57, when the second position was occupied by the taxes on persons. Taxes on property improved from 6.44 to 9.38 per cent of the total tax revenue. The growth of taxes on property has been 243.41 per cent during the decade giving an annual rate of 24.34 per cent. The explanation for this changeover in importance is found in the rationalisation of tax structure brought about by the Rajasthan Municipal Act, 1959, under which this tax has been made one of the three obligatory taxes and the state government persistently requesting the municipalities to levy this tax.

The taxes on persons during the period of the study has declined in importance from second ranking to the third in

TABLE I
Tax Revenue of Rajasthan Municipalities Classified as Direct and Indirect Tax Revenue during the Second and Third Plan Periods

Year	Direct taxes (Rs)	Percentage to aggregate income	Indirect taxes (Rs)	Percentage to aggregate income	Index No. of growth of tax revenue (in Rs)
Second Plan					
1956-57	11,19,143 (11.07)	6.68	89,88,194 (88.93)	60.43	100.00
1957-58	11,25,559 (9.95)	5.73	1,01,83,015 (90.05)	57.63	111.88
1958-59	12,67,906 (11.31)	7.25	99,43,130 (88.69)	45.46	110.92
1959-60	11,90,161 (8.75)	4.59	1,24,10,307 (91.25)	52.64	134.55
1960-61	11,07,094 (8.13)	3.58	1,25,15,620 (91.87)	44.68	134.78
Third Plan

the tax structure, of the municipalities. The percentage yield from tax on persons declined from 8.05 per cent in 1956-57 to 1.43 per cent in 1965-66 because of public resistance to direct taxes and constitutional limitation in case of profession and terminal taxes. Miscellaneous taxes also recorded a decline in importance both in absolute and percentage terms. The rate of growth of taxes on persons and miscellaneous taxes shows a decline, which is an alarming situation. Taxes on persons declined by 58.26 per cent and on miscellaneous taxes by 69.14 per cent during the decade.

unchanged composition

An analysis of total tax revenue of municipalities in Rajasthan (Table III) indicates that the composition of taxes and their relative importance during the period has not changed materially. Of course, octroi predominates over other items of tax revenue and contributed 74.40, and 85.86 per cent of the total tax revenue in 1956-57, and 1965-66 respectively. This tax was levied by 114 in 1956-57 which number increased to 137 municipalities in 1965-66. During the period, its growth has been of the order of 172.15 per cent recording an annual rate of 17.22 per cent associated with a rise in volume of trade. Next in importance comes the tax on building and land which contributed 6.44 in 1956-57, and 9.38 per cent in 1965-66. The number of municipalities was 22 and 78 in 1956-57 and 1965-66 respectively. Its growth rate during the period was 243.41 per cent giving an annual rate of 24.34 per cent and was associated with increase in the number of municipalities levying this tax and number of houses, revision in the annual rental value of houses and of tax rates.

Octroi and house tax combined contributed 95.26 per cent of the tax revenue of the municipalities in Rajasthan in 1965-66.

The remaining five per cent was contributed by taxes like terminal tax (2.29 per cent), visitor tax (1.32 per cent), vehicle tax (0.48 per cent), other taxes (0.41 per cent), toll tax (0.13 per cent) and profession and vocation tax (0.11 per cent). In 1956-57, on the other hand, house tax and octroi contributed 80.84 per cent and the remaining 19.16 per cent was contributed by terminal tax (5.89 per cent), entertainment tax (5.08 per cent), visitor tax (2.78 per cent), vehicle tax (1.65 per cent), toll tax (0.30 per cent), and other taxes (3.27 per cent). Except in visitor and profession and vocation tax which showed a slight rise, the revenue from the remaining taxes declined during the period. The sharpest decrease of 70.64 per cent during the decade was recorded by the head 'other taxes'. This was because the municipalities withdrew these taxes under the plea of re-organisation of their tax structure under the Rajasthan Municipalities Act, 1959.

local situation

It should be appreciated that size of the income does not only depend on the number of taxes levied but also on the local situation, productivity and scope of the taxes. It may be that even one tax is sufficient to yield a substantial revenue e.g. octroi in Kherli. On the other hand, there may be municipalities, with a host of taxes and still with smaller income. Municipalities of Amber and Ajmer both levied five taxes in 1960-61; but there is world of difference both in their total and per capita tax revenue. However the diversification of tax sources signify the developed tax pattern and indicates the tax efforts made by the municipalities. Although the local bodies have been allowed to exploit 15 taxes at present; yet not more than 5 taxes are being exploited, mainly because of the

unproductive nature of the taxes allocated. This is a result of the tendency by higher governmental units to allocate to themselves the most productive and elastic sources of revenue; but it is also their duty to see that municipalities get their due share. At present not much attention has been paid by the state governments to this aspect. The result is that the list of taxes leviable by the urban local bodies is no indication of its revenue exploitation.

tax effort

A study of Table IV will throw light on tax efforts made by all the municipalities in Rajasthan over the years.

Octroi which was levied by 114 municipalities in the year 1956-57, increased to 127 in 1959-60, when the Rajasthan Municipalities Act, 1959, came into force. The number had increased to 136 by 1965-66. However, even by that time, octroi, an obligatory, tax was not levied by five municipalities.

The number of municipalities levying, building and land tax—another obligatory tax—came down from 22 in 1956-57 to 19 in 1959-60. It was during the third Plan period, that the number of municipalities levying this tax increased. This was due to the state government's insistence in giving grants subject to levying of at least one tax—either octroi or house tax. Still in 1965-66, out of 141 municipalities only 78 levied this tax.

Profession tax which was levied by 21 municipalities in 1956-57, even after making it obligatory, the number could only come up to 23 in 1965-66. This was so because of the low yield and difficulties in imposing it due to constitutional limitations.

Vehicle tax suffered most at the hands

TABLE III
Tax Revenue from Different Taxes in Municipalities in Rajasthan over the Second and Third Plan Periods

Year	Octroi	Building & land tax	Terminal	Entertainment	Other tax	Passenger & pilgrimage tax	Vehicle tax	Toll tax	Profession & vocation tax	Total tax
1956-57	75,19,461 (74.40)	6,51,003 (6.44)	5,94,943 (5.89)	5,13,196 (5.08)	3,30,132 (3.27)	2,81,427 (2.78)	1,66,703 (1.65)	30,562 (0.30)	20,010 (0.19)	1,01,07,437 (100.00)
1959-60	1,16,13,512 (85.39)	7,39,875 (5.44)	5,00,198 (3.68)	—	2,65,474 (1.95)	2,38,507 (1.75)	1,90,200 (1.40)	31,103 (0.23)	21,579 (0.10)	1,36,00,468 (100.00)
1965-66	2,04,41,186 (85.88)	22,35,626 (9.38)	5,45,505 (2.29)	—	98,578 (0.41)	3,14,546 (1.32)	1,15,175 (0.48)	30,129 (0.13)	25,457 (0.11)	2,38,29,201 (100.00)

of the elected leaders, as the number of municipalities levying this tax came down from 85 in 1956-57 to 62 in 1965-66; the reason was the desire on the part of politicians to earn cheap popularity.

Toll tax was neither favoured nor disliked by the elected leaders as the number of municipalities levying this tax varied between 25 to 29 during the period.

Terminal tax, now being a central tax under the Constitution of India, can be levied only by those municipalities, which were levying it earlier. Thus it is an in-elastic source of revenue.

The number of municipalities levying 'other taxes' which include quite a number of taxes came down from 68 in 1956-57 to 39 in 1965-66. Thus it is clear that on the one hand the municipalities did not care

to exploit fully the existing tax measures and on the other elected leaders were more in favour of abolition of existing taxes rather than imposition of new ones except octroi and house tax. If this tendency continues the finances of municipalities are bound to remain in a parlous state.

To sum up, the study reveals a number of significant trends during the period. Municipalities in Rajasthan have evolved a tax structure which is neither diversified nor elastic and is dominated by indirect taxes, particularly taxes on trade or commodity viz., octroi, terminal, vehicle and toll tax. Moreover, these taxes are imposed at a flat rate and are therefore lacking in graduation or progression. These municipalities exploited in 1965-66 more or less the same taxes which they

POINTS OF VIEW

were levying before 1956-57. The tax structure has not undergone any major change except that certain taxes have been discarded by the local bodies and certain others have been taken over by the government. This is in spite of the fact that there exists considerable scope for the expansion of the tax revenue of municipalities in Rajasthan, if they levy the taxes permitted—obligatory and discretionary—by the Rajasthan Municipalities Act, 1959 and the tendency to abolish vehicle tax, toll tax and 'other taxes' is checked.

Existing municipal taxes are not fully exploited and in many cases not efficiently administered. A great laxity exists in the tax administration and collection. The taxes levied at present are also capable of yielding larger receipts provided the administrative machinery is geared to maximum collection. In spite of all this the nature of local taxes is such that even with the utmost care and economy it would not be possible for municipalities to secure enough revenue for ensuring a decent level of civic development unless municipal finances are linked to state and national finances through a realistic scheme of grants-in-aid.

Industrial development in Uttar Pradesh

Dr P. K. Bhargava

UTTAR PRADESH has remained one of the most backward states of India and nearly 50 per cent of the poorest districts of the country are found in the state. Still depressing is the fact that the economic position of the state has relatively gone down during the era of planned economic development. Thus the *per capita* income of the state in the pre-Plan period was 5 per cent above the all-India average whereas at the end of the second Plan it was 20 per cent lower than the all-India average and 27 per cent lower than that in the year following the third Plan. There are districts (such as Uttar Kashi and Tehri Garhwal) in the eastern region of the state where *per capita* income is as low as Rs 129; even the prosperous districts (such as Dehra Dun, Naini Tal and Kanpur) of the state have a *per capita* income slightly higher than Rs 385. This is not a happy situation as it poses a serious threat to the integrity of federal structure of our country since the strength of a nation lies in its weakest links.

The economy of Uttar Pradesh is ag-

rarian in character as agriculture provides employment to over 75 per cent of the state's working population and contributes about 61 per cent of its total income. Even then Uttar Pradesh has to import foodgrains from other parts of the country to feed its population. Industrially also the state is extremely backward. It is depressing to note that central investment in the industrialization of Uttar Pradesh has been smaller than in other states. Out of a total investment of Rs 1,856.57 crores in centrally sponsored projects during the three Plans, the four states of Madhya Pradesh, Orissa, West Bengal and Bihar accounted for Rs 1,428.88 crores or nearly 77 per cent of the total.

Uttar Pradesh had no investment on central or state sponsored projects during the first Plan. There was no investment on central projects during the second Plan also even though industrial investment by the central government considerably increased, but an investment

of Rs 3.24 crores was made in state projects. It was only in the third Plan that investment in centrally sponsored projects in Uttar Pradesh was Rs 71.44 crores. Besides, the state government incurred an expenditure of Rs 9.29 crores on industrial development.

A working group of the Planning Commission in February 1969, on the basis of certain criteria such as total *per capita* income, *per capita* income for industry and mining, number of workers in registered factories, *per capita* annual consumption of electricity, etc., identified six states including Uttar Pradesh as industrially backward areas eligible for special treatment by way of incentives for industrial development. It is a happy augury that the government of Uttar Pradesh on its part has offered far-reaching concessions and facilities to the industrialists. These facilities and concessions include:

- Loans at concessional rate of interest;
- Sheds in industrial estates available for

In our little way...

we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front, Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals

essential for the pharmaceuticals, paints, textiles, iron and steel and rubber industries. On the export front, Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts!

UNION CARBIDE

sowing the seeds of progress

The battle against inflation

POINTS OF VIEW

outright purchase or hire purchase or on reasonable rent;

Developed sites on outright or hire purchase;

Sales tax holiday for three years on the finished products of new industries. Exemption is also granted on raw materials used for manufacturing for certain specified industries for a period of three years;

A rebate of 15 per cent in power rates to such new units whose contracted demand to exceed 100 KVA for a period of three years. Certain categories of small scale units receive power subsidy up to nine paise per unit provided their load does not exceed 20 horse-power;

Feasibility reports, prepared in consultation with NIDC and technical experts, available;

Supply of raw material at competitive prices through UP Small Industries Corporation Ltd;

Common facility services to small-scale units for improving their productivity, efficiency and quality on normal service charges; and

Small-scale industrial units of the state are given 15 per cent price preference and the large and medium units given 5 per cent price preference over their counterparts in other states under government purchase programme by way of marketing assistance.

minimising red-tape

In addition to the above incentives, the government of Uttar Pradesh has set up various corporations in order to minimise red-tapism and procedural delays at various levels. The UP Small Industries Corporation is engaged in solving the problems of small-scale industries in matters of capital, technical know-how, marketing and utilisation of idle capacity. The corporation, among other facilities, provides hire purchase assistance, marketing assistance, technical know-how assistance and raw material assistance. The UP State Industries Corporation provides developed industrial plots of land mostly ranging 1/2 acre to 5 acres at selected places on "no profit no loss" basis. The corporation also provides finance in the form of share capital after underwriting of public issues to joint stock companies in the private sector. It also procures industrial licences from government of India for projects of fundamental importance and sets up industrial units and develops selected mineral based industries. The UP Financial Corporation helps industrialists by way of granting loans for the establishment of

industries and for renovation, expansion or modernisation of existing plant and machinery or other fixed assets and also in issuing deferred payment guarantees to industrial concerns.

Then there is also the Uttar Pradesh Export Corporation Ltd. that serves as a channel for the outflow of goods from Uttar Pradesh. It co-ordinates the activities of exporters with the various export promotion councils in respect of cash incentives and enters into direct exports without effecting the exporters' interest in general, particularly to assist those small exporters, who cannot export their goods due to lack of resources and knowledge. The corporation also renders financial assistance to exporters for the execution of export orders in deserving cases and assists the exporters in getting scarce raw materials for the execution of export orders. It introduces new items of exports and reorients UP products particularly manufactured by cottage and small industries in relation to the markets abroad and undertakes survey of the markets abroad.

government effort

The above discussion amply demonstrates that the government of Uttar Pradesh is taking various steps to develop the industrial base of the economy. The state, with its sturdy agricultural base, cheap labour, plenty of water resources and power generation together with the various incentives and facilities provided by the government, possesses good prospects for industrialization in the near future.

It is, however, depressing to note that there was not much enthusiasm in UP especially among those who could invest to take advantage of the liberalised policy adopted by the centre to set up industries in the state. It needs to be emphasised there were only 120 applications from UP for setting up industries out of the 3,300 applications from the whole country. It is, therefore, of paramount importance that the climate of stagnation and pessimism is changed and that a proper environment created which can usher confidence and enthusiasm among the entrepreneurs. This will help in harnessing the rich potentialities of the state and take it on to the path of rapid industrialization. Without the self-confidence and enthusiasm of the entrepreneurs, the incentives and facilities provided by the government to industrialize the state would hardly be of any use.

Another important aspect of the state's industrial policy should be to give as wide

publicity as possible to the incentives, concessions and facilities that the state is going to provide to industrialists so that outsiders may be attracted to invest in the state. It is also necessary to concentrate on the existing units and invigorate them rather than to establish new units. The primary task of the state government should be to develop adequate infrastructure for the existing industries rather than to divert resources in establishing new units. Once the existing industries are fully developed, ancillary industries will grow automatically.

lopsided development

The present difficulty of the state in the field of industrialization is lopsided development. If a district such as Barabanki has surplus power, rail-road link facilities and financial resources, there are no technical training facilities. There are districts such as Bahraich and Azamgarh where roads are in a bad shape, transport facilities inadequate and supply of electricity irregular. Communications are so bad that at some places one has to go as many as 24 kilometers to send a telegram. It is, therefore, necessary that the state government concentrates its efforts to remove these bottlenecks so that the existing resources of the state are utilised productively for its industrialization.

No doubt, the state of Uttar Pradesh possesses potentialities to develop agro-based industries, oil and mineral based industries and consumer goods industries based on fruits and vegetables. The available industrial potentialities survey reports reveal that there are 29 districts in the state which have potentialities to develop industries such as fertilizers, insecticides, power-tillers, tractors and other agro-industries; petroleum refinery, naphtha-based products such as ethylene, propylene and butadiene gases and aromatics, cement pipes, asbestos sheets, crockery, sheet glasses, scientific glasswares, paints and varnishes, chemical detergents, resins and acids; engineering industries based on aluminium, steel forgings, machine tools, scooters and automobile industries, industrial machines, scientific instruments, power cables and other electrical engineering items, cotton and woollen textiles, synthetic fibres, leather industries, food processing, pharmaceuticals, rubber industries, etc. The establishment of these industries will accelerate the tempo of industrial development in the state. For the healthy industrial advancement however it is inevitable that the barriers to the existing industries are removed so that the state develops a sound base for its industrialization in future.

Home Truths from Australia

LIKE ALMOST every other country in the world Australia is struggling against inflation. The latest issue of the *Review of the influential Australian Institute of Public Affairs* (289 Flinders Lane, Melbourne 3000) not only analyses the immediate causes of Australia's present discontents but prefaces its analysis by a recall to first economic principles, all the more impressive because it states them in terms simple enough for any mildly intelligent employer and worker to understand.

The Institute opens its attack by saying that cabinet ministers, press commentators, and even some economists, repeat *ad nauseam* that rising prices result from wages and salaries increasing faster than productivity. It needs, says the Institute,

garettes, result *immediately* in higher prices to the consumer. Increases in company tax and payroll tax come out in higher prices. Increases in charges by governments and their business undertakings for TV and radio licences, postal and telephone services, water, fares, and many other items, directly increase the cost of living. They also add to business costs and thus to prices.

Those who engage in prolonged strikes in key industries forget that they cause the under-utilisation of plant capacity so that overheads have to be spread over a smaller volume of output, thus increasing unit costs and selling prices, often decreasing the demand for their products. Wage and salary increases are thus *not* the only immediate cause of rising prices, though they constitute the main element.

How far are wage and salary increases,

A general scarcity of labour, or even of particular types of labour, will produce a rise in the price of labour. A great part of the wage and salary increases of a year or two ago in Australia were the result not only of union action but of employers competing for a shortage of workers from skilled artisans to office secretaries. The spiralling of payments in excess of wage awards at the time is clear evidence of this. Admittedly, increases in award payments were granted by wage tribunals, but these increases had their chief source in the widening disparities in wages paid to different industries, as a consequence of above-award payments. This was the reason behind the now notorious 6 per cent National Wage Judgment in December, 1970. Thus, the root cause of inflation at that time was not incomes exceeding productivity, but over-full employment, i.e., excess demand. Moreover, once excess demand appears, its inflationary effects may continue long after the excess has been corrected. Thus, many of the wage increases in 1971 originated in the disturbance of relativities which resulted from the spiralling of over-award payments in 1970.

New Delhi, please note!

In an economic climate of excess demand inflationary wage and salary rises inevitably occur. But this is not the whole story. Other conditions which virtually guarantee inflationary wage and salary increases, arise where (New Delhi, please note!) governments, year by year, are expanding their claims on the resources available and increasing their taxes and charges to make their claims effective. Over the past decade the Australian public sector share of total national expenditure has risen from 29 to 33 per cent at the expense of personal consumption and private capital investment. I do not know what the comparable figures are for India, but I would not be surprised if they were even higher.

When governments add to prices in this way thus raising living costs, they must expect increased pressures for higher incomes as wage and salary earners try to retrieve their former position. Moreover, taxes and charges which act directly on prices are often accompanied by increased taxes on personal incomes: so the people are hit at both ends: living costs soar at the

WINDOW ON THE WORLD

no unusual powers of perception, or knowledge of economics (a grasp of simple arithmetic is enough) to see that this is the main *immediate* cause. But what we need to uncover are not the immediate but the deep-seated, root causes of inflation.

First, however, note that wage and salary increases are not the only immediate cause of higher prices. Higher costs for imports are clearly another.

Lower export returns for primary products associated with home prices support schemes may result in higher domestic prices. Higher prices for other exports, for example beef and zinc, mean higher prices on the domestic market for these commodities. Increases in sales tax and excise duties on e.g. cars, beer and ci-

which exceed productivity gains, a cause of inflation in themselves? How far are they merely a secondary response to less obvious causes? To an important extent, wage and salary rises are a cause in themselves — especially at the moment in Australia. It would be wrong to argue that there are no elements of what is now called "cost-push" in recent price increases. But it would be equally wrong to argue that wage and salary increases are the *only* cause, or that Australian inflation is entirely "cost-push".

If the diagnosis is pursued further, it becomes clear that rising incomes are often a natural response to other factors. When this occurs, they are part of the inflationary process itself, not a cause of it.

same time as there is less money in the pay envelope. This inevitably intensifies pressures for higher incomes. People, become accustomed to a certain standard of consumption. If that standard is threatened they will do all they can to try to protect it.

The reason for increasing taxes and charges is partly due to expanding government expenditures to meet deficiencies in community facilities, from hospitals and schools to roads and sewerage. In turn, these deficiencies chiefly arise from a rate of population increase that the economy cannot digest properly, and so suffers serious inflationary discomforts. This, again, applies to India.

Thus the pressure for higher incomes comes not only from Oliver Twist's desire for more, but from the understandable concern of the people to hang on to the living standards that they have achieved.

From this it follows that to curb inflation, we must create an economic climate in which the pressures for wage and salary increases — which will always exist — are reduced to a minimum. This means, first, keeping total demands in the economy from exceeding supplies with acute shortages of labour and increasing over-award payments. And, second, it means avoiding conditions in which governments feel compelled to make expanding claims on the resources of the community and, in so doing, leave less resources for satisfying the improvements in standards of personal consumption which are the natural wish, if we are to be frank, of us all.

II

Why Workers Demand Higher Wages

The rise of 2.3 per cent in the Consumer Price Index in the December quarter sent a shock-wave of alarm through the community.

The announcement of the increase on January 20 was accompanied by a warning from the Federal Treasurer on the growing menace of inflation. The text of the Treasurer's statement, one of high national importance, received scanty treatment in most newspapers.

Mr Snedden's comment contained two significant points. The first was its summary rejection of the "scarce" pictures of the economy and the unemployment position given in recent months by the media, many economists, some trade union and political leaders — the last-named for obvious political purposes. The Treasurer said:

"With all this in mind, it is necessary to say something about the various alarmist

opinions so freely expressed in recent months as to the state of the economy in general and the labour market in particular. Charges such as 'recession' and even 'depression' have been freely asserted from many quarters. So far from being in recession, the economy is basically sound and is growing quite strong. Gross national product can be expected to show an increase of over 4 per cent in real terms in 1971-72. If that is to be described as a 'recession', words have lost their meaning".

public support

The Treasurer's second point emphasised that the battle against inflation was one for the whole community, not just for government: "It is fair to say that no democratic government, of whatever political complexion, can deal effectively with this grave matter unless it has the broad support of the community." The fight, Mr Snedden said, will not be easy, "for those charged with the hard decisions involved. These include not just the government, but others such as wage tribunals union leaders and employers". He could have added those who play a major role in forming opinion and shaping public attitudes — the press, radio and television.

This was clearly not an attempt by the government to lay the blame for inflation at every door but its own — which it seemed to be doing only a few months ago. It was a plain statement of an economic truth. The task of beating out the fires of inflation is one for the whole community. It is absurd to think that government alone can do the trick while the community looks on. If inflation is to be overcome, new and different attitudes are required of employers, trade unions, wage tribunals, state and local governments, government agencies, press and radio.

Leadership, self-discipline and example will be demanded of all sections of the nation. Unless they are willing to play their part in the battle to defeat inflation, the Australian government will be like a general in command of troops who refuse to fight. The government would, however, be well advised to spell out in unmistakable terms what is required of each section of the community if the battle is to be won and the victory thereafter maintained.

Employers, for the time being, need to pursue moderation in their pricing policies. It is true that the declining level of company profits in recent years suggests that over a good part of the field this is already being done. Over the last three years net company profits as a percentage of shareholders' funds have fallen: 1968-69 — 8.7 per cent; 1969-70 — 8.5 per cent; 1970-71 — 8 per cent (estimated). More-

over, unavoidable increases in costs, resulting from wage rises unmatched by productivity improvements, or from higher government taxes and charges, must, in the main, be passed on. If they are to continue to attract the capital necessary for the expansion of their enterprises employers are left with no alternative. Nevertheless, the times are such that a special effort should be made to keep price increases to the minimum compatible with inescapable business necessities. The maximisation of profits should, for the time being, take second place to the need for overall economic balance.

The trade unions have a clear responsibility to moderate their wage and other cost-increasing claims. They should face the truth that wage and salary rises in excess of productivity gains are not genuine rises: or, if some sections gain, others must lose. Those who lose are, in the main, not employers or investors but fellow workers (including hundreds of thousands in retirement) less favourably placed to enforce their demands. However loudly they may proclaim that wage rises are not the cause of price increases, trade union leaders know in their hearts that this is not true. Unless union officials are prepared to give a higher priority to the national interest, and to educate their members in the simple relationship of wages, productivity and prices, inflation will go on. The reduction of work stoppages and threats of work stoppages will, needless to say, be another test of how far the trade unions are prepared to co-operate with the rest of the community in achieving the goal of price stability.

crucial role

The role of wage-fixing authorities is, of course, crucial. While fair-minded people readily concede the special difficulties that the tribunals have faced in recent years — largely because they have been operating in an environment of over-demand with spiralling above-award payments — these bodies have not, in general given sufficient weight to economic needs and the effect of their decisions on the cost and price structure. If anything close to price stability is to be achieved in the future, wage authorities must recognise the importance of productivity improvement in non-inflationary wage awards. While the Australian government has argued in case after case for this principle, it has by allowing conditions of excess demand to develop, not made the task of wage tribunals easy.

The communications' media are important in the war against inflation. Public opinion and attitudes are largely formed by what the people read in their papers and hear and see over the air. Unless the media are prepared to undertake a

proper share of responsibility by educating and guiding the public, the task of the government will become virtually impossible. The media have regrettably been more concerned to stir up controversy, to create alarm and disturbance through the community by presenting sensational accounts of the economic situation than to paint a balanced picture. This has contributed to the gloom which has overtaken business psychology in recent months and in the reluctance of consumers to spend. Criticism of policies and personalities is legitimate and necessary but criticism carried to extremes is irresponsible, and destructive of the public interest because it distorts understanding of the real issues.

III

What the Government Could Do

With an election pending in Australia later this year, it has been argued that the government has no alternative but to provide a strong stimulus to the economy, in other words, to recreate what would be in effect an inflationary climate of over-employment and excess demand. This would mean that the government could only assure its return to office by acting in a way opposed to the best interests of the nation — if true, a sad comment on democracy. But the government should remember that once resistance to inflation is relaxed, what it might gain on the political swings could be lost on the roundabouts. Notwithstanding the difficulties created for it by the media, the government might be well advised, in its own political interests, to place the defeat of inflation above all other objectives.

While the Australian government cannot beat inflation on its own, it must bear full responsibility for the strategy and direction of the battle. In this task it is entitled to ask for the full support and co-operation of the remainder of the public sector — state and local governments and government and semi-government undertakings.

The Australian Institute of Public Affairs has never wavered from the view that the first and all-important step in combating inflation must be a sharp reduction in the rate of increase of public sector spending, which has increased, and continues to increase, much faster than private spending. The private sector, not the public, has had to bear the brunt of any attempts to bring supply and demand into balance.

At this time last year, it appeared that the government had accepted, belatedly, the necessity of arresting the strong growth in government claims on resources. In a TV address to the nation in January, 1971, the then Prime Minister, Mr John Gorton, said: "We believe our first line

of attack should be to ensure not only restraint of government expenditure but reduction in government expenditure this financial year". Mr Gorton got to the heart of the reason why government rather than private spending should bear the brunt of any expenditure cut-backs when he said "By reducing the demand of governments, more is made available to meet the demand of private persons". The truth is that heavy government spending, particularly on capital projects puts a brake on the rate of improvement in personal living standards. In doing so it causes smouldering discontent throughout the community, which intensifies claims on wage tribunals and employers (government as well as private) for increased wages and salaries. The cost-push pressures on the economy are thus greatly aggravated. (Are you listening, Indira?)

The way that the public sector gets the money for increased spending is higher taxes and charges at all levels of government — personal and company income taxes and indirect taxes at the federal level, state taxes of various kinds, local council rates and such things as fares, water rates, postage and telephone rates, gas, electricity, hospital and other charges by the multitude of government agencies. Faced with increases in all these directions, it is not surprising that the mass of the people try to retrieve their losses by clamouring for higher wages and salaries.

spendthrift budget

In the first Snedden budget, a pitifully small concession was paid to the need for curbing federal government spending. However, the main emphasis of the budget strategy, which provided for increases in personal and company and indirect taxation, was directed at expenditure in the private sector. This, the Australian Institute of Public Affairs believes (and said at the time) was a serious blunder. While, as the government is now claiming, its policy has curbed demands in the private sector, it will do little to relieve the pressures on costs. The main contributions to higher prices in recent years have been coming not from goods and services supplied by private enterprise, but from rising taxes and charges imposed in the public sector.

Had the budget provided for a substantial cut-back in government spending and has the state governments, in the weeks that followed not acted irresponsibly by greatly increasing their own expenditures, these mass pressures would have been avoided. In fact, the net outcome of all government expenditures in 1972 will be to increase substantially the public sector claim on total resources.

The IPA cannot agree that the current

unemployment position in Australia calls for the material increases in government expenditures decided at the Premiers' Conference of February 14. At a time of rapid inflation, and with unemployment little or no greater than the long-term average, it is strange to introduce emergency measures to provide for a large expansion in government spending!

The IPA, however, supports the rise in unemployment benefits and the restoration of the industry investment allowance — the latter largely because it should help overcome the lack lustre psychology in business circles.

reduction in levy

Rather than provide for such big increases in government spending, the government might have been better advised to reduce the present 5 per cent levy on personal income tax to 2½ per cent — i.e. to the pre-1971-72 budget position. While this might not have had such an immediate impact on employment as expanded government spending, it would have had the advantage of taking some of the steam out of the pressure for high wages and salaries which is the immediate cause of current inflationary difficulties.

It is no good crying over spilt milk, but had the government refrained from imposing such large increases in taxes in the last budget, and adopted a sterner attitude towards the growth of government expenditure at all levels, the present situation might have been less critical. As it is, the structural bias of the economy towards inflation has been strengthened. This bias is inherent in an economy where, because of a too rapid growth in urban population, governments are virtually compelled constantly to increase their demands on available resources through raising taxes and charges of all kinds in order to meet inescapable capital expenditures. The strategy of curbing government spending was accepted by the government at the beginning of 1971. Over the last 12 months this strategy, has suffered a resounding defeat the reparations for which may have to be paid in the continually rising bills of inflation. But no government policies will succeed in arresting inflation and, at the same time, provide the basis for healthy growth, unless employers, unions, wage tribunals, and all sections of the community, are aware of their responsibilities in the difficult task of maintaining economic balance.

This report on inflation in Australia covers the situation in the majority of all countries. All you have to do to apply it to your own national circumstances is to substitute the words India, the U.K., France, or the United States for Australia.

Regional development in Wales

Hardev Singh

IN INDIA there are state development corporations looking after the interests of industries in each state. These corporations in collaboration with the state directorates of industries try to encourage entrepreneurs from all over the country and abroad to establish new industrial units in the respective states by offering incentives. Here, in Wales too, a similar body has been operating with similar objectives and has been in existence for the last fourteen years. It would be of some interest to examine its working in the light of the fact that its experience can be of interest to India.

Wales was faced by unemployment following the decline of its two major industries—coal and steel—that were concentrated in the area. During the inter-war period the level of unemployment increased to the extent of 50 per cent. By way of immediate remedial measures some industries were helped in their development. Industrial estates were established, the first one being ten miles out of Cardiff.

representative body

In the face of comparative underdevelopment and unemployment, the industrial and economic affairs of Wales required a strong representative body which was able to speak upon all matters affecting its industrial progress. The Development Corporation of Wales was the answer. This is a vigorous organisation supported and financed by industry, local bodies and the government. It devotes all its energies and resources to the development of industry, trade and commerce in the Wales.

This institution was established in 1958 in the first instance as a limited company for the benefit of industry in the area. But gradually the government took more interest in the affairs of the region and was obliged to come forward in a big way. The government assumed the responsibility of the body for the benefit of the economy of the area. The financial responsibility of industry to run the organisation was reduced to the extent of 25 per cent so that 50 per cent of the expenses were borne by the government and the remaining 25 per cent by the various local authorities. At the same time the scope of the organisation was extended to include the interests of several commercial bodies such as the British Transport

Docks Board, the Tourist Board, the Electricity Board, the Institute of Science and Technology and the Department of Industry and Trade.

The operations of the corporation have been broadly divided into two spheres, namely, development of new industries by inviting fresh investment and the expansion and welfare of the existing industry.

The corporation uses two instruments, grants and taxation concessions, as measures for the encouragement of new investment. The range of financial assistance is such that the interested investor can hope to derive advantage to the extent of 50 per cent of his investment. This is offered roughly in the form of grants to the extent of 20 per cent and the remaining part in the form of other concessions and tax reliefs when he starts marketing his products.

financial aid

Financial assistance is available to the incoming industry by way of building grants too. New factory premises and warehouses are available free of rent for an initial period of occupation. Assistance is also provided for the purchase of plant and equipment and grants and loans are also available for special purposes.

Over the decade these efforts have yielded considerable positive results. New industries, widely diversified in production have been established and the basic industries have been redesigned according to new techniques. No fewer than 100 overseas firms have set up subsidiary operations or associate companies in Wales, of which 70 per cent are from the United States or have US associates. Nearly 3,000 manufacturing organisations are employing over one third of the entire working population on industrial units, an increase of more than one hundred per cent in the last 25 years. As a result of the massive investment undertaken by the manufacturing industries, productivity in Wales has increased at a rate more than the average for the entire United Kingdom in recent years.

The proposed entry of the United Kingdom into the EEC has induced some non-European countries such as Japan to establish new units in this country. As Wales offers some facilities, they have shown considerable interest in the area. In this

context the Development Corporation made sure with the government that the current regional policy involving concessions should not be diluted or weakened in any way if Britain joined the EEC. A strong regional policy in an expanded EEC would produce opportunities only if the assistance is assured for a certain minimum period.

importance of grants

A spokesman of the corporation stressed the importance of outright grants as against concessions alone. He pointed out that the advantage of tax concessions could be wiped out by the imposition of some fresh taxation, but the grants were a positive step that acted as an instantaneous incentive. The spokesman also made it clear that though regional development has been aimed largely at employment, that was not the rule.

The corporation does not concentrate only on inviting new industries, but also looks after the already established units. The corporation believes that a happy industrialist in the region is the best ambassador of the area and helps to invite more units. With that aim in view the corporation continues to improve the infrastructure of the area. The facilities of roads, airports, power, water and communications are always kept in mind.

The corporation helps the industries in the region by holding permanent and temporary fairs and exhibitions. In London, for instance, it has a permanent exhibition for the overseas buyers visiting the city. The corporation also sends trade missions abroad in order to explore markets for the products manufactured in the area.

It may be observed that the success achieved by the corporation in improving the economic conditions of Wales has largely been due to three factors. In the first instance the corporation has composite representation and comprehensive powers. Secondly, it has all the interests working harmoniously for the same purpose—the development of the area. Moreover the objectives of the corporation are precise and clear and not vague and idealistic. In the third place the grants and concessions are fairly substantial and carry no obscure and complicated conditions.

I had always suspected

that the Prime Minister and her party would convert the silver jubilee of the nation's independence into one grand occasion for further advertising and glorifying her image. It is now very clear that Mrs Gandhi and her henchmen are determined to make as much political capital as possible out of this national occasion. As information becomes available of the central government's plans and programmes for this August 15, the conclusion becomes hard to resist that not only public funds but also the simple patriotism of the people are going to be unscrupulously exploited for boosting the career of an individual politician and the fortunes of her party.

It has been announced, for instance, that Mrs Indira Gandhi is going to travel across the length and breadth of the land ceremonially visiting places sacred to the memory of the martyrs of the freedom struggle. This I would consider to be a monopolistic or restrictive trade practice of the worst kind since this would squeeze out effective participation by other political or public figures in this emotive ritual. Mrs Gandhi ought to remind herself at least occasionally that she is only the grand-daughter of the freedom struggle. There are happily still with us many who could lay claim to a more proximate place in the lineage. Why should they not be given their legitimate place in the national celebrations? The Prime Minister and her courtiers may believe that she has made history, but they cannot make the people believe that Indian history began and would end with the prime ministership of Mrs Indira Gandhi. The mere fact that the Prime Minister can commandeer an IAF plane is not justification enough for her wanting to fill the entire national scene with her presence on a day when the people's thoughts must naturally and properly turn to the ordinary men and women who, in their hundreds of thousands, had given their all to the service of the country in its hour of greatest need.

Whether the Prime Minister

has demoted Mr C. Subramaniam or not, he seems to have demoted himself. Whereas he was using a luxury foreign car when he was Minister for Planning, he has opted for an Ambassa-

dor after his transfer to the Ministry of Industrial Development. I fail to see the logic or reasoning behind this act of ostentatious austerity. Do our ministers still believe that the public can be taken in by such cheaply clever gimmicks? It is common knowledge that extravagance and conspicuous consumption in government is growing day by day. Against this background people can have but little patience with the empty gestures of politicians in power.

Mr T.A. Pai has gone one better. He has not only declared that he would tax the tax-payer only to the extent of the price of an Ambassador car for his official use, but has also taken up his residence in a railway saloon pending the allotment of suitable ministerial accommodation for him. Mr Pai has been appointed Minister for Railways. He has probably assumed that this entitles him to the use of a saloon as a temporary residence. I am not sure that the rules permit this. In any case what would Mr Pai have done had he been appointed Minister for Civil Aviation? Would he have gone to live in a hangar in Palam? It passes my understanding why reasonably intelligent persons should so readily succumb to the temptation to play the fool merely in order to catch the public eye. Do our ministers realize at all that the country is passing through a very difficult time and that the public is in no mood to put up with clowning as a substitute for clean government or efficient administration?

In the relatively short

and inglorious career of Dr Ashok Mitra as Chief Economic Adviser in the Finance Ministry lies a cautionary tale. People who are light weights must surely be chary of throwing their weight about. Dr Mitra has exhibited on various occasions a degree of intellectual arrogance which has been invariably short on intellect. He has done probably as much as anybody in his position could have done to sow confusion in government policies, particularly in the monetary and banking areas. There has been some speculation about the reason for his leaving the Finance Ministry. The wonder, however, must be how it was that he was tolerated in the government so long. His thesis on differential interest rates will forever remain the ultimate absurdity in economic analysis.

The Chief Minister of

Himachal Pradesh, Dr Y.S. Parmar has been a more enduring landmark or Simla than most of its more natural landmarks. He has been successfully defying political erosion in a way which must be the envy of the Jakk hill so constantly threatened by wind weather or water. It is therefore rather difficult to believe that the 'ceiling epidemic' is about to overtake even his tenure as Chief Minister. Dr Parmar has of course done many good things to Himachal Pradesh. For instance, he has greatly helped to develop its orchard wealth, primarily by building a network of roads through its hills and across its valleys. More important still, he has encouraged and enabled the hill people to cultivate in themselves a sense of belonging and this he has done mainly by easing and extending their access to the emerging economic opportunities in the state. He need have no regrets therefore when he does step down from the leadership of the state government. On the contrary, there would be a risk of his being unjust to himself if he permits himself to be unduly reluctant to give up office. Too long a tenure of power at the top must necessarily lead to the creation of a cluster of vested interests, political or other, although Dr Parmar's record has been on the whole a clean one. All the same it cannot be asserted that a change in the chief ministership in Himachal Pradesh will not be to the advantage of good government. Incidentally Mrs Gandhi seems to have ideas of her own in this matter.

Dwarkanath Kalhan who

passed away in New Delhi last week was a rare journalist. In a profession where dog habitually eats dog, he was not only no cannibal but was, so to speak, a strict 'vegetarian'. Kalhan believed not only that the world was large enough to accommodate all kinds of people but also that even the vocation journalism was wide enough to permit its practitioners to live and let live. I worked with him for several years on the staff of *The Hindustan Times*. What made me feel somewhat sentimental about him was his transparent social conscience. He was not in the best of health in his later years and it is possible that it was only his wife's mothering care which saw him into the threshold of his sixties. It so happened that I met him at a dinner a few days before his death. He talked to me enthusiastically about the places he had visited recently in south India and said that he was hoping to return to that part of the country for a more leisurely tour of its temple-towns or historic centres. To him, however, wherever he went, people were always more important than places, for he truly loved his fellowmen.

Tax Burden on Agriculture in India: Dr K.N. Reddy; Good Companions Publishers, Baroda; 1972; Pp 110; Price Rs 15.

Exporting to the Socialist Countries of Eastern Europe is a comprehensive and excellent marketing guide intended for exporters and export promotion officials of developing countries interested in eastern European markets. This guide is limited, because of the basic similarities, to seven of the socialist countries of eastern Europe, namely Bulgaria, Czechoslovakia, the German Democratic Republic, Hungary, Poland, Rumania and the USSR.

Case material is used extensively in this book. Most of it is based on the recent experience of some thirty developing countries that are actively promoting export of their products to east European countries. This guide, unlike many other books on the subject, does not limit itself to the marketing of industrial capital equipment but is written with the specialised marketing needs of exporter of food-stuffs, raw materials and simple manufactures, since most of the developing countries are selling these products to eastern Europe at present.

important assumptions

Underlying the approach of this book are two closely related important assumptions. The first assumption is that a developing country that desires to increase its exports to eastern Europe will have to expand imports from this area more or less to the same extent. The second assumption is that some of the east European countries referred to in this book prefer to trade on bilateral basis with the developing countries. This is because their planning of imports and ex-

ports is implemented most efficiently when there is bilateral payments agreement with each trading partner.

The ten chapters in this book are devoted to development of marketing strategy, organising of sales efforts, choosing a representative in the markets, obtaining and analysing trade and market data, conducting formal market studies, organising and managing exhibitions at trade fairs in the area, selecting appropriate advertising and publicity media, the size and nature of the markets, the foreign trade systems of the seven countries and their commercial practices and regulations.

extremely instructive

It would be extremely instructive to have an idea of the size, trends in growth in foreign trade, relative importance of markets of the seven east European countries under study here, level of their economic development and importance of their foreign trade, especially in the broader perspective of world trade.

We find that in 1968 the seven countries of eastern Europe accounted for 11.3 per cent of the world trade and for more than 30 per cent of the world's industrial production. In 1968 exports from the seven countries totalled \$25.159 billion and their imports \$23.906 billion, the USSR alone accounting for some two-thirds of exports and imports. But exporter should not assume that the vastness of the USSR would justify concentrating most of their efforts in that market. The greater dependence of the other east European countries under study here on

foreign trade make them of equal interest to foreign exporters.

The data in the book reflect the large differences in the relative levels of economic growth among the seven countries. Rumania has the lowest GNP per capita and the German Democratic Republic the highest. There are also large variations in the levels of industrialisation in the seven countries and we find that in general, lower the level of industrial development, higher the country's rate of growth. Planners in the seven countries expect to maintain roughly the same annual growth rates during the 1970s that have been recorded since 1950. Where foreign trade is concerned, its share in each of the seven economies and its growth correspond roughly to the relative levels of industrialisation and per capita GNP. Only the foreign trade of USSR varies from this pattern because of the Soviet economy's resource endowment and size leading to a greater degree of self-sufficiency.

decrease in share

It is interesting to note that during the past decade, the share of foreign trade of the socialist countries in the total world trade has declined slightly from 11.7 per cent in 1960 to 10.7 per cent in 1968. Nevertheless in absolute terms, their total trade has increased substantially during this period, from \$ 15 billion in 1960 to \$25.38 billion in 1968. Of greater significance to the developing countries is the substantial growth of their trade with the socialist countries of eastern Europe which increased at an annual rate of 13.2 per cent during 1960-68. In fact since 1968 the rate of growth of eastern European imports and exports has tended to exceed the international average. It is observed that during the decade 1955-65, trade between the developing countries and eastern Europe was the most dynamic sector of world trade. There seems to be no sign of abatement in this trend.

In terms of composition of this trade, industrial manufactures have been the fastest growing category of products exported by developing countries to eastern Europe and also offers the greatest promise in coming years as reflected in the substantially increased import quotas for indus-

trial manufactures in bilateral trade agreements recently negotiated between eastern Europe and many developing countries. This means trade between the developing countries and eastern Europe offers plenty of scope for expansion. Nearly all the governments have shown awareness of this and have entered into bilateral trade and payments agreements.

During the 1960 nearly 90 per cent of exports from developing countries to eastern Europe were accounted for by agricultural products and raw materials. The fastest growing category of exports during that period was manufactures and semi-manufactures which rose from eight per cent of all exports to Eastern Europe in 1962 to 27.8 per cent in 1968. On the basis of the survey, it is apparent that for many years to come, the major market in eastern Europe for the exports of developing countries will continue to be food products and raw materials for industrial use. Also, for developing countries that export industrial manufactures, the markets of eastern Europe hold much promises. It should be noted that despite the impressive expansion eastern European imports of manufactures from developing countries — \$ 654 million in 1968 — have not yet reached a significant proportion of their total imports from those countries and one half of their imports of manufactures came from only three countries, namely Cuba, India and the United Arab Republic (Egypt).

bright picture

Regarding prospects of exports from developing countries to eastern Europe it is observed that the overall picture is exceptionally bright, provided the developing countries take suitable measures to ensure a long-term readiness on the part of their east European trade partners steadily to increase their imports. The bilateral trade and payments agreements assume that the developing countries will take steps to increase their purchases of capital goods and consumer products from east European countries. The study warns that although growing markets exist in eastern Europe, unless developing countries take energetic steps to enter them, they will not be in a position to take full advantage of the opportunities.

It is an exhaustive study with 38 appendices which are packed with every conceivable detail of relevant information and a fairly exhaustive and extremely useful bibliography on the trade of developing countries with eastern Europe. Developing countries are finding it increasingly difficult to increase their exports to western countries and therefore are in need of new markets which fortunately for them the east European countries are in a position

to provide and which the developing countries must fully exploit. This authoritative and exhaustive guide to marketing techniques and exports to east European countries should prove extremely useful in achieving the objective of diversifying exports of developing countries like India.

COMPETITION AND ECONOMIC GROWTH

A conference was held in England in September 1969 and was sponsored by the Board of Trade and OECD and was attended by officials, lawyers and economists from the United States and most of the European countries. The central theme of the conference was the relationship between policies on competition, rationalisation in industry and economic growth. *International Conference on Monopolies, Mergers, And Restrictive Practices* reproduces the papers read at the conference.

As regards the ultimate objectives of competition there was some tendency to think of these ultimate objectives in terms of full employment, stable prices, a more equitable distribution of income, raising living standards and sound balance of payments. But it was thought that it may not be possible to aim at such a wide spectrum of objectives at one and the same time. Prof Cairns emphasised that there was danger in expecting competition to do too much and therefore the main objective should be to ensure the speedy and effective transfer of resources from less to more efficient uses.

Prof Phillips referred to the most important difficulty in achieving the efficient use of resources through competition. Individual firms in the pursuit of profit ordinarily do not take account of externalities—those costs on the community which may be incurred through the industrial and commercial activities of an enterprise but which do not enter directly or indirectly into their profit and loss account. Pollution of the environment is the most obvious example. Unless such factors are taken explicitly into account as would be required in a social cost-benefit analysis, the pursuit of profits—whatever the state of competition—may well lead to a misallocation of resources. The solution to this problem is for the state or some other appropriate authority to impose regulations or to manipulate decision variables so as to bring private and social interests more closely together. Thus by bringing externalities in to profitability reckonings of firms, the pursuit of competition policy may lead to a better social allocation of resources than if externalities are ignored.

The scope of competition policy was

being regarded as potentially very wide. To a greater or lesser degree it could be taken to relate to monopolies, mergers, restrictive practices by industry and trade unions, consumer protection, patent legislation, advertisement, establishment of companies, copyright laws, tariffs and so on. Several speakers urged that in Britain more decisions in the implementation of competition policy should be made through the application of legal criteria rather than through ad hoc decisions within a rather broad legal framework. This line of reasoning received considerable support and led to the proposition that in some areas the time has come for the more precise specification of the rules of conduct. But there was also some doubt as to whether general laws regulating competition could be framed with sufficient precision to cover the many different circumstances which might arise in practice, while at the same time affording businessmen clear guides to action.

competition policy

The participants at the conference analysed and discussed many specific problem areas in the implementation of competition policy. Some of the issues discussed in the book are the multinational corporations which have been posing many critical problems to national governments, the law's delay and whether the market is a better judge, concentration, firm's size, invention and innovation, economies of scale, the problems of resale, price maintenance and refusal to sell, price discrimination and non-price competition. Though some of these issues are very technical and the plane of analysis is highly sophisticated, most of the papers have succeeded in bringing out the various implications of these issues very lucidly so that there is no mistaking on the part of the readers about the complexities involved in the problems of competition and monopoly.

Indian authorities dealing with the problems of monopolies, mergers, concentration and such other aspects of industrial organisation in the country would do well to ponder over some of the most complex issues dealt with fairly exhaustively in this book. So far the impression created is that in this country the government has not been looking at these problems objectively and scientifically but with essentially political objectives in view with the consequence that the rate of industrial growth has been declining over years. In the interest of economic growth and maximising social welfare, these problems of competition and monopoly in the industrial field need to be dealt with rationally and the papers in this book will give enough food for thought to

those interested in the problems of industrial organisation.

BANKING REGULATION

Is there the necessity of a new book on the Banking Regulation Act of 1949 after July 1969 when 14 major commercial banks in the country were nationalised? Now that the major commercial banks are owned and managed by the government, there is no question of banks making a profit or suffering a loss or their going in to liquidation. Does not the new situation make a book on banking regulation superfluous? L.R. Suneja's exhaustive and excellent book on *Banking Regulation Act—1949* which has gone into the second edition, proves that the study of banking regulations is as important today as before nationalisation and thus makes a useful contribution to the relatively sparse literature on banking in India.

The Banking Companies Act which was passed on March 10, 1949 was a significant landmark in the history of banking in India. Though at the time of passing it was thought that the Act was very well thoughtout and comprehensive piece of legislation, it soon become obvious, in the light of the experience gained in its actual operation, that there were many deficiencies and loopholes and amendments were passed in 1950, 1953, 1956, 1957, 1959 and 1960. The author has dealt exhaustively with the main act and all these amendments and has explained their implications very lucidly. These amendments related to amalgamations, liabilities of directors, powers of the Reserve Bank of India to supervise and control commercial banks and so on.

The government however was not satisfied with the results obtained and felt that the commercial banks should play a more decisive role. The deficiencies of the Indian commercial banking system came to be discussed widely in the context of planned objectives and targets. There were complaints that the bulk of bank advances tended to be directed to the large and medium scale industries and big and established industrial houses while priority sectors such as agriculture, small-scale industries and exports had not been receiving their due share. In order to mobilise the country's resources more effectively and to bring about the desired changes in the pattern of bank lending, it was considered necessary to evolve appropriate guidelines for bank management and to bring about a reorientation of their decision-making machinery so that the policy formulated in the sphere of bank lending by the Reserve Bank of India was properly implemented. It was with this end in view that Social Control Order

came into operation since December 1968.

According to the author the Indian bankers soon reconciled themselves to the ideas and methods of social control. They redoubled their efforts in the field of branch expansion, deposit mobilisation and diversification of credit, particularly in favour of priority sectors. The author feels that a favourable change was clearly discernable in the attitude of Indian commercial banks.

The Social Control Order was hardly in operation for six months when on July 19, 1969 nationalisation of 14 major commercial banks with deposits of Rs 50 crores and more was announced and the banks taken over by the government. The declared goal of the nationalisation is to diversify the pattern of lending in favour not only of the priority sectors of the economy as envisaged by the Social Control Order but also in favour of weaker sections of society and of backward areas.

additional responsibilities

According to the author the task ahead of the nationalised banking sector lies in two directions — the operational and organisational. The diversification of credit pattern and its functional distribution are the most important changes on the operational side of the banking system. "Attuning the banking transactions to the changing needs of the economy and enabling the system reorganise itself to shoulder the additional responsibilities is the major organisational task." The author has rightly emphasised that the speed and efficiency with which the nationalised banking sector adapts itself to these requirements is of the crucial importance because on it depends the future growth of the Indian economy.

According to the author nationalisation and Social Control Order are now working together in India. While nationalisation controls the State Bank of India with its seven subsidiaries and 14 major commercial banks, Social Control regulates the business of 38 Indian commercial banks as yet out of public sector and 13 foreign exchange banks. This book on banking regulation is still relevant because many of the provisions of this Act with its amendments are still applicable to nationalised banks not to speak of non-nationalised banks in the country. Both the nationalised and non-nationalised commercial banks are still guided by the provisions of the Banking Regulation Act. This means that full knowledge of the provisions of this Act is absolutely essential for the officials and others working both

in the nationalised and non-nationalised banks in the country.

This book is easily one of the finest on the subject of banking legislation in India. L.R. Suneja has dealt exhaustively and clause by clause with the provisions of the Act and its various amendments including the Banking Companies (Transfer of Property and Undertakings) Act, 1970 and the Nationalised Banks Management Scheme, 1971. The remarkable lucidity with which the exposition and analysis are carried on from beginning to end shows the deep study of the author as also his great practical experience in the field of commercial banking. This book is a must to all the commercial bankers in the country.

SUCCESSFUL MANAGEMENT

Since *Sale — A Profile*, an earlier publication by the same authors (already reviewed in these columns) received a favourable reception, the authors have made an attempt in *Business Switch* to catalogue a few of the important techniques that are necessary for the smooth functioning of a complex business organisation, viz, the retailing unit. "Whether the retailing units are managed by private individuals largely motivated by profit consideration or through the agency of co-operatives with an aim of curbing consumer exploitation, the techniques mentioned in this book are essential pre-requisites to the successful management of a retail shop.

This book regarding retail trading should be of significance as retail trading so far happens to be a neglected field. In several countries the monetary value of retail trade is roughly a little more than a third of the Gross National Product. Even in developing countries where traditional occupations with rural background still predominate, the share of retail trading is not any less. The chances are that with economic progress, retail trading will grow both in volume and value. It is in this context that systematic study of retail trading becomes necessary so that wasteful growth in that business is avoided.

The authors have emphasised that the failure of a retail business unit is not as sudden as is often made out to be. Deterioration in business efficiency sets in at several stages in a very imperceptible way. And therefore the basic pre-requisite to understanding an activity such as retailing is an awareness based on knowledge and know-how of the weak and strong points pertaining to this business.

The authors have dealt with all the sources of income and expenditure of a retail business unit and with other topics such as the importance of the rate of turn-

over of stock, wage costs, sale per employee, budgeting, work organisation, depreciation and so on. They have discussed the factors to be kept in mind when fixing the prices of commodities, how to raise and use capital, how to watch cash inflow and outflow, cash control, control over inventory, and result calculation and evaluation. The authors have emphasised that in a fast moving complex business organisation such as retailing, the management has to review the programmes regularly with the help of 'key figures'. The compiling of these key figures should be a routine to be rigidly followed at the end of each stipulated period. Some of the key figures mentioned by the authors are sale per consumer, sale per employee, stock turnover, break-even sale, margin of safety, net profit per employee and assets turnover ratio. The authors have also given in a detailed way job description i.e. functions of various officials in a retail business unit such as branch manager, section manager, sales assistant, sales promotion man and so on, generally employed in big co-operative retail business unit.

Retail trading in developing countries like India is yet run on traditional lines and without adopting most of the sophisticated techniques mentioned in this book. But there is no doubt that this vital sector of our economy needs to be based on rational and modern techniques. Many of the techniques described in this book are quite simple ones and can very easily be adopted by even small retail shops. The book will certainly be found useful not only by big departmental stores and large consumer co-operatives but also by small retail shop-keepers.

REGIONAL DEVELOPMENT

Literature on banking is relatively scarce and books of quality on the subject rarer still. One is therefore extremely pleased to read *Regional Development Banking* by R.M. Saksena who within a small compass of 124 pages has done full justice to the subject and has produced an excellent book on regional development banking.

Though after World War II there is a distinct movement towards international economic co-operation under the aegis of the United Nations, there is however a feeling among statesmen and economists that it would be better to narrow down the scale of co-operation in the economic sphere because international relations as at present cannot be very intimate. "The concept of economic internationalism due to its inherent weakness to sustain itself under diverse pressures from various directions has, therefore paved the way for economic regionalism. "The outcome of such an attitude has resulted in the

establishment of regional development banks. European Investment Bank — 1958 (EIB), Inter-American Development Bank-1959 (IDB), African Development Bank-1964 (AFDB), and Asian Development Bank-1966 (ADB) are the four regional development banks that are functioning in different parts of the world today.

The author has traced the origin and growth of the four regional development banks and has analysed the meaning of the term 'regional development bank', their ideological foundation, their objectives and scope, their functions, managerial pattern, capital structure and the terms of development finance and the part which they have been playing in the economic development and social progress of their respective regions. The author has also made an attempt to evolve certain guidelines for their future policies.

macro standpoint

It would be extremely instructive to look to all these development banks from the macro standpoint, though the European Investment Bank stands generally in a different category from the other three in several respects. The functions which the regional development banks perform are either financial or developmental in their nature. The former category refers to provision of financial assistance in various forms and the latter refers to provision of technical assistance, conducting techno-economic surveys and pre-investment studies and such other aspects.

According to the author the objective of removing regional imbalances makes it incumbent on these banks to give greater attention to developmental functions rather than purely banking activities. It follows that establishment of priorities for the provision of financial assistance is a *sine qua non* of effective regional development banking. Naturally there is the necessity of adoption of different schemes of priorities by different regional banks, depending upon the strategy of economic growth and the socio-economic context of the applicant country. And still the author has suggested some excellent guidelines. According to him highest priority should be given to multinational projects which accelerate the rate of economic growth of the region as a whole, as also to projects which facilitate regional economic integration by making economies of the countries of the region complementary with one another, to projects which are likely to increase intra-regional and extra-regional trade, to projects which would quicken the pace of economic growth of relatively less developed areas in the region, and to projects which are likely to attract intra-regional and extra-

regional investible resources, both public and private. Though there is no rigidity about this scheme, the author rightly feels that the scheme suggested above is likely to help the regional development banks substantially optimise the use of their limited resources.

broaden the spectrum

As regards administrative matters the author is of the opinion that the directors should be appointed for a period of five years instead of two or three years as at present as that is too short, that the regional development banks should pay more heed to advisory committees which should be strengthened, that while the majority of bank employees should be recruited from the region concerned, experts from other centres should be appointed as that would broaden the spectrum of thinking in the bank, that training centres should be opened for training officials in developmental banking, that there should be follow-up action by the development banks after post-sanction and post-disbursement, instead of leaving the responsibility for follow-up action with the recipient countries, that regional banks should provide direct financial assistance mainly for the international projects which require international outlook, international experience and international financial resources, that the regional banks with paucity of resources should think of syndicating i.e. undertaking joint financing operations with large and prominent private investors, bankers and industrial concerns throughout the world, that these banks should look to the problem of export finance which has remained neglected so far, that the regional development banks should examine feasibility of the scheme for underwriting bonds and debentures floated by the national development banks, that the rate of interest of these banks be as low as feasible and that in order to avoid conflicts and duplication of activities, the operations of the regional development banks be dovetailed with those of the national development banks on the one hand and those of the World Bank on the other.

The author has also pleaded that in order to make the regional development banks (excepting EIB) to play their role more effectively, the advanced countries should come forward with subscriptions to the capital of these regional banks and should provide special funds to them on concessional terms. These are all eminently practicable and extremely useful suggestions which the regional development banks can follow with profit to the regions they are serving.

This is an extremely thought-provoking study of a subject which is bound to be of

increasing significance in years to come. The book certainly deserves to be read by all those who are interested in development finance. The book is an excellent addition to the relatively sparse literature on banking.

TAXING AGRICULTURE

One suffers from a surfeit of discussions on the subject of agricultural taxation in India these days. Dr K.N. Reddy has added his share to this lot by his *Tax Burden on Agriculture in India*.

One school of thought holds the view that agriculture in India has been an under-taxed sector and hence this sector must be taxed more, both on grounds of equity as well as the need to raise additional resources for the country's development. Among the many measures advocated by this school, agricultural income tax finds a conspicuous place. Due to increase in agricultural incomes, especially among farmers with substantial holdings in the wake of the green revolution, this view has gained wider currency in recent years and a committee under the chairmanship of Prof K.N. Reddy is again examining the issue.

There is also the opposite view which while conceding that agriculture has been under-taxed would not advocate imposition of additional taxation as the increased burden of taxation would nip the agricultural revolution in the bud by adversely affecting the willingness and the ability of farmers to invest.

Dr Reddy rightly feels that it is necessary to know the factual position in regard to the benefits received by and the costs incurred in the agricultural sector so that one could form an informed judgement on the net position of the sector. Also since the argument is often put forward in the name of equity, the author feels that it is necessary to know how the net position of agriculture compares with that of non-agricultural sector, as also various groups within the two sectors. Further, since in the discussions, agricultural income tax finds a conspicuous mention, it is necessary to know the pros and the cons involved and find out if and whether there are better alternative ways of raising additional resources.

In regard to the above matters, the author has arrived at the following conclusions. As regards the fiscal burden on agriculture, his findings are that the per capita income and per capita tax incidence are lower in the agricultural sector than in the non-agricultural sector, that the per capita benefit received by the agricultural sector is higher than that of the non-agri-

cultural sector, that measured in terms of per capita taxes as percentage of per capita income, agricultural sector has borne more burden than non-agricultural sector, that the tax incidence in the agricultural sector is lower than in the non-agricultural sector and that the presumption of some economists that agricultural sector has borne less burden seems to be unwarranted, particularly in the context of concealed taxes borne by the agricultural sector.

As regards intra-sectoral equity, the author has concluded that the tax payments by lower income class in the agricultural sector were roughly equal to the tax payments by the same class in the non-agricultural sector upto 1960-61 and lower by 35 to 40 per cent thereafter. However the upper income class in the agricultural sector bore comparatively less tax burden than that of the upper income class in the non-agricultural sector. Efforts for mobilising additional resources from the agricultural sector have got to be made primarily as a part of financing development programmes and secondarily as a part of bringing equity in the tax burden between the two sectors.

plugging the loopholes

On the basis of the above findings Dr Reddy has made the following recommendations. In his scheme the short-term measures do not envisage any radical changes in the existing agricultural taxation. They are aimed at raising at least that much revenue (say about Rs 35 crores) which would bridge the inter-class inequity. The long-term measures, on the other hand, concern the basic changes needed for plugging the loopholes in the existing tax system and attaining certain other Plan objectives.

Regarding short-term measures, the author has recommended a surcharge on land revenue, the rates being framed in such a way that the surcharge will be in consonance with the progression and higher yield. Holdings below 25 acres are to be exempt and the rest of the holdings are to be subject to surcharge at progressive rates. While fixing the progression in tax rates, inequity of tax burden as between the upper income class in the agricultural sector and non-agricultural sector is taken into account. Also, discrimination may be made among states by taking into account the existing levels of agricultural taxation in each state. According to the author a surcharge of Rs 2.50 per acre on holdings between 25 to 49.99 acres and Rs 7.50 per acre on holdings between 50 acres and above will yield about Rs 50 crores annually.

As regards long-term measures, the

author has suggested reorganisation of agricultural taxation which is to take place within 6 to 8 years. He recommends land-based taxation instead of income-based taxation, especially in the context of lowering down of ceilings on the existing land holdings.

In the reorganised system of agricultural taxation, the author wants that the existing type of agricultural income tax should be done away with, since it does not serve the purpose of raising substantial revenues for the states. Instead, the author has made the following proposals. Systematic valuation of agricultural land should first be done on the basis of soil classification, topography, climate, fertility, irrigational facilities etc., etc. The different grades of land should be subject to different rates of taxation, distinction being made especially between irrigated and non-irrigated lands. Wealth tax on agricultural property may also be imposed. If a high rate of wealth tax is imposed, this would perhaps reduce tax avoidance in personal income tax. Further, to impart elasticity to the agricultural tax system, a surcharge on land revenue may be thought of once in three years until another assessment of land and valuation takes place. The surcharge according to the author, may be fixed

taking into account the average wholesale price index of foodgrains during the three years. And finally, to ensure progression in the tax system as well as for increasing revenue, the author suggests that some indirect taxes may be levied such as taxes on electric motors, pumpsets, oil engines, fertilisers and tractors which enter mostly the consumption pattern of higher income groups in the agricultural sector.

While the analysis and short-term mea-

sures suggested by the author are useful and practicable, his long-term measures are too complicated and are likely to violate the canon of simplicity. It is to be wondered whether in the existing setup such a complete overhaul of agricultural taxation is possible even in the course of next decade or two. Set back to agricultural production this year should make us cautious about the measures that we take in the agricultural sector which after long period of stagnation is just pulling up.

TRADE WINDS

Cashew Corporation

THE CASHW Corporation of India (CCI), a public sector enterprise formed on September 1, 1970, has reported satisfactory results for the first 1½ years of its operations. The gross profit of the corporation during the 18 months to March 31, 1972, aggregated to Rs 2.86 crores—Rs 2.13 crores for 1971-72 and Rs 0.73 crore for the earlier six months. Of this gross profit, Rs 1.94 crores have been contributed to the exchequer as tax, Rs 77 lakhs have been credited to the reserves account and Rs 15 lakhs have been paid to the State Trading Corporation (STC) by way of dividends on a paid-up capital of Rs 50 lakhs. The Board of Directors of the CCI has further proposed to issue bonus shares to the STC to the value of Rs 25 lakhs. Ultimately, it is proposed to raise the paid-up capital of the company to two crores of rupees.

The total exports of the enterprise, including CNSL, in 1971-72 amounted to Rs 62.35 crores, as against Rs 52.86 crores in 1970-71 and Rs 58.44 crores in 1969-70. Deducting the value of imports of raw cashew nuts, the net foreign exchange earnings in 1971-72 were of the order of Rs 37.01 crores, as against Rs 23.45 crores in the previous year and Rs 30.84 crores in 1969-70. The foreign exchange earnings from the general currency area in the three years were Rs 16.66 crores, Rs 4.94 crores and Rs 3.70 crores, respectively. From the rupee currency areas, they were Rs 20.35 crores, Rs 18.51 crores and Rs 27.14 crores, respectively.

The sizeable increase in exports and some improvement in the profitability of the corpora-

tion in 1971-72 have been achieved in the face of heavy odds. The year 1971-72 was marked by numerous crises and uncertainties caused by the prolonged closure of factories due to a heavy carry-forward of unsold stocks, the international monetary crisis and the imposition, in the wake of the national emergency, of a 2.5 per cent regulatory duty on imports.

Compulsory Export Obligation

The Foreign Trade Ministry has a proposal under consideration to impose compulsory export obligation on a wide variety of industries so as to increase exports. The Minister of Foreign Trade, Mr L. N. Mishra, said on July 30 that the proposal was part of a radical plan which he intended to put into operation during the year to restructure the country's external trade in consonance with the growing accent on self-reliance. The legal and constitutional aspects, of this proposal were now being seriously examined in consultation with various ministries. Initially, compulsory export obligation would be put on a few selected industries.

Mr Mishra said he also proposed to devise schemes to make inputs available to exporters at internationally competitive prices in view of the serious erosion into the profitability of exports because of rising prices within the country. Another measure he had in view was to draw up a comprehensive programme for the growth of export-oriented units.

Compulsion, Mr Mishra added, had become inevitable in a situation where domestic demand continued to outstrip

the rate of growth in industrial consumption in order to create exportable surpluses. Further, he said experience had shown that the attraction of increased profit margins in the home market was a disincentive to exports.

Realistic Prices

The seminar on public undertakings held recently in the capital recommended that the government should fix "realistic prices" for their products which would enable them to meet inevitable increase in operating costs and also be fair to consumers. Criticism was voiced against the fact that "predominantly non-economic factors" were allowed to affect projects at the stage of formulation. It was urged that sound feasibility reports should be prepared on the basis of scientifically formulated guidelines.

The seminar described over-capitalisation and under-utilisation of capacity as major ills afflicting the public enterprises. According to the consensus at the seminar, under-utilisation of capacity resulted from overambitious and bad planning, imbalanced or defectively-designed plants, shortage of working capital, power failures, industrial unrest, recession, and lack of raw materials and transport facilities.

Several enterprises had problems of "overcapacity" as a result of "fantastic" installed capacities. These problems could be tackled through product diversification.

Two other problems highlighted were overstaffing and excessive inventories. Overstaffing was due to lack of proper manpower planning in initial stages. Adequate control was not exercised over creation of additional posts. Among the reasons for excessive inventories were technological changes and obsolescence, procedural delays in releasing foreign exchange, lack of planning and constant review by top management.

Panel for Fiscal Set-up

The IMF announced on July 28 formal approval by its board of governors of the new

"committee of 20" to negotiate reforms of the world monetary system and "related issues". The approval was by an overwhelming majority of the governors of the Fund who are either finance ministers of their countries or central bank governors. A few countries abstained on the poll taken by mail.

The 20 countries constituting the committee will be the five who have the largest quotas in the fund—the USA, the UK, France, West Germany and Japan—six from the developed world—very likely Italy, the Netherlands, Belgium, Canada and a Scandinavian country—three from Latin America and six from Asia, Africa and West Asia among whom India will be one.

The main purpose of the committee will be to recommend monetary reform, including an amendment to the articles of IMF agreement. The committee will also give full attention to the inter-relationships between these matters and existing and prospective arrangements among other countries, including those involving international trade and the flow of capital investment to developing countries. Monetary reform was strongly advocated at UNCTAD-IV where a resolution was passed, in the teeth of opposition by the rich countries, that developing countries should fully participate in process of decision-making and reform of the fund.

Science and Technology

The National Committee on Science and Technology (NCST), which was inaugurated in November 1971, is currently engaged in the formulation of a Science and Technology (S & T) plan. This is the first time that such an attempt is being made in the country. The strategies of the S&T plan would be determined by the socio-economic goals as defined in the five-year Plan. The more important among these goals are maximum utilisation of resources, self-reliance, increasing employment potential and provision of basic minimum needs. But, as the choice of

specific scientific problems within the broad areas has to be tactical and an only working scientists can make these tactical choices, MCST has involved about 1,500 working scientists for formulating the S&T plan. This has also given a great sense of participation to our scientists, particularly the younger scientists.

To cover the various sectors of S&T, NCST has constituted 22 panels. These in turn have formed a number of groups and sub-groups comprising scientists, technologists and other experts. They have been drawn from R&D organizations industries and government agencies, with a view to ensuring an inter-disciplinary approach. The S&T plan would cover the entire innovation chain, from research and development through design, engineering, pilot plant to production.

Aromatics Project

The union Minister for Law & Justice and Petroleum & Chemicals, Mr H. R. Gokhale, informed the members of the Parliamentary Consultative Committee attached to the Ministry of Petroleum & Chemicals recently that the Aromatics Projects of the Gujarat Petrochemical Complex was likely to be commissioned by the end of 1972. He explained that there had been some delay in the implementation of the project mainly on account of the fact that indigenous fabricators, who were given fabrication jobs relating to certain critical parts of the plants had not been able to meet their schedule.

Regarding downstream units of the Olefins Project, the Minister said that investment approvals for all the downstream units had been accorded and letters of intent for all except synthetic rubber and poly-ethylene had been issued. Foreign collaboration proposals in respect of all units except poly-ethylene had been approved by the Foreign Investment Board. The Olefins Project would take approxi-

mately 36 months for completion.

The Aromatics Project, the Minister said, consisted mainly of a DMT plant and a Xylenes plant. The DMT part of the project was expected to be in position earlier than the Xylenes part and the Indian Petro-Chemical Corporation proposed to commission it on the basis of imported paraxylene till such time as the Xylenes plant was commissioned, saving considerable foreign exchange through reduction in DMT imports as such.

Social Security

The conference of state ministers of social welfare and in charge of backward classes on July 23 agreed that in the fifth Plan a system of public assistance should be evolved for the benefit of some categories of persons who would normally be in great distress otherwise. These categories were: old persons who have no income and no one to support them, orphans and children whose parents cannot support them, widows with no income during the first year of widowhood and persons who are severely handicapped.

The scheme will cost about Rs 750 crores during the fifth Plan period. It was agreed that such proposals should be formulated and incorporated in the Plan.

A new strategy for tribal development has also been approved by the ministers.

Wagons to Yugoslavia

Yugoslavia has agreed to an extension of five months in the delivery schedule for the first consignment of the 3,600 railway wagons that the State Trading Corporation has contracted to supply over a period of years from the beginning of 1973. The chairman of the Projects and Equipment Corporation, Mr P. Sahai, told the Press in the capital on July 27 that there was no dispute with Yugoslavia on the question of the price to be paid for the Indian wagons which would be exported in knocked-down condition and assembled

in Yugoslavia. However, there were some differences of opinion on who should bear the penalty in the event of the supplies being delayed to the Yugoslav Railways. The Indian stand was that if the delay was not due to late deliveries by the Projects and Equipment Corporation, the penalty should not be charged to its account.

The corporation has made, in the very first year of its working, a profit of Rs 21.19 lakhs after paying a tax of Rs 60 lakhs to the government. The total turnover of the corporation was nearly Rs 40 crores and the corporation proposes to raise it to Rs 60 crores this year.

Liberal Credit Policy

Mrs Sushila Rohatgi, union Deputy Minister for Finance, has asked bankers to be less conservative while advancing loans. She was speaking at the inauguration ceremony of a branch of the Bank of Baroda in the capital on July, 26.

The government, she said, was concerned that the advance-deposit ratio was going down. She said that it was impossible to believe that this was due to lack of demand for credit. In a country which chronically suffered from lack of resources there would always be need for bank loans. She was satisfied that banks were on their way to fulfil socio-economic objectives of nationalisation.

Power Supply in Calcutta Area

The government has appointed a committee to find out the causes of frequent breakdowns of power supply in the Calcutta area and suggest measures for preventing the breakdowns and improving power supply in the area. The committee is to submit its report within two months. It is headed by the Vice-Chairman of the Central Water and Power Commission Mr A. K. Ghose. The other members on the committee are Mr B.S. Raghavan, Commissioner and Secretary to the government of West Bengal, Department of power, Calcutta; Mr S. K. Mukherji, Chairman, West Bengal State

Electricity Board, Calcutta; Mr S. K. Sen, Chief Electrical Engineer, Damodar Valley Corporation, Calcutta; and a representative each of the Calcutta Electric Supply Corporation Ltd, Calcutta and Durgapur Projects Ltd, Calcutta. Mr B. Sinha, Chief Engineer, Central Water and Power Commission, (Power Wing), New Delhi is Member Secretary.

New Business by LIC

The total new business completed by the Life Insurance Corporation of India (LIC) in June this year amounted to Rs 96.68 crores involving 1,11,405 policies.

In the three months from April to June 1972, the new business completed by the corporation totalled Rs 203.61 crores as against Rs 155.91 crores completed in the corresponding period of 1971—a rise of Rs 47.70 crores. The number of policies went up during the same period by 38,193.

Nationalisation of Coking Coal Mines

A bill for the final acquisition of the coking coal mines will be introduced in the current session of Parliament, which began on July 31. Another bill will be introduced in Parliament providing for the government ownership of the Indian Copper Corporation, the management of which was taken over recently.

The national income at current prices from mine sector in 1970 had reached about Rs 314 crores from Rs 139 crores in 1960, he said.

MSSIDC

The Maharashtra Small Scale Industries Development Corporation has succeeded in securing a big rate contract for a small-scale industry in Maharashtra for the supply of folic acid and ferrous sulphate tablets to the family Planning Department of the union Ministry of Health and family Planning. It is expected that the government might buy these tablets worth anything between Rs 75 lakhs to one crore of rupees every year.

The MSSIDC had quoted the

tender on behalf of Messrs Lupin Laboratories, Bombay and the Director General of Supplies and Disposals approved MSSIDC's tender for a rate contract lasting for two years from April 1, 1972. As a result of this rate contract, the Family Planning Department will place orders from time to time for the supply of specific quantities. The MSSIDC has already received an order for the supply of tablets worth Rs 42 lakhs at the rate of ten crore tablets per month. More orders will follow during the year.

Rural Industries

More than Rs 13.75 crores have been spent on the Rural Industries Projects Programme sponsored by the Planning Commission, in the past few years. Of this, Rs 6.81 crores were spent as grants on promotional schemes and Rs 6.94 crores were loaned to industrial units for investment. The number of industrial units receiving financial assistance has increased to 30,171 from 28,641 in 1970, registering a growth of 5.4 per cent. The total investment by these industrial units increased from Rs 16.68 crores to Rs 18.58 crores in the past year.

Accountancy Profession

The Young Chartered Accountants Forum has sent a memorandum to the Prime Minister urging her to bring drastic reforms in the accountancy profession to meet the present day socio-economic requirements. The Forum has pointed out that the rotation of auditors in itself would not solve the problem of concentration as the audit of companies may then be rotated between the same audit firms. In addition, there should be a ceiling on the number of companies for which the same person could be appointed an auditor. Further the appointment of an auditor should be in the individuals name and not in his firms name as is the case in regard to cost audit.

The Council of the Institute of Chartered Accountants of India is dominated according to the Forum, by monopoly

audit firms or their supporters. This requires to be drastically reformed. It has been suggested that the role of audit should also be changed and that it should be made clear in the Companies Act that the audit should be conducted with a view to ensure that (1) No malpractices are resorted to by the company management, (2) there is maximum utilisation of resources in the interest of the company, (3) there is no evasion or taxes, (4) the labour and the consumer have been given fair deal and that (5) there are meaningful disclosures in the published accounts of the company.

Chartered Accountants Meet

Mr A.B. Tandan, President of the Institute, held a Press Conference to highlight the decisions taken at the 63rd meeting of the Council of the Institute of Chartered Accountants held at New Delhi on the 27th and 28th July 1972.

The Council approved in December 1970 certain measures of self-regulation to be followed by members of the profession in order to ensure an equitable flow of professional work within the profession. These measures included:—

(1) Non-acceptance of audit work below a certain fee by larger firms; (2) work of audit of branches of companies not being conducted by statutory auditors so that it is left to be done by local small firms of auditors; (3) in the case of audit of large companies, encouraging association of smaller firms of chartered accountants as joint auditors; (4) maintaining within the firms of chartered accountants a certain ratio between the number of members *vis-a-vis* the audit of public limited companies and statutory corporations they have; (5) maintaining a certain ratio between qualified and unqualified staff in firms of chartered accountants.

With a view to meeting the immediate needs of the situation and for mitigating the problems of younger members, the Council has now decided

that the above self-regulatory measures should be made mandatory and that the government be requested to amend the Chartered Accountants Act and/or the Chartered Accountants Regulations in such manner as it may deem necessary to achieve the desired objective.

For the purpose of ascertaining the extent of alleged concentration of audit work in a few hands, a committee of the Council is collecting data about the names of

the auditors, the amount of audit fees paid and the capital structure in respect of government companies, statutory corporations, nationalised banks and companies listed with stock exchanges.

The Council is preparing guidelines to members in respect of audit being performed as joint auditors and also on the question of ethics and other related problems.

The Council has decided that articled clerks who are

KANDLA FREELING ENTREPRENEURS

If you are looking for new sites for setting up export-oriented industries, the Kandla Free Trade Zone offers you the most alluring incentives. There is a whole range of concessions available—exemption from customs and excise duties, local sales and purchase taxes; advance import licences; revolving foreign exchange credit scheme of the Export Credit and Guarantee Corporation and foreign exchange loans for raw materials; exemption from income tax on remittances of capital and many more... Kandla Free Trade Zone is a sure place for enterprising industrialists; it is a place for those who think ahead.

For details, write to:
Administrative Officer,
Kandla Free Trade Zone,
Gandhi Dham (Kutch),
Gujarat.

enrolled on or after April 1, 1973 shall be paid a monthly stipend at the following rates:

(a) In Bombay, Madras Calcutta, Kanpur & Delhi.—Rs 60 (1st year); Rs 100 (2nd year) Rs 150 (3rd year); (b) In other places — Rs 30 (1st year), Rs 50 (2nd year), Rs 75 (3rd year).

With a view to helping poor and needy students in pursuing their education, the Council has already instituted a Loan-Scholarship Scheme. This scheme has now been amended in following respects: (1) All students, whether articled clerks or audit clerks, are eligible to receive the scholarships; (2) The amount of loan-scholarship has been increased from Rs 75 p.m. to Rs 100 p.m.; (3) The number of scholarships has been increased from 20 to 50 per year; (4) Freeships will be provided to 200 students per annum.

For securing an easy and speedy administration of the Companies Act, the Council has submitted a set of suggestions to the government. It has also submitted two representations to the government on the amendments in Part II of Schedule VI to the Companies Act.

The Council is finalising the conditions which should be specified for regulating the undertaking of management consultancy services by members of the Institute in the form of corporate bodies, by themselves or with members of other disciplines.

Cooking Gas Prices

The government has decided to fix the selling price of LPG (liquefied petroleum gas) when used as a domestic fuel. The selling price has been fixed on the basis similar to that adopted for other petroleum products and will result in price reduction in varying degrees all over the country.

As a result of the introduction of rational pricing principles it has been ensured that nowhere will the price of LP Gas exceed Rs 22.76 for a 15 Kg. cylinder. The revised prices will come into force from

August 1, 1972. However, to avoid shortage of product and inconvenience to the public, a maximum period of seven days has been given to the agents to dispose of old stock so that the revised prices will become operative everywhere latest by August 7, 1972.

The new prices are based on a rational formula whereas previously the prices of cooking gas had been fixed on an *ad hoc* basis.

New Air Terminal for Delhi

Plans have been finalised for the construction of a new air terminal at Palam for the Delhi Airport. A master plan for development of a 7,000 acre complex, keeping in view the future requirements of the anticipated increase in air passengers and the operation of new types of aircraft for mass movement of passenger and cargo traffic has been drawn up.

The new air terminal, located south of the present terminal, will be a group of modules or units added one after the other as the traffic grows during the next twenty years and as funds for capital investment are available during the successive Plan periods.

The whole architectural concept is of a circular air terminal formed by putting up nine modules or units, each contiguous to the other. Each of the modules will be a separate independent unit capable of handling passengers and their baggage. For customs and immigration clearance each will have its own counters. They will be served by new taxiways, high speed exit ways, parking bays etc. to cater to the movement of aircraft they have to handle.

When the entire terminal complex is ready by 1990, according to the plan, out of the nine modules, the three large ones will serve the international traffic and six smaller ones domestic traffic. The terminal building will then be capable of handling 19 million air passengers every year, and

will rank with the major terminals of the world.

Employment Generation

The five-day workshop sponsored by the Expert Committee on Unemployment in co-operation with the ILO will discuss in depth four important aspects of employment generation, namely, Specific Fiscal and Financial Measures for Promoting Employment through Industrialisation; a Strategy for the Development of the Full Employment Potential of Large Industrial Complexes in India; Levels of Technology in Agriculture and Employment with particular reference to Dry Farming Areas and Small Holdings; and the Educational System and Employment Promotion and Vocationalisation of Education linking it to job opportunities.

The workshop, under the

Chairmanship of Mr B. Bhagwati commenced on August 2, 1972 after inauguration by Mr R.K. Khadilkar union Minister of Labour and Rehabilitation and will last till August 7, 1972. The conclusions reached in this workshop will be considered by the Expert Committee before finalising its report.

Names in the News

Mr Viren J. Shah has been appointed chairman of the board of directors of Mukand Iron and Steel Works Ltd. in the vacancy caused by the death of Mr Kamalanayan Bajaj.

Mr K. T. Satarwala has taken over as officer on Special Duty with the rank of Special Secretary in the Ministry of Foreign Trade. He was until recently Adviser to the Governor of Gujarat during the President's Rule in that state.

Readers' Roundtable

BANGLADESH CURRENCY

Sir, While the Pakistan currency continues to float in Bangladesh all reserves against the currency are held by the Reserve Bank of Pakistan in Pakistan. Normally this should lead to heavy inflation but there are no such indications. It will however, be necessary for Bangladesh to create necessary reserves as quickly as possible without sacrificing expenditure on nation building. The people of Bangladesh also would for obvious reasons like to see that Pakistan marked currency is replaced by Bangladesh currency as quickly as possible. But can Bangladesh issue new currency without adequate reserves backing it?

The answer appears to be in the acquisition of property left by Pakistani nationals and government, which stands 'acquired', without payment of compensation and the value of such property can be treated as reserves as India did immediately after World War II

when foreign reserves of about Rs 3000 crores, most of which was in UK were treated as reserves for the issue of currency.

The banks in Bangladesh which had advanced huge sums to industries having head offices and securities in Pakistan will find it difficult to recover such loans unless the industries left behind are run profitably and assure the return of loans and payment of interest.

These matters need clarification because probably first time in the world such a case has happened where a large area of land and population have separated from the parent country reducing it in size to less than half.

I hope your readers will throw light through your esteemed columns on the vital but probably forgotten subject of the reserve currency of Bangladesh.

Yours etc.
Visakhapatnam M.L. Jain

COMPANY AFFAIRS

Jiyajeerao

THE DIRECTORS of Jiyajeerao Cotton Mills Ltd have recommended an equity dividend of 11 per cent for the year ended March 31, 1972 which will be payable on an increased capital of Rs 6.95 crores following the issue of bonus shares made in March 1972 in the proportion of one equity share for every two shares held. In 1970-71 the company paid a dividend 15 per cent on the old capital of Rs 4.64 crores. The working results show that the company has fared extremely well during the year with sales, gross profit and net profit recording impressive improvements over 1970-71. With a sizable expansion in sales from Rs 28.48 crores to Rs 35.37 crores the gross profit has moved up sharply to Rs 5.50 crores registering an increase of as much as Rs 1.17 crores over 1970-71. Out of the gross profit the directors have earmarked a sum of Rs 124.33 lakhs for depreciation, Rs 23.46 lakhs for development rebate reserve, Rs 220 lakhs for taxation as against Rs 118.37 lakhs, Rs 27.61 lakhs and Rs 156.90 lakhs provided respectively in 1970-71. Besides a sum of Rs 6.91 lakhs was allocated for payment of gratuity as against no allotment in the preceding year. This leaves a higher net profit of Rs 175.63 lakhs as compared to Rs 130.56 lakhs in 1970-71 and the entire amount had been transferred to the general reserve out of which the proposed dividends will be paid. Equity dividends will claim Rs 76.50 lakhs, Rs 6.96 lakhs more than in 1970-71 while preference dividends will absorb Rs 9.30 lakhs the same as in the earlier year.

Despite higher prices of cotton compared to the previous year the working of the textile division during the year was

satisfactory because of the timely action of the management in stepping up production of blended fabrics. The company spent Rs 54.58 lakhs on renovation programme of the mill during the year. The directors have expressed optimism about the current year's working. As for the chemicals division its working remained satisfactory during the year. The application for expansion of soda ash capacity from 500 tonnes to 800 tonnes per day is pending with the government for more than three years.

Hindalco

Hindustan Aluminium Corporation has submitted a proposal for setting up a 250 MW power plant at an estimated cost of Rs 50 crores with a view to augmenting the availability of electricity. At present the company draws electric power from its own power plant which has a capacity of 135 MW and 50 MW power from the UP State Electricity Board. The company has in hand a programme aimed at stepping up capacity for production of aluminium by 40,000 tonnes to 120,000 tonnes per annum in two phases by the end of 1973. The first half potline of the company is expected to go on stream early this month. This will augment production annually by 15,000 tonnes.

The company has been requesting the UP State Electricity Board to supply power for starting up the expansion but there has been no response. For the power supply for the interim period till Hindalco's own power station is expanded the state government had agreed that SEB would supply power at the rate of 4.2 paise per unit.

TISCO

The Tata Iron and Steel Company Ltd is engaged in a

detailed study on the possibility of formulating a viable expansion project. This is revealed in the Chairman Mr J.R.D. Tata's statement circulated to the shareholders of the company. But the most important aspect of any scheme of expansion, according to the chairman, would depend as to how it could be financed and what its impact would be on the shareholders' interest. The capital cost of a major expansion programme, the chairman felt, would be so large that, with the monopoly of investible and lendable capital which the government has created for itself, government funds in one form or another or government-guaranteed funds would be virtually the sole of source of finance for the project. These would be subject to convertibility rights in accordance with the guidelines recently issued by the government to its financial institutions and now in force.

Considering that, directly or indirectly the government already controls 40 per cent of the voting rights in the company, it is clear that any appreciable increase in its shareholding would automatically convert Tisco into a 'government company' as defined in the Companies Act and into a joint sector company under any possible definition of the joint sector. In fact with the government as the company's largest shareholder, with the right to have three representatives on the board, with veto powers in the hands of the government or of the financial institutions and with production, sales and prices wholly controlled by the government, the company is for all practical purposes already in the joint sector. However, in this business, the chairman said one must take a long term view and he hoped that

the time would soon come when the government would realise the imperative need, through a fair and rational price policy of safeguarding the health and economic viability of the country's most vital industry.

On the production side the company has at last reached a stage when it can expect some real progress from the number of steps that were taken in the past year or two to re-establish full production, including those to increase coke, sinter, and pellet availability. Hence the company is expected to fare better during the current year but only in 1973-74 alone the company hopes to reach the rated capacity which the company last achieved in 1967-68.

Meanwhile the company has to contend with constant interruptions in power supply. Last year alone over 20,000 tonnes of steel production was lost because of this handicap. Besides wagon shortage continues to cause not only some dislocation but also the need for carrying larger inventories which in turn involve higher interest charges.

Mukand

Mukand Iron and Steel Works Ltd has reported excellent working results during the year ended March 31, 1972 with notable advances in sales and profits. The directors have recommended issue of bonus shares in the ratio of one share for every share held by capitalising a sum of Rs 2.69 crores out of reserves besides maintaining the equity dividend at 15 per cent. The entire dividend will be exempt from tax in the hands of the shareholders. With a significant improvement in sales from Rs 17.34 crores to Rs 23.56 crores gross profit recorded a smart rise to Rs 3.88 crores from Rs 2.84 crores in 1970-71. Out of the gross profit the directors have enhanced the appropriation to depreciation reserve by Rs 5.09 lakhs to Rs 73.24 lakhs while the allotment to development rebate reserve was reduced by Rs 71 lakhs to Rs 9 lakhs. A sum of Rs 130 lakhs was set apart towards tax liabilities as against no allocation in the preceding year. This leaves a higher net profit of Rs 1.76

crores as compared to Rs 1.36 crores in 1970-71. After adjustments a sum of Rs 9.57 lakhs was transferred to special reserve of tax-exempt profits and Rs 167.96 lakhs to general reserve as compared to Rs 110 lakhs and Rs 26.13 lakhs provided respectively in 1970-71. The proposed dividend will claim Rs 40.36 lakhs and will be paid out of the general reserve.

Chase Bright Steel

Chase Bright Steel Ltd has received a letter of intent to double its licensed capacity to 24,000 tonnes per year and the necessary licence is awaited. The company's hopes to commission the enhanced capacity at a relatively small cost installing some balancing equipment.

The company has improved its working during the year and this has enabled the directors to declare a maiden dividend of six per cent for the year ended March 31, 1972. Although sales have gone up by 17 per cent from Rs 2.58 crores to Rs 3.04 crores the gross profit has declined by 32 per cent from Rs 18.06 lakhs to Rs 12.40 lakhs. Out of the gross profit the directors have allotted a sum of Rs 2.29 lakhs to depreciation reserve as against Rs 2.04 lakhs while the appropriation to development rebate reserve was reduced by Rs 6,500 to Rs 13,500. An amount of Rs 5.77 lakhs was set apart for meeting tax liabilities as against no provision in 1970-71. This leaves a surplus of Rs 4.60 lakhs and the entire amount has been transferred to general reserve out of which the proposed dividend absorbing Rs 3 lakhs will be paid.

Indian Bright Steel

Indian Bright Steel Company Ltd has fared extremely well during the year ended March 31, 1972. The company's encouraging performance during the year has enabled the directors to declare a maiden dividend of six per cent for 1971-72. Despite a handsome rise in sales from Rs 86 lakhs to Rs 120 lakhs the

gross profit has dropped by 20 per cent to Rs 9.60 lakhs from Rs 11.90 lakhs in 1970-71. Out of the gross profit the directors have earmarked a sum of Rs 1.20 lakhs to depreciation reserve as against Rs 1.10 lakhs in 1970-71 while the allotment to development rebate reserve was lower at Rs 8,500 as compared to Rs 60,000 in the previous year. After adjustments an amount of Rs 8.30 lakhs was transferred to general reserve out of which the proposed dividend claiming Rs 1.65 lakhs will be paid.

Premier Automobiles

A new car model known as "Premier-President" has been introduced by Premier Automobiles after the expiry of its 20-year agreement with Fiat of Italy. The new car had all the good features of Fiat 1100-D with several modifications and improvements. With 99.9 per cent of the components produced in India, only 0.1 per cent of the car's spare parts worth about Rs 130 were imported. Even these parts would be manufactured in the country within the next nine to ten months. As a result of the termination of the agreement with Fiat, the country saves Rs 95 per car hitherto paid as royalty to the Italian firm. The company had plans to expand production capacity from the present 14,000 cars to 18,000 cars per annum in the first phase and 24,000 cars per annum in the second phase. The first phase of the expansion plans had been approved by all the concerned ministries. The matter is now with the union cabinet and a decision is expected soon.

News and Notes

Expansion and Diversification

Shree Vallabh Glass Works Ltd is planning in a big way to modernise, expand and diversify its lines of manufacture. The company, which has been permitted to install modern glass drawing machines, expects to improve significantly the quality of its sheet glass and the improved product will be marketed in the course of next year. The modernisation of the

Andheri unit manufacturing toughened glass, for which government approval has been received, is under way. The Vallabh Vidyanagar unit has commenced production of mirror glass. The plant for the manufacture of quartz sand, the principal raw material, at Limkhoda at the rate of 125 tonnes per day on a two shift basis is expected to go on stream towards the end of this year. Plans are afoot to undertake the manufacture of heat-resistant coloured glass. The company has already entered the export field and it hopes to export annually glass worth at least Rs 25 lakhs after modernisation.

Poysa Industrial Company Ltd is going ahead with its expansion programme. It is setting up two new large can factories, one each at Madras and Calcutta. The capacities of the company's Ghaziabad and Cochin factories are also being expanded. The company expects to receive shortly the government's approval for its technical collaboration with American Can Company, the largest can producers in the world. As a result of the collaboration the company will be able to undertake the manufacture of several new items

such as beer cans, aerosols and cans with easy opening ends.

New Issues

General Electric Company of India Ltd is entering the capital market on August 14 with a public issue of 8,71,125 equity shares of Rs 10 each at premium Rs 6.50 per share. In addition to the public issue the company is making a rights issue of 2,62,500 and offering 27,875 shares to its employees on the same terms. A sum of Rs 8.50 per share is payable on application and the balance of Rs 8 per share has to be paid within one year from the date of allotment. Applications must be for a minimum of 50 shares or multiples thereof. The subscription list will close on August 25 or earlier but not before August 17. It is taken for granted that the issue will be heavily oversubscribed and the shares, in unofficial deals, are already commanding a premium of Rs 7.

After the present issue the Indian participation in the company will increase to 26 per cent from the present level of 10 per cent. The company has undertaken to increase the Indian participation in the capital progressively to 33%

Now Available

Technical Studies on Indian Banking—Two Volumes

These two volumes contain a selection of studies and reports on surveys sponsored by the Banking Commission and papers prepared mainly by the research staff of the Special Cell in the Reserve Bank to assist the Commission.

Volume I : An econometric model of banking in India; depositors' / agents' / managers' appraisal of banking services; economics of scale in banking; use of inventory control technique for cash management in banking; report on the sur-

veys of small-scale industrial units and small artisans.

Volume II : (Eight sections containing 38 papers) : restructuring of banking system—general; restructuring of banking system—co-operative sector; geographical and functional coverage of banking system; competition and co-ordination in banking; procedures and personnel development in banking; non-banking financial intermediaries; laws affecting banking; and certain other issues relating to the banking system.

Price (Volumes I & II) : Rs. 27.50 (postage extra)
Copies can be had from
The Administrative Officer, Economic Department, Reserve Bank of India, Post Box No. 1036, Bombay-1.

per cent and to 40 per cent in stages. The proceeds of the issue amounting to Rs 1.91 crores will be utilised for financing the expansion of the company's business.

The company's sales are expected to move up by 50 per cent in the next two or three years. The directors are hopeful that the profits for 1972-73 will be definitely higher than for 1971-72 and they are confident that the company will be able to maintain the dividend of 14 per cent on the enlarged capital for 1972-73. The new shares will be eligible for pro-rata dividend for the current year ending on March 1973.

Britelite Carbons Ltd is issuing 1,20,000 equity shares of Rs 10 each and 50,000 (9.5 per cent) cumulative redeemable preference shares of Rs 10 each at par to the public for subscription. The subscription list opens on August 7 and will close on August 14 or earlier but not before August 9. The issue is fully underwritten. The company is setting up a project at Halol in Gujarat to manufacture cinema arc carbons, photo process carbons and other carbon products. The installation of the plant for the three million pairs of cinema arc carbons is expected to be completed by February 1973 and regular production will commence from April. Thereafter the installation of midget electrode plant will be undertaken which will be completed by September 1973 with a capacity of 80 million pieces of battery carbons. The outlay on the project is estimated at Rs 65 lakhs and it will be financed through the share capital of Rs 25 lakhs, loans from financial institutions of Rs 30.5 lakhs, subsidy from the union government of Rs 5 lakhs and

foreign exchange loan—to be negotiated—of Rs 4.5 lakhs. The management hopes to pay a dividend of 15 per cent for 1973-74.

Eddy Current Controls (India) Ltd, Chalakudy, Kerala, is setting up a project in technical collaboration with Yaskawa Electric Manufacturing Co. of Japan to manufacture variable speed motors with Eddy current couplings and electronic controls, a new item, to be produced in India for the first time. The installed capacity of the plant will be 4,000 units per annum and production is expected to commence by February 1973. The requirements of this item needed by industries such as cement, rubber, chemicals, paper, electric wire, metal, mining and chemical fibre units are met at present by imports. The potential demand is placed at 15,000 units per annum.

The company has been promoted by Kerala State Industrial Development Corporation and Mr. M.D. Jos and Associates. It has an authorised capital of Rs 60 lakhs and an issued capital of Rs 20 lakhs of which the Kerala State Industrial Development Corporation will subscribe to equity shares worth Rs 6.50 lakhs and other promoters to the extent of Rs 6.25 lakhs. The remaining equity capital of Rs 7.25 lakhs in equity shares of Rs 10 each are offered at par to the public for subscription. Of the public issue of Rs 7.25 lakhs, the IDBI has agreed to underwrite shares worth Rs 5 lakhs. The capital cost of the project is placed around Rs 40 lakhs which will be met by the share capital of Rs 20 lakhs, loan from IDBI of Rs 10 lakhs and an amount of Rs 10 lakhs as loan from banks. The foreign exchange component of the

project is estimated at Rs 3.11 lakhs.

East West Hotels Ltd will soon be in the capital market with a public issue of Rs 22 lakhs consisting of 1,35,000 equity shares of Rs 10 each and 8,500 cumulative redeemable preference shares of Rs 100 each, carrying a dividend of 10 per cent per annum. The proceeds of the issue will be utilised for the construction of a hotel at Bangalore. The project is expected to be completed by June 1973. Barring unforeseen circumstances the management is confident of declaring reasonable dividends from the third year of the commencement of operations. The Rs 85 lakh project will be financed through the share capital already subscribed of Rs 10.11 lakhs, present issue of Rs 24.89 lakhs of which shares

of the value of Rs 2.89 lakhs have been reserved for subscription by directors, and their friends, loans from Hotel Development Board of Rs 25 lakhs, another loan from the Mysore State Financial Corporation of Rs 15 lakhs, and deferred payments advances and bank borrowings to the extent of Rs 10 lakhs.

BANK OF INDIA

Directors' Report

The Year 1971

The year 1971 was one of the most eventful in recent times in the country's history. Early in the year, the Prime Minister was returned to head the Government with a massive mandate from the electorate. Hardly had the new Government settled down to the changed environments, when the country was faced with a vast influx of population from across the eastern borders. And, there was the enormous problem of providing shelter, food and clothing to almost ten million refugees, who had crossed over. Subsequent events culminated in an open conflict with Pakistan. Then came our great victory, followed by the unilateral declaration of ceasefire and the emergence of a new nation — Bangla Desh.

In the international monetary field, an event of historical importance was the suspension of the convertibility of the US dollar into gold, on August 15. This led to the floating of all the major currencies in the foreign exchange markets. Eventually, on December 18, gold was revalued from \$35 to \$38 an ounce, amounting to a devaluation of the dollar by 7.9 per cent. Following this, most of the stronger currencies were revalued to realign their par values on a more realistic basis—Japanese yen by 16.88 per cent, deutsche mark by 13.58 per cent, French franc by 8.57 per cent, pound sterling by 8.57 per cent — in terms of the US dollar. The Indian rupee, on suspension of convertibility of the US dollar into gold in August, maintained its par value with the US dollar, although it stood devalued *vis-a-vis* other currencies such as sterling, Japanese yen and deutsche mark. But, after the revalua-

tion of the gold on December 18, the Government of India decided to maintain rupee-sterling parity at Rs 18.9677 per pound sterling, which in effect amounted to a revaluation by 3.0 per cent in terms of the dollar and a devaluation of nearly 5.4 per cent in terms of pound sterling.

Economic Background

Thus, throughout the year, the country's economy was put to extraordinary stresses and strains. A striking feature, however, was that the price situation exhibited a remarkable degree of resilience. The general index of wholesale prices (1961-62=100) increased only by 3.9 per cent as against 6.2 per cent the previous year, despite the substantial increase in money supply consequent upon the fairly large doses of deficit financing resorted to by the Government — reflecting the inherent strength and maturity of the economy to meet crises of vast dimensions.

Otherwise, the year 1971 was marked with a slow growth of the economy. The national income is estimated to have grown by about 4 per cent during the year, as against a little less than 5 per cent in 1970. This was because of the significant decline in the rate of increase in output in the industrial sector — the index of industrial production during the eight months went up by 2.0 per cent compared to 5.5 per cent in the corresponding period of 1970. In contrast, agricultural production recorded a fairly satisfactory growth rate, 5 per cent against 5.3 per cent in 1970. The production of food-grains had registered a sharp increase from 99.5 million

tonnes in 1969-70 to 107.8 million tonnes in 1970-71; the estimates for 1971-72 place the production at 112 million tonnes.

In foreign trade, the gap between exports and imports widened from Rs. 89 crores in 1970 to Rs. 252 crores in 1971. Export earnings aggregated Rs 1,581 crores in 1971 (as against Rs. 1,504 crores in 1970); but imports were higher at Rs. 1,833 crores (Rs. 1,593 crores in 1970), due mainly to larger imports of capital goods and industrial raw materials. However, this gap in the balance of trade was more than covered by the net receipts in foreign aid, and, inclusive of the allocations during the year of SDRs, the foreign exchange reserves showed a rise of Rs. 63 crores, to stand at Rs. 802 crores at the end of December 1971.

Banking System

The Banking system during 1971 recorded a faster rate of growth of deposits and a slower expansion of credit. Aggregate deposits of scheduled commercial banks went up by 21.8 per cent from Rs. 5,685 crores on December 25, 1970 to Rs. 6,922 crores on the last day of December 1971, as against the increase of 16.6 per cent in 1970. On the other hand, advances of the scheduled commercial banks rose only by 13.4 per cent, from Rs. 4,452 crores to Rs. 5,047 crores, during this period, compared to the rise of 23.1 per cent in 1970. The branch expansion programme continued, though at a somewhat slower pace — 1,805 offices were opened in 1971 as against 2,137 in 1970. Of the 1,805 new offices opened, 1,073 were located at unbanked centres. And, at the end of December 1971, the number of commer-

cial bank offices stood at 12,985, of which 4,889 were at rural centres, 4,224 in semi-urban centres, 1,850 at urban centres and 2,022 at metropolitan centres. The average population served per office was brought down to 42,000, compared to 50,000 in December 1970 and 65,000 in December 1969.

The public sector banks made a major contribution in this progress of the banking system. The offices opened numbered 1,502, of which 889 were located at unbanked centres. Their aggregate deposits increased by about Rs. 970 crores to Rs. 5,742 crores at December end 1971, i.e., by 20.3 per cent, as compared to a rise of Rs. 689 crores (16.9 per cent) in 1970. Their aggregate advances recorded a rise of Rs 449.06 crores or 12.1 per cent and stood at Rs. 4,172.14 crores at the end of December. Advances to the weaker sections of the society, such as persons engaged in agriculture, small industry, transport, small business and distributive trades, rose by Rs. 72 crores to stand at Rs. 960 crores, constituting a proportion of 23 per cent. The number of borrowal accounts rose by 13.9 per cent — from 11,49,587 to 13,09,731.

Credit Policy

The admirable manner in which the banking system was able to adapt itself quickly to the demands created by the conflict with Pakistan needs special mention. The tenor of bills was extended beyond the specified periods and selective credit controls relaxed in so far as they related to trade in or with border districts. Credit limits were liberalised in respect of defence oriented industries. Even in other cases, limits were allowed to be ex-

ceeded when warranted, upto 15 per cent, without prior authorisation from the Reserve Bank.

The Bank

The Bank of India was in the forefront to adapt its operations to the needs of mounting war psychosis, the war itself and its aftermath. The Bank also took a series of steps to attuning its policies and services to the emerging socio-economic problems of the community. Unfortunately, almost synchronising with the ushering in of the year, the Bank's operations got dislocated for about a month because of an agitation by the Federation of Officers' Associations on the question of revision of pay and allowances of officers. Also, the aftermath of non-recruitment of staff in the two years, 1969 and 1970, during which period the Bank set up 166 new branches, began to be increasingly felt as the year progressed and the acute shortage of staff operated as a constraint throughout the year. But, on the other side, the Bank was able to introduce some sophistication in its dealings in foreign exchange, while expanding the scope and content of its exchange operations. And, through an optimum deployment of its resources, both human and monetary, coupled with the full use of the opportunities that came its way, the uptrend in the Bank's progress was maintained.

Thus, in 1971, the Bank had another successful year. Deposits increased by Rs. 75.23 crores to stand at Rs. 588.24 crores at the end of year. Advances increased by Rs. 54.77 crores, from Rs. 352.56 crores to Rs. 407.33 crores. The branch network expanded by 110, and, at the end of the year, the Bank had 510 branches in India, 13 offices abroad and two foreign subsidiaries with three offices. Total working funds of the Bank at the end of 1971 rose to Rs. 715.13 crores from Rs. 622.36 crores at the end of 1970.

Operating Results

The total income of the

Bank, after making the usual and necessary provisions, amounted to Rs. 42.43 crores, recording an increase of 25.9 per cent, following an increase of 15.8 per cent in 1970. Earnings on Interest and Discount increased by Rs. 8.81 crores. But, expenditure rose by Rs. 8.36 crores, to Rs. 40.08 crores, or 26.4 per cent, following the increase of 15.3 per cent the previous year. Interest paid on Deposits and Borrowings was higher by Rs. 5.73 crores, while Establishment charges increased by Rs. 1.73 crores. The net profit for the year, at Rs. 2.35 crores, was accordingly higher by 18.1 per cent, compared to the net profit of Rs. 1.99 crores in 1970.

With this increase in profit, it was possible to strengthen the reserves by a 23 per cent transfer, instead of the statutory 20 per cent. The transfer to the Reserve Fund thus amounted to Rs. 54 lakhs, as against Rs. 40 lakhs in the previous year, raising the 'Reserve Fund and Other Reserves' to Rs. 7.74 crores.

The allocation for bonus to staff amounted to Rs. 87 lakhs; the cost of the bonus was actually reckoned at Rs. 126 lakhs, but part thereof, viz., Rs. 39 lakhs, was met by transfer from the Contingency Fund, to which transfers have been made from income from time to time including the year under review. The allocation to Staff Welfare Fund, was also higher at Rs. 10 lakhs compared to Rs. 5 lakhs in the previous year.

After the above allocations, the balance of Rs. 84.46 lakhs was paid as dividend, yielding a return of 5.746 per cent on the acquisition compensation amount of Rs. 14.70 crores or 20.85 per cent on the paid-up capital of Rs. 4.05 crores, compared to 5.528 per cent and 20.07 per cent respectively in 1970.

Operations in India

The Bank's operations in India during the year were marked with three significant trends—the concentration of effort to create a nucleus of

branch network in each of the Bank's 'lead' districts, to enable the Bank to give appropriate attention to the credit needs of the communities therein, including the locally oriented trade, commerce and industry; the endeavour to remove regional imbalances in banking development as well as in provision of credit; and, the giving of stimulus to cater, in increasing measure, to the credit requirements of the weaker sections of the society. What is more, there was a healthy and judicious deployment of funds; while increasing the quantum of the credit directed to the weaker sections of the society, the Bank also took care to ensure that no other sector of the country's economy was denied or starved of credit, so long as the credit was needed for productive purposes.

Branch Expansion

A record number of 110 branches was opened in 1971, as against 90 in 1970 and 76 in 1969. Of the 110 new branches opened, 73 were located in rural centres and another 27 at semi-urban centres, making a total of 100; only 10 were opened at urban and metropolitan centres. In other words, 91 per cent of the branches opened during 1971 were located at relatively less developed centres. Viewed from another angle, 71 were at unbanked centres, while those located in lead districts also numbered 71. And, 50 per cent of the total number of branches opened were located in the relatively backward States of Bihar, Madhya Pradesh, Orissa and Uttar Pradesh.

The Bank's branch expansion thus made a fairly significant thrust in achieving rural penetration and removing regional imbalances. At the end of 1971, the Bank had 510 branches. Of these, 57 per cent were located at rural and semi-urban centres, as against 47 per cent at the end of 1970 and 41 per cent at the end of 1969. Also, 22.9 per cent of the branches were located in the relatively backward States of Bihar, Madhya Pradesh, Orissa and Uttar Pradesh, as against 15.8 per cent at the end of 1970

and 13.5 per cent at the end of 1969.

The Bank is also moving steadily towards a more balanced dispersal of branches as between one region and another. Until the middle of July 1969, the Bank had no representation in Jammu & Kashmir and Himachal Pradesh, while it had only marginal representation in certain other States, particularly in the relatively backward States. On the other hand, there was a high degree of concentration in Gujarat and Maharashtra. This picture is now rapidly changing. Branches have been opened in all the major States, while a large number of the new branches opened are being located in the relatively under-banked States to increase our representation therein.

Mobile Branch Units

In 1971, the Bank opened one more mobile branch unit in Andhra Pradesh, raising the total number of mobile units in operation to twelve. Already the Bank was operating nine mobile units in Gujarat and one each in Maharashtra and Madhya Pradesh. The mobile branch units have been able to mobilise sizable rural deposits, in a few cases as much as Rs 32 lakhs. They carry modern banking facilities to the doorsteps of people in remote villages and thus play a significant promotional role in the spread of banking, and inculcation of the saving habit.

Deposits

Aggregate deposits of the Bank in India went up by Rs. 76.87 crores during 1971, from Rs. 435.42 crores to Rs. 512.29 crores. The rate of growth at 17.7 per cent was slightly higher than 15.9 per cent in the preceding year, but lower than the average of 21.8 per cent for the banking system. Component-wise, fixed deposits registered a 20.8 per cent rise, compared to 11.0 per cent in 1970, while savings bank deposits rose by 21.7 per cent, compared to 16.1 per cent in 1970—these growth rates compare well with the average growth rates for these deposits of the banking system.

BANK OF INDIA

Balance-Sheet (Condensed) as at 31st December, 1971

As at 31-12-1970		Rupees in crores	
		As at 31-12-1971

0.81	Dividend	0.84	
33.71	Total	42.43	

In current deposits, however, the growth rate was very much lower at 6.2 per cent, compared to 27.4 per cent in 1970.

This was partly attributable to the very much lower surplus funds carried by some of our large institutional depositors and partly to the tendency on the part of some institutional depositors to maintain accounts in more than one bank to minimise inconvenience on dislocation of the normal banking services. The number of deposit accounts increased from 13,66,876 at the end of 1970 to 15,68,437 at the end of 1971 recording a growth rate of 14.7 per cent.

Historically, the Bank of India grew up as the most metropolitan-oriented of all banks and has been deriving as much as 72 per cent of its deposits from 8 metropolitan cities. The Bank has had the highest per branch deposits in these metropolitan cities and, in the shift that was called for, the Bank could open between January 1969 and December 1971 only 24 new branches in these metropolitan cities, as against as many as 599 offices opened by all the banks therein, recording a share of only 4 per cent as against the Bank's normal business share in the banking system of about 7.5 per cent. Also, because of the shortage of staff, the pace of the Bank's programme of branch expansion has been slow; indeed, of the 110 branches opened in 1971, 89 were opened during the latter half of the year, while as many as 40 were opened only in the month of December. Besides, very few branches were opened in those States which experienced a faster rate of growth of deposits. And, the branch expansion programme could not make its due contribution to the Bank's deposit growth.

The deposits collected by the 240 new offices opened since July 19, 1969, of which 138 were at rural centres, 56 at semi-urban centres, 26 at urban centres and 20 at metropolitan centres amounted to Rs. 24.21 crores as at the end of December 1971 giving an average of Rs. 10.1 lakhs per

office and forming 4.7 per cent of the total deposits in India. The average deposits per branch works out to Rs. 4.86 lakhs in rural centres, Rs. 9.98 lakhs in semi-urban centres, Rs. 20.88 lakhs in urban centres and Rs. 32.45 lakhs in metropolitan centres. If the 40 branches opened in December 1971 are excluded, the average deposits per branch at rural centres would work out to Rs. 5.93 lakhs, at semi-urban centres Rs. 12.33 lakhs, at urban centres Rs. 22.54 lakhs and at metropolitan centres Rs. 33.96 lakhs. These averages are higher (except in the case of metropolitan centres) than the averages for the new offices of the scheduled commercial banks, which are Rs. 3.37 lakhs, Rs. 7.92 lakhs, Rs. 8.23 lakhs and Rs. 32.54 lakhs respectively.

Advances

The Bank's advances in India rose by Rs. 58.22 crores or 18.2 per cent during the year, from Rs. 319.99 crores on December 25, 1970 to Rs. 378.21 crores (exclusive of participation certificates, Rs. 3.99 crores) on December 31, 1971. This was higher than the banking system's average of 13.4 per cent. The additional accommodation granted for food procurement purposes accounted for Rs. 23.5 crores, or 40 per cent of the rise in credit, while advances to agriculture and allied sectors, small industry, small business and other weaker sections of the society took up a further Rs. 11.41 crores, viz. 24 per cent. Another 8 per cent or Rs. 4.7 crores, was taken up by export credit. The balance covered credit to other sectors—industry and trade.

Thus, while on the one hand the Bank directed credit in increasing measure to the weaker sections of the society and other priority sectors, the Bank also ensured that credit was not only not denied, but was timely disbursed to other sectors as well, so long as it was needed for productive effort. At the same time, the Bank took due care to see that the credit disbursed was in consonance with the actual

requirements, to obviate grant of excessive credit. This is reflected in the larger percentage of utilisation of the limits during the year, viz., 69 per cent compared to 65 per cent in the previous year.

Advances granted by the new branches amounted to Rs. 6.80 crores as at the end of December 1971, forming about 28.1 per cent of the deposits collected by them. But, what is significant is that the share of the new branches at rural centres amounted to as much as Rs. 3.05 crores or 44.9 per cent; the average per branch at rural centres at Rs. 2.21 lakhs was higher than the average of Rs. 1.96 lakhs for scheduled commercial banks. The share of semi-urban branches was Rs. 1.26 crores or 18.5 per cent. The urban and metropolitan branches shared Rs. 1.30 crores and Rs. 1.19 crores respectively or 19.1 per cent and 17.5 per cent of the total.

The number of borrowal accounts with the Bank went up from 72,405 to 81,136 registering a rise of 8,731 during the year. This number would have been much larger but for the fact that a good number of accounts under the Consumer Loans Scheme granted two-three years ago in the context of recession in engineering and certain other industries mainly at metropolitan centres like Bombay and Delhi, has been closed on the completion of the instalment payments. Consequently upon the relatively larger credit expansion in 1971, the credit-deposit ratio of the Bank (exclusive of participation certificates) moved up to 73.8 per cent on December 31, 1971, from 73.5 per cent on December 25, 1970.

Investments

Investment in government securities moved up by Rs. 19.20 crores during the year from Rs. 126.07 crores to Rs. 145.27 crores. As much as Rs. 5 crores was subscribed to the National Defence Loan floated by the Government of India in December 1971. Investments in foreign government and trustee securities were also

stepped up slightly and these, together with the investments in shares and debentures, stood at Rs. 11.36 crores at the end of December 1971.

There was an increase of Rs. 3.78 crores in cash holding over the year, although the ratio of cash to total deposits actually recorded a decline from 6.3 per cent in December 1970 to 6.1 per cent in December 1971, reflecting a more rational use of cash.

Lead Districts and Lead Bank Role

The quick impressionistic surveys of all the 30 districts allotted to the Bank—4 in Bihar, 9 each in Madhya Pradesh and Maharashtra, 6 in Uttar Pradesh and 2 in Orissa were completed early in 1971 and the survey reports compiled by June 1971. The surveys had identified about 400 centres with banking potential for opening branches, of which 219 were unbanked centres. Out of the unbanked centres identified, 80 were taken up by the Bank of its own. The other centres were taken up by the other banks operating in those areas.

At the time of allocation of lead districts, the Bank of India had branches only in 13 districts out of the 30 allotted to it; there were no branches even at the headquarters of 20 districts. During 1970, 19 branches were opened and during 1971, a further 71 branches. Thus, by the end of 1971, the Bank had branches at all the 30 district headquarters and at 92 other centres in the districts.

In furtherance of the lead bank role, Consultative Committees have been set up in all the 30 districts to discuss and devise the strategies for follow-up action of the impressionistic surveys, to formulate plans and programmes for banking development in, and economic growth of, the districts and the communities therein, and to direct as well as supervise the implementation of those plans and programmes. These Committees have held a few meetings—some with district autho-

rities too—in an endeavour to identify the particular projects/schemes to be taken up, to assess the extent of the credit required and to formulate operative plans for action. And, the Bank hopes to be able to make some positive headway in the implementation of this role in a few of the Bank's lead districts during the course of the year 1972.

Priority Sectors & Weaker Sections of the Community

The Bank has been consistently stepping up the flow of credit for export promotion and to agriculture, small-scale industries, retail trade, road transport operators, self-employed and professionals and other weaker sections of the community. The outstanding increased from Rs. 74.90 crores to Rs. 91.02 crores at the end of 1971, i.e. by 21.5 per cent, although the rise in total advances was only 18.2 per cent. And, the outstandings at the end of 1971 formed a proportion of 24.1 per cent of the total advances of the Bank of India. Exclusive of exports, the credit to these sectors accounted for 15.9 per cent of the total credit.

Export Promotion

The Bank's assistance to the export sector, comprising both pre-shipment and post-shipment credit rose from Rs. 26.35 crores to Rs. 31.06 crores. While the exports handled covered both traditional and non-traditional items, a major part of the post-shipment credit covered export of engineering goods. The Bank gives particular attention to the need of the exporters and, where necessary, tailors credit to suit their requirements.

Agriculture

The Bank's lendings to the agricultural sector rose during the year from Rs. 21.01 crores to Rs. 27.70 crores, or by about 32 per cent. The number of accounts under direct finance increased from 32,801 to 39,918 with outstandings rising from Rs. 12.24 crores to Rs. 15.30 crores. Of the 39,918 accounts at the end of 1971, as many as 19,176, or 48 per cent, were those having land-holdings of 5 acres or less, as against 10,591

accounts, or 32 per cent of the total number of accounts at the end of 1970. The Bank has thus not only been expanding its coverage of lending, but also emphasising on financing the small farmer.

In the case of indirect finance too, a very large part, viz. Rs. 11.09 crores out of Rs. 12.40 crores covered finance for energisation of wells; although routed through the Electricity Boards, the finance has really gone to assist some 22,000 and more farmers.

An endeavour has been made to diversify gradually the Bank's portfolio of agricultural finance, in respect of areas as well as types of loans. In view of the concentration of the Bank's branches in Maharashtra and Gujarat and the better infra-structure facilities available in these States as well as in Tamil Nadu, the bulk of the Bank's agricultural lending was initially confined to these three States. With the expansion of branch network and gearing up of the organisation in other States, the area of operation, has been widened to include the other States as well, and, in particular the backward States. Further, the Bank's lendings to the agricultural sector are not confined merely to crop financing, but cover also land development, farm mechanisation, creation, of minor irrigation facilities and development of allied activities such as dairy farming, poultry, fisheries, etc.

While financing a farmer, emphasis is always laid on initiating him to modern methods and techniques of farming. In a few villages, where groups of farmers have been financed under various intensified programmes, the results have been spectacular. For instance, in Vaduth village, located in Satara District in Maharashtra, production of hybrid jowar and bajra seeds and chandramukhi potatoes, with financial and technical assistance from the Bank, has given the farmers rich harvests, raising their income significantly. In another village in Baroda district, where production of a new hybrid cotton-seed H-4 was programmed, the farmers have reaped a four-fold in-

crease in the yield.

In addition, a few special schemes have been taken up such as financing of small farmers in coordination with the Small Farmers Development Agencies (SFDA) in Ujjain, Bhandara and Ratnagiri districts and assisting marginal farmers and agricultural labourers in Ratnagiri, Ranchi and Keonjhar districts in conjunction with Marginal Farmers and Agricultural Labourers Agencies (MFAL). In both these categories of financing, provision is made for subsidiary occupations, such as poultry farming, dairy and piggy, in order to get fuller employment and supplementary income.

The Bank has also participated in schemes financed by the International Development Association, through the Agricultural Refinance Corporation, such as Punjab Agricultural Credit Project for farm mechanisation (Rs. 49 lakhs) and Andhra Pradesh Agricultural Credit Project for farm mechanisation and minor irrigation (Rs. 75 lakhs). In addition, the Bank has financed projects processed by the Agricultural Finance Corporation Limited for construction of wells and energisation thereof, development of eucalyptus plantation, rubber plantation, etc. in participation with other banks. A deep-sea fishing project has also been financed, right from the purchase of trawlers till the export of the catch.

The Bank's experience of recoveries in agricultural finance has been satisfactory.

Small-Scale Sector

The Bank's assistance to small industry sector was also

steadily stepped up during the year. Over 650 new units were brought into the Bank's fold and the outstandings rose from Rs. 22.80 crores to Rs. 26.35 crores. The rate of growth, at about 16 per cent, was no doubt lower than in the previous year. But, this was due to the conditions prevailing generally in the industrial sector, as the lower growth rate therein had necessarily its impact on the small sector.

The small units financed continue to be largely concentrated in Maharashtra, Gujarat, Tamil Nadu and Punjab, but steps have been taken to boost up this activity in the other States as well. Industry-wise, plastic goods, chemicals, metal products and engineering were the major activities of the units financed by the Bank.

Road Transport, Retail Trade, Small Business

The financing of the other weaker sections of the community, such as road-transport operators, retailers and small businessmen also made progress during the year, as given in table below:

The Bank's educational loans are aimed at providing opportunities to diligent students for prosecuting higher studies, mainly in scientific and technological fields, in India or abroad. Of the 458 students assisted by the Bank, 326 are prosecuting their studies in foreign countries.

Finance under the other heads is aimed at providing gainful employment. The Bank operates special schemes to assist artisans, craftsmen and other technically qualified entrepreneurs, to enable them to

(Rs. in lakhs)

	End of 1970		End of 1971	
	No. of Accounts	Outstandings	No. of Accounts	Outstandings
Road Transport	520	114	620	137
Retail Trade	1599	234	2121	274
Small Business	2944	23	2989	20
Professional and Self-employed	1073	44	1008	66
Education	272	60	458	94

engage themselves in gainful employment. A worthwhile project, technical feasibility and economic viability are the only credit factors considered, apart from the managerial and technical ability of the entrepreneur. The finance made available is tailored to suit the requirements of the individual project. The approach is need-based and the terms flexible to cater to the varying needs. Special concessions are granted to projects undertaken in backward regions or by backward classes of the community to suit the local social and economic environments.

Operations—Overseas

The Bank's overseas offices continued to operate satisfactorily. They registered higher turnover, bringing in increased returns.

The overseas offices continued to act as useful links for the Bank's overseas operations and assist in development of international trade. In addition, they help in promotion of joint ventures, apart from acting as contact points and providing liaison with the concerned authorities/organisations. Their role in this respect and as suppliers of commercial and economic intelligence concerning international trade was made more active during the year.

In U.K., arrangements were finalised for opening one more office at Wembley. The Bank's branch network in U.K. would then increase to six—at London, Birmingham, Leeds, Leicester, Manchester and Wembley.

In the far East, it has been decided to add to the branch network of four—two in Japan and one each in Hongkong and Singapore—a representative office in Indonesia at Djakarta. This representative office would be a prelude to the establishment of a full branch, our application for which, made in 1967, is awaiting its turn in the queue.

The subsidiary in Nigeria—the Bank of India (Nigeria)

Limited—also increased its earnings. But, the pre-tax profit at £N. 151,930 was marginally lower than £N. 154,247 in the previous year. The operations of this subsidiary are being so geared that it may play an increasingly positive and meaningful role in the development of the Nigerian economy. To this end, while, on the one hand, arrangements are being made to establish more offices, on the other, provision is being made to bring to bear on our operations there, our expertise in financing small industry and business aimed at promoting small industry and developing Nigerian entrepreneurship. There has also been gradual Nigerianisation of the Bank's staff and, to train senior level staff, training facilities available here in India are being utilised.

The subsidiary in Uganda—Bank of India (Uganda) Limited—had another satisfactory year returning a net profit of U.Shs. 1,146,333 as against U. Shs. 804,867 in the previous year. In the larger interests of the operations in Uganda, a decision has been taken that the Bank of India (Uganda) Limited be taken over by the Bank of Baroda (Uganda) Limited; arrangements to that end have now been finalised and the take over, subject to the final clearance of the Uganda government, is likely to be effected on 1st July 1972.

Staff—Recruitment and Training

To bridge the gnawing gap between the requirements and availability of human resources, arrangements were set in train for fresh recruitment of staff on a war footing. But, the formalities took some time, and it was only towards mid-year that it was possible to add to the officer strength 335 officers, largely through promotion; those recruited from the market were only a few technical officers, with specialisation in agriculture, engineering and law. The recruitment of probationary officers from the market had also been taken in hand, but was still in process at the close of the year. To the clerical

strength, over the year, 771 new recruits were added.

Training facilities too were augmented and intensified. Training centres were set up at Ahmedabad, Calcutta, Madras and New Delhi, while arrangements were in hand to set up training centres at Lucknow and Patna. A mobile squad of instructors was also pressed into service for training of clerks at a number of other centres. Simultaneously, the Bank's Residential Staff Training College at Bombay was geared to go into full operation, while increased use was made of the training facilities at the Joint Staff Training College (also in Bombay) run in collaboration with the Bank of Baroda.

A crash programme for training was introduced. Apart from short induction courses, carefully planned condensed course materials were adopted, aimed at imparting expeditiously to the new recruits the basic training in banking procedures. And, specially designed courses were organised for junior officers scheduled for posting at rural and semi-urban centres. These courses, *inter alia*, aimed at giving the trainees the necessary orientation in outlook and at developing in them the special skills and the right attitudes needed to deal with the emerging new class of clientele and handle their problems.

In all, 17 training courses were organised for clerical staff and 608 clerks were trained. Seven training courses were organised for officers; these included courses on branch banking for junior and middle level managers, export finance, initiation to banking of technical officers and induction of promotee officers. In addition workshops were organised at Coimbatore and Rajkot to train branch agents and officers in financing of agriculture. And, the Bank continued to take advantage of the training facilities provided by the Reserve Bank Training College as well as the National Institute of Bank Management.

To cover the shortfall and

provide for the increasing requirements of the human resources, the Bank has introduced forward planning of manpower and training requirements based on business-plan-budgets for the coming three years. The organisation is also being geared for speeding up the recruitment process. Simultaneously, arrangements have been set in train to meet the training needs on that basis; these envisage opening of more training centres, including three residential training colleges at Calcutta, New Delhi and Poona.

Organisation

The Bank's expanding business, both in scope and content, called for a modification in the Bank's organisational structure. On the one hand, there was the increasing branch network and, on the other, the lead responsibility for banking development in regions far removed from the Bank's areas of operations, where the Bank's base of operations was only marginal and where the Bank was required to start virtually from scratch. Simultaneously, a new class of clientele was emerging, which required sympathetic understanding and skilful handling of its needs. The Bank's existing clientele too was becoming more demanding. There was also the Bank's corporate citizenship responsibility or the social responsibility, to sponsor, support and take up programmes which help translate the gains of economic progress for the benefit of the common man and assist the nation's efforts at ensuring that the fruits of economic progress are shared by all.

The modified organisational structure had to take care of all these requirements. It called for a new approach and a new orientation, the primary objective being to serve all classes of customers at all centres more effectively and efficiently. There was need for greater decentralisation of functions and wider delegation of authority, so that, on the one hand, decisions are taken, as far as possible, at or near the points where problems arise

in order that they be prompt as well as realistic, and, on the other, Head Office may have more time to concern itself with the more important aspects of management, such as corporate planning, direction, superintendence and control.

These requirements were duly taken note of towards the end of 1970 and an appropriate plan of reorganisation conceived. But, because of the continuing acute shortage of staff, it was considered appropriate to administer the recipe in small doses spread over a period of time. The first steps were initiated in July 1971 and the revised Regional set-up has now taken shape. The Regional set-up follows an areawise distribution and takes due account of the areas where the Bank has lead responsibility. The country has been divided into seven Regions and each Region placed under a senior official designated as the Regional Manager. The Regional Managers have responsibility for administration, superintendence and control of the Bank's branches and business in their Regions; for that purpose, they are being given wider powers commensurate with the responsibility. The Regional Managers are assisted by Area Managers, each of whom is in charge of a compact group of 25/30 branches, they assist the Regional Managers to maintain contact with the branch staff, provide on-the-spot help and guidance to Branch Managers/Agents, and review operations of the branches in relation to their business plans, giving particular emphasis on the developmental and promotional activities. Their role has a developmental bias, with special responsibility for the lead districts falling within their jurisdiction. They also form an integral part of the communication system in the Regions, by not only clarifying and interpreting to Branch Agents/Managers the various communications and circulars issued by the Regional Office (and Head Office), but also by providing the required feed back for policy formulation or corrective action.

The reorganisation at Head

Office, which is currently in progress, covers a functional distribution by way of Departments. Each Department, placed under the charge of a senior officer designated as Chief Manager, is to concentrate on specific areas of the Bank's activities and develop a specialist's expertise therefor. In most of the Departments, and particularly those entrusted with 'line' responsibility, an additional division is being created for "strategic planning and control", which division is to concern itself with preparation of strategic plans for action in the Department, providing the general framework of operating strategy, and reviewing, analysing and counselling the operating personnel. Operational efficiency and periodical review of the progress are to be secured through four high level Committees, called the 'Corporate Planning Committee', the 'Business Development Committee', the 'Credit Committee' and the 'Personnel and Services Committee'. Except for the first Committee, which is ordinarily to meet monthly, the other Committees will meet weekly. They will have specific powers delegated to them, and will be presided over by the Chief Executive and, in his absence, by the next Senior Executive in station. This system is designed to enable collective decisions to be taken and simultaneously assist in the development of executives.

Some of the Head Office Departments have already come into existence. Amongst them are those designated as 'Development' and 'Community Banking'. The Development Department covers the two important activities of branch expansion and agricultural and cooperative credit. The Community Banking Department is to focus attention on catering to the needs of small industry, new entrepreneurs, retailers and other locally oriented business and individuals. Both these Departments are being oriented towards providing 'tailored' credit, or credit tailored to meet the individual requirements, particularly of the weaker sections of the community.

The Department of Economic and Statistical Research

is being reorganised for it to assist the management in policy formulation and corporate planning through supply, from time to time, of management information. It will also provide the economist's support to other 'line' personnel, both at Head Office and at Regional Offices.

A new Department designated as 'Planning and Systems Development' is also being set up, which will concern itself with areas of activities such as Management Services, Banking Services and Systems Development. It would be innovation-oriented, and charged with the responsibility to constantly look for areas which call for action—to modify, to adapt and to create—improvements in systems and procedures, adaptation to technological changes and introduction of new services.

One other aspect of the reorganisation involved is the introduction of performance budgeting. Branches would prepare the annual 'business plans', as their contribution to the corporate plan-projections of broad performance levels in different areas for the whole Bank. Apart from following the policy directions from Head Office, the branch business plans, would take into account past performance the economic outlook for the year, and the specific development programmes, if any, in the areas. They would then be translated into budgets. And, the actual performance would be periodically reviewed against these budgets to take stock of the progress and determine critical areas, if any. These reviews would also, provide a useful tool for management control and enable corrective or remedial action to be initiated as and when required. It is expected that this system would go into operation next year.

Viewed from the organisational angle, therefore, 1971 could well be regarded as a formative year for the Bank. And, the organisation is gradually getting geared for the Bank to operate more effectively in environments which are becoming increasingly more

complex. The Bank can now look forward with confidence to meet the new challenges that are being thrown up and play a more active role in the development of the national economy.

Staff Relations

But for the incident referred to at the commencement of the Report, the staff relations continued to be cordial throughout the year. The Board of Directors take this opportunity to place on record its appreciation of the services rendered by the staff at all levels and the hard work put in by them during a year of considerable stress and strain.

Board of Directors

There was no change in the Board of Directors of the Bank during the year. In all 25 Board meetings were held. One of the meetings was held in New Delhi and one in Ujjain. Ujjain is one of our lead districts and the meeting was held there for the directors to familiarise themselves with the specific problems of the area and meet the customers and official and non-official agencies operating therein.

RECORDS AND STATISTICS

Household Demand for Money

IN A study published in the June 1962 Bulletin of the Reserve Bank of India, an analysis has been presented of the Household Demand for Money@ in this country on the basis of statistical series of currency, time deposits and demand deposits between 1950-51 and 1967-68. Time deposits have been found to be highly interest elastic while demand deposits are price elastic as well as interest elastic. In regard to demand for currency for household purposes, the analysts found some difficulty in interpreting the data. It is known that a substantial part of the demand for currency by households represents transactions balances. However, the observed substitution effect between currency and other assets indicated that it contained idle balances as well.

The study is reprinted below in full :—

The main object of this study is to empirically test whether household demand for money is stable in the Indian case and if so, spell out the significant factors influencing it, based on the data available for the past two decades or so. Separate demand functions for each of the constituents of money like currency, demand deposits and time deposits have also been tried with a view to throw light on the important aspects such as (a) the actual magnitudes of income and interest rate elasticities of demand for these

instruments; (b) the consequences of aggregation of the demand functions over the individual money components; (c) the degree of substitution between that set of financial assets defined as money and other financial assets, say corporate securities, and (d) the precise nature of the 'adjustment' mechanism towards their 'desired' levels.

Money has been the subject matter of controversy for long and the significant issues on which discussions have centred round are : what should be the appropriate definition of money; what is generally the nature of the transmission mechanism whereby monetary changes influence expenditure decisions and in particular the precise role of the interest rate variable in demand for money; how to measure satisfactorily the 'market' rate of interest;

should the relevant interest rate be short or long or both; apart from the income and interest rate variables what are the relevant variables in the demand functions for money; what should be the appropriate functional form of the demand curve; is the demand for money best measured in real terms or in nominal terms (proportional to price level) or alternatively, should the specification of the demand function be in real or nominal terms.¹

Empirical investigations, especially in some of the developed countries like the USA and UK, have in recent years contributed a great deal in narrowing the area of dispute over the importance of money and the repercussions of its changes on the system. There is hardly any one at present who, for instance believes, as the quantity theorists believed, that money does not interact with other variables in the system and monetary adjustments are at best passive to changes in real activity. Instead, a growing consensus is clearly discernible in the modern literature on money whether credit theorist (Keynesian) or monetarist (Chicago) and the current dispute is not so much regarding the determinants (or

determinates) of money as to the significance or otherwise of the effects involved.² If this be so, then the solution lies in their empirical verification covering as far as possible a wide range of developed and developing economies and differing time periods with due reference to conditions prevailing in them.

The scope of the present study is restricted to household demand for money. This was felt necessary for the following reasons. The money-holdings of government (with the exception of government-owned commercial undertakings) although sizeable, are more a result of its fiscal operations and cannot possibly be explained in any generalised behavioural terms. The cash balances of the corporate sector are quite small relative to the monetary aggregates and are meant for smooth conduct of day-to-day transactions. The case with households is somewhat different. In their case both the transaction motive and the asset motive are important. They account for a substantial part of money stock, roughly 90 per cent of currency and 75 per cent of bank deposits, in recent years. Moreover, household transactions, even as of now, have a sizeable

TABLE I
Demand Deposit,*

Note : Figures in brackets represent proportion (per cent) to total demand deposits held by all sectors. *Estimated using the results from Surveys of Ownership of Deposits. †Excludes interbank deposits. **Exclusively owned by households.

component of non-monetised (or barter) transactions which, although gradually shrinking in volume, is likely to have some impact on the quantum of money demanded.³ It is, therefore, hoped that the study, if restricted to household demand for money, may help to bring the relevant issues under sharp focus than a similar study at the aggregate level. Furthermore, households are the important savers in the economy and a fairly large proportion of their financial savings is in the form of monetary assets and hence a study relating to household demand for money would be helpful in short-term projections of non-contractual transferable resources in the economy.

The study broadly falls into three parts. Part I deals with some of the important issues referred to in the introductory paragraph with particular reference to the Indian economy. Part II presents the fits obtained and discusses the results emerging therefrom. Some of the important limitations of the exercise are also stated in this section. A summary of the conclusions drawn is given in Part III.

PART I

In this paper money is defined in two ways. Following the conventional approach, the first definition of money (M_1) is taken to comprise the estimated holdings of currency and demand deposits of household sector with commercial banks. The other definition (M_2) is more comprehensive in so far as it includes also the time deposits with commercial banks. The issue as to which of these definitions of money is superior cannot be settled on *a priori* considerations because equally valid arguments have been put forth both for and against the choice of a particular definition. For instance, some have preferred M_1 for the reasons that (a) currency and demand deposits together represent that stock of most liquid assets which are generally used for making payments and yielding only services (convenience, liquidity etc.) but no other income to the holder, (b) time deposits, besides being interest earning, has

to be first converted into either cash or demand deposits before they could be spent and (c) inclusion of time deposits in money confounds the interest rate effect in so far as a rise in interest rate, while reducing the demand for money defined in conventional terms, increases the demand for time deposits. Those for whom M_2 appeals more, have based their reasoning on the 'stability' aspect of demand for money. This stability will be achieved only when money is comprehensively defined so as to include all near-money assets also. On practical considerations, however, they stop with time deposits as this is considered to be nearest to money.

In the Indian case, there are some points in favour of M_2 . Savings deposits which are exclusively owned by households and account for 25-33 per cent of total bank deposits held by them have the traits of current and fixed deposits and their allocation into demand and time portions has a certain element of arbitrariness. With the progressive liberalisation of rules governing withdrawals from such deposits over the years, an increasing proportion of these is getting reflected under demand deposits. Furthermore, there is some empirical evidence to show that there is substitution between demand and time deposits during the busy and slack seasons of any year.⁴ By defining money to include time deposits also the results obtained would be free from any bias on this score. The ultimate choice, however, will have to wait judgement based on the results obtained.

Apart from differences in opinion regarding the role of interest rate in determining the demand for money through its direct and indirect effects on expenditure, income and wealth, views in regard to the selection of a relevant interest rate variable from among a variety of such interest rates available, have been equally divergent. This is partly because the choice of a proper interest rate is also linked to the definition of money used. Relevant interest rates for a study at the aggregate level are: yield on government (long-

term) securities, yield on variable dividend industrial securities, rates offered on bank deposits of differing maturity or on postal savings deposit, rates charges on bank advances, call money rate, treasury bill rate and the bazaar bill rate. From among these, the rates which appear to be significant for households, in particular, are the yield on variable dividend industrial securities, bank deposit rates and the bazaar bill rate. The first two rates are important for the reason that households own a substantial part of the corporate equities and bank deposits and so have a direct bearing on saving-decisions of households. The bazaar bill rate owes its importance to the existence of a sizeable unorganised money market in India. Industrial securities' yield is taken as the long-term rate of interest and the rates offered on bank deposits of maturity of three months to represent the short term rate.

The selected interest rates are not without limitations. The yield on industrial securities may be based in view of the relatively less developed nature of stock-market in India. Furthermore, the rate used is the 'running' yield rather than 'redemption' yield which is normally used.⁵ The bank deposit rate also has its shortcoming, namely, that it is administered to some extent in accordance with the inter-bank agreements concluded by banks from time to time and is currently being regulated by the Reserve Bank.

To explain the demand for money, the variables chosen are household income in nominal terms and the interest rate. As referred to earlier, the non-monetised income is not relevant to a study of the demand for money and as such the total household income series is adjusted to exclude such income accruing to households. The exact procedure of estimating non-monetised income is given in the Annexure. Besides, it also gives the method followed in estimating the holdings of currency, demand deposits and time deposits in respect of household sector.

In some versions of the de-

mand equation, additional variables such as proportion of agricultural income to national income, prices and a trend factor have also been tried. The wealth variable (or the permanent income) is admittedly yet another significant factor but could not be considered for want of data.

As regards the functional relationship to be used, relatively simpler formulations of linear and log-linear equations have been attempted.

PART II

This section is devoted to a discussion of the results obtained from the empirical fits attempted in respect of demand for money and its important constituents. The equations tried for the period 1952-53 to 1967-68 are given in Table II. To begin with, the results in respect of deposits are first presented followed by those for currency and for the two concepts of money adopted in this study. For the sake of brevity only such equations which are 'good' fits to observed data, judged on the basis of values of R and $D.W.$ and in which most coefficients not only have the right signs expected but also are statistically significant have been given. While reading the results, the main limitations of single-equation models, namely, that they implicitly assume the exogenous determination of the explanatory variables may be borne in mind.

Time Deposits

In all, seven selected equations have been presented in Table II. Household (monetised) disposable income (Y_{dh}), rate offered on bank deposits of one year maturity (R_1) and the yield on variable dividend industrial securities (R_2) are the explanatory variables used. The deposit rate chosen is R_1 because the bulk of the fixed deposits with banks (nearly 62 per cent in 1967-68) has a maturity period of less than a year during the period studied. The industrial yield rate is introduced to take care of the effect of substitution between time deposits and corporate securities generally believed to be true in respect of the better-off sections of urban households.

It is, however, necessary to add a caveat in this regard. As mentioned in Part I, if R_i is taken as a proxy for the long-term profit rate in the economy⁶ then the observed substitution effect should not be narrowly interpreted in the sense that the time deposits are liquidated for purchase of more industrial securities but in a wider sense of these being drawn upon for alternative avenues of investment also.

The income variable specified in nominal or real terms has come out to be the most significant factor affecting demand for time deposits. In the linear case, the income elasticity co-efficients computed at mean levels, work out in the range of 1.19 to 1.60. Corresponding range in the log-linear case is seen to be 0.90 to 1.71. The elasticity with respect to real income is around 1.23 (See Equation 6). These values are sufficient to show that the in-

come variable exerts significant influence on demand for time deposits.

It may be seen from the linear equations (1) and (4) and log-linear formulations (2) and (5), that the inclusion of interest variable R_2 has reduced the income elasticity coefficients from 1.60 to 1.19 and from 1.71 to 0.90 respectively. The co-efficients of R_2 are highly significant and possess the expected positive sign. This result is to be viewed especially in the context of the implementation of successive five-year Plans in the country. The growth in planned investment undertaken in the public sector has indeed generated large money incomes and the intensified efforts to mobilise resources on a larger scale have been associated with a rise in interest rate in general and the bank deposit rate in particular. During the period, the precondition for deposit formation, namely, the exten-

sion of banking facilities to more and more unbanked centres has also been increasingly met.

Equations (1) and (2) wherein R_i alone appears besides the income variable, the coefficient of R_i has the correct sign although it turns out to be statistically insignificant. However, in equations (4) and (5) where it appears along with R_2 , the R_i coefficient becomes significant. This apart, the degree of reliability of the equations has improved in terms of (a) reduced standard errors associated with the regression coefficients of R_i and R_2 and (b) a small improvement in R . It can therefore, be safely concluded that the negative impact of substitution between time deposits and other types of investment is forcefully brought out only if the positive effect of a rise in bank deposit rate is

adequately taken into account.

Equation (7) is of the distributed lag type and yields a good fit to observed data. The speed of adjustment of demand for time deposits seems rather slow taking approximately four years to reach the 'desired' level. The short-run income elasticity coefficient is 0.40 whereas the corresponding long-run coefficient works out to 1.54.

Demand Deposits

In the case of demand deposits, the variables chosen are interest rate offered on bank deposits of three months' maturity (R_3) and income. R_3 is chosen to represent the opportunity cost of holding money as it corresponds to a typical short-term asset available for investment by households and having a maturity period comparable to that of treasury bills. From the fits obtained, it can be seen that although the co-

efficient of R_3 has the expected negative sign, it is statistically not significant. The income elasticity coefficient ranges from 0.99 to 1.48.

The weak effect of interest rate obtained will have to be seen in the light of the significant changes in the growth and composition of demand deposits during the period studied. Data used in this regard are given in Table I. It may be observed from here that demand deposits held by households have grown faster since 1955-56 compared to the holdings of other sectors like corporate and co-operatives, other financial institutions, government and rest of the world. In fact after excluding savings deposits, the picture observed is that the share of households in current deposits has not shown any visible change except for a nominal decline. Thus the growth in demand deposits

is mainly brought about by the increased popularity of savings deposits among households. For most salaried and fixed income earning individuals, savings deposits equally serve those purposes which are met by current and fixed deposits. Besides, they also earn higher rates of interest, even higher than those offered on three monthly bank deposits. It is, therefore, to be expected that with a rise in both R_3 and savings deposit rate, such deposits held by households should increase weakening thereby the negative impact, if any, of a rise in interest rate on current deposits.

Equation (10) reveals that price elasticity of demand for demand deposits is 1.30 and significant. This evidence together with the interest inelasticity referred to above is a pointer to the fact that demand deposits are in the nature

of transaction balances. The long-run income elasticity coefficient is 1.80 as revealed by equation (11). Corresponding short-run elasticity is 0.54.

Currency

Currency as a mere function of time trend gives a good fit but this is not dependable for prediction purposes in view of the low DW statistic indicating the existence of positive serial correlation in error terms (equation not given).

The choice of an appropriate interest rate variable in explaining the demand for currency is unduly complicated because (a) there are no alternative forms of financial assets to keeping currency for most households in rural areas until recent years except money lending against promissory notes, mortgages etc. which is highly unorganised and (b) the aggregation of 'pure' households and

'enterprise' households into one sector; the former generally being the savers and the latter, borrowers (or investors). Now in analysing the effect of a change in interest rate on currency holding one has to necessarily take into account both the lending and borrowing aspects simultaneously. A rise in interest rate would mean diminished currency balances with savers in view of the increased cost of holding money but the implications of this change in interest rate from the borrowers' angle would be increased currency balances in view of higher cost of borrowing.⁸ The net effect, therefore, of any change in interest rate can be expected *a priori* to be small. These inferences have been drawn so far on the assumption that currency does not earn any income; but it is noteworthy that currency confers certain benefits such as tax-evasion

and concealment of wealth and so may be held even in the context of increased rates offered by banks. Also for most rural households, alternatives to holding currency are not really bank deposits but assets like gold, commodity stock, land and other investment in own-business. For these reasons the longterm profit rate ' R_i ' for the economy is preferred instead of bank-deposit rate which is relevant only for a part of the urban household sector.

The equation with income in nominal terms and R_i as the interest rate variable has yielded a satisfactory fit. R_i gets the negative sign; its effect, however is significant only at about 15 per cent level. As in the case of deposits, the results obtained for the distributed lag version of the demand equation

for currency are also presented in Table II⁹.

Money (M_{1dh})

From the foregoing discussion of results in respect of currency and demand deposits, alternatives to the selection of an appropriate interest rate variable are quite clear. Apart from the income and interest rate variables, some empirical studies include additional variables such as the rate of change of prices to represent yield on real assets especially for periods in which prices have risen substantially. Some trial runs carried out taking this variable did not achieve better result.¹⁰ Bazaar bill rate is not explicitly used because of its close correspondence with the movements in industrial securities yield over the period studied.¹¹ The empirical fits obtained

in respect of M_{1dh} using the income variable and alternative interest rates are presented in Table II.

It may be seen from the equations that the fits are on the whole quite satisfactory. The income variable has the predominant effect and the income elasticity of demand for money works out to be 1.04 in the linear case and 1.10 as per the double log equation. This compares favourably with the elasticity estimates referred to in other empirical studies.

In regard to the influence of interest rate on demand for money, the effect of the short-term interest rate which is sought to be represented by three-monthly bank deposit rate does get the expected negative sign.¹² The interest rate coefficient, however, is not statis-

tically significant. There are valid reasons for this weak effect observed, which could be properly understood with reference to what has been discussed in the case of currency and demand deposit equations.

Based on empirical results obtained for some of the developed countries it is contended that for demand equation in respect of M_{1dh} the long-term rate should be the relevant interest rate variable. This is based on the statistical reasoning that short-term interest rates are susceptible to larger fluctuations than the long-term ones which understate the true effect of interest rate on money demanded. Following this line of reasoning alternate formulation for M_{1dh} replacing the three monthly deposit rate (R_3) by the yield on variable dividend industrial securities (R_i)

TABLE II—EMPIRICAL RESULTS OBTAINED FOR THE PERIOD 1952-53 to 1967-68

Note: Figures in parentheses under the coefficients represent standard errors and elasticities respectively.

has been tried. It is seen that the income elasticity remains much the same as observed earlier whereas the interest elasticity is negatively signed though not highly significant. The negative coefficient of interest rate is a pointer to the prevalence of substitution between money on the one hand and long-term financial assets or physical assets on the other, however small this effect may be.

Monetary Resources (M_{2dh})

Demand equations for M_{2dh} have been fitted with income variable and alternate interest rate variables of R_1 and R_{12} (see Table II). As in the case of time deposits, the demand equation in respect of M_{2dh} wherein R_1 and R_{12} together appear, has yielded the best possible fit. Only in the presence of R_{12} the effect of R_1 assumes statistical significance whereas the coefficient of R_{12} is so with or without R_1 . Particularly in equation (21), the income and interest rate coefficients are all significant and have the expected signs. However, the inclusion of R_{12} variable is found to reduce substantially the income elasticity coefficient. Almost identical behaviours was observed in the case of time deposits and the explanation given may hold good in this case also.

PART III

Summary and Conclusions

(1) Time deposits are found to be highly interest elastic. There is evidence to show that significant substitution takes place between time deposits and other types of investment and corporate securities in particular. This substitution effect is brought out clearly only in the presence of a suitable interest rate offered on bank deposits.

(2) Demand deposits are price elastic and interest inelastic and are therefore, mostly in the nature of transactions balances of households in the Indian case.

(3) Households behaviour in regard to demand for currency has been the most difficult to explain. There is no gain-saying the fact that a substantial part of it represents transactions balances. However, the observed substitution effect

between currency and other assets, although weak, indicates that it contains 'idle' balances as well. Further, the interpretation of the interest rate effect gets complicated in view of (i) the aggregation of rural and urban households and (ii) the mixing up of 'pure' and 'enterprise' part of household economic activities, notably in rural areas.

(4) Income elasticities of demand for currency, demand deposits and time deposits, as revealed by the identical empirical fits attempted, show that they are in ascending order of magnitude. For instance they are 0.9 for currency, 1.5 for demand deposits and 1.6 for time deposits.

(5) Yield on variable dividend industrial securities appears to be the most appropriate interest rate variable in a study of the demand for money or its constituents in the Indian economy.

(6) In view of the diverse circumstances in which households are placed in regard to choice of assets, a disaggregated approach to the problem seems to be a better alternative. The disaggregation will have to be in terms of both instruments and sectors.

(7) Monetary resources (M_{2dh}) has an edge over money supply (M_{1dh}) from the point of view of 'stability' in the demand function. Even otherwise, M_{2dh} is preferred because it circumvents the element of arbitrariness involved in the allocation of savings deposits as between demand and time portions.

2. Goodhart, CAE; "The Importance of Money", Bank of England Quarterly Bulletin, June 1960.

3. To our knowledge there is only one study in the Indian case wherein

the income variable is adjusted to exclude the non-monetised part. See "Role of Money Supply in Developing Economy" Kanta Prasad, 1969. Others take care of this through indicators like share of non-agricultural income total income or a time trend; see "An Econometric Study of the Money Market in India" Thanipyan Mammen, 1967.

4. Vide article on "Seasonal changes in Liabilities and Assets of Scheduled Commercial Banks" by P. K. Pani, R.B.I. Bulletin, June 1970.

5. Redemption yield is assumed to be a better approximation to expected yield over the holder's planning period than the other. This need not always hold good because of opposite movements in expected and real yields on account of either extrapolative or regressive expectations; C.A.E. Goodhart, op. cit pp. 171.

6. This assumes that good performance on agricultural front implies a favourable outlook for the industrial sector and for the entire economy.

7. Estimated mean lag.

Symbols used

M_{1dh} = Money supply of households ($C_{dh} + D_{dh}$)

= Currency of households (C_{dh}) + Demand deposits of households (D_{dh})

M_{2dh} = Monetary Resources of households

= M_{1dh} + Time deposits of households (T_{dh})

C_{dh} = Currency of households.

D_{dh} = Demand deposits of households.

T_{dh} = Time deposits of households

Y_{dh} = Household (monetised) disposable income at current prices.

Y_{cdh} = Household (monetised) disposable income at constant prices.

R_3 = Rate offered by commercial banks on 3 monthly deposits.

R_{12} = Rate offered by commercial banks on 12 monthly deposits.

R_1 = Yield on variable dividend Industrial Securities

T = Trend

P_w = Index Number of wholesale prices.

8. R.T. Seldon, *Monetary Velocity in U.S.A.—Studies in quantity theory of Money*, ed. Friedman 1956. pp. 231.

9. In such equations tried with income and interest rate variables, it was observed that even the income effect did not turn out to be statistically significant. This would imply that currency stock at the beginning of the year explains most variations in current year's stock of currency. Furthermore, the speed of adjustment is found to be extremely slow so that additions to currency stock even in a remote year does influence the current stock of currency.

10. In another empirical study also, this variable has not proved to be useful. See D. V. Ramana, *Deficit financing & import substitution : India, 1951-1965*, paper read at the AID/University of Wisconsin Conference, Bangkok, Jan. '67 where he gets an insignificant coefficient when the variable, rate of change of prices, used at the aggregate level rather than for households.

11. The correlation coefficient works out to 0.85.

12. The equation is not presented in Table II.

ALUMINIUM CAN MAKE YOUR HOME LOVELIER AND LIVELIER

Sleek, elegant, light, bright, strong, durable, rust-proof, hygienic...one could go on listing the virtues of the wonder metal, ALUMINIUM. Every modern home uses versatile aluminium furniture, fixtures, utensils and appliances. Join the modern trend—use aluminium in your home too. Make sure that your furniture is made of Hindalco Aluminium. Hindalco does not make these finished goods but it supplies the much-needed aluminium (in primary & Semi-fabricated forms) for their manufacture.

Canutes all

The cabinet secretariat, the Planning Commission and presumably the Finance Ministry seem to be furiously at work concocting measures for holding the price line. This will not be the first time that the government may be stamped into reacting wrongly and in a hurry to problems which are of its own making and which it has been sleeping over far too long. Unnerved by rising concern among the people over the soaring cost of living—a mood to which the press and Parliament have been giving forceful expression—the government appears to be thinking in terms of resorting more and more to the apparatus of controls—commodity, credit and the rest—in the hope that this desperate remedy may perhaps work a cure for the inflationary pressures in the economy. It has been shown again and again, however, that credit control can do but little to alleviate the inflationary sins of fiscal profligacy. A rather relatively outspoken former Governor of the Reserve Bank of India had gone on record more than once to the effect that it was unfair of the government to except the central banking authority to compensate through credit controls for the excesses of the government's budgetary policies. Experience has in fact shown that credit restrictions are not only a poor substitute for fiscal discipline but are also an objectionable alternative to it in that they could do more harm by hampering production than good through checking the play of excessive money supply.

As for commodity controls, the outlook is even less promising for the simple reason that as the years have passed by, inefficiency and corruption in public administration or government-controlled economic activities have been going up by leaps and bounds. It would therefore be a fair expectation that any amplification of commodity controls would neither make economic sense nor make for equity. In any case the best short-term bet for the government appears to be to show a little more imagination and business efficiency in deploying government-held stocks of foodgrains as a means of dampening the current tendency of food prices to go up and up. The aim here should be rather to use the existing distribution channels in a more competent manner than to build up additional high-cost, but low-performance administrative networks.

It must however be frankly conceded that so far as the immediate future is concerned the deciding factor will be the behaviour of the southwest monsoon, or what remains of it. It is interesting to note how effective a postponement of the rains is in putting the fear of God into the politicians in power. Within a period of less than a month the government's attitude towards the price problem has changed from one of "the leader is right; the future is bright" to a laboured admission that complacency in high places has now been proved to be a betrayal of the people's interests. Unfortunately, even if the government has at last rediscovered its conscience, its power to influence proximate developments on the price front is very limited indeed. Should the monsoon fail to make good at least the major part of the losses of delay within this fortnight the year 1972 is bound to witness a large rise in the price level most of which is likely to become permanent.

In the industrial field again reports of immediate steps on the part of the government to encourage current production will have in the main a value which is only psychological. Even if past mistakes are rectified and no new ones are made by the government, the industrial production picture is unlikely to change substantially for the better before this year is out. Even then there is very little likelihood of industrial output playing an important price stabilizing role for some time to come. This is for the simple reason that, for a period of five years in the past, the government has been only playing politics with saving and investment and, consequently, the further industrialization of the country. Almost every element in government policy has been biased against the growth of industry, while all kinds of sterile pseudo-ideological controversies have been deliberately worked up with the purpose of fouling the economic climate for the growth of industry or commerce.

The direct consequence of all this is that there has been created a situation in which any further true economic progress has become impossible unless the whole range of government policies, particularly the fiscal and regulatory policies, are dramatically reversed and liberalised. The regimentation of business by politics has proceeded to an extent where the economy has become disabled and enfeebled in its potentiality for developing in accordance with the needs of the nation for supporting a growing population at improving levels of living. The people's poverty which the politicians have made into a propaganda against large sections of the people themselves, the unemployment in the nation which has been treated as grist to the mills of power politics and the current trend of inflation which the ministers are no longer able to wish away are all but symptoms, of varying degrees of dramatic impact, of the failure of the government in the last five years to allow the industrial economy of the country to develop

its resources for expanding production in anticipation of the demands of the seventies.

Viewed in this perspective there is clearly no reason for any of us to be unduly impressed by newspaper accounts of feverish anti-inflationary efforts on the part of certain ministers who have been artificially stimulated by the recent changes in the cabinet. More than ever it has become necessary for the country to call for an end to slogan-mongering or Plan-peddling. The public is not interested in the debris of the fourth Plan or even in the anticipatory midwifery for a fifth Plan. On the contrary what the people need is the reassurance of a clear declaration by the government of the few basic policy decisions that are indicated for the revival of the dynamics of industrial expansion and economic growth.

STC: towards rising profiteering

THE CHAIRMAN of the State Trading Corporation (STC), Mr P. L. Tandon, who relinquished charge of this public sector institution on July 31, 1971, has emphasized, as is natural, the improvements he has been able to effect in its operations. He has shown how, within four years, he has rationalised and modernised its working through various management accounting techniques which minimised expenditure and maximized profits. Undoubtedly, he deserves to be congratulated on having reduced inventories even after almost doubling turnover in four years. In 1968-69, the STC had locked up Rs 70 crores of funds in "stocks and debtors" while the turnover was Rs 140 crores. In 1971-72, the turnover had increased to Rs 263 crores but the corresponding figure for stocks had been reduced to Rs 40 crores. This spells not only a narrow monetary gain but a distinct socio-economic benefit.

The highlight of the performance of the STC group—STC and its four associates—for 1971-72 is the sharp increase in profit before tax from Rs 7.2 crores to Rs 17.0 crores—a rise of 136 per cent in a year. Within the last four years, the STC has raised its dividend from Rs 20 lakhs to two crores of rupees. It may be recalled that the equity capital of the STC when Mr P. L. Tandon took it over in 1968 was only two crores of rupees and it is now being raised to Rs 10 crores. Surely it is no mean achievement to raise the value of dividend of the corpora-

Mr Mohan Kumara-

mangalam's is an interesting mind. It is in fact so interesting in itself that what it does is often much less significant than what it is. Its most remarkable attribute, of course, is its ape-like agility. Only an extraordinarily skilled intellectual gymnast can keep track of all its tricks or turns. When this minister nationalized colliery companies mining coking coal, his argument was that this industry was neglecting conservation as well as failing to invest sufficiently in modernization or expansion. When he took over the Indian Copper Corporation for the state, he explained simply that he wanted to 'grab' the technical personnel of the company for the development of the industry concerned under national auspices. More recently, when his ministry assumed control of the Indian Iron and Steel Company Ltd and the responsibility for its mana-

has been the suggestion that, wherever the private sector is found to be unable or unwilling to undertake strategically or socially important investment or production responsibilities, the public sector should step in and fill the gap. Lately it has also become a fashion to assert that the production of commodities of mass consumption, an increase in which has become necessary for the success of anti-poverty programmes, cannot be promoted fast enough unless the public sector undertakes large responsibilities in this area. Mr Kumaramangalam has now been able to add substantially to both the literature and the grammar on the subject—thanks to his very interesting mind.

Mr Mohan Dharja also has a mind which is interesting in its own way. The 'interest' in this case, however, lies wholly in the question what kind of mind it is that Mr Dharja has got.

WITHOUT CHARITY

gement, Mr Kumaramangalam's contention was that its affairs were being grossly mismanaged. Last week, in Rajya Sabha, when a question was put to him whether the government might consider taking over the non-coking coal mines, the minister replied that the government would certainly do so if the colliery owners failed to make investments for more production or pay proper wages for Labour.

The expansion of the public sector has been advocated over the years on a variety of grounds by those who seem to believe that the proper function of a government is to do everything but govern. There has been the familiar argument that the state should occupy the commanding heights of the economy in order to reduce inequalities of income or wealth, prevent concentration of economic power or build socialism generally. It has been pleaded, again, that, wherever there are possibilities of large manufacturing or trading profits being made, the government should enter the business so that the profits could be captured and used for the benefit of the community as a whole. Then there

There is a story told of a young beauty married to a man of great wealth. When she asked him more or less playfully where he had been when the good Lord was distributing beauty, the reply she got was that he had gone away to make his fortune since he always knew that, once he had got the money, he would be able to buy all the beauty he wanted. I wish it were true that once a politician has managed to become a minister, he would be able to acquire all the wisdom he needs. I am saying this because Mr Dharja is reported to have stated in Parliament last week that one of the major decisions to be taken in the fifth Plan might be a decision to nationalize some of the big business houses. The subject is well worth pursuing further with the Minister of State for Planning. It is very easy indeed to see that the government can nationalize individual industrial units or even whole industries, but could it be that the Law Minister Mr Gokhale, aided and abetted by the impressive legal acumen of his colleague the Minister for Steel, Mines and Metals, has already thought of a formula for enabling Mr Dharja to "nationalize" business

houses, big or small? It is true that the law makes an ass of itself occasionally. It is even more true that law-makers make asses of themselves rather more frequently. Even so, it would be a strange legislative happening indeed if "business houses" are "nationalized" by an Act of Parliament in tribute to Mr Dharja's radical heart which he seems to wear on his sleeve.

Talking of minds interesting and not so interesting, Mr T. A. Pai's problem seems to be that his brain-waves cannot even wait for him to settle down properly in a ministerial bungalow. The new Railway Minister, it appears, wants to do away with the third class on the Railways. His objection to the third class is not that, as matters stand, it makes travel a torture, but that the term 'third class' is derogatory to the dignity of the Indian citizen on the twentyfifth anniversary of the country's Independence. One can sympathise with Mr Pai that no easy alternative is open to him. For instance, the mere change of nomenclature from 'third class' to 'economy class' obviously won't do. Considering the continuous increase in third class rail fares in the context of the progressive deterioration in the quality of service or accommodation, it would be adding insult to the injury being suffered by the third class passenger to rechristen this class of travel as 'economy class'. For, the question will arise who has been economising and at whose cost.

Finally, there is the mind of the Speaker of the Lok Sabha which seems to be unduly sensitive on certain occasions. A report in *The Statesman* of August 5 says: "A member's reference to the House of Commons provoked Mr Dhillon to ask him not to refer to the Commons which did many things that the Lok Sabha did not; he recalled that nine Speakers of the Commons had been hanged including two in a day".

I was considerably amused by these observations of Mr Dhillon since, only a day earlier, I had chanced to read the following note in *The Spectator* (London) of July 29 (in the column *Corridors by 'Tom Puzzle'*):

"Puzzle met the Speaker of the Indian Parliament on a visit to Westminster. He explained that procedure was exactly the same with such obvious pride that it seems some of the claims in more pompous constitutional textbooks about our influence might be right after all—at least in India. Most surprising".

TOUCHSTONE

tion to the value of original equity capital within such a short period.

How has this turn in the working of the STC been brought about? According to Mr Tandon, besides other things, the secret lies in keeping expenditure under check. While the expenditure of the STC group was maintained in 1971-72 at the same level as in the preceding year, that of the STC, the holding company, was reduced by 4 per cent. Before Mr Tandon took charge of STC, the expenditure of the corporation used to increase at the rate of more than 20 per cent per annum.

But this is only a part of the explanation for its encouraging financial results. The bulk of its profits is due to profiteering on an extensive scale consequent upon a rapid advancement in canalisation of imports. The opportunities for growth (and consequently for increased profits) have virtually been offered to the corporation "on a plate" as conceded by Mr Tandon. The official policy of increasing diversion of imports to state agencies has inflated its operations at a breakneck speed. Imports of the STC group, for example, rose from Rs 154.0 crores in 1970-71 to Rs 221.8 crores in 1971-72. And most of the goods imported by the STC and its associates are in short supply in the country and the prices at which they are sold to consumers bring rich dividends to it because of its monopoly position. The chairman has stated that the prices of imported products are fixed in consultation with the relevant ministries but the fact remains that, taking advantage of the shortages in the economy, the sale prices are invariably hiked.

This can be illustrated with reference to the operations of STC's largest import division i.e. the Oils and Fats Imports Division. A major part of the increase in the profits of STC in 1971-72 has been contributed by this division which imports tallow, soybean oil, rape seed and copra. The trading profit on imported sales of this division in 1970-71 at Rs 57.3 crores came to Rs 8.1 crores; with increase in the value of imported sales in 1971-72 to Rs 75.3 crores, trading profit jumped up disproportionately to Rs 12.5 crores. The STC has ascribed this improved performance to "successful buying on the fluctuating world commodity markets", but has failed to explain why the advantage of its rare acumen to buy cheap has not been passed on to the consumer. Glibly the annual report for 1971-72, while discussing this aspect of the problem, states that "prices and allocation of imported materials are determined by the ministries concerned" implying that it had no hand in this profiteering or that it had the backing of the ministries concerned in this operation.

To refute the charge of profiteering, Mr Tandon has compared STC's rate of profit

before tax to turnover with the corresponding rate in the private sector industry and trade. It is not the overall rate of profitability of the STC which is resented. The consumers of industrial products who are dependent upon the STC due to canalisation of imports are forced to pay high prices; the rate of profitability on individual items of imports is excessive and the charge of profiteering relates to these transactions alone.

That the STC group increased its exports by more than 30 per cent in 1971-72 over the preceding year is without doubt satisfying but continued losses on this account are hard to justify. The Consumer Goods Export Division suffered a setback with increase in trading loss from Rs 0.8 crore to Rs 0.9 crore. The Development Exports Division with export sales of the order of two crores of rupees had a loss of Rs 0.1 crore. The Industrial Products Export Division and Leatherware Export Division had minor profits. A loss of Rs 1.6 crores was recorded by the Produce Export Division (rice, coffee, opium, jute, tobacco and dry fish). A real test of the efficiency of the STC lies in its performance in exports. The day it is able to export without loss, even with all the subsidies and drawbacks provided by the government, it will have justified itself as a business organisation.

The subsidiaries of STC have all shown encouraging results in 1971-72. The Projects & Equipments Corporation of India with a turnover of Rs 38.19 crores made a profit of Rs 0.47 crore. The Cashew Corporation of India with total sales of Rs 27.40 crores recorded a profit before tax of Rs 2.13 crores. The Handicrafts & Handlooms Exports Corporation of India Ltd, registered a profit of Rs 0.64 crore with turnover at Rs 4.34 crores. The Indian Motion Pictures Corporation had a nominal profit of Rs 5.38 lakhs. In other words, all the subsidiaries had intrinsic strength and none of them was a burden on the resources of the STC.

It is undesirable that 1971-72 was an exceptional year for the STC in more than one way. Sales rose sharply from Rs 217.83 crores to Rs 262.62 crores. Similarly, profit before tax increased steeply from Rs 6.43 crores to Rs 14.25 crores. However, prospects for 1972-73 do not look to be equally bright. Sales are expected to rise modestly to Rs 278.80 crores while trading profit is expected to drop to Rs 8.10 crores. The major reduction in turnover and profitability is anticipated because of the sharp fall in the imports of fats and oils. States the annual report for 1971-72: "Since the bulk of its purchases were made in the USA under PL-480 which has ceased, the division has lowered its target for next year to about half".

New approach to tea promotion

THE INDIAN Tea Association (ITA) and the United Planters Association of South India (UPASI) have recently submitted a joint memorandum to the government of India suggesting the need for a new approach to tea promotion. They have argued that India's tea promotional policy since 1952 has been confusing and ambivalent, that in the last twenty years after withdrawing from the International Tea Market Expansion Board, we have lost our share of the markets in all those countries from which we earned freely convertible currencies except West Germany, and that therefore a separate Tea Promotion Council should be set up with full autonomy to function in the specific area of tea market expansion. They have recommended that substantially larger resources should be made available for tea promotion and, if necessary, a separate levy may be introduced and the excise duty reduced to the extent. The proceeds of this levy are to be entrusted to the proposed promotion council.

The council is to consist of not more than seven members of which four would be nominees of the industry, one would be a non-official with specialised knowledge, and two officials one of whom will be the chairman of the Tea Board and other a representative of the government of India. It will implement an integrated promotional policy and not in terms of compartments as between generic and national, internal and export markets. It will work under the broad supervision of the Ministry of Foreign Trade and co-ordinate its efforts with any international body set up to promote tea in the world market by agreement reached through the Food and Agricultural Organisation (FAO). the council is estimated to need a fund of Rs 5 crores, the major share of which will be for an international generic campaign to promote tea in competition with the rival beverages.

The ITA and UPASI have advanced convincing arguments and statistics to

prove that the Tea Board has failed to promote tea exports in a dynamic way. It is stated that India's tea exports increased by only 2.4 million kg or by less than 1.2 per cent between 1951 and 1970 though production in this period rose by 136.4 million kg or 47.8 per cent. India's share of the world market dropped from 45.0 percent to 31.6 per cent between 1951 and 1970. And, significantly and surprisingly, a sharp fall in our tea exports has occurred precisely in those countries where we had spent most money such as the United Kingdom, Eire, the USA, Canada, Australia, New Zealand, and west Europe. This will be clear from the following table:

Indian Exports to Certain Countries where Tea Advisers have been located

Year	(in thousand kgs.)		
	UK & Eire	USA & Canada	Australia & New Zealand
1950-51	142,890	26,570	8,707
1955-56	136,344	19,369	3,239
1960-61	131,584	15,317	2,693
1965-66	110,413	11,090	5,228
1970-71	92,785	10,093	3,418

While the ITA and UPASI have effectively exposed the failure of the Tea Board, their case for a new promotion council does not seem to be quite convincing. It is not clear whether these two organisations have made this plea only on behalf of their own members or the entire tea industry in India. What, for example, are the views of the Tea Association of India on this subject? This association also has a large and influential membership. The government of India may not be inclined to consider a major proposal such as the formation of a separate tea promotion council unless it is backed unanimously by the country's tea industry.

The ITA and UPASI seem to underestimate the importance of our trade with the countries with whom we have bilateral agreements. They say: "Whereas in 1952, 86.4 per cent of India's exports went to countries which paid in freely convertible currencies and exports to bilateral trade countries were only about 4.66 per cent by 1970-71, when the total volume of exports remained more or less the same, our earnings of freely convertible currencies dropped to 56.3 per cent only." They add that "there is very little promotional activity which India could do to popularise tea drinking in countries with

a centralised economy and the rupee account countries." It is, of course, necessary that we should try to maximise our tea exports to countries which bring us free foreign exchange. But should not the bilateral countries also continue to receive our attention? The government of India has been attaching a great deal of importance to the promotion of our trade with these countries. Moreover, in most of them the per capita consumption of tea has been quite low, which therefore offers much scope for increasing our exports. It is not correct to suggest that countries with a centralised economy do not provide opportunity to undertake promotional activity for tea. They require different promotional techniques as compared to the western countries and our tea industry can hardly afford to remain indifferent to the development of the markets in them.

The ITA and UPASI point out that tea is not an essential of life and there are many other beverages which compete with it and which are being promoted with a great deal of vigour, imagination, and resources. They argue that if tea's future as a preferred beverage has to be maintained and increased in world markets where other beverages are more attractively, efficiently, and powerfully presented to the consuming public, it is necessary to display the same sophistication in appeal and pressure by advertising skills. "It cannot be done", they say, "without freedom and flexibility appropriate to each market situation and a decision making procedure quite different from that of public administration".

But is it not possible to improve the working of the Tea Board by providing it with more funds and more autonomy? Is not the Board's counterpart in Ceylon able to function more effectively because of the greater freedom it enjoys in undertaking promotional activities for its tea in foreign countries? The working of our Tea Board has often come in for scathing criticism by many parliamentary committees. But the Board seems to continue to work in its traditional way. It appears that organisations of Indian tea trade and industry have also not been effective in their criticism of the Board's working. Many of them are represented on the

Board. But somehow they have not been able to make their influence felt on the Board's administration. Incidentally, it is pertinent to enquire why the ITA, UPASI and similar organisations have not made their own efforts to undertake market surveys for our tea in various parts of the world, for which financial assistance is available from the government of India through the Market Development Fund?

The memorandum of the ITA and UPASI seems to have assumed that Indian tea can do better in the world markets merely by launching a "vigorous public relations campaign". But no less important is the imperative need to reduce our costs of production and sell our tea at competitive prices. The new producers like Kenya, for instance, have been able to achieve considerable success in many markets because of their ability to sell tea at more favourable prices than India.

The ITA and UPASI have argued the case for a new promotion council at a time when it has become the fashion for the government of India to take over industries and trades on some pretext or the other. New Delhi seems to be firmly convinced about the superiority of the public sector not only in developing industry but also in promoting foreign trade. In this background, is the government of India likely to listen favourably to the plea to divest the Tea Board of most of its functions? The memorandum of the ITA and UPASI is not consistent in its arguments. It has strongly attacked the government for its failure to expand the export of tea. It says that "a stop-go policy, with long gaps of uncertainty in decision and inadequate financial support can never succeed in the field of publicity". At the same time it says, in concluding its memorandum, that the "Government has been providing vigorous leadership in promoting exports".

Eastern Economist 25 Years Ago

AUGUST 15, 1947

Eastern Economist Independence Day Silver Jubilee Number

The next issue of *Eastern Economist*, dated August 18, will be the Independence Day Silver Jubilee Number. It will carry a number of articles on national affairs contributed specially for the occasion, besides a survey of developments in the states. Priced at Rs. 5 per copy (postage extra), copies of this special number will be on sale with leading booksellers or can be had direct from:

The Manager
The Eastern Economist Ltd.
UCO Bank Building,
Parliament Street,
New Delhi-1.

Today is a great moment in the history of India. After over 1,000 years of successive subjugation and foreign rule, India becomes free and independent. British conquest and power was more complete and effective than any previous subjection and was also more alien, but India had ceased to be independent centuries before. The capacity for absorbing foreigners so often referred to by historians has not been as great and real as was often supposed, as Pakistan which has cut itself away proves to the hilt. The British brought about political unification under common subjection for nearly two hundred years but destroyed it in the process of withdrawal. The independence that India and Pakistan enjoy is unique and has had no counterpart in India's history. The period of Asoka and Sumundra Gupta was the nearest approach to an independent India but the quality of independence then was very different from that achieved at the present time.

We have said that today it is a great moment in the history of India. But in an equally significant sense it is a great moment in the history of Asia and the world. For India's slavery and dependence meant the slavery and dependence of nearly the whole of Asia; her liberation and freedom spell the liberation and freedom of the unliberated countries of Asia. Discerning historians have always known this. Hence it was that the freedom movement in India had a wide significance and was a symbol and portent. If Burma, Ceylon, Indonesia, Malaya and the Middle East are all near independence today, it is at least as much due to the struggle for freedom carried on in India as to their own efforts. But India's freedom is of world significance. The balance of political power will have altered and, its dispersion will be such as would enable India to share in it in due proportion.

The plague of power politics

R.V. Murthy

STATE ELECTRICITY boards are verily becoming a law unto themselves, as witness the utter irresponsibility of some of them in the matter of meeting the demands of its consumers even after their solemn commitments under written agreements. This has prompted some serious minded electricity interests, it is reliably understood, to approach the centre with a plea for the abolition of all state electricity boards and forming one central or national electricity board with a number of regional offices to cater for the needs of all users of electricity without importing parochial or political considerations into this vital public utility field. Some of these state electricity boards are also becoming growingly intolerant of the relatively more efficient working of electricity supply undertakings under the corporate sector and are alleged to be actually behind the latest campaign of some misguided political busybodies for taking over all privately run electricity undertakings, evidently with a view to eliminating the scope for any comparative study hereafter of working of electrical undertakings under the two sectors. These conclusions stem from the way in which the UP State Electricity Board is stalling the supply of electrical power to Hindalco and holding up both utilisation of installed capacity and higher production of Hindalco's aluminium plant at Renukoot, on the one hand, and the reported allegations against the licences in the corporate sector, on the other. It is, therefore, worth examining both these issues with a view to focussing public attention on the merits thereof.

assurance by govt.

To take the supply of power to Hindalco by the UP State Electricity Board (UPSEB) first. When the question of expanding the capacity of Hindalco from 60,000 tonnes to 120,000 tonnes came up, the Hindalco management took care to get assurances in writing from both the UP government and the UPSEB that until the power supply for this expansion on a long-term basis became available from the expansion of Hindalco's own captive

thermal power plant (and the installation of this was sanctioned in writing by both the UP government and the UPSEB), that is for an interim period, the UPSEB would supply the necessary power at 4.2 paise per unit (which is more than double the rate paid for power supply by manufacturers of aluminium in other states). This rate, it must be noted, was fixed by the UP government after prolonged deliberations and taking all relevant factors into account. And yet, for reasons best known to them, neither the UP government nor the UPSEB have cared to respond to Hindalco's frantic appeal for power to enable the corporation to start up the expansion by commissioning its first half potline in the first week of August, 1972. Even a cable sent on June 30, 1972, to the Chief Minister of UP, does not appear to have produced any result.

unreasonable demand

According to the terms of the clearance letter issued by the government of India, Hindalco is required to complete its expansion to 120,000 tonnes by December 31, 1973, and inquiries made with the Hindalco management show that their expansion schedule is 15,000 tonnes by August, 1972, 15,000 tonnes by end of 1972 and 10,000 tonnes by end of 1973, that is the completion date prescribed by the government of India. But, if the UP government and the UPSEB fail to supply additional power, Hindalco cannot be expected, in all conscience, to produce the extra tonnage of metal as per the schedule to which it has committed itself. Even to ensure maintenance of the supply as per an earlier agreement (this expired on December 31, 1971 and the UP government has yet to renew it) it is known, the corporation had to get a high court injunction after resorting to the extreme expedient of a writ petition.

At a time when every one from the Prime Minister to the new Minister for Industrial Development has been urging the optimum utilisation of installed capacity and the maximisation of production

by all industries, it is difficult to explain this positively unhelpful attitude of the UP government *vis-a-vis* Hindalco. The UP government, it is perhaps worth recalling here, has reason to be grateful to the Birlas, first, for agreeing to set up their aluminium plant here (they had the alternative site at Koyna then) and then for agreeing to take up the present expansion. Conscious though it was of the several disadvantages of locating an aluminium plant in this area, this firm still undertook to do so and to take up this expansion, bearing in mind the need for the industrialisation of this extremely backward area in the eastern region of UP and at the specific request of the UP government, as also the written directives of the government of India.

If this stalemate were to continue and the UP government does not make power available to Hindalco what would happen? The first reaction of the Hindalco management, not unnaturally, would be to give serious thought to the question of whether they should at all proceed with further expansion. Apart from the losses that Hindalco might suffer, (as it must when the huge capital investment in installation of the additional capacity remains idle and unproductive) there would be several other consequences, besides, that would affect the country and its economy generally.

overall loss

In the first place, the government of India would lose excise duty on the expected additional production of some 1,250 tonnes per month. This works out to a loss of Rs 15 lakhs per month or nearly two crores of rupees per year. Secondly, the union government would also be deprived of the income-tax on the profits accruing to Hindalco from this additional production. Thirdly, the government of India would have to expend badly needed foreign exchange to the tune of Rs 50 lakhs per month or Rs 6 crores per year on importing an equivalent quantity of aluminium from abroad. Next, the state government would lose sales tax estimated

at about Rs 30 lakhs per month. Finally, so many technicians and workers would be denied the opportunity of gainful employment.

Surely wiser counsels must still prevail somewhere in the UP government which should recognise the futility of this foolish pastime of cutting one's nose to spite one's face. If, as is believed, the main hitch with regard to the supply of power by the UPSEB is the rate, it could be settled across the table by Hindalco and the state government and, notwithstanding the earlier agreement, Hindalco is stated to be prepared to leave the decision even now to the UP government. Hindalco's only submission, however,—and no sensible person would take exception to this—is that, in fixing the rate, the UP government should keep in view the circumstances of the statutorily controlled selling rates for aluminium fixed by the government on a uniform basis for all the manufacturers (even this has put Hindalco at a disadvantage *vis-a-vis* other aluminium producers) and the commitment for export imposed on Hindalco in the industrial licence.

relative disadvantage

It could not have escaped the notice of the UP authorities that, in regard to cost of power, which is a very important component of costs in aluminum manufacture, Hindalco is at a relative disadvantage already. As determined by no less authoritative sources than the Tariff Commission and the Wanchoo Committee, the power cost (on the basis of which the present selling prices of aluminum have been fixed) of Hindalco is higher by over Rs 500 per tonne as compared to that of other aluminium manufacturers. And, yet the Delegated Legislative Committee of the UP, in a report submitted by it to the UP Assembly recently, attributes the losses incurred by the UP State Electricity Board to the supply of 50 MW power to Hindalco at a rate of two paise per unit. This is not understandable not only because the rates charged by other state governments to aluminum factories in their respective jurisdictions are lower than two paise per unit (Kerala charges only 1.24 paise per unit, Tamil Nadu 1.52 paise per unit and Mysore 1.90 paise per unit) but also because of the reported allegation made in the Kureel Committee that many of the licensee's tariffs are much higher than those of the state electricity boards which suggests that tariffs charged by the latter are reasonably cheaper.

It would, therefore, be interesting to

know the comparative rates charged by the UPSEB to other consumers and make a thorough study in the economics of power supply in the U P. Since, for obvious reasons, especially at the present juncture, UP government may not allow this, the government of India should appoint a committee to go into the economics of the whole electricity supply industry in the country, both in the private sector (manufacturing or supply or both) and in the public sector, with a specific term of reference *viz* to determine differential rates of supply that ought to be charged to different users depending upon the percentage that such rates bear to total costs of production in different industries, in particular those employing the electrolytic process.

premature acquisition

However, it is unfortunate that, instead of adopting some such straightforward approach the powers-that-be seem to be indirectly encouraging the cry for nationalisation of the electricity supply industry. There are reports in the daily press, for instance, that the Kureel Committee has already formulated recommendations for premature acquisition of electricity supply undertakings under the corporate sector. Whatever the Kureel Committee may have recommended, and however compelling the pressure of some politicians, one hopes the authorities would carefully weigh the pros and cons of the whole matter before taking any decision—either nationalisation, which is irrelevant in the case of this industry—as the licences under which various undertakings operate carry within themselves specific points of time when the Purchasing Authority could exercise the option to take them over or premature acquisition of these undertakings. They should, in particular, consider whether it is at all advisable to go in, at this stage, for any special legislation to modify the existing provisions of the Indian Electricity Act, 1910. There is also the important point that several government financial institutions have very large investments in these electricity undertakings, so much so that they actually participate in their day-to-day management. And, to this extent, they are semi-nationalised undertakings, or joint sector projects in the real sense.

One of the points often made by the protagonists of take-over of electricity supply undertakings is that these undertakings (licensees) act as "middlemen" with a profit motive. Whoever talks of

profit motive with reference to electricity supply undertakings must be blissfully unaware of the fact that all licensees (this term, by the way, does not include captive power plants such as the Renukoot thermal power plant of Hindalco) have to operate within the very strict provisions laid down under the Sixth Schedule to the Electricity (Supply) Act, which impose both price control and control on expenditure. In fact, no other industry in the country is controlled so rigidly. There is thus no profit element in so far as electricity undertakings are concerned beyond the modest reasonable return permissible under the Act. (7 per cent on the capital base up to 1965 and 2 per cent over the Reserve Bank rate thereafter). As for the appellation of "middlemen", even some electricity boards happen to fall under it, as, for example, the two electricity boards in western India, in that these import power from the Atomic Energy Authority. That apart, don't these "middlemen" carry out the important functions of distribution and consumer service, although consumer service may not at all exist in the dictionary of some state electricity boards?

rationalised tariff policy

Much is also made of the big surpluses generated by the licensees as compared to those of the state electricity boards. But the two are strictly not comparable for the simple reason that the method of determining the surplus is not the same in respect of either of these. Then, again, although the grid tariff is weighed against the licensees, (save for slightly enhanced charges dictated by a particular consumer's load pattern), many of the licensees actually charge lower tariffs than the state electricity boards. So, rather than recriminate against private electric supply undertakings with a view to gobbling them up, state electricity boards would do well to adopt a rationalised tariff policy.

What the country needs today is not nationalisation or take-over, but rationalisation. Let, therefore, our state electricity boards take in to account only electrical factors or circumstances in formulating tariffs and supplying power and not be influenced by extraneous considerations. The latter may satisfy the whims or fancies of a particular individual, but they will not serve the nation's interests or even the parochial interests of a particular state.

POINTS OF VIEW

Aid element in W. German and Japanese loans

S. Radhakrishnan
A.V.K. Iyengar
N. Venkatesan

INDIA HAS received external assistance from many countries and international institutions for its programmes of economic development. The assistance has taken various forms, that the aid spectrum consists of grants at one extreme and hard loans of strictly commercial type at the other. In between, there are soft loans, loans repayable in domestic currency and in foreign currency, commodity loans in the form of sale of agricultural products, suppliers' credits, loans for re-scheduling existing loans etc.

All these various forms of external assistance are euphemistically called 'aid', a misnomer, as all of them except grants are to be repaid with interest. They have different interest rates and maturity. Except in the case of hard loans (such as the IBRD loans) the other forms of assistance contain an element of aid or grant in them. The object of this article is to estimate the aid element in the foreign loans India has received from Japan and West Germany during 1960-1970.

important question

The first question that arises is what is aid element? Aid elements may be defined as "the difference between the face value of the loan and the present value of all future repayments (amortization and interest payments) discounted at a proper rate of interest".¹

An aid element is said to arise when a foreign loan contains concessionary terms. The terms include a concessionary rate of interest (i) [i.e. a rate less than that of the discount rate, (q)], a grace period (G) during which only interest is paid and a period of maturity (T). Thus, aid element is a function of i, G and T. Here is the critical variable; if the rate of interest is the same as the rate of discount, aid element will be zero. If the rate of interest is less than the rate of discount, aid element will be positive and if it is more than the rate of discount, aid element will be negative.

For the purpose of our study, we have

selected West Germany and Japan. The study being experimental in nature, the choice of the countries is rather arbitrary. The loans extended by these two countries are repayable in foreign currencies.

We have relied for our data upon the Finance Ministry publication "External Assistance—1968-69 and 1969-70."

We have chosen 6 per cent as the rate of discount to calculate the present value of the future payments. This rate represents approximately the average rate of the IBRD loans to India between 1960-70.

For the purpose of our study we have used the following formula.²

$$s = \left(1 - \frac{i}{q}\right) \left(1 - \frac{e^{-qG} - e^{-qT}}{q(T-G)}\right)$$

Where

s : grant element as a percentage of face value
i : interest rate
q : discount rate
G : grace period
T : maturity

The aid element and the loan element have been calculated for each individual

POINTS OF VIEW

tional relationship with grace period and maturity period.

Our results also show that the 48 West German loans have *on the whole* an aid element of 21.33 per cent and a loan element of 78.67 per cent, while the 13 Japanese loans have an aid element of 3.4 per cent and a loan element of 96.6 per cent. From the point of view of debt burden the West German loans are relatively less burdensome than Japanese loan.

4	5 $\frac{3}{4}$	5	15	5	1778.2	1.85	32.9	1745.3
5	5 $\frac{3}{4}$	5	10	1	45.6	1.5	0.68	44.92
				13	2790.8		95.93	2694.87
							3.4%	96.6%

loan of the two countries. The results are given in Tables I (p. 258) and II below.

From the tables it is seen that there were 48 West German loans and 13 Japanese loans during 1960-1970, with varying terms. The West German loans carry interest rates ranging from one per cent to 5 $\frac{3}{4}$ per cent and the Japanese loans from 4 per cent to 5 $\frac{3}{4}$ per cent. The grace periods in the case of West German loans vary between one year and 11 years and in the case of Japanese loans from 3 to 5 years. The West German loans are repayable in 10 to 30 years, while the Japanese loans are repayable in 9 to 18 years.

Out of the 48 loans given by West Germany to India, 33 loans (about 69 per cent) carry an interest rate of 3 per cent per annum; 25 loans (about 51 per cent) have a grace period of 8 years; and 31 loans (about 64 per cent) are repayable in 25 years.

In the case of 13 Japanese loans, six of them are at 5 $\frac{3}{4}$ per cent or nine of them are at over five per cent; the grace period is five years for 10 loans (77 per cent) and eight loans (about 62 per cent) are repayable in 15-18 years.

The important point is that in the West German loans, the percentage of aid element declines from 49.85 to 1.64, as the interest rate rises from one per cent to 5 $\frac{3}{4}$ per cent. Similarly in the Japanese loans the aid element declines from 9.95 per cent to 1.5 per cent as the interest rate rises from 4 to 5 $\frac{3}{4}$ per cent. Thus, aid element is functionally related to the rate of interest (i). But two loans carrying the

Location as an exercise in political economy

Vijay K. Seth

IN MODERN economic analysis it is a fashion to observe a distinction in human and material resources. Keeping this distinction in mind Hla Myint¹ has provided different connotations to the terms "backward" and "under-developed", by using the former for "backward masses" and latter to refer to "under-developed resources". The term "backward masses" may be defined as a group of people who are in some fashion or other unsuccessful in economic struggle. By economic struggle we mean here that continuous process of

mutual adaptation between wants, activities and environment. Further, the idea of "degree of backwardness" implies a comparison of different degrees of success in economic struggle. On the other hand, by "under-developed" countries and regions we mean, those which possess potential resources waiting to be developed.

Economic history of developed countries reveals that different countries arranged in different sequences the reduction

of backwardness of masses and development of material resources. The arrangement of different sequences is the function of different patterns of growth and the economic system which the country has adopted for its socio-economic organisation. Those countries which believe in simultaneous process of reducing backwardness of masses and achieving development of material resources have followed planned economic development as a pattern of economic development. This choice has historical validity because i

PRESENTING THE NIGHT FANTASTIC!

The PHILIPS TLF Reflectalite a tubelight with a built-in reflector.

A brilliant new concept.
The TLF Reflectalite is a tubelight which has an inner reflector coating. This reflector coating may well be the greatest invention in fluorescent lighting. Because of its many benefits, the whole of the West has switched over to it.

It gives more light where you want it.
The TLF Reflectalite's coating prevents light from escaping upwards. It reflects the light downwards. So you get more light where you want it.

It is India's first dust-proof lamp.
When dust falls on an ordinary lamp, its light level goes down. Not so in the Philips TLF Reflectalite. Dust has no effect on it. Because of this you save a lot on maintenance.

It outshines all other tubelights.
Tests prove that the Reflectalite maintains lumen output twice as long as that of any other tubelight.

Better value for your money. Philips TLF Reflectalite is the ideal tubelight for your factory, office, shop or home. It will give you better light. And it will save a lot of money for you.

POINTS OF VIEW

many countries material resources were developed as fully and rapidly as market conditions permitted while inhabitants have been left out being either unable or unwilling or both to participate in the process of development of natural resources. Our country has also adopted the pattern of planned economic development. My objective in this article is to demonstrate that since we have a different objective underlying our development planning we have to follow those policies which are consistent with our objective.

In every planning model, politicians provide to the planners a well defined objective function. Given this objective function planners evolve programming exercises to maximise or minimise this function. It is said "all planning is a political as well as an economic process. Though the political constraints often remain implicit in an economic programming, they constitute the boundaries within which the economists must work".²

In our country planning was based so far on the assumption that even keeping existing inequalities as they are, if we shall be able to achieve a reasonable rate of growth of national product, which will be distributed evenly among the masses, we shall be able to make everybody better off without making anybody worse off—a sort of pareto-improvement. Practically the gulf between the rich and the poor has increased.

neglected aspect

Because of this neglected aspect of planning, namely redistribution, A.J. Fanseca has said that "planning in India misses the parameters of distribution."³ One can say that so far planning had been an exercise in import substitution (in industrial sector) ignoring the problem of distribution. It is only during the last general election, that the ruling political party started a campaign against poverty. Elimination of poverty requires redistribution (redistribution of fruits of economic growth). The phenomenon of distribution has become so vital that Prof. K. N. Raj, recently said that "planning in India has now become an exercise in political economy"⁴ Since then there has emerged a number of studies dealing with the problem of distribution by B. S. Minhas,⁵ Pernob K. Bandhan⁶ and by Dandekar and Rath⁷, but their studies deal only with agricultural sector. My purpose here is to evolve an exercise to distribute the fruits of industrialisation, namely, new skills, new sources of income, new environment and mass-participation in

bringing about industrial revolution, accompanied with regional balance.

Redistribution can be made by two different approaches:⁸ (i) by redistributing means of production, and (ii) by redistributing incomes without redistributing means of production. The first approach is not feasible in our country which is undergoing a process of socialist transition in a free society. Moreover, our objective will not be satisfied simply by changing the ownership (nationalization) of industrial capital. Hence we are left with only the second alternative, to provide new sources of income, new environment and mass-participation. Now, how can we achieve our objective? The answer is, we can achieve our objective by using location as a policy instrument in planning exercises, because by locating industrial units in the industrially poor regions we can distribute fruits of industrialization. Since our objective is redistribution, we have to review the policies based on existing location theories to assess whether or not they are consistent with our objective.

factor endowment

The existing theories of locations rest on the idea as to why as a result of uneven distribution of different resources, some goods can be produced more cheaply in one region than another. One region may have plenty of iron and coal but have little land for wheat growing, while another has plenty of wheat land but scanty supply of mineral resources; clearly the former is adapted better to iron ore production and less to wheat growing than the latter. It is the factor endowment of the region which determines its fitness for specific industry. Variations in equipment of industrial activity, according to Ohlin,⁹ are the fundamental reason of inter-regional division of labour and trade just as varying individual abilities are the reason of individual exchange. On the basis of this factor endowments he propounded the hypothesis of comparative advantage.

Ohlin states at one place "industrial activity must be adapted to the varying supply of such factors in different places because only to a limited extent can the supply itself be adapted to the demand of various industries". This statement is no more valid these days because in the dynamic world today we find emergence of synthetic goods or substitutes of various natural resources. Emergence of these new substitutes enables the supply to reach near the source of demand. Moreover, different industries depends upon localized

raw materials with varying degrees. Hence movement of industries towards sources of demand is a function of the type of goods and the economic growth accompanied with scientific and technological advancement, which sets free industries from the problems about sources of raw materials. This argument carries historical validity that improvement in the means of transportation and communication and methods of production weakens the forces which work in locating units close to the sources of raw materials. For example industrial revolution in the western countries began where there was water power and after the invention of steam power where there were coal and iron. But as its scope extended industry tended to move close to market. These days industrially advance countries of Europe and Japan draw their material resources from the whole world.

simplifying assumptions

Weber¹⁰ starts with certain simplifying assumptions and on the basis of these simplifying assumptions, he establishes his hypothesis. Three simplifying assumptions on which Weber has developed his analysis are (i) absolutely even plain and equal transportation rates throughout, (ii) many consuming centres, scattered over the plain, finally (iii) equal cost of fuel and raw materials at all deposits assuming uneven distribution of such deposits. After classifying raw materials according to their geographical availability (localised and unquitors) and according to their nature (pure and weight loosing) he creates distinction between primary and secondary regional factors of cost; transportation costs and labour costs, ignoring that there exists multi-collinearity between these cost variables if we state that the locational changes are the function of these two variables because transportation cost is itself a function of labour cost. After analysing the pull of various factors which affect locational changes, he establishes his first hypothesis "the location of manufacturing industries is determined by ratio between the localised raw materials and the weight of product". This ratio according to the terminology of Weber is known as "material index".

The above hypothesis is based on the assumption of constant labour costs. After this assumption he provides another hypothesis: "when labour costs are varied an industry deviates from its transport location in proportion to the size of its labour coefficient". He has also provided the analysis of secondary factors (agglomerating and deglomerating forces) in his

study. Weber has ignored the interdependency between the location of different industries. This ignorance has resulted in partial equilibrium analysis of the forces which causes locational changes. Losch later on achieved in providing general equilibrium approach considering the interdependency of various locations.

A close look on the above analysis reveals that the locational theories from Weber to Losch were simply trying to analyse the various attributes which make a particular region suitable for particular industry. In this way these theories were exploring a least cost region for different industries. This can be termed as comparative advantage. The concept of comparative advantage is now believed to be a static concept. Moreover comparative advantage is itself the function of economic growth. These weaknesses of comparative advantage theories have compelled the under-developed countries to deviate from this principle. A thing which is not valid for international analysis cannot help in inter-regional analysis. These location theories explain the forces underlying the locational changes working via market mechanism. In under-developed countries where we observe market imperfections and have planning to supplement the role of market forces, these theories have little to explain.

different growth pattern

Finally, these theories emerged during take-off of western countries. Their growth pattern was different because they followed a different economic system. This difference suggests two things: (i) the role of state has been ignored in these theories. In a planned economy state is not only employer of BSF but an active instrument affecting all economic calculations (ii) these theories explain the suitability of a particular location in terms of private cost-benefit analysis. Our economy is in a phase of dynamic planned development. We should be careful in our application of essentially static theories which are not consistent with our objectives and economic system.

The location theories are based on three basic assumptions: (i) mobility of capital,

(ii) mobility of labour and finally, (iii) immobility of land. Capital is mobile which can be interpreted in the words of (Bagehot) that capital "runs everywhere it is wanted and as rate of interest tempts it"; but in planned economies not because of its sensitivity to the rate of interest but because in such economies state plays the leading role as entrepreneur.

nature of labour

The assumption of mobility of labour ignores the distinction between the nature of skilled and unskilled labour. In this way these location theories ignore what Adam Smith said, that "of all baggages man is most difficult to be transported". If we define land, not only as the "original and indestructible powers of soil" but inclusive of nature's, raw materials and forces of all kind including fuel and power then the assumption of immobility is no more valid. Power can be transported with the help of transmission lines. Fuel necessary for generating power can be transported, mineral certainly can. Even original and indestructible qualities of soil can be transported as chemical elements in the form of fertilizers. This suggests that the relative immobility of labour is an important force. Since, "most of the backward regions suffer from under-employment and unemployment. To ameliorate this, the planner must attract industries that requires labour inputs. A measure of labour intensity is essential".¹²

The above analysis reveals that capital entrepreneurship, fuels, raw material and even power are mobile but that it is only labour which is immobile. Hence, we have to take industries near to the labour and "backward masses" which live in the backward region, because with the help of this we can achieve the objective of simultaneous process of reducing "backwardness of masses" and development of material resources; side by side we will be able to distribute the fruits of industrialization to the backward masses of backward regions.

Some primary industries are bound to localise where basic materials and power costs are decisive. But our

POINTS OF VIEW

nation is planning to develop manufacturing and processing industries using the products produced by the primary industries. It is in the case of such industries where we have to abandon the narrow private cost benefit analysis and to consider social costs and benefits in regard to disposal, regional equality and the distribution of gains of industrialization that the case considering human as distinct from the material aspect of location policy is immensurably strengthened.

In the countries of Europe it was possible to choose between economic growth and distribution of its fruits and to arrange them in that sequence. But in our country if economic growth is pursued simply for its own sake, it will never obtain momentum. For the short run while enclaves of development and prosperity may emerge they will remain insecure. The developed region will soon reach the limits of expansion, if the backward region are set aside. Hence we have to mobilise industries in the backward regions, because there is no other way through which they can rise from the depths of backwardness and poverty in which they sink deeper and deeper year after year. To achieve this, society has to make a trade off between social cost and social justice.

PRAGA

When precision is essential call on Praga for Machine Tool Accessories

Praga has a wide range of machine vices designed for precision tool-room work and to meet the strenuous requirements of production work. The moving parts are precision-machined from special steel and the jaws are accurately finished to ensure perfect alignment. Praga is in collaboration with Pratt—the largest manufacturers in the world of all types of lathe chucks—to make lathe chucks and work-

holding devices. Praga were also the first to manufacture chucks in technical collaboration with Kearney & Trecker C.V.A. The vices are all manufactured according to Jones & Shipman designs. Praga also manufacture and distribute cast iron surface plates, Sine Bars and all types of precision tools. Their experience in the field goes back 28 years.

For Precision Machine Tools the name is **Praga**

NOT UNEXPECTEDLY, the steep rise in prices during the past three months and the Simla parleys between President Z. A. Bhutto of Pakistan and Prime Minister Indira Gandhi dominated the proceedings in the two Houses of Parliament which reassembled on Monday for the "monsoon" session. With rains having given a slip this year over wide tracts of the country, resulting in severe drought conditions, to style the current session after the monsoons appears to be ironical. Perhaps the rain god will smile soon to justify this nomenclature.

The government, undoubtedly, faced a hostile opposition on the prices issue when it came up in the two Houses through calling attention notices. The efforts of the Finance Minister, Mr Y. B. Chavan, to play down the uptrend in prices in general, by stressing that the rise had been primarily in the prices of foodgrains, edible oils, sugar and allied products, apparently failed to satisfy the agitated members.

seasonal pressures ?

Mr Chavan attributed the spurt in the prices of these commodities between May 6 and July 15, 1972—by 8.9, 11.3 and 10 per cent, respectively—to seasonal pressures which, he added, had been accentuated because of the delay in the onset of monsoons and the current dry spell. Contrary to earlier expectations, the output of foodgrains in 1971-72, he further stated, had failed to rise; in particular, the production of coarse grains last year appeared to have declined significantly as a result of the damage caused by floods and drought. The result had been that over the year, the prices of jowar had gone up by 15.8 per cent, those of bajra by 39.4 per cent, of pulses by 25.3 per cent and of sugar and allied products by 28.3 per cent. In an effort to prove that other farm products had not been affected by the price rise, the Finance Minister pointed out that cotton prices had declined by 2.5 per cent, leading to a downtrend in the prices of cotton textiles. But he seemed to forget that cotton prices had scaled unprecedented heights last year and the slight fall in them this year still left them appreciably higher

than what they were in 1969-70, the previous year of normal cotton supply.

Mr Chavan did refer to the substantial increase in money supply last year as a contributory factor to the rise in prices, but he attributed this primarily to the expenditure incurred on refugees from Bangladesh and the confrontation with Pakistan. He only obliquely admitted that the mounting non-Plan expenditure, both at the centre and in the states, was also an important factor in the expansion of money supply. The impact of monetary expansion, he pointed out, had to be felt sooner or later.

monetary policy

Talking about the measures which were being taken by the government to arrest the uptrend in prices, the Finance Minister referred to the fairly restrictive monetary policy being followed by the government, the efforts at curtailing non-Plan expenditure, the open market operations which the Food Corporation of India had been directed to undertake, and the extension of the public distribution system (opening of fair price shops). With over nine million tonnes of foodgrains in stock, the present crisis, he thought, would be overcome. He, however, stressed the need for raising production, both in the agricultural and industrial sectors.

Although Mr Chavan expressed government's concern over the recent spurt in prices, many opposition members doubted that the government would be successful in arresting the uptrend. Their main argument was that the policies of the government were not attuned to this task. The Jana Sangh spokesman, Mr A. B. Vajpayee, in fact, thought that the government had completely failed in containing the prices spiral.

Ideological considerations continuing to dominate government thinking—a clear indication of this was available in the discussion on the prices issue in the Lok Sabha—it is doubtful that mere expansion of the public distribution system will be able to check inflationary tendencies. This system can cope with only a few commodities. But since the prices of

industrial raw materials too have started moving up, an upswing in the prices of many an industrial commodity in the near future cannot be ruled out. The rise in the cost of living index, resulting from the recent sharp rise in the prices of foodgrains, edible oils, sugar, etc., is also bound to be reflected in demands for higher wages, leading to a general increase in the cost of production in the industrial sector. It is further a moot point whether the government, despite its best efforts, will be able to contain its non-Plan expenditure and resist an upward revision in the dearness allowance of its employees. The measures being taken to step up production appear to be only half-hearted. Pious intentions cannot produce goods. What is needed is concerted action suitable to the circumstances prevalent today.

In the Lok Sabha, the discussion on the prices issue was prefaced by a walk-out by the entire opposition, except the CPI and a few independent members. The opposition took exception to the admission by the Speaker of the calling attention notice in preference to a move to censure the government for its inept handling of the situation.

drought situation

The drought in various parts of the country came up for a separate discussion also in the Lok Sabha. The major points made during this debate were: (i) the government is acting in a complacent manner in dealing with the situation which ought to be tackled on a war footing; (ii) measures should be undertaken immediately for digging wells and starting minor irrigation projects in the drought-affected areas; (iii) cattle and crop insurance should be introduced in the country; (iv) a high-powered committee ought to be set up to go into the failure of various developmental projects; and (v) the unsocial elements, who are taking undue advantage of the present situation, should be severely punished.

In his reply to this debate, the Minister for Food and Agriculture, Mr Fakhruddin Ali Ahmed, admitted that a very severe drought was stalking the country.

Inflation in three countries

But he assured the House that the government had sufficient food stocks with which it would be able to overcome all the difficulties on the food front. Arrangements for moving foodgrains to all the drought-affected areas were being made. The government was also looking into the question of inter-state movement of foodgrains. Mr Ahmed refuted the allegation of a CPM member, Mr Jyotirmoy Bosu, that a large number of starvation deaths had occurred in West Bengal and Tripura. He, however, agreed that the drought problem had to be met on war basis.

With a view to combating the drought, Mr Ahmed revealed that the government had drawn up a massive programme which included supply of pumpsets, bunding of streams, crash schemes for rural employment, diversion of power for agricultural purposes, etc. A committee was proposed to be set up to supervise the implementation of this programme. Mr Ahmed further stated that the government was also thinking of taking some austerity measures.

Simla pact

The endorsement by Parliament of the Simla pact between President Bhutto and Prime Minister Indira Gandhi was never in doubt as most of the opposition groups had already declared their approval of it. The only dissenting voice was that of the Jana Sangh. The ratification of the pact by President Giri just on the eve of the current session of Parliament, however, provided a handle to some opposition groups, besides the Jana Sangh, to assail the government. They alleged that nothing would have been lost if the ratification had followed the discussion in Parliament in consonance with democratic practices.

In his statement on the pact, the Minister for External Affairs, Mr Swaran Singh, stressed that it marked the first step towards the establishment of durable peace on the sub-continent. He underscored the provision in the agreement that India and Pakistan would now settle all their disputes without third party intervention. Another important feature of the pact, he pointed out, was that both sides had agreed that the basic issues and causes of the conflict which had bedevilled relations between the two countries during the last 25 years should be resolved by peaceful means and not through use of force.

The Jana Sangh spokesmen in the two Houses scathingly criticised the agreement by styling it as "betrayal of the nation by the government". They alleged that Mrs Gandhi had not stuck to her promise of having a package deal with

Pakistan. Instead, she had yielded to foreign pressures for piecemeal settlements of the disputes with Pakistan. The Simla pact, they further felt, had once again opened the Kashmir issue, although the government had all along been maintaining that Kashmir was not negotiable.

Intervening in this discussion in the Lok Sabha, the Prime Minister stoutly defended the Simla agreement and castigated the Jana Sangh for the allegation it had made that the understanding at the Simla summit had been reached at the instance of the Soviet Union.

The Lok Sabha has set its seal of approval on the bill seeking to nationalise the coking coal mines in the country, the management of which was taken over by the government last year. The quantum of compensation proposed to be paid to the original owners of the nationalised mines was a point of sharp controversy during the debate on this bill. While a majority of the participants in this discussion felt that the proposed compensation was too generous, the Swatantra group expressed the view that it was too small. The need for judicious utilisation of our limited coking coal resources was generally stressed both by the opposition and the treasury benches. The bill will now go to the Upper House for approval.

important bill

Another important bill that has been adopted by the Lower House relates to the payment of gratuity to employees of factories, mines, oilfields, plantations, ports, railway companies, shops and other establishments. Although initially the Minister for Labour, Mr R. K. Khadiolkar, had expressed himself against the inclusion of the period of "illegal strikes" in computing "continuous service", he later on resiled from this position and agreed to include this period in computing continuous service. The wage limit for the beneficiaries under this bill has been fixed at Rs 1,000 per month.

Three bills have been adopted by the Rajya Sabha. These are: (i) the Dentists (Amendment) Bill, which seeks to extend the parent act to the state of Jammu and Kashmir, besides vesting in the central government powers to fix qualifications for dentists and for making uniform rules of professional ethics in this line of activity; (ii) the Indian Telegraphs (Amendment) Bill, which provides for the interception of telegraphic messages on the occurrence of a public emergency or in the interest of public safety, the security of the state, friendly relations with foreign states, public order etc.; and (iii) the Rice Milling Industry (Regulation)

Amendment Bill, which aims at extending the Rice Milling Industry (Regulation) Act, 1958, to Jammu and Kashmir. The Adoption of Children Bill, which seeks to provide for a uniform law of adoption applicable to all communities, was referred by the Rajya Sabha to a joint select committee for detailed consideration.

The following information was provided by various ministers in the two houses during the question hour.

(1) The purchasing power of the rupee this year is just 42.4 per cent of what was in 1949.

(2) It will not be possible to bring the Newspapers (Diffusion of Ownership) Bill before Parliament during the current session. Attempts would be made to introduce this bill in the next session.

(3) There is no proposal under consideration of the government at present to impose a ceiling on urban and rural incomes through legislation.

(4) An ordnance factory is proposed to be set up in Madhya Pradesh at a cost of about Rs 67 crores. It will produce propellants for the armed forces.

(5) The government is not yet considering take-over of TISCO or TELCO.

(6) The first 235 MW unit of the fourth atomic power station at Narora, in Uttar Pradesh, will be completed in January 1980. The fifth and the sixth atomic power stations are proposed to be set up by 1982 and 1984. Sites for these two projects are yet to be selected. The setting up of an atomic power station in the eastern electricity region has been ruled out for the present because of the easy availability of coal and hydro-electric sources of power in this region.

UCO Bank Building, P. Box 34,
Parliament Street, New Delhi-1.

The United Kingdom

FOLLOWING THE introduction of reflationary measures, gross domestic product grew in the second half of 1971 at an annual rate of more than 4½ per cent. In January of this year, however, the miners' strike and consequent disruption to power supplies intervened, not only causing growth to be temporarily halted but also effectively concealing underlying economic trends (and the dockers' strike and flurry of unofficial strikes must further muddy the crystal).

Thus in the first three months of 1972 consumers' expenditure, which accounts

aim of which was to increase the growth GDP between the second half of 1971 and the first half of 1973 to an annual rate of about 5 per cent. (It seems unlikely, however, that government targets will be fully met without further stimulus).

To this end the Chancellor, primarily through increased personal allowances against income tax, reduced the government's tax revenue in the current financial year by some £1,200 million which, together with other measures, will cause an estimated public sector borrowing requirement of £3,360 million, nearly thrice the actual amount required in 1971-72. The direct tax concessions only became effective in May and thus the main stimulus to consumer spending has yet to

of the industry, particularly in sectors supplying consumer goods manufacturers and service industries. It is not expected, however, that heavy engineering will benefit markedly until next year.

In a bid to promote industrial expansion, measures were introduced in the budget which make initial depreciation allowances of 100 per cent for investment in plant and machinery and 40 per cent for new industrial buildings applicable throughout the country instead of in Development Areas alone. In addition, a new and more generous system of regional development grants has been proposed. Despite improved company liquidity and profitability, however, these measures are likely to be of limited significance until order books expand sufficiently to reduce existing spare capacity.

labour situation

The previous rise in unemployment eased in the opening months of 1972, while at the same time the number of adult vacancies began to rise. Further evidence of a change of trend was provided by figures for the two months to mid-June, the number of wholly unemployed (excluding school-leavers) in Britain then fell by 92,000 to 799,000 (seasonally adjusted) i.e. to 3.5 per cent of the working population. The comparable figure in June, 1971, was 722,000.

The reduction of unemployment is a top priority and lies behind the introduction of the Industry Bill, the most radical measure of which is the proposal to set up an Industrial Development Executive with powers to help companies and industries needing increased capital but unable to obtain adequate financial support from normal commercial sources. While the legislation will apply to the country as a whole, the major effort will be directed towards assisted areas with obsolescent industrial structures.

Increasing activity in manufacturing industry has not as yet been translated into significantly higher borrowing. Bank lending, however, continues to grow rapidly; total advances to UK residents in May were some 29 per cent higher than before credit restrictions were relaxed in

WINDOW ON THE WORLD

for more than two-thirds of national product, showed a fall of about half a per cent from the preceding quarter. Other major components of aggregate demand, with the exception of public sector expenditure (naturally!) on goods and services, also failed to grow; in particular, capital spending by manufacturers is estimated to have remained at the low level of the last quarter of 1971 with stocks being further run down, while the value of exports despite higher prices, declined by over 2 per cent.

Such figures do, however, overstate the underlying sluggishness of the economy, but nevertheless the desire to re-establish expansion, even at the risk of causing sectoral overheating and danger to the balance of payments, was predominant in the budget introduced in March, the

come, but retail sales already appear to be benefiting.

In terms of output growth, recovery has been slow; the index of industrial production stood at 124.3 in the last quarter of 1971, the same as at the beginning of the year. With firms making up for output lost at the time of the power shortages, the index in April reached 127.7 which supports the view that the long-awaited industrial expansion may be beginning. As in past months it is industries closest to the consumer, and especially the motor car industry, which are experiencing the most buoyant demand, but (prior to the July dock and other strikes) there were signs that brisker demand was working its way through to the depressed engineering trades. An improvement in enquiries and orders is reported at the lighter end

August last; over the period lending to personal customers increased by 66 per cent and to the financial sector by 82 per cent, while lending to manufacturing industry rose by under 2 per cent. As a result bank reserve asset ratios have fallen towards the 12½ per cent minimum; that of the London clearers stood in May at 13.8 per cent, compared with 17.5 per cent in January. Since other interest rates have already risen, several banks raised their base rates early in June; those of the "big four" now stand at 5 per cent, and further rises must be expected as the demand for credit grows.

Now that overseas capital inflows are no longer significant, the strong expansion of domestic credit was the major factor in the growth of the money stock in the first quarter; after seasonal adjustment the money stock increased at an annual rate of nearly 20 per cent.

The impact of excessive monetary expansion, on the one hand, and the inflationary pay awards on the other, have not yet been reflected in retail prices. Indeed, in May last the retail price index was only 6.1 per cent higher than twelve months earlier, whereas in the year ended August, 1971 it rose by 10.3 per cent. Against the background of a more modest improvement in the rate of wage inflation (wage rates were 12 per cent higher in the first quarter of 1972 than a year earlier) much of the credit for the deceleration in retail prices must go to the Confederation of British Industries' initiative to limit price increases of its members to 5 per cent, and also to the lowering of purchase tax.

It is apparent, however, that inflationary pressure is strengthening again; the government is opposed at present to direct intervention. The CBI has happily decide to continue voluntary price restraint.

balance of payments

In the past few months Britain's trading performance has deteriorated. Reflecting declining price competitiveness and the effects of both reflation and the miners' strike, visible trade was in deficit by an average £42 million a month between January and May, compared with an average surplus of £40 million in the preceding five months. Invisible earnings in the first quarter were lower as a result of falling tanker charter rates and increased aid disbursements but remained sufficient to keep the current account, after seasonal adjustment, in surplus. The net capital inflow, influenced by the trade deficit and the relative calm in international monetary relations, amounted to £54 million in the first quarter, well below the average quarterly inflow

of £465 million recorded in 1971. This flow and a £124 million allocation of SDRs have for the most part been added to the reserves, which at the end of May, 1972, stood at £2,744 million, compared with £1,468 million a year earlier. In addition, in April the remainder of the United Kingdom's outstanding debt to the IMF was repaid, thereby reconstructing the UK reserve position of £292 million in the IMF (the gold tranche) and freeing the nation of all official short and medium-term debt for the first time since May, 1964.

Poor trade returns and uncertainty over inflation caused a setback to sterling in mid-June. Heavy support was given by EEC central banks, the UK Bank Rate raised from 5 to 6 per cent, and on June 23 the foreign exchanges were closed for two working days and the pound allowed to float temporarily.

effect of the strikes

At the time of writing, the UK is plagued by a dock strike which has closed virtually all ports and by unofficial sympathetic strikes in a scattering of other industries. The cause of the dock strike is that transport by containers, which are filled inland all over the country, have reduced, and continue to reduce, employment in the docks. The dockers are understandably anxious but it is often forgotten that the latest recommendations for redundancy arrangements suggest for dockers lump sums from £4,000 upwards (depending on their length of service) and that since the total amount of work at present available is not enough to keep all of them employed, those not called (in rotation) to work receive wages simply for being on the register.

The dockers demand to be employed inland to fill containers and have been picketing transport companies to prevent lorries being loaded. This brought them into conflict with other fellow members of the Transport and General Workers Union who began picketing the docks. The law of the land does not allow picketing of companies (such as the inland transporters) not directly engaged in a dispute and five dockers were (on the complaint of a small company reduced to the verge of bankruptcy by the stoppage of its business) summoned to appear before the High Court. They refused and were arrested for contempt of court. There is a widespread belief among workers that the new Industrial Relations Act is responsible for their arrest. This is not so. The arrested men were defying the law as it stood before the new Act was introduced. How it will end is anyone's guess, but it should not be forgotten that, deplorable and wasteful though strikes are

their ultimate effect on production is usually less than the drama which envelops them suggests. Workers who have lost pay through strikes usually put their shoulders to the wheel on return to work and boost production through overtime. I am not suggesting that a nation which is not utilising its full capacity should encourage strikes in order to boost production, but simply that strike losses are rarely as bad as predicted.

II

Sweden

The economy experienced a period of stagnation, coupled with rising prices during 1971 when the Gross National Product expanded by only 0.3 per cent compared to an official forecast of 4 per cent. Recent indicators suggest that the downturn has ended but a general upswing is not yet apparent and a forecast annual growth rate of 3.5 per cent seems optimistic. Improved consumption is not inducing any significant expansion in production, and investment remains sluggish. Unemployment is relatively high and the rate of inflation continues to cause concern. Imports are recovering from last year's depressed level and this could detrimentally affect the trade account and the balance of payments, both of which moved from deficit into surplus in 1971.

Despite recent increases in retail sales and motor car purchases, a high level of stocks accumulated by manufacturers in 1971 has precluded any substantial upturn in industrial production which registered no increase last year. In contrast to signs of a recovery in demand for paper and pulp products, output of engineering goods, chemicals, textiles and clothing was stagnant in the first quarter of this year. Output of steel declined by some 4 per cent in 1971, reflecting a world recession in demand and the increasing penetration of European markets by low cost Japanese producers. However, greater co-operation between producers is contributing to more efficient production, particularly of specialised steels which account for just under 30 per cent of total output.

Construction is benefiting from a special injection of official funds into building projects at the end of 1971 as an attempt to alleviate unemployment. At the same time, tax concessions were granted for investment in machinery but capital expenditure declined by some 2.4 per cent for the year as a whole and there is still no sign of any significant revival in investment. In consequence, unemployment reached a postwar record of some 3.5 per cent in February last and, al-

though there are signs of a slight improvement, the level remains high.

Despite the low level of activity and the maintenance of a price freeze during 1971, the index of consumer prices rose by nearly 7.5 per cent for the year as a whole. To a large extent this reflected a liberal interpretation by the authorities of the price regulations. In most cases, manufacturers were allowed to increase their prices to compensate for higher costs of imported materials. In addition, if the Central Pay Settlement, which was concluded in June, 1971, and will grant wage increases of some 28 per cent between 1971 and 1973, eroded normal profit margins, the additional cost could be passed on in higher prices, which, of course was no fun and games for the workers in their capacity as consumers! An agreement on farm prices in 1971 further intensified the rate of inflation and food prices alone probably increased by about 12 per cent for the year as a whole. This resulted in outbreaks of public protest and the removal of the price freeze at the beginning of January is unlikely to bring joy to anyone.

needs of private sector

The government's realisation of the pressing need to switch resources into the private sector, specifically towards investment, coupled with a fear of overstimulating the economy, was reflected in the budget proposals for 1972-73. Expenditure is estimated to increase by some 4.5 per cent to Kronor 59,110 million compared to an expected rate of growth during the past fiscal year of 17 per cent. The deficit for 1972-73 is to be cut by Kronor 1,000 million, the target being Kronor 3,300 million.

Official fear of accentuating the rate of price increases was also reflected in recent attempts to shift emphasis from direct to indirect taxation. Initially the authorities intended to finance a reduction in income tax by raising value added tax and duty on spirits, tobacco and oil, but this evoked intense opposition within parliament. The suggested increases were applied only to wines, spirits and tobacco, and payroll tax was raised from 2 to 4 per cent. The additional revenue is estimated at Kronor 1,900 million per annum. In contrast, the reduction in the yield from income tax, which will become effective in January, 1973, should amount to Kronor 2,400 million and the resultant shortfall will add to the government's borrowing requirements — i.e. more inflation.

Credit has become progressively easier over the past twelve months and Bank Rate, currently standing at 5 per cent, was reduced on four occasions in 1971. However, the extensive financial needs of the

public sector (naturally!) have restricted the supply of credit and capital to private enterprise at a time when the self-financing ability of business is (equally naturally!) declining. In addition, savings banks and credit associations are increasing their participation in traditional banking activities and this is partly reflected in amalgamations between the leading commercial banks.

trade and payments

The depressed level of domestic demand favourably affected the external sector in 1971. Although exports expanded at a slower rate, stagnant imports reversed a traditional trade deficit and contributed to a surplus of some £63 million in the current account of the balance of payments compared to a deficit of £126 million in 1970. This favourable movement was achieved despite substantial increases in foreign aid and tourist expenditure abroad. The reserves benefited and amounted to \$1,355 million at the end of May last, a rise of \$423 million compared to a year earlier.

Despite continued low activity, imports expanded by some 4 per cent in the first four months of 1972 compared to the same in 1971 and this rate of growth is likely to accelerate once an upswing is sustained. In contrast, exports are rising at a slower rate than in 1971 and this, coupled with under-capitalisation in industry and continued increases in costs, could result in progressive deterioration in the balance of payments particularly in view of a continuing weakening in the invisible account.

In the long term, a significant redistribution of resources towards export and import-competing industries will be required but, in the short term, the negotiation of liberal trade arrangements with the EEC is vital, because the enlarged Community will account for some 70 per cent of Sweden's exports. The non-applicant EFTA countries, including Sweden, have been offered industrial free trade with the enlarged EEC through the progressive dismantling of tariffs and trade barriers over a five-year period beginning January, 1973. However, free trade in "sensitive" products such as paper and pulp would be achieved over a 12-year period, the *status quo* being retained in the first three years. Sweden is anxious to secure better terms, since paper and pulp products account for 15 per cent of foreign sales, and exports to Britain, Norway and Denmark, currently duty free under EFTA, would be subject initially to a tariff after enlargement of the Community in 1973.

An upturn in activity is possible in the latter part of 1972 once accumulated

stocks have been run down. Measures to stimulate investment particularly in export industries, may be introduced in a bid to improve industry's competitiveness within the proposed EFTA-EEC free trade area. However, policy will continue to reflect the need to restrain inflation and to prevent deterioration in the balance of payments on the resumption of expansion.

III

Turkey

The economy has recovered sharply from the 1970 slowdown and Gross National Product is estimated to have grown by over 9 per cent in volume during 1971 compared with 5.5 per cent during 1970. Much of the growth came from rebuilding of stocks, which rose by nearly a third after two years of decline, and from consumers' expenditure. Private investment grew by around 8 per cent in volume, the same rate as in 1970. In addition, there was a particularly good harvest, with a record wheat crop; as a result it may be possible to export more wheat for the first time for some years and this will help the trade balance. Moreover, because about 70 per cent of the population is in agriculture, the bumper harvests will have chain effects throughout the economy in the form of increased purchasing power.

The Turkish lira was devalued by 66 per cent in the summer of 1970. This drove the cost of imports up sharply, and prices have risen rapidly: the cost of living in Istanbul is estimated to have increased by 23 per cent between December, 1970, and December, 1971. In line with this, most wage settlements during 1971 produced increases averaging about 30 per cent.

In 1971 the government budget, like other sectors of the economy, was affected by the rise in costs; a personnel reform and salary increase in 1970 began to have a financial impact during the year, and pay increases deferred from 1970 were also due. As a result current expenditures voted in 1971 showed a rise of TL 5,800 million, whereas investment expenditures went up only nominally (implying a fall in real terms given the high rate of inflation). The total expenditure voted was thus TL 38,500 million, compared with 1970's out-turn of TL 32,200 million. However, expenditures rose much more rapidly than planned, and by the end of 1971 total outlays of TL 46,000 million were foreseen. With revenue inflows on target, this implied a sharp rise in the deficit: in the first eleven months of 1971 revenue collections fell short of expenditure by about TL 4,800 million, while in the corresponding period of 1970, the shortfall had been only TL 7 million.

pick of the year

NP3/GR-338

Despite the increased deficit, however, the 1972 budget proposed expenditure of TL 51,900 million, plus a further TL 4,000 million to be spent by the state sector. Consequently the total expenditure proposal was around TL 55,900 million, an unprecedented figure amounting to about 30 per cent of GNP. Until the machinery for revenue collection is able to cope with the demands placed on it, it will be difficult to increase revenue inflows: it follows that a continuing expansion of the budget deficit appears likely, which will place a considerable strain on the central bank as a source to the government, i.e. the end of inflation is not in sight.

the problem

The growth of private consumption and government expenditure is a problem, because, if devaluation is to work, resources must be switched out of consumption into exports, and the impact of the parity change on Turkey's trade has so far been disappointing.

Trade deficit has actually widened substantially to \$387 million. This probably reflects a certain built-in slowness of response. At present the trade balance is financed almost entirely by workers' remittances from abroad, which were unexpectedly high last year (a record \$490 million). Reserves in April totalled \$897 million, more than double a year ago.

At the Washington agreement of parities in December last the lira was revalued slightly against the dollar, by 6.7 per cent. This may be marginal hindrance to exporters to the country, but benefit should be obtained from new import regulations issued at the beginning of 1972. Currency allocations for permitted imports, especially industrial raw materials, were increased; the allocation for private sector capital goods imports was raised from \$60 million to \$100 million, and has now been further expanded to \$260 million; in addition documentary formalities were reduced.

Agriculture is Turkey's principal source of export earnings, providing 90 per cent of the total; cotton accounts for nearly 30 per cent. In 1971 a particularly marked improvement in cotton production was achieved in the south and the tobacco harvest also improved by 14.3 per cent.

Agricultural production in total improved by 9.5 per cent in 1971 (compared with a 1.4 per cent increase during 1970). The record wheat output derived partly from good weather but probably also from the introduction of new hybrids. By 1975, almost the entire coastal region will be planted with Mexican wheat, and annual output from this is expected to run at over four million tonnes. As a result a substantial increase is expected on the present total harvest of 10-12 million metric tons. In addition, farmers gained from the devaluation of 1970 when floor prices for most products were raised by about 30 per cent, and from an increase in government support prices of around 15-20 per cent in 1971.

Despite this, however, incomes in agriculture are much lower than those in other sectors. This has led to migration into urban areas. A related feature has been a growth in unemployment, which, estimated at 1.83 million in 1971, reached the two million mark early in 1972. This is no less than 14 per cent of the labour force and, together with the rural underemployment which probably exists, is a very serious long-term problem.

political situation

Economic progress has been achieved despite policies. The military-backed government formed by Dr Erim after army intervention in March, 1971, broke up in December when thirteen cabinet ministers resigned over the slow pace of reforms. These included land reform (the issue which hastened the collapse of Dr Erim's first ministry) and the nationalisation of various resources. Dr Erim then formed a new administration with a broader political base, still committed to nationalising the borax and lignite mines and to placing petroleum under state control, but with its land reform bill weakened (large holdings would nevertheless have been confiscated and redistributed). After an unsuccessful attempt to govern by decree, Dr Erim resigned. The acting Minister, Mr Ferit Melen, was eventually asked to form a government.

Mr Melen faces both left-wing violence and party dissension. The recent split in the Republic People's Party has strengthened its left wing and this could aggravate the situation, because, on the

one hand, the army insists that land and other social and economic reforms go through and, on the other, the majority Justice Party has been blocking their passage through Parliament. Collapse of the coalition would force a choice between the two parties.

Licences are required for all imports, which are divided into two lists subject to periodic revision; goods not included on either list are prohibited. The first list, divided into two parts, includes liberalised goods; licences for goods on the second list are allocated by global quotas. Imports can be made only to persons holding an Importers Certificate issued by the Ministry of Foreign Economic Relations.

FABRIC

THE EAST MOORS Steel Works in Wales is an old sprawling structure built in 1936, when economy in land use was not a great virtue and labour was not all that dear. Going round the 'iron' section of the works, made up of the coke oven batteries, huge gas containers and four tall blast furnaces, I was told that the unit has gradually been renovated, keeping the basic structure intact. My guide admitted, however, that in this section the scope for modernisation was not as much as it was in the 'steel' making section.

In the second section, the molten iron from the blast furnaces travels nearly 200 yards to be converted into steel and gets cast into ingots. These slide while red hot through the half-mile long rolling mill to be given the specific saleable forms of billets, blooms etc.

One secret for the survival of this plant which was conceived on the processes and techniques of 1936 lies in some specific advantages. In the first place it uses coal from the mines which are less than ten miles away. Even iron ore reaches the works almost straight from the ship as the plant is situated adjacent to the port of Cardiff.

important factor

Another important factor which seems to have helped is the comparative high cost of new plants. In other words, even if the open hearth process is outdated, the replacement of this unit by a modern one is nearly prohibitive. The book value of the capital investment of the plant being low, it is able to yield profits, although according to an engineer on the plant, the labour cost per unit of steel at this plant is roughly twice that of the plant at Port Talbot nearby, which itself was set up over a decade ago.

The British Steel Corporation is therefore running the plant to make 900,000 tons of steel for the country and to provide jobs for nearly 5,000 workers. In the context of rising unemployment in the region, this does not seem to be a minor consideration.

This attitude of the British Steel Corporation was apparent when it expressed differences with the government over the projected capacity for 1980. The government recently published a report which carried the agreed figure of the capacity for 1980 at 28 to 36 million

tons, a wide range which comfortably embraces two opposing points of view. The British Steel Corporation (BSC) seemed to fight for a target of 40 million tons, keeping in view the possibility of an export of 7.5 million tons. The government on the other hand feels that by 1980 British steel will not be competitive enough to export over four million tons.

The report jointly prepared by the government and the representatives of the BSC had not talked about the important issue of redundancies, or for that matter the establishment of new plants. It was revealed, however, that the corporation did have its plans to gradually rationalise the industry.

obsolete capacity

The capacity of the corporation is around 28 million tons and a part of it is virtually obsolete. Lord Malchett, chairman of the corporation, stated therefore that the projected capacity of 28 to 36 million tons will give him the authority to go ahead with a new capacity of 11 or 12 million tons. This might allow the corporation to go ahead with a giant 10 million ton plant in the style of the Japanese steel plants costing around £1,000 million or a big development on an existing unit, but possibly not both. In that case the steel industry will have to choose a plant site to attract the labour force which will be released by the process of rationalisation in some plants. Such a site will also be considered advantageous because trained manpower will be available.

One estimate places the level of redundancy at around eight million tons and a list of steel plants whose future was in doubt was prepared. These include Shotton (1.6 m tons), Corby (1.2 m tons), Consett (1.1m tons), and Ebbw Vale (1.1m tons).

The example of Japan in the context of steel production is often cited in Britain with some kind of envy. Those who support the establishment of large plants with modern techniques argue that by 1975 there will be 12 plants in the world, with a capacity of 10 to 16 million tons each. Out of these seven will be in Japan. This is considered to be the main reason why 'Japanese steel after travelling thousands of miles from the Far East can be offered at prices five per cent cheaper than those of British steel'.

Views on new investments differ wide-

ly in Britain. Some experts are of the opinion that the Japanese have gone ahead of the western steel producers to an extent that the only hope for the latter to catch up is to evolve a new technology. Dr Robert H. Barnes, director of research and development of the BSC explained in this context that his job was to ensure that the BSC will be in a situation, when the time comes, to put in a different kind of technology. At the appropriate time, he stated, the BSC would be able to take the right decisions. It is as much concerned with improving the quality of steel that is being produced, as with research about the scale of operation, which has already become too cumbersome.

A possible glimpse into the future has been provided by Prof A.R.E. Singer, head of the department of metallurgy at the Swansea University in Wales. He observed that the giant modern steelworks are a 'vast anachronism' in the view of a chemical engineer. The present bulk steel works, he said, have three main sections: the blast furnace in which coke and iron ore are heated and coke smelts the ore into iron. Molten metal is carried into huge containers through which oxygen is blown at high pressure to convert iron into steel. Hot steel from the converter is cast into ingots which are then rolled to the required thickness.

bypassing blast furnace

Prof Singer's method aims to convert the ore directly into steel powder, which can be compressed and heated to the required thickness. In other words Prof Singer has attempted to bypass the blast furnace and the converter and to reduce high grade superconcentrated iron ore chemically into steel.

A laboratory plant has been built by him where the steel produced can equal the mechanical, if not the metallurgical properties of the conventional material. Prof Singer has stated that he may have a better solution which is effect will combine the powder-making and rolling into one.

To expand capacity on the basis of 'monster' steel plants or to wait for the new technological breakthrough is not an immediate issue. Even the optimists do not hope to translate the new process to commercial scale in the present decade. Till then, some of the plants like the East Moors Steel Works in Wales, can hope to survive.

Clouds and a silver lining

E. B. Brook

Vienna.

THE EUROPEANS and their parliaments are on their annual holidays with very uneasy minds, keenly conscious that when the sun and sea breezes have done their best for Europe's citizens the latter will return to a mass of most uncomfortable problems. The bogey everywhere is inflation which, quite briefly and brutally expressed, means that your money is worth continuously less and less. The man who, a generation ago had a few hundred pounds or a few thousand francs was better off than his son today with thousands of pounds and many tens of thousands of francs. It is significant that all the small coins—the British farthing, the penny, three penny bit—even now the shilling—and the French sou have, in some cases, long since, disappeared. Only bigger denominations are, in most places, of value in making purchases.

political timidity

The germ on which the disease of inflation feeds is political and big industrial timidity. Neither governments nor big industrial corporations will any longer stand up to stiff demands for wage and salary increases. In the case of governments which, in effect, means the most recently successful political party, the bogey of facing an electorate much of which it has denied the ability to live better is altogether too alarming for the political organisations. For the big industrial corporations it is easier to concede considerable and frequent wage increases and pass the burden on to consumers than it is to risk the loss of a long shut-down loss of production and a profitless period during which rivals from other countries will be making hay at their expense.

The result is that inflationary pressure is not only inevitable but continuous and the man with a fixed income is a disappearing integer because he will soon no longer be able to afford to exist. At present, until governments and big industry in Europe have learned how, and summoned up the courage, to operate their discovery, to control and live with inflation there will continue to be the series of strikes and acute class conflicts of which Britain is at present the worst example in Europe—although it should not be overlooked that very similar circumstances are frequent in Italy and Japan and that France and Germany are by no means without their internal conflicts.

The disease of inflation began, in fact,

to become increasingly difficult to control, not in Britain, but on the continent, particularly France which, for itself and through the Common Market resorted as a measure of industrial peace and content to the device of farm support prices which kept riotous French farmers quieter but made farm produce prices higher everywhere in the west of the continent. These farm support prices have been followed by the Common Market's protectionist trade policies and a mass of minor protective practices which help to keep the public peace and keep political parties relatively popular by sustaining small inefficient enterprises, old fashioned in their methods and financing at the cost of exerting ever upward pressure on prices.

The inflationary fever has become such that it fairly generally recognized that there will have to be an official intervention on prices and incomes, possibly on a continuing basis. But price stability in general will only be achieved in growing economies such as are all those in west Europe if prices in the most efficient industries can not only be contained but brought down. If these categories of prices cannot be brought down there will inevitably be claims for higher wages and higher prices from the less efficient and well-organised areas of the national economies.

instability of currencies

The second nightmare to which the European—and other—holidaymakers will return is the instability of international currencies. The London monetary conference of the Common Market on July 17-18 brought a little calm to crisis-plagued financial centres in Europe but the British industrial disputes since have done a good deal to ruffle that slight calm once again. The most reassuring event in this important sector was the intervention on July 19 by the New York Federal Reserve, with the approval of President Nixon and the US Treasury, to prop up the US dollar in world markets and its assurance to other nations that it would assume a share of the responsibility for maintaining current exchange rates.

This was the first time for eleven months that the US had taken such a step and it appeared to many in Europe as a most welcome end to the "Connally era" of US withdrawal and of adverse relationships with America's major financial and trading partners. One result of US "benign neglect" has been to make the

interim monetary system established at the Washington conference in December increasingly crisis-prone. Another result has been the speculative attack on the pound which forced its downward float as from June 23 and the subsequent attack on the dollar rate which made American intervention essential in American interest as well as other peoples'.

There is no likelihood of a return to the United States again taking up responsibility for supporting the exchange rate of the dollar but the weight of the USA in world trade and monetary transactions is too immense for Europe—that is, west Europe—to carry alone. There is no prospect of a satisfactory, flexible, permanent international monetary system unless there is a joint European-American effort.

prospect of collaboration

Fortunately there is some prospect of this. If only there can be even an assurance that the USA will stand beside Europe in defence of December's Washington new exchange rates speculative raids, such as have heavily damaged the pound, will probably begin to fade out. The form of this assurance now proposed by the US Federal Reserve Board is a return to currency swaps such as prevailed before President Nixon's fateful announcement of August 15 last year.

Even more reassuring than the US Federal Reserve Board's insistence that if more international monetary crises are to be avoided monetary reform negotiations must begin promptly is the statement by the US Treasury Secretary, Mr Shultz, that the UDA and other nations "are now in substantial agreement" over the formation of a new Group—the Group of Twenty instead of the group of Ten—to consider monetary reforms, international trade, investments and other issues. This group—which will give a voice not only to Europe and the USA and Japan, as before, but to others—will begin its work at the time of the International Monetary Fund meeting in Washington in September.

It gives a little hope that, as the Common Market, after ten years of bargaining, has agreed on terms on which it will trade with the remaining members of EFTA, a steadier and more reassured background will develop for the increasingly productive and profitable world commerce which suffers at present from uncertainty as to what really all its efforts are really worth.

At her last press conference

when a local journalist, who is rather fastidious about his socialism, asked the Prime Minister how some of her ministerial colleagues could reconcile their partiality for astrology with their professions of socialism, the Prime Minister reacted in a manner which suggested that she at least was above practising superstition. Can it be that Mrs Gandhi is mistaken in her claim? According to a report in *The Times of India*, she has admitted that she occasionally visits Anand Mai Ma, a saintly personage of Banaras. Mrs Gandhi's explanation is: "My mother was close to her and I have maintained the link". This tempts me to record a conversation I recently had with the socialist knight of the press to whom I had earlier referred. He very seriously told me that, although he himself did not believe in religion or rituals, he had to perform the funeral rites for his father for fear of hurting his mother's feelings. It is only too frequently the case that sentiment is made to serve as an *alibi* for superstition.

Whether Mrs Gandhi professes non-belief or disbelief in religion or God I do not know, but I did hear some time ago that, when she visited Tirupati, her behaviour before the *sanctum sanctorum* left nothing to be desired even from the point of view of the most zealous devotees. This, of course, could have been only a matter of culture or civilized behaviour. But an eye-witness account has it that her bearing and demeanour on that occasion exhibited every sign of her being lost in prayerful contemplation. The god at Tirupati is, of course, a special kind of god. He has, for one thing, vast properties, both immovable and movable and, indeed, some of the latter seem to be so easy to move that even god Venkateswara is not always able to keep track of where they go. The Prime Minister, however, is no worshipper of wealth, even when wealth is divinely owned. It must therefore be presumed that her act of homage at the Tirupati shrine was a deed of religious piety.

Her own father's attitude or attitudes towards religion or even belief in God were always vague. If I am not mistaken, he claimed at one time that he was simply a

pagan; nevertheless his last Will and Testament did give an impression that he had more than a touch of religious mysticism in him. His daughter's religious attitudes, so far as I know, have not been clearly spelt out either by her or on her behalf. Meanwhile there is certainly much gossip in New Delhi or elsewhere that a complex of astrologers, palmists, yogamen and other assorted varieties of soothsayers and fortune-tellers have grown around her establishment. Some time ago, a palmist in Madras claimed in a Tamil weekly that he had been privileged to read Mrs Gandhi's future for her on a number of times. He is on record that, when his daughter was married, Mrs Gandhi, who was then touring in Tamil Nadu, did him the honour of asking him to take the newly wedded couple to the airport in Madras so that she could give them her blessings. There is also a rumour that, somewhere on her august person, the Prime Minister wears an amulet which has been prescribed as a charm to ward off the evil spirits which a person in her position must presumably be on guard against. Normally the personal beliefs or the private activities of any individual, even a politician in the public eye, do not call for comment in the press. There are, however, exceptions to this rule. Our country and its people at large are no doubt a superstitious lot, but nobody has a right to sneer at their superstition unless the one who would turn up his or her nose has managed to keep it clean.

'The Times of India',

again, has another interesting note, this time on Mr Prakash Tandon who has left the chairmanship of the State Trading Corporation of India to become the Custodian of the Punjab National Bank. Mr Tandon, it appears, is 'sore' that the government of India had not acted on his proposal that a vice-chairman might be appointed in the STC so that he could have been groomed to take over as chairman in due course. The fact that the vacancy caused in the STC by Mr Tandon's departure is not being immediately filled up would lend substance to Mr Tandon's criticism. At the same time, I would like to put one or two questions to him. Would Mr Prakash Tandon have agreed to leave the chairmanship of Hindustan Lever and

join the STC as a vice-chairman under the then chairman, Mr B.P. Patel, in order that Mr Tandon might be groomed to take over from Mr Patel in due course? The point I am trying to make is that, if it is the government's policy to try at the chairmanship of the STC as a truly high-level appointment, the procedure which Mr Tandon recommends may not always be workable and in any case it would not have been able to secure the valuable services of Mr Tandon to the STC had it been in force at the relevant time.

More important still, is it not on balance a sound principle that the chairman should generally be selected from outside the organization? It seems to me that in these matters an ounce of new ideas is worth a ton of deputizing and indeed I am sure that Mr Tandon himself will concede that much of the progress of the STC under his stewardship was due not so much to his personal superiority over his predecessors as to the fact that he came with a background that happened to be appropriate to the needs of the STC at the time and with both ability and willingness to apply to his assignment the skills of his previous training. I would certainly allow that there are several other considerations which must also be taken into account before Mr Tandon's proposition is finally pronounced upon, but the case in its favour is certainly not as simple or as conclusive as Mr Tandon would have us believe.

In his statement at the sixteenth annual general meeting of the STC, which is in the nature of a swan-song, Mr Tandon has thrown a hint that the STC sometimes has to do business according to the bidding of the government acting under the influence of pressure groups. Even if he had not said this in so many words, he still deserves great credit for being fair to the public. It is of course no secret that, from its inception, the STC has been subject to the pulls and pushes of governmental influence or even interference. Quite possibly this kind of undesirable pressure on its functioning has been far less during Mr Tandon's tenure than at any time previously. Even so, it is not altogether a secret that not very long ago tobacco lobbies from Andhra Pradesh were trying to influence through the government STC's purchases of this commodity. Mr L. N. Mishra threatened the country that the government was planning to take over about 90 per cent of the import trade within the next two years. The prospects are not exactly reassuring especially in view of the fact that even a prestigious professional such as Mr Prakash Tandon has had to enter a caveat against the political manipulation of state trading.

TRADE WINDS

Minimum Pay for Managers

ACCORDING to the provisions made in the Finance Act, 1971, the payment of salary up to Rs 5,000 per month by a company to its executives including directors, is ordinarily allowed as an expense of the company. Payment in excess of Rs 5,000 per month is not only not allowed as an expense of the company but is subjected to tax as well, in its hands. Similarly, the Finance Act, 1971, has also placed a ceiling of Rs 1,000 per month or Rs 12,000 per annum on the taxable perquisites which would be allowed as deductible expense of the company. Here again, expenditure on taxable perquisites over and above Rs 12,000 per annum will be subject to tax. Thus the payment of any salary above Rs 5,000 per month and taxable perquisites above Rs 1,000 per month will bear an additional tax liability and be a financial burden on the company.

Keeping in view the larger interest of the shareholders and the companies, the central government has decided that where companies are not earning adequate profits or are incurring losses and the managing or whole-time directors or managers are paid their remuneration on a monthly basis and the central government is satisfied that for the efficient conduct of the company's business, the minimum remuneration of Rs 50,000 per annum stipulated in Section 198(4) will be insufficient, the minimum remuneration payable to any one of them with the sanction of the central government under the proviso to Section 198(4) read with the proviso to Section 309(3) of the Companies Act, 1956, shall not, ex-

cept for compelling reasons in public interest, exceed the aforesaid ceiling of salary and taxable perquisites specified in the Finance Act, 1971.

However, in cases where the managerial remuneration is paid as a percentage of the net profits, the maximum amount which could be paid as minimum remuneration in the event of inadequacy or absence of profits is Rs 50,000 per annum as per Section 198(4) of the Companies Act, 1956. In such cases the actual minimum remuneration which could be allowed in a given case within the aforesaid ceiling of Rs 50,000 per annum, will, as at present, continue to be decided having regard to the various factors, i.e., size of the company, nature of the industry, sales and turnover, its profitability and other relevant factors.

Export Design Improvement Meet

"How must I modify my products to sell them in industrialized countries?" This is the question that some 100 manufacturers from 16 Third World nations will have answered when they meet face-to-face with production, marketing and distribution experts from industrialized countries at a United Nations sponsored meeting to be held in New York from October 2 to 13. Details of the meeting, believed to be the first of its kind anywhere, were outlined at a press conference at United Nations Headquarters recently.

The meeting, which is not a trade fair but a product improvement clinic, has been organized by the United Nations Industrial Development Organization (UNIDO) in co-

operation with the World Trade Institute (WTI) and the United States Agency for International Development (USAID). Mr F. Abdel-Meguid of UNIDO, chairman of the programme's joint sponsoring committee, told the press conference that the October meeting was part of international efforts to boost exports of manufactured goods from developing to developed countries. The serious interest of developing countries was indicated by the fact that manufacturers were paying their way to the New York meeting, with the sponsoring organizations providing accommodation only, he said.

The range of products includes furniture, leather goods, plastic articles and giftware. The meeting will involve intensive private discussions between the manufacturers and the experts from industrialized nations. It will take place at the World Trade Centre—the world's tallest building.

"We're not just going to talk," Mr Abdel-Meguid emphasized. "UNIDO will finance a follow-up programme to implement the suggested changes. Technical experts will go to the developing countries to help manufacturers make the necessary changes at the factory and plant level."

The meeting follows successful product improvement programmes carried out in India and north Africa by UNIDO and New York department store specialists. The products involved are aimed not only at north American market, but also at European industrialized nations.

Manufacturers are coming to the meeting from Brazil, Colombia, Costa Rica, El Salvador, Guatemala, Honduras, India, Iran, Ivory Coast, Mexico, Morocco, Nicaragua, Peru, Pakistan, Philippines and Tunisia.

Hoarding of Essential Goods

The Home Ministry has advised all the states and union territories to take strong action to check vigorously the tendency for hoarding and profit-

teering in essential goods and commodities. Strong action has become specially necessary on account of drought conditions in large parts of the country. The union Home Secretary has suggested to the chief secretaries of states and administrators of union territories that prominent cases caught should be dealt with severely. The Home Secretary also told the Administrations that the tendency towards the rise in prices has also to be checked by all available means including co-operation of consumer associations. It has to be ensured, according to the instructions, that stocks of essential commodities are available in all markets and consumers are not put to any trouble.

Bhel Training Centre Apprentices

Mr K. Murugan and Mr P.E.A. Abdul Kareem, apprentices of the training Centre of Bharat Heavy Electricals Ltd (Tiruchirapalli) have won the "President's Gold Medal" for the "Best Welder Apprentice" and "Best Turner Apprentice" respectively in the All-India Skills Competition for apprentices held at Madras and Bombay respectively in June, 1972.

The Award Scheme was introduced in 1968 to foster a spirit of healthy competition among the apprentices and also the establishments in the country which have been training apprentices under the Apprenticeship Act, 1961.

U.P. Ceiling on Property Ordinance

Recently, the Uttar Pradesh Ceiling on Property Ordinance, 1972, was promulgated by the Governor according to which no person could transfer any urban property or agricultural land for a period of three months beginning on July 11, 1972. The state government has already introduced the Uttar Pradesh Urban Property (Ceiling) Bill, 1972, and the Uttar Pradesh Imposition of Ceiling on Land Holdings (Amentment) Bill, 1972. Since the enactment of both of these bills is likely to take some time, the ordinance is

expected to prevent transfers of agricultural land and urban property in anticipation of the enactment of the bills as law.

Change in Banking Attitudes

The Finance Minister, Mr Y. B. Chavan, told a gathering of bankers in the capital on August 4, that apart from their traditional role, the banks have to undertake certain developmental functions which would call for a radical change in the attitude of a traditional banker.

Mr Chavan was addressing the Top Management Conference organised by the National Institute of Bank Management. He said whether it is the task of branch expansion, deposit mobilisation or credit extension, the banks should increasingly evaluate their activities in terms of their contribution to social and economic development. "We do not regard the banks," he said, "as a passive infra-structure facility. We should like them to serve as an important prime-mover in the development process."

The Finance Minister said it is important for a bank to understand the precise language of development and co-ordinate its activities with other developmental agencies. For this a banker has to get out of his traditional shell. The developmental task undertaken without a change in spirit and in the usual cold manner of a traditional banker will produce no development but only paper reports.

Mr Chavan referred to the success achieved in the programme of branch expansion and deposit mobilisation, but he said mere opening of new branches in the hitherto unbanked areas is not enough. One would judge the success of these branches in terms of business that they do in those areas, particularly the business of credit extension. The Finance Minister said that if the banks have to discharge their social responsibility adequately, they should be as aggressive towards deposit mobilisation. He declared: "It is not indiscrimi-

nate lending that is called for but lending with a social purpose—to enable all productive endeavours to get going and become viable."

Speaking of economic and social objectives, Mr Chavan said the main emphasis is on developing the economy along lines that will make life richer and better not only for a few but for all. In this national endeavour, he said, the banks have been assigned a definite role and one would judge their performance not in terms of their profitability rate but in terms of their positive contribution towards the nation's economic and social objectives.

Yarn Prices Reduced

The Foreign Trade Minister, Mr L. N. Mishra, announced in the Rajya Sabha on August 4, that following discussions with the representatives of the Indian Cotton Mills Federation and the South India Mill Owners' Associations, the textile industry has undertaken to reduce prices for cotton yarn of 60 counts and above. It has been further agreed that each mill will make available up to 60 per cent of its market deliveries within the regulated prices for meeting the requirements of co-operative societies and registered associations through the respective state governments.

The new scheme has been brought into effect accordingly by the Indian Cotton Mills Federation from August 1, 1972. A committee consisting of the Textile Commissioner, representatives of the consumers, state governments and the industry has also been formed to supervise the working of the scheme.

Cotton Yarn

Since January 1972, prices of cotton yarn of superfine counts have gone up considerably. Complaints have been received about the non-availability of superfine counts of cotton yarn at reasonable prices. The industry has agreed to a reduction in prices by each mill for counts of cotton yarn of 60s and above in hank and cone forms packed and delivered for civil consumption. The reduction in price will be calculated by

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

taking the difference between the highest contract price as on June 1, 1972 (or in case of no sale on that date the nearest date of the sale contracted for) and the highest contract price for the relevant count and form of packing during January 1972 and allowing one-half of the difference to be reduced from the former price (i.e. from June 1972 price) to arrive at the regulated price. For instance, the highest contract price of, say, Rs 76 for 60s combed yarn in hanks per 4.54 kgs. in January 1972 and Rs 85 as on June 1, 1972 would work out to a difference of Rs 9 and one-half of the difference i.e. Rs 4.50 will be reduced from Rs 85 to arrive at the regulated price of Rs 80.50 per 4.54 kgs. Excise duty, sales tax and other incidents will be extra.

The industry has also agreed to deliver by each mill up to 50 per cent of the civil deliveries effected by it, of yarn of counts 60s and above within the regulated price for meeting the requirements placed by the co-operative societies/registered associations through the respective state directors of industries/handlooms. The quantum of yarn delivered for exports will be set off against the quantum delivered under the regulated scheme. The above scheme will come into effect immediately. The working of the scheme will be reviewed from time to time. It has also been decided to set up a Watchdog Committee to oversee the working of the scheme. The committee will comprise two representatives of the Indian Cotton Mills Federation and two representatives of the Textile Commissioner. The committee will meet once a month for the purpose.

Minimum Bonus

The memorandum submitted by the All-India Manufacturers' Organisation (AIMO) Bombay, to the Bonus Review Committee has focussed attention on two questions: (1) Is there a case for raising the minimum bonus (four per cent) and if so, to what level? and

(2) Whether the present minimum bonus of four per cent may continue but a provision be made for its being supplemented through suitable schemes of production/productivity?

As regards the question of raising the minimum bonus, the AIMO is of the definite view that there is no case for raising it. It will only aggravate the situation since the compulsory four per cent bonus has caused great hardship to those concerns which do not have any surplus. It has imposed an unjustifiable burden on concerns incurring losses. The AIMO has stressed the fact that wages in industry have increased considerably over the years and that there should not be any further increase in wages without corresponding increase in productivity. In addition, quantum-wise, employees have been getting higher amounts as ex-gratia payment under the caption of bonus since bonus now payable is inclusive of dearness allowance which in turn is linked with the cost of living index number.

With respect to the query whether the present minimum bonus of four per cent may continue, but a provision be made for it being supplemented through suitable schemes of production/productivity, the organisation has taken the reasonable stand that since the payment of four per cent as minimum has been the past practice and has been accepted as a part of the wage structure, it could be retained. However, any supplementing of this should be strictly in the form of a sharing in the prosperity of the concern, a principle already accepted by the Bonus Commission itself.

The AIMO has brought to the attention of the Bonus Review Committee that before making its recommendation, the committee should make a careful assessment of the likely impact of its recommendations on the national economy. The organisation has very strongly urged that there should be no interim report or recommendation and that only one single compre-

hensive report should be submitted after taking into account the totality of the situation and the impact of the recommendations on the national economy.

Shortage of Sugar

The Indian Sugar Mills Association (ISMA) has suggested that the government should import at least 200,000 tonnes of sugar to bring down prices effectively. The ISMA has expressed the fear that unless the additional quantity is procured from abroad it will not be possible to make any impact on prices. The sugar prices in international markets have been falling and it should be possible to arrange supplies within two to three months.

Another suggestion made by ISMA is that sugar factories should be provided incentive in the form of rebate on excise for starting crushing early next season. Since the sucrose recovery is less on the cane crushed earlier than the start of the season, ISMA wants a reduced rate of excise on the quantity crushed earlier.

The ISMA president, Mr M. L. Apte, said at a Press Conference in the capital on August 3 that the government should also ensure that factories were not subjected to unfair competition from gur manufacturers in purchase of cane. The government must effectively control prices of gur. Mr Apte said that a number of factors had combined to create the present situation. The production of sugar in the 1971-72 season was estimated to be not more than 3.1 million tonnes. The production next season is not likely to be more than 3.7 million tonnes because the cane crop had been affected by drought. But Mr Apte did not think that hoarding was responsible for the increase in sugar prices.

Central Ground Water Organisation

A unified Ground Water Organisation came into being on August 1, 1972, at the national level when the Ground Water Wing of the Geological Survey of India merged with the Central Ground Water

Board in the union Ministry of Agriculture. The new organisation will give a big push to the programmes of the ground water development, providing alternate source of irrigation to millions of farmers in the country, specially in the drought-prone areas and supplementary irrigation in areas with assured irrigation of rainfall for multiple cropping.

As a result of this merger, Central Ground Water Board acquires as many as 757 posts, including 225 geologists, 133 drilling personnel and 172 other technicians, besides a large fleet of rigs, vehicles and other equipment. And the unified Central Ground Water Board is now well poised to take up additional responsibilities by way of surveys and investigations in a number of typical situations in various parts of the country and to offer assistance and guidance to state Ground Water Board in technical matters.

Drilling at Surinsar

The next cement casing of the exploratory well being drilled by the Oil and Natural Gas Commission at Surinsar, 45 Kilometres from Jammu, is likely to be lowered towards the end of this month when a drilling depth of over 3,900 metres would have been reached. The well, according to the latest information available, has already been drilled to a depth of 3657 metres. Large quantities of steam and hot water have been coming out of the well for some days rendering normal drilling difficult. Such occurrences are not uncommon particularly in the case of deep wells where sometime during the process of drilling engineers come across huge reservoirs of water and steam trapped in subterranean hard zone rock formations. In such cases, the well is allowed to 'bleed' for sometime, followed by the use of high specific gravity mud which controlled the influx and permitted resumption of normal drilling. With the lowering of the next casing the project will complete the third phase of its drilling. The well, which is to be the deepest in Asia, is

National Awards for Inventors

Eighty-five persons received National Awards for meritorious inventions and import substitutes for 1971-72. The inventors got Rs 85,000 in cash for their 52 inventions. Besides, they also received cash totalling over Rs 1.28 lakhs, three gold shields, 16 silver shields and 28 bronze shields for their pioneering work in developing indigenous technology for nearly 70 items which were, hitherto, being imported. The awards were sponsored by the Inventions Promotion Board under the Ministry of Industrial Development.

Abortions

During the first quarter (April-June) after the Medical Termination of Pregnancy Act came in to force, 1594 abortions have been performed in the country. States of Haryana, Kerala, Punjab and Manipur did not report any abortion. In the union territory of Delhi alone 388 abortions were performed during this period.

Victims of Change in Political Climate

To the ranks of the educated unemployed in this country will be added shortly between 300 to 400 qualified persons who have held senior jobs in USAID Mission in the capital. In view of the stoppage of US aid to India, this wing of the American embassy has no work. Consequently, a decision has been taken by the US embassy to retrench almost all persons who have been engaged by the USAID Mission. Included in the list of the retrenched persons are accountants, auditors, financial analysts, writers, editors and librarians. This will no doubt cause hardship to a large number of families which have hitherto been placed comfortably. While the government may not come to the succour of these victims of change in political climate, the private sector companies, especially those which have received during the last 25 years liberal assistance from

various funds earmarked for development by the USAID Mission in this country, should take steps to absorb these talented persons so as to mitigate their misery.

Exchange Rate for Yen

Referring to domestic economic issues in his first press conference held on July 19, Prime Minister Kakuei Tanaka stated that his government was resolved to maintain the present exchange rate for the yen—the "central rate" set at ¥308 to the United States dollar under the "Smithsonian" agreement. He continued that the government would resort to every practicable means to ward off another revaluation of the yen by pushing ahead much more actively with the domestic measures of economic stimulation. Specifically, he said the government would reinforce the seven-point emergency economic programme formulated last May by the former Sato government, through the creation of a "Second Foreign Exchange Fund Special Account" for the more effective use of foreign currencies.

Speaking of the problem of price increases, the Prime Minister stressed the need for import liberalization through the introduction of a system of genuine competition and for elimination of an excessive concentration of population into the cities. He also called for a shift in the emphasis of economic activity in the period ahead from the hitherto high-rate economic growth to improvement in national welfare through the active use of economic growth.

Khadi and Village Industries

The Khadi and Village Industries Commission has drawn up an ambitious programme to celebrate the 25th anniversary of Independence. The programme envisages a national drive to register one lakh families pledged to the habitual wearing of khadi to the use of swadeshi articles, including the village industries products. To reinforce this campaign, a chain of khadi

and village industries exhibitions will be held in two hundred places in India stressing the value and reality of decentralised production of essential consumer goods. These exhibitions will also show the technological improvements effected in the tools and techniques of production as a result of efforts on applied research programme, which has helped to provide higher wages to the village artisans and produce better articles.

There will also be a nationwide programme of peoples' education through the audio-visual media of literature, seminars, symposia, lectures, newspapers, films, radio, television, etc. This will help to educate the people about the economics of khadi and village industries and their role in the national economy in generating employment opportunities and producing consumer goods. It is as well proposed to produce and sell during the year two crores of rupees worth of ready-made garments (Azadi Poshak) and also village industries products through nearly 4,000 khadi bhandars.

The one lakh families pledged to wearing of khadi would be given cards to enable them to purchase khadi. The cardholders will also affirm their faith in the use of Swadeshi articles, preferably gramodyog, abstinence from liquor and active support to prohibition, renunciation of casteism and communalism, donation of 1/20th of land (if the family has it) to the landless labourer and redressal of grievances through non-violent methods. The aim of this programme is not merely to produce and sell more khadi and village industries products, but also to revive the spirit and outlook of the Gandhian revolution and integrating khadi and village industries with the nation building activities.

Rural Electrification

The Committee of Members of Parliament on Rural Electrification in its final report, has recommended that outlays in the state plans for rural electrification should be specifi-

cally earmarked as was done in the third Plan. If this is done, the committee feels, two things could be ensured; firstly, that the states use their own resources for rural electrification, and secondly, the funds sanctioned by the Rural Electrification Corporation are in addition to and not in substitution of the state plan resources.

The committee was constituted in pursuance of a recommendation made by the Consultative Committee of Parliament for the Ministry of Irrigation and Power at its meeting in March 1968. Its terms of reference were to suggest measures for accelerating rural electrification in nine states where achievement in this sector was below the all-India average—with special reference to energisation of irrigation tube wells and pump-sets and electrification of villages with a population of over 2000. The states were: Assam, Bihar, Jammu & Kashmir, Madhya Pradesh, Nagaland, Orissa, Rajasthan, Uttar Pradesh and West Bengal.

The committee submitted an interim report in September 1968. Mainly as a result of the recommendations in this report, the government of India set up the Rural Electrification Corporation in July 1969 with the primary objective of providing central assistance to state electricity boards for rural electrification schemes. The final report was presented recently to the Minister for Irrigation and Power, Dr K.L. Rao.

Besides recommending a change in the pattern of assistance by the Planning Commission, the committee has urged the strengthening of the technical organisations with the state electricity boards and co-ordination of planning and implementation of schemes with other departments and agencies connected with agriculture, irrigation, electricity and industry.

More weightage has to be given to backward states, says the committee, and for this purpose the agricultural context of the schemes sanctioned by the REC should be widened

ITC reached out to help him

Osmania Medical College, Hyderabad

At 20, Muthyaloo Rao joined the army full of zeal and patriotic fervour. A decade later he lost a leg in a tragic accident. The career he had looked forward to with so much hope, was brought to an end. Then ITC reached out to help. To give Muthyaloo Rao another chance at life, renewed hope for the future.

We gave him a fully equipped Jai Jawan Stall, outside the Osmania Medical College, Hyderabad. Today, with a variety of wares in his stall 'Businessman' Rao faces the future with a confident smile. And everyone who buys from him says his own little "thank you" to the brave man who served his country so well.

It all began over five years ago when our first Jai Jawan Stall was inaugurated in Poona. Since then, more have been set up in various States of the country, and still more are planned. But it's a massive problem to help these many thousands of ex-servicemen and it can only be solved if other organisations join in with similar ventures. To let India's brave warriors know that they are not forgotten once their active service is over.

to include agro-industries, horticulture, animal husbandry and allied activities.

According to the committee, a contributory factor for the slow progress of rural electrification in backward states is lack of proper finance, planning and indenting of scarce raw materials like steel, aluminium and cement. It, therefore, recommends that the REC should set up a special wing to look after this work.

It has noted with satisfaction that, as a result of its recommendations, the fourth Plan has provided for resources for the electrification of 1.5 million irrigation pumpsets. Progress of work so far has been good but needs acceleration in backward states. On the basis of the present progress the committee recommends provision for further outlays for electrification of 1.8 million pumpsets and 87,000 villages.

Regarding provision of funds, it has been recommended that the REC's fourth Plan outlay should be increased from Rs 150 crores to Rs 260 crores. About Rs 21 crores should be provided for the construction of high tension transmission networks in backward areas. A further allocation of Rs 24 crores would have to be made for the provision of shunt capacitors to reduce energy losses, and stabilise voltage conditions in rural areas. A special central assistance of Rs 65 crores has also been recommended for rural electrification in backward states.

Names in the News

Mr Kisan Mehta was elected Chairman of the Processed Foods Export Promotion Council. Mr Mehta is on the Advisory Council for Trade of the Ministry of Foreign Trade as well as a Member of its Import-Export Advisory Council for Northern Region. He is also the Executive Member of Protein Foods Association of India; All India Food Pre-

servers Association; Indo-American Chamber of Commerce and the Nirodh Advisory Committee of the government of India. Mr Mehta is the Vice-President of COCA-COLA and a Director of Polson Limited.

Brigadier C. C. Uthup has taken over as Managing Director of Modern Bakeries (India) Ltd.

Mr M. L. Apte and Mr Pradeep Narang have been elected President and Vice-president

respectively of the Indian Sugar Mills Association.

Mr S. Narayanswamy has been elected President of the Southern India Chamber of Commerce and Industry, Madras, for 1972-73.

Readers' Roundtable

Performance of Nationalised Banks

SIR, Mr R.V. Murthy's article published in your esteemed journal seems to be a generally well-presented and fair assessment of the performance of nationalised banks. However, some observations may be pertinent for viewing the performance in right perspective. As pointed out by the writer, the deposit growth of these banks has improved markedly, particularly in the post-nationalisation period. However, their deposit growth during 1971 over that in 1970 appears to work out to 18.2 per cent compared to 20.6 per cent for all scheduled banks. Secondly, the deposit growth needs viewing in relation to the very considerable branch expansion to see whether it has kept pace commensurately with it. Also to be reckoned is the degree of inflation persisting markedly in the economy.

As regards advances made by the nationalised banks, the reference to the slight decline being mainly attributable to the "factors beyond the control of banks" and reflecting the "slack in the economy" seems plausible. The capacity of the different economic sectors to absorb credit productively is also a factor to be reckoned with. With greater emphasis on bank lending to priority sectors—consisting of the small farmers, the small industrialists, the retailers, the small self-employed, etc.—any significant growth in bank credit implies a more than proportionate increase in the borrowing accounts—a process, however, which is necessarily slow.

Sluggish growth of bank cre-

dit could also be due to the relative discount that has come to be placed on bank finance to medium and large industry and trade whose development is as important, if not more, as that of the small sector, for increasing much needed production. Some time ago, the chairman of a leading bank observed that the dilemma confronting the commercial banks was that "large and medium scale industries cannot be denied assistance without detriment to industrial production, and weaker sections of the community cannot be denied assistance without a serious setback in public policy". With the rapid growth in bank deposits, banks now seem to be in a happier position and "banking beyond means" could be a thing of the past. While meeting the legitimate productive needs of the small sector adequately, it would seem that they would do well to assist the medium and large sectors also, to the extent possible, in the interests of economic growth as much as of their own profitability. The banks could of course do this taking due precautions to prevent the organized large sector strangling the small and medium scale sectors.

The article contains a good review concerning the profits returned by nationalised banks to the government expressed as percentage of compensation paid to the erstwhile shareholders. However, while the table gives the percentages for 1970 and 1971, the review seems to be on the basis of 1970 figures only. The declining

trend in profitability is noteworthy and the main reasons appear to be the unprecedented increase in bank costs on account of large scale expansion of branches which are yet to prove economical, and the rapid increase in concessional lending to priority sectors.

As a corollary to this, the net profits of the 14 nationalised banks generally have recorded a decline in 1970. Expressed as a percentage of the compensation paid by government, returns to government by the nationalised banks together work out to 4.7 per cent. Nine out of the 14 returned to the government a percentage higher than 4.7 per cent, while the remaining 5 returned less. If the 5½ per cent paid by government on bonds held by ex-shareholders of the nationalised banks is adopted as the criterion, only 9 banks gave a return higher than 5½ per cent and the others gave less.

In the year 1971, the result is only marginally better. Returns to government by all the 14 together work out to 5.08 per cent. Ten of the 14 gave a return higher than this figure. The same 10 also gave a return higher than the government bond rate of 5½ per cent.

Our bank's return to government in 1970 was 7.7 per cent and in 1971, 8.6 per cent, the highest in both the years. In the context, however, of the problem generally experienced, of increasing advances commensurately with deposit growth, especially in rural areas, there is no room for complacency.

Yours etc.

COMPANY AFFAIRS

Zenith Steel

ZENITH STEEL Pipes Ltd has maintained the equity dividend at Rs 1.20 per share for the year ended April 30, 1972. Although sales have gone up by about 17 per cent from Rs 8.06 crores in 1970-71 to Rs 9.42 crores, the net profit for the year, after adding excess provisions for earlier years, slumped to Rs 23.25 lakhs recording a decline of as much as Rs 43.53 lakhs over 1970-71. The steep fall in profitability is attributed to the substantial increase in the prices of steel and zinc, inadequate availability of steel during some months, depression in the price of steel pipes and higher incidence of power charges, salaries and wages. The prices of indigenous hot rolled strips was revised twice during the year, the increase being from Rs 1102 to Rs 1,268 per tonne. The price of imported zinc, released by MMTC, too has gone up, increasing from Rs 3,150 per metric ton in the first quarter of 1971-72 to as high as Rs 5,000 per metric ton in the fourth quarter of 1971-72. Obviously the cost of production has increased and is still increasing steadily and substantially.

The outlook for the current year too is not quite encouraging. The production of pipes has been suffering on account of acute shortage of both imported and indigenous steel. With the prices of steel in world markets having gone up, the company will not only face the problem of shortage but also of high prices of its raw materials such as steel and zinc, although the recent increase in the prices of pipes will partly neutralise the impact.

Meanwhile the government has endorsed its industrial licence for the manufacture of steel pipes and tubes on the

basis of 72,000 tonnes capacity per year with a view to permitting a fuller utilisation of the capacity. P.T. Zenith Steel, Indonesia, in which the company has an equity holding, is expected to start production in the first half of 1974.

Universal Cables

Significant rise in sales and gross profit has enabled the directors of Universal Cables Ltd to enhance the equity dividend to 14 per cent for the year ended March 31, 1972 as against 12 per cent declared for the preceding year. Sales during the year recorded a smart rise to Rs 10.05 crores registering an increase of as much as of Rs 2 crores over 1970-71. The full benefit, however, has not been attained because of the after effect of the labour trouble and rise in cost of production as well as fiscal levy. Gross profit too went up significantly during the year and it touched the high level of Rs 1.18 crores which was higher than the previous year's figure by Rs 0.17 crore. Out of the gross profit a sum of Rs 37.14 lakhs was earmarked for depreciation, Rs 7.85 lakhs for development rebate reserve, Rs 40.50 lakhs for taxation, as compared to Rs 31.82 lakhs, Rs 6.25 lakhs and Rs 16.40 lakhs respectively in 1970-71. This leaves a lower net profit of Rs 32.44 lakhs as compared to Rs 46.68 lakhs in the preceding year and the entire amount has been transferred to the general reserve. The dividend claiming Rs 17.58 lakhs will be paid out of the general reserve. The company has made an application to the income-tax department to determine the percentage of dividend which would be exempt from tax under Section 80 K of I.T. Act.

The company's application for expansion is still pending

with the government. This may necessitate fresh technical collaboration agreement with British Insulated Callender Cables Ltd, London, since the present agreement is expiring on February 1974.

Birla Jute

Birla Jute Manufacturing Company Ltd has enhanced the equity dividend to 12 per cent for the year ended March 31, 1972 as against 11 per cent paid for the preceding year. The dividends on preference shares will be paid at the stipulated rates of 7.5 per cent and 9.3 per cent. During the year the company earned a lower gross profit of Rs 4.35 crores as against Rs 4.57 crores in 1970-71. Out of the gross profit the directors have appropriated a sum of Rs 1.89 crores for depreciation, Rs 1.30 crores

for taxation and Rs 66.04 lakhs for development rebate reserve as against Rs 1.29 crores, Rs 1.41 crores and Rs 11.72 lakhs provided respectively in 1970-71. This leaves a net surplus of Rs 50.22 lakhs as compared to Rs 1.75 crores in the preceding year and the entire amount has been transferred to the general reserve. The dividends will absorb Rs 56.27 lakhs and will be paid out of the general reserve.

During the year the company incurred a capital expenditure of Rs 3.03 crores relating mainly to improvement and renovation of plant and equipment. Although the manufacturing costs have risen steeply in all divisions, the company has been able to achieve satisfactory working results mainly because of favourable trading conditions, especially by the jute mill division. The working of calcium carbide division had been satisfactory. The company's application for expansion is still pending with the government. Nevertheless the company has offered its technical know-how for setting up manufacturing units of calcium carbide as it is a pioneer in this field. The profitability

of the cement division was affected due to various adverse factors. There had been accumulation of stocks at Satna and Chittorgarh following shortages of wagons. The Durgapur slag cement project is likely to go into production in early 1974.

Larsen & Toubro

Larsen & Toubro Ltd proposes to acquire 23 per cent of the capital of Hindustan Brown Boveri Ltd from Brown, Boveri Ltd, a Swiss Concern which holds 50 per cent of the equity. The company, together with its subsidiary EEC, already holds four per cent of the equity capital of Hindustan Brown Boveri. With the proposed acquisition Larsen & Toubro and Brown Boveri will be equal partners of Hindustan Brown Boveri, each holding 27 per cent of the capital. The lines of manufacture of Hindustan Brown Boveri and the company are, in fact, complementary to each other and hence considerable advantages are expected to accrue to both the companies by streamlining their manufacturing, marketing and research activities. This is revealed in the Chairman Mr H. Holck-Larsen's annual statement circulated to the shareholders of the company.

The company is also entering the line of manufacturing high-speed bottling plant and the first few units have been installed. In the field of switchgear, the other major line of manufacture, several new products were added during the year. A new switchgear unit is being constructed to take up the manufacture of contactors, moulded case circuit breakers and additional new products, many of which have been developed by the company's own research and development wing.

Of the three joint ventures with reputed foreign concerns the company had planned, effective steps have been taken to commence production of tyre curing presses. In fact, the company L & T-McNeil Limited has already been registered and important initial orders have been received and steps have been taken to commence production. The two

other joint ventures, one in the field of electronic components and the other which is an integrated scheme for the manufacture of agricultural tractors and self-propelled harvester combines, have not yet been completely cleared by the government. Meanwhile one of the collaborators has informed the company that it is no longer prepared to continue holding funds earmarked for the scheme.

The future prospects of L and T and its subsidiary and associate companies are indeed quite bright. All the units are poised for expansion, increased sales and higher profits.

Shareholder's Seminar

The National Forum of Shareholders has decided to hold an all-India seminar on November 11 and 12, 1972, at Calcutta. The seminar will have four sessions dealing with (i) problems of shareholders, (ii) protection of shareholders under Company Law; (iii) the role of stock exchanges and institutional investors in promoting shareholders' interests, and (iv) how to make shareholders democracy effective and shareholding popular? Mr K. V. Raghunatha Reddy, the Minister of Company Affairs, has consented to inaugurate the seminar, which is expected to be attended by representatives of various shareholders' associations in the country, stock exchanges, concerned ministries, and financial and banking institutions. Several ministers, eminent public men and members of Parliament are being invited to address the seminar. Invitations have as well been extended to shareholders' organisations in the United States, the United Kingdom and other countries for participation in the seminar.

News and Notes

Expansion and Diversification

Garware Nylons has received bulk of the plant and equipment from foreign and indigenous sources required for the implementation of its expansion scheme which envisages an increase in nylon yarn capacity to 2000 tonnes per annum. The erection of the spinning

section is expected to be completed by the end August and trial production is expected to commence next month. The trial production of polymerisation section is expected to start by October or November. Meanwhile the company has received letters of intent to further expand the nylon yarn capacity to 3,840 tonnes per annum and also to manufacture polyester filament yarn with a capacity of 360 tonnes per annum. The company is awaiting the capital goods licence from the government for expansion of the nylon yarn capacity.

Bharat Bijlee proposes to diversify the company's activities in a small way with the existing facilities. One of the new lines to be taken up is the manufacture, installation, erection and maintenance of lifts which will not involve any fresh capital investment. The company is already manufacturing various types of electric motors and castings and has facilities for steel fabrication work. Moreover it is proposed to make a start as manufacturer, dealer and repairer of all types of machinery, equipment, apparatus, instruments, devices and parts thereof. Both, these lines are expected to enhance the company's profitability.

New Venture

Bharat Gears Ltd is setting up a Rs 4.60-crore project for the manufacture of automobile gears. The plant being set up near Thana, outside the Bombay-Thana industrial complex, will have an annual capacity of 1,000 tonnes. Land for the project has been acquired and the company has been allowed to import equipments valued at around Rs 1.53 crores against foreign exchange loans to be obtained from financial institutions. The project will be financed through the share capital of Rs 1.80 crores—Rs 1.35 crores in equity and Rs 45 lakhs in 9.5 per cent cumulative redeemable preference shares—and term loans amounting to Rs 2.80 crores from financial institutions. The company has already raised a capital of Rs 25 lakhs of which Rs 2.5 lakhs has been

subscribed by Bharat Steel Tubes. The directors of BST propose that their company may invest up to Rs 40 lakhs in the equity capital of this new venture by way of diversification of its activities.

New Issues

The Madras Modern Builders Ltd is offering 127,500 equity shares of Rs 10 each at par to the public for subscription. The subscription list opens on August 17 and will close at the discretion of the Board of Directors of the company but not before August 19. Application for shares must be for a minimum of 50 shares or multiples thereof. A sum of Rs 2.50 per share is payable on application and a like amount on allotment. The balance of Rs 5 has to be paid in two equal calls to be made as may be determined by the Board of Directors of the company with an interval of at least two months between the calls. As an overwhelming response to the issue is expected from the public no arrangements have been made to underwrite the issue.

The company has taken over all the existing activities of 'The Modern Builders' a partnership concern started in Madras in 1961 with a modest capital Rs 10,000. 'The Modern Builders' has completed many giant housing projects running into several crores of rupees, the latest one handled being the Sri Padmanabha Nagar-I stage in Adyar, Madras. In order to finance the big projects 'The Modern Builders' has transferred all its construction activities along with all its transport, experienced and qualified engineers, and its vast and varied experience in its various types of work to the new company—The Madras Modern Builders Ltd—which was incorporated on October 7, 1971 with an authorised capital of Rs 50 lakhs. The main objects of the new company are to undertake all types of civil works including mass construction of houses especially to the middle and low income groups. The company has already completed about 100 houses at Sri Pad-

NOTICE THE GWALIOR RAYON SILK MFG (WVG) CO. LTD. Registered Office: BIRLAGRAM, NAGDA, M.P.

NOTICE is hereby given that the Registers of Members and Transfer Books of the Equity and Preference Shares Series 'A' and 'C' will remain closed from Tuesday, the 22nd August 1972 to Monday, the 11th September, 1972 (both days inclusive) for the purpose of payment of dividends on Equity and Preference Shares of the Company.

The Dividends on Equity Shares and Preference Shares Series 'A', 'B' & 'C' when sanctioned by the Shareholders will be made payable to those shareholders, whose names stand on the Registers of Members of the Company as on 11th September, 1972, (and, in the case of Preference Shares of Series 'B' and such of the Preference Shares of Series 'A', which have been since redeemed, as on 31st March 1972), as under:—

- i) Dividend on Preference Shares ... On or after 22nd September, 1972.
- Series 'A', 'B' & 'C'
- ii) Dividend on Equity Shares ... On or after 30th September, 1972.

BY ORDER OF THE BOARD
B. N. PURANMALKA
Secretary
Birlagram, Nagda
Dated: 31st July 1972

manabha Nagar-I stage which were transferred from 'The Modern Builders'. Immediately it has taken on hand another prestigious scheme — the Sri Padmanabha Nagar-II stage — which is estimated to cost Rs 50 lakhs. About 12.5 acres in the adjoining area in Adyar has already been acquired and about 150 houses are proposed to be constructed in the new area. The present issue is mainly to finance this scheme. Barring unforeseen circumstances the directors are hopeful of declaring a maiden dividend in the very first year of its operations.

The company also proposes to undertake mass housing schemes to serve all categories of people in all income ranges with types of houses of A, B, C and Peoples flats.

Anil Steel and Industries Ltd will soon be offering for public subscription 3,20,000 equity shares of Rs 10 each and 15,000 preference shares of Rs 100 each for cash at par. The proceeds of the issue will be utilised for financing a part of the cost of the project which the company is setting up at Jaipur for manufacturing high carbon and low alloy steel strips. The plant will have a licensed capacity of about 3,600 tonnes per annum and it will involve a capital expenditure of Rs 2.22 crores but it has been so designed as to allow for expansion in future with some balancing equipment. During the initial stage the company will be engaged in hardening, tempering, grading, polishing and edge rounding of high carbon low alloy steel and this will be done for the first time in the country. On achieving the licensed capacity the company will be able to save foreign exchange to the tune of Rs 1 crore as the entire strips are now being imported. The present estimated indigenous demand for strips is about 5,000 tonnes and it is likely to rise to 6,000 tonnes by 1973-74 and to 10,000 tonnes by 1978-79. Also the company will be deriving the benefits of technical know-how from Hoeoch Werke Hohem limburg Schwerts A.G., a reputed German steel making firm, which will act as a consultant.

Vidarbha Glass Works will

be entering the capital market shortly with a public issue of Rs 6 lakhs, all in equity shares of Rs 10 each. The proceeds of the issue will provide part of the finance required for the implementation of the company's proposed glass project at Nagpur. Initially it proposes to manufacture 2,700 tonnes of glass bottles for the first two years, and 5,700 tonnes per annum thereafter. The plant is expected to go on stream by October 1972. The capital outlay on the project is estimated at Rs 25.55 lakhs and it will be financed through the share capital of Rs 8 lakhs, loan from the Maharashtra State Financial Corporation of Rs 8.40 lakhs, another loan from SICOM of Rs 4.20 lakhs, borrowings from banks for working capital requirements of Rs 4.50 lakhs and deferred payments to the tune of Rs 45,000.

New Registrations

A total of 229 companies were registered under the Companies Act, 1956 in different states and union territories during the month of February, 1972. Of these, only one was association not for profit, registered as guarantee company. The remaining comprised 20 public limited companies and 208 private limited companies having aggregate authorised capital of Rs 15.41 crores and Rs 19.61 crores respectively. They also included five government companies. Their names (with the name of state of registration and authorised capital in brackets) are as follows: Kerala Minerals and Metals Limited (Kerala; Rs 5 crores); Maharashtra State Powerloom Corporation Limited (Maharashtra; Rs 1 crore); Kichha Sugar Company Limited (Uttar Pradesh; Rs 2.5 crores); Cheran Transport Corporation Limited (Tamil Nadu; Rs 1 crore); and Cholan Roadways Corporation Limited (Tamil Nadu; Rs 3 crores). Nineteen of the total companies registered during the month were large-sized companies each having an authorised capital of Rs 50 lakhs or above.

The highest number of new registrations was reported from the state of Maharashtra while the state of West Bengal topped in the number of companies that had ceased function-

ing during the month under review. The state-wise distribution of new registrations (with figures for liquidations/struck off companies in brackets) was: Maharashtra 60 (7); Delhi 59 (7); West Bengal 29 (20); Gujarat 16 (—); Tamil Nadu 16 (—); Kerala 8 (—); Mysore 8 (—); Uttar Pradesh 7(1); Rajasthan 4 (1); Goa, Daman & Diu 4 (1); Assam 3 (—); Haryana 3 (—); Punjab 3 (—); Andhra Pradesh 2 (—); Bihar 2 (—); Madhya Pradesh 2(—); Himachal Pradesh 1 (—); Orissa 1 (—); and Jammu and Kashmir (—) (1). The industrial classification of the newly registered companies (with the classification of those ceased functioning in brackets) is as follows: Processing & Manufacture 127 (13); Commerce (Trade & Finance) 47 (16) and other activities 54 (9).

THE MADRAS MODERN BUILDERS LIMITED

Incorporated on 7th October, 1971 under the Companies Act, 1956.

Registered office : 1-A, Rama Rao Street, T'Nagar, Madras-17.

Announcement regarding the issue of 1,27,500 Equity Shares of Rs. 10/- each at par.

All those who are interested in full details may obtain copies of the Prospectus and application forms from the Offices of the Brokers and Bankers to the issue mentioned hereunder, and from the Registered Office of the Company.

The subscription list will open at the commencement of banking hours on Thursday the 17th August, 1972, and will close at the discretion of the Board of Directors of the Company but not before the close of banking hours on Saturday the 19th August, 1972.

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company takes its origin from "The Modern Builders", a Partnership Firm, which was started in Madras in 1961, and expanded its activities and earned a good reputation all over India for its lay-out and house construction activities. It has to its credit several projects.

The firm has transferred all its construction activities to the new Company "The Madras Modern Builders Limited" which was incorporated on 7th October, 1971.

The main objects of the Company are, to undertake all civil works, to serve the basic social needs of the people by putting up mass construction of houses especially for the middle and low income groups, etc. The Company has completed about 100 houses at Sri Padmanabha Nagar, I Stage which were transferred from "The Modern Builders". The construction of 150 houses at Sri Padmanabha Nagar, II Stage which is likely to cost about Rs. 50 lakhs is in progress. Lay-out approval for this scheme has been granted by the Corporation of Madras in their letter No. U.D.C. No. G. 31/L.A. 230/70 dated 7.3.1972. The preliminary works are in progress. This locality is in Madras in the midst of highly developed colonies like Indira Nagar, Sastri Nagar, etc. with excellent facilities for education, trans-

port, shopping and evening beach resort.

With a view to tackle the colossal housing problem the Company proposes to put up mass housing scheme to serve all categories of people in all income ranges with types of houses of A, B, C and Peoples' Flats.

The balance of Rs. 5/- shall be payable in two equal calls to be made as may be determined by the Board of Directors of the company with an interval of at least two months between the calls.

RECORDS AND STATISTICS

Rates of power supply

In a statement presented to the Rajya Sabha on July 31, 1972 in answer to a question—Dr K. L. Rao gave details of the rates of power for domestic, commercial and agricultural power supply rates in different states and union

territories. He also said: "It is the aim of the government to ensure that there are uniform rates for each category of consumers within each state in the first instance and ultimately, on the establishment of an all India Grid to narrow the disparities in the rates to the extent feasible in the country as a whole. Uniform power tariff for each category of consumers have been introduced in the states of Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Kerala, Mysore, Punjab, West Bengal and Madhya Pradesh. The boards in the states of Maharashtra, Orissa

and Rajasthan and also taking steps in this direction. In Uttar Pradesh there is uniform tariff throughout the state, except in three major cities namely, Allahabad, Kanpur and Lucknow, where lower low tension tariff for domestic and commercial consumers is in force due to historical reasons. Although Tamil Nadu Board introduced uniform tariff, it has kept separate high tension tariffs for large and heavy industries in hydro and thermal areas. In the case of agricultural consumers the state electricity boards have adopted promotional tariffs. During fourth Plan central assistance to the states is being given in the form of block grants loans and there is no subsidy scheme in force for electricity rates to the agricultural consumers." The statement is given below:

Development of irrigation

DR K. L. RAO, the Minister for Irrigation and Power, stated in the Rajya Sabha, on July 31, 1972, in answer to a question asked by four members, that "irrigation facilities are provided in the country from major and medium irri-

gation projects, as well as from minor irrigation works like small tanks, wells and deep tube-wells. A general assessment at present has indicated that it is possible to bring 45.6 million hectares under major and medium irrigation and

36.4 million hectares under minor projects, thus providing irrigation facilities to about 50 per cent of the cropped area. Further investigations are expected to show possibilities of irrigation of additional area. In particular, the construction of a National Water Grid to transfer water from water surplus areas to water scarce areas would add significantly to the possibilities of irri-

gation of additional areas in the country".

A statement showing the ultimate irrigation potential as assessed at present the development in 1970-71 and the development which would have been achieved on completion of the various major and medium projects in hand is given below:—

HINDALCO HELPS TO BUILD NATION'S ECONOMY...

In May, 1962 Hindalco started production of aluminium with a smelter capacity of 20,000 tonnes a year. The capacity was raised to 40,000 tonnes in November, 1965, 60,000 tonnes in August, 1967 and to 80,000 tonnes in May, 1969. Plans are in hand to expand the plant further to 120,000 tonnes by end-1973.

Between May, 1962 and December, 1970 Hindalco, now India's largest producer of aluminium, has produced 372,903 tonnes of aluminium, which has saved for the nation nearly Rs. 180 crores of precious foreign exchange.

As a substitute for imported copper in the electrical industries, the above output represents a much larger foreign exchange saving, since one tonne of aluminium is replacing two tonnes of copper and as imported copper is several times costlier than indigenous aluminium.

As a vital raw material for Electrical Conductors & Cables, Telecommunications, Electric Capacitors, Condensers and Motors, Transportation (by road, rail, air and

Bins, Drainage Culverts, Water Mains and countless other applications, HINDALCO aluminium is helping to build a new India... With its almost limitless variety of forms and shapes and its versatile properties, HINDALCO aluminium is sure to play a crucial role in meeting industrial India's challenge today and tomorrow...

ALUMINIUM IN CONSTRUCTION & STRUCTURAL USES

For Building & Construction, HINDALCO offers Semi-fabricated aluminium products (sheets and extruded shapes) in a wide range to suit diverse jobs. High strength-to-weight ratio and low maintenance costs make Aluminium the ideal choice of modern builders and architects. Besides, for making buildings cool in summer and warm in winter, aluminium panels are being increasingly used today in modern sky-scrapers.

HINDALCO Semi-fabricated products are so versatile that they can be used in making almost anything, from landing mat for Aeroplane in an emergency defence purpose to drainage culverts in farms for Agricultural purposes.

MODERN BUILDERS SPECIFY HINDALCO ALUMINIUM.

All hands to the wheel

THE PRIME Minister, Mrs Indira Gandhi, is reported to have said—in an interview to the editor of "Nilachal", an Assamese weekly—that the government and the people must make a major effort to increase production and that all those who had the interest of the country at heart must help in this process. "If workers and employees think merely of their sectional interests, whatever they may gain through trade union action will be lost because of inflationary pressures which develop from under-production", she added. For once, her analysis of the economic situation in this country is not only correct, it is also refreshingly realistic. At last she seems to have realized that the only way to provide content and meaning to the slogan of "Garibi Hatao" is to harness all the forces which will stimulate the productive machinery and increase the flow of consumer goods in the market which, in turn, would match the supply of money with the people to keep prices under restraint.

After having diagnosed the malady correctly, the Prime Minister must now summon sufficient courage to take the steps needed to achieve the objective of increased production. The Tata memorandum has been with her for more than three months. The suggestions given therein can bring about a big change in the industrial climate.

One of the main causes for the current slowdown in industrial output is the continued shortage of raw materials, fuels, power and rail transport. What steps has the government taken to maintain their uninterrupted availability to industry? Perhaps short-term measures can relieve the pressure somewhat, but it is the long-term plans alone which can ensure ready supply of these materials to industry. Rightly has the Tata memorandum stated that "in the formulation of the next and subsequent plans, the Planning Commission and government allot the highest priority to providing funds and taking action to ensure that materials, products and services essential to industrial growth are never in short supply".

Labour unrest has also been a big factor in slowing the pace of industrial growth. The man-days lost by industry in 1968 were nearly 17.2 millions which increased to 19.0 millions in 1969 and further to 20.6 millions in 1970. Thanks to some improvement in employer-employee relations in 1971 in West Bengal the man-days lost fell to 15.0 millions, though lately reports have been received of increase in tension in that state again. With the massive mandate provided to Mrs Indira Gandhi's government at the centre and to her party in most of the states, it should certainly be possible to harmonise the employer-employee relations. Recently, the public sector undertakings and the nationalized banks are increasingly becoming victims of inter-union rivalry which tends to slow down their work. What is more, the morale in any organization should not be allowed to deteriorate. The government can certainly use its influence with trade unions to put a moratorium on all strikes till we are able to put our industrial machinery in order.

The industry in this country has also suffered because of "inadequate controlled prices, high taxation, and much high cost of new equipment than the original cost for which depreciation was provided". All these subjects have been discussed in the columns of this journal a number of times. Rigidity in approach to these problems has caused a high degree of obsolescence in machinery which again needs a long-term plan for the replacement and modernisation of old and sick industrial units. Taking them over for control by the state is no solution.

Besides these factors, the licensing policy needs to be changed drastically. The limitations put on the expansion of the companies managed by the "larger houses" need to be removed. The Tata memorandum has specifically pleaded the cases of those companies which, though belonging to the larger houses, have a good record in regard to quality of products, prices charged, labour policies, use of profits, professional competence of management, help to small-scale industries, expenditure on research, etc. In other words, it has recommended that the "socially responsible houses" should be treated differently from other "larger houses". On this question there is bound to be difference of opinion among the larger houses themselves and also between the business community and the government because the criteria listed are not comprehensive enough. Perhaps this is not the time to split hairs on this issue. This is the time to use all available resources in the country to achieve the objective of increased production without debarring any one from participation in the war against want and poverty.

That the government is currently thinking out ways and means of utilising the capabilities of the larger business houses was clear from the informal discussions which Mr C. Subramaniam, the Minister for Industrial Development, had recently with members of the Forum of Financial Writers. He stated that the new industrial policy which was being evolved by the government would lay down a role for the larger industrial houses and foreign-controlled firms. He also opined that these concerns had a wealth of management talent and expertise and it would not be wise for the country to waste it. "Without assigning a definite role to them we will not be using the manpower available there", added Mr Subramaniam. Besides manpower and

management expertise, the larger houses also possess substantial financial resources for which they are not finding adequate avenues for investment in view of the unhelpful attitude adopted by the government. In a study published in the July, 1972, issue of the Reserve Bank of India Monthly Bulletin, it was clearly demonstrated that 290 large companies (with

paid-up capital of more than one crore of rupees), which mostly belong to the larger business houses, had increased their retained profits year after year and were finding it hard to make full use of them. It is to be hoped that the revised industrial policy will attempt to use the resources of the larger business houses fully.

Mopping up liquid funds

IN A bid to restrict the quantum of deficit financing to the minimum extent and to take advantage of the improved liquidity of the banking system, the Reserve Bank has thought it desirable to raise as large amounts as possible through the issue of loans and bonds of the central and state governments and the statutory corporations and electricity boards. While the new strategy was clearly indicated by the monetary authorities some time back, even the record borrowing of the governments and public bodies last year, when a big effort was made to mobilise resources for meeting the emergency and maintaining the tempo of Plan implementation, is proposed to be surpassed. The union Finance Minister could have well decided to fix a higher target for net borrowing in 1972-73 having regard to the strident growth in deposits and the absence of a keen demand for funds from industry and trade. But it was then explained that the target had intentionally been fixed low because of the need for expanding credit sizeably for procurement purposes.

These intentions however have now to be changed because the budgetary position has been badly affected by the compulsion on the part of the central government to spend large amounts on relief operations in the drought and flood-affected areas. It may also be necessary to spend additionally Rs 150 crores towards food subsidies. A position has thus emerged in which the government has to garner resources in the same frantic manner as it did in 1971-72 and the earlier hopes of a fairly comfortable financial position may not materialise.

Luckily the scheduled commercial banks have been gathering large deposits without finding much use for them while the Life Insurance Corporation and provident funds are also adding to their assets at a faster rate than ever before. The scheduled commercial banks alone may be increasing their deposits in 1972-73 by nearly Rs 1400 crores. Even allowing for a growth in advances to the extent of Rs 650 crores and the wiping out of earlier borrowings from the central banking institution of Rs 100 crores, the investible surplus will be of the order of Rs 650

crores. It is now proposed that the central government should borrow additionally Rs 108 crores as compared to 1971-72 taking the total to Rs 323 crores. The state governments for their part are needing an extra amount of Rs 32 crores or an aggregate net amount of Rs 133 crores. The state electricity boards alone will be raising Rs 25 crores more or a total of Rs 108 crores. When taking into account the likelihood of the statutory corporations issuing their bonds for Rs 50 crores, the aggregate borrowing will be only Rs 614 crores which the banking system and other institutions are in a position to find easily.

There will however be concentrated borrowing in September as the state governments have asked for a record notified amount of Rs 197.25 crores. It had been generally expected that the states would be borrowing much larger amounts as their recourse to unauthorised overdrafts had been prevented and additional expenditure on Plan schemes could be incurred only if there were the required resources. The state governments will thus be raising a net amount of Rs 133 crores in 1972-73 against Rs 101 crores in 1971-72 which was in itself a record. The new feature of this year is the emergence of Himachal Pradesh, Meghalaya, Manipur, Nagaland and Jammu and Kashmir as borrowers in the open market for the first time. All these governments except Jammu and Kashmir are requiring Rs 1 crore each while J & K will be issuing a loan for Rs 2 crores.

Andhra Pradesh will be asking for Rs 20.50 crores against Rs 12.75 crores in 1971, Bihar for Rs 12 crores (Rs 6.25 crores), Haryana Rs 7.50 crores (Rs 5.50 crores), Punjab Rs 6.25 crores (Rs 6 crores), Madhya Pradesh Rs 9 crores (Rs 10 crores), Maharashtra Rs 19.75 crores (Rs 18 crores), Mysore Rs 14.25 crores (Rs 10 crores), Orissa Rs 8.50 crores (Rs 7 crores), Rajasthan Rs 16.75 crores (Rs 7.25 crores), Tamil Nadu Rs 20 crores (Rs 19.50 crores), and Uttar Pradesh Rs 19.75 crores (Rs 15.50 crores). Kerala will be raising a smaller amount of Rs 7 crores (Rs 7.75 crores), Gujarat Rs 12.50 crores (Rs 12.75 crores), and West Bengal Rs 13 crores (Rs 14.25 crores). Assam also is raising a smaller amount of Rs 4.50 crores (Rs 6.25 crores) presumably because, Meghalaya is coming out with a separate loan. As stated earlier Himachal Pradesh, Manipur and Nagaland will be offering

loans for Rs 1 crore each and Jammu and Kashmir for Rs 2 crores.

The subscription lists opened on September 4 and will close on September 9 or earlier if the loans are over-subscribed. All the state governments have reserved their right to accept subscriptions up to 10 per cent in excess of the notified amount. There is no change in the terms of the loans as the interest rate will be unchanged at 5½ per cent. The issue price has been fixed at par in all cases thus avoiding again earlier invidious distinctions. The new loans will mature after 12 years in 1984. On the last occasion there was oversubscription in all cases and the net amount borrowed was Rs 101 crores with gross subscriptions amounting to Rs 175.15 crores against the notified amount of Rs 158.75 crores. While there are maturing loans now for Rs 84.22 crores there were maturing loans in 1971-72 for Rs 72.71 crores. There is no doubt that all the lists will be closed in one or two days as the commercial banks have the required resources and their borrowings from the central banking institution during the week ended August 18, 1972 amounted to only Rs 2.24 crores.

The central government will be opening the lists for its loans on September 15 barely 11 days after the opening date of the state loans. This crowded borrowing will be possible only because of the extremely slack conditions in the money market. Three loans issued in July are to be re-issued for Rs 215 crores. The terms are unchanged with the 4½ per cent 1979 and 5½ per cent 2002 being offered at par. The medium dated 5 per cent 1983 loan will be available at a discount of ¼ per cent as before. The gross amount of applications will surely be Rs 236.5 crores. There are no conversion terms for the loans that will mature in October and November and it is perhaps the intention of the government to redeem these loans by paying cash on the due dates. Net borrowing is therefore expected to be of the order of Rs 323 crores in two stages against Rs 295 crores in three stages in 1971-72. This could even be Rs 375 crores if the government felt compelled to effect fresh reissues later.

There would have been a slowing down in the rate of growth of deposits if there was a big decline in the output of food and cash crops with severe drought conditions in several areas. The latest reports however indicate that the shortfall in kharif crops may not be so serious as at first feared and with the increasing monetisation of the economy the increase in deposits of the scheduled commercial banks alone can be easily Rs 120 crores every month. As the banking system will not have any borrowing from the Reserve Bank on the eve of the next busy season the position can be reviewed later in the year for effecting fresh reissues. The

government however must make it a point to use fruitfully available resources and not fritter them away unproductively simply because the banks and other ins-

titutions are in a position to extend liberal support to new loans and bonds. There should be no misuse or misapplication of available resources.

Power crisis in West Bengal

ALTHOUGH power shortage has prevailed in many parts of our country during recent months, nowhere does it seem to be felt more acutely and persistently than in West Bengal. When Mr Siddhartha Shankar Ray formed his ministry in March this year, it was expected that he would give top priority to this problem. This hope was further encouraged when soon after assuming office, Mr Ray announced his intention to electrify 10,000 villages by the end of 1973. This was an ambitious target since West Bengal had less than ten per cent of its villages electrified. But the chief minister did not seem to have considered carefully the implications of this proposal. Nor has the government given sufficient thought to the availability of power in order to revive the state's economy. At present power scarcity has assumed serious proportions and no one seems to have any idea as to how soon the situation is likely to improve.

The crisis has developed due largely to the absence of proper planning in regard to the state's requirements of power, lack of regular maintenance of the public sector power plants, and the unco-operative attitude of certain sections of labour. When the government announced in August 1971 a comprehensive scheme for developing the state's economy, known as the 16-point programme, it did not appear to have given thought as to how it was going to provide power to all the closed units that were to be opened, for the existing industries for expansion, and for the new industries to be set up. This aspect was ignored with the result that even at this current low level of economic activity in the state, there is not enough power. What is more unfortunate is the fact that industrial units have complained of damage being done to their costly machines by the sharp and sudden cuts in power supply. Such industries as jute manufactures had pleaded that they should be exempted from load-shedding because of their important role in export promotion. But this plea has not been heeded. The jute industry lost production valued at over seven crores of rupees in 1971 and in the current year also the loss continues to be substantial. According to the Indian Jute Mills Association, from January

1972 till August 25, this year, the industry's total loss from power cut was 23,000 tonnes valued at Rs 8.5 crores, including Rs 5 crores in foreign exchange. "The industry", said the IJMA, "is extremely concerned at the deterioration in the power supply position"; and it added that in less than eight months this year the jute mills in West Bengal have suffered a bigger production loss compared to 20,000 tonnes for the whole of 1971.

The maintenance of the power plants in the public sector has been sadly neglected because of the indifference of the administration. For instance, the thermal power station at Bandel under the state electricity board has four generators each with a capacity of 85 MW, making a total of 330 MW. But its capacity has been derated to 300 MW on account of the lack of proper maintenance. Though the turbo-generator of the No. 2 unit of this power station was installed in 1965, its first overhauling is reported to have been done only in 1970. Inadequate supply of water is also said to be a cause for the defective working of the cooling plant of this power station.

Has labour any responsibility in causing and perpetuating the power crisis? It is difficult to prove this point definitely though it is obvious that disturbed labour relations due to inter-union rivalry have prevented the power plants from maximising their production. Mr Ray some time ago hinted at the possibility of sabotage but this was promptly and angrily denied by the trade unions. They asserted that "the most criminal negligence and gross inefficiency of the administration, leading to the power crisis, was sought to be covered up by transferring the blame on the workers of the electricity generating units."

Whoever is really responsible for the current crisis, it is high time that the state government took some immediate steps to deal with it effectively. Mr Ray has been the chief minister now for about six months and he has given much evidence of his earnestness and determination to provide a new deal to the people of West Bengal. But unless he is able to do something to ensure the supply of power regularly and adequately especially to the industrial consumers, all programmes to revive the economy and create employment are bound to fail. The state government has in the recent weeks held discussions on many occasions with the representatives of industrial organisations on

the power problem. But these talks do not seem to have produced any concrete result. For example, in the last week of July this year, the government and industry agreed on certain proposals like the working of factories running three shifts on all the days of the week with the grant of weekly rest days on a rotational basis instead of Sundays, realignment of shifts where factories were running on two shifts to avoid working during the peak hours between 5 p.m. and 10 p.m., and readjustment of the working hours of factories where they were working only one shift. It was also agreed that the plants working on a continuous basis would be assured of power supply without interruption.

However, the government has not been able to enforce these or other arrangements in order to ensure that the available supply of power is distributed in such a manner as to cause the least dislocation to industrial production. The trade unions also do not seem to be in a co-operative mood. In a recent memorandum to the government, some organisations of the trade unions strongly opposed the proposal to alter the working hours of factories. They said, inter alia, "The holiday on Sunday is an accepted and established right of the workers and there is no reason for its being changed. For any exigency if the workers are to work on Sundays, they are paid double wages. The workers' right in this regard cannot be surrendered." The trade unions added that the spread-over of shifts would mean that workers would have to remain waiting 24 hours and they would work as and when power is available and that this arrangement would run contrary to the interests of the workers.

Among the other suggestions made by the industrial organisations in Calcutta to meet the power crisis, the more important are that five or six gas turbine generators of 20 MW each may be installed in the industrial areas and attached to the generating system of the Calcutta Electric Supply Corporation, that arrangements be made for the import of power from Bihar and Orissa through a power grid, and to permit and encourage, with official financial assistance the industrial units in the private sector to set up their own plants with 5 MW or more. Though these suggestions have been made many months ago, the government of West Bengal does not appear to have given them serious consideration. Mr B. S. Raghavan, the state's Power Commissioner, recently disclosed that the Chief Minister was personally looking into the problems of power shortage, that he was keeping in close touch with the authorities of the Durgapur projects in order to ensure better production, and he was also in correspondence with Mrs Indira Gandhi on this subject. But, despite Mr Ray's interest and initia-

tive, the power shortage has become more acute and reports suggest that some improvement is possible only with the onset of winter. But, surely, the situation ought not to drift indefinitely. The central government should immediately and effectively intervene and bring about

Canalisation of textile exports

SURELY NO ONE was taken by surprise when on August 22, Mr L. N. Mishra, Minister of Foreign Trade, announced in Parliament that the government had decided to take over the textile export trade. The Sword of Damocles has been hanging over the head of this trade almost since the last general election. "In organising the basic policies of the Ministry of Foreign Trade", Mr Mishra had told the Lok Sabha over three months ago—on May 12 to be precise—"I have been primarily guided by the programme outlined in the Election Manifesto of my party. . . . An important plank of our policy is to extend the role of the public sector in critical sectors . . . if national interests demand, we shall not hesitate to canalise the exports or imports of a number of other commodities, including traditional items through the public sector agencies. . . For years, we have witnessed the depressing failure on the part of the textile industry to meet its export obligations by failing to fulfil the textile quotas in a number of important markets like the UK and the member-countries of the European Economic Community. We were convinced that, short of canalising the exports of textiles through the public sector there was no other workable remedy. In principle, therefore, we have decided to canalise the exports of textiles through the public sector agencies".

Even earlier, that is about 15 months ago, Mr Mishra had made known this pet fad of his and proceeded to give it concrete shape by appointing a committee of experts to advise the government on the institutional framework for this purpose consisting of Mr K. Kishore, the then Textile Commissioner, Mr S. R. Damani, MP, Dr C.B. Nath, Director, State Trading Corporation of India, and Dr Manmohan Singh, Economic Adviser, Ministry of Foreign Trade. This committee submitted its report in April last. Mr Mishra informed the Lok Sabha on May 12 that the government had received the recommendations and that the details of the scheme would be announced shortly.

If at all any one was taken by surprise,

some improvement. The centre has enough data to understand why the crisis has occurred and why it continues to persist. It is high time that New Delhi did something to save West Bengal's economy which is threatened with serious dislocation due to the power crisis.

therefore, it must have been the textile industry itself which had been nursing its great hope of creating a record in textile exports during 1972. And the hope, far from being utopian, seems to be perfectly feasible of fulfilment, considering that, in the first seven months of this year (1972), textile exports have been earning valuable foreign exchange at a monthly rate of Rs 11 crores or an annual rate of Rs 132 crores, as against the peak established in recent years (1969, 1970 and 1971) of Rs 117 crores in 1970. There is nothing to suggest that this tempo has since slackened or is likely to slacken in the near future. For the industry has only recently taken measures to step up exports still further and its export target this year is believed to be Rs 145 crores which the industry is quite confident of achieving. May be the all round export performance of the industry has not been spectacular. Textile exports to the UK, for instance, the industry itself admits, has not been very good, but this is due to special difficulties not unknown to the authorities. Incidentally, it is not clear why the Foreign Trade Minister has decided to take the industry to task for not fulfilling its quota of exports to the UK only and not to the socialist countries where the public sector agencies are involved.

According to the information given by the Foreign Trade Ministry itself on the floor of the Lok Sabha, the other day, exports of cotton textiles to these countries during the year 1971-72 show a decline. Of course the ministry quickly explained the decline as being largely due to high cotton prices which were reflected in the production of cotton textiles, in particular yarn, exported during 1971-72. There were other explanations besides, namely, that the prices offered by some of the socialist countries were too low to be accepted and contracting with some of these countries accordingly got delayed and that currency difficulties of some of the importing socialist countries were also responsible for the decline. The irresistible conclusion is that what is sauce for the goose is not sauce for the gander.

Obstacles in the way of exports to any destination are more or less similar. Developing countries especially have been experiencing a variety of these obstacles more acutely even when they can command export surpluses and are able

to offer quality goods at competitive prices promptly on the delivery date, as Mr S. Jagannathan, Governor, Reserve Bank of India, told the All-India Exporters' Chamber at Bombay recently. Said Mr Jagannathan:

"I am conscious of the fact that even export surpluses with competitive prices and even with competitive quality and delivery dates would not suffice to break into the international markets. This market is very competitive and, to some extent, it is a very choosy market especially affecting newcomers. Even if our goods and services are competitive internationally, it is difficult to sell them without earning a reputation for our ability to manufacture complex and sophisticated goods".

This means that more than ordinary efforts are needed to push our exports in relentlessly competitive international markets. It cannot be said that textile exporters have not been making all-out efforts to augment the country's textile exports. For instance, the industry has taken the unique step of accepting voluntary obligation for every composite mill to export to the UK a stipulated percentage of its production on pain of a penalty of 25 paise per sq. metre for any shortfall in this percentage. Again, with a view to carrying out a number of special export promotion measures, the industry has been, of its own accord, collecting spindle levies.

It is ironical that just when the textile exporting interests are feeling that they are more efficient than ever before and that they are justifying their existence more than any time in the past, they should be charged with having failed the country and condemned so cavalierly by the Foreign Trade Minister. Giving a dog a bad name and hanging it is an age-old pastime of politicians such as Mr Mishra. The question is not whether he or the government can or cannot take over the textile export trade. But will the decision, if and when implemented, be to the best interests of the country? Prudence and past experience suggest it will not. Textile export is a highly personalised business calling for immense capacity continually to adjust and improvise. Before taking on yet another important item of export such as cotton textiles, let the public sector agencies demonstrate that they are able to deliver the goods in respect of these which they have already taken over. In any case, if eventually the textile industry itself is going to be nationalised as the President of the political party to which Mr Mishra belongs seems to be never tired of threatening, the authorities could well afford to be patient and let sleeping dogs lie.

Rural electrification in India

C. R. Ekambaram

RURAL ELECTRIFICATION, from many points of view, is not only a vital but a gigantic task. Over 80 per cent of our people live in 5,67,000 villages in the country engaged mainly in agriculture which is the backbone of our economy.

So far only a little over a fifth of these villages have been electrified in the purely technical sense of the word. In the first stage of this electrification covering the first five decades up to the start of the first five-year Plan only 3558 villages or 0.6 per cent of the total number had been electrified, and only 18,709 agricultural pumpsets had been energised. The second stage covers the first three five-year Plans from 1951 to 1966. By the end of this period, the number of electrified villages rose to 45,806 constituting 8.1 per cent of the villages in the country, and the number of energised pumps rose to 5,12,920. The third phase is the period since the end of the third five-year Plan (1965-66). As a result of severe drought experienced in different parts of the country during 1965-66, it was decided to accord the highest priority to the provision of assured irrigation in the villages through the exploitation of underground water resources.

adjunct to irrigation

It was brought home to planners, policy makers and administrators alike that rural electrification was a necessary adjunct to irrigation and was complementary to the construction of wells and installation of pumpsets envisaged in a number of all-India and state programmes. The success of the new agricultural strategy, which aimed at attaining self-sufficiency in food production depended to a large extent on success in irrigation. It was against this background that the emphasis of rural electrification was shifted from village electrification to pumpset energisation.

It was in recognition of the importance of rural electrification in quickening the pace of agricultural development that the government of India decided to set up a specialised body, namely the Rural Electri-

fication Corporation (REC) with the objective of promoting and financing rural electrification projects in the country. The formation of such a corporation had been recommended by the All-India Rural Credit Review committee, headed by Mr B. Venkatappiah, in 1969. This committee, in the course of a comprehensive review of all sources of rural credit in the context of the growing needs of agriculture came to the conclusion that for the modernisation of agriculture in India, a massive programme of rural electrification was essential as farm mechanism and adoption of improved practices would depend very largely on the availability of assured irrigation through the use of electricity.

policy directives

The Rural Electrification Corporation came into existence in July 1969 specifically:

- (1) to finance rural electrification schemes in the country;
- (2) to subscribe to special rural electrification bonds that may be issued by the state electricity boards on conditions to be stipulated from time to time;
- (3) to promote and finance rural electric co-operatives in the country; and
- (4) to administer the money received from time to time from the government of India and other sources as grants or otherwise for the purposes of financing rural electrification in the country in general.

In carrying out these objectives, the Rural Electrification Corporation is guided by certain directives given by the government of India, of which the more important are that:

- (i) the corporation may consider schemes for financing on the basis of a project approach;
- (ii) it should provide financial assistance for schemes which satisfy criteria of economic viability, and in particular help increase agricultural production;
- (iii) in financing projects, the corpora-

tion should give special consideration to the requirements of relatively backward areas and may offer preferential terms and conditions of loans for such areas; and

(iv) the corporation should help to promote some pilot rural electric co-operative projects and generally try to promote the co-operative method of distribution of electricity in the rural areas.

The principal borrowers of the Rural Electrification Corporation are the state electricity boards of which there are 17 today. These boards have been vested with the responsibility for generation, transmission and distribution of power within their respective states. Apart from the state electricity boards, the Rural Electrification Corporation has, at present, five borrowers in the co-operative sector, viz., five pilot rural electric co-operative societies set up in the five states of Andhra Pradesh, Gujarat, Maharashtra, Mysore and Uttar Pradesh.

In determining the eligibility of any scheme for financial assistance, the Rural Electrification Corporation takes into consideration the following factors:

- (a) the project concept;
- (b) economic viability with special reference to increasing agricultural production; and
- (c) the special needs of co-operative projects.

project concept

The project concept arises from the shift in emphasis from villages electrification to energisation of pumpsets which has recently taken place in our country. Electrification of rural areas is recognised as a key factor in stimulating the economic development of the rural areas. This implies that rural electrification is not an end in itself but is a means to activating other forces for rural development as part of an integrated rural development programme.

The economic activities likely to be stimulated by rural electrification in India

are primarily agriculture and, secondarily, rural industries. Therefore, one would have to take into account the plans for agricultural development in the given area and the extent to which other agencies have created conditions for the use of electricity for irrigation as a profitable proposition for the farmers. Similarly, one would have to look into the potential for the growth of village or rural industries in terms of the availability of raw material, entrepreneurship and credit. Credit is an important aspect in agriculture as well as rural industries. The state of communications and the availability of market for agricultural as well as industrial products will be additional considerations.

Another very important factor to be taken into account is the availability of ground-water resources for the operation of electrified pumpsets. When pumpsets are fitted with electric motors, the consumption of water for irrigation will be appreciably increased. It would be necessary, therefore, to ascertain from experts whether the ground-water resources in the region will be able to sustain the operation of electrified pumpsets for the number of hours per year likely to be required for agricultural operations.

The project approach, therefore, really means that whenever a scheme comes up for consideration the Rural Electrification Corporation looks into it not just as a project aimed at extension of electric lines to certain villages and provision of service connections to certain points, but as an essential component in the integrated plan of economic development for the area.

economic viability

The next important consideration is that of economic viability. The considerations which arise in assessment of economic viability are connected with the project approach. Economic viability has to be spelt out in concrete terms. Criteria for economic viability have been evolved by the Rural Electrification Corporation on the basis of classification of areas from the point of view of economic development achieved and the potential for future development.

Areas which are classified as economically backward are allowed an additional period of five years to reach the level of viability as compared to areas which are classified as advanced. The achievement of the prescribed level of viability is expected both for advanced as well as back-

ward areas, over a period of time, the period for advanced areas being 10 years and that for backward areas 15 years. A project to be viable should be capable of a net return of 3.5 per cent on the capital investment involved in the project by the tenth year or the fifteenth year of the commencement of the project, depending on whether the area is classified as advanced or backward.

under-developed areas

There are, however, certain exceptional areas like under-developed hill regions in some states of the Indian union, which call for special treatment in the matter of rural electrification. A rural electrification project in such an under-developed area may not be able to achieve the prescribed level of viability even in fifteen years. Recently the category of specially under-developed areas has been extended to include tribal areas and desert regions.

In such exceptional cases an additional period of five years is allowed for reaching the level of viability. The periods of loan and the rates of interest are suitably adjusted to meet the requirements of advanced, backward and specially under-developed areas. According to the present policy decisions of the Rural Electrification Corporation, a loan for a project in an advanced area is repayable over 20 years; a loan for a backward area is repayable over 25 years; and a loan for specially under developed hill regions is repayable over 30 years.

In addition, in order to correct imbalances in rural electrification, special category loans are being made available for extension of high tension transmission lines and connected sub-stations in states which are backward in rural electrification, i.e., below the all-India average of rural electrification. These loans are subject to certain norms to ensure that the lines primarily cater for rural loads.

More recently, the Rural Electrification Corporation has evolved a new category of special loans. The loans are specifically for systems improvement in areas covered by projects sanctioned by the corporation.

The corporation has also been entrusted with administering a special fund specifically designed to extend electricity mainly for public and street lighting in areas inhabited by Harijans adjoining villages which are already electrified. In the projects sanctioned for loans by REC

POINTS OF VIEW

also provision is made for the inclusion of Harijan basties in the rural electrification project areas.

Since the Rural Electrification Corporation started sanctioning loans in March 1970 until the end of July 1972 it had approved 264 projects including pilot rural electric co-operatives. These projects which will help spread the benefits of electricity to about twenty-five thousand villages have been sanctioned in all loans amounting to Rs 160 crores. One hundred of these projects are for areas which are economically backward and six for specially under-developed areas in the hilly regions. Six are for special transmission lines. One hundred and forty seven projects are for advanced areas and five for Rural Electric Co-operatives. Nearly three and a half lakh agricultural pumpsets will be energised and connections provided for a little less than ten lakh agro-industries and light and cottage industries. The villages and the adjoining hamlets will be provided with several thousand domestic and commercial connections and street lights.

In addition, the Rural Electrification Corporation has approved about Rs 56 lakhs specially for the electrification of hamlets inhabited by Harijans adjoining villages which are already electrified.

rural electric co-operatives

At present there are five pilot rural electric co-operative projects each covering on an average 160 villages. These projects are somewhat different from the projects of state electricity boards financed by the corporation. A project sponsored by a state electricity board is a scheme for extension of power to a certain number of consumers of different classes. The economics of the scheme can be judged with reference to the economic benefits to be derived by the consumers as well as the return on the capital investment made by the state electricity board. But a rural electric co-operative project is a scheme of area coverage under which the co-operative society takes a distributing licence. Under the law it is obliged to provide connection to any consumer within the area of its operation. Some of the areas covered by co-operative projects are also urban or semi-urban in character and sometimes the co-operative societies have to cater for bulk consumers also. Moreover, the co-operative societies have to take over the existing assets and installations within the project area from the

THE END

Modi Steel Wires

Paper clips are just one of the thousands of end products Modi Steel Wires can be shaped into. The process begins at the Modi Steels plant where special steel is rolled for various kinds of wires and their end products. Wires of all forms and specifications, galvanised, black and special alloy can be drawn to meet your particular requirements. Modi Steel Wires are manufactured under rigid quality control and conform to ISI specifications. Modi Steels are licencee for ISI/280/1962—the highest guarantee of quality.

why do we search for new styles of tobacco

We have exported flue cured virginia tobacco for years at a steady level. Yet we are speeding up our search for new varieties of tobacco. Why?

To respond to international competition.

We treat it as a primary responsibility. New sources of tobacco have emerged overseas.

At the same time the consumer's taste has changed. So far the emphasis was on brightness in colour. It favoured

our flue cured virginia tobacco in the world market. With the swing towards filter tips, international customers now prefer

ripe, open-grained tobacco with more

positive characteristics and filling qualities.

To satisfy this new taste we are developing alternative areas for tobacco cultivation in Andhra Pradesh and Mysore. Soon this search for new varieties should bring results.

Meanwhile our export—currently a third of the country's total tobacco exports—must resist the pressure of overseas competition. There has to be someone to face it.

if we export traditional varieties successfully?

ILTD at the root of scientific tobacco farming

state electricity board and they have to lay out further distribution lines.

The Rural Electrification Corporation has agreed to provide loans to these societies to meet the cost of taking over existing assets from electricity boards as well as of construction of new lines and service connections within the project period not exceeding five years. Specially concessional rates of interest have been allowed to these pilot co-operatives. It is expected that these co-operatives, being organisations of consumers, will be able to pay close attention to the needs of the rural areas within their coverage, and their functioning, being consumer-oriented, will be conducive to economy. After these five pilot projects have functioned successfully for some time, similar projects are likely to be set up in

other areas also. Feasibility studies for such new projects have already been undertaken.

The REC has also initiated certain special measures to bring about economies in rural electrification. It has established a special cell with expert staff to study this problem, in continuation of the work already done in this field by the Central Water & Power Commission, the Indian Standards Institution and other expert bodies. It has held consultations with manufacturers, research organisations and the state electricity boards. As a result, it has been possible to evolve standards in respect of conductors, distribution transformers and other items which constitute a significant proportion of the total cost in rural electrification. It is estimated that with the adoption of the standards

POINTS OF VIEW

evolved, construction cost can be economised to a considerable extent.

The overall emphasis in the Rural Electrification Corporation's approach is on stimulating the use of electricity in rural areas for productive purposes such as energisation of pumpsets for agriculture and provision of electricity for small and cottage industries as well as for domestic purposes street lighting, and for community institutions such as village recreation centres, libraries, etc. The Rural Electrification Corporation also seeks to lay stress on the inter-relationship of electrification of rural areas with other developmental activities in order that the load growth is hastened and at the same time the community as a whole can derive the optimum benefits from electrification.

Industrialisation of Uttar Pradesh

S. K. Ray

IN THE industrial geography of the sub-continent, Uttar Pradesh unfortunately does not find as yet a place of importance. There are several reasons for this, and the one commonly advanced is that the province is backward in its possession of industrial raw material. Other reasons include paucity of surplus industrial capital as also of effective industrial entrepreneurship. While these reasons are partially correct, they do not wholly explain the halting progress of industrialisation even in post-independence era.

In Uttar Pradesh, strictly speaking, there is only one industrial pocket, in and around Kanpur, and only recently an industrial area is opening up in the Garhwa-Singrauli valley where several industrial complexes have been started. Besides, a diesel locomotive works has been functioning at Varanasi for some time and there are spot industrial organisations here and there and a few industrial estates. The sum total of all these, however, does not amount to very much compared to the industrial development of a truncated state like West Bengal and, for that matter, states like Maharashtra, Gujarat or Tamil Nadu.

It is true that basic industrial raw material is scarce in the major part of Uttar Pradesh and there is only a fringe of min-

ing wealth along Chopan-Garhwa-Singrauli sector. Industrialisation in the country so far had taken place in and around important mining belts where iron, manganese and such other ores are available in plenty, and where, above everything else, coal is available.

If meaningful steps towards industrialisation were to be taken in Uttar Pradesh, the emphasis should be the development of *white coal*, i.e., electricity, and on the development of agriculture as an industry. Other industries like diesel locomotive works at Varanasi, the aeronautics factory coming up near Lucknow, the scooter industry at Lucknow, the textile mills in Kanpur area, can add to spot industrial development in different areas, as a sequel to industrial policy decisions of the governments at the centre and in Uttar Pradesh; but a wave of industrialisation which can sweep over the length and breadth of the province can come up only in the directions mentioned above, and mainly by industrialising agriculture.

There is no gainsaying that Uttar Pradesh, which is situated in the fertile alluvial belt of the Ganga, the Yamuna and a net of other tributaries, and has easily the largest agricultural land for any single state in the country, has one of the poorest

systems of agriculture. Industrialisation does not necessarily mean raising up of huge factories producing ingots of steel; contrarily it can also take shape in ventures where a large number of men are employed, where output is turned out on scientific lines, the economies of scale are realised, and the rate of productivity is larger than the rate of investment.

Industrialisation in Uttar Pradesh, therefore, must flow from agriculture. In this state the settlement systems are still disorganised, holdings are uneconomic, fallow lands are extensive and the output per unit is dismally low. There should be an attempt at *wholesale industrialisation*, so to say, of agriculture in the state.

For this, the barriers of uneconomic holdings should be broken up, modern methods of farming should be introduced on a *collective* basis, centralised farming should be organised, godowns and silos should be set up for storage and to function as bargaining counters, and factories on small and medium scales should be set up in districts based on and sustaining agricultural output. Here, one has to think very seriously about the need for introducing collective farming and organising agriculture on modern techniques in the state.

To what extent nationalisation of agri-

culture (even though not of holdings) is a necessity, would have to be seriously investigated. It will be necessary, to begin with, for the government to take over and arrange cultivation on modern methods of the very large areas of cultivable lands in the state, which have not so far come under any tractor wheels. Then the programme may be extended in phases to other lands.

The Irrigation system in Uttar Pradesh is very backward and does not compare at all with the facilities already created in Punjab and Haryana. This has to be vastly improved and, if that can be done, cultivation will prosper and agriculture will bring affluence all around the countryside. There has to be far-reaching revision in the land settlement systems and the *ryotwari bandobast*.

There will then be money to spare for future investment into small and medium-scale industrial enterprises and for a ring of mills and factories which can be based on agricultural products and by-products, and which themselves will further the development of a modernised industry of agriculture. Since there is no investment readily available for this purpose in the state today, (which itself is a bit of a paradox), the small and medium industries even when they are being sponsored partially in the state should not prove much of a success, unless sufficient industrial surplus is generated for investment and the flow of capital becomes spontaneous and ceases to be reluctant. It has to be repeated that the basic fact of industrialisation in the context of Uttar Pradesh has to be understood in this background. There is no need to set up by the dozen mills and factories in Uttar Pradesh, which have to depend on coal, iron ore or manganese ore. In this state there are many turbulent rivers which can be permanently harnessed and from which any amount of electricity can be generated.

industrial projects

The major industrial enterprises which can be set up should, therefore, be based on consumption of electricity, and should not be dependent on materials which have to be transported from distant areas, because the productivity of such industries will be severely limited by the economics of location, which is a very important factor in industrial economics.

It is, therefore, that before wholesale industrialisation of large areas in the usual sense can take place, there needs to be a

fast and sponsored development of hydel power.

In any programme of industrialisation of Uttar Pradesh transportation will not be a major problem. The state is already linked up with criss-cross railway lines, both on broad and metre gauges, and there will be railhead services for any industry that may come up or that which already exists.

Planned development of the railways will also take into account any programme for industrialisation in any part of the state, as elsewhere. This, today, will never be a problem, provided there is material to be moved into the state or material to be moved out of the state.

In fact, when all on a sudden, a *green revolution* started in Punjab and Haryana, it was the railways which came to the rescue of the states by moving any amount of wheat to the deficit states, thus preventing uneconomic gluts in the home markets, and thereby sustaining the productivity and profitability of agriculture and marketing enterprises. The railways also have later participated in the revolution by suggesting to the state governments and Food Corporation of India to create sufficient storage facilities in the states.

arterial roads

Contrarily, in Uttar Pradesh, where last year there was a comparatively successful harvest, it is common knowledge that there was difficulty in bringing the procurable surplus to the railways for movement for want of arterial and feeder roads and also for lack of adequate storage capacity in the countryside.

If agriculture in Uttar Pradesh has to be industrialised, rail transport network will certainly give it a big hand. In order, however, to take full advantage of the railways the state government will have to develop a larger network of feeder road and storage services, including godowns and silos, both in the countryside and at the major railheads.

There are many areas in Uttar Pradesh where the hinterlands for the major railheads for dispersal of industrial and agricultural output need to be opened up. Such hinterlands extend over the large non-urban agricultural and semi-agricultural areas and over distant industrial estates, like the one slowly developing in the wake of Rihand Dam project. The whole area is beyond the Chopan river bridge and a number of hillocks, and connected by a good highway, making it more suitable and profitable for road

POINTS OF VIEW

transport to link up the area with the nearest railheads, such as Robertsganj, Chopan and Churk, and other points on the Garhwa-Singrauli links.

Under the five-year plans, India has projected, and to a large extent worked out, a mammoth extension of railway services, all over the country, including Uttar Pradesh. Yet, considered from the viewpoints of the necessities of developing industrial and agronomical economic sectors, Uttar Pradesh, like most other states, will have to depend for a long time on the roads in addition to whatever further development in the railway system may be achieved in the near future. It is necessary to have an extensive network of arterial and feeder roads to open up the hinterland for the railheads.

anachronistic farming

The per capita income in Uttar Pradesh is low. This is because industry has made no meaningful progress, and because the system of agriculture is anachronistic. Mineral resources are scarce. Potential for development of hydel power is enormous. Labour is mainly unskilled and agrarian. Agricultural land already under cultivation (but in an uneconomic way), arable lands not under cultivation and lands which are not arable but can be brought under cultivation by dint of irrigation and investment, are all vast and extensive.

A large number of large-scale industries also can be set up in the state which will draw their sustenance from agriculture, and will be run on electricity which should be available in plenty in the state if the rivers are properly harnessed.

As far as rail transport is concerned, the facilities already available can attend to the increased industrial requirements. If more facilities are required to be created, these will certainly be developed and offered to the state. In fact, a state gets such railway networks as it deserves. If Uttar Pradesh takes progressive steps in industrialisation of its ventures, there will be no dearth of adequate rail movement capacity.

But this alone will not be enough. It will be necessary for the state itself to develop a large network of arterial and feeder road systems, which now are more or less primitive, so that these can link up the agricultural holdings and the village-level industries with the silos and godowns in the markets and the factories in the towns and cities and all of them with the nearest railheads.

Instability in agricultural prices

THE FOURTH five-year Plan has outlined two objectives for fulfilment, namely, to provide the conditions necessary for a sustained increase in agricultural production of about five per cent per annum over the next decade and to enable as large a section of the rural population as possible, including the small cultivator, the farmer in dry areas and the agricultural labourer to participate in development and share its benefits. These objectives imply attainment of self-sufficiency in foodgrains and remedying imbalances in the agricultural economy with social justice. In addition, there is also an urgent need for stepping up the exports of some of our cash crops and for making sustained efforts for exporting even foodgrains in future to meet the foreign exchange payments for our increasing imports for exporting even foodgrains in future development, debt servicing in the face of an uncertain climate of foreign aid and so on. To achieve these objectives, it is necessary that the grower is not only assured of certain minimum returns but also of some incentives to grow more. For this the basic requirement is to see that the cultivator is ensured of getting a certain minimum price for his product under all circumstances. As the late Dr P.S. Deshmukh put it "all efforts at increasing agricultural production will be of little avail if increased production were to continue as in the past to result in abnormal lowering of farm incomes. For sustained high level of production, it is absolutely necessary that the grower should be given a reasonable price for his produce."

price checks

It is also equally desirable to ensure that the prices of agricultural commodities do not shoot up causing much hardship to the consumer. Abnormal rise in the price level may also divert the flow of goods to consuming centres within the country thereby cutting into exportable surpluses and in some cases may even result in our products being priced out of international markets. It is, therefore, obvious that undue fluctuations in agricultural prices which cause considerable hardship to the grower and consumer alike and affect our export trade are cur-

bed in the interest of our economy.

In our country where there is no cropping regulations, it is largely the level of prices that determines the use and availability of resources and the acreage under different crops. In other words, agricultural production cannot be regulated according to the consumers' demand. The problem of sudden surpluses or deficits of agricultural commodities is the outcome of this peculiarity. This inherent uncontrolled mechanism in the agricultural sector disturbs the price equilibrium. Secondly agricultural commodities, whose elasticity of demand is somewhat low, are prone to react to a small increase or decrease in their supply with a disproportionate rise or fall in prices. More specifically, agricultural prices are affected by the following short term and long term factors:

difficult storage

1. Agricultural commodities are generally speaking voluminous and in some cases perishable rendering their long term storage difficult and risky.

2. The harvest period which is limited to a few weeks is followed by a glut in

the market as the Indian farmers' holding capacity of stocks is low.

3. Apart from the temporal fluctuations in prices there will be, at a point of time, wide regional disparities in price levels (of even comparable qualities/varieties of the crops grown) stemming from the existence of pockets of surplus or deficit that are separate by long distances in our country. Inadequate storage and transport facilities aggravate the position.

4. Sometimes, strong varietal preferences by consumers lead to substantial differences in the price level in regions producing different varieties of the same commodity.

long-term factors

1. The rate of investment in the economy has a direct impact and on the price level, subject of course, to the increase in volume of production brought about by such investment. That is to say, any step-up in investment unaccompanied by a corresponding growth in production would tend to push up the prices.

2. The rate of growth in population is another secular factor that will have a direct influence on the price level.

In the context of the need for stabilis-

(Cont)

ing agricultural prices, which by and large have been subject to considerable fluctuations in our country, it would be beneficial to carry out an objective price analysis before any measures for remedial action are contemplated. Such analysis consists in studying how the prices behave over time, finding out how much of the variability is ascribable to known sources of variation and testing whether the effect of each source of variation is significant or not. In what follows, the prices of dry chillies which are grown in many states of India and which are also an important foreign exchange earner among Indian spices have been considered for price analysis as outlined above.

Monthly average wholesale prices of five different centres, viz. Bombay, Guntur, Nizamabad, Patna and Virudhunagar for a period of six years from 1965-66 to 1970-71 (see Appendix) have been considered for studying the seasonal variation in the prices of chillies. The seasonal indices of chillies for these five centres worked out after eliminating the random or irregular fluctuations by means of a 12 monthly moving average are given in the Table I (p. 555). The graph on page 558 depicts the movement of prices month after month in the five different markets:

seasonality in prices

These seasonal indices show when the prices are generally easy and when they are likely to harden up. It would be apparent from the table and the graph that prices of red chillies in all the centres are very low during April-May in the year with the exception of Bombay where the price level is the lowest in August-September, and rise high during October-January. The seasonal indices will also facilitate comparison of price levels in different centres at the same point of time. Such indices, if made available to the producers—sellers will prove to be of immense use in helping them to choose the market for the disposal of their produce at a specified time. For instance, in the month of December or January, it may be advantageous for a seller in Nizamabad to shift his stocks to a place like Guntur or Virudhunagar for disposal subject to the consumers' preferences and the freight charges involved in transporting the stocks from Nizamabad to Guntur or Virudhunagar. If the price differential is wide enough to more than compensate the freight charge and other incidental expenses, it would be advisable for one in Nizamabad to sell off his stocks in Guntur or Virudhunagar in December-January.

In the same way with such information regarding price movements on hand, buyers also can choose the market from where to purchase their requirements. Besides being of much use to the producer and consumer in regard to the sale or purchase of the produce as the case may be, the indices of seasonal variation can be an important tool for the policy maker to adopt measures and timing them properly for curbing the extreme fluctuations in prices.

analysis of fluctuations

Seasonal indices give an idea of how the prices vary and the extent to which shifts in price movements take place in the year. However, the variation in prices apart from season, may be due to a multiplicity of factors such as the place, trade-cycle and other long-term and secular forces at work.

Analysis of variance is a device by which the total variation (in price) is compartmentalised into several parts, each part being attributable to a single factor bringing about the variation. It also aids in determining on a scientific basis, whether the quantum of variation attributable to individual factors is significant or not, by the application of statistical tests of significance. In order to carry out the analysis of variance, the monthly price of chillies in the five different centres of Bombay, Guntur, Nizamabad, Patna and Virudhunagar for the six-year period 1965-71 have been tabulated in the form of a three-way classification and the variance analysed. Table I (p. 555) shows the results of the test to verify the significance or otherwise of the variation due to month, year and the centre as also the variation due to the interaction between year and month, month and centre, and year and centre.

These results show that except for the variation due to the interaction of month and centre, the effect of all other sources of variation is significant, the effect of the year being highly pronounced. The variation in prices of chillies between months in a year and between centres is also quite high.

What is true in regard to the prices of chillies is broadly true in the case of prices of all agricultural commodities in general except those fixed or controlled by the government such as foodgrains, sugar, cotton, jute etc. As emphasised earlier it is essential that the fluctuations in agricultural prices are evened out and towards the end an effective price stabilisation policy followed. The steps outlined below may help realise this aim.

1. Adoption and extension of uniform

Monthly Prices of Chillies in different Centres in India, 1965-66 to 1970-71

POINTS OF VIEW

grades and standards for as many agricultural commodities as possible which would facilitate the sale and purchase of goods at standard prices all over the country. National grades and standards are important not only to the farmer and consumer within this country, but also to the manufacturer, exporter and foreign buyer. Grading and standardisation are equally important from the point of view of cutting down the packing and transport charges incurred in moving unwanted foreign maker from producing to consuming centres.

2. Extension of regulation of markets to states where it is not practised today and to tighten the regulation where it is

loose. In a regulated market the farmer enjoys the benefit of open bids, standardised market practices and predetermined market charges. Incidentally, it is inherent in the system of regulation that all information on arrivals, prices etc. should be recorded so that this may simplify the task of collection of reliable and comprehensive market intelligence.

3. Organisation of market intelligence which would not only help the farmer in the orderly marketing of his produce but also aid the government in formulating sound food and agricultural policy. Market intelligence connotes not merely price data but also information regarding seasonality in prices, market arrivals, mar-

ketable surplus, likely demand and other allied information.

4. Timely dissemination of market information by organising an efficient Market News Service and evolution of a system of price broadcast that will bring to an increasing number of persons, the timely, accurate and comprehensive interpretation of factors influencing the market. It would be useful to include in the broadcast from one state the market news of other states. This would enable farmers to keep in touch with the price movements in the neighbouring states.

5. Adoption of suitable fiscal and monetary policies by the government in regard

to extension of credit, imposition of levies and the like.

6. Improvement in government warehousing facilities and promoting scientific methods of storage in godowns owned by private individuals through energetic extension work.

7. Ensuring that the institutional credit advanced by banks and other financial institutions really reaches the needy far-

mer on easy terms which alone can improve his holding power after harvesting his crop and his bargaining power vis-a-vis the trader or the middleman.

8. State intervention to curb extreme fluctuations by open market operations. Strengthening the Food Corporation of India (FCI) and extend its activities to cover a wide range of other agricultural commodities or, if need be, setting up of

another corporation on the lines of the FCI is a proposal worthy of consideration.

9. And finally organising an efficient network of public distribution through fair price shops, departmental stores and agmark emporia to ward off any price spiral in times of scarcity. The price spiral is bound to hit the poorest section of the hardest just as any crash in price is bound to hit the small farmer.

Our Parliamentary Correspondent

New Delhi.

THE BEHAVIOUR of the ruling party in the Lok Sabha on Saturday, when the House was scheduled to discuss the affairs of the Food Corporation of India, did little credit to it. It, indeed, was an unseemly attempt to stall the discussion on the issue which had assumed great significance in the recent past because of the agitation by a section of the officials of the FCI. One fails to understand why the deputy whip of the government started taking the Congress party members out from the House when with its overwhelming majority, the ruling party could squarely face the debate. Presumably, the effort was designed to get the House adjourned sine die without the operations of the FCI being discussed on the plea that there was no quorum. The alert opposition, however, foiled this attempt and forced the Speaker to extend the sitting of the House by a day — on Monday.

As stressed in this column earlier on several occasions, it is true that both the treasury benches and the opposition have responsibility to maintain quorum in the House so that proceedings can go on smoothly. But in view of the setback suffered by the opposition at the last parliamentary election the responsibility of the ruling party to keep quorum has assumed heightened significance. Any recurrence of the last Saturday's happening can do a great harm to the faith of the people in democracy. Could it be hoped that a serious note would be taken of the matter by the union government and a thorough probe will be instituted to find out the reasons for the attempt of the deputy whip at carefully emptying the House just before an important debate was to be held?

refreshing change

When the matter was taken up on Monday, it was, of course, refreshing to note that not only the opposition members were exercised over the working of the FCI but many Congress members also expressed their deep concern over the affairs of this biggest public sector undertaking, whose turnover aggregates to about Rs 1,600 crores per annum. The FCI chief, Mr Iqbal Singh, was the main target of the Opposition. Mr Pilo Mody (Swatantra), who had raised the discus-

sion, alleged that Mr Iqbal Singh was tempering with official records to forestall a fair inquiry against him. He, along with several other opposition members, called for the suspension of Mr Singh and the constitution of a high-powered commission of inquiry to investigate the various charges against him, some of which were being looked into by the Central Bureau of Investigation. The charges, as mentioned in the House, included (i) purchase of mustard oil by the FCI at prices higher than those prevailing in the market, (ii) the supply of maize to starch manufacturers through negotiable tenders and not through open tenders, (iii) the disposal of gunny bags, (iv) transportation of foodgrains to some parts of the country, and (v) pulses deals. According to Mr Mody, the working of the FCI under Mr Iqbal Singh was a story of "swindle and leakage of crores of rupees of public sector money".

reeking corruption

Some of the Congress members who participated in the debate, expressed the view that the CBI inquiry ought to have been directed not only against the Chairman of the FCI but also against bureaucrats so that the whole truth could come out. They felt that Mr Iqbal Singh was being victimised by officials who did not like certain actions of his. Some other Congress members, however, agreed with the opposition and demanded the exit of Mr Iqbal Singh. Mr S. S. Mahapatra (Congress) alleged that there was reeking corruption in practically every branch of the FCI.

Replying to the debate, the Minister for Agriculture, Mr Fakhruddin Ali Ahmed, assured the House that the government would carefully examine the allegations made by members. He, however, preferred not to say anything on the demand for the constitution of a high-powered commission of inquiry. He also rejected the plea for the suspension of Mr Iqbal Singh. It would not be proper to punish a man till he was found guilty, he stressed. Mr Ahmed disclosed that Mr Iqbal Singh had sent to him a 200-page explanation which he was studying. The government would take action only if a prima facie case was established

against the FCI chairman. The Agriculture Minister admitted that the CBI was inquiring into some charges against Mr Iqbal Singh, but he pointed out that he had not referred any case to the CBI except the one relating to a deal in pulses. The CBI, of course, had taken up the inquiry into the other charges on its own.

Wanchoo committee report

Another important subject which came up for discussion during this terminal week of the monsoon session of Parliament was Wanchoo Committee's Report on Direct Taxes. The government was assailed for not taking effective steps to check the growth of "black money", which, it was stressed, was playing havoc with the economy. Mr Jyotirmoy Bosu thought that the ruling party was not interested in curbing the growth of black money because it was dependent on it. He also alleged that at one time the government had decided to demonetise currency, but at the last minute the proposal had been abandoned because the Prime Minister did not give clearance to it.

Intervening in this debate, the Minister of State for Finance, Mr K. R. Ganesh, promised that a comprehensive legislation would be brought forth during the winter session of Parliament (of course, if the Finance Ministry's processing of the Wanchoo Committee's report was completed in time) to mount a determined attack on the citadels of black money. The government, Mr Ganesh added, had already acted on some of the recommendations of the committee.

Another highlight of the proceedings of Parliament this week was the discussion on the notice served by the Uganda government on Asian settlers to leave that country within a stipulated period. All the sections of the House expressed concern over the developments in Uganda. The opposition members demanded that the issue of Asian settlers there should be taken to international forums. The Minister for External Affairs, Mr Swaran Singh, however, did not agree with this proposal. He expressed the view that it was better to rely on bilateral approaches, both at the political and official levels, which had already been made by the go-

vernment. He expressed dissatisfaction with the curbs placed on the departing Asians taking away with them all their cash and movables. "We consider that the present facilities for the repatriation of cash and movables are wholly inadequate in relation to their (Asians') long residence in Uganda as well as for starting a new life", he observed.

Mr Swaran Singh rejected the suggestion that India should accept all persons of Indian origin in Uganda. It would be wrong, he said, to let the British who had accepted full responsibility for all British passport holders to get away from that responsibility. The provision of temporary transit facilities to British passport holders agreed to by India, he pointed out, was being done on humanitarian grounds. He assured members that government would shoulder full responsibility for the re-settlement of Indian passport holders. The stateless, he stressed, however, would have to be the responsibility of Uganda, where these people have lived for long.

Lipa posts

Clarifying the recent parleys between a Pakistani delegation and the government of India on the delineation of the new ceasefire line in Jammu and Kashmir, prior to the repatriation of Pakistani prisoners of war, Mr Swaran Singh assured members that Pakistan would have to quit the two Lipa Valley posts which it had occupied after the cessation of hostilities between India and Pakistan in December last.

In a statement made in the Lok Sabha this week, the government announced its sugar and sugarcane policy for 1972-73. The policy envisages stepping up of the statutory minimum price of sugarcane from Rs 7.3 per quintal for 9.4 per cent sucrose content to Rs 8 for 8.5 per cent sugar recovery and increase in the quantum of levy sugar from 60 to 70 per cent of production. The export quota henceforth will be met out of the free-sale sugar; hitherto, it was to be made available by mills at the levy prices, along with 60 per cent of their output to be distributed through fair-price shops.

The government also announced in this statement its intention to have a uniform issue price for levy sugar throughout the country by means of pooling the widely different levy rates for mills in different parts of the country based on the statutory minimum prices of sugarcane. The pooling scheme is to be worked out soon by the Department of Food.

The statement as well described as government's aim the achievement, in a few years, of a balance between the supply

and demand of sugar by raising the production of sugarcane adequately to meet the requirements of the manufacturers of sugar, khandasari and gur, and the creation of a buffer stock to provide against fluctuations in production. This aim is proposed to be achieved through "a well-conceived and properly integrated long-range policy" by both "qualitative and quantitative" improvement in sugarcane production to enable mills to work for nearly 200 days in a year. The imposition of a small extra central cess on sugar would be considered for the purpose.

sugar distribution

Later on, replying to a discussion on the policy in the Rajya Sabha, the Minister of State for Agriculture, Mr Sher Singh, indicated that the government could not take over the entire production of sugar for supply through the public distribution system—this demand had been made in the House by several members, belonging both to the ruling party and the opposition. The reason the Minister gave for this was that if all the stocks were taken over by the state, the mills would not be in a position to pay to cultivators more than the minimum price fixed for cane supplies. He explained that the minimum price for cane, which had been fixed by the government, was only notional. The mills would be able to pay more than the minimum price out of the higher proceeds from the sale of non-levy sugar.

In view of the fall in production and poor carry-over stocks, the government, Mr Sher Singh added, desired that output of sugar during the next crushing season should go up; it could contain sugar prices and build up a buffer stock only if there was an increase in production.

Several members called for the nationalisation of sugar industry. The minister's reply to this demand, however, was that only the interim report had yet been received by the government from the Sugar Inquiry Commission. The Commission had been asked to expedite its final report. The issue of nationalisation could be decided upon only after considering the final report. Some members thought that the increased minimum price for sugarcane too was not sufficient. They wanted it to be raised further.

Several important bills were adopted by the two Houses of Parliament this week. These included: (i) the Mines and Minerals (Regulation and Development) Amendment Bill; (ii) the Rulers of Indian States (Abolition of Privileges) Bill, (iii) the General Insurance Business (Nationalisation) Bill; (iv) the Delhi University (Amendment) Bill; (v) the Former Secretary of State Service Officers (Conditions

of Service) Bill and (vi) the Indian Copper Corporation (Acquisition of Undertaking) Bill.

The Mines and Minerals (Regulation and Development) Amendment Bill sought to amend the parent act in the light of the recommendations of the Mineral Advisory Board. It also aimed at vesting in the government some additional powers in respect of terminating a mining lease in consultation with the state government concerned if the public interest demanded so. During the discussion of this bill, the Minister of State for Steel and Mines, Mr Shah Nawaz Khan, assured members that the government did not propose to take over the entire coal industry. It wanted to give an opportunity to the private sector to play its role in a fair and honest manner. He, however, made it clear that if the private sector did not play its part, the government would not hesitate to step in.

The Rulers of Indian State (Abolition of Privileges) Bill, which sought to abolish a number of privileges which were enjoyed by the erstwhile rulers of Indian states and which empowered the government to pay the former rulers tax-free transitional grants and certain tax exemptions to enable them to adjust progressively to

the changed circumstances after the abolition of privy purses, was generally welcomed by members in both the Houses. Even the exemption granted by the bill from wealth tax to the official residence and heirloom jewellery for the lifetime of the beneficiaries did not attract any adverse comment. Some criticism, however, was voiced against the ex-gratia payment of Rs 10.75 crores to the former rulers.

The General Insurance Business (Nationalisation) Bill, which provided for the nationalisation of the general insurance companies whose management was taken over by government last year, came in for a good deal of criticism. While some members with rightist leanings continued to feel that even the revised compensation amounts fixed by the Joint Select Committee were inadequate and were likely to give a jolt to the investment climate in the country, those with leftist leanings reiterated their objection to the very principle of paying compensation to the shareholders of the acquired companies. The waiving of a rule by the presiding officers of the two Houses by virtue of which the passage of the bill was allowed to be effected on the same day on which discussion on it took place, though a number of changes had been made in the bill by the Joint Select Committee, was seriously objected to by the opposition. In the Lok Sabha, the bill was passed after the entire opposition had staged a walkout. In the Upper House, the proceedings were held up for quite some time.

college councils

The Delhi University (Amendment) Bill, which provided, among other things for the institution of college administration councils, came in for sharp criticism following a strike by the teachers of the university. The government, however, did not yield and got the bill passed. A significant point made by the Minister for Education, Mr Nurul Hasan was that the provision for college administrative councils was only an enabling clause. Perhaps this would help in the restoration of normalcy in the Delhi University.

The Former Secretary of State Service Officers (Conditions of Service) Bill, which aimed at ending the special privileges enjoyed by the members of this service, including the drawing of pension in sterling, and sought to reduce their retirement age from 60 to 58 years, had an easy passage as the number of members affected is now very small. Some members questioned the wisdom of this enactment on the above ground.

The Upper House also passed four other

bills as adopted earlier by the Lok Sabha. These were: (i) the Wild Life Protection Bill; (ii) the Indian Iron and Steel Company (Taking-Over of Management) Bill, (iii) the Antiquities and Art Treasures Bill; and (iv) the Insecticides (Amendment) Bill. The Lok Sabha adopted the Indian Copper Corporation (Acquisition of Undertaking) Bill.

The following information was provided by government spokesmen in the two Houses of Parliament during the question hour:

(i) Some industrial houses whose units were the subject of inquiry by the Sarkar Commission investigating the circumstances which led to production by some industries in excess of licensed capacity, were not barred from applying for expansion or new capacity in respect of the other units they controlled.

(ii) The proposed manufacture of stainless steel at the Salem steel plant would in no way affect the Durgapur Alloy Steel Project. The installed capacity of the Durgapur plant in this line of manufacture was originally thought to be 18,000 tonnes per annum. Due to defects in equipment, the actual capacity, however was only 13,000 tonnes. The actual production during 1970 and 1971 had been just around 3,000 tonnes.

(iii) The government has decided to build up a buffer stock of seven million tonnes of foodgrains by the end of the fourth Plan period, as against the earlier decision of building up a five million tonnes stock. A crash agricultural production programme is being launched by the state governments for the rabi crops to make up the loss in production of kharif crops due to the recent drought and floods.

(iv) There were 120 American companies at work in India as on March 31, 1971. Of these, 68 were companies as defined under section 591 of the Companies Act, 1956, and 32 were Indian subsidiaries of American companies. Of the total, 76 companies had been working in India since 1960 or earlier.

(v) The government proposes to import fish worth Rs 1.5 crores per month during the remaining term of the trade agreement with Bangladesh. About 70 per cent of the imported fish is proposed to be utilised for supply to Calcutta. Contracts have already been entered into with Bangladesh for the export of coal, tobacco and cement and for the import of furnace oil, newsprint and some jute. Regular trade in these items and in fish and textiles between the two countries is

expected to gather momentum in the coming months.

(vi) The government has agreed to make an inquiry into the allegation of exorbitant prices having been paid to a foreign firm for the import of tool and alloy steel through the State Trading Corporation. An Austrian firm was named by a member in this connection. It was alleged by him that the STC had purchased tool and alloy steel from this firm worth about Rs 1.12 crores. The prices paid were more than twice the quotations from the Japanese suppliers. It was further alleged that they were even higher than the prices prevailing in Austria itself.

(vii) India would purchase crude oil from Iraq at the rate of seven to eight lakhs tonnes per annum up to 1974-75. This crude would be processed at the Barauni refinery. The Oil and Natural Gas Commission has put in a bid for prospecting and development of oil in some areas of Iraq.

(viii) The government has written to the Pay Commission drawing its attention to the increase in the cost of living index to 237.08 in July and the possible need to revise upwards the dearness allowance of government employees.

(ix) The first blast furnace of Bokaro Steelworks is expected to be commissioned this month. The commissioning of the blast furnace had been delayed by about a month due to some mechanical trouble.

(x) The government of India has no scheme for the entertainment of claims for compensation from those who suffered losses during the hostilities in December last. The border states, however, have been authorized to provide ex-gratia relief to these sufferers.

The two Houses adjourned *sine die* on Monday to re-assemble on November 13, for the winter session which would last till December 22.

Face to Face with Gold

I HAVE had the privilege of the acquaintance of M. Jacques Rueff, France's "Grand Old Man of Economics" — now hale, hearty and intellectually as vigorous as ever in his seventysixth year — since I met him in 1928 when I was a departmental chief at the headquarters of the International Chamber of Commerce in Paris and he was a brilliant young member of the Secretariat of the League of Nations. He reached the peak of his active career when as President de Gaulle's financial adviser, he was appointed President of the Committee for the Reform of the French Financial Situation in 1958.

As the old hands, who regularly tie a

price was \$61 per ounce. Today it hovers between \$65 and \$70 — surely undoubted evidence of M. Rueff's prescience. An official revaluation of gold is regarded in France as only a matter of time. Everyone now accepts M. Rueff's view that the official price is laughably unrealistic. It has led to acute complications in Italy in applying the Basel Agreement on the narrowing margins of fluctuation and payment of current debts between member countries of the EEC in gold or foreign currency.

The Italian government obtained a concession that for three months until September 30 it could settle its debts in inconvertible dollars which no one wants. In Tuscany, some way round the difficulty, possibly in the form of a book-keeping

with some interspersed comments from me, is the case which you must answer.

II

M. Rueff's Case for Gold

The rise in the price of gold in dollars from a theoretical parity of \$35 an ounce until December 18, 1971, and thereafter of \$38, until it reached more than \$61 on June 21, 1972 — profoundly modifies the world monetary problem.

The solution of doubling the price at \$70 per ounce, that M. Jacques Rueff proposed in 1961 as a means of re-establishing convertibility, is now, in fact, three-quarters realised. The increase in value of the gold stocks — although only "virtual" as long as the bullion has not been officially revalued — creates a reserve of available funds to contribute to the repayment of the existing dollar balances.

It is certain that the USA will not hold out indefinitely against this bonus and that sooner rather than later then will do exactly what President Roosevelt did in 1934 and what France has done several times (notably in 1958 under M. Rueff's auspices), i.e. re-value their gold reserves at a rate close to that of the market.

M. Rueff is confident that gold will be revalued despite all the vigorous denials trumpeted abroad. It is, he says, certain that the USA will gather the ripe fruit hanging over the garden wall offered them by the rise in the market price of gold.

But the change in the official price of gold in dollars — i.e. the legal parity of the currency — can come about in different ways:

—Either unilaterally in the USA, with the Americans as sole debtors of huge dollar-balances;

—Or simultaneously in all western countries.

There is a vast difference between these alternatives.

III

Alternative I: Unilateral US Change in Legal Parity

To analyse the consequences of a change in the price of gold close to the market

WINDOW ON THE WORLD

wet bandage round their heads before tackling this column every week, will know, M. Rueff has for years proclaimed that gold, which Keynes dismissed as a barbaric relic, continues to be the only acceptable basis for international trade. Before anyone exclaims in disgust that M. Rueff wants to "crucify us on a cross of gold," let him read the following article, which M. Rueff has kindly allowed me to translate from the original French, published in the Paris newspaper *Le Figaro*. Note that for several years past M. Rueff has been advocating that the price of gold should be doubled. And all the while that people have been scoffing at him for this the price of gold on the free market has been creeping up. When he published this article on June 21, the

revaluation of gold reserves of central banks to take account of the market price, was discussed.

The French government is concerned lest the Basle Agreement should be gradually undermined by the reluctance of all central banks to surrender gold at the present official price. But such a revaluation, even if merely a book-keeping one for internal European settlements, raises political difficulties. It would lead to the creation of a European monetary block distinct from the United States.

If you agree with those who favour Special Drawing Rights and the relegation of gold to the limbo of lost causes, here,

price, M. Rueff starts by assuming that the price of gold fixed in 1934 is doubled, which would take the official price of an ounce of gold in the USA to \$70.

The nominal value of the US gold reserves — \$10,206 millions at the end of 1971 — would become about \$20,000 millions.

Of this total, a weight of gold representing \$10,000 million at the new exchange rate could be deducted to repay proportionately certain dollar balances held outside the USA. Such a deduction would leave the USA with a gold reserve of a value in dollars equal to that which they had before the deduction. But note that the liquidity of a balance appreciates not in its weight in gold but in monetary units.

As to the liquidities of the USA's creditors, they would gain the amount of repayments paid in gold by the USA but would lose the amount — exactly the same — of balances repaid. For them, there would be no change in the total of resources necessary to ensure the convertibility of their currencies. Thus there would be neither inflation nor deflation either inside the USA or in the rest of the world — the global situation would remain virtually unchanged.

repayments decrease

On the other hand, the repayment of the dollar balances would proportionately decrease the total of these balances, which is actually about \$50,000 to 60,000 millions. The weight of American sight liabilities held abroad would only fall by a small amount: a fifth or sixth of their total.

Even if the repayment operation were completed by the appropriate funding on the part of holders of dollar balances, it is improbable that the decrease in this minimal proportion of the sight liabilities, which burden American currency, would allow the gold convertibility of the dollar to be restored.

If gold convertibility is desired, other resources must be found.

A decrease in the gold parity of the dollar would involve a lowering of the dollar's exchange rate relative to the currencies of those countries which had not carried out a similar adjustment.

The competitiveness of American products would be increased by the same proportion.

Such a shift would cause profound disturbances in world trade. Above all it would evoke screams for protection

against what would be called American "monetary dumping". We should see a world-wide revival of discriminatory customs duties and import quotas. Inevitably the USA would seek to defend themselves by counter measures. Their isolationist tendencies would be vastly reinforced. Under this double influence we should see the world split up into the economic blocs from which we suffered in 1931-33. The progress won by the liberalisation of the exchanges achieved in the last ten years would be lost. The economic expansion and the improvements in living standards that followed would be gravely, perhaps irredeemably, compromised.

IV

Alternative II : Simultaneous Changes in Gold Parities

If the change in the price of gold were effected simultaneously in the USA and in the principal western currencies, the parities of exchange would not be affected. There would therefore be nothing to fear from the new conditions of international competition. No grievances, no counter measures. World trade would be the same the day after the change as the evening before.

The extension, however, to all the most important countries of the west of a revaluation of their reserves in terms of the market price of gold would set free resources fossilised in the present gold reserves not only of the USA but in all the participating countries.

The non-American states would have available the surplus of the nominal values given to their reserves, without modifying their international liquidity, and thus without loss of any kind. It would be open to them to offer these surpluses to the USA in the form of long-term loans at very low rates of interest.

Strengthened by these additional resources, the USA could use them to repay the dollar balances which would have survived the repayments effected by levy on their own duly revalued gold reserves. Thus the revaluation of the reserves of the non-American countries would have caused neither inflation nor deflation since the amount of the resources loaned to the USA would be gained by the countries whose dollar balances had been repaid.

At the end of 1971, the gold held by the non-American countries of the west represented \$25,904 millions in 1934 dollars, to which should be added \$5,097

millions held by the international institutions (the IMF, World Bank, EEC etc.), i.e. a total of \$31,000 millions. The revaluation of this total at the rate of \$70 to the ounce would put at the disposal of the USA, as explained above, a like addition to their resources. Added to the disposable funds that the USA would have realised by the revaluation of their own bullion (about \$10,000 million), these resources would enable the total of the dollar balances to be reduced by about \$41,000 millions. It is certain that such a reduction, added to the fundings (which could be agreed to both by the central banks and the international institutions) and to the dollar reserves which the non-American countries would keep for their current needs would make it possible to re-establish immediately and totally the gold convertibility of the US currency.

The present system of reserve currencies would have practically disappeared. Nothing would any longer hinder the USA from pursuing an adequate credit policy to ensure the speedy elimination of the deficit on their balance of payments. At the same time, the chief source of international inflation — the US payments deficit — would have been dried up.

Bharata Natyam

All the precedents suggest that such an operation would ensure in a very short time throughout the world the disgorging of a vast proportion of resources at present hoarded outside the market and I add (although M. Rueff does not mention it) not least in India. I can see the Minister of Finance in New Delhi, and the Governor of the Reserve Bank doing some joyous Bharata Natyam with Mrs Gandhi and the editor of *Eastern Economist* — all friends together for once — on the maidan outside the Rashtrapati Bhavan, and telling each other that the long term rate of interest was now plummeting downwards and enormously increased investment opportunities were opening up.

It would be, in M. Rueff's view, certain that the morrow of such an operation would see the beginning of an era of prosperity unique in the history of the world.

But if the solution is so simple, why has it not been recognised long ago?

The solution, which M. Rueff offers, is simple because the problem to be resolved is of itself simple, but in present conditions it is entirely beyond the comprehension of the average man.

The gold stocks held are insufficient to restore monetary convertibility to the currencies of the west because their value

s calculated at the price fixed by President Roosevelt in 1934 whereas all American prices have more than doubled since then. The present absurd valuation conceals more than half the real value of the reserves in gold.

It is in substitute for these hidden values, stupidly buried beneath piles of fraudulent balance figures — those of central banks, whose chief asset is artificially undervalued — that the experts have dreamed up all the drawing rights on the international monetary funds, swap agreements, SDRs, Euro-dollars and whatnot. The repayment of these fallacious assets by using the product of revaluation of the gold reserves would of itself disperse all the evils that a fictive exchange rate has spread.

But if the problem can be so easily solved, why is American opinion so hostile to any solution implying recognition of a rise in the dollar price of gold?

Those who ask this overlook that all solutions involving currency devaluation — i.e. a return to the currency's true price — have always been resisted to the last possible moment. When one remembers the absurd opposition to all France's devaluations — that, for example, proposed by Prime Minister Paul Reynaud in 1935, and that achieved by M. Rueff at the last moment in 1958 (devaluations whose

necessity is now apparent to all)—there is no need to be surprised that American opinion is as hostile to the monetary adjustment as was European opinion.

What, on the other hand, is astonishing is the blindness of the non-American experts in the face of a solution proposed more than ten years ago, the adoption of which would have spared the world all the monetary crises, and a large part of the inflation, which have not ceased to shake the political and social structures of the west. Instead, we have experienced in all circumstances the narrow conformism of politicians and their timidity before the intransigence of ill-informed public opinion, especially when it is that of a country as rich and powerful as the great American republic.

V

Need For Policy Decision

M. Rueff's suggested currency operation, summarised above, requires an international convention by which the participating states would agree to modify simultaneously the legal parities of their currencies in order to raise in each one of them the official price of gold by the desired percentage.

To the USA, the reform would present itself as a Marshall Plan in reverse, a just recognition of their own generous

contribution to the reconstruction of post-World War II Europe.

For the non-American holders of dollar balances the operation would transform an uncertain asset into a weight of gold of the same value while procuring for them unchallengeable international liquidity.

It seems difficult to believe, urges M. Rueff, that such an operation should not be regarded enthusiastically by a world longing for stability.

But the negotiation of an international convention assuring simultaneity in the changes of parity raises difficult political problems, similar, indeed, to those solved in December, 1971, by the Washington Smithsonian agreement which was only possible because it was preceded by the Franco-American initiative of the Azores.

A new international initiative at the highest level is now essential. M. Rueff believes that the summit envisaged by President Pompidou for this autumn offer such an occasion.

The statesman who will raise from the ruins of Bretton Woods an effectively reconstructed international monetary system will have warded off the basic threat which at present overshadows all the non-totalitarian countries. He will indeed have saved democratic civilisation.

E.B. Brook

Implications of rising prices

THE REPORT of the twenty executive directors of the International Monetary Fund completed recently is likely to be no more than an uncertain opening salvo in the coming lengthy and contentious discussions on world monetary reform. The document is to be made public shortly but enough is known of its contents to indicate that, as might be expected, it continues the clashes between already well-known national attitudes.

Of itself, this report may not be of great importance, valuable chiefly in restating and concentrating the various points of view on this complex and vital subject. The IMF's new committee of twenty from 11 industrial or semi-industrial states and nine from less advanced industrial states will have this report before them when they meet later in Sep-

tember. They will have before them no clear recommendation on the future role of gold or on how currencies should be convertible into monetary reserve assets.

Whatever happens at the IMF meeting it is increasingly clear that the most effective negotiations will take place within the enlarged European Common Market and between it and the United States. The only effect so far of what has leaked of the IMF report is a further rise in the speculative price of gold encouraged by the belief that a small minority led by the French favours emphasizing the role of gold and possibly increasing its official price. This speculative sentiment has been further encouraged by the Governor of the South Africa Reserve Bank who suggested that South Africa would be supplying less

metal to the free gold market. This move upwards in the price of gold will certainly be opposed by the US Administration. West Germany will also oppose it for Common Market banking transactions. The Germans prefer a gradual phasing out of gold as the financial staple and its replacement by Special Drawing Rights from the IMF as the international reserve medium.

The IMF's committee of twenty and, later, the Common Market's leaders will meet when it has become abundantly and repeatedly clear that no national currency and no national reserves are adequate to fight off the effects of speculative capital movements. The heavy loss in British reserves before London decided to float the £ was the most recent sharp reiteration of this fact. It is not reassuring to

reflect that Britain intends still to revert to a fixed rate for the £ as soon as possible. A fixed rate regime, despite Common Market and, especially, French insistence on it, is ultimately doomed to recurring crises arising from these frequent massive movements of capital.

Equally dubious is Britain's apparent intention, if a voluntary prices and incomes policy cannot be devised in a way to make it work, to introduce statutory controls. Holland's experience has already shown that such statutory controls do not work and that when they are abandoned the result is very sharp wage and price increases. In a continent plagued with inflation, Holland, as a result of this experiment, is very near the top of the group of countries with high inflation rates. The West Germans, as a result, will not consider prices and incomes regulation.

Inflation is currently the Common Market's biggest worry, beset though that organisation is with problems of enlargement and economics. In the last six months living has become 4.4 per cent more expensive in Holland, 3.2 per cent in West Germany, 2.8 per cent in Italy and 2.7 per cent in France and Belgium.

Outside the Market the cost of living has risen also just as steeply in EFTA's Sweden, Austria and Switzerland and the introduction of the Market's value-added-tax there next year is regarded as certain to make the price rise still steeper as it will also be in the UK and other new Market countries.

With a very delicate general election before him Herr Willy Brandt appears set to emerge as the leader in Europe intent on creating a "Community of Stability" and he is likely to make this the central issue at the Market summit meeting in Paris in October. Across Europe civil servants are now working on suggestions of ways in which inflation in Europe can be fought. Brandt has recently in a number of pre-elections speeches stressed the need for joint Common Market action to fight inflation; he realizes that West Germany cannot much longer remain an island of relative stability in a European sea of inflation. His chief disadvantage in this role is the fact that, with an eye on not losing votes in Germany's December elections, his own Finance Minister is preparing a budget which risks inflation by avoiding both tax increases and cuts in public spending. This will be a consi-

derable weakening of Brandt's position in the Paris talks; his chief advantage will be that European governments are beginning to realize they cannot any longer act in isolation in the monetary and budgetary policies and must, in any case, keep themselves far better informed about one another's fiscal policies.

There are still doubts whether the Paris summit will take place — the tour this week by the French Foreign Minister to London and Bonn has increased these doubts — but, if it takes place the Paris meeting will, like the IMF meeting next month, be unlikely to be able to do more than produce a set of general guidelines, leaving it to individual members and countries to work out their own means of keeping prices and incomes in their own areas within the guideline limits.

As Market enlargement approaches and ministers return reinvigorated from holidays the period of in-fighting and bully-boy methods in Market discussions and manoeuvrings is approaching; the risk is the menace of inflation may momentarily move out of sight as the Ten jockey for position.

Australia: new dimensions in foreign trade

Hardev Singh

MINING AND minerals processing industries have given a new dimension to Australian foreign trade. Also, the discovery of large deposits of several minerals including iron ore, bauxite, nickel, uranium, coal and natural gas has greatly improved Australia's prospects for industrial growth. As the Australian domestic market is relatively small, most of the minerals are expected to enter the export markets. The value of mineral exports has already increased from \$A 543 million in 1968 to over \$A 1,000 million in 1971 and it has been envisaged that a further doubling is possible in the second half of the seventies.

The pastoral and agricultural products continue to be Australia's main source of exports at present but they are passing through troubled times because of low prices and problems in marketing. For instance wool, which contributed 40 per cent of Australia's export revenue in the early sixties, had dropped now to less than 20 per cent. On the other hand the total

contribution of minerals to exports has increased from about seven per cent in the early sixties to more than 24 per cent at present. Recently Australian News and Information Bureau in Canberra released projections of export incomes from selected mineral products (see table on p. 567) which show that even after allowing for fluctuations in prices of metals, minerals would contribute about 40 per cent to Australia's export trade.

These projections have been supported substantially by the developments in mineral industries in the recent past. The scale of the discoveries of iron ore in the Pilbara region of north-western Australia and the speed with which large mining schemes have been established to work the deposits have given a new status to iron ore. The shortage of iron ore at one time was considered to be the main limitation on Australia's future industrial growth. Today, in the state of

Western Australia alone reserves of iron ore with iron content of more than 50 per cent are estimated at 18,000 million tonnes. Iron ore has now become the most important item in the export of minerals, in spite of a recent set-back following a decline in demand from Japan which had brought about a revision in the long-term contract. Australia, however, hopes to expand iron ore exports and has increased its investments in Paraburdoo mines.

There have been impressive gains in the production of non-ferrous minerals too, particularly in aluminium and nickel. When Australia's first aluminium smelter plant began operations at Bell Bay, in Tasmania, in 1955, Australia had no known deposits of bauxite of sufficient size or quality to justify commercial mining. Today Australia is one of the main world sources of bauxite, with reserves estimated at 4500 million tonnes. If all current plans come to fruition, capital expenditure of about \$A 2,000 million

will be needed to develop new mining, alumina and aluminium capacity over the next decade.

Most of the principal international aluminium groups are now represented in Australia. The largest operator is Comalco Ltd, a combine owned 45 per cent by Conzinc Riotinto of Australia Ltd, 45 per cent by Kaiser Aluminium and Chemical Corporation of the United States and 10 per cent by the Australian public. Comalco's operations are based on the rich Weipa bauxite deposits discovered in 1955 on Cape York Peninsula in northern Queensland. Weipa bauxite reserves, estimated at about 2,500 million tonnes, far outrank other Australian deposits.

A second Australian integrated bauxite-alumina-aluminium scheme has been established by Alcoa of Australia Ltd, based on bauxite deposits in the Darling Ranges near Perth, the capital of Western Australia. Alcoa is owned 51 per cent by the Aluminium Company of America and the remaining shares are held by a group of Australian mining companies. Alcoa has expanded rapidly since mining began in 1963. The company has an alumina refinery at Kwinana, south of Perth, while a second is being built at Pinjarra with an initial capacity of 425,000 tonnes of alumina a year. Alcoa has an aluminium refinery at Geelong in the state of Victoria, which is close to the markets of the eastern states.

a major project

The next major project to come into operation will be at Gove in the Northern Territory where Nabalco (Pt) Ltd is building an alumina plant with an initial output of 500,000 tonnes a year, rising to 1,000,000 tonnes by the middle of 1973. All the production of this plant is likely to be exported.

In fact all the new projects are almost exclusively export schemes and are based on the export of alumina, rather than bauxite. The Australian Bureau of Mineral Resources has predicted that exports of bauxite, alumina and aluminium will increase sharply to about \$A 600 million by the mid-seventies and then level off in the range \$A 600 to 700 million in the later part of the decade.

Three companies are producing nickel ore in Australia and the largest mine is operated by Western Mining Corporation, a diversified minerals group with interests that also include iron ore and gold. Western Mining in the 1970-71 financial year produced 32,000 tonnes of nickel in concentrates from ore at its mine at Kambalda, south of the gold mining centre

of Kalgoorlie in Western Australia. The company has a nickel refinery at Kwinana and is building a \$A 30 million smelter at Kalgoorlie.

Until the Kambalda mine came into production in June 1967, Australia was not a commercial nickel producer. Estimates within the Australian industry reveal that by 1975 Australia could be supplying up to 20 per cent of total world demand. Nickel would then rank as one of Australia's most valuable mineral exports, after iron ore, coal and the aluminium-alumina group. Although the market has tightened considerably and nickel stocks have lost some of their glamour, there is strong exploration interest in Australian nickel. By 1975 eight companies are expected to produce ore or concentrates and at least three will be refining or smelting metal. Investment in this industry by then will exceed \$A 500 million.

These mineral products in Australia are likely to have increased significance for India too in the years to come. This fact has been supported by the Indian Trade

and Economic Delegation which visited Australia from May 14 to May 24, 1972. It stated that Australia is ideally situated both by virtue of "geographical proximity to India and the sizeable production it has of non-ferrous metals to supply these to us in larger quantities" It has also been suggested that the recent shifts in the international aid programmes might make it incumbent on this country to look for some of these commodities in countries other than those from which we had been getting them earlier. Australia appeared to the delegation as "the most natural source", provided we worked out a systematic programme of exporting to that country goods which it required and which we could supply.

It may be added that already our imports of zinc, lead, ore concentrates of non-ferrous metals from Australia have increased during the recent years. In the event of our improved trade with Australia, which has been predicted by the delegation, it has been considered likely that we would rely upon Australia for minerals and metals to an increased extent.

Projection of Export Income from Selected Mineral Products

(Financial years ending June 30)

(Value in \$A million)

Commodity	1971-72	1974-75	1977-78	1980-81
Aluminium (a)	222	462	752	822
Iron (b)	493	775	797	822
Coal (c)	269	400	570	720
Lead (d)	97	116	121	158
Zinc (e)	73	99	103	18
Nickel (f)	44	134	227	301
Copper (g)	112	179	185	173
Manganese (h)	17	23	26	27
Mineral Sands (i)	73	78	86	87
Tin (j)	14	19	15	11

(a) Includes bauxite, alumina and primary refined metal; (b) includes ores, pellets, metallised agglomerates and pig iron, but excludes steel; (c) black coal only; (d) includes concentrates, bullion and primary refined metal; (e) includes concentrates and primary refined metal; (f) unwrought nickel metal only; (g) includes concentrates and primary refined metal; (h) includes ore only; (i) includes rutile, zircon, leucoxene and ilmenite concentrates and beneficiated ilmenite; (j) includes concentrates and primary refined metal.

TRADE WINDS

ONGC'S Operations

ONE of the major issues that the government will have to decide while considering the Malaviya Committee Report on the Oil and Natural Gas Commission (ONGC), is the administrative control on a public sector unit, particularly a scientific and technically-oriented project. The decision has to be taken not only on the control to be exercised by the Ministry concerned but also by the administrative set-up in the organisation itself. In the case of the ONGC, the committee says: "Administration, instead of being a service, has become the master of scientific/technical departments". The Directorate of Administration is a super-Directorate; it has a say over all other directorates in matters of creation of posts, recruitment, promotion or posting. The power of the Director of Administration is much higher than that of the directors of scientific and technical departments. The rate of promotion in the Directorate of Administration has been higher than the same in the scientific directorates. This has created utter demoralisation among the scientists and technologists possessing much higher qualifications".

Regarding the inter-relationship between the ONGC and the Ministry of Petroleum and Chemicals, the committee has prefaced its remarks by citing its own experience. It says that although it was designated as a high-power body, "in its own work (involving small expenditure) it felt greatly inconvenienced by the way things are processed in the government." It thus had "a taste of the disadvantages that organisations like ONGC have

to suffer from. Certain government procedures, allegedly in response to some earlier audit objections, are patently illogical, derogatory to people outside the Ministry and inimical to speedy completion of any work".

The strange mixture of the commission - cum - subordinate office that the ONGC has become now, the committee feels, has proved detrimental to its operations. The control of the Ministry over the ONGC has retarded the work of the latter in various ways. Two pertinent examples of this, which have been given by the committee, are: (i) full one-year delay in the clearance by the Ministry of an expenditure of Rs 60 lakhs in foreign exchange for the purchase of four digital recording units and one data processing unit; and (ii) the rejection of the ONGC's proposal to purchase the Telex-IV vessel. The latter purchase, the committee says, could have saved the country most of the money that is now being spent on the survey in the Bombay High area by a French firm, besides yielding the benefit of surveying many more areas of our continental shelf.

The Ministry, the committee further points out, also failed to appreciate that ONGC's operations abroad were necessary to build up quality leadership in the organisation and were also in the overall interest of the country. The two official members of the committee, Mr M. S. Pathak and Dr G. Ramaswamy, of course, have differed from the above views of the other members.

Among the other shortcomings of the ONGC, which the committee has pertinently commented upon, are: (i) the

rapid expansion of ONGC projects and a more rapid increase in its pay roll have contributed to a certain extent to a deterioration in the working of the organisation—some persons were promoted without preparing them for high responsibilities; (ii) there has not been sufficient differentiation between the "basic function" of the ONGC, which is to explore oil, and the "service functions" connected with the production of oil; (iii) the financial control exercised over the ONGC is also out of tune with the objective with which the organisation had been set up; (iv) there is a lack of balance in the operations of the various departments of the organisation; (v) the ONGC leadership has been following "a penny-wise pound-foolish policy" in as much as inadequate efforts have been made to acquire the most modern exploration aids which would not have cost much in comparison to the overall operations and expenditure of the organisation; (vi) the incentive scheme, which was introduced a few years ago to step up the drilling operations, has led to many distortions in ONGC's operations; (vii) the various disciplines of the organisation are busy in finding fault with—and, to a certain extent, even jamming—one another—no discipline is looking inward to improve itself. The tendency in the ONGC to develop jacks of all trades, instead of specialists in particular fields, the committee recommends, ought to be checked. There is also need for better co-ordination between the ONGC, the Geological survey of India and universities.

Exploration Expenses

The above shortcomings, according to the committee, however, do not imply that the ONGC lacks competence to handle the job of oil exploration in the country or abroad. In fact, the committee feels that a reservoir of competence has been built in the ONGC and there are numerous instances of enough expertise in the organisation.

A very significant recommendation of the committee is that the exploration expendi-

ture of the ONGC ought to be treated as research and development expenditure, instead of being subjected to commercial norms. The financing of this expenditure should, therefore, be through grants and not loans from the government which impose on the ONGC an increasing interest burden and repayment obligations.

Foreign Participation

Equally pertinent are the observations of the committee on foreign participation in oil exploration in the country. The committee is of the view that the ONGC personnel should be exposed to the newest geological and geophysical concepts developed elsewhere in the world. Its observations on foreign participation in oil exploration in India emanate from this suggestion. The committee says:

"Since Indian Business Houses have not come up to the stage where they would take entrepreneurial initiative in a high-risk business like oil exploration, the issue was naturally limited to foreign private participation. Till a decade back, the foreign private companies were not interested in joint enterprises with the host country's state companies. In a situation of world surplus, their policy was mainly to preempt the leases. Even if they found oil, they did not develop the fields until their global interest demanded. With the development of the "minor majors" among the oil companies, there is now a change in this rigid attitude. Due to a much greater awareness in the host countries, mere pre-emption or 'sitting tight' is no longer possible. Relinquishment of acreage after a certain period is now forced on the companies everywhere. There is, moreover, a deep change in the whole set of relationships between the host countries, producing companies and the consuming nations. With the emergence of the Organization of Petroleum Exporting Countries, the companies have lost much of their freedom, and the scales are turned decisively against the importing countries. The rising world-wide demand for oil, the increasing

cost of oil finds in the USA, and the growing competition in the world oil industry together created the economic base for OPEC's dominance, while the new world situation created its political basis. In the context of the power block rivalry, it was no longer possible for the parent governments of international companies to take the exporting countries for granted.

"In this situation, it is possible to conceive of a pattern where ONGC becomes a holding company overseeing several subsidiaries with varying percentages of foreign participation. Such partnership can help not only by sharing in the investment burden but also by collaboration in foreign prospects. The principle that should guide any partnership is the reciprocity of rights in oil exploration venture, which means that the foreign partners must be prepared to associate India in their ventures outside the country."

The committee has also discussed the question of equity participation by foreigners on specific projects and concluded that while it cannot be entirely ruled out, it is beset with many problems. "This country," it says, "must not rush to share a high prospect with a collaborator who is not based in India and will possibly demand payment in hard currency for the oil in its share. Rating of the prospect should be the decisive criterion in all such questions. We do not consider it necessary to enter into equity participation with a foreign company merely on the ground that the cost of offshore field development will be huge. After oil has been found in any area, the finance needed for the development of the field can be borrowed even from the international banks, without any collaboration."

Relinquishment

The committee has also reviewed the advantages of enforcing relinquishment after a stipulated period. "Provision for relinquishment", it says, "is always a spur to a more thorough and scientific investigation. Even a national exploration company can be given a

deadline, and if failure is reported on its expiry, it should be open to the government to invite partnerships." However, the committee thinks that such a course would not normally be necessary if its re-organisation proposal, which provides for a machinery for continual review, is accepted.

Crude from Iraq

The union Minister for Law & Justice and Petroleum & Chemicals, Mr H. R. Gokhale, informed recently members of the Parliamentary Consultative Committee of the Ministry of Petroleum & Chemicals that arrangements had recently been made for import of crude from Iraq and that a protocol covering these imports had been signed by the two countries during the Iraqi Foreign Minister's visit to India in the third week of August. He told members that India expected to import from Iraq 4,25,000 tonnes of crude oil by March 1973. The imported crude oil was meant for use in the Barauni refinery. The Minister also told the committee that relations between India and Iraq were very cordial and that future progress in many directions was anticipated.

Dock at Haldia

A new Dock system under construction at Haldia was expected to be commissioned by the end of 1973 when it would be possible to handle larger ships and provide fast loading and unloading facilities for bulk cargo. This information was given by Mr Raj Bahadur, Minister for Parliamentary Affairs, Transport and Shipping in Rajya Sabha recently.

Petrochemical Complex

The Minister for Petroleum and Chemicals informed recently that Aromatics Project of the IPCL was expected to be completed by the end of this year. As for the Naphtha Cracker Plant of the Olefins Project, inaugurated only in January this year, steady progress was being made and orders for equipment and machinery etc. were being placed. Regarding the downstream

units of the Naphtha Cracker, Mr Gokhale said that process licensing had been approved for all of them. While it was too early to say when exactly these units would be ready, the expectation was that they would be completed between the second half of 1974 and the third quarter of 1975 and that it might be possible to commission all downstream units in the public sector by the end of 1975.

Coastal Shipping

Arrangements have been finalised to obtain 10 dry cargo liners from Romania, 3 tankers from Russia and 2 tankers from Yugoslavia which would considerably help in the coastal movement of cargo and oil during the fifth Plan period, stated Mr Raj Bahadur, Minister of Shipping, Transport and Parliamentary Affairs, while addressing the members of the National Shipping Board meeting recently. Most of the 43 dry cargo liners on coastal fleet, he said, had become due for scrapping within the next few years. At present there were 43 dry cargo liners of which 17 were over 20 years' old and 13 in the age group of 16-20 years. In the case of 4 tankers, 3 had become due for scrapping. In other words, he said, "the bulk of our coastal shipping consisted of old and obsolete vessels." When the orders placed for the cargo liners and tankers were carried out it would greatly help in the coastal shipping.

The Minister regretted that while in 1962 the movement of coal by coastal shipping accounted for 1.98 million tons, it had shrunk to 250,000 tons in 1970. It had since picked up slightly in the neighbourhood of 500,000 tons in 1971.

Fertilizers Imports

The Minerals & Metals Trading Corporation of India Ltd have recently concluded contracts with Romania and Bulgaria for supply of nitrogenous fertilizers during October 1972 to June 1973. The contract concluded with Romania is for supply of 80,000 tonnes of nitrogenous fertilizers during 1972 and 75,000 tonnes during

January to June 1973. The contract with Bulgaria is for 30,000 tonnes of nitrogenous fertilizers for supply during the current year. With the contract now concluded with Romania, the total shipments during the year 1972 will work out to about 238,000 tonnes of nitrogenous fertilizers. Romania will thus, be the largest single supplier of nitrogenous fertilizers to this country during the year 1972.

LIC Board

The Board of the Life Insurance Corporation has been re-constituted from September 1. Mr K. R. Puri, Managing Director LIC, Bombay, will be the Chairman of the Board. The other members are: Mr V.V. Chari, Deputy Governor, Reserve Bank of India, Bombay; Mr A. Rajagopalan, Officer on Special Duty & Ex-Officio Additional Secretary to the Government of India, New Delhi; Dr K.K. Datey, Bombay; Dr P.V. Kurian, Anand; Mrs Asoka Gupta, Calcutta; Mr Khalil Ahmed, Patna; Mr P. L. Tandon, Kanpur; Mr R. P. Tamta, Almora, Dr N.L. Hingorani, Udaipur; Mr R. Kanakasa-bhai, Madras; and Mr R. M. Mehta, Managing Director, Life Insurance Corporation of India, Bombay.

Sugarcane Prices

Mr M.L. Apte, President, Indian Sugar Mills Association has expressed disappointment at the government's decision to increase the minimum cane price from Rs 7.37 to Rs 8.00 per quintal, which he felt would not meet the needs of increased production of sugarcane. He, however welcomed the government's decision to reduce the basic recovery from 9.4 per cent to 8.5 per cent which was a step in the right direction in that it would cover almost 90 per cent of the cane crushed in the country and growers in low recovery areas too would have the necessary incentive to improve the quality of cane. The ISMA Chief while appreciating the government's anxiety to plug leakages of levy sugar into open market, expressed serious concern over the government's decision to raise the proportion of levy sugar from 63.5 per cent

to 70 per cent. Its impact on next year's output would be quite significant. Reduced proportion of free sugar would on the one hand help maintain higher gur and khandsari prices and on the other it would seriously impair the industry's capacity to compete with gur and khandsari. As a result, diversion of cane from factory areas to gur and khandsari will be accentuated with consequent adverse effect on sugar production.

Colloquium on Exports

The union Minister for Finance, Mr Y.B. Chavan, while inaugurating a three-day colloquium on exports organised by Hindustan Chamber of Commerce at Madras recently, stated that the development of export markets and the adaptation of product to the requirements of potential foreign buyers must constitute the integral part of the long term plans of well endowed and experienced industrial firms and units. He warned that if they failed in their export effort, they would be plagued with acute shortages of all manner of inputs and materials and the country's industrial structure would, for the lack of adequate replacement and modernisation of equipment, soon begin to show symptoms of arterior hardening.

Mr P.A. Narielwala, President, Federation of Indian Export Organisations, called for the setting up of a new Fiscal Commission to find out whether the government's fiscal policies in the last few years were not directly and indirectly responsible for the high cost economy that had been generated. Mr Narielwala who presided over the Business Session of the Colloquium on Exports said that a study of our failure to offer competitive rates and good quality products would show that our fiscal levies called for drastic reorganisation.

Mr D.C. Kothari, speaking on Production and Pricing said that with the advent of the

European Economic Community, there was going to be a tremendous market outlet and he was not sure if the government and trade in the country had realised the implications of this development. Both production and pricing determined the quantum of exports and unless we paid attention to these aspects it would be difficult to succeed in our export efforts. It had to be realised that 75 per cent of the total exports consisted of prime commodities and agrobased industries. Enough attention had not been paid to potentialities of agricultural production, especially cash crops.

Ban on Exports to Sudan Lifted

Indo-Sudanese mid-term trade review talks were held in New Delhi from August 29 to September 1, 1972. The Sudanese Delegation was led by Mr Sayed Ibrahim Moneim Mansour, Minister of Economic & Trade assisted by Mr Mohamed Abdelmagid Ahmed, Permanent Under Secretary of Economic & Trade. The Indian Delegation was led by Mr L. N. Mishra, Minister of Foreign Trade, assisted by Mr Mohammed Yunus, Special Secretary in the Ministry of Foreign Trade. As a result of these talks, it was decided that during the remaining period of the current trade plan which expires on December 31, 1972, this country will be exporting to Sudan a variety of goods worth about Rs 17 crores.

These exports will consist of jute manufactures, tea, spare parts, chemicals, machines and some essential oils etc. In return, India will be importing additional 100,000 bales of Sudanese long staple cotton during the same period. It was proposed to earmark Rs 4.5 crores for goods which were manufactured for Sudan prior to the difficulties which had recently cropped up in the working of the current trade plan, as a result of which the government in mid-July had to put a temporary halt on further Indian exports to Sudan. This temporary ban on

exports to Sudan will now be lifted.

Trade with Zambia

The Minister of Industry and Trade of Zambia, Mr A.J. Soko, MP and Minister of Finance of Zambia, Mr J. M. Mwanakatwe, held discussions re-

cently with the Minister of Foreign Trade, Mr L. N. Mishra on issues relating to expansion of trade and economic co-operation between India and Zambia. It was understood that following these discussions a trade agreement between the two countries was likely to be signed in November this

Your daughter's wedding isn't child's play.

But our RECURRING DEPOSIT SCHEME can make it just as easy

Enough money at the right time... that's what your daughter's wedding demands.

You can ensure this under our RECURRING DEPOSIT SCHEME. Every month you save a fixed amount. Your savings grow and grow, and when the wedding day dawns, you are the happiest person... no money problem at all.

Monthly deposits: Rs. 5/- or multiples.

Period: 1 to 10 years.

Interest: up to 7%

Full details from any of our Branches.

BANK OF MAHARASHTRA

Head. office : 1177, Budhwar Peth, Poona-2.

7216 A

ear. Mr L. N. Mishra was expected to go to Zambia in this connection in response to an invitation from the Zambian ministers. It was also decided that three teams of Indian experts should leave for Zambia a fortnight's time to assist and advise the Zambian authorities on their programmes of industrialisation and development of infrastructure. These discussions also centered round the possibilities of expanding the trade relations between the

two countries. In 1970-71, imports into India from Zambia amounted to over Rs 27 crores while exports to Zambia from India totalled only about Rs 3 crores.

Economic Co-operation with EEC

The Foreign Trade Minister, Mr L. N. Mishra, stated recently that as a result of some recent developments, he was more hopeful "than ever" be-

fore" that it would be possible for the European Economic Community to conclude a Commercial Co-operation Agreement with India, which would safeguard India's essential trading interests. Addressing the meeting of the Board of Trade on September 1 Mr Mishra said, "I am leaving for Europe tomorrow and will be personally impressing upon the Foreign and Foreign Trade Ministers of the Member-States of EEC the need for their

support when this matter comes up before the Council of Ministers of the EEC."

Tariff Value for Sugar

The union government has decided to revise the tariff value for sugar produced in the vacuum pan sugar factories from Rs 210 per quintal to Rs 235 per quintal with effect from September 1, 1972. This tariff value will apply only to sugar sold in the open market.

Bankers! You'll love the rough, tough Sergeant-Major Null Control headquartered inside every ASCOTA Accounting Machine you buy!

With Sergeant-Major Null Control on guard-duty in your Ascota, Corporal Wrong Posting doesn't have a chance to creep by. Which is just fine, making Ascota the most reliable accounting machine there is.

'NULL CONTROL' helps you in two ways:

- Warns you the moment an incorrect posting is made.
- Stops the machine instantly and returns the carriage to its starting position.

What more could you ask of such a lovable tyrant?

ASCOTA Accounting Machine comes to you with or without a typewriter, just as it suits you. It will suit you for other reasons too—each you can solidly bank on to render better service to increasing numbers of depositors.

Versatility With a choice of 5, 10, 15, 25, 35, 45 & 55 totalizers, ASCOTA can be custom-programmed to handle a variety of jobs in your bank. Current & Overdraft, Savings Inward & Outward Clearing, Salary, Provident Fund, Branch Reconciliation, Supplementary.

Flexibility Simply by interchanging pre-programmed Control Panels, in just a matter of seconds, you can utilize the same ASCOTA machine for any number of different jobs.

Speed The blind-touch 10-key key-board and faster automatic totals speed up postings. Cut down operator fatigue. Shoot up productivity.

Service Prompt, expert service rendered by factory-trained technicians free for the first 12 months. Thereafter, under a fixed-price annual preventive maintenance contract.

For a demonstration, contact Blue Star today.

Available to actual users only, against Rupee-payment

PREPYN/11/72

COMPANY AFFAIRS

Goodyear

WITH THE commissioning of the new plant for bicycle tyres and tubes and the new automotive tyres and tubes plant the Goodyear India Ltd has doubled its production capacity and its full impact will be reflected in the company's operations in 1972. Meanwhile the company has submitted a scheme to the government for expansion of capacity by another 250,000 tyres annually and the matter is being actively pursued. Acting on the letter of intent for flat belting and V belts granted to the company it has applied to the government for capital goods and it is the company's intention to implement this project as speedily as possible. This was revealed by the Managing Director Mr Parks Chrestman while addressing the annual general meeting of the company.

Dealing with the company's outlook, Mr Chrestman said that the company's sales and profits were very satisfactory in the first quarter of 1972. The performance in the second quarter was reasonably good but in the third quarter production is expected to be affected by the power cut imposed in August. But this will be only a temporary setback and some definite improvement in profit and considerably higher sales are expected in 1972 than in 1971.

Referring to the difficulties faced by the company in the field of exports Mr Chrestman said that the world markets for exports were rapidly shrinking as a result of one country after another installing its own tyre factories. Moreover several countries were having excess tyre manufacturing capacities thereby creating a low price competition for the available markets. At this critical juncture when price element has

become so important, it is tragic that the government of India has effected substantial cuts in duty drawback rates, with the result export costs have gone up by as much as eight to ten per cent. The managing director therefore pleaded for an export-support programme besides suggesting for an increased cash subsidy to offset the heavy losses incurred by the company on all exports.

The tyre industry the world over has made phenomenal progress in recent years. New designs, new rubbers, polymers, carbon blacks, rubber chemicals and tyre fabrics are under constant improvement and development which are having a tremendous effect on tyre performance. But the company is kept fully informed of these latest developments and technological innovations by its associates, the Goodyear Tire and Rubber Company, USA, for which the company is paying a service fee of a small percentage out of its net sales. In brief, the progressive modifications in tyre designs and components and the continuous improvements in technical innovations have almost revolutionised tyre technology so much that the tyres built by Goodyear in 1980's will be radically different from those that are built today as today's tyres differ from those built in the 1960's.

Jay Engineering

Over the years a momentum has been generated by the Jay Engineering Works Ltd that it can be confidently said that the company is heading in the right direction. But considering the capital facilities and the operating inputs, the profit earned by the company is still inadequate and has indeed not yet reached even the level where

a reasonable dividend return can be paid to equity shareholders. The principal reason for the disappointing improvement in profit position has been largely due to the poor performance of the sewing machine factory at Calcutta. The operations of this factory has resulted in a substantial loss but what is more unfortunate is that no reversal trend is in sight in the near future. Over the past several years the local markets for the upper price bracketed sewing machines, to which the company's products belong, have remained almost stagnant and the major expansion has been in low-priced machines. The company being a high cost unit is unable to compete effectively with the machines produced in the small industry sector. On the other hand the costs keep going as a result of wage increases, government levies and general inflation and these can neither be recovered by commensurate increase in prices nor absorbed by increased production. This vicious circle tends to make the sewing machine factory a veritable millstone for the company. These observations are contained in the Chairman, Lala Charat Ram's statement circulated to the shareholders of the company.

The chairman denounced the government for subjecting private initiative to bureaucratic and political control. It is but natural that the designers of engines aim at minimising internal utilisation of the power generated by the engine so that the power transmitted for productive use would be maximum. If business management was conceived of as an engine, it would be a shocking experience when one thinks of the proportion of the power that was used up internally in overcoming the friction arising

from restrictive regulations with the result the energy available to real productive work was proportionately rather less than the energy absorbed internally just to stay alive.

The chairman welcomed certain government measures which were aimed at preventing economic abuses, but the disapproval of the government's interference with healthy marketing practices, disturbing of normal relationship between manufacturers and the trade and the forbidding of self-discipline in pricing and distribution. Elaborating the chairman said that the provisions regarding unscrupulous take-over bids was bound to have a salutary effect. But provisions such as further administrative controls, dividends and deposits on the other hand would further hamstring company managements. The danger of such regulations, in the chairman's opinion, was that though they were aimed at unscrupulous elements, they in fact would affect the scrupulous just because the unscrupulous always find a way to be a step ahead of the regulations.

Estrela Batteries

Estrela Batteries has reported encouraging working results during the year ended March 31, 1972. The company earned during the year a gross profit of Rs 33.70 lakhs as compared to a loss of Rs 2.01 lakhs in 1970-71. While net sales have gone up to Rs 6.29 crores, recording an appreciable rise of Rs 1.38 crores over the preceding year. These results have been achieved in spite of a substantial loss in exports and marked increase in the employees emoluments and prices of raw materials. Out of the gross profits the directors have earmarked a sum of Rs 15.69 lakhs towards depreciation, as against Rs 7.90 lakhs while an amount of Rs 8.13 lakhs was appropriated to development rebate reserve as compared to Rs 40,635 in the previous year. This leaves a net profit of Rs 9.88 lakhs as against a net loss of Rs 10.31 lakhs in 1970-71. After adjustments a sum

of Rs 10.80 lakhs has been transferred to the general reserve. The board has recommended the payment of an unchanged dividend of 12 per cent on the enlarged capital of which dividend on new equity shares is payable on proportionate basis. This together with the usual payment on preference shares will absorb Rs 6.14 lakhs and it will be paid out of the general reserve.

To finance the cost of replacement and balancing equipment planned by the company as well as for the expansion programme, a loan of one crore rupees has been obtained from the IFCI. Out of this the company has availed of the loan to the extent of Rs 79 lakhs. Of the additional capacity of 60 million cells licensed by the government, the company has implemented two thirds of the expansion. The entire programme is expected to be completed during the current year. The project for the manufacture of plastic jackets has been abandoned. The company has submitted the second phase of the replacement and balancing equipment programme costing Rs 22 lakhs to IFCI for approval.

Vickers Sperry

Vickers Sperry of India has received the governments' approval for expansion of its capacity. The expansion will cost Rs 50 lakhs and it will be financed by the issue of capital and from internal sources. The company will offer at par shares worth about Rs 9 lakhs to its foreign collaborators for the supplies of machinery and a similar amount to the Indian shareholders. For meeting the capital expenditure the company will issue fresh capital to the tune of about Rs 32 lakhs. The shares will be offered at that time—may be at a premium—presumably to reduce the collaborators' holding in the company's equity from the present level of 50 per cent to about 45 per cent. On completion, of its expansion the company's turnover is expected to be doubled. Its profits are also

expected to show a corresponding improvement.

Mahindra and Mahindra

The Board of Directors of Mahindra and Mahindra had allotted 12,42,825 equity shares of Rs 10 each and 12,51,227 convertible bonds of Rs 6 each to the shareholders of the Union of Bank of India Ltd pursuant to the bank's scheme of merger with the company which has been sanctioned by the Bombay High Court. The shares now issued will qualify for dividend from May 1971, in respect of the company's year ended October 31, 1971.

Larsen & Toubro

A marine unloader is soon to be installed at Kandla port for rapid unloading of raw materials for the fertiliser industry. The marine loader which is of Buhler design will have a unloading capacity of 150 tons per hour and it will be supplied, erected and commissioned by Larsen & Toubro Ltd. Incorporating advanced technology it will be the first of its kind in the country. More such loaders are expected to be set up at major Indian ports. With such installation the ships will not have to wait in the harbour for prolonged periods up to a month while they are being unloaded. This will save the country considerable amounts of foreign exchange.

Unit Trust

The sale and repurchase prices of a unit of the Unit Trust of India were raised by five paise each to Rs 10.60 and Rs 10.30 respectively with effect from August 30.

News and Notes

Expansion and Diversification

Encouraged by the success of acrylic emulsion introduced a year ago **Blundell Eomite Paints** will soon be introducing in the market two new products — Eomite Universal Stainer and 'Super Bluncem' decorative waterproof coating. The former is suitable for use with any type of paint, emulsion or enamel and the latter is a low-cost waterproof cement paint which can be

applied to new walls without waiting for the usual curing period. Both of them will be available in various shades. With the assistance from its UK associates, **Blundell — Permoglaze**, the company is engaged in developing new formulations to meet specific situations. It is also enlarging and strengthening its technical servicing capacity to render more useful services to the consumers. Meanwhile the company has established in July last a new sales depot in Chandigarh. This depot is equipped to extend Eomite service more intensely to Punjab, Haryana, Himachal Pradesh and Jammu and Kashmir while the Delhi office is now concentrating on extending the comparatively under developed markets of Uttar Pradesh and Rajasthan. The current year holds out promise of more encouraging performance for **Blundell Eomite**. It has planned an elaborate development programme and is launching on a sustained campaign for the use of selected decorative items on a national scale.

Seshasayee Paper and Boards has received a letter of intent to increase its capacity from 35,000 tonnes to 50,000 tonnes of pulp and paper per annum. The company has submitted an application for the issue of an import licence which is still pending with the government. Meanwhile the company has finalised the terms of renewal with the Tamil Nadu government for the supply of bamboo from the government sources. Under the agreement the company has to pay higher seigniorage effective from April 1, 1970. The extra incidence of expenditure on this account will work out to nearly Rs 2.05 lakhs per year. Besides the company has to supply to the state government annually 1500 tonnes of printing paper at market rates. The agreement will be in force up to April 10, 1978. The rate of seigniorage payable, however, is subject to review on April 1, 1975.

Jagatjit Industries Ltd is entering the protein field in a big way by setting up plants in Maharashtra with assistance of SICOM for the manufacture

of soya flour, soya protein concentrates, isolates, formulated products and soya milk beverages. It is also proposed to promote a separate company for setting up a composite milk plant in Andhra Pradesh for the manufacture of processed milk foods. The project is being planned to process about one lakh litres of fluid milk per day and is expected to turn out a complete range of milk products. Steps to secure an industrial licence and to complete other formalities are in progress. Meanwhile the company has received a letter of intent for the expansion in the industrial licence for the manufacture of glass containers and miscellaneous wares from 12,000 to 18,000 tonnes per annum. Land measuring 20 acres have already been acquired in Sahibabad near Delhi, and negotiations are under way with financial institutions for getting foreign exchange and rupee loans for this project.

The company's application for grant of industrial licence for the manufacture of a whole range of milk products at the milk processing plant at Bahadurgarh, Patiala, is still pending with the government. In the meantime the company is carrying on negotiations with machinery manufacturers for the supply of plant and equipment for implementing this project. The expansion at the malted milk food plant for 'Viva' is progressing well. The new plant installed for the production of malt extract has recently gone into production. The expansion in the distillery are proceeding as planned and the company has introduced in the market new varieties of Indian-made foreign spirits such as "Bonnie Scot" sales of which are picking up.

In an effort to diversify its activities **Dawn Mills** has established in February 1972 a subsidiary company styled **Dawn Apparels Ltd** for the manufacture of ladies garments. The new company has an authorised capital of Rs 10 lakhs of which Rs 2.50 lakhs has been issued and fully subscribed by **Dawn Mills**. To begin with the subsidiary company has

taken up the manufacture of brassiers and in some cases matching panties for ladies. Since it has worked for only one month during the year ended March 31, 1972 its accounts show a loss of Rs 68,711. When the company reaches its optimum production it is hoped that it will be able to produce 20,000 dozen brassiers per annum with the present machinery. The company hopes to earn a reasonable profit considering the response to its products.

Cellulose Products of India Ltd has been denied permission for expansion under the MRTP Act. The company is now taking up a new project for the manufacture of 500 tonnes per year of polyvinyl alcohol (PVA) at its Kathwada factory. The cost of the project is expected to be around Rs 50 lakhs and it is proposed to be financed partly by way of long-term borrowings from financial institutions and partly from the internal sources of the company. The PVA project is expected to go on stream before the end of the current year.

Joint Venture

The **Standard Batteries Ltd** has entered into a collaboration agreement with the government of Sudan for setting up a battery manufacturing plant with a capacity of 50,000 batteries per annum. The factory in Sudan will be working under the company's technical direction and guidance. The assembly portion of the machinery manufactured by the engineering division of the company has already been shipped and is under erection. The manufacture of components will be taken up in stages and the requisite machinery will be supplied by the company on a turn-key basis. The terms of know-how fees and the percentage of royalty on sales payable to the company are under negotiation with the government of Sudan. This encouraging development has prompted the company to entertain a similar project for the manufacture of batteries in Indonesia with the assistance and co-operation of Messrs **Tata Exports Ltd**. The pro-

ject envisages the establishment of a factory in Indonesia with an initial capacity of 150,000 units of six volts and 12 volts batteries per year. The promoters of the company will be: **Indonesia State Railways**, **Messrs Tata Exports Ltd** and **the Standard Batteries Ltd**. The **Indonesia State Railways** will invest 35 per cent of the share capital whereas the balance of 65 per cent will be shared between **Standard Batteries** and **Tata Exports Ltd**. This factory, like its counterpart in Sudan, will start with the assembly of components, which will be supplied by the company from India and will take up the manufacture of other components by stages during a period of five years. The company has agreed to make available to the new Indonesian enterprise complete technical know-how for the manufacture of storage batteries on terms and conditions which are at present under negotiation.

New Issues

India Engineering and Construction Company is setting up a plant in a backward region of UP for the manufacture of steel tubular poles with a capacity of 39,00 tonnes a year. The **Organa Walzewerk** technik of West Germany will be providing the technical know-how, designs and drawings for this project and if all goes as planned the project is expected to be completed by the end of this year. According to current indications the plant is expected to reach the rated capacity by 1974-75. The company has also a proposal to set up a strip mill plant near the tube mill.

To raise part of the resources required for the implementation of this scheme the company will be entering the capital market shortly with a public issue of Rs 30.70 lakhs consisting of Rs 25.70 lakhs in equity shares of Rs 10 each and Rs 5 lakhs in 9.5 per cent cumulative redeemable preference shares of Rs 100 each.

The 5.75 per cent bonds 1984 (second series) issued by the **Industrial Development**

Bank of India for Rs 15 crores which opened for subscription on August 29 were closed within a short while after opening on being oversubscribed. This is the second time that the **IDBI** has entered the market for borrowings. The first series of bonds for Rs 11.50 crores issued on March 20 was also oversubscribed.

Company Meetings

Seshasayee Paper and Boards Ltd: Registered Office, Palli-

palayam, Salem District; September 23; 10.45 A.M.

The Tata Power Company Ltd: Registered Office, Bombay House, 24, Bruce Street Fort, Bombay; September 21; 4.00 P.M.

Hindustan Ferodo Ltd: Gateway Room, Taj Mahal Hotel, Bombay; September 15; 3.30 P.M.

letters of intent were issued under the Industries (Development and Regulation) Act 1951 during the four weeks ended June 3, 1972. The list contains the names and addresses of the licensees, articles of manufacture, types of licences viz.—New Undertaking (NU); New Article (NA); Substantial Expansion (SE); Carry on Business (COB); Shifting—and annual installed capacity.

Licences Issued

Metallurgical Industries (Ferrous)

Shree Hanuman Industries, 178, Mahatma Gandhi Road, P.B. No. 6771, Calcutta-7. (Liluah-Howrah-West Bengal)—Steel Pipes and Tubes—24,000 tonnes (after expansion)—(S.E.); Shri Anand Prakash Khandelwal, C/o Ramji Lal Ram Saroop, Mirza Ismail Road, Jaipur (Rajasthan) (Alwar-Rajasthan)—Grinding Media—4000 tonnes; Mn-Steel and Alloy Steel castings—4,000 tonnes; Ni-Hard and other Castings—2,000 tonnes—(N.U.).

Metallurgical Industries (Non-Ferrous)

M/s Shri Mahesh Metal Works, Madangan, Kishangarh, Rajasthan. (Madangan, Kishangarh, Rajasthan)—Hot and cold rolled brass copper, zinc and aluminium sheets/strips/circles/coils/plates—210 tonnes—(C.O.B.); M/s Braloc Metal Industries Pvt Ltd, Gupta Mills Estate, Reay Road, Darukhana, Bombay-10. (Darukhana, Bombay-Maharashtra)—Non-ferrous semis (copper and copper alloys of all kinds and aluminium alloys) including sheets, strips, and foils—4100 tonnes—(C.O.B.).

Telecommunications

M/s Murphy India Ltd, Dr. Shirodhar Road, Parel, Bombay-12. (Thana-Maharashtra)—Loudspeakers and cones for loudspeakers.—Expansion from 0.3 million Nos. to 1.0 Nos.—(S.E.).

Transportation

M/s Sri Ramdas Motor Transport Pvt Ltd, Subhas

Road, (P.O.B. No. 42), Kikina (South India), (Kikina-Andhra Pradesh)—Piston Pins—1,80,000 Nos.—(S.E.).

Industrial Machinery

M/s Cutfast Abrasive Tools Pvt Ltd, Pallikaranai, P.O. Medavakkam, Madras-15. (Medavakkam - Madras - Tamil Nadu)—Coated Abrasive Products—36,000 reams—(C.O.B.); M/s Interstate Equipments (India) Pvt Ltd, E. 24, N.D.S.E. II, Ring Road, New Delhi. (Bhaga-Distt. Dhanbad-Bihar)—Aerial Ropeways—Rs 10 Million (N.U.); M/s Buckau-Wolf New India Engineering Works Ltd, 16, Nirmal, Nariman Point, Bombay-20. (Pimpri - Poona - Maharashtra)—Plant and Machinery for Breweries and Malteries Industries. Rs One crore licensed capacity for the mfg. of sugar Machinery and Steam Tube Calciner Plants—(N.A.).

Machine Tools

M/s Triveni Engineering Works Ltd, National Insurance Building, 1st Floor, 5, Parliament Street, New Delhi-1. (Naini-Allahabad-Uttar Pradesh)—Hydraulic Presses (20 tons to 5000 tons capacity) such as Baling Presses, Multi Platen, Compaction, Extraction, Forming and Moulding and Radial Punching Presses—Worth Rs. 25 Lakhs—(N.A.).

Agricultural Machinery

M/s Indequip Engineering Ltd, Reid Road, Ahmedabad-2. (Tahsil Naroda, Distt. Ahmedabad-Gujarat)—Power Tillers 'Iseki' (k-48c) (6.5 H.P.)—10,000 Nos.—(N.A.); The Managing Director, The Kerala Agro-Industries Corp. Ltd, General Hospital Road, Tri-vandrum (S. India) (Alwaye-Distt. Ernakulam Kerala)—'KUBOTA' Power Tillers (Model KMB-200) with engine ER-90N. (9-12 HP Diesel)—12,000 Nos.; 'KUBOTA' Diesel engine Model ER 40 (4-5-HP)—5,000 Nos.; 'KUBOTA' Diesel Engine Model ER-6.5 (6.5-8HP)—5,000 Nos.—(N.U.).

Engineering Industries

M/s Secals Ltd, Nungambakkam High Road, Madras-34. (Ambattur-Tamil

Nadu)—Cast tools for forging Industry—70 tonnes; Cast tools for plastics mould and rubber mould Ind.—25 tonnes; Cast cutting tools—25 tonnes; Cast tools for other industries—25 tonnes—(N.U.).

Chemicals

The Managing Director, Punjab State Industrial Dev. Corp. Ltd, United Commercial Bank Building, 3rd Floor, Sector 17-B, P.B. No. 81, Chandigarh, (Rajpura-Punjab)—Synthetic Detergents—10,000 tonnes only—(N.U.); M/s Haryana Industrial Gases Corp., A-30 N.D.S.E., Part II, New Delhi. (Faridabad-Haryana)—Oxygen Gas—0.45 million cu. metres—(N.U.); The Indian Petro-chemicals Corp. Ltd, P.O. Jawahar Nagar, Distt. Baroda, Gujarat. (Koyali, Baroda-Gujarat)—Ethylene (polymer grade)—1,30,000 tonnes; Propylene (polymer-grade)—35,000 tonnes; Propylene (Chemical-grade)—43,300 tonnes; Butadiene—22,000 tonnes; Benzene—23,600 tonnes; Light Pyrolysis gasoline—29,300 tonnes; Heavy Pyrolysis gasoline—34,600 tonnes; Raffinate—8200 tons; Carbon Black feedstock—17,900 tonnes—(S.E.); M/s Pacific Chemicals Hindustan Ltd, 14, Golf Links, New Delhi-3. (Bulandshahr Road-Ghaziabad-Uttar Pradesh)—Dalapon, Dowpon, Dowpon, Dursban, Dinoseb, Zectran—Solid 1700 tonnes; Liquid 1320 K.L.—(N.U.).

Sugar

M/s Pravara Sahakari Sakhar Karkhana Ltd, Pravaranagar, Distt. Ahmednagar-Maharashtra. (Pravaranagar-Ahmednagar - Maharashtra)—Sugar 1,000 tonnes of sugarcane per day—(S.E.); The Chairman, M/s Sri Mahadeswara, Sahakara Sakhar Karkhana Ltd, Kollegal, Distt. Mysore, Mysore. (Kunthur - Taluk Kollegal - Distt. Mysore-Mysore)—Sugar—1,250 tonnes per day—(N.U.); M/s The Vellore Co-operative Sugar Mills Ltd, No. D.S. 2, Vellore, Distt. North Arcot, Tamil Nadu. (Thiruvallam-Ammundi Village - Gudiyatham Taluk-Distt. North

Arcot, Tamil Nadu)—Sugar 1,250 tonnes per day—(N.U.);

Letters of Intent

Metallurgical Industries (Ferrous)

M/s La Precis in Spring and Engineering Co. Pvt. Ltd, 1-Suyojana House Society, Koregaon Park, Poona-1 (Poona-Maharashtra)—Metallic Precision Springs such as coil springs, flat springs and formed springs—600 tonnes—(N.U.).

Metallurgical Industries (Non-Ferrous)

M/s Saru Smelting Pvt Ltd, Sarunagar, Sardhana Road, Meerut-U.P. (Uttar Pradesh)—Beryllium copper alloys, wires rods and flats—50 tonnes—(N.A.).

Electrical Equipment

M/s Jaipur Metal & Electricals Ltd, Near Railway Station Jaipur-6. (Jaipur-Rajasthan)—Electrical Steel stampings and Laminations—12,000 tonnes—(N.A.); Shri Krishan Lal, M-132, Connaught Circus, New Delhi. (Uttar Pradesh/Jammu & Kashmir/Haryana)—Winding wires upto 41 swg (Thicker Gauges)—300 tonnes; Winding wires 42 SWG and thinner—50 tonnes—(N.U.); M/s Chandra Electrical Industries, E-25, Himalaya House, 2nd Floor, 23, Kasturba Gandhi Marg, New Delhi (Delhi)—Winding wires upto 41 SWG—440 tonnes; Winding wires 42 and thinner—50 tonnes—(S.E.); M/s Jayant Metal Mfg. Co., Post Box No. 7009, 16, Sayani Road, Bombay-25DD. (Bombay-Maharashtra)—Winding wires upto 41 SWG (thicker gauges)—300 tonnes—(S.E.); M/s Haryana Wires, C/o M/s Bombay Premier Trading Co., H.O. 230 D. N. Road, Fort, Bombay-1 (Haryana)—Enamelled winding wires upto 41 SWG—300 tonnes; Enamelled winding wires upto 42 SWG. and above—50 tonnes—(N.U.); M/s Ashok Brothers, C/o Shri H. C. Gupta, 26/28, Shakti Nagar, New Delhi-7. (Sonapat-Haryana)—Glass covered wire (42 SWG. and above)—100 tonnes; Synthetic Enamelled

wires (42 SWG and above)—50 tonnes; Aluminium winding wires—300 tonnes—(N.U.); M/s Victor Cable corp., 802, Joshi Road, New Delhi. (G.T. Road-Sahibabad-Uttar Pradesh)—Winding wires upto 41 SWG. (thicker gauges)—200 tonnes; Winding Wires upto 42 to 44 SWG (thinner gauges)—(N.A./S.E.); Shri A. P. Mehta Managing Director, Deepak Insulated Cable Corp. Ltd, 4th Floor, 1-Vindhana Veedhi, Bangalore-1 (Bangalore-Mysore)—Winding Wires upto 41 SWG—556 tonnes; Winding wires 42 SWG and thinner—50 tonnes—(S.E.); M/s N.G.E.F. Ltd, Post Box No. 5384, Bangalore-1 (Bangalore-Mysore)—E.H.V. Power Transformer upto 400 KV/400 MVA—2500 MVA—(N.A.); M/s Electronics Corp. of India Ltd, Industrial Dev. Area, Cherlapalli, Hyderabad-40. (Andhra Pradesh)—New articles: Antennas with feed (of various sizes)—250 Nos; Electronic Equip. instruments and components for indicating recording and controlling vacuum and temperature.—45,000 Nos; Items for which expansion of capacity has been approved—Nuclear and allied Instruments: Nuclear Instruments and systems—Expansion from 640 Nos. to 1200 Nos.; Medical Instruments and systems Radio logical and Health—Expansion from 730 Nos. to 1000 Nos.; Electronic Text and Measuring Equip.—Expansion from 725 Nos. to 1200 Nos.; Industrial and Agricultural Instruments—Expansion from 170 to 500 Nos.; Resistors and capacitors: Carbon Metal oxide Film Resistors Grade I and II—Expansion from 3.5 millions to 30 millions Nos; Potentiometers—Expansion from 12,000 Nos. to 30,000 Nos.; Tantalum Capacitors—Expansion from 0.26 million to 1 million Nos.; Servo Controls: Synchro-expansion from 2000 to 2500 Nos. Power Reactor instrumentation: Instrumentation and controls for Nuclear and other power Stations—Expansions from the value of Rs 7.8 million to the value of Rs 23 million; Computers: Digital computers for real time and scientific application.—Expansion from 10 Nos. to 50 Nos; Analog computers—Expansion from 10 to 100 Nos.—

(N.A./S.E.); Shri S. K. Sarangi 5 Lower Rawdon Street Calcutta-20. (Faridabad-Haryana)—Nickel Cadmium Cells—2,00,000 Nos—(N.U.); M/s Khatau Junker Ltd, Laxmi Building, 6 Ballard Road, Bombay-1. (Maharashtra)—Power Factor Correction capacitors—2,00,000 KVAR—(S.E.).

Transportation

Shri Ranjit Singh Sahni, 4/32, Western Extension Area, Karol Bagh, New Delhi-5. (Haryana)—Contacts sets—10 lacs Nos; Distributor Assemblies—40,000 Nos; Condensers—40,000 Nos; Rotors—40,000 Nos; Distributor caps—40,000 Nos; Ignition coils—40,000 Nos.; Ignition Swit-

ches—40,000 Nos—(N.U.); M/s Victor Gaskets India Ltd, B-88, Defence colony, New Delhi. (Bombay - Maharashtra)—Piston Ring—3,00,00,000 Nos—(N.A.); M/s Virinder Singh, 5/9, Kirti Nagar Industrial Area, New Delhi-15. (Haryana/Uttar Pradesh)—Propeller Shafts—30,000 pcs; Teeth and Yokes—75,000 pcs; U.J. Crosses—

The exporter's friend
DENA BANK
can help you
to develop and expand
your exports.

Count on DENA BANK to make credit available to you promptly for export of mill machinery, electrical equipment and other capital and engineering goods on cash basis or deferred payment terms. With correspondents at all important financial centres, our Foreign Department is fully equipped to handle Letters of Credit, Export Bills, Foreign Remittances and also to help you with market information and advice on trade procedures.

M/s Harbans Lal Malhotra & Sons Pvt Ltd, Bombay.—Industrial Furnaces.

V/O "Elektronorgtekhnikha" offers all-purpose Electronic Computer, model "NAIRI-3" destined for solving of various scientific, engineering, planning, economic and statistical problems in works' laboratories, design bureaus, universities, computing centres, automatic control systems, experiments in the physics field and in complex computing systems.

The small-sized "NAIRI-3" is a simple and operationally reliable electronic computer employing integrated hybrid circuits.

Particular features of "NAIRI-3" are the concept of microprogram control and variability of command system implemented in the design enabling to solve problems programmed in command systems of other machines, i.e. electronic computers, models "NAIRI-2" and "MINSK-22"

"NAIRI-3" internal storage capacitance of a minimum set is 4,096 words incrementable to 32,768 words, whereas the capacitance of the permanent storage is 32,768 words. The

word length is 37 binary digits. Double length can also be handled.

A "NAIRI-3" minimum set contains an arithmetic unit, an external unit, internal and permanent storages. The external unit comprises of printer, tape puncher, photo input unit and digital printer.

A minimum set may, if necessary, be supplemented by devices for information input from cards and output to cards, fast close printer, chart plotter, matcher for remote terminals to serve upto 64 users simultaneously, 16 magnetic drum storages with the total capacitance of 16x8,000, 37-digit words, 8 magnetic tape storages with the total capacitance of 8x3.10⁶, 37-digit words, 7 internal storage units of 4,096 words each and by a permanent memory for 16,000 words.

V/O "Elektronorgtekhnikha" renders assistance to buyers in assembly, alignment and launching of the equipment, in establishing and running the maintenance services, as well as in training the personnel.

RECORDS AND STATISTICS

Editor : R. V. MURTHY

A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.

The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.

Inquiries regarding subscription and advertisements may be addressed to :

The Eastern Economist Ltd, Post Box No. 34, New Delhi-1.**

RECORDS AND STATISTICS

Power Development

IT HAS been known for some time that the power supply position has been turning critical in some states. Industries in Maharashtra, Gujarat, Punjab, Haryana and Uttar Pradesh have suffered in a grievous manner in recent months due to the shortage of power. This has resulted not only in slowing down the pace of industrial growth but also in reducing our capacity to earn foreign exchange through increased exports. In order to focus attention on this problem, the Federation of Indian Chambers of Commerce and Industry (FICCI), New Delhi, has arranged a seminar which will be held in the Capital on September 8 and 9. The FICCI has prepared a special background paper for discussion at the seminar; this paper is given below in full:—

There has been considerable shortage of power supply in various parts of the country during the last few years. Of late, the position has aggravated considerably and we are virtually on the threshold of a perennial power crisis. Since the beginning of the year, the shortage has been felt particularly in the western region including Maharashtra and Gujarat. In March last, the power cut in Gujarat was 25 per cent. Punjab, Haryana and UP are also affected by power cuts for the last few months. In Punjab, the power cut was about 30 per cent and factories had to resort to five-day working. Now Andhra Pradesh is also in the throes of a

power crisis. Both West Bengal and Bihar have been passing through a period of considerable power shortage affecting the operation of industrial plants and coal mines. The jute industry's loss of production due to power shortage since January last is valued at Rs. 8.5 crores of which the loss of foreign exchange is five crores.

2. There are various factors which have contributed to the power shortages such as delay in the construction of power stations, shortage of rainfall in the catchment areas for some hydro-electric stations, low capacity utilisation due to lack of maintainance, non-availability of coal, lack of transmission facilities, leakage in transmission, labour trouble, etc. The leakage in transmission is said to be abnormally high particularly due to lack of maintenance and proper equipment. The point to note is that the power shortage is not localised, nor are the factors responsible for the shortage of a temporary nature. The Minister of Irrigation & Power himself stated recently in Parliament that the country should be prepared for a power shortage of 2-3 million kW by 1973-74, even after the completion of some power projects in Haryana.

3. Shortage of power has severe repercussions not only on industrial production but also on general economic growth. Out of the total consumption of electricity, industrial sector accounts for more than 70 per cent. The persistent deficit in power supply may prove to be a roadblock in the acceleration of industrial production which has been lagging behind at 3-4 per cent, a rate of growth much below the Plan target. A considerable quantity of power is also

necessary for providing irrigation facilities to agriculture. Besides, development of backward areas and rural electrification, which are being given greater emphasis recently, will give a further spurt to the demand for power. It is, therefore, essential that timely steps are taken to plan power development in such a way that not only the malaise of periodic power shortages are removed but also a firm basis is laid for development of the basic infrastructure by planning power supply well ahead of likely demand.

4. The Seminar proposes to discuss the short-term and long-term issues concerning power development, the impact the present shortage is having on industrial production and development and the steps that should be initiated to being about a rapid increase in the power generating capacity and its transmission and distribution in the years that lie ahead. The Paper is divided into the following sections:—

- Power Shortages and Potentials
- Problems of Transmission and Distribution of Power
- Rationalisation of Electricity Tariffs

Power shortages and potentials

5. It is almost axiomatic that to increase standards of living from whatever starting point requires energy consumption. Those countries with the greatest consumption of power per capita have also the highest standard of living. Electric power occupies a key position as a stimulant to industrial and agricultural expansion and modernisation. Availability of adequate and reliable power supply has necessarily to be an important aim of planning and development.

6. In the successive five year Plans, beginning from the first Plan in 1951, power development made considerable strides. As much as Rs 3500 crores were invested during the period 1961 to 1971 on electricity generation and transmission. There,

has been substantial progress in terms of capacity for power generation, the number of villages electrified and the number of pump-sets energised.

Year	In-stalled generating capacity (mill. kW)	No of electrified villages (000)	No. of pump-sets energised (000)
1950-51	2.31	3.5	19
1955-56	3.42	9.6	58
1960-61	5.65	26.0	192
1965-66	10.17	48.0	513
1969-70	15.50	84.0	1370
1970-71	16.40	105.0	1600
1971-72	17.70	123.0	1926
1973-74 (Target)	23.00	166.0	2310

7. Despite nearly an eight-fold increase in generating capacity, the availability of power has become a major constraint in development of both industry and agriculture. What could be the reason for this anomaly? Has the demand been outstripping supply? Or, has the supply of power for various reasons fallen short of Plan targets which are based on estimates of requirements of power for various uses? Possibly, both those factors have been responsible for widening the gap between demand and supply of power. One thing, however, is clear that the shortage in supply of power has contributed more in increasing the gap in as much as from beginning of the first Plan, installation of power generating capacity has always been falling short of the Plan targets.

8. The shortfalls in physical targets in respect of power generation during the successive five year Plans are shown in Table II on page 581.

It is stated that out of the total projected outlay of Rs 2500 crores on power development during the fourth Plan, in the first three years of the Plan, the anticipated outlay was about Rs 1200 crores representing over 60% whereas upto

now the physical achievement has been 37% less than the target.

Was the physical achievement commensurate with the capital expenditure? If not how the efficiency of investment can be improved?

9. The short-fall in the achievement in the second Plan was ascribed to foreign exchange deficiencies and also to delay in the execution of some of the more important projects. For the fourth Plan, against a target of generating capacity of 23 million kW the total may come to slightly above 20 million kW by the end of the fourth Plan, which is even lower than that envisaged in the Mid-Term Appraisal.

10. The Seventh Annual Electric Survey which is based upon an assessment of the power potential that is likely to be available as a result of the commissioning of new plants forecasts, as the table III shows, power shortages in the northern, Western and southern regions of the country by 1973-74 which among them account for about 80 per cent of the total estimated all India requirements of electric power.

11. The deficit is endemic in the northern region and is developing in the western and Southern regions. Even in the Eastern region in which the Electric Survey has forecast a surplus, the position is far from comfortable and the West Bengal industrial complex is now severely affected by power shortages, fluctuations in supply and voltage dips. In these and other regions, the problem has been not merely one of shortage due to inadequacy of generating

capacity but also of insufficient transmission facilities and the low level of efficiency of operation and maintenance of power plants.

12. It is important to note that not only is the supply of power quantitatively short of requirements but its quality has deteriorated. There are frequent stoppages, unscheduled shut-downs, trippings and wide fluctuations in voltage of power supply. All these cause serious dislocations in the production schedule of industry, particularly those in which power inputs are comparatively high. Besides, these are likely to cause serious damage to the installed machinery and equipment, and reduce their life. This also adds to the cost of industrial output.

13. A variety of factors have contributed to the present situation in respect of power supply:

- Delay in the implementation of power projects;
- Low utilisation of power generating capacity already installed,
- Lack of transmission facilities,
- Low financial provisions,
- Labour troubles.

(i) Delay in the Implementation of Power Projects

14. Execution of power projects has suffered serious setbacks, due to a number of factors such as (a) delay in delivery of equipment, (b) shortage of essential construction materials like cement and steel, (c) labour troubles. The major cause, however,

is the delay in delivery of power generating equipment by the public sector heavy electrical plants viz. Bharat Heavy Electricals Ltd. (BHEL) and Heavy Electricals Ltd. (HEL). It is to be noted that the third five-year Plan document also ascribed the shortfalls in power development to the same factors. For one reason or the other, it appears that there has been persistent delays in the supply of equipment. As against a projected target of installation of generating capacity of 2 million kW in 1972-73, a shortfall of 25% is envisaged in a recent assessment, mainly on account of delay in the supply of equipment. Similarly, keeping in view the present progress of civil works at site and the latest indications of delivery of equipment by (BHEL) and (HEL), some of the major projects that were to be commissioned by 1973-74 may spill over to the fifth Plan. What is even more significant is that the public sector plants which are expected to produce the heavy generating equipment are, at present, operating at 30-40% of their capacity. The

public sector plants are in some cases, shifting the responsibility for the delay in fabrication and delivery of some essential components to the Heavy Engineering Corporation. Also the delay in the delivery of power generating equipment is ascribed by the BHEL and HEL to the delay in the placing of orders by the state electricity boards. State electricity boards, on the other hand, complain of inadequate resources for advance orders. The question, however, remains whether it is possible for the producers of power generating equipment to manufacture some units of power generating equipment in anticipation of the likely demand. The fact also remains that there are many complaints about the delay in procuring the electrical equipment from the indigenous manufacturers as well as their quality.

How can these problems be overcome?

(ii) Low Utilisation of Power Generating Capacity Already Installed

15. Another contributing factor to the present difficulties in

TABLE II
Shortfall in Physical Targets

Period	Planned addition Mill. kW.	Achievement Mill. kW.	Shortfall Percentage
First Plan (1950-55)	1.40	1.12	20
Second Plan (1956-61)	3.48	2.23	36
Third Plan (1961-66)	7.04	4.52	35
Three Annual Plans 1966-69)	6.68	4.12	38
Fourth Plan (1969-72) (first three years)	4.13	2.60	37

TABLE III
Estimated Surplus/Deficit — Statewise

Regionwise	1968-69	1969-70	1970-71	1971-72	1972-73	1973-74	1974-75
Northern Region	1132	549	582	—1766	—1473	—411	2027
Western Region	908	1155	1658	1091	412	—164	—1536

North Eastern Region	313	241	240	183	176	226	470
All India	8430	7623	7879	3835	2266	2040	3346

power supply is that even the generating capacity already installed could not be utilised to the full or to the best advantage for a variety of factors.

(a) Efficiency of operations and maintenance of power plants has been low as admitted by the union Minister for Power recently in Lok Sabha. Both technical and non-technical factors were responsible for this. Lack of sufficiently trained and experienced men, lack of proper equipment, appointment of personnel on non-technical considerations leading to inefficiency in management, shortage of components for replacement and their delayed delivery have all contributed to the low efficiency of maintenance and operations at the plant level.

(b) Non-availability of coal in time to thermal plants has led to under-utilisation of power plants in some instance. Sometimes inferior quality of coal has been a factor.

(c) For many hydro-electric plants, low storage levels in reservoirs has been the cause for trouble due to lack of rains in the catchment areas. The question arises whether there are sufficient inter-connections with thermal stations to make up for deficiencies arising on such occasions.

(iii) Lack of Transmission Facilities

16. A significant feature of the power situation today is that while there are a few areas with surplus power, there are others which are deficit or may be in temporary difficulties due to the break-down of important supply centres like Tarapur Atomic Power Plant. Lack of adequate transmission facilities from one state to the neighbouring states has prevented supply of power from surplus to deficit areas. There are complaints of insufficient transmission lines even with uncertain states. The subject is being more fully discussed in the next section.

(iv) Low Financial Provision

17. As stated by the union Minister for Irrigation and Power recently in Parliament, power development has suffered

due to inadequate financial provisions made for power generation during the Plans.

(v) Labour Troubles

18. Frequent labour troubles in power plants at least in some areas like West Bengal have been the cause of dislocation of power supply in a number of instances.

A number of questions arise:

1. Are there any practical remedies for removing these difficulties?

2. Which are the organisations that need more attention and call for gearing up to meet the current exigencies of power supply e.g. power service organisations like Central Electricity Authority, State Electricity Boards, etc. or producers of power generating equipment, or also other public sector organisations like the HEC?

3. Has the private industry any role in the supply of power generating equipment?

4. How to speed up implementation of power projects?

The answers to these questions would be useful guides in planning for power development in the fifth Plan and after.

Planning for Power Development

19. Planning for power is very crucial especially in the context of the long gestation period required to instal power plants. There are limitations in indigenous supply of plants and designing capabilities making for expeditious delivery of equipment. Setting up power plants involves heavy initial investments and foreign exchange, and both have proved to be serious constraints. Power affects production and growth if it falls short. It is equally true that capacity that is installed should be used to the maximum extent, and what is produced should be also be utilised. This means there has to be a well co-ordinated programme of power development correlated with the growth of industry, agriculture and other sectors which consume it.

20. For the successful planning and implementation of power development, firstly, it is necessary to have a long range plan

extending over a period of 10 to 15 years and based upon a realistic estimate of demand. Secondly, a scientific selection of projects has to be made after a comparison of advantages of the alternative sources of energy/fuel, hydro, thermal, nuclear and a combination of them, within each region, depending upon the feasibility. Thirdly, an assessment of the indigenous machine building and designing capacities and the time required for fabrication and delivery should be made with a view to planning for imports, wherever indigenous capacity is not sufficient. Fourthly, there should be a definite implementation schedule feasible to be achieved. Finally, the state electricity boards should be required to place their orders with indigenous equipment manufacturers sufficiently in advance.

21. Demand: There are varying estimates of demand. The Seventh Annual Electric Survey (1972) has estimated the annual growth rate at 12.4 per cent in demand, but according to official estimates, actual consumption has been increasing by 20 per cent or more in some areas. The power development programme during the fifth Plan (1974-75 to 1978/79) envisages increasing generating capacity to 41.5 million kW after allowing for retirement of some obsolete plants. This means an addition of 21.8 million kW of generating capacity during the fifth Plan. The requirements of power upto 1980-81 has also been projected by the Ministry of Irrigation and Power. The estimated requirement in 1980-81 involves the creation of a generating capacity of 48 million kW, at the present given levels of efficiency in use. Some margin has also to be kept to meet contingencies. A total generating capacity of 52 million kW has been suggested by 1980-81. The seasonal spurts in demand due to conditions of drought cannot be quantified but the number of pumps energised is an indication of the growth of demand. There has been a three-fold increase in energisation of pumps. A much larger rate of increase has been visualised in rural electrification. In the case of industry a growth rate of 8 to 10 per cent is the minimum required against the present

growth of 3 to 4 per cent. Even at this sluggish rate, the supply position of power has been remaining unsatisfactory. The fifth Plan projection, be it noted, is based on an assumption of 8-10 per cent growth of industry. The question arises whether the fifth Plan target of 41.8 million kW of generating capacity would meet the criterion of planning power supply well ahead of demand by providing for a margin for accelerated demand for power.

22. Selection of Projects: There are several sources of energy — coal, water, oil, gas, nuclear fuel etc. What should be an ideal mix? Of the total targeted addition of 21.8 million kW in fifth Plan, 11.8 million kW will be in thermal plant, 1.4 million kW in nuclear plant and the balance of 8.6 million kW in Hydro electric units. During the last few years frequent power cuts have been a recurrent phenomenon in areas fed mainly by hydro-electric power stations because of erratic or delayed monsoons. A suggestion, is made that there should be a reduction in the dependence on hydro-electric energy. But then the question arises as to the availability of the basic resources/fuels required for thermal development.

23. Equipment needs: In launching a programme of creating an additional 20.8 million kW of power generating capacity in the fifth Plan the machinery fabrication potential will have to be considerably geared up. This would mean an average annual rate of delivery of about 4 million kW p.r annum. Is it practicable to realise this magnitude of production by the existing indigenous manufacturers of electrical equipment plants in the Fifth Plan period? It is understood that the two public sector plants BHEL and HEL have a capacity of 7.8 plants of 200 mW and 8 plants of 100 mW respectively. Even as it is, the programmes of the heavy electrical plants are stated to have suffered due to various bottlenecks such as difficulties in importing castings, forgings and some finished components. Other limitations stated to be

faced by these plants are inadequacy of testing facilities for turbo generators; and lack of capacity for manufacturing blades to suit different types of turbines which have to be imported. The question arises whether for ensuring timely and smooth implementation of the programme of power development of the magnitude envisaged it will be feasible to rely on the existing plants, and to what extent? Considering the long gestation period of such plants will it not be advisable to plan from now? Will not the private sector of the electrical equipment industry be allowed to play a role? The largest single turbine produced in India have a much lower capacity of about 200 mW against 1000 mW in United States and Soviet union and 750 mW in Britain and West Germany. What are the constraints, if any in designing and fabrication of turbines of higher ranges of say 500 mW especially since the heavy electrical plants have collaboration with competent authorities abroad?

What are the ways of improving the design sections and technical capabilities of the heavy electrical plants?

The following are some other issues concerning power development which may also be discussed:

Can the shortfalls in power development be attributed to lack of long term planning, taking into account the long period of gestation of power projects to materialise? Was the demand for power much in excess of anticipations or was the supply also short of planned targets? Or have maintenance and operational problems of existing plants aggravated the shortages?

24. Implementation Schedule: It is said that the emphasis during the last 25 years was on setting up large units based on energy resource availability. Is there a need to optimise the location of generating stations by providing for transport of fuel to the station? What is the economics of locating thermal stations away from the sources of fuel? On the basis of the time

that will be required for completing civil works, fabrication and supply of indigenous equipment and delivery period of imported equipment, realistic implementation schedules can be worked out. It is stated that the present policy of not importing heavy electrical plants has been a cause for delay in implementation of power projects due to uncertain delivery periods of equipment by the public sector plants. Whether allowing more imports will ensure expeditious implementation is a point to be discussed?

II Problems of Transmission and Distribution

25. After electricity is generated in power stations, it is to be distributed to consumers through transmission lines erected for the purpose. It is not as easy to describe the transmission systems statistically as the generating systems. But, as the Energy Survey Committee (1965) had put it, it can be said that the rapid growth of demand for electric power had led to infinite improvisations to enable an inadequate system of distribution to carry as much load as possible. In most of the cities which are also centres of industry, the distribution system is not only outdated but very seriously overloaded.

25. The fourth Plan describes the progress on transmission schemes as shown in Table IV below.

27. While additions made in the third Plan nearly doubled the length of transmission lines, these were admittedly not commensurate with the requirements arising out of the increase in generating capacity.

28. In the industrially advanced countries, investment in transmission and distribution is about equal to that of generation. In India total investment in transmission upto the end of annual plans in 1968-69 was about Rs 920 crores as against about Rs 2204 crores on generation; besides, Rs. 420 crores were spent on rural electrification. The fourth Plan was expected to strengthen the transmission and distribution system appreciably.

But the proposed investment on the latter head was only Rs. 722 crores whereas generation schemes got an allotment of Rs 1255 crores. Only by adding the proposed investment on rural electrification the two amounts come nearer to the desired levels. The question is whether financial provision itself is sufficient for installation of an adequate transmission system?

29. The transmission system consists of transmission lines and various other equipment required for transport of electricity from the generating stations to the consuming centres and individual consumers. The significant point to note is that transmission of electricity involves the capital cost of transmission equipment as also some transmission losses and the cost of what is called reactive compensation.

30. The first issue is the economics of transport of electricity. This is of some practical significance in Indian conditions where, as observed by the Energy Survey Committee, in future a large share of power will have to be obtained from by-product coking coals from the iron and steel industry. The question is whether it is economical to carry the coal to instal power stations near consuming centres or to carry electricity through transmission lines to those centres through high-voltage transmission lines. From investigations carried out in India and elsewhere the general principle is clear. For a reasonably high load factor, electrical transmission is cheaper but for low load factors cost of coal transport is cheaper. Therefore, for a peakload plant, the site should be selected as near the load centre as

possible. The Energy Survey Committee studied this problem in depth and came to the conclusion that the relative costs of rail transport and electrical transmission depend on a number of complex factors, and each case should be considered on its own merit. This, is, no doubt, a techno-economic problem on which the Seminar is expected to throw some light. One thing, however, is clear. Electrical transmission to long distances requires high voltage transmission lines which are currently much below requirements in the present system.

31. Then, an integral part of any transmission system is a network of inter-connections joining one power station or generating system to another. Such inter-connections may be required to connect power generating stations within a state or may cross state boundaries to connect those located in neighbouring states. Regional and national grids may be formed out of such inter-connections.

32. The advantages and economies of such inter-connections are well-known. In India as elsewhere power generation may be based on thermal, hydro or nuclear plants. Sizes of plants also may differ due to individual circumstances. The full and effective use of large thermal and nuclear stations and their integration with the hydro system can be possible only through inter-connections. Even within the overall shortage of power some states and regions are better off than others. Even within the same state, there may be areas of shortages and comparative surpluses. Supply of electricity from surplus to defi-

TABLE IV
Progress of Transmission Schemes
(Circuit Km)

	Above 500 V 11/15 KV	Above 11/15 KV to 66/67 KV	110 KV and above	Total
1960-61	102027	41960	13901	157888
1965-66	185969	76358	28491	290818
1968-69 (est.)	291000	—	194200	495200

cit areas is possible only by proper integration through inter-connections.

33. Energy losses in transmission in India, particularly in some regions like the Southern and the Northern, are very high. The all-India average loss in transmission has been estimated to be as high as 16 per cent as against 8-10 per cent in Europe. Inter-connections make it possible to substantially reduce wastage of power due to transmission losses. It is understood that for 1 per cent reduction of losses, the revenue benefit may be of the order of Rs. 5 crores. Moreover, in developing countries like India where the rate of growth of power demand is high, precise load forecasts are not easy despite the technical competence of the forecasting personnel, and may be much below the potential demand which should form basis for planning future development programmes. The result, as observed in India over the past few years, is that there are surplus in certain systems side by side with deficit in others. In such a situation, inter-connections will reduce wastage of power and enable the surplus power to be utilised in deficit areas. There are instances in Indian conditions where the absence of inter-connections has involved avoidable interruptions of supplies. Potential economies, specially of stand-by equipment, inherent integrated systems have also not been available in their absence.

34. Some other benefits of inter-connections are: mutual assistance between power generating stations-systems in case of break-down, lower requirements of total installed capacity for generation due to diversity of load, economy in capital outlay and operating costs by siting large size plants in appropriate locations, low overall production cost, exchange of power between systems to mutual advantage as in case of peak demands occurring at different times, enabling facilities to be scheduled for maintenance, closure of some stations at times of low system

demands and taking over their load, etc.

35. Not only are the advantages of inter-connections already known, but systematic efforts are, no doubt, being made in the country for some years past for evolving a co-ordinated transmission system and forming regional grid systems out of inter-connections, with the ultimate objective an all-India grid. For this purpose, the country has been subdivided into 5 regions with appropriate regional agencies operating since 1964-65. Some planning and work has also been made in installing high-voltage transmission lines, state/regional load despatch centres, etc. which are urgently required for a co-ordinated grid system to be built out of inter-connections. But for various reasons the progress has been very slow indeed.

36. One of the main prerequisites for co-ordinated operation of state and regional power systems is to ensure that strong inter-state links are established. Upto the end of the third five-year Plan, only 31 inter/state inter-Regional links were in existence. The progress during the first three five year Plans apparently had been slow due to the reluctance on the part of the state governments to implement inter-state transmission links. In the fourth Plan, with a view to stimulating implementation of inter-state links, government decided to provide 100% loan assistance to states to implement programmes of inter-state transmission links. Under this arrangement while funds are advanced by the centre, the executing authorities are the state electricity boards within their respective areas of supply. However, even this scheme has not apparently proved to be very effective. Only 3 out of the 38 inter-state links approved during the fourth Plan have so far been completed. It is estimated that another 5 lines may be completed within the fourth Plan period spilling over the balance of 31 schemes to fifth five-year Plan period.

What are the major impediments in the progress of

establishment of inter-State and inter-Regional transmission links? Is it because of the deficiencies in the execution of the projects by the state electricity boards? Can this problem be resolved by assigning the responsibility for executing the programmes of Regional Electricity Boards under Central control? To what extent the transmission linkage programmes between states and Regions have suffered on account of the shortage of steel and other raw materials required for fabricating transmission equipment? Has the programme of establishing inter-state and inter-Regional links suffered on account of paucity of finance, and if so, what steps are needed to meet the financial requirements in full?

Transmission Equipment

37. Transmission equipment comprises a number of items such as cables and wires, transmission towers, transformers for sending and receiving ends, switch-gear, lightning arrester, voltage control gears etc. The most significant fact in the supply of transmission equipment is that manufacturing capacity exists almost for all the items so that investment on transmission has a high indigenous content. In fact some of the producers as those of cable and wires have a large capacity installed but utilised only in part. There is no doubt a shortage of some essential raw materials like steel, copper etc. But once a firm decision is taken to gear up the transmission system to the current needs and to quickly implement the programmes, the supply of required raw materials can be arranged through imports. The issues before the Seminar therefore are:

Is there any shortage in the capacity for any item of transmission equipment? If so, which is that item and what is the extent of shortage? What are the short-term and long-term measures required to step up the availability of the equip-

ment required for transmission of electricity?

38. According to the Ministry of Irrigation and Power, 30 new inter-State linkage schemes will be taken up in the fifth Plan over and above those spilled over from the fourth Plan. A capital outlay of the order of Rs 125-150 crores might be required financing schemes.

How the material requirements of a programme of this magnitude can be fully met? To what extent availability of such items as transformers, switch-gear, control gear, steel, zinc, etc. for terminal equipment and lines have to be stepped up? Whether there is scope for increasing the capacity installed for transmission equipment in the country considering the importance of achieving self-reliance and at the same time-bound implementation?

Rural Electrification

39. Rural electrification is another important aspect of the distribution of power. In the first year of the fourth Plan, about 16,000 villages were electrified and about 2.66 lakh pumpsets were energised; in the second year of the Plan, 17,000 villages were electrified and 2.7 lakh pumpsets energised; in the third year upto December, 1971, the total number of villages electrified stood at 114,573 and the pumpsets energised about 18 lakhs. The fourth Plan provided for an outlay of Rs 294 crores for rural electrification. In addition, an outlay of Rs 150 crores has been provided in the Central sector for the Rural Electrification Corporation. Against the planned expenditure of Rs 93 crores in the first two years of the Plan, the actual expenditure on rural electrification amounted to Rs 144 crores.

40. The concept of rural electrification has to be understood from a wider perspective instead of restricting it simply to the number of villages electrified or the number of pumpsets energised. For its success, rural electrification has to be dovetailed with a well co-ordi-

nated programme of progressive industrialisation of the rural areas. It is necessary to develop the countryside by the establishment of medium and small scale industrial complexes through various incentives and wide spread growth of the infrastructure by transport, medical and other facilities so as to attract talents from the urban to the rural area.

The issues can be put as follows:

What is the objective of rural electrification? Can this be met by extension of electricity supply to rural areas without adequate provision of the required transmission lines? Does this cause any strain on the transmission lines elsewhere or effect the supply of electricity elsewhere either quantitatively or qualitatively? What is the role of progressive industrialisation of rural areas in relation to rural electrification, and what should be the priorities?

III

RATIONALISATION OF ELECTRICITY TARIFFS

41. The electricity supply undertakings being utilities will have to play a promotional role, and cannot be strictly compared to commercial undertakings in the proper sense. Their performance cannot, therefore, be measured strictly in terms of the return or profits they earn.

42. The question arises as to what price should be charged from the consumers of power. For promoting industrial growth, provision of cheap power has to be an essential ingredient of governmental policy. It is in fact so in most countries. Even the TVA in USA produced power at a very low rate of return and could not for a long time pay back the principal of the loan it had taken from US government nor the interest there of. An element of subsidy in pricing electricity is implicitly accepted every-

Save with grace

Linoleum floor-coverings are an economic investment. Linoleum endows your home with a graceful decor. By retaining its striking elegance for years, it saves you so much in repair and renovation costs.... you'll need a whole elephant to serve as a piggy-bank!

Stain-proof, easy to clean and polish, Linoleum comes in a wide range of colours and designs. Choose yours.

ASP/L-5

where. Since electricity has to be sufficiently cheap as to be a stimulant to development, the tariffs be high. Power development is capital intensive and power projects have a long period of construction of as much as ten years, and capital-output ratio is as high as 5:1 according to some estimates. It is of considerable importance to economise the use of capital by placing emphasis on increasing the efficacy of operation, maintenance and capital construction. Electricity supplying units will be able to improve efficiency of electricity supply undertakings if they are to fully serve their socio-economic objectives. The Energy Survey Committee (1965) observed that while it was important the electricity undertakings earned a return on their investments, it was equally significant to ensure that tariffs fixed at higher levels did not create an atmosphere of "relaxation and lack of effort to push up efficiency".

43. It may be pointed out that there are other ways than price adjustments to enable electric supply undertakings to increase earnings. For example, considerable cost reductions can be ensured by higher thermal efficiency, larger plants, better maintenance, fuller utilisation and improved transmission and distribution facilities. What is the present pattern of tariffs obtaining in India? To what extent the existing tariffs are based upon considerations of efficiency and economy in the services rendered? What role tariffs can be made to play in the matter of promoting development of industry?

44. Annexure III gives the state-wise and consumer-wise tariffs on electricity supplied by electricity boards, DVC and private licences. The all-India tariff structure given in the Annexure shows that tariffs are not uniform and differ widely as between different states and even within the same state, depending upon whether the supply is made from hydro-electric or thermal stations.

45. As far as industrial supplies are concerned, there

is a two-part tariff system under which a fixed monthly charge is levied on the basis of a maximum demand, supplemented by a charge per kilowatt hour of energy actually consumed. This device favours high load use because the fixed monthly charge does not vary with the load factor.

46. The industrial tariff, however, is not a single rate for all. The rates charged to different industrial consumers like large, medium and heavy industries vary widely. Many of the industrial tariffs attempt in various ways, to provide incentives to high load and off-peak use of electricity. Industrial tariffs, in some cases, particularly in respect of power intensive industries are subject to long term agreements between the state governments/ electricity undertakings and the concerned industrial undertakings. But to what extent the need to keep electricity tariffs as a means of attracting industries and investment is recognised. Availability of cheap power is as significant a consideration in the location of industries, especially those which are power intensive, as the regularity, efficiency and quality of power supply.

47. It is felt in some quarters that as the conditions regarding power development as also the costs of generation vary from state to state, it is not practicable nor feasible to formulate any uniform pattern of tariffs for various classes of consumers throughout the country. There is another school of thought which favours pooling of uniform tariffs for region as a whole. The pooling of tariffs may be of particular advantage to the State which are deficient in power resources.

48. The rates charged on agriculture are subsidised so also differential rates are admitted as means of attracting industries to certain backward areas. There are political and social considerations besides purely economic which have gone into the formulation of present tariffs. Tariffs on the whole are more the result of historical factors than any

predetermined criteria. Is there a need to fix the tariffs on a more scientific basis? Is it necessary that certain uses are subsidised by charging a higher rate of tariffs on certain other uses in a situation of overall scarcity of power?

49. It is stated that in formulating tariff structure of any electricity supply undertaking, the cost both at high tension and low tension ends should be arrived at by taking into account all items of operation and interest charges payable on the capital investment as also the transmission and distribution losses. Further the end cost so arrived at should normally be kept in view when farming the tariff rates as a whole so that the net relations does not fall short of the cost. What are the merits of this suggestion? To what extent the fixation of tariffs at a level sufficient to cover cost including a normal return, of say 10 per cent, can be reconciled to the equally important principle of the 'capacity of the consumers to pay'?

50. What should be the attitude of the industry which is the largest consumer of electric power? Increases in electricity rates add to cost. What should be the criteria to be followed by suppliers in increasing tariffs? If the rates in neighbouring states are more favourable, the question that industry asks is whether the various suppliers are comparable with regard to efficiency of operations. Just as the industrial units are presumed to be working with maximum possible efficiency, can we make similar presumptions about the working of the electricity undertaking?

51. It must be noted that in the case of some industries like aluminium, cement electrolytic production of caustic soda, nitrogenous fertilizers, copper, etc. the cost of power as a percentage of total cost of power is very high. Taking the present tariff rates into constitution, the power cost constitution 20 to 30 per cent

of the cost of production in electrometallurgical processes. It is equally high in electrochemical processes. It is important that power is made available at cheap rates to these industries, if they are to develop on sound lines. Perhaps it may be useful to reserve some capacity, at least where power is cheaper, for supplying power at lower rates to power intensive industries. This will help such power stations to improve their load factor. Another suggestion is to locate the power-intensive industries in areas of low-cost power. It has also been advocated in some quarters that as a measure of attracting industries to certain backward areas or for promoting heavy investment industries like aluminium, it may be feasible to have a long term contract for supply of power at concessional rates, say for a period of 20 to 25 years with provision for renewal of the agreements. What are the merits of these suggestions?

52. It is agreed on all hands that a major prerequisite for power development is the availability of funds. Even if loans are given to the electricity undertakings to finance expansion, replacement and modernisation, the loans have to be repaid and interest payment also has to be made. There are two ways of improving the finances of electricity undertakings. First, by increasing tariffs and the second by reducing costs by technical improvements, larger plants, better maintenance etc. The latter is more acceptable of the two alternatives. What are the ways of reducing the cost of generation and supply of electricity.

53. There is a regular system of collecting electricity duty on power supplied in various states. The rates of duty are not uniform and the variations cause distortions in cost of production. Is there a case to give duty exemptions on power supplied to specific categories like bulk industrial consumers? And with regard to others, is it desirable to have a uniform rate of duty?

How to buy steel

What every steel user should know

Steel is in short supply. This makes the users of steel vulnerable to exploitation by speculators. To prevent this and to ensure need-based distribution of steel products, the Government has constituted what is known as the Billet Re-rollers' Committee. This Committee controls the price, production and distribution of round bars, Torsteel, wire rods, flats, squares, angles, tees and hexagons rolled out of billets supplied by the main steel plants of the country. The rules and procedures laid down by this committee eliminate possibilities of profiteering and speculation in the buying and selling of steel products.

BRC controls steel prices:

Prices for each and every individual section and shape are determined and published. Extras chargeable, even of a very minor nature—like bending charges, bundling charges, etc., are also similarly determined and published. Therefore, every individual invoice is backed up by a pre-determined list of prices which an individual user of steel has to pay. No more, no less. He pays over the counter and gets a full receipt.

BRC controls production:

In each quarter the main producers indicate to the Committee the availability of billets. To this is added the likely quantum of imports. This total availability of billets is then divided among the re-rollers. Meanwhile the Committee

has received information on the requirements of individual consumers. These requirements are screened and the total demand is broken up on the basis of size and priority. The Committee then draws up the rolling programme for each individual re-roller.

BRC controls distribution:

The following categories of consumers are recognised as eligible for direct distribution through the Billet Re-rollers' Committee: Government Departments, Public Sector Units, Wire Drawing Units, Electrode Manufacturers, Manufacturers of Fasteners on DGTD list and Contractors building multi-storied structures. A consumer under any of these categories has to fill in a prescribed form which must reach the Billet Re-rollers' Committee 45 days before the commencement of a quarter.

The Committee then allots him the steel, if it is available, and asks any of the various re-rollers to convert it to the sizes or sections required by the consumer. The terms and conditions of sale are fixed by the Committee, i.e. price, terms of payment, mode of lifting and all other commercial formalities. Each consumer is given 21 days to complete the commercial formalities, failing which his allotment will lapse. If he fails to lift the material on time as specified by the Committee he may again lose his allotment.

These then are the procedures laid down to ensure need-based distribution of steel at a controlled price. This approach, we believe, would be fully shared by those who do not wish to encourage undesirable practices.

Issued in the interest of steel users by MUKAND IRON & STEEL WORKS LIMITED.

GARMENT MANUFACTURERS

**CHECK YOUR TICKETS BEFORE YOU
TAKE-OFF !!!**

THIS IS IT ..

A Travel Ticket to all Garment-manufacturers taking off for a safe and successful cruise .. to the increased marketing outlets, conscious buyers and connoisseurs with impeccable taste in garments. Ticket No. 50 and 60 are the Code-Tickets detailing all vital specifications to meet the various requirements of modern Garment-manufacturers .. these tickets are for our quality threads specially made for high-speed sewing machines .. threads which are adequately lubricated to facilitate efficient operation, uniform stitching and minimum breakages .. they are balanced to meet the exact requirements of the fabric to be stitched .. threads that give a perfect sewing to cuffs, collars, seams and cut a fine figure cut of every buyer's personality.

Modi Thread Mills produce finest threads on sophisticated machinery, with latest technical advancements from choicest raw material.

Remember, these tickets are your guarantee to progressive Garment-manufacturing.

Wholesale prices

THE WHOLESALE prices as measured by the official index (with the year ended March, 1962-100) rose by 0.5 per cent to 193.2 in May, 1972 as against 192.3 for April, 1972. The index for May, 1972 was higher by 6.2 per cent when compared to 181.9 for May, 1971. During the month under review food articles advanced by 1.2 per cent to 219.1, liquor & tobacco by 0.6 per cent to 217.8, fuel, power, light & lubricants by 0.2 per cent to 178.1, chemicals by 0.6 per cent to 200.0 and machinery & transport equipment by 0.3 per cent to 165.9 as compared to 165.4 for the previous month. The index for 'industrial raw materials' and 'manufactures' however, declined by 1.3 and 0.1 per cent to 173.5 and 173.2 respectively.

Food Articles

The index for 'cereals' sub-group moved up by 1.1 per cent to 211.4 due to a rise in the prices of all the cereals (except wheat and ragi which declined). Enhanced prices of arhar, masur and urad pushed up the sub-group index for 'pulses' by 0.9 per cent to 231.9. The prices of gram and moong, however, fell. On the whole the index for foodgrains rose by 1.2 per cent to 224.3. At this level the index for 'food grains' was also higher by 11.6 per cent when compared to that of a year ago.

Liquor & Tobacco

The index for 'liquor & tobacco' moved up by 0.6 per cent to 217.8 due to an increase in the prices of tobacco raw.

Fuel Power Light & Lubricants

The index for this group went up by 0.2 per cent to 178.1 due to a rise in the prices of kerosene oil and lubricating oil.

Industrial Raw Materials

Lower prices of cotton raw, wool raw and silk raw brought down the sub-group index for fibres by 0.9 per cent to 151.6 although the prices of jute raw & mesta, hemp raw and coir fibre advanced. A fall of 2.6 per cent to 191.1 in the sub-group index for 'oil seeds' was caused by a fall in

the prices of all the oil seeds except castor seed which moved up. The sub-group index for 'minerals' remained unchanged at its last month's level of 141.5. The sub-group index for 'other industrial raw materials', advanced by 1.3 per cent to 177.4 due to an increase in the prices of hides, raw, skins raw, tanning materials and lac.

Chemicals

The index for 'chemicals' group registered a rise of 0.6 per cent to 200.0 on account of an increase in the prices of calcium carbide.

Machinery & Transport Equipment

The sub-group index for 'electrical machinery' stood stationary at its last month's level of 170.0. The sub-group

index for non-electrical machinery moved up from 173.4 in the last month to 173.7 in the current month. The sub-group index for transport equipment rose by 0.9 per cent to 148.2 as against 146.9 in the earlier month due to an increase in the prices of vehicles. The prices of cycles however, declined slightly.

Intermediate Products

The index for 'intermediate products' declined by 0.5 per cent to 204.2 due to a fall in the prices of cotton yarn, rayon yarn and copper sheets. The prices of aluminium sheets, zinc, brass sheets, tin and lead, however, advanced.

Finished Products

Lower prices of cotton manu-

factures (—0.1 per cent to 164.4). jute manufactures (—1.6 per cent to 199.4), and Silk & rayon manufactures (—0.2 per cent to 131.9) brought down the sub-group index for 'textiles' by 0.2 per cent to 170.8. The indices for woollen manufactures and coir mats and mattings however, advanced by 9.4 and 2.8 per cent to 212.6 and 187.8 respectively. The sub-group index for 'metal products' stood at 191.0 as against 190.9 for the previous month. The sub-group index for 'oilcakes' went up by 2.2 per cent to 182.1. On the whole the index for 'finished products' worked out at 165.7 as against 165.6 for the previous month.

Abdullah, anti-establishment

It will be sad indeed were Sheikh Abdullah's clean sweep of the civic elections in the Valley to be exploited by certain publicists (including some journalists) in this country who are habitually inclined to take their news of Kashmir from Miss Mridulabehn Sarabhai and their views about it from under the counter. Nothing could be easier than to overemphasise the point that the Sheikh has vindicated his claim to command widespread support for himself among the people of the Valley; there has never been much doubt about this. What would be more to the point is to analyse the true nature of this support.

It used to be thought that once the younger generation had come of age in the politics of Kashmir, the Sheikh would to some extent have become an irrelevant if not an alien figure and thus lose political ground. This, it is now obvious, has not happened and is not happening. On the contrary, he has been able to capture the imagination of the newer generation to very nearly the same extent as he had commanded the affection and the confidence of an earlier generation in the heyday of the National Conference. There is, however, a very important difference in the appeal he now makes to the people of the Valley and the appeal he had earlier. Today the younger generation which supports him has no very effective memory of him as the champion of the cause of the people's liberties against the ruling house of Maharaja Sir Hari Singh. They again are not very much concerned with Sheikh Abdullah's latter-day politics as the advocate of an independent status for Kashmir or a political line which seems to run so dangerously close to Pakistan's ambitions relating to the future of the Valley. What this present generation of his supporters sees in the Sheikh and approves of is an anti-Establishment figure pure and simple.

To put it differently, Sheikh Abdullah's current appeal to those who follow him or vote for his nominees does not lie either in the fact that he was once a heroic figure in the state people's fight for liberty or that at a later stage he had turned himself into a challenger or even a repudiator of the state's accession to the Indian Union. It is doubtful that his highly personalised politics, which are essentially of bygone days, greatly interest the young men and women of the Valley who are now so openly enthusiastic about the Sheikh. Their real stake in him is that, through his political personality, they may be able to express effectively their mounting discontent with the Establishment, their sense of frustration and their resentment of things as they are. These people seem to think that their generation cannot get a fair deal from the powers-that-be unless overwhelming pressure is brought to bear on the Establishment to change its thinking as well as its ways. Since the new generation of the people in the Valley appears to have concluded that this change cannot come through a process of internal reform in the Establishment in which the central government is included, they expect Sheikh Abdullah to provide the external pressure or stimulus which could move things in the desired or in a desirable direction.

Fortunately, the present Chief Minister of Jammu & Kashmir State, Syed Mir Qasim, appears to have grasped the true significance of the current political situation in the state. More important still, he evidently respects the desire of the people for change, and he is perhaps even ready to do business with Sheikh Abdullah in the role which the people of the Valley want to give the Sheikh as a battering ram against the Establishment. This may explain the nuances of the strategy which the Chief Minister has followed with regard to the civic elections. He had repeatedly said that he wanted to take politics out of these elections and ensure that they were fought on civic issues. He was successful in keeping the Congress party in the state out of these elections in the Valley, but at the same time he had shrewdly contrived a situation in which Sheikh Abdullah felt encouraged to involve himself deeply in the elections. Since the Chief Minister is not without his share of political savvy, the Sheikh's success could not have come as a surprise, far less as a shock, to him. He has evidently gambled on the fact that the Sheikh's explosive political personality could be defused to a considerable extent by dragging it into down-to-earth politics — at the municipal level, to start with — and thereby draining it of some of its mystique. We would do well to wait and see how his calculations fare.

Meanwhile, if the Chief Minister's attitudes and activities since he came to this office on the death of Mr G.M. Sadiq, are any guide, it may safely be assumed that he will not waste time in dealing with the people's discontent with the Establishment at the various levels at which it must necessarily be dealt with. First, on the political plane, he has to establish himself as a statesman of sufficient stature in whom the people may repose confidence. So long as Sheikh Abdullah is alive, there is no question of another personality cult having a chance in the Valley. In any case the keynote of Syed Mir Qasim's own personality is the quality of practical common sense rather than

a show of glamour. His great asset is that his record in politics and government has created an impression that he is a knowledgeable and competent administrator with a large capacity for taking pains and also taking thought of details. Syed Mir Qasim's best bet therefore is to persevere in creating among the people of the state the image of a Chief Minister who cares and could act as well. It has become important and urgent that the state government should persuade the people to believe that it can and will be more efficient and far less corrupt than what it has been all these largely wasted years. The activation of Sheikh Abdullah in Kashmir politics through the civic elections could well act as a catalyst in this process.

On the economic plane, it is equally important and urgent that both Srinagar and New Delhi should realize that there must at long last be some genuine economic planning particularly in the Valley. It was reported in the *Statesman* a few days ago that the union Minister for Planning, Mr D.P. Dhar, claimed that he was no stranger to his present job since he had been an advisor on planning in Jammu and Kashmir and framed the state's first Plan. We sincerely hope that Mr Dhar could cite better credentials than this because the brute fact is that economic planning in this state has all along been a contrived and costly make-believe. It is only too evident on the face of the state's economy that very little has been done to organize its resources, agricultural or industrial, although vast amounts of money, much of which has come from the central government, have been spent on so-called economic development programmes or projects.

More than anywhere else in India, the poor and the underprivileged in Kashmir have failed to benefit from alleged Plan expenditures. It only needs a cursory comparison of the economic development in this state with economic development in Punjab, Haryana or Himachal Pradesh for the sad fact to be brought out that economics has been brutally subordinated to politics to an extent which has deprived the people of Kashmir of opportunities of any real progress in their material welfare during these twenty-five years. As a result, the gains from tourism or the trade in handicrafts are no more than froth on the surface of mass poverty in the state. The present Chief Minister and his colleagues, fortunately, do not have any illusions about the quality of the economic planning the state has been getting. This disillusionment could be a healthy starting point for a really honest attempt on their part to place the economic interests of the people of Kashmir first in the order of priorities to which the state government

must address itself if it is to survive the anti-Establishment offensive symbolized by the success of Sheikh Abdullah in the municipal elections. Fortunately there

Economics of industrial estates

AT LONG last, it seems, serious notice is being taken in some quarters of how industrial estates in our country have been faring. It is surely time this was done. For it is now about two decades since the first such estate was set up and all that we used to hear about them so far concerned only targets for, or location of, industrial estates in this area or that region during the different Plan periods and nothing much about their qualitative progress. But when it came to a question of financing these estates in a big way those who were required to take an interest began — or is it were driven to begin? — the probe. "Unless adequate attention was paid to the conditions determining the successful functioning of industrial estates", the fourteenth conference of representatives of the state financial corporations felt, for instance "it would not be prudent for the financial institutions to expand their loan assistance to these ventures." The Deputy Governor of the Reserve Bank, who presided over the conference sessions, not only asked financial institutions to come forward with suggestions for augmenting the resources available for financing industrial estates but also to ensure that "the resources are utilised properly and not frittered away (to end up as 'empty shells' as some industrial estates had turned out to be, to quote the Governor of the Reserve Bank who inaugurated the conference) in the construction of estates based on political or other considerations resulting in the entire expenditure becoming infelicitous".

The chances of political and other considerations in setting up industrial estates or, for that matter, any venture in future, however, are going to be greater and not fewer than in the past. Hence the need arose to go into the problem of financing industrial estates in all its aspects, and this is the genesis of the working group set up by the Reserve Bank of India and headed by Mr K.N.R. Ramanujam, then Chief Officer, Industrial Finance Department of the Reserve Bank (now its Chief Accountant) to do this job and make recommendations for consideration by the lending institutions. Although it has taken

are signs that new ideas and new attitudes are becoming fashionable in the various ministries and at many levels of the government and the administration.

the Working Group on Industrial Estates (WGIE), as the group has been called, nearly 17 months to complete its labours (this long-drawn-out essay was perhaps unavoidable, as there were as many as nine changes—four members ceased to be members and five new members had to be taken in the 12-man membership of the group—and the Reserve Bank took over six months more to release the report), the outcome has certainly been worthwhile. Another reason for the delay, presumably, was that, when the working group was actually set up, its terms of reference were not confined to just the financing of industrial estates by financial institutions, but included a study of the economics of establishment and operations of all industrial estates — i.e. those owned by government, public sector organisations or bodies, co-operative organisations and private parties — with a view to suggesting suitable criteria for the future establishment of these estates, as also for appraising their working. The latter has been done on a sample survey basis.

Full justice has been done to these twin terms of reference and the findings of the WGIE need to be carefully studied and followed at least by those states who believe industrial estates have a role and a future. The working group itself is convinced that industrial estates would be a successful aid to the development of industries, especially in the small-scale sector, provided care is taken to avoid the defects or deficiencies which its study in depth has revealed. According to the WGIE, four factors account for the failure of the programme in the rural and backward regions where the authorities particularly want industrial estates to achieve results. These are: (1) failure to bring about a dispersal of industries; (2) wrong location of industrial estates; (3) faulty planning and execution of estates, and (4) lack of effective machinery to supervise the day-to-day operations of industrial estates. But, inasmuch as all these are remediable, the WGIE has rightly argued, past failures of some industrial estates should not be regarded as a deterrent for setting up new industrial estates.

Before we pass on to the recommendations of the working group, let us have a look at the position of industrial estates on the eve of the WGIE's study. At the end of March 1970, according to the Development Commissioner for Small-Scale Industries (DCSSI), the total number of industrial estates sponsored by the go-

vernment (central and states) as well as by co-operative and private agencies financially assisted by governments, was 519. Not all these estates, however, had sheds constructed; some consisted merely of developed plots. Right from their inception and up to 1969-70, the aggregate outlay by government was a little over Rs 42 crores. Together with the amount invested by state industrial development corporations on these estates and on the development of industrial areas, as also investment by way of loans from financial institutions (excluding the share of co-operative institutions of another Rs two crores) the total was a third higher, at Rs 56 crores.

It is obvious from the study made by the working group that, out of the 519 estates sponsored by government as above, only 385 were completed with all the requisite facilities and, even out of these 385 estates, as many 58 had not started functioning; in 33 of these water supply and electricity facilities had not yet been provided. The remaining were under various stages of construction. Further, although, in all, 9,678 sheds were completed, only 6,000 sheds were occupied and functioning. In other words, as much as 38 per cent of the completed sheds were remaining idle. The average utilisation of sheds in completed estates was only 65 per cent, varying from 44 per cent (in Haryana) to over 80 per cent (in Mysore, Delhi and Tripura). Of course, utilisation did not mean satisfactory utilisation in every case. Qualitatively, Gujarat had the best record, while Tripura the least economically satisfactory record (industrial estates in this case were more in the nature of welfare undertakings).

A notable finding of the working group was that the percentage of utilisation differed from urban to semi-urban and semi-urban to rural locations. For all the states together, this was 76 per cent, in urban areas, 51 per cent in semi-urban areas and 39 per cent in rural areas. It would appear that there is further scope for growth in the first two areas, although, in some states (Andhra Pradesh, Assam and Rajasthan), the performance of the estates in semi-urban areas was worse than of those in rural areas.

Another interesting feature was that, out of the 22 states/union territories covered by the working group, only nine had co-operative industrial estates, the largest number of sheds completed in this sector in any state being in Maharashtra with its 882 sheds. Gujarat and Tamil Nadu followed with 328 sheds and 101 sheds, respectively. Only Gujarat (1) and Maharashtra (2) had industrial estates set up by municipalities, the utilisation of these sheds in both states being 100 per cent.

The rate of utilisation of sheds in industrial estates set up in the private sector was not only relatively very high in all cases but, what is more significant, high irrespective of the area of location. This means that something more than mere location or the existence of a shed or a given agency, apart from finance, is needed to make a success of industrial estates. And that is, broadly speaking, entrepreneurial ability. Before an entrepreneur sets up an industrial estate, he is certain to take stock of all the relevant factors and only after he feels convinced of its economic soundness will he proceed further in the matter. Being pragmatic, he seldom allows himself to be swept off his feet by political or ideological pulls or pressures.

The WGIE has, therefore, done well not only to emphasise the need for adequate financial assistance to these estates and spell out the extent and the precise way in which each of the different financial institutions — LIC, SFC's and commercial banks — could help, but also to mention in detail the manner in which state governments and state development bodies like industrial development corporations, as also local bodies, could help further the role of industrial estates. It is noteworthy that particular stress has been laid on the efficient management of these estates. For obvious reasons, the working group has suggested the entrusting of this work to state industrial development corporations, which have been asked, significantly enough to run the estates on purely

business lines and hold themselves responsible for their growth and expansion.

Evidently the working group has bestowed considerable attention on the pattern of financing. The pattern suggested varies not only from location to location (urban or rural) but is also related to the particular purpose for which financing is desired. Similarly there is difference in approach, depending upon whether a particular industrial estate is managed by a government or a governmental agency, a municipality, a co-operative agency, or a public limited company.

While all financial institutions — LIC, state financial corporations and commercial banks — have been assigned specific roles, the LIC has been asked to take on the brunt of the responsibility for financing industrial estates, presumably because it has vast resources and has been in the field for some time already and has also evolved certain useful norms for financing these estates. Limits have been laid too on the extent of credit to be extended, both party-wise and purpose-wise, by SFCs and banks, singly or jointly. Even the IDBI is sought to be brought into the picture and a suggestion has been made to amend the relevant Act to enable the IDBI either to lend directly or to refinance loans given by SFCs and banks for financing the setting up of industrial estates. And the services of the credit guarantee corporations of India too are to be pressed into service in certain cases. All this shows

Microfilm Edition of Eastern Economist

EASTERN ECONOMIST announces with pleasure that, for the benefit of its readers, both at home and abroad, it has made arrangements with University Microfilms of Ann Arbor, Michigan, USA, for the latter undertaking the reproduction of *Eastern Economist* on microfilm and through xerographic copies.

This arrangement covers for the present back issues of *Eastern Economist* starting from January 1971. The question of including issues from earlier years in this arrangement is under consideration.

University Microfilms will be sending the relevant literature to prospective microfilm subscribers soon. It is believed that this service will be of particular interest and value to libraries, business houses, firms, government offices and other institutions which may find it useful to maintain files of *Eastern Economist* for record and reference.

Prospective microfilm subscribers may address their enquiries to: Serial Publications University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106, USA.

the recognition of the rightful role of industrial estates in the economic development of the country, as also the keen desire on the part of the working group to ensure their sound growth and successful functioning. While the Reserve Bank seems to be ready to take such action as it is required to (which suggests it has almost accepted the recommendations), it is now for the different financial institutions,

to whom these recommendations have been forwarded, to make known their views, as Mr V.V. Chari, Deputy Governor of the Reserve Bank, told a news conference the other day when releasing the report of the WGIE to the press. It is to be hoped they will do so early so that the sound guidelines indicated by the WGIE may be followed without avoidable delay.

Financing Inflation

THERE is considerable confusion in thinking in the union Finance Ministry and of the hierarchy of the central banking institution about the factors responsible for the spiralling of prices and the manner in which inflationary pressures can be effectively checked. Large-scale deficit financing by the central and state governments has no doubt been responsible for an accentuation of inflationary pressures in the past year and an increase in wholesale prices by over 14.8 per cent since the beginning of 1971. The quantum of deficit financing in 1971-72 can be easily Rs 700 crores if not more as the state governments alone had overdrafts with the Reserve Bank of as much as Rs 711 crores on April 29, 1971 while the revised estimates of the central government for the past year placed the overall deficit at Rs 385 crores.

If the net increase of Rs 336 crores in overdrafts in a twelve month period ending April 29 is taken into account it will be agreed that aggregate deficit financing was between Rs 700 and Rs 750 crores though the actual position will be known when the accounts have been finalised. The creation of currency of such large dimensions has necessarily resulted in a big increase in money supply with the public and created a large demand for goods and services at a time when agricultural production has not shown any significant improvement and there has been a pronounced slowing down in the growth of industrial production.

It cannot be stated however, that deficit financing alone has been responsible for the present impasse and other factors are not having the same or more forceful inflationary impact on the economy. Even with an estimated decline in the output of foodgrains by over two million tonnes in 1971-72 as compared to the previous year buffer stocks held by the Food Corporation and other agencies increased by over two million tonnes in a

twelve month period ending last July while procurement operations particularly in wheat were extremely successful in April-June this year even exceeding the target and all previous records. There had also to be heavy purchases of raw cotton by the Cotton Corporation because of a bumper crop and sizable stocks of around five lakh bales involving bank credit of over Rs 50 crores are held by this corporation. The large purchases of foodgrains at procurement prices and the purchases of cotton above prevailing market prices have been responsible for the injection of purchasing power into the agricultural income group of over Rs 300 crores.

It may be argued that the net increase in income of the rural population would be due to created currency only if the lending institutions had utilised to a great extent refinance facilities provided by the Reserve Bank for meeting these commitments. This position existed till May last year when there was heavy pressure on the banking system and borrowing from the central banking institution by the scheduled commercial banks was on a fairly large-scale representing to a great extent procurement credit made available to the Food Corporation and other agencies. Since then however these borrowings have been completely repaid and all advances by commercial banks have been financed by owned funds.

It can therefore be legitimately contended that there have been no net additions to aggregate resources through these operations and the earlier inflationary influences have been eliminated by subsequent developments. Even so, the fact cannot be overlooked that lending to official agencies for procurement or buffer stock operations has been very liberal and if the trade had been allowed to operate under reasonable restrictions the resources available with them would have been utilised to a significant extent and credit inflation would not have taken place to the same degree. What is really responsible for a heightening of inflationary pressures is the payment of prices at the time of procurement for either wheat or raw cotton which were higher than the prevailing ruling

market prices. This policy also led to serious malpractices.

It is therefore necessary to study carefully the implications of procurement of buffer stock operations when separate prices had not been fixed for support operations in a falling market. This aspect of the problem may not have immediate validity as the fears of a major failure of kharif crops have led to sizable sales out of the stocks held by the Food Corporation though curiously enough the Cotton Corporation is still saddled with large holdings of indigenous cotton and it is also reported that the outlook for the new crop is quite satisfactory.

What is however more disturbing is the compulsion to spend large amounts by way of relief operations and on heavy subsidies when effecting sales of foodgrains out of buffer stocks in the drought and flood affected areas. The expenditure in this regard can be easily Rs 300 crores in 1972-73 over and above the budget estimates while large sums have been allocated for implementing a crash programme for boosting the output of rabi crops and overcoming the shortfall in production that might be experienced in the current season.

There is also the prospect of an increase in administrative expenditure of the central government and even the states with the need to grant additional dearness allowances which may add up to a total of Rs 100 crores in a full year. These unexpected drafts on the central exchequer should have normally resulted in a larger dose of deficit financing especially as the centre had taken over fully the overdrafts of state governments from the central banking institution in April this year and it was making serious efforts to reduce this liability as far as possible by using its own resources and mobilising larger amounts through open market loans.

It has not been necessary however to create currency on a large scale so far thanks to the opportunity for issuing and effecting sizable open market sales of securities to the lending institutions. The massive borrowing by the states in the first week of September and by the centre, for the second time in a few months, by the middle of September will put them in possession of funds which may obviate deficit spending for several months. Between March 31 and September 1 of this year the aggregate of rupee securities in the Issue Department and investments and holdings of treasury bills in the banking department increased by Rs 685 crores. But this was mainly due to the operations connected with the state over-

drafts which declined by as much as Rs 568 crores.

As there was also a sharp decline in borrowings of scheduled commercial banks, the net addition to money supply with the public on account of governmental action was not very large during the period under reference. There may even be a further contraction in notes in circulation in the coming weeks with an assertion of slack season trends while the government might cancel ad hoc securities at least temporarily with the mobilisation of record amounts though re-issues of earlier loans. The states also may be making some payments to the centre in pursuance of their obligations.

However, can these developments be considered helpful for bringing about a reduction in the money supply with the public and will it be correct to presume that government spending in a big way will not have its inflationary impact especially when it does not prove to be immediately productive? Without examining carefully the implications of various policies and actions of the government it has been loosely suggested in some quarters that there should be withdrawal of currency as if deficit spending only has been the villain of the piece, heavy spending even out of mobilised resources is not inflationary and there has been unnecessary credit inflation. Correct answers to these questions are necessary in order to understand the peculiarities of the present situation and of the harmful effects that have been induced by stagnant industrial production and larger purchasing power of the agricultural income groups.

The level of government expenditure has remained fairly high even without deficit financing and as the direction of this expenditure has been of a nature which will accentuate inflationary pressures, it has to be decided how unproductive expenditures can be eliminated. But can the central and state governments think on these lines or will it be desirable? Again, an analysis of the growth of deposits and advances of scheduled commercial banks for a twelve-month period ending September 1, 1972 shows that advances rose by only Rs 495 crores out of total additions to deposits of Rs 1,282 crores.

Investments have therefore jumped by Rs 502 crores. These relate only to holdings of government securities and treasury bills. If the support extended to the issues of bonds by state electricity boards and statutory finance corporations is taken into account the actual increase in investments would be nearer Rs 600 crores than Rs 500 crores. This has come about even after wiping out borrowings from the Reserve Bank completely and augmenting cash balances by Rs 94 crores.

A deliberate policy of disinflation can take place only if the government restricts both its non-Plan and Plan expenditures. There may be a reduction in Plan expenditure and not in non-Plan expenditure which is needed. On the other hand if the amounts held by banks were prevented from being utilised from lending to industry and trade there may be serious harmful effects. Besides

there is no warrant for this approach because credit expansion benefiting the private sector has been meagre and the accumulation of surplus resources has been very helpful to the public sector.

The upward trend in wholesale prices can therefore be checked only if there is not so much pampering of the agricultural sector and bungling in procurement and buffer stock operations. There will also have to be a conscious attempt to boost production of the public sector industrial undertakings besides encouraging the private sector to play its due role. Any other approach will have a defeating effect and it is needless to say that all talk of withdrawal of currency without the government mending its ways and the advisability of a credit squeeze at a time when there is need to stimulate production will have only harmful effects and no beneficial impact.

RECORDS AND STATISTICS

Editor: R. V. MURTHY

A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.

The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.

POINTS OF VIEW

S. P. Chopra

Growth in the corporate sector

TWO STUDIES relating to the financial operations of the corporate sector have been published in the July, 1972 Monthly Bulletin of the Reserve Bank of India. They throw light on various aspects of its working with special emphasis on the incidence of taxation and the policies pursued by managements regarding distribution of dividends and retained profits. The first study in respect of 1,501 public limited companies has been split up into two parts. The earlier part relates to 290 large-sized companies wherein each unit has paid-up capital of one crore of rupees or more. The second part deals with 1211 companies — called medium-sized companies — each having paid-up capital of less than one crore of rupees. The second study relates to 701 medium and large private limited companies which account for about 28 per cent of the total paid-up capital of all non-government, non-financial private limited companies which were in operation as on March 31, 1966.

Both the studies make it abundantly clear that the bulk of the profits of the private sector companies originate in the large-sized public companies (290 in number) which have an encouraging record in all respects. Their profits before tax rose steadily from Rs 253 crores in 1965-66 to Rs 370 crores in 1970-71 despite the marginal setbacks received in the recession years of 1967-68 and 1968-

69 (see Table I). The profits before tax of the medium-sized 1211 companies were Rs 77 crores only in 1965-66 and rose marginally to Rs 81 crores in 1969-70; the downtrend in the profits of these companies in the recession years was of a pronounced character. The private limited companies — 701 in number — did not show much improvement in their profits before tax which changed a little between 1965-66 and 1969-70. Whereas the profit before tax of these private limited companies was Rs 44.8 crores in 1965-66, it was no more than Rs 45.4 crores in 1969-70. In the recession years, it had dipped to Rs 39 crores (1967-68) and Rs 38 crores (1968-69).

Besides the fact that the bulk of the profits of the corporate sector emerged from the large-sized companies, the real growth of the corporate sector was also due to expansion in the operations of the large-sized companies. The value of output (at current prices) of 290 large public companies rose by 71.1 per cent between 1965-66 and 1970-71 (see Table II). The index of wholesale prices increased by 31.2 per cent during the same period indicating that real output improved by 40 per cent in five years (eight per cent per annum). As against this, the output of 1211 medium-sized public companies rose by 37.2 per cent only while wholesale prices in the same period shot up by 23 per cent.

In real terms, the sector recorded a growth of 14 per cent in four years (around 3.5 per annum). The performance of the private limited companies was still worse. With a rise of 35 per cent in the value of output and rise in prices at 23 per cent, the real increase in production was not more than 12 per cent or three per cent per annum.

If the bulk of the profits in the corporate sector was thrown up by the large-sized companies, the provision for taxation was also the highest in their case. In other words, the tax provision of Rs 122 crores made by 290 large-sized companies in 1969-70 was nearly double of the total provision made by private limited companies (701 in number) and 1211 medium-sized companies taken together. This also applies to dividend distribution and retention of profits. The profits retained by private limited companies as well as the medium-sized public limited companies at less than Rs 14 crores was nearly one-seventh of the total profits retained by the large-sized companies. This clearly indicates that it is the large-sized companies which have the capacity to finance their further growth through their own resources and any restraint on the expansion of their activities is bound to result in stagnation of industry as a whole.

The provision for taxation as a percentage of profit before tax for large-sized companies has been declining during the

For self reliance..... NBC Bearings

Steel Balls
Ball Bearings
Roller Bearings
Taper Roller Bearings
or any special bearing.

We can design and manufacture any kind of bearing that you need. It may be one giant bearing to launch a rocket into space, or high temperature bearings for pulsating steel plants, or bearings for high speed locomotives.

No matter how technically complex in design or manufacture, we are well equipped with the technical know-how and manufacturing skill to make bearings to satisfy the most demanding engineer.

NEI have been pioneers in the manufacture of bearings in India, and have supplied millions of bearings of different specifications to many industries all over the country.

The manufacture of bearings is so complex, and the precision to be achieved in shaping the steel balls is so fine and exacting, that a few minute balls weighing as little as 30 gms. can

cost as much as a lakh of rupees—or one large bearing of 8 to 10 metres diameter, can cost nearly a crore of rupees!

Today, the skill, expertise and experience of 25 years is entirely at your service. We can design and manufacture any type or size of bearing to suit any individual need. Our Research and Design Cell is there to solve specific problems, no matter how complex. And there is no bearing requirement that we cannot meet indigenously—thus making the country self-reliant.

last six years (see Table III). Whereas in 1965-66 tax provision as a percentage of profit before tax was as high as 47.4 per cent in 1965-66, it dropped to 39.8 per cent in 1969-70 only to improve to 42.8 per cent in 1970-71. These figures demonstrate that the large-sized public limited companies have been able to avail of a number of tax incentives which the corporate sector has received during this period. The central budgets during the last five years have reduced the incidence of super tax and sur-tax, whose impact has been clearly reflected in the tax provisions of these large-sized companies. In the case of the medium-sized public limited companies, the tax provision as percentage of profits before tax rose from 58.4 per cent in 1965-66 to 74.1 per cent in 1967-68 but declined to 60.5 per cent in 1969-70. What is clear is that this particular ratio has been higher in the case of

the medium sized companies than in the case of the large-sized companies throughout the period under review. In the case of private limited companies also, this ratio has been higher in each one of the years under review in relation to both the large-sized and medium sized public limited companies. This is because the tax rates in the case of the private limited companies have been higher than that of the public limited companies.

It is pertinent here to mention the recommendation of the Wanchoo Committee that the rates of taxation should be reduced which would lead to increased—not reduced—revenue to the exchequer and would also bring about improvement in the general economy. In the budget for the United Kingdom in 1972-73, substantial reductions in taxation were initiated for the objective of faster rate of economic expansion. Some other countries such as the USA, Japan, West Germany, Belgium and the Netherlands have also tried this expedient with favourable results. Our government has however been fighting shy of adopting this tried path.

Among the many incentives suggested by the Wanchoo Committee for the corporate sector was one relating to special assistance for small companies with paid-up capital not exceeding Rs 5 lakhs. It was recommended that in the case of such companies, distributed profits up to eight per cent of the paid-up capital or Rs 25,000, whichever was less, might be totally exempted from tax by allowing this amount to be deducted in computing the total income. In the case of companies with paid-up capital exceeding five lakhs of rupees, distributed profits up to eight per cent of the paid up capital, it was suggested, should be taxed at the rate of 30 per cent.

An analysis of "dividends as a percentage of share capital" of 1501 companies shows that this suggestion was rightly made for smaller companies because the large-sized public companies had declared, during the last six years, dividend varying between 9.9 and 11.9 per cent of paid-up capital. Not even once during the last six years had this ratio fallen below 9.9 per cent. The analysis of the dividends policy of 1211 medium-sized public companies showed that this percentage ruled between 6.2 and 7.6, i.e. in each of the five years from 1965-66 to 1969-70, it ruled well below eight per cent. Surely, a majority of the medium-sized companies would benefit from Wanchoo Committee's suggestion if and when accepted by the government. Even in the case of private limited companies, it was seen that the

POINTS OF VIEW

over-all ratio of dividends as a percentage of paid-up capital ruled below 8 per cent in each of the five years ending in 1969-70.

There were certain groups of industries where this percentage was definitely above the prescribed limit, though the over-all performance was below it. The philosophy behind this suggestion is that reduced tax incidence would result in increased distribution of dividends by the small-sized as well as medium-sized companies which, in turn, would revive the investment market and would be instrumental in giving a push to a number of industries which have hitherto suffered for lack of investible funds. However, the magnitudes of the surplus funds thrown up by the three components of the corporate sector discussed above indicate that it is the large-sized companies which hold the key to its further expansion. A majority of them belong to the larger business houses whose activities have been restrained in recent years under the Monopolies and Restrictive Trade Practices Act. At a time when industrial stagnation has slowed down the progress of the economy, it is unwise not to use the resources as well as the talent available for reviving industrial growth.

POINTS OF VIEW

Prosperity for progressive farmers

K. S. Turna & R. C. Agrawal*

MOST of the developing economies, including that of India, are primarily agricultural. The increase in output and income is, therefore, largely a function of the growth in the agricultural production. Rapidly increasing population leads to a continuously growing demand for food and fibre and if the supply does not keep pace with the growing demand, the gap between demand and supply widens. Fortunately for us, in recent years, Indian agriculture has experienced phenomenal progress on the technological front. (In the year 1970-71, we had a record harvest of 108 million tonnes of foodgrains as against 72.35 million tonnes in 1965-66). This is particularly true of the farming in the "Tarai" region of the Rampur and Nainital districts in UP. The land was reclaimed only two decades back and since then is cultivated by very enterprising farmers. The establishment of UP Agricultural University in 1961 came as a boon to these farmers. Thanks to their enterprising nature and to research and extension efforts of the university, the high yielding varieties are being cultivated on a large scale. The yields per acre compare favourably with those in technologically advanced countries in the world.

However, "even at this current level of technology followed by the farmers in Tarai, is there still any possibility of a more effective allocation and use of existing resources so that their incomes could be further augmented or their present level of resource use represents the ultimate?" The present study is an attempt to answer this and related questions. More specifically, the objectives of this study are:

- To work out an optimal cropping pattern, which maximizes profits of the farmers from existing resource availability and to suggest guidelines for more efficient allocation of resources among diffe-

rent enterprises at the existing level of technology, and

- To find the extent to which the production and the incomes from the farm could be increased by (a) above. As the resource situation varies widely, for meaningful results, the potential has been worked out separately for small, medium and large farmers.

The "Tarai" (so called because of humidity) belt lies in the foothills of Siwalik region of the Himalayas. This 18-20 Kms. wide belt stretches from Bijnore and Rampur districts in the western part of UP to Gonda in the east. Due to the impact of the UP Agricultural University, a large numbers of farmers in the Tarai of Nainital and Rampur districts are growing high yielding varieties of crops. Most of the farmers of this area have a relatively high-supply of capital and use larger quantities of inputs like fertilizer, improved seed

irrigation, etc. as compared to the farmers in other parts of UP. Because of their progressive outlook, education (many of them keep records) and co-operation in supplying the required information, reliable data could be obtained for the purposes of the study.

methodology

(a) *Selection of farmers:* A block (Bilaspur) in the "Tarai" region of Rampur districts was purposively selected because of (a) the familiarity of the authors with the local conditions and the farmers and consequently availability of reliable information and (b) existence of farmers with widely varying resource situations.

The farmers of the area were classified on the basis of the size of holdings into small (those having up to 10 acres), medium (having more than 10 acres but not more than 30 acres) and large (having holdings larger than 30 acres). This classi-

TABLE I
Resource Restrictions and Their Levels

Resource restrictions considered	Available quantity on various farm sizes		
	Small	Medium	Large
Kharif land irrigated (acres)	5.1	15.2	63.5

fication, by and large, was also representative of the resource availability category. Six villages were selected at random. A list of all the farmers in the village was prepared and a total of sixty farmers with number in each being proportionate to probability were selected.

(b) *Collection of Data and Specification of the Model:* Data on resource availability, cropping pattern, resource restriction, etc. were collected during the crop year 1968-69. The average prices at which the farmers sold their products and purchased the inputs during the period of study were also collected. Linear programming technique was used to arrive at the optimal farm plans from the existing resource level and technology and to find out if these plans were significantly different from those actually followed by the farmers of different categories.

(i) *Specification of Resource Restrictions:* The available resources on these random selected farms and various restrictions concerning them were recorded. On the basis of collected information, the following resource restrictions were included in the model:

(1) Irrigated land, (2) unirrigated land; (3) labour availability during peak periods: viz. (i) July-August, (ii) October-December, (iii) February-March and (iv) April-May, (4) fertilizers in terms of kilograms of nutrient [nitrogen (N), phosphate (P_2O_5) and potash (K_2O)]; (5) machinery hours (6) bullock power in day; (7) cash expenditure in rupees, and (8) acreage to be kept under fodder for the milch and draught animals kept on the farm. These are given in Table I.

(ii) *Activities Included in the Model:* In the Tarai farming situation in general, and on sample farms in particular, the crops are the chief enterprises. Livestock is not taken as a major business proposition by the farmers but is usually kept to meet the milk requirements of the farm family. Important crops of the region are sugarcane, paddy (local varieties like Hansraj and HYV like IR-8, Padma and Jaya), maize local and hybrid (like Ganga-2 and composites), wheat (Desi and Mexican varieties), lahi, gram and pea. The common fodder crops for kharif and rabi are jowar (chari) and berseem respectively. All the crops actually grown by the farmers on the sample farms have been included in the models and are given in Table II. Different varieties of crops have been treated as separate activities.

The technological (input-output) coefficient were derived on the basis of existing farm situations.

(iii) *Developing Representative Farm*

Situation: Synthetic farm situations were developed for each class (small, medium and large) by taking into account all the data belonging to that particular group and then averaging the same by assigning appropriate weights.

(iv) *Formulation of the Linear Programming Model:*—The linear programming technique used in this study permits simultaneous consideration of all available alternatives in order to select the profit maximizing combination of activities (crops). The mathematical formulation of the model is as follows:

$$\begin{aligned} \text{Maximize : } Z &= \sum_{j=1}^n C_j X_j \\ \text{Subject to: } \sum_{j=1}^n a_{ij} X_j &\leq b_i \quad (i=1, 2, \dots, K) \\ \sum_{j=1}^n a_{ij} X_j &\leq b_i \quad (i=K+1, K+2, \dots, m) \\ X_j &\geq 0 \quad (j=1, 2, \dots, n) \end{aligned}$$

where,
Z—total farm returns over variable costs (in rupees)

X_j —level of the J th crop activity ($J=1, 2, \dots, n$)

C_j —Returns (in rupees) over variable costs from one unit of J th activity.

b_i —available quantity of the i th resources. (For $i=1, 2, \dots, K$)

b_i —Fodder requirements (for $i=K+1, K+2, \dots, m$)

a_{ij} —the amount of i th input required for raising one unit of X_j .

Empirical Analysis and Results: The different sized farms differed from each other with respect to:— (1) The size of holding; (2) activities (crops) raised on the farms; (3) resource availability; (4) land under fodder crops; and (5) input: coefficients.

Accordingly, three farm plan, one for each size, were prepared with the help of linear programming technique. Except for large farms, where farmers were taking crops for commercial as well as seed purposes, farm plans were prepared taking into consideration the 1968-69 commercial prices. In case of large size group, both commercial as well as seed production activities were considered. The latter (seed production) was confined to maize, wheat and pea. The results are discussed with reference to the land use pattern, intensity of cropping, net farm income and resource requirements per acre on the three farm sizes.

A. Land Use and Cropping Intensity Under the Existing and the Suggested (Optimal) Plans.

A comparison of the existing and the optimal plans with respect to the land use intensity is given in Table III. The total cropped area, in case of large farms, has

TABLE II

Note: X—Considered —Not considered.

increased by 11.07 acres in the optimal plan because of the replacement of sugarcane by wheat seed and pea seed in rabi, which allows an additional kharif crop of maize seed as well. On the small and the medium farms, though the income is higher in the suggested plans, the total cropped area has decreased by .86 acres and 3.12 acres respectively bringing down the intensity from 173 per cent and 165 per cent to 161.7 per cent and 151.4 per cent for the two sizes of farms. This is due to the increase in the acreage of sugarcane under the "New" plans which turned out to be most profitable activity and taken as a one year crop (i.e. considered as having 100 per cent cropping intensity).

If the intensity of sugarcane crop is taken as 200 per cent (because it occupied the field for the whole year), then the total cropped area as well as the intensity of cropping under the optimal plans came to more than that under the existing pattern even on the small and medium farms as can be seen from column 6, 7 and 8 of Table III. In fact, the land has been fully used for all classes of farmers in the suggested plans with cropping intensities of 200 per cent (considering sugarcane as a crop with 200 per cent intensity) as against those of 188.68 per cent, 185.28 per cent and 178.07 per cent respectively for small, medium and large farmers under the existing plans.

II. *Cropping Pattern*: The details of the existing and the optimum cropping patterns are given in Table IV.

(A) *Small Farms*: In kharif, of the existing crops, Paddy IR-8, maize, Ganga-2 and sugarcane (for the whole year) have come in the optimal plan at a higher acreage; paddy T-3 and maize local, occupying 3.50 acres and 0.41 acres in the

existing plans, do not find any place in the optimal plan in kharif. In rabi, lahi (0.09 acres), wheat S-227 (1.38 acres) and wheat deshi (3.57 acres), have also vanished in the optimal plan. Instead, lahi+gram (2.50 acres in optimal against 0.14 acres in the existing plan), and wheat RR-21 (1.79 against 0.63) have a greater acreage. In kharif, nearly 0.86 acre of land is left uncultivated by the farmers. Under the suggested plans, no land is left unused.

(B) *Medium Farms*: In the optimal plan, the land use pattern includes paddy T-3 (4.06 acres), maize local (6.50 acres) sugarcane (11.14 acres), jowar fodder (1.2 acres), lahi + gram (7.70 acres), wheat S-227 (3.36 acres) and berseem (0.70 acres). Paddy IR-8, lahi, gram, wheat RR-21, Pb-18 and deshi wheat do not find a place in the optimal plan. Paddy T-3 has come due to its higher returns (over variable costs per acre) and these are as a consequence of higher prices. Sugarcane is the dominating crop on medium size farm occupying 11.14 acres of land in the optimum plan. The unused land, both of kharif and rabi season of the existing pattern has been fully utilized in the optimum plan.

(C) *Large Farms*: Under the existing pattern, sugarcane commanded 22.45 acres of land. In the suggested plan, the crop land has been allocated to maize Ganga-2 (19.60 acres), sugar cane (30.09 acres), jowar (2.20 acres), Maize Ganga-2 seed (33.41 acres), berseem fodder (1.50), wheat S-227 seed (31.91 acres) and pea Bonville seed (21.80 acres). Paddy, local maize, lahi, gram and commercial wheat have been completely eliminated. 18.83 acres of kharif and 0.18 acre of rabi land, that was left unused by the farmers (in the existing pattern) has been

fully utilized in the optimum plan.

III. *Changes in Returns*: The results of different optimum farm plans indicated substantial potentiality of increasing the farm net returns for each size group of farms by recombining the crop enterprises and proper allocation of farm resources. This is a reflection of the productivity of resources and production possibility through reallocation process. Table V shows that farm net returns per acre under optimum plans have increased from Rs 1308.30 to 1503.10 (14.89 per cent) in case of small, from Rs 1082.19 to 1309.71 (21.02 per cent) in case of medium, from Rs 905.19 to 1463.92 (61.79 per cent) in case of large farms. In all those cases, this increase was found to be significant at five per cent level which indicates that the present allocation of farm resources on all sizes of farms is less than efficient and, there is scope and potentiality of increasing farm income by optimum combination of enterprises on these farms. The same holds true for total returns..

The empirical analysis and results discussed here show a substantial potentiality of increasing net farm returns even in progressive agricultural region by reallocating the resources as suggested in the optimal plans. Total net returns under the suggested plans are higher over those obtained from existing conditions by 14.89 per cent, 21.02 per cent and 61.79 per cent in case of small, medium and large size farms respectively. These increments have been found to be highly significant. However, these differences are, a function of, among other things, production and prices. For this reason, one may be a little cautious in interpreting these results and making recommendations specially in view of very wide fluctuations in case of sugarcane prices.

TABLE III

Land Use and Cropping Intensity under the Existing and the Suggested Plans

Size of farms	Average size of holding (acres)	Available net cultivated area (acres)	Total cropped area (with 100 per cent intensity of sugarcane)		Total cropped area (with 200 per cent intensity of sugarcane crop)		Net increase (acres) (7-6)	Intensity of cropping (with 100 per cent of sugarcane crop)		Intensity of cropping (with 200 per cent intensity of sugarcane crop)

Diplomacy in Asia

Josselyn Hennessy

London:

The Middle East Oil Crisis

THE ORIGINS of the dispute between the Iraq Petroleum Company (IPC) and Iraq go back to 1961, when Iraq seized part of the IPC concession in the North Rumaila field. Since then arguments over compensation have never ceased. In 1969 the Soviet Union and Iraq signed an agreement for the financing and the exploitation of the North Rumaila field. The immediate reasons behind the Iraqi nationalisation of IPC are, however, due to decisions made in 1970 and 1971 by the Organisation of Petroleum Exporting Countries (OPEC). This organisation consists of eleven countries, of which seven are Arab (Saudi Arabia, Abu Dhabi,

Libya, then obtained a premium over the Gulf prices, justifying it by their lower transport costs to Europe. With more than two-thirds of the world's oil reserves in the Middle East, the agreement was damned expensive for the international companies. US companies alone control, through the Arab American Oil Company (ARAMCO) at Dhahran, almost 100 per cent of Saudi Arabian production, nearly 50 per cent of production from Kuwait and 40 per cent from Iran. At the moment the United States is in the fortunate situation of relying on imported oil for only three per cent of its domestic needs, though this is likely to change. Indeed in the 1980s the US expects to be importing as much 50 per cent of its oil (not necessarily from the Middle East). The western European countries depend on the Middle East (including Libya) for almost 90 per

Francaise de Petroles (CFP) own 23.75 each. The remaining 28.75 per cent is divided up by Mobil and Standard Oil New Jersey (11.875 per cent each) and the Gulbenkian five per cent interest. The British government has a 49 per cent interest in BP, and the French government controls 33 per cent of CFP. The total value of the IPC concession at Kirkuk amounts to £130 million. Iraq did not nationalise the other two IPC concessions at Musul and Basra.

IPC's warning

The temperature of the dispute has risen sharply ever since the tentative agreement made in June, 1971, between IPC and the Iraq government. Despite a higher sulphur content and the political complications of the two pipelines going to Baniyas in Syria and Tripoli in the Lebanon, Iraq demanded an increase in posted prices comparable to that paid to Libya. In signing the agreement, IPC warned that with such high prices, should freight rate fall, Iraqi oil would become uncompetitive with oil from the gulf, which would make the long journey from the Gulf round the Cape as economical as oil brought from the Mediterranean. Unfortunately for Iraq, western Europe had experienced two mild winters in succession, and the demand for oil (which had increased at an annual rate of 8.9 per cent between 1966 and 1970) in 1970-71 and 1971-72 rose by only 4.2 per cent per annum; freight rates fell accordingly. As a result IPC started cutting the daily take-off from Iraq from one million barrels per day to 600,000. In March, 1972, IPC suggested to the Iraqi government that it should cut the Mediterranean premium in return for increased production, but Iraq rejected this suggestion even though it depends for 85 per cent of its foreign earnings on oil royalties.

Turning a blind eye on the slack in demand for crude oil from the Middle East, OPEC countries in June and July maintained the pressure on the western major companies through Dr Nadim Pachachi, the Secretary-General, for a minimum 20 per cent equity. Sheikh Zaki Yamani, the Saudi Arabian Oil Minister (responsible as well since March, 1972, for conducting negotiations on behalf of the Gulf States) has made it clear that the eventual aim is for 51 per cent participation. The oil companies are requesting compensation based on the market value of assets and loss of current profits until the expiry of the concessions. Some producing countries are ready to pay compensation on

cent of their supplies. Japan is similarly dependent.

In February, 1971, Algeria launched a new factor into the international oil situation by taking over 51 per cent of the French oil interests in Algeria. In January, 1972, Libya nationalised the British Petroleum (BP) wells for which it has paid no indemnity. Libya had already wrung concessions from the major companies for even higher prices than those agreed at Teheran. The advantage of Libyan oil for western European countries is that it is particularly suitable for certain purposes and secondly, and more importantly, it is cheaper to transport.

On June 1, 1972, President Hassan al-Bakr announced the nationalisation of the IPC concessions in the field of Kirkuk, 150 miles north of Baghdad. IPC is a consortium of western companies — BP, Royal Dutch Shell, and the Compagnie

book value, but refuse to consider indemnifying loss of profits.

On June 18 the Compagnie Francaise de Petroles (CFP) made a bilateral agreement with the Iraqi government to buy its quota of oil for ten years at the price that prevailed before nationalisation. At the same time, however, CFP announced that it would not exercise the agreement until a satisfactory settlement had been reached between IPC and Iraq. Meanwhile IPC have declared that they would not block Iraq's oil at least for the next three months. In June, the Italian State Oil Company (FNI) reached an agreement to increase its purchase of Iraqi oil at a fixed price to be negotiated in return for technical aid. This may undermine the collective negotiating position of the other companies inside IPC. On June 24 the Shah of Iran (which produces 30 per cent of the oil from the Middle East) announced that he was not in favour of participation. Instead, he said that Iran would abide by the 1954 agreement until its expiry in 1994, at a rate of output compatible with fifty years estimated reserves. A meeting was held with the oil companies on July 23 in Teheran to follow up the intentions of the Iranian government with Iraq to develop port and ore-handling facilities in return for substantial supplies of crude. Iraq is reported to be interested in a similar deal with India for the construction of a fertiliser plant. India has already agreed to buy fairly sizable quantities of crude oil from Iraq in the next three years.

new factor

A new factor was brought into the dispute by the USSR's announcement that they would increase their purchase of Iraqi oil. Soviet policy now seems based on three factors: (1) Iraqi oil is closer to the Soviet Bloc industrial centres than its own vast reserves in Siberia and Kazakhstan, while the Baku fields are running dry; (2) Soviet domestic production, chiefly from the Ural-Volga fields, increased last year by 5.4 per cent, but the total Soviet consumption rose by nearly nine per cent, so that the demand for oil, especially in eastern Europe, will tend to make the Soviet Bloc a net importer; and (3) the desire to undermine the western position among oil producing countries. But the Soviet's own position is weakened by their lack of foreign currency, which is what all sellers in the Middle East want. It therefore looks as though neither the USSR nor the west European countries can afford to throw their weight about.

In the Commons on July 3 Mr Joseph Godber, the British Minister of State for Foreign and Commonwealth Affairs, was

asked if he was satisfied that the agreements concluded between the French and Iraqi governments would not prejudice Britain's oil supplies from Iraq Petroleum Company. He replied that the UK had received firm assurances from the French government that they would do nothing to prejudice the interests of the British, Dutch and United States shareholders of the Iraq Petroleum Company. "We do not at present have sufficient knowledge about the Italian negotiations for the purchase of Iraq oil to know how these would affect the position in regard to compensation for the Iraq Petroleum Company", he added.

II.

Sir Alec Douglas-Home's Asian Tour

During the two weeks beginning on June 23, the British Foreign Secretary, Sir Alec Douglas-Home, flew round five countries in Asia — Australia, New Zealand, Bangladesh, Indonesia and Afghanistan. This was the Secretary of State's second tour of Asia this year. In February he paid visits to India, Thailand, Hong Kong and Korea. Sir Alec's main purpose in visiting Australia in June was to attend the 17th Annual Meeting of the Council of the South East Asia Treaty Organisation (SEATO), though naturally he took the opportunity to have a tour of the whole diplomatic horizon with the Australian government.

The meeting was attended by representatives of six of the eight SEATO signatories (Australia, Britain, France, New Zealand, Pakistan, the Philippines, Thailand and the United States) and by observers from South Vietnam, which is a Protocol State under the Treaty. The absentees were France and Pakistan. France has been a "sleeping partner" in the alliance since the mid-1960s when General de Gaulle decided to dissociate himself from the policies followed by the United States in Indo-China. French representatives have not attended a SEATO Council meeting since 1964 though France continues to pay her contribution to the SEATO budget. Pakistan's interest in the SEATO area has diminished since the secession of Bangladesh, and there was no great surprise when President Bhutto announced early in July that Pakistan would be withdrawing from the Organisation. (This is not part of an overall policy of withdrawal from alliances with western powers, for Pakistan has this year taken a renewed interest in CENTO).

In the course of his speech to the council meeting Sir Alec Douglas-Home, said:

"We must remember that an alliance is at its most vulnerable when the pressure is off". He made it clear that in his view, despite the considerable changes which have occurred in Asian affairs since the founding of SEATO in 1954, the alliance continues to be relevant to the political conditions of the 1970s.

With characteristic bonhomous informality Sir Alec added: "The Prime Minister of Australia has just said that there would be a vacuum without SEATO and that is true. Someone spoke to me yesterday at the airport as I arrived, as they will do, and I believe that my brain was clear enough to hear properly the question that he asked: 'Is SEATO any longer necessary?' His question contained the clear implication that in his opinion it was not. I replied: 'In stormy weather I do not take off my raincoat until I see a clear patch of blue sky. There is a glimpse of blue sky, but so far it is no more. Until we can see more clearly that the Communist powers really desire to live with us in fair weather we must keep up our guard. That is why Britain supports the SEATO Alliance'".

SEATO meeting

The Council heard a strong affirmation of the American Administration's support for SEATO from Mr Rogers, Secretary of State, who made clear that the Nixon Doctrine did not mean any abandonment of American commitments in Asia: "Our interests in Asia and the Pacific are fundamental: in our own self-interest and in the interest of our friends and allies, our involvement will not end with the end of our military involvement in Vietnam". The conference, having heard an account of developments in Vietnam, condemned the escalation of the war brought about by the North Vietnamese in April. In the communique, the failure of Hanoi to negotiate seriously in the Paris peace talks was deplored, and support was given to the eight-point peace plan for a settlement to the conflict which had been made public by Washington and Saigon in January.

This year's SEATO meeting was taking place against the back-drop of the Sino-American rapprochement (which is perhaps more accurately described as the beginning of a long distance 'phone call between the United States and China), the first results of which were becoming visible when the Council met in April of last year in London. The Council welcomed President Nixon's visits to Peking and Moscow and expressed the hope that "their success would open up opportunities for a lessening of the threat in the treaty area..." Referring to China's role in Asia,

WINDOW ON THE WORLD

Iraq, Kuwait, Libya, Bahrain and Qatar). The other four members are Iran, Nigeria, Venezuela and Indonesia. (Trinidad and Tobago was proposed for membership at the July meeting of OPEC countries in Vienna but its nomination is not yet, as far as I know, in the bag).

At the meeting in Caracas in December, 1970, the OPEC countries drew up a list of claims to be submitted to the major international oil companies. These were, essentially, an immediate increase in posted prices and a new agreement to be made on the sharing of profits between the oil companies and the producing countries. After long and tough negotiations, an agreement was reached in Teheran in February, 1971, giving six producing countries — Iran, Saudi Arabia, Iraq, Abu Dhabi, Kuwait and Qatar — an increased income of \$1,200 million rising to \$3,000 million by 1975. The Mediterranean countries, led by

Sir Alec Douglas-Home told the conference: "We cannot realistically discuss the prospects for peace and stability in South and South East Asia without taking account of the proximity of the People's Republic of China and of the policies pursued by that country... There can be no doubt that China will play a key role in Asia during the coming decade, a role independent of Russian Communism".

UK seeks Asian stability

The defence commitments entered into by SEATO states are less precise than those which bind NATO countries. The SEATO Collective Defence Agreement states under Article IV that each state "recognises that aggression by means of armed attack in the Treaty area against any of the parties... would endanger its own peace and safety, and agrees that it will in that event act to meet the common danger in accordance with its constitutional processes". No military structure has been built up within SEATO comparable to that within NATO. Although a permanent secretariat services the Organisation from Bangkok, the activities on the military side are limited to contingency planning and the holding of periodic military exercises. In the context of contingency planning, certain SEATO countries undertake to make a contribution of forces should certain circumstances arise. Last year the British government told SEATO, that it was reversing the former Labour government's decision to cease declaring forces to SEATO contingency plans as from the end of 1971. This Labour decision was part of their post-1968 policy of withdrawing forces from east of Suez by the end of last year — policy which the Conservatives have modified by maintaining a military presence in Singapore (Singapore and Malaysia are not members of SEATO) which, in my view, contributes to stability in south-east Asia and certainly helps Britain's relations with her allies in the area.

Though SEATO has always been concerned to some extent with countering subversive activity — article IV of the founding treaty alludes to the danger — the recent meeting renewed emphasis on SEATO's counter-subversive activities. It was decided that SEATO's economic and social programme, as well as what it does in the field of information and cultural co-operation, should be "increasingly complementary to, and closely co-ordinated with, its counter-subversive and counter-insurgency activity". The more relaxed international climate had brought no let-up in the subversion from (you know whom) with which the governments of both Thailand and the Philippines have

to contend; indeed in Thailand there has been an intensification of the threat.

III

UK, Indonesia and Asean

In Djakarta on July 4, Sir Alec Douglas-Home told his Indonesian hosts that "the time is right to cement relations between Britain and Indonesia" and that a "strong, independent and flourishing Indonesia is, and will continue to be, an influence on the side of peaceful evolutionary change in the whole of south-east Asia, as it could be of the utmost importance in the cause of world peace".

Anglo-Indonesian relation have steadily improved since President Sukarno's campaign of "confrontation" was brought to an end in 1966. Confrontation was not only militarily futile, but cut off Indonesia's nose to spite her own face by causing havoc to the economic life of the country; soaring inflation inflicted particular hardship. Measures taken in recent years to restore the economy have had success, as reports on Indonesia by the World Bank and the IMF testify.

increased production

In the more stable economic conditions thus created, agricultural and industrial production has begun to move ahead and steps have been taken to exploit the country's natural resources. Over the past four years, Britain has progressively increased her aid programme to Indonesia. Expenditure on capital aid amounted to £4 million in 1971-72, double the figure for the previous year, while technical assistance trebled to nearly £500,000. I understand that the Heath government's intention is to increase expenditure on capital aid in the current financial year by a further 75 per cent and technical assistance by a further 40 per cent. To enable these targets to be met, £7 million has been pledged in project aid and an additional £3 million for "essential general imports". This will make Indonesia the biggest non-Commonwealth recipient of British government aid.

When relations were at a low ebb in the mid-1960s, the Indonesia government seized British-owned assets (or those thought to be owned by British nationals) on a large scale. After the fall of Sukarno these assets were offered back to those from whom they had been expropriated and compensation was offered to anyone who did not wish to resume possession. Claims for compensation, as well as other debt repayments to British firms, are still in negotiation. Djakarta is apparently trying to live down this unfortunate past by a liberal attitude towards foreign private investment — which, after

all, is but common sense. Some forty Britain concerns have a commercial stake in the country and British investment is estimated at between £20 million and 30 million. It is also worth noting that Indonesia is the first country to have received investment funds from the Commonwealth Development Corporation since the change in the CDC's charter allowing it to operate in any part of the developing world and not in the Commonwealth alone.

In its foreign relations, Indonesia adopts non-alignment, supported by what its government calls a policy of "national resilience" — a pleasing term that I have not met before. I hope it means something. It seems to imply a positive approach to co-operation in regional organisations which suggests a realistic appreciation that co-operation produces benefits for all parties. One of these organisations is the Association of South East Asian Nations, (ASEAN) set up in 1967 as a successor to the now defunct Association of South East Asia (ASA). The other members of ASEAN are Malaysia, Singapore, Thailand and the Philippines. The Organisation has achieved encouraging success in the economic, social and cultural fields, in which it is intended to promote closer co-operation, and there is no lack of ideas as to how to continue the good work. ASEAN is not supported by any formal organisation, though the possibility of creating a central secretariat is at present being considered. And if I know anything about Parkinson's law the possibility will become a certainty and within a few years the secretariat will have outgrown a building as big as the Old North and South secretariats in New Delhi. The important development on the eve of the enlargement of the Communities is that ASEAN countries have set up a special co-ordinating committee to work out a joint approach to the European Economic Community in trade matters.

Indonesia reverses policy

A meeting of ASEAN ministers in April this year resulted in agreement that periodically the foreign ministers should get together in a special meeting ("outside the purview of ASEAN") to exchange views on international affairs generally. This move among ASEAN states to explore the possibilities of political co-operation really dates from the autumn of last year when their representatives met in Kuala Lumpur and adopted a declaration in which they agreed to secure recognition of south-east Asia "as a zone of peace, freedom and neutrality". It is good to know that the ASEAN states are acquiring the habit of working together, even though the Kuala Lumpur meeting re-

vealed differences of approach as well as certain basic common attitudes, but this is hardly surprising when one remembers the varying affiliations of the member states. Whereas Indonesia is not involved in any collective security arrangement, both Thailand and the Philippines belong

to SEATO, and Malaysia and Singapore combine non-alignment with participation in the Five Power Defence Agreement.

When asked in Djakarta about the British government's view on regional co-operation in South East Asia, Sir

Alec said: "We are very glad to see the ASEAN association active because it will give strong base for south-east Asian economic development and political co-operation... It is for the countries of this part of Asia to decide what sort of political structure suits them best".

In search of a new model

E. B. Brook
Vienna.

THE WORLD has been giving its attention chiefly to the Olympic Games in Munich and the political murders that accompanied it; two highly important reports that signal the opening stages of comprehensive changes in the world monetary and trading systems have passed relatively unnoticed. Although the greater attraction of sport and the bizarre must go unchallenged it is an unhappy reflection that the relative public indifference to the far more humdrum matters of exchange rates, trade preferences and convertibility may lull people to the import of developments that are likely to set the fundamental framework of world economic relationships for the rest of this century, for most of their lifetimes and affect them personally for better or worse.

The two reports are those published from Paris by an ad hoc group of twelve experts from the Organisation for Economic Cooperation and Development (OECD) and from Washington by the executive directors of the International Monetary Fund (IMF). The complication of the titles is enough to deter all but a few directly interested readers; the endless series of reports and conferences weary all except those aware of how very important matters these prosy groups are handling with.

new model

Expressed briefly, these reports, the current conferences in Rome of Finance Ministers and in Brussels of senior treasury and bank officials and the annual meeting of the IMF in Washington beginning on September 25, are seeking a new international economic model to replace the post-war model inspired by the wartime Atlantic Charter and embodied in the Bretton Woods Agreement of 1944 which finally broke down on August 15 last year when President Nixon announced the suspension of the dollar's notional convertibility into gold. Apart from the communist states, the world for 25 years had worked on the ideal of free trade policed by the IMF, the World Bank and the General Agreement on Tariffs and Trade (GATT), later re-

inforced by the OECD. Its tools were convertible currencies with agreed fixed exchange values and multilateral agreements.

Gradually, and far more rapidly in the last six years, this system has broken down and for the last twelve months been floundering in a broken down condition, making do with temporary makeshift patchings-up—such as the floating pound—and made to appear deceptively secure by an American refusal to make its dollar convertible while west Europe kept its often very inefficient and always greedy farmers content by treating agriculture as specially delicate and needing heavy financial support denied to any other form of industrial production.

wholesale pretences

It has ambled along, also, with the pretence that the trade preference system of the six members of the Common Market could be extended to almost the whole of western Europe, to much of the Mediterranean area and to parts of the developing world, especially to those formerly politically associated with France. It has pretended that agriculture was exempt from all the liberal principles governing other branches of trade and that Japan, now almost the world's most thriving economy, was still a war-ravaged economy under reconstruction.

President Nixon's bombshell of August 15 last year was the moment of truth for western Europe, but it was a truth which aroused at first more protest than acceptance and, later, more wriggling adaptations than frank facing of facts. As a result, the French now find their recommendation to increase the price of gold (a recommendation made also in the latest bulletin of the Moscow Narodny Bank from London) rejected by the IMF's executive directors and the Americans discover their "do-nothing" policy similarly treated.

Both the IMF and the OECD's experts realize not only that "something must be done" but that they are required to make at least some measure of practical sug-

gestions to the world's finance ministers and to the IMF and its new "group of twenty" as to what that "something" should be. But while the world in uncomfortably conscious that it can no longer safely paddle along in an increasingly swirling stream it is most unlikely that it will do anything remarkable in a hurry. Some people, obsessed by a need for target dates, seize on next year's meeting of the IMF in Nairobi, 12 months ahead, as a date when it may begin to be clearer what sort of world we are living in. Others, more realistic, shy away from accepting the probability of finding a generally accepted solution in even two or three years and the most realistic accept already that monetary reform is an impressive concept unlikely ever to be realized and that what will eventually emerge is a stamp of approval on most of the practices nations have already independently decided to follow.

The matter has been most plainly and sincerely expressed by US Treasury officials who deny the possibility of any major country, without the irresistible pressure of a military defeat, agreeing to reduce its degree of sovereignty over the price of its money or the level of its reserves. The British have already flouted the rules of the Common Market it is intent on joining by floating the pound; the Italians defer repeatedly, despite protests and rebukes, conforming to Market rules which do not suit them and the USA steadily refuses to make the dollar convertible or to hurry in reducing its heavy imbalance in trade deficit.

The outcome of the OECD report most generally acceptable is that it declines to recommend setting up any more expert bodies—an inner group in the OECD and another in GATT is as far as it will go—and it has avoided outlining any new economic philosophy to replace that of the Atlantic Charter or Bretton Woods. The IMF Executive Directors have restressed the usefulness of Special Drawing Rights (SDRs) to supplement gold and dollars as reserve assets, but this extension of the function of SDRs would increase the

monetary authority of the IMF and of the World Bank in determining liquidity and reserves to an extent unacceptable to many Treasuries. It would require the USA to settle, like all other nations, its balance-of-payments deficits with reserve assets rather than by increasing dollar liabilities. In a US election year, particularly, this idea is unlikely to find acceptance and a bitter debate at the

IMF annual meeting seems almost certain.

Behind governments' prestige and authority in these financial and commercial matters looms in every state the individual's fear of loss of jobs, especially when industrial technical progress is increasingly displacing human labour in manufacturing. The growth of trading blocs, in which,

despite its approaching Market membership, Britain's interests are closer to those of America than to those of west Europe, raises the need for a central strategy of which there is so far no sign. The worst will be a continuation of the present haphazard interventions in money values and trading rules, but, at the moment, this is the practice which seems most likely to continue.

Third replenishment of IDA

THE WORLD Bank Group's lending and investment operations in developing countries reached a record annual figure of more than \$3,000 million in the fiscal year ending June 30, 1972. The year's lending included 72 Bank loans in 40 countries totaling \$1,966 million. The World Bank's affiliate, the International Development Association (IDA), approved credits of \$1,000 million for 74 projects in 38 countries. The International Finance Corporation (IFC) made 23 investments of \$116 million in 17 countries.

The combined Annual Report by the Executive Directors of the Bank and IDA, indicates the growth in the Group's development assistance to poorer member countries. The continuing rise in operations means that the amount of development financing recorded by the World Bank Group during the current five-year period (1969-73) probably will be more than double the 1964-68 figure.

The volume of World Bank borrowings in fiscal 1972 reached a new peak, both in amount and in the number of issues sold. Thirty issues of Bank obligations were sold, 17 through public offerings in the capital markets, and 13 by private placement. The total principal amount was \$1,744 million, compared with sales of \$1,368 million in fiscal 1971, and \$735 million in fiscal 1970.

In March 1972, the Bank arranged for the largest single borrowing in its history when it signed an agreement with The Bank of Japan to borrow up to 100,000 million yen (US equivalent \$325 million). The Bank raised funds also in Belgium, Canada, France, Germany, Kuwait, the Netherlands, Switzerland, the United Kingdom and the United States.

The Report shows there has been not only an increase in the volume of lending, but that the base of the Bank Group's assistance is being broadened, and today includes new fields such as urbanization,

population planning, nutrition, education and rural development.

Although total production and income in the developing countries seem to have grown at an average annual rate of more than 5.5 per cent during the past decade, the Report issues a warning. In global terms, this performance is impressive and averages are not wholly revealing. In certain cases, behind the statistics lie the grim realities of how life at the lower end of the scale is lived by the poorest among nations, and the poorest within nations, the World Bank says.

A very real problem is the mounting external debt of developing countries. Debt service payments are estimated to be rising by about 18 per cent annually. According to the latest figures available in the Report, the outstanding debt of developing countries was close to \$ 70,000 million in December 1970.

The World Bank's ability to assist the

poorest of its members depends heavily upon funds made available to the International Development Association which gives credits to member countries on highly concessionary terms. The resources of IDA are replenished periodically by contributions from more affluent member countries. Under an international agreement concluded in 1970, contributions of about \$800 million had been expected during the current year.

By June 30, 1972, 16 of the 19 Part I (or richer) nations had ratified the agreement. But without ratification by the largest contributor, the United States, the third replenishment of IDA could not come into effect. However, IDA was able to maintain and even increase the flow of credits to the poorest countries in fiscal 1972 because of special action by 15 governments in making advance contributions totalling \$448 million.

The description of the Bank's and

Eastern Economist 25 Years Ago

SEPTEMBER 26, 1947

The effects of partition on the economy of the country are slowly being felt, although in a general way the authors of the partition settlement as well as the people in general have been conscious of the inevitability of forced adjustments and readjustments. In particular sectors of the economy the problems consequent on the partition are rather bewildering and extremely difficult, though not incapable of solution. Perhaps it is fortunate for us that the division of the country should have almost coincided with the preliminary phase of our vast post war reconstruction. This should be perhaps taken as a happy accident because if partition was to have come later, the stress and strain and the necessary readjustments

would have been even costlier. It might also be taken as a happy augury that in most cases of the industrial schemes, both at government and a private levels, no start has as yet been made. With the partition question now settled we are in full knowledge of the far reaching effects of partition. This background is of particular importance in a consideration of the future of the jute industry—both the agricultural and the manufacturing parts of it—in the Indian Union. The conditions of the jute industry and the almost absolute monopoly which this country has held (this monopoly is now shared between the two new states) assume a new importance both for the governments concerned and the commercial and agricultural interests.

IDA's worldwide activities on a regional basis in this year's Report gives a clear picture of the extreme diversity among member countries—diversity in resources and in their capacity to develop.

The lending record by area since 1964 shows how sharply the Bank and IDA have stepped up their operations in recent years (see table below).

In eastern Africa, says the report, the Bank and IDA have lent 90 per cent as much in the four years ending June 30, 1972, as in the 19 years from 1950-68. Support for agricultural development in the area in 1972 — all interest-free IDA credits — was 10 times as great as the annual average for 1964-68.

The Bank Group's activities in western Africa place heavy emphasis on transportation, power, education, and agriculture. But there are also new trends. Many governments in this region are concerned about the rapid growth of urban centres.

In consultation with governments, the Bank is attempting to find more effective solutions to deal with the problems of ill-equipped, destitute rural migrants who settle in western Africa's mushrooming towns and cities.

promising approach

One promising approach is to encourage people to build their own low-cost housing. During the year, an IDA credit of \$8 million was approved for the first project of this type. A specially organized government unit will provide home sites and basic public services for about 160,000 people in Dakar and Thies, Senegal.

The Annual Report says that the last 12 months have been a time of unusual trial for the greater part of south Asia. Civil conflict in Pakistan was followed by war with India last December, and the emergence of the new nation of Bangladesh. Although Bangladesh, with a population of 75 million, did not become a member until August 17, the Bank and IDA already had made preparations during fiscal 1972 to assist the country in the task of reconstruction.

In the same region, IDA and the government of Sweden are providing \$31.8 million to help the family planning programme of India, the largest of its kind in the world. Another IDA credit of \$13.2 million for population planning went to Indonesia (east Asia and Pacific). The project includes not only physical facilities and technical assistance, but support for activities in training, motivation,

evaluation, research and population education.

In South America, a major feature of development has been the growth of manufacturing. This trend is reflected to some extent by the high level of lending in Brazil which this year became the Bank's biggest borrower, with cumulative loans since 1949 of \$1,460 million.

The Bank Group backs the growth of industrialization, and at the same time is trying to encourage member countries to achieve more equitable income distribution within their borders. The Report says the World Bank intends to support reform programmes when this is feasible. During the year, for instance, the Bank made a second loan to Colombia's agrarian reform agency — the fourth agricultural improvement loan in that country in

four years for a total of about \$48 million.

Mexican borrowing from the Bank reached a record annual figure of \$277 million during the year, including \$22 million for the first tourism infrastructure project.

Outstanding borrowings of the World Bank on June 30, 1972, stood at \$6,951 million, an increase of \$1,527 million for the year. Of the total, it was estimated that about 35 per cent was held by investors in the United States, 26 per cent in Germany, 10 per cent in Japan, six per cent in Switzerland and four per cent in Canada.

Subscriptions by members to the Bank's capital stock were increased in fiscal 1972 by \$635.2 million. Total subscriptions to the capital stood at \$24,506.2 million. The Bank's membership increased to 117 and IDA's to 108.

Financial record of IFC

TWENTY-THREE investments in 17 countries were made by IFC during fiscal 1972 for a total of \$115.6 million. Concurrently with IFC others invested \$459.0 million in the same enterprises. Both these totals were the highest for any year since the Corporation was set up in 1956. The total cost of the 23 projects was \$688.5 million.

During the year IFC for the first time made an investment in Zambia. Elsewhere in Africa the Corporation invested in projects in Kenya, Senegal, Sudan and Uganda. In Latin America investments were made in Argentina, Brazil, Ecuador, Mexico and Venezuela. Other commitments were made in Indonesia and the Philippines, in Asia, and in Iran in the Middle East. In Europe projects were supported in Yugoslavia, Spain, Greece and Turkey.

Of the total of IFC's commitments during the year, \$33.8 million was invested in the pulp and paper sector. In addition, \$23.0 million was invested in the production of motor vehicles and accessories, \$22.0 million in cement production,

\$15.0 million in mining, \$10.0 million in the textile sector, \$5.0 million in steel production, and \$3.5 million in tourism projects.

Of these investments \$63.7 million was for the expansion of production of 14 existing concerns and \$51.8 million for the establishment of six new enterprises. The companies produce, or will produce, aluminum, radial tyres, printing and industrial papers, polyester and cotton fabrics, footwear and ceramic tiles. They also include a nickel mining enterprise and two tourism projects.

Other investments during the year included \$76,467 in two pilot projects in Mexico and Senegal. These investments, although not large, were of particular interest. They were made in support of pilot projects to undertake experimental technology — the one in Mexico to explore the possibilities of producing newsprint from bagasse, and the other in Senegal to experiment in growing vegetables for the winter market in Europe.

IFC's operations in fiscal 1972 brought

the cumulative total of the Corporation's investments since 1956 to \$693.8 million in 184 enterprises in 48 developing countries. Of this total, \$329.1 million, or nearly half, has been committed in the last three years.

Of this total IFC investments, \$272.3 million (39 per cent) had been made in Latin America and the Caribbean, \$197.6 million (28 per cent) in Asia, \$118.2 million (17 per cent) in Africa and the Middle East, and \$104.6 million (15 per cent) in Europe. Others invested approximately \$3,038 million of foreign and local capital in the same enterprises.

At the close of the fiscal year, the Corporation held a portfolio of \$417.6 million, consisting of loans aggregating \$301.3 million and equity investments of \$116.3 million. A year earlier the portfolio stood at \$349.9 million, consisting of \$243.8 million in loans and \$106.1 million in equity.

Sales during the year amounted to \$39.8 million and brought the Corporation's cumulative sales to \$196.5 million.

Currency Crisis and IMF

THE MAJOR disturbances to the international monetary system in the past eighteen months are emphasized in the 1972 Annual Report of the International Monetary Fund, published on September 10, 1972. In its review of events in 1971 and the first part of 1972, the Report focuses on the conditions surrounding the major changes in domestic and international economic policies which the US Administration initiated on August 15, 1971, in response to rising prices at home and sharply mounting pressures on the dollar abroad. It describes the climate which gave rise to those changes, notably the fundamental imbalance in international payments relationships, divergent national financial policies and cyclical positions, and accelerating speculative capital movements.

The Report examines the international impact of these developments, particularly the suspension of dollar convertibility. The events of the succeeding months are reviewed, including the floating of many currencies and the appreciation of most major ones vis-a-vis the US dollar, leading to the Smithsonian Agreement of December 18, 1971, on the realignment of major currencies and the subsequent exchange rate actions of most Fund member countries. Particular attention is given to the impact of the currency crisis and the resulting uncertainties on international liquidity, on trade and payments, and on the Fund's own policies and operations. The Report emphasizes that great challenges remain for the longer run, foremost among them the task of improving and reforming the international monetary system and of improving the management and performance of the main industrial economies.

foundation-stone removed

In its general review of currency developments, the Report makes the point that the action taken by the US on the external front removed one of the foundation stones of the international monetary system as it had operated since World War II under the Bretton Woods Agreement. When the US was no longer prepared to convert officially held dollars into gold or other reserve assets, many countries responded by ceasing to maintain the parity of their currencies with the US dollar. This resulted in the appreciation of most major currencies against the US dollar, generally limited, however, by official intervention in the exchange markets or measures taken to curb capital inflows. Strong upward pressures on ex-

change rates respecting the dollar and/or increases in reserves were sustained by the continuing basic deficit in the US balance of payments reinforced by speculative capital flows. In these circumstances, further large accumulations of dollars in official holdings took place. In a number of cases, the extraordinary expansion of reserves during 1971 tended to generate excessive domestic liquidity and thus to complicate the problems of containing inflationary pressures. The result was a proliferation of measures intended to discourage capital inflows or encourage outflows.

widespread concern

Widespread concern that the prevailing confused and unsatisfactory situation would threaten to produce severe economic effects if it continued for too long, ranked high among the considerations that led to the Smithsonian Agreement. It provided for a realignment of exchange rate relationships among major currencies as the first essential move to eliminate disequilibria in international payments. The most important aspects of this realignment, observes the Report, were the depreciation of the US dollar in terms of gold and SDRs and the appreciation of a number of currencies, including the Japanese yen, the Deutsche mark, the pound sterling, the French franc, the Netherlands guilder and the Belgian franc. The Canadian dollar continued to float.

The Report points out that this pattern of changes had the overall effect of leaving the value of the SDR (and of reserve positions in the Fund) approximately unchanged in relation to major currencies in general. In addition, the Smithsonian Agreement included an understanding about the need for consideration of long-term reform or improvement of the international monetary system, a provision for temporary wider margins of exchange rate fluctuations, and an agreement on the immediate removal of the US import surcharge. On the same day, the Executive Directors of the Fund, adopted a decision providing for a temporary regime of wider margins and central rates. Under this, exchange rates in transactions between a member's currency and its intervention currency can move within margins of 2½ per cent on either side of the parity relationship between them as indicated by par values or central rates, and as a result maximum margins of 4½

per cent are possible in relation to other currencies.

The realignment of exchange rate among the major countries was followed by exchange rate actions of many other countries. The decision made by the developing countries resulted, on the average, in a moderate depreciation of their currencies in relation to those of the developed nations.

After the realignment, the expected reflux of speculative capital to the US was deterred by both international differences in interest rates and a variety of special factors, including the initial pattern of exchange rates within the newly widened margins and the lack of public appreciation of the lags with which the intended effects of exchange rate changes are felt. In the absence of such a reflux, the continuing basic deficit in the US balance of payments resulted in further additions to foreign official dollar holdings in the first quarter of 1972. In the ensuing months a calmer exchange market atmosphere emerged. This period of relative calm was interrupted in June when the pound sterling came under downward pressure. Heavy outflows of short-term capital and the resulting loss of net UK reserves led the UK authorities to allow the pound sterling to float for the time being. fifteen other member countries that have close trading and financial ties with the United Kingdom and whose currencies were pegged to the pound followed suit. A number of other countries abandoned their previous pegging to the pound and maintained the existing relationship to gold or the US dollar. Slightly variant actions were taken by a few other sterling area countries.

speculative activity

The Report reviews the effect of intense speculative activity in the private gold market during the second quarter of 1972 and the factors that appear to have been responsible for the sharp gold price increase in recent months. It mentions that, on the supply side, where the level of current production was somewhat reduced the marked improvement of South Africa's balance of payments after the end of 1971, together with changes in sales by some suppliers, resulted in a substantially lower volume of gold sales on the free market. Demand, however, was strong, as the surge in speculative demands for gold during the first half of 1972—reflecting uncertainty about the future role of gold and

uneasiness regarding the stability of currency relationships — was superimposed on a generally buoyant underlying trend of industrial, artistic, and traditional hoarding demands.

Commenting on wider margins, the Report observes that experience with wider margins has been too brief, and too strongly affected by special circumstances, to permit generalization about the impact of wider margins on the management of capital flows by national monetary authorities. The EEC agreement on narrower bands between Community currencies is referred to as is the recent US initiative to intervene from time to time in the exchange market.

slow growth

In the non-financial sphere, the Report observes, the main features of 1971 were a continuation of slow output growth coupled with inflation. Economic recovery proceeded at a moderate pace in the US while the slowdowns in Japan and Europe were still running their course. This sluggishness of the industrial economies depressed the growth of world trade and had a particularly dampening influence on the prices of commodities exported by many primary producing countries. At the same time, import costs of the primary producing countries were raised by the continuing inflation in the industrial countries. The Report expresses the opinion that as of mid-1972 the short-run economic outlook appeared more hopeful than at the turn of the year, with a sharp pickup in the overall rate of output growth in the industrial countries from 1971 to 1972, along with some lessening in the average rate of inflation. Nevertheless, the reduced rate of inflation would still be high in comparison with past experience.

In 1971, as in 1970, growth of volume of total output on a worldwide basis was well within the 3-4 per cent range, markedly below the long-run average of 5 per cent during the 1960-70 decade. Among the industrial countries the growth picture was compounded of a recovery in the US and Canada and a deceleration almost everywhere else. Output growth also slowed down for the primary producing countries from 1970 to 1971, except in the Middle East area, but the total growth rate for the less developed countries was still above the average for the decade of the sixties. Throughout most of the world, output changes were accompanied by strong inflationary pressures. Taken together, the industrial countries experienced a price rise in 1971 of 5½ per cent as measured by GNP deflators, only slightly less than the exceptionally high rate of 6 per cent in 1970 and more than double the average annual rate for

the first part of the 1960s. In primary producing countries consumer price increases averaged 9 per cent for both the more and the less developed groups, markedly higher than in the previous year.

At the present juncture, the Report states, a substantial rise in output growth from 1971 to 1972 seems clearly indicated for industrial countries as a group, primarily stemming from sharp gains anticipated in the relatively depressed US, UK, and Canadian economies. In other industrial countries (covering continental western Europe and Japan), projected output expansion is below longer-term trends. A better price performance is also expected for the industrial countries particularly in the US, the UK, and Germany. However, in these and other industrial countries, the overall price increases expected for 1972 would still be above the rates generally typical in the past.

increased unemployment

The Report assesses the situation in the industrial countries as one in which the pressures of excess demand have been eliminated in many cases, unemployment has increased and policies of renewed expansion are being pursued. At the same time, cost-push forces are still strong in a climate of deep-rooted inflationary psychology. The combination of these elements poses a very difficult problem for the conduct of economic policies throughout the industrial world. The Report discusses the use many countries have made of incomes policy as a supplement to the instruments of demand management. Though incomes policy has a mixed record of effectiveness, the Report observes that an increasing number of countries, particularly in the past year, have had recourse to incomes policy in the belief that it may be helpful in carrying out a task that fiscal and monetary policies proved incapable of handling alone. The greater attention that incomes policy has been attracting is part of an active re-examination of economic policies in general and gives rise to the obvious question whether its wider application could assist restrictive demand-management policies in preserving or extending progress in the fight against inflation.

The Report notes that world trade volume grew in 1971 at a rate of 5½ per cent which was considerably lower than the average rate of increase over the 1960s. Foreign trade prices, however, continued in 1971 to advance at a high rate reflecting primarily the pervasiveness and intensity in recent years of inflationary forces in the main industrial countries. Average prices of internationally traded goods, which had risen only slightly from the mid-fifties to 1968, showed a marked

upturn in 1969 and advanced quite sharply in 1970. Their further advance from 1970 to 1971 by about 5½ per cent — measured in US dollars — was somewhat larger than in 1970. However, the 1971 increase included two special elements, an unprecedented increase in oil export prices and the adaptation of prices to the appreciation of several major currencies in the period of floating. The latter factor may have accounted for as much as 2 percentage points of the increase in the average unit value of exports, measured in US dollars. The Report sees as the principal reason for the lower growth of world trade in 1971 the cyclical slowdown of economic activity in continental industrial Europe and Japan. This was in line with the experience of earlier years when the course of world trade developments was governed in important respects by cyclical changes in aggregate demand and imports of the main industrial countries.

underdeveloped countries

For the less developed countries, 1971 was a year marked by generally weaker gains in export volume, sagging average prices for primary products other than petroleum, and a very uneven distribution of changes in export values and trade balances. In terms of total value, the exports of developing countries other than oil exporters showed a rise of only about 2 per cent, by far the smallest increase since 1967. With the continuing rise in these countries' import prices, the purchasing power of their export earnings apparently suffered an overall net decline, the Report observes. The trade balances of many of these countries, already deteriorating somewhat in 1971, may come under further pressure in 1972 because of the terms-of-trade effect of the realignment of currencies. The rate of growth of the developing countries' imports in 1971 did not parallel the corresponding changes in exports as has been typical in the past. In 1971 imports were exceptionally high and the "gap" between import growth and export growth for the less developed countries, excluding oil exporters, had no precedent in the previous twelve years.

Analyzing balance of payments developments in 1971, the Report emphasizes that the 1971 currency crises had their root in a long period of imbalances in payments relationships among major industrial countries. Although the proximate causes of the crises could be found in explosive movements of capital, it was largely because these occurred against a background of chronic imbalances that they went beyond the scope of containment by internal policy means. At the heart of the disequilibrium in international

payments relationships, the Report says, has been the deficit in the basic external accounts of the US, with, as its counterpart, the rather widespread surpluses of other countries, particularly Germany and Japan. The overall US balance of payments deficit on official settlements for 1971 rose to approximately \$30 billion, from \$10 billion in the previous year. Surpluses amounted in the case of Japan to more than \$10 billion, the UK to \$6½ billion, Germany to \$4½ billion and France to \$3½ billion. The floating of the Deutsche mark in May 1971 and the succession of measures adopted to restrain capital inflows were largely responsible for the German figure being \$1½ billion lower than in 1970. Japan's striking increase reflected partly a \$4 billion increase in the current account balance and partly the inflow of short-term capital in reflection of the unsettled international monetary situation.

The Report reviews the causes of the huge capital movements that dominated changes in the overall payments balances of the industrial countries and dwarfed current account changes. It observes that during 1970 and the early months of 1971, the flow of capital from the United States to other industrial countries, while abnormally large in comparison with any prior movements of funds, reflected primarily the responses of financial market participants to the shift in comparative monetary conditions and interest rate levels. However, as these large flows proceeded against the background of underlying imbalance in the global payments structure, they were progressively reinforced by shifts of other types of capital in anticipation of, or hedging against, possible changes in exchange rates for major currencies. Among the current account changes the Report singles out as particularly strong and disequilibrating the negative swing of \$3 billion in the US current account and the unprecedented \$4 billion positive swing in the Japanese account in 1971.

floating of sterling

The Report notes that speculative capital movements had started subsiding by the time of the December realignment and continued in that direction throughout the first five months of 1972, though not without an occasional revival of exchange pressures, especially in early March. Shortly after the middle of June, a strong revival of such pressures led to the floating of the pound sterling. The Report further notes that the general climate as well as the continued interest rate differentials have so far impeded a reflux of capital to the US. The realignment is expected to produce changes in countries' current account balances only gradually,

with much of the impact coming after 1972, and the cyclical positions of key economies are such as to exert disequilibrating influences on the current account balances during 1972. Therefore, prospects for the avoidance of further major overall payments imbalances this year seemed largely to depend on partial reversal of speculative capital flows.

Some of the counterpart of the US deficit was to be found among the primary producing countries which showed a \$8 billion combined surplus in 1971, nearly twice as much as the year before. The more developed among these countries had a continued large inflow of capital combined with some shrinkage in their current account deficit, resulting in an aggregate overall surplus of \$3½ billion. The less developed countries obtained, according to preliminary information, an overall surplus of \$4½ billion, as inflows of capital and aid more than covered an approximately \$9½ billion current account deficit. The Report points out, however, that net inflows of private long-term capital rose only moderately from 1969 to 1971 and that the increase in receipts of official capital and aid accounted for less than one fourth of the apparent rise in total inflows. The remainder stemmed from a sharp swing in movements of short-term funds and unidentified capital.

uneven rise

The aggregate rise in the overall payments surplus of developing countries in 1971 was unevenly distributed among regional groups. The great bulk of it was centre in the Middle East, which was the only region having a decrease in its current account deficit and the one with by far the largest rise in capital inflows. The other principal regional groups of developing countries showed comparatively small changes in their respective overall payments balances. It was in the Western Hemisphere that the sharpest deterioration of trade and current account balances occurred, and this deterioration was not matched by the increased inflows of capital and aid. For the Asian and African regions, the increases in current account deficits were smaller and were covered by increases in financial inflows. Receipts of SDR allocations have become important elements in the overall balances of many developing countries, especially in Asia and the Western Hemisphere.

In a section on the international adjustment process, the Report deals with the economic impact of the 1971 current realignment on the trade and the balance of payments of the major industrial countries, on countries' official reserves, and on the foreign debt, debt service and trade of developing countries. This section also

comments on the role of national policies generally in supporting the realignment and rendering it effective. It states according to studies made by the I staff the realignment can be expected due course to lead to the restoration of international payments equilibrium less its intended effects are blunted or frustrated by inappropriate national policies. The qualification "in due course" refers to the fact that because of inevitable lags in trade volume adjustments, equilibrating influence of the realignment cannot make itself strongly evident before 1973, and its full impact will probably not be apparent until even later. In interim, the terms-of-trade effect of realignment, which precedes the impact on trade volume, will be dominant and in reverse.

increasing surpluses

The current account surpluses of Japan, Germany and other countries whose relative exchange rates appreciated, are expected to increase because the dollar price of their exports will rise more than the dollar price of their imports, while the current account deficit of the US will increase because its import prices will rise by more than its export prices. In addition, cyclical developments in 1972 are expected to bolster import growth in the US relative to that of other major countries while affecting more severely US exports than those of other countries which will benefit from the pickup in the US market itself. The Report emphasizes that it is sufficient public appreciation of this prospect and of the time lags involved may have postponed the emergence of market confidence in the new exchange rates.

The "purchasing power" of reserves has also been affected by the realignment. According to calculations made by the I Fund staff, the overall value of the member countries' reserves increased by about five per cent in terms of US dollars because of the currency realignment, while the expected realignment effect on the world price level of international transactions is estimated at 7.4 per cent over the level prevailing immediately before May 1971. These estimates, based on import price changes, thus indicate that the loss of "purchasing power" because of the realignment outweighs nominal revaluation gains for the reserves, producing a net loss in real terms of 2.3 per cent of the total value of reserves, inasmuch as reserves provide means of financing any net imbalances.

With respect to the external debt and debt service of developing countries, the realignment raised the US dollar equivalent of most non-dollar debt and debt service while at the same time it is expected to increase US dollar prices of

developing countries' exports. The latter factor "deflates" the nominal rise in debt and debt service. Taking both factors into account, estimates made by the Fund indicate that the outstanding long-term external public debt of developing countries was reduced in real terms by 1-1½ per cent as a result of the realignment, while the real value of annual debt service payments was also reduced by 1½ per cent. This estimated net decline in outstanding debt in real terms, attributable to the realignment, amounting to \$ 500 million, is of the same order of magnitude as the estimated \$ 500 million net loss in purchasing power of reserves held by developing countries as a group. Estimates made by the Fund staff also indicate that the exchange rate decisions made by the developing countries in reaction to the 1971 realignment of major currencies resulted in an average effective depreciation of about 4½ per cent of the currencies of the developing countries in their trade with all developed areas. On the basis of reasonable assumptions regarding such relevant factors as the price elasticities and demands for and supplies of goods traded by the developing countries, the Fund staff has estimated that this effective depreciation in due course may result in an eventual improvement in the collective trade balance of the developing countries equivalent to about 2½ to 4 per cent of the group's combined exports, or roughly \$ 1½ to 2 billion.

national policies

The Report also discusses the role of national policies in the adjustment process in the period ahead. It emphasizes that despite the potentiality of a large reflow of short-term funds to the United States, through a combination of interest rates and of confidence factors, and despite the probability that conjunctural factors would be conducive to an upward movement of US rates relative to those in other major centres, the fact remains that future developments with respect to short-term capital flows and to exchange market conditions cannot be predicted with any confidence. Therefore, the Report states that it is imperative for policies of the major industrial countries to give attention to the international adjustment process and, more specifically, to support the realignment by seeking to ensure that the international payments situation develops satisfactorily over the short run. This would imply, according to the Report, that countries that have slack in resource utilization, large current account surpluses, and high reserves and that are projecting a near-term output growth below potential (i.e., Japan and various continental European countries), should earnestly consider the adoption

of more expansionary policies. In so far as feasible, policies of expansion in this group of countries should be so conducted as to bring down short-term interest rates. It would also be helpful to the adjustment process if US monetary policy would exert upward pressure on short-term interest rates without, however, incurring undue risks of affecting the general level of US rates to such an extent as to have a retarding effect on economic growth. Any needed restraint on the US expansion should, at least in part, come through monetary policy.

international liquidity

The Annual Report's discussion of international liquidity focuses on developments in that area during 1971 and their effect on the general problem of the adequacy of reserves. It uses SDRs as the unit of account. The main feature of developments during the period was the record growth of international reserves and particularly their foreign exchange component, far larger even than in the already exceptional year of 1970. The accrual of the equivalent of SDR 29 billion in 1971 greatly exceeded the increase of almost SDR 17 billion in 1970. The level of the foreign exchange component and hence of total reserves would have even been higher by some SDR 4.3 billion had it not been for the impact of the realignment, as certain currencies, held in reserves, mainly dollars, are deemed to have declined in value against SDRs by an estimated amount of SDR 4.7 billion and others to have appreciated by about SDR 0.4 billion.

The world's official gold holdings remained at SDR 41 billion, of which SDR 36 billion was held by national authorities, the rest by international monetary institutions which registered an increase of SDR one billion. The second allocation of special drawing rights at the beginning of 1971 added SDR 2.9 billion but reserve positions in the Fund dropped by SDR 1.3 billion in the year. Although gold, SDRs and reserves positions in the Fund comprised slightly over one half of the world's stock of international reserves at the end of 1970, those elements made very little contribution to the striking increase in the total stock that took place during 1971. The expansion was thus concentrated in the foreign exchange component which rose by SDR 29 billion, double the previous year's accrual. It marked a 66 per cent rise in current claims and brought the proportion of such claims in total reserves to 60 per cent.

The unprecedented SDR 30.5 billion US deficit on an official settlement basis added SDR 27.4 billion to US liabilities to official holders and thus to official re-

serves, only SDR 3.1 billion having been financed by the US from its holdings of reserve assets. The huge increase in official claims on the US overshadowed such developments as the SDR 1.5 billion increase in overseas sterling holdings, the SDR 0.4 billion decline in Deutsche mark claims held in Germany and the rise in aggregate reserves denominated in Deutsche mark held in the Euro-currency market.

In considerable part reflecting the overall US deficit, countries recording reserve gains far outnumbered those experiencing losses. Three fourths of some 120 countries reporting data to the Fund showed gains in gross reserves with the bulk, however, heavily concentrated in the large surplus countries discussed earlier in the Report. The increase in the combined reserve assets of 11 countries amounted to SDR 27 billion or 93 per cent of the global increase. The emphasis given to the role of a few countries, and the fact that the Reserve gains recorded by these countries virtually matched the total for the world as a whole, does not mean, says the Report, that these were the only countries with balance of payments surpluses. For the more than 100 countries reporting balance of payments data to the Fund for 1971, the aggregate amount of surpluses—for those countries that showed a surplus—was almost SDR 40 billion. On the other hand, apart from the US deficit of SDR 30 billion, other countries reported overall deficits amounting to almost SDR 2 billion, with 6 countries contributing SDR 1.4 billion to this total. The net excess of recorded surpluses over recorded deficits, amounting to some SDR 8 billion was mainly attributable to the 1971 allocation of SDR 2.9 billion and to the placement of SDR 5.4 billion in Euro-currency markets.

distribution pattern affected

The Report points out that reserve growth in 1971 was concentrated, by and large, in the same few countries that had added large amounts to their reserves in 1970, strongly affecting the total distribution pattern. The proportion of world reserves held by industrial countries, other than the US, grew from 50 per cent of the total at the end of 1969 to 63 per cent at the end of 1971, while US holdings declined from nearly 19 per cent to 10 per cent. The proportion held by the more developed primary producing countries remained constant at 10 per cent but that of the less developed countries in this group declined from nearly 21 per cent to just over 17 per cent. If the oil-producing countries are excluded from this category the decline was even more marked, i.e., from over 15 per cent to 11 per cent.

In its analysis of the adequacy of inter-

national reserves, the Annual Report observes that their rapid growth since 1969 has altered their earlier tendency toward increasing scarcity, though a precise appraisal of the degree of reserve ease achieved in 1971 is difficult to make due to the special circumstances of the period. Referring to two methods of assessing changes in reserve adequacy, the Report first compares the recent development of the supply of official reserves with the need, particularly in the light of the ratio of reserves to imports. Following an almost continuous decline in this ratio since the middle 50's, 1971 showed a substantial increase, bringing that year's ratio to a level slightly higher than that of 1968, when global reserve ease was judged less than adequate. The behaviour of the ratio of reserves to imports suggests that the degree of reserve ease has recently stopped its decline and has thereafter increased considerably. This statistical comparison leaves out of account some important factors affecting the adequacy of global reserves in the present circumstances.

special attention

The Report gives special attention to four of these factors. The first is that the degree of reserve ease over the last two years was attributable not only to the level of reserves but also to their high rate of increase. The second factor is that the major part of increase over 1970 and 1971 was highly concentrated in a few industrial countries thus reducing the significance of reserve expansion for global reserve ease because of the unevenness of its distribution. In addition, the reversible nature of at least part of the short-term capital flows associated with the reserve accruals must be regarded as a contingent charge on the reserves of those countries. Thirdly, the growing international mobility of capital may have somewhat improved countries' ability to finance balance of payments difficulties by borrowing but this is likely to have been outweighed by its effect in increasing potential balance of payments deficits. Lastly the enhanced flexibility of exchange rates, particularly under the wider margin arrangements introduced after the Smithsonian Agreement, may permit a certain economy in the use of reserves through inducing equilibrating and impeding disequilibrating short-term capital movements. It is felt, however, that the experience with wider margins—and tightened capital controls—is as yet insufficient for an assessment of the effect on the need for reserves.

The Annual Report supplements this approach, described above, by one based on the observation of manifestations of an increase in global reserve ease such as re-

duced reliance on restrictions on imports and payments; an increase in the volume or a reduction in tying of aid; reduced propensity to devalue and increased willingness towards revaluations; reduced reliance on balance of payments credits; and imposition of restrictions on capital flows. Moreover, an increase in reserve ease may induce countries to pursue somewhat more expansionary demand policies than would be appropriate in the light of domestic policy alone and a reduction of reserve ease would have the opposite effect.

outward payments

Taking these criteria one by one the Report notes only limited resort to increased use of restrictions on outward payments during the period covered. Several countries, in fact, applied measures to reduce capital inflows. Official development aid from the countries of the Development Assistance Committee declined as a percentage of GNP since the middle sixties. This decline appears to have been arrested in 1971 but most official development assistance remains subject to tying restrictions. Upward appreciations or upward floats of the exchange rates of many industrial countries since May of last year provide evidence of excessive reserve ease in these countries while the suspension of US dollar convertibility—analogueous to a downward float—and the number of devaluations by developing countries as well as the later float of the UK and a number of sterling area countries offer evidence in the opposite direction.

Reliance on balance of payments credits was reduced in the past two years as manifested also by the decline in net use of IMF credit. The divergence of countries' demand management policies from what might be regarded as optimal in the light of domestic developments, alone, is difficult to assess. Recent price movements however, do not preclude the possibility that conditions of reserve ease, where they existed, may have affected the strength of resistance against price changes. Nevertheless, failure to counteract recent inflationary development more effectively must be ascribed more to the conflict between the targets of price stability and full employment, as well as to the inadequacy of available policy instruments, than to any lack of concern, caused by a high degree of reserve ease, over the goal of price stability.

The events described earlier had a profound impact on the Fund's activities, the Report notes. Re-examination of the exchange rate structure was intensified, the conduct of the Fund's financial operations required new methods and procedures, and improvement or reform of

the international monetary system gained added urgency. The importance of progress in each of these areas was emphasized in a Resolution adopted by the Fund's Governors at the Fund's 1971 Annual Meeting. The Report reviews the Fund's actions in such areas as exchange rate and Fund financial operations which separate initial report reflecting the detailed examination by the Executive Directors of the various aspects of international monetary reform is being submitted to the Board of Governors. Earlier, July 26, the Governors had adopted a Resolution containing a proposal by Executive Directors to establish a Committee of the Board of Governors on the form of the International Monetary System and Related Issues.

The Board of Governors also approved a change in the Fund's By-Laws to provide that the accounts of the Fund's General Account be summarized in SDRs.

Reviewing exchange rate developments during the period, the Report notes that May 1972 exchange rate actions of Austria, Belgium, Germany, and the Netherlands the fairly generalized floating of currencies resulting from the suspension of dollar convertibility, the return to more orderly exchange rate relationships following the Smithsonian Agreement, the establishment of a temporary regime of central rates and wider margins, the month following the December 1971 Agreement, the Fund concurred or noted changes in the par values of the currencies of 12 member countries and non-metropolitan territories and formal took note of the establishment of 33 central rates. Other members advised the Fund that they were maintaining the par values of their currencies or that they were pegging their exchange rates with some other currency. By the end of January 1972 the Fund noted that 51 member and non-metropolitan territories were availing themselves of the wider margin under the appropriate Fund decision. The establishment of a new par value by the United States on May 8, 1972 followed by similar actions of 21 countries by the end of May is reported. On June 23, 1972, the Fund was notified that the pound sterling would, for the time being, be allowed to float and later received notifications from 17 other member countries that they had also decided to let their currencies float.

(a) Special Drawing Account

The Report observes that, notwithstanding the disturbances of the period, the mechanism of the Special Drawing Account has remained fully operative. However, the uncertainty about currency relationships and the increasing likelihood that the US dollar price for gold would be

raised created a temporary disincentive for participants to use their SDRs, the value of which is constant in terms of gold. A Fund decision of January 1972 enabled participants to obtain against SDRs amounts of foreign exchange that corresponded to the prospective change in the par value of the US dollar. Following the establishment of the new par value of the US dollar on May 8, 1972, this earlier decision was terminated.

The third and final allocation of SDRs in the first basic period was made on January 1, 1972 to 112 participants in the amount of SDR 2,952 million. The total value of all transfers during the fiscal year May 1, 1971 to April 30, 1972 amounted to SDR 1,306 million against SDR 1,213 million during the previous year. Nearly two thirds of the year's total was the result of the transfers amounting to SDR 355 million by the United States to redeem balances of US dollars from Belgium and the Netherlands and the SDR 438 million used by the United Kingdom largely in repurchase of sterling held by the General Account. Mostly as a result of the UK transaction, the General Account's holdings increased by SDR 420 million to SDR 910 million during the fiscal year.

During the fiscal year a total of SDR 540 million was transferred in the General Account, of which SDR 501 million was accounted for by members repurchasing their currencies held by that Account. The largest transaction by far was the SDR 425 million repurchased by the United Kingdom. In payment of charges the Fund received SDR 30 million, about half of the total charges paid by members during the fiscal year. In the same period, the Fund transferred SDR 120 million to participants.

next basic period

The Report also noted, that the Managing Director, in accordance with the Articles of Agreement of the Fund, informed the Executive Directors on June 26, 1972 that at that time, i.e., six months before the end of the current basic period, it was not possible for him to make a proposal with respect to the allocation of special drawing rights for the next basic period. Further discussions, including consultations with participants would be necessary before definite conclusions could be reached on the duration of the next period, on the question whether an allocation should be made, and, if so at what rate. These discussions would be pursued actively in order to enable the Managing Director to arrive as promptly as possible at a proposal consistent with the Articles.

(b) General Account

The Report notes that although the cir-

cumstances created serious difficulties for the functioning of the General Account during the fiscal year, aggregate amounts of purchases and repurchases exceeded those of the previous year, reflecting large purchases by the United States and substantial repurchases by France and the United Kingdom. Repurchases equivalent to SDR 3.1 billion were almost double those of any previous year. Total purchases by 30 members of currencies and special drawing rights from the Fund amounted to the equivalent of SDR 2 billion and for the second year in succession repurchases exceeded purchases. This brought about a reduction in members' outstanding drawings from SDR 4.1 billion on April 30, 1971, to SDR 2.9 billion on April 30, 1972, the lowest level in seven years. Moreover, purchases were concentrated in the gold tranche, and on April 30, 1972, only 28 per cent of members' indebtedness to the Fund was the result of purchases in the credit tranches. Members' creditor positions in the Fund decreased slightly, from the equivalent of SDR 1.7 billion on April 30, 1971, to SDR 1.6 billion on April 30, 1972.

The Report reviews the technical difficulties created for the General Account operations, for the period August 15, 1971 to May 8, 1972. Certain members with super gold tranche positions were reluctant to have this primary asset diminished through the use of their currency in repurchase and members with liabilities to the Fund saw advantage in their discharge. In consequence, the normal currency policy of the Fund was suspended for the time being and a special arrangement was made with three countries — Canada, France, and Germany — for their currencies to be used in transactions with the Fund to the extent of their prior use in drawings since August 15, 1971.

The realignment of December 18, 1971, did not resolve the operational problems of the Fund. While the new exchange rates of major currencies in the exchange markets expressed in terms of the US dollar reflected the latter's prospective gold value, this was not so in the Fund because a new par value for the US dollar had not been established. It became necessary to establish appropriate exchange rates in the Fund to permit transactions in currencies other than the US dollar that reflected the realigned exchange rates in the market. A January 4, 1972 decision, adopted as a temporary measure to facilitate the orderly conduct of Fund operations, enabled the Fund to adjust its holdings of a currency used in a transaction on the basis of the ratio of the representative rate for the member's currency in the exchange market to the effective parity relationship between that currency and the member's intervention cur-

rency. On May 8, 1972, following the change in the par value of the US dollar, a decision was adopted regarding rates for computations and adjustments of the Fund's holdings of currencies for which rates were not being maintained within the margins prescribed by the Articles. This decision terminated the January 4 decision.

During the year, the Executive Directors also adopted several decisions providing for wider use of SDRs held by the General Account, including one that enables participants in the Special Drawing Account to purchase SDRs from the General Account for immediate use to acquire currencies through designated transactions.

In the past fiscal year the Fund also repaid in full its outstanding indebtedness consisting of two repayments totalling SDR 274 million under the GAB and the second half of the SDR 250 million claim of Japan on the Fund which had been acquired by Japan from Italy and which was based on an earlier bilateral borrowing agreement between Italy and the Fund.

(c) Transactions and Operations in Gold

During the fiscal year the Fund received gold in a gross amount equivalent to SDR 1,139 million and disbursed gold to members in an amount equivalent to SDR 147 million of which amount SDR 121 million was sold in replenishment of its currency holdings. The amount of gold received reflected in large measure the repurchase obligations incurred in gold by members and the termination of the Fund investment in US Government securities. The Fund terminated its investment in these securities in February 1972 and reacquired an equivalent of SDR 400 million in gold from the United States. It also liquidated the general deposits of gold, equivalent to SDR 143.9 million held at the Federal Reserve Bank of New York and equivalent to SDR 25.8 million held with the Bank of England. During the period the Fund also purchased the equivalent of SDR 105 million of gold from South Africa.

(d) Distribution of Net Income and Remuneration

In October 1971 the Fund distributed SDR 12.5 million of the total net income of SDR 46.4 million over fiscal 1970-71 to 39 members, bringing net income distributed plus the remuneration of SDR 37.4 million for the same period paid earlier up to 2 per cent of net creditor positions. In May 1972, the Fund paid remuneration in the amount of SDR 30.5 million to 42 members, of which SDR 2 million was paid in special drawing rights and SDR 28.5 million in gold, at a rate of 1½ per cent of net creditor positions over the fiscal year 1971-72.

It seems to be especially

true of violence that nothing succeeds like excess. The enormity of the Munich massacre seems to have brought out the old Adam in the Israeli character. The reprisal air raids ordered by Mrs Golda Meir's government on Syria and Lebanon on September 8 serve only to endorse the argument of the Black September guerillas that the war between Zionism and the Palestinian Arabs is a truly total one to which the mores of human civilization have become irrelevant.

Since the press in the country has not given an adequate account of the havoc wrought by the Israeli jets on the civil population of the concerned Arab states during the raids of September 8, I would like to quote from a report in *The Guardian* (London) of September 11 from its correspondent in Beirut, Mr David Hirst. According to him some three hundred people, a great many of them women and children, were killed. Out of this large number of the dead, only about sixty-six were reported to be guerillas and the rest civilians many of whom were machine-gunned by low flying Israeli aircraft as they ran for cover. Mr Hirst writes: "The main question in today's Arab press, still smarting at the world's outrage over Munich, is: What does the 'civilized world' think about all this?" It cannot be said that this query has remained unanswered. A spokesman for the Secretary-General of the United Nations has said after all that Dr Waldheim deeply deplores the new breaches of the cease-fire in the Middle East. May we presume that Tel Aviv is duly impressed?

Let me not be misunderstood. I readily concede that Arab terrorists have placed themselves beyond the pale of all law. The government and the people of Israel are certainly entitled to deal with these terrorists ruthlessly on the simple ground of self-defence. What I am pointing out is that the reprisal air strikes on the people of Syria and Lebanon did not have for their targets only the guerilla bases. They destroyed, presumably by design, a very much larger number of ordinary

men, women and children than terrorists. They were, therefore, themselves in the nature of an organized act of terrorism against the civil population of the Arab states in question.

The Palestinian terrorists have resorted to terrorism against Israel because they believe that they cannot expect justice for their cause from the international community such as it is. The Israelis in their turn seem to have decided to resort to the practice of a terrorism that will end all terrorism because they have come to the conclusion that the international community — again, such as it is — is unable or unwilling or both to do anything to check guerilla activities directed against Israel.

One encouraging aspect of the global reaction of horror at the Munich massacre is that the human race does not seem to have lost entirely its capacity to be pained by or resent things evil. This is rather surprising considering that human sensibilities should have been dulled by the destruction of the Ibos in the Nigerian civil war, the slaughter of the innocents by Pakistan's military regime in its bid to suppress the Bangladesh movement and the prolonged indulgence by the Nixon administration in the mass massacre of peasant communities in the two Vietnams with the cruellest weapons or tools of warfare that a mad technology could devise. It must be noted, however, that even Vietnam may not have defined the ultimate in man's inhumanity to man. Here is a report, again from *The Guardian* (London), this time of a heart-rending incident in a hospital in darkest South Africa. Let Mr Stanley Uys, the newspaper's correspondent in Cape Town, tell the story in his own words:

"For two hours, Dr Karl Abrahamse, aged 29, a coloured South African, waited helplessly at the bedside of Mrs Caroline Amas, aged 18, at Oudtshoorn, Cape Province, unable to perform the caesarian operation she required because hospital regulations forbade him calling on the services of white staff.

"A white doctor was summoned to

perform the operation; three days later, Mrs Amas, who was also coloured, died".

Students of colleges and

technical educational institutions in the capital have been having fun hijacking buses of the public transport system in the city. The more aggressive spirits among them have also resorted to occasional arson in the course of which a number of vehicles has been destroyed. The consequential loss of property suffered by the Delhi Transport Corporation has been estimated at about Rs 10 lakhs. This is no doubt to be regretted, especially as the transport agency has been pleading that lack of funds comes in the way of its modernising or augmenting its fleet of buses. At the same time I am unable to resist entirely the thought that if only the DTC takes, so to speak, in the right spirit the violent attitude towards it or its buses of the student population in the capital, it may well be able more than to make up its loss in terms of equipment destroyed.

It cannot be denied that the users of the capital's public transport, including emphatically the student community, have been suffering grievously from the inadequacies of the transport facility. Not only years but decades have passed without the city bus transport system succeeding in meeting with reasonable efficiency the transport needs of the capital. There simply cannot be any valid reason why a city which, incidentally, is the seat of the central government, should continue to be so ill-served in the matter of public road transport.

There have been regular inquiries into the working of the Delhi transport system and the administration or the authority concerned has been organized and reorganized a number of times. Still, there has not only been no improvement but there has, in fact, been a steady deterioration in the availability of transport facilities in relation to the growth of demand.

In the circumstances, the burning of a few buses by an irate public or a section of it, however regrettable in itself, certainly has some legitimacy as a search for desperate remedies. This is why I believe that if the arsonists could only be successful in putting the fear of God into the DTC and compel it to attend to its efficiency, the Rs 10-lakh loss will not only be more than made up but the DTC may well be on its way to becoming a viable and worthwhile public utility.

MOVING FINGER

TRADE WINDS

Bonus Report

THE BONUS Review Committee unanimously recommended enhancement of the present minimum bonus of four per cent to 8.33 per cent in all industrial establishments making profit. However, representatives of the workers and the employers have sharply differed over the quantum of bonus to be paid by establishments that are losing. The former wanted payment of 8.33 per cent the same as for profit making concerns, while the employers would agree only to an increase of one per cent from four to five per cent. Two separate reports, one signed by the Chairman of the Committee, Mr B.K. Madan, two employers' representatives and an independent member, and the other by representatives of the AITUC, HMS and INTUC and a public sector spokesman, were presented to the Labour Secretary. The two sides also differed on whether workers of departmental undertakings such as Railways and Posts and Telegraphs should be covered by the present recommendation. The employers' representatives did not favour this. On another question, namely, extending the bonus formula to public sector industries too, the employers' representatives did not support the idea on the ground that it need not be considered at this stage. Despite these disagreements, the two sides were agreed on the basic premise that the concept of bonus was not related to productivity or production.

Central Board of Reserve Bank

The union government has appointed four new Directors to the Central Board of the Reserve Bank of India. They are: Mr M.P. Chitale, Char-

tered Accountant; Dr K. Kanungo, Dean and Joint Director, Indian Agricultural Research Institute; Dr V. Kurien, General Manager, Kaira District Co-operative Milk Producers Union, Anand, Gujarat, and Dr G. Parthasarathy, Vice Chancellor, Jawaharlal Nehru University, New Delhi.

Import of Steel

Engineering Association of India (EAI) in a communication to the Ministry of Foreign Trade has expressed its apprehension about the effects which import policy for steel would have on large export of engineering goods from this country. The Association considered that procedure outlined was so cumbersome and time consuming that the advantage which the government thought would accrue to the industry out of speedy disposal of applications for import licences would be nullified. The Associations has therefore, suggested appointment of a small committee consisting of the officers of the Engineering Export Promotion Council, the Directorate General of Technical Development and the Iron & Steel Control, to meet fortnightly to dispose of applications received. Such meetings could be held alternatively at New Delhi and Calcutta. On the recommendation of such meetings duplicate certificates should be issued to the applicant for making his application to the CCI copies of which could be sent to the HSL who should proceed to arrange for import without waiting for actual release orders from the office of the CCI & E.

TRISTAR

Recently newsmen of the capital, along with some offi-

cials of Air India, IAC, the Civil Aviation Ministry and members of the diplomatic corps, were taken on a demonstration flight by Lockheed Aircraft Corporation on their L-1011 'TRISTAR', which they described as 'quickest wide bodied transport'. The manufacturers emphasised the low noise produced by the Rolls Royce RB-211 engines, reduced pollution and the automatic landing system. According to Mr J.A. Rigg, the Financial Director of the company, the engines were designed to consume 25 per cent less of fuel than other jetliners.

The manufacturers stated that the aircraft had already about 80 demonstration flights in about 17 countries. According to them, the Indian Air lines may consider to add it to their fleet, since it will be economical to have them for domestic flights, and it is certainly a comfortable aircraft. Introduction of TRISTAR with a seating capacity of between 350 to 400, on domestic routes will no doubt ease the situation at booking offices.

Inside the aircraft, the first class has six-abreast seating arrangements while the economy class has eight-abreast seating system. There are two aisles and one has not to cross more than one seat while taking one's own seat. The aircraft could accommodate 400 passengers in comfort and is claimed to be a "passenger-oriented aircraft".

India-Ethiopia Air Talks

Talks between the union government and the Imperial Ethiopian government regarding air transport matters were held recently in New Delhi. The six-member Ethiopian delegation was led by Mr Gatachew Bekele, Minister of State, Ministry of Communication, and the seven-member Indian delegation was led by Mr N. Sahgal, Secretary, Ministry of Tourism and Civil Aviation. Presently, the Ethiopian Airlines are operating two weekly services terminating at Bombay while Air India are operating once a week service transiting Addis Ababa. Apart from Mr Gatachew

Bekele, Ethiopian delegation included Mr Gatachew Mekasha, Ethiopian Ambassador to India; Mr Hailu Alemayehu, Administrator, Civil Aviation Administration; Mr Gad Gebrekristos, Dy. Administrator, Civil Aviation Administration; Mr Hailu Molla, Director, International Affairs (Ethiopian Airlines) and Mr Haddis Zeggai, Manager, India and Far East Ethiopian Airlines.

Trade with East Europe

A two day national Seminar on Trade with East Europe will be held here in the first week of December 1972 under the auspices of Ministry of Foreign Trade on the occasion of 'ASIA 72' Fair. The Seminar which is being organised by the National Alliance of Young Entrepreneurs (ANYE) will be attended by more than 200 delegates representing governmental, non-governmental, and private institutions. A Preparatory Committee has been constituted under the Chairmanship of Mr S. Than, Joint Secretary, Ministry of Foreign Trade. Dr (Mrs) S. Chishti, Professor, Indian Institute of Foreign Trade has been appointed Director of the Seminar. The Seminar will apply its mind to the question of devising ways and means of increasing the volume of trade with the East European countries. The Seminar will also highlight the need to accelerate the economic ties between India and East Europe and to strengthen friendship and co-operation with these countries.

World Package Award

A presentation pack for WIMCO matches, designed, printed and manufactured by The Metal Box Company of India Limited, has won the Worldstar '72 contest, recently held at Tokyo. This is the first time an Indian entry won the coveted world award. The Worldstar '72 has been instituted by the World Packaging Organisation consisting of the Packaging Federations in Asia, Europe and North America. 16 nations from all over the world had entered 21 packages, including

VOLTAS

If you are in the market for quality machine tools then Voltas can tell you all about Praga.

As a leading distributor of machine tools in India, Voltas is vitally interested in the progress of the machine tool industry and is well-placed to understand the needs of the buyer. That is why Praga chose Voltas to market their machines —

- 1) The Praga-Jones & Shipman 540 Precision Surface Grinders.
- 2) The Praga Cutter and Tool Grinders.
- 3) The Praga 137 Column Drilling Machines.
- 4) The Praga-Gambin Milling

Machines. 5) The Praga/ + GF + Copying Lathes. Complete technical details of all these machines are available with the Machine Tool Division of Voltas. Its country-wide sales and service organisation is fully geared to supply, install and service Praga's sophisticated machine tools wherever you want them. An unbeatable combination—Praga quality machine tools, distributed and serviced by Voltas.

For Precision Machine Tools the name is **Praga**

two from India, for the awards. Of these, 11 won the awards. The judging took place at the Imperial Hotel, Tokyo, Japan. The awards were to be presented on the occasion of Worldpack-Tokyopack 1972 which was to follow the Second World Packaging Congress in September, 1972, at Tokyo. Countries receiving the awards are: USA, Japan, Australia, France, Sweden, W. Germany, Netherlands, Switzerland and India.

Sub-contracting Exchange

The industrial sub-contracting exchange which the government of West Bengal propose to set up with Central assistance would be set off in motion in the first week of November. This was stated by Mr N.K. Biswas, Secretary to the Department of Commerce and Industries, West Bengal, when addressing the annual meeting of the foundry division of the Indian Engineering Association in Calcutta recently. Mr Biswas explained that the sub-contracting exchange would not only allow the farming out of orders to the small-scale units but he felt that the information stored in the exchange could also be used for purposes of international trade and also assist in framing a definite policy for promotion of small units as ancillaries to large scale manufacturers.

Mr S.K. Neogi, the Divisional Chairman stated at the meeting that where the pig iron supplies in the required grades had been irregular, the situation in the last few months had shown a marked improvement. Of course, Mr Neogi added this should not give cause for complacency as major industrial projects coming up would require various types of light and heavy cast items. Another important raw material was ferro silicon and, Mr Neogi informed the meeting of the successful way in which the division had taken up this subject with the government of India; was a result of concerted efforts, the rise in ferro silicon prices had been checked and had reverted to the

October 1970 level. Scrap availability, mainly of the heavy melting type, was very unsatisfactory according to Mr Neogi, with indiscriminate price increases and irregular collection and distribution procedures.

Colombo Plan Meet

"Brain Drain" from developing countries will be a special topic of discussion when the Consultative Committee of the Colombo Plan meets here next month for its 22nd annual session. The meeting, which opens on October 30, will last until November 8. The Consultative Committee, which is the top policy-making body consisting of ministers of member governments, will review the economic progress made by the South and South-East Asian region and will prepare a report setting out major issues and problems confronting member-nations. The Colombo Plan has 24 members. They are: Afghanistan, Australia, Bhutan, Burma, Cambodia, Canada, India, Indonesia, Iran, Japan, Republic of Korea, Laos, Malaysia, Republic of Maldives, Nepal, New Zealand, Pakistan, Philippines, Singapore, Sri Lanka, Thailand, United Kingdom, United States of America and Republic of Vietnam. More than 150 delegates from these countries are expected to attend the meeting. In addition, there will be observers from the governments of Fiji and the Federal Republic of Germany and also from international agencies such as FAO, UNESCO and the World Bank.

Credit for Tea Gardens

The Reserve Bank has communicated to the commercial banks and the state financial corporations to try to ensure adequate flow of development capital to the tea industry. Lead banks in the tea growing districts are required to help tea gardens. The banks and the SFCs will singly or in consortiums provide development loans for terms "long enough to suit the repayment capacity of the assisted unit, wherever there is considerable time lag between the outlay and its

fruition", the Reserve Bank has told the banks and the SFCs. They will get refinance from the Agricultural Re-nance Corporation. The lenders have the discretion to provide a moratorium on repayment of principal for five years with respect to plantation loans. In "exceptional, deserving" cases, a moratorium on interest may be considered. No interest rate concession is to be given, the Reserve Bank has told the banks.

Shipping Conference

An All India Shipping and Shipbuilding Conference will be held in Calcutta for three days beginning from January 22, 1973. The seventh conference is being organised jointly by the Institute of Marine Engineering, the Society of Naval Architecture and Marine Engineering, the Indian Institute of Technology, Kharagpur and the Institute of Marine Technologists. The conference will be attended by delegates from various countries.

Upasi Conference

The seventy-ninth annual conference of the United Planters' Association of Southern India was inaugurated by Mr R.K. Khadilkar, Minister for Labour & Rehabilitation, at Coonoor recently. Dr Colvin R. de Silva, Sri Lanka's Minister for Plantation Industries also attended the meet. The Conference was preceded by a scientific conference and a Seminar on Management Development in Plantations.

Automobile Convention

The Federation of Automobile Dealers Associations will be holding a convention of all-India automobile dealers in New Delhi on November 18 and 19, 1972. The convention will be inaugurated by Mr C. Subramaniam, Minister of Industrial Development, Science and Technology. The Convention the first of its kind to be sponsored by the Federation, will discuss various problems before automobile dealers in the country and will strive to achieve various ob-

jectives for the benefit of everyone concerned in the automobile trade and industry and the consuming public. The main objective of the convention is to project the right image of the automobile dealers before the government and the public.

New Airlines

Malaysia-Singapore Airlines (MSA), the jointly owned international and regional carrier of the Republic of Singapore and the Federation of Malaysia, will go out of business on October 1. But there will be no interruption of service over its routes. In its place, Singapore's new flag carrier, Singapore Airlines (SIA) will take over MSA's international routes and the Malaysian Airline System (MAS) will continue to serve cities in West and East Malaysia, as well as Hong Kong and Bangkok. The original predecessor carrier, Malayan Airways, was formed in 1947 as a domestic airline. By the end of 1972, Singapore Airlines will be operating eight Boeing 707s and five 737s to 26 cities in 19 countries. When it starts to fly under the Singapore colour in October, SIA will be serving London, Rome, Bahrain, Bombay, Colombo, Athens, Zurich, Frankfurt, Osaka, Tokyo, Taipei, Hong Kong, Bangkok, Singapore, Jakarta, Bali, Perth, Melbourne, Sydney, Saigon, Manila, and Brunei. SIA is also investigating the possibilities of trans-Pacific routes to the US. From MSA, Singapore Airlines will inherit (in addition to the Boeing fleet) a majority of the present line's 6,300 member staff and a sophisticated computer reservation system.

SIA's chairman, Mr J.Y.M. Pillay, has already announced plans for increasing the number of flights on several routes. By December, SIA expects to have five flights a week from Singapore to London, two a week to Zurich, daily service to Osaka and Hong Kong, and ten flights a week to Australia. The new line's colours will be a rich yellow and midnight blue and its logotype will

be a stylized bird in flight.

Literacy Award

UNESCO has awarded the Mohammad Reza Shah Pahlavi Prize for 1972 to the movement 'Gram Shikshan Mohim' (Village Literacy Campaign) of the government of Maharashtra for its meritorious work

in the field of eradication of illiteracy at a ceremony in Paris on September 6. The UNESCO prize was started in 1967. The purpose of this prize is to reward the services of institutions, organisations or individuals displaying outstanding merit and achieving success in contributing to the

fight against illiteracy. Since the initiation of this prize it is the first time that this prize has been awarded to a movement in India. Gram Shikshan Mohim of Maharashtra represents a new approach to the problem of eradication of illiteracy in the sense that a village educates itself by its own efforts.

Names in the News

Mr Q.L. Wood has been elected Finance Director of Goodyear India, at the annual general meeting of the company held at Calcutta recently. Mr Wood came to India about three months back and works as Chief Financial Officer of Delhi head office.

**The Cat
is out of
the Bag!**

No secrets about our ability to serve you promptly where paper and flexible packaging are concerned. We make paper and laminates. Convert foil. And we have complete control over every stage of manufacture. Paper, blocks, cylinders, the actual printing and conversion.

We also offer these services: printing, artwork, cylinder and block-making.

Paper Products is an example of an entirely Indian enterprise, small enough to give individual attention to every customer. With our new plants and sales offices all over the country we offer you speedy service.

Remember, ready stocks of paper in all sizes, for sale and processing, available any time at all our 15 sales offices.

COMPANY AFFAIRS

Orient Paper

THE IMPRESSIVE improvements in working results have encouraged the directors of Orient Paper Mills Ltd to enhance equity dividend substantially to 20 per cent for the year ended March 31, 1972 from 11.5 per cent declared for 1970-71. The dividends on the two categories of preference shares are also being paid at the stipulated rates for the year. The dividends will be exempt from tax under section 80 K of the Income Tax Act 1961. However tax will have to be deducted if necessary certificate is not received by the company before the payment of the dividends. According to the preliminary statement of accounts company has earned during 1971-72 a net profit of Rs 2.28 crores after appropriating Rs 1.91 crores to depreciation reserve, Rs 15 lakhs for development rebate reserve, and Rs 3.30 crores for taxation. No provision, however, has been made for gratuity. The net profit in 1970-71 amounted to Rs 2.35 crores after providing Rs 2.11 crores for depreciation, Rs 55 lakhs for development rebate reserve, Rs 1.20 crores for taxation and Rs 1.43 crores for gratuity. Writing back Rs 3.72 lakhs being the previous year's credit allowance and transferring Rs 9.75 lakhs against nil from development rebate reserve, a sum of Rs 1.46 crores has been credited to general reserve as against no allocation in the preceding year while dividend equalisation reserve was allotted with Rs 89.08 lakhs as compared to Rs 56.63 lakhs in 1970-71. In the previous year a sum of one crore rupees was earmarked for research and development reserve while a sum of Rs 75 lakhs was provided for repairs and renewals. A balance of

Rs 5.70 lakhs has been carried forward to next year's account.

Delhi Cloth

The board of directors of Delhi Cloth and General Mills have decided to pay a final equity dividend of five per cent for the year ended June 30, 1972. This together with the interim makes a total of 10 per cent for the year, the same as in 1970-71. Although the total dividend is being maintained at 10 per cent the actual benefit accruing to shareholders will be larger as 95 per cent of the dividend is expected to be exempt from tax under section 80 K of the Income Tax Act 1961. According to the preliminary figures, DCM has earned during 1971-72 a substantially higher gross profit of Rs 15.91 crores as compared to Rs 13.07 crores in 1970-71. Out of this the directors have allocated a sum of Rs 6.35 crores to depreciation, Rs 1.14 crores to development rebate reserve, and Rs 5.20 crores towards tax liabilities as against Rs 5.70 crores, Rs 21.07 lakhs and Rs 90 lakhs provided respectively in 1970-71. This leaves a surplus of Rs 3.21 crores as compared to Rs 6.26 crores in the previous year. The company has already paid Rs 87.01 lakhs as interim dividend. The balance of Rs 2.34 crores is being transferred to the general reserve out of which the final dividend would be paid.

Mohan Meakin

Although sales of Mohan Meakin Breweries Ltd. have spurted to Rs 21.14 crores during the year ended March 31, 1972 from Rs 17.98 crores in the preceding year gross profit has inched up to Rs 2.61 crores from Rs 2.57 crores in 1970-71. The profit might

have been substantially higher but for the loss in output in its Lucknow distillery worth Rs 11.5 lakhs on account of floods in the Gomti river and all-round rise in cost of production. The directors have, however, stepped up the dividend to 11 per cent from 10 per cent paid for 1970-71. Out of the gross profit the directors have appropriated during the year under review, a sum of Rs 58.20 lakhs to depreciation reserve, to Rs 4.60 lakhs to development rebate reserve and Rs 1.36 crores to taxation as against Rs 52.04 lakhs, Rs 3 lakhs and Rs 1.26 crores provided respectively in the previous year. After taking credit for some provisions no longer required general reserve was allotted with Rs 81.61 lakhs as compared to Rs 67.97 lakhs in 1970-71. The proposed dividend will claim Rs 46.80 lakhs, Rs 4.26 lakhs more than in 1970-71.

In view of the increased demand for its products, the company has decided to set up a distillery at Solan. The new unit is scheduled to go into production sometime next year. The cold storage at Mohangram in Punjab has started functioning and the ice factory in the same area is also in operation since April. Mysore Fruit Products Ltd., a subsidiary of the company, however, remained closed during the year. Efforts are being made to secure a licence for the manufacture of Indian-made foreign liquor and for allocation of reasonable quota of raw material such as molasses so that the factory might resume operations.

Swadeshi Cotton

Swadeshi Cotton Mills has suffered a further marked setback in its working during the

year ended March 31, 1972. Despite an increase of about 50 per cent in turnover from Rs 20.33 crores to Rs 31.04 crores, gross profit has declined to Rs 43.87 lakhs from Rs 48.59 lakhs in 1970-71. Hence no dividend on ordinary shares has been declared for 1971-72. The disappointing performance for the year is attributed to all-round rise in cost of production and labour unrest. The new textile mill at Rae Bareilly is expected to go on stream by the end of the current year. The company has promoted a new enterprise styled 'Swadeshi Fabrics Ltd.' for the manufacture of knitted fabrics with foreign collaboration. The company has spent during the year Rs 38.85 lakhs on modernisation, renovation and expansion and contracts aggregating Rs 20.48 lakhs remained to be executed at the end of the year. Meanwhile the company has received further orders, to the tune of Rs 1.20 crores. In spite of further increase in wages, imposition of 25 per cent power cut and the voluntary price control on staple fibre yarn the working results for the current year are expected to be reasonably satisfactory.

Rathi Alloys

Rathi Alloys and Steel Ltd has reported a gross profit of Rs 29.5 lakhs for the year ended June 30, 1972 out of which a sum of Rs 7.1 lakhs has been provided for depreciation and Rs 17.3 lakhs for development rebate reserve. After writing off Rs 78,812 towards the loss brought forward from the previous year the balance of Rs 4.3 lakhs has been transferred to general reserve. The company is working quite satisfactorily in spite of frequent electric trippings, steep rise in the cost of steel scrap and refractories. During the year one furnace has worked more than nine months and the other furnace for three months. As such the year commencing from July 1, 1972 will be the first year when both the furnaces of the factory will be in production for a complete year. The company has on hand a number expansion programmes. It includes

the setting up of a 10-ton electric arc furnace (which has already gone into production), a twin-strand continuous casting machine and a 20" cogging mill meant for producing billets from big-size ingots. The installation of the continuous casting machine will be delayed as the import licence is still being awaited. The erection of the cogging mill will also be behind schedule due to various difficulties, but it is expected to go on stream in November-December 1972. To have strict quality control, a modern and fully equipped laboratory has been set up. The company is also planning to diversify its production and proposes to manufacture light structural sections such as angles, channels, joists and re-rolled sections including that of special steels and alloy steel. The expansion and diversification are expected to improve further the profitability of the company. The directors hope to fulfil their commitment of paying dividend for the year commencing from July 1, 1972.

Devidayal

Devidayal Cable Industries Ltd will henceforth be known as Devidayal Electronics and Wires Ltd. A special resolution to this effect was adopted by the shareholders at an extraordinary general meeting of the company held recently. The board of directors have thought of the change in name in view of the diversification of its activities into the electronics field. The company is putting up a separate plant at Bangalore where it will be manufacturing 3000 electronic desk calculators and 30,000 tape recorders. This plant is expected to go on stream by the middle of next year and attain full production in 1974 when the turnover will be of the order of Rs 4 crores a year. The working of the company during the current year so far is very satisfactory. Its sales in the first eight months of the current year is appreciably higher at Rs 4.20 crores as compared to Rs 3.13 crores in the same period of last year. It hopes to achieve a turn over of Rs 6.25 crores for 1972 as against

Rs 5.26 crores for the previous year. The company's gross profit for the first half of 1972 is however, slightly lower at Rs 23.07 lakhs as compared to Rs 23.57 lakhs in the similar period of last year. The fall in profitability is attributed to sluggish demand for steel wires, higher bonus to workers and the canalisation of copper, the basic raw material — through the MMTC which had increased the price arbitrarily.

Larsen and Toubro

For the first time Indian industry can have "off the shelf indigenous contactors" rated 300 A. Developed and tested by Larsen & Toubro Ltd, these contactors are suitable for motors up to 225 HP (168 Kw) for AC 3 duty. Designated ML 12, these are the only contactors in the country specially designed to take the larger aluminium cables. This is a distinct advantage since Indian cable industry has now switched over to aluminium due to the acute scarcity of copper. The L & T now offers the widest range of contactors in India with ratings from 10 A to 300 A. Scores of design engineers backed by sophisticated research and testing facilities have taken three years to develop the present range of contactors. In the process they have taken into account indigenous needs and conditions through sustained feedback from users, dealers and L & T's own field staff. The development of the larger rated contactors, ML 12 and ML 8 (125A) marks yet another step forward towards import substitution.

News and Notes

Expansion and diversification

Punalur Paper Mills Ltd has undertaken an expansion programme to increase the capacity of paper and pulp production from 12,500 tonnes to 33,000 tonnes per annum. The capital outlay on the project will be of the order of Rs 6.05 crores. The company will raise a part of the finance required for the implementation of this project by a public issue and also by arranging long-term foreign exchange loans. A sum of Rs

2.28 crores will also be raised from internal sources to finance the scheme. According to current indications the company will be offering to the public for subscription equity capital worth Rs 1.02 crores in shares of Rs 10 each and Rs 50 lakhs in preference shares of Rs 100 each. The company hopes to maintain the dividend of 10 per cent on the increased capital after the proposed issue of capital.

Kanoria Chemicals and Industries has obtained industrial and import licences to expand annual capacities of caustic soda by 12,000 tonnes, chlorine gas by 10,641 tonnes, liquid chlorine by 7,250 tonnes and hydrochloric acid by 5,505 tonnes. The ICICI has sanctioned for the proposed expansion a loan in US currency equivalent to Rs 58.60 lakhs. The company also holds a letter of intent to double the capacity of the BHC plant to 6,000 tonnes per year and is awaiting an industrial licence. The company has submitted to the union government proposals for foreign collaboration for the manufacture of methyl methacrylate monomer, polymer and toluene di-isocyanate for which it has letters of intent.

New Issues

Bata Shoe Company Ltd proposes to raise additional capital by offering to the public for subscription 5,00,000 equity shares of Rs 10 each at a premium of Rs 30 per share. According to present indications a sum of Rs 10 per share — Rs 2.50 on capital account and Rs 7.50 on premium account — has to be paid on application, a similar amount on allotment of shares, and the balance in two instalments. The new shares will rank for dividend for the year ending December 1973. This public issue is being made in view of the government's directive to the company to dilute its foreign shareholding through the sale of a part of the existing shareholders holdings and by issuing shares to Indian nationals. The company, accordingly, has agreed to introduce Indian participa-

tion in its capital and the government has granted its approval to the company for the sale of five lakh shares by its foreign shareholders to LIC and UTI and for further issue of five lakhs shares to the Indian public. The company produces at present 45 million pairs of footwear and provides employment to about 22,000 people in its factories, offices and sales network. The company is also a leading exporter of footwear earning foreign exchange worth Rs 4.5 crores a year. During 1970 and 1971 the company's business and profitability suffered due to factors beyond the control of the management such as labour trouble, a strike at Bata-nagar and Faridabad factories and floods in Bihar. The trend in regard to the company's working, in the first half of 1972, however, is reported to be very encouraging. It is therefore hoped that barring unforeseen circumstances the company might be in a position to pay a dividend of not less than 30 per cent on the increased capital.

Indian Dairy Entrepreneurs Agricultural Company Ltd is setting up a giant agro-industrial complex in Rajasthan for diverse purposes such as raising of dairy cattle, for producing of several high-yielding varieties of commercial and food crops, establishing a milk plant to manufacture milk food, butter and cheese and also a feed mill to compound balanced cattle feed. The company has already received a letter of intent to produce annually 2,500 tonnes of infant milk food, 3,000 tonnes of sweetened condensed milk, 1,500 tonnes of whole milk powder and 500 tonnes of processed cheese. The plant will be located near Raniwada in Jalore district. The local residents have offered to subscribe Rs 5 lakhs to the company's share capital.

The company has an authorised capital of Rs one crore — Rs 80 lakhs in equity shares and Rs 20 lakhs in preference capital. To raise part of the finance required for the implementation of the scheme the company will be entering the capital market towards the

end of this year with a public issue of Rs 64.14 lakhs consisting of Rs 45 lakhs in equity shares and Rs 19.14 lakhs in preference shares. The total capital requirements, including short-term working capital, is estimated at Rs 288 lakhs. Term loans and short-term borrowings have been arranged through banks and financial institutions.

Anil Steel and Industries Ltd promoted by Mr S.N. Khaitan in technical collaboration with Hesch Werke, Hohenlimburg-Schwerte AG; of West Germany is entering the capital market on September 28 with a public issue of Rs 47 lakhs comprising Rs 32 lakhs worth of equity shares of Rs 10 each and Rs 15 lakhs in redeemable cumulative preference shares of Rs 100 each carrying a dividend of 9.5 per cent per annum. The subscription list for this fully underwritten issue will close on October 10 or earlier but not before October 3. The company's plant located at Kanakpura, near Jaipur, is claimed to be the only unit of its kind

in India and also in South-east Asia. The plant being designed to manufacture hardened and tempered steel by continuous process. These are presently being imported and is mainly used in metal and wood working industries, automobile and other industries. When the plant goes into production it will result in saving of foreign exchange to the tune of Rs 60 lakhs a year. The company holds an industrial licence for an annual capacity of 3,600 tonnes. Initially the company will start with a production of 2,400 tonnes. The plant is expected to start trial runs in the third quarter of 1973 and attain commercial production early in 1974. When it will have a turnover of Rs 3 crores. The promoters are confident of paying a reasonable dividend of 10 to 12 per cent from the second year of its operation out of the profits earned in 1974-75. The capital outlay on the project is estimated at Rs 222.02 lakhs.

Indo Solex's issue has met with a very good response from the public. On persistent

demand from sharebrokers and under-writers the board of directors have decided to keep the list open till September 20. The company offered for public subscription 115,000 equity shares of Rs 10 each at par, the list for which opened on September 11.

Interim Dividends

Amar Dye-Chem Ltd: proposes to maintain the interim equity dividend for 1972 at Rs six a share. The company paid a total equity dividend of Rs 12 for 1971 as against Rs 14 for the previous year.

The Titagur Paper Mill Company Ltd has declared an interim dividend on 'A' and 'B' ordinary shares at the rate of Rs 0.40 per share for the year ending March 31, 1973

Readers' Roundtable

What Ails LIC?

SIR, The Life Insurance Corporation of India is celebrating a "personalised servicing week" from September 1. It is ironical that what should be given to the policy holders on every working day of the year is sought to be given only through a special week!

LIC, being a state monopoly which is perhaps the worst form of economic organisation so far as consumers are concerned, is callous to the interests of policy holders.

For 10 years, I had been paying the premium on my policy 3 to 4 weeks in advance of the due date. This year also I did the same but owing to a technical flaw in the cheque it was returned by the Bank to LIC about 25 days prior to the due date of the premium. Yet I received a letter from LIC 65 days after the premium due date asking me to give a fresh cheque for premium as also the interest on the premium for late payment! My protests that I was not to be penalised to pay interest for the inefficiency of LIC was of no avail. Nor was my request to return the first cheque honoured.

Finally, I had to send a letter to the Chairman drawing his attention to Clause 6 (3) of the Life Insurance Corporation of India Act, which enjoins on LIC an obligation to act "on business principles which it had not done, and pointing out that the cheque being an instrument of credit LIC's refusal to return my first cheque, to which it no longer held a title, was improper.

As a result of this letter "a special case" interest was waived and the first cheque was returned.

There is an urgent need for the LIC management to look into some of its 'archaic' procedures and practices which result in harassment to policy holders. Also, it should consider whether adequate powers have been delegated to its so-called "managers", who seem to be impotent to effectively deal with even routine matters, except on the directive of its Chairman.

Perhaps, it is the stimulus competition alone which will set LIC right.

Bombay Yours etc
Sept. 14, 1972 (D.B. Kotia)

COMPANY MEETING

SIMCO METERS LIMITED

Meter Factory Road, Tiruchirapalli-20

Chairman's speech delivered by Sri S. Narayanaswamy, MLC, at the 11th Annual General Meeting of the Company held at Tiruchirapalli on 16th September, 1972.

Friends,

I have pleasure in extending to all of you a cordial welcome to the Eleventh Annual General Meeting of the Company. The Report and Accounts for the year ended 31st March, 1972, have been circulated to you already and I dare say you have perused the contents with interest. I request your permission to take them as read.

Sri S. Narayanaswamy, MLC

I think it is important to highlight some features about the Company's operations during the year under review, mainly as indicative of future trends in the market for both our conventional production of energy meters and for materials covered by our diversification.

Our sales during the year totalled Rs. 149.70 lakhs as against Rs. 127.20 lakhs in the preceding year. The net profit for the year before taxation but after providing depreciation was Rs. 20.15 lakhs as against Rs. 13.68 lakhs in the preceding year. The major difference between last year and this year is, that our profits have begun for the first time to attract taxation. Provision for taxation is as much as Rs. 8.72 lakhs, which has substantially slashed the

amount available for making allocations. The previous years' profits were not subject to any such deduction.

Members will remember that last year it was possible to transfer to outlay on Research and Development a sum of Rs. 6.46 lakhs while during the current year, the additions we could make under this head amounted only to Rs. 2.09 lakhs.

Another major outgoing out of the company's revenues is a sum of Rs. 6 lakhs, paid by the Company towards excise duty on energy meters, which we are taking every possible step to recover from the purchasing Electricity Boards. It is correct to add that the Electricity Boards concerned are strenuously resisting this claim, on the ground that they had contracted to buy these meters on a 'firm price' basis. The terms of sale, however, spell out quite categorically that the sale price agreed upon, is exclusive of any duties or levies such as may be imposed later by the Central or the State Governments. It is my sincere hope that it would be possible to arrive at a satisfactory settlement with the concerned Electricity Boards on this question of recovery of excise duty.

The Company has initiated a Life Insurance-cum-Gratuity Scheme in consultation with the Life Insurance Corporation of India, which will greatly benefit the employees. The initial outgoing under this head is Rs. 1.10 lakhs.

I now come to the Company's operations during the year under review. The company's manufacturing programme was greatly influenced by the fluctuations in the ways-and-means, position of Electricity Boards, rather than the quantum of orders placed by

these Boards on the company.

In the first half of the year under review, the total sales were as high as Rs. 110 lakhs, while the sales in the second half amounted to Rs. 40 lakhs only. The Company had manufactured 20,000 meters towards the end of last year, which we were not in a position to deliver for want of one component, which arrived after the expiry of the financial year. This obliged us to complete the delivery of these 20,000 meters only in the first half of the year under review. This had the effect of swelling the sales figure in the first half of the year. This is, however, quite independent of the fact that during the period the company was able to maintain a record production of 10,000 polyphase meters per month, resulting in our aggregate production for the first half year being over 60,000 meters.

But, the company had less luck in the second half of the year, in that despatch instructions were withdrawn by the concerned Electricity Boards, presumably on grounds of financial stringency. Consequently our production of polyphase meters had to be cut back to an average of 4,000 nos. per month. I am sorry to say that this unsatisfactory position has spilt over to the new year.

This unexpected under-utilisation of the installed capacity by the company, compelled the Management to disengage the services of contract labourers numbering over 150 during the second half of the year. The company had also a brief lock-out in October, 1971, in the wake of an illegal strike, which was followed by intimidation and violence. These compelled the company to take disciplinary action against a small number of workers.

The findings of an independent investigating officer held 14 workers guilty of indiscipline and gross misconduct and the company served notices of termination of services on these 14 workers. The serving of these notices was again followed by intimidatory activity by the aggrieved workers and the company was obliged to declare a lockout onwards of 21st July, 1972.

It will thus be seen that your Board of Directors has been compelled to proceed cautiously with regard to the Company's manufacturing programme, notwithstanding the fairly heavy orders booked. It is my hope that the present labour situation will terminate early and normal production will be resumed, within the next few weeks.

There has been a steep increase in the cost of production during the year under review, by levy of excise duties, on many components like screws, bolts and nuts, which are used copiously in meter production. The Indo Pakistan war resulted in the levy of surcharges on several duties, which further escalated the cost of intermediate materials. The withdrawal of excise duty concessions on many essential raw materials like copper, has also increased the cost of production. As you will appreciate, it is not possible to pass on such escalations in the cost of production caused by increase in cost of components to the consumers, with whom we have firm contracts for supply of manufactured goods.

I would now like to draw your attention to the activities of the Scientific Research Centre. The particulars of what the Centre has done are given in the Directors' Report under the heading Scientific Research.

I am glad to state that the pace of research on the whole Power Factor Range Meter was kept up during the year and a complete range meter was developed and bench tests were conducted. As a result of these research activities it was possible for the Centre to develop another version of the whole Range Meter called "Two

Part Tariff Meter" incorporating the KWH as well as KVA Meters with Maximum Demand Indication on both. I am glad to state that the above meter has found satisfactory acceptability among the Electricity Boards.

In the last year's address I have mentioned about the development of a Die Cast Meter. This has since been developed and bench trials are on and as soon as the trials are over the company has proposed to produce a few prototypes in the current year to conduct complete trials to meet all the aspects of various specifications. This would enable us to bring out new generation of energy measuring meters into production some time later over a period of next 12 months after the completion of the trials.

I am glad to report that the team of engineers in the Scientific Research Centre has further developed two indigenous versions of complete Maximum Demand Meters and these are undergoing bench trials which are likely to be completed over a period of next six months.

Simultaneously the Research Centre has undertaken refinement work on the hysteresis motor and it is expected to take a further significant step towards import substitution in the manufacture of Maximum Demand Registers.

In the field of electronic components a newly designed miniaturised version of the polyethylene variable capacitor is expected to expand our market for this material.

We have added a few more important items of equipment to meet the needs of the Scientific Research Centre and we have a comprehensive programme to develop an All-Electronic Energy Meter over a period of a year or so.

With the experience acquired during the short-period of the establishment of the Scientific Research Centre we have inducted top class electronic engineers to assist the Chief Executive and to work on

individual projects so as to produce speedy results.

We are now on the threshold of the Fifth Five-Year Plan. This is expected to spell out a massive programme of electricity generation and distribution, such as would rectify the present position of acute shortage of electric power felt all-over India. The accent on rural electrification is likely to be increased. There is, therefore, every reason to expect that, there will be less fitful and more evenly spread out investment of funds allocated to Electricity Boards. That should ensure a freer flow of orders and a more predictable resources position with these statutory bodies. This should, in turn, enable us to keep our operations on an even keel, such as we have failed to do in the year under review.

I, therefore, look forward to the future of the Company with reasonable confidence.

Before concluding I would like to take this opportunity of placing on record our deep appreciation of the splendid work done by the Managing Director, Sri R. Subbarayan and I would also like to say how grateful we are to Sri S. Ranganathan, our Chief Executive for the fine work put in by him and to all his colleagues at the supervisory level and all ranks of workers and staff for their dedicated work during the year.

I would also like to place on record our deep sense of gratitude to our bankers, Messrs. United Commercial Bank and Kumbakonam City Union Bank Ltd., for the sustained support and assistance extended by them during the year under review.

Friends, I thank you for your forbearance.

I now move for adoption of the report and accounts and, in doing so I should be glad to answer any questions relating to the Annual Report and Accounts.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

RBI's report on economic trends

THE ANNUAL report of the Central Board of Directors of the Reserve Bank of India is split up in two parts. The first part sets out an analysis of the current economic situation in the country while the second part discusses trend and progress of banking in India during the year ended June 30, 1972.

The Reserve Bank has emphasised the importance of putting a restraint on monetary expansion and the provision of institutional facilities for mobilising the savings of the community. The expansion in money supply, states the report, would require limiting the extent of deficit financing by the government sector which, in turn, would demand that maximum effort should be made to enlarge tax collections through widening of the tax base, maximisation of market borrowings and the generation of surpluses in the public sector commercial undertakings through increased operational efficiency.

Discussing the rise in prices between September 1971 and March 1972, the report states that the increase has been larger than anticipated and rather disconcerting. While the rate of growth in national income in 1971-72 declined, prices started increasing at a rate which were double of the rise

in the preceding year. In food products, the situation has been created where a decline in production gets immediately reflected in rising prices while increase in production does not result in commensurate benefit to the consumer. Hence the policy in regard to the administration of prices of different commodities should bear in mind not only the income requirements of farmers but also of the consumer.

The first part of the report of the RBI which discusses the current economic situation in the country is given below:

While the Indian economy was able to withstand successfully the strains of refugee influx from across the border in the east and the subsequent conflict with Pakistan, it exhibited certain disquieting features, according to the Annual Report of the Central Board of Directors of the Reserve Bank of India for the year ended June 30, 1972. The response to an increase in aggregate demand has been more in terms of price increases than of output increases. The prices in consumer goods prices has, among other things, worsened industrial relations, and this also has had an adverse effect on industrial production. Further, demand for the products of investment goods industries continues to be less than adequate, although larger domestic savings and the net capital inflow from abroad have contributed to an increase in domestic investment. Likewise, while the aggregate receipts of the public sector have gone up, public expenditure has increased still more. Consequently, public savings have diminished and deficit spending has been larger.

It is against this background,

the Report emphasises, that the tasks ahead need to be defined keeping in view the objectives of the fifth Plan. Pointing out that the fulfilment of these objectives is predicted on a rapid rise in production and strengthening of competitive efficiency, the Report observes:

"Maximising production would imply promotion of new industries, fuller utilisation of existing capacity and wider spread of new agricultural technology. Equally, the management of demand will be crucial to restraining price increases. Ideally, this will require the adoption of policies relating the increase in money earnings to increases in productivity in the economy, concurrently with increasing savings and redistribution of income".

This, according to the Report, would require two basic lines of action from the point of view of financial policy: one, monetary expansion will have to be restrained and, two, institutional facilities will have to be provided on an extensive scale to mobilise the savings of the community. An essential element in controlling monetary expansion, it is stated, would be to limit the extent of deficit financing by the government sector. This implies that maximum efforts should be made to enlarge tax collections through widening of the tax base, to maximise market borrowings and to generate surpluses in the public sector commercial undertakings through increased operational efficiency.

Emphasising that the institutional measures in the financial field will require provision of infra-structure in the form of extending and deepening banking services, the Report says: "Banking developments in India show that, given the requisite manpower and other resources, banks can play a useful role in the development of the less developed regions. Apart from encouraging institutional facilities, the Reserve Bank's policy will have to be one of general credit constraint

in view of the objective of price stability."

Trends in the Economy

General

The dominant feature of the Indian economy during the year July 1971-June 1972, according to the Report, was the resilience it demonstrated under conditions of unexpected and large increases in domestic expenditure, arising primarily from the influx of refugees from across the border in the east and the subsequent conflict with Pakistan in December 1971. Since not all of the addition to domestic spending was matched by increases in industrial and agricultural output, the excess demand manifested itself in both higher prices and bigger trade deficit. Price increases between September 1971 and March 1972 were fairly small, "but, since then, the rise has been larger than anticipated and rather disconcerting".

According to Reserve Bank estimates, despite the unusual circumstances of the year, total domestic investment as a proportion of Net Domestic Product increased from 10.5 per cent in 1970-71 to 11.5 per cent in 1971-72, following improved domestic savings and larger aid utilisation. The achievement in real terms, however, was probably less impressive, because of a sizable increase in prices.

Output and Prices

The analysis of the output and price situation shows that the decline in the rate of growth of national income in 1971-72 was caused by a decline in the growth rates of both the commodity sectors. Agricultural production showed a much smaller rise in 1971-72, largely because of a decline of about 2.7 million tonnes in bajra output, coupled with short-fall in the output of pulses. Foodgrains output may not equal last year's level of 108 million tonnes. While cotton and jute have recorded increases in output, the production of oilseeds and sugarcane has declined. The growth rate of industrial output declined

from 7.1 per cent in 1969 to 4.8 per cent in 1970 and was only 2.9 per cent in 1971, due to a series of "supply bottlenecks as well as demand constraints" — shortages of raw materials, power and transport bottlenecks, slower growth in public sector investment, problems of organisation and labour relations in critical sectors, and capacity constraints in some specific industries. Pointing to the shortfall in growth rate of national income during the first three years of the fourth Plan, the Report emphasises that national income would have to grow at a rate of seven per cent in the remaining two years, if the targets postulated in the Plan were to be achieved.

With these trends in output, increased internal demand worsened the price situation. There was a sharp increase of 6.8 per cent in the general price index, more than double the rise in the previous year. With the exception of industrial raw materials, all the major groups included in the price index shared the rise. Foodgrains, sugar, and manufactured articles experienced price increases ranging from 5 per cent to 28 per cent.

The Report points out that the continuation of procurement prices at the previous year's level prevented a decline in prices when the new rabi crop arrived in the market. In recent weeks, the market prices of wheat and other foodgrains have risen to levels somewhat higher than procurement prices. The small and marginal farmers could not benefit in this situation, because they had little or no surplus to sell or, having sold a part of their output earlier, they had to buy foodgrains from the market when the prices had gone up. To quote the Report: "The basic point here is that a situation has been created where a decline in production gets immediately reflected in a rise in prices, whereas increase in production does not result in commensurate benefit to the consumer. Hence the thrust of policy in administering the prices of different commodities should clearly be in

the direction of maintaining them at stable levels; but in deciding what these levels should be, it is necessary to keep in mind the income requirements of farmers as well as the interests of the consumer."

Budgetary Deficit

Analysing the aggregate national expenditure, the Report refers to the sharp rise of 16.5 per cent in total disbursements (including loans and advances) of the central and state government in 1971-72, as compared with 11.4 per cent in 1969-70 and 9.5 per cent in 1970-71. Developmental outlay rose by 17.4 per cent, but the increase in non-developmental outlay at 19.8 per cent was much sharper due to the large and unexpected expenditure on refugees and defence during the year. The budget of the union government for 1972-73 aims at enlarging the amount of capital formation and the contribution of government to the total savings pool, thus reversing the 1971-72 position. The public sector Plan outlay is to rise by 22 per cent or by Rs 710 crores to Rs 3,973 crores. The Plan provision in the central budget anticipates a rise of 14.7 per cent over 1971-72 budget estimate.

The combined deficit of central and state governments at Rs 631 crores for 1971-72, according to revised estimates (still larger according to final accounts), shows a deterioration from the position in 1970-71 when the over all deficit amounted to Rs 431 crores (accounts). For 1972-73, the combined overall deficit is estimated at Rs 242 crores (net of yield from additional measures for resource mobilisation).

State Overdrafts

The Report also refers to the new scheme on overdrafts introduced in the context of the worsening position of overdrafts of state governments from the Reserve Bank. The outstanding overdrafts of 11 states, which had aggregated Rs 371 crores as on June 28,

1971 (against Rs 82.7 crores on June 27, 1970 for six states), reached a level of Rs 642 crores at the end of April 1972 with as many as 12 states having overdrawn on their accounts. In view of the wider repercussions on the financial balance in the economy of unregulated and unauthorised overdrafts, steps were initiated by the Reserve Bank and a new scheme was drawn up by the Ministry of Finance and the Planning Commission in consultation with the Reserve Bank. The new scheme, which came into force from May 1, 1972, required that overdrafts be discontinued from end-April 1972. Simultaneously, in view of the increased volume of budgetary transactions of state governments, the limit for clean or unsecured ways and means advances from the Reserve Bank were enhanced to four times the previous levels, effective from that date. This is in addition to what they could borrow against the security of their investments. According to the Report, the overdrafts of all the 12 states on the books of the Reserve Bank had been cleared by end of April 1972. Ten states were granted special ways and means advances totalling Rs 416 crores by the centre to clear their overdrafts, the balance being adjusted against Plan assistance (Rs 32 crores) and payment on account of states' share of income-tax (Rs 195 crores) released as on April 30, 1972. Under the new policy no overdrafts are allowed by the Reserve Bank except for purely temporary periods of not more than 7 days. These steps which represent a tightening of treasury control over states are expected to contain the expenditure of state governments within available resources.

Savings and Capital Formation

The net capital formation (i.e., excluding expenditure on renewals and replacements) by the central government for 1971-72 (RE) was Rs 516 crores, representing an increase of Rs 88 crores over the previous year. But net saving was only Rs 211 crores, thus showing a gap of Rs 305 crores.

As for the states, available indicators show that the bulk of their capital formation was financed by capital transfers from the centre. Hence, on their own account, the states probably contributed little by way of addition to public sector savings.

From available indicators, it would appear that private sector investment probably registered a rise, particularly in agriculture and small industries.

A significant development in the economy was the increase in household savings in the form of financial assets. This is reflected in the growth of deposits, currency holdings, contributions to provident fund and life insurance, small savings and subscriptions to capital issues of companies. This development is noteworthy because it implies a greater flexibility in the deployment of savings in the economy.

Money Supply

Money supply (i.e. currency in circulation plus demand deposits with banks) with the public expanded by 13.6 per cent in 1971-72 against 12.5 per cent in the previous year. Monetary resources (i.e., money supply plus time deposits with banks) also recorded a larger rise of 16.2 per cent, against 14.3 per cent last year. The increase in the net bank credit to government, reflecting the widening budgetary gap. Increase in total bank credit to the commercial sector at Rs 788 crores was larger than in 1970-71 by Rs 67 crores. However, there was a rise of Rs 786 crores in the time deposits of banks. A notable feature of the expansion in money supply during the year was that the increase in deposit money was faster than the increase in currency component. Within the area of bank deposits, saving and time deposits have risen much faster than demand deposits. A slower increase in the rate of currency expansion can be explained, according to the Report, by two factors: The transactions demand for currency has increased in

A year of silent activity...

and now it is time
we talked about Asia's most
sophisticated petro-chemical
refining plant.

Yes! You do not see us at work but we are very much there! The lamp in your house is lit because of us and our specialty oils make an equally important contribution to giant industrial complexes. We are there behind most of your daily necessities-

Cosmetics, Drugs, Appliances, Textiles. In short, from Baby oils to Bridges!

WE PLAY AN INVISIBLE BUT IMPORTANT PART IN YOUR DAILY LIFE. Yes, it has been a year of Silent but Intensive effort and we are proud of the Result.

the aggregate in line with growing economic activity, specially in the agricultural sector. Also, a section of the population which was accustomed to keep its savings in the form of currency has apparently developed the banking habit. This change in the asset preference of the public from currency to deposits is perhaps attributable both to the feeling of security engendered by nationalisation of banks and the attraction of interests yields.

Bank Deposits and Credit

Another significant development during 1971-72 as highlighted in the Report was the highly liquid position attained by the banking system due to accretion of deposits at a rate faster than expansion of bank credit. The aggregate deposits of scheduled commercial banks (at current prices) increased by 21 per cent, as compared with 17.9 per cent in 1970-71, while total bank credit went up by 12.9 per cent (Rs 614 crores) against 13.1 per cent (Rs 550 crores). But, exclusive of food procurement advances, the rise in bank credit was Rs 451 crores (10.3 per cent) as compared with Rs Rs 378 crores 9.4 per cent) last year. Not only was the credit-deposit ratio of commercial banks low in the year under review but their cash ratio also was low. The improved resources position of banks enabled them to step up their investment in government and other approved securities and also to reduce their indebtedness to the Reserve Bank.

Reserve Bank's Policy

In view of the price situation, the Reserve Bank's policy laid emphasis on credit restraint. Simultaneously, measures were also taken to encourage the flow of resources to certain sectors which were in need of credit. Estimates of data for sectoral flow of credit are available upto the end of December 1971. Total advances granted by commercial banks for exports, which had shown a rise of Rs 19 crores in the half of 1971, rose further by Rs 77 crores to Rs 459 crores

by end-December 1971. During the period end-June 1971 to end-December 1971 commercial banks' credit to other priority sectors (agriculture, small industries, road transport operators, professionals, self-employed, education, retail trade and small business) increased by Rs 77 crores (7.5

per cent) against Rs 143 crores (16.4 per cent) in the corresponding period last year. The lower rise in credit to these priority sectors is attributable partly to the general slack in industrial sector, affecting the output of small industries and partly to the greater attention being paid by banks to the qua-

lity of their lending and strengthening of their organisational structure. Also, the rate of growth in credit, recorded in the period immediately following the nationalisation of 14 major banks could not be sustained, as the base of advances to these sectors which was narrow in the initial period has

Facts And Figures About India

Backed by 117 years of experience, The Times of India Directory and Yearbook including Who's Who is an indispensable work of reference. In one handy volume, it provides all the factual information you need to know about India and her 560 million people—their problems and progress in all spheres.

since considerably widened, and therefore, the rate of growth would be necessarily low.

Exchange Reserves, Imports and Exports

Reviewing the external payments balance of the country in 1971-72, the Report indicates that the foreign exchange reserves increased by Rs 59 crores to Rs 846 crores in contrast to a fall of Rs 50 crores in 1970-71. Excluding the special factors — viz., repurchase from and gold contributions to the IMF in 1970-71 and the rise in 1971-72 in the rupee value of the reserve assets held in

currencies whose exchange value appreciated — the reserves would show an increase of Rs 72 crores in 1970-71 and of Rs 43 crores in 1971-72. According to DGCIIS data, import payments rose by Rs 219 crores, while export earnings showed a rise of only Rs 32 crores, resulting in a trade deficit of Rs 286 crores, against the deficit of Rs 99 crores in 1970-71. The growth rate in exports during the financial year 1971-72 was 2.1 per cent, compared to 8.6 per cent in the preceding year. However, a part of the increase in exports in 1970-71 was statistical, arising out of a change in the procedure for recording exports. On this basis, the ex-

port data for 1960-71 may be said to be an overestimate, while those for 1971-72 seem to be an underestimate.

International Monetary Situation

Developments of a far-reaching nature took place in the international monetary sphere. The fluctuations and uncertainties in international monetary arrangements, due mainly to the actions of the US and the UK, had repercussions on trade and on the value of the aid flowing to India. It is in the context of the continued uncertainties in the international monetary field that India and other developing countries have been seeking to be actively

associated with the process of international monetary reform and the continuation of SDR distribution in quantities adequate to meet the developing countries' needs. Having continued the old parity with the dollar until December 1971, the Indian Rupee participated in the general realignment of the international currencies resulting from the monetary agreements of December 1971 and established its central rate for exchange with sterling subject to the accepted margin of 2.25 per cent for fluctuation in either directions. The floating of the pound sterling last June has not resulted in any change in India's position in this regard.

ceilings on urban property. On the basis of this bill, a few states have enacted legislation, while others have introduced a bill in their assemblies.

Meanwhile, some states have indicated their intention in favour of a central legislation, on the subject. The position is that 12 states viz. Andhra Pradesh, Assam, Haryana, Himachal Pradesh, Kerala, Maharashtra, Orissa, Punjab, Rajasthan, Tripura, Uttar Pradesh and West Bengal and the union territory of Goa, Daman and Diu have conveyed their final views in favour of a central legislation.

Of these, 6 states viz. Andhra Pradesh, Haryana, Himachal Pradesh, Maharashtra, Punjab and West Bengal have forwarded resolutions under Article 252 of the Constitution, empowering Parliament to

legislate on the subject.

Gujarat proposes to introduce the resolution under Article 252 of the Constitution empowering Parliament to enact a legislation on the subject, in the ensuing Session of the Assembly.

Assam has introduced the Bill on July 19, Uttar Pradesh on May 9 and Punjab on the May 12, 1972.

Mysore government had stated that it was in favour of state Legislation.

As regards enactment of a central Legislation on ceiling on urban property, the Study Group appointed by the government to go into the question submitted its Report on the April 15, 1972. The Report has been remitted by government to a group of ministers for detailed consideration. The central government may introduce a Bill in the next ses-

sion of Parliament after examining the various recommendations of the Group.

In the background of the developments hitherto some suggestions may be made, *vis-a-vis* the provisions contained in the central and the state legislations on the subject.

1. Urban Area

According to the Central Model Bill an urban area means any area which is within the jurisdiction of a local body and which has a population of 10,000. Areas which are within 8 Kilometers from the local limits of such a body also fall within the purview of the urban area. This definition of the urban area has been emulated by all the states.

The inclusion of a town with a population of 10,000 will make the problem still more complicated. In this connection, it may be recalled that an

Official Committee set up by the Tamil Nadu government went into the question of towns which should be covered by the urban ceiling Legislation. The Committee is believed to have strongly opposed the suggestion that a ceiling on urban property should be applied to all towns with a population of 10,000 or more. The Committee is reported to have emphasized that this would only act as a disincentive to construction activity and will run counter to the state's objective of providing accommodation to the houseless.

In view of the above it is suggested that to make the definition of urban area more realistic, the criterion should be a town or municipality with a population of not less than 50,000.

2. Urban Property

Urban property has been

Ceilings on urban property

What is an "urban area"? What is an "urban property"? What monetary ceilings have been indicated in the bills of state legislatures? How should property in urban areas be valued? In order to provide answers to all these and many other allied questions, the Federation of Indian Chambers of Commerce and Industry has prepared a note which puts together the available information on the subject and brings out the variegated problems which legislation on this knotty subject would throw up. "It may lead to inequity, harassment and injustice on many counts" concludes the FICCI note which is given below in full:—

The idea to impose ceiling on urban property was mooted in 1964 at the Guntur Session of the All-India Congress Committee, in the form of a non-official resolution. It was accepted as a part of the Party's policy programme at its Bangalore Session in July, 1965. In December 1969 a Working Group of senior officials was set up for preparing a comprehensive scheme for the imposition of the ceiling on urban property. The Working

Group, *inter alia*, examined the following main questions:

I. Fixation of monetary ceilings and legislative competence of Parliament and/or state Legislatures.

II. Imposition of a tax on urban property held in excess of the monetary ceilings and the levy of an additional estate duty on urban property passing on the death of a person.

III. Restrictions on the transfer of property in excess of the ceilings.

IV. Compulsory acquisition of property by government in excess of the ceilings.

Working Group's Recommendations:

In regard to competence of Parliament and/or state legislatures to fix the ceiling, the Working Group came to the conclusion that under the constitution, the subject fell within the exclusive purview of the state Legislatures. The states were free to legislate on the subject. However, Parliament could take action only when under Article 252 of the Constitution, a resolution was passed by state Legislatures and forwarded to the Parliament.

In regard to other three points, that is, levy of a tax on urban property held in excess of the ceiling and levy of an additional estate duty on urban property passing on the death of a person; imposition of restrictions on the transfer of

of excess holding; and compulsory acquisition of property in excess of the ceilings, the Working Group felt that Parliament had the competence² to legislate.

The other important points on which the Working Group expressed its opinion are given hereunder:

(a) Urban Area

In its Report, the Working Group suggested that the ceilings should apply only a such urban local bodies as have a population of 10,000 or more. The area of such local bodies was extended upto eight km. from their limits as it was felt that the grant of exemptions may lead to large unearned increments accruing to those who hold or have acquired land awaiting conversion to non-agricultural use on the urban fringe.³

(b) Monetary Ceilings

The Working Group was of the opinion that it was not possible to adopt a uniform basis for applying the ceiling in physical terms, and that a ceiling expressed in monetary terms⁴ would be more rational. It was also considered desirable to have an upper limit for families having more than five members.

(c) Individuals share in properties held by other legal entities

The Working Group suggested that the ceiling should be reckoned not only with ref-

erence to the property held by an individual in his own name, but also other properties owned by him indirectly through other forms of ownership. In view thereof, it suggested that properties owned by an individual indirectly through HUF, partnership firms, association of individuals, etc., should be taken into account in determining the monetary ceiling.

(d) Exemptions

The Working Group felt that certain categories of properties may have to be exempted wholly or partly from the purview of the proposed ceilings as they "subserve desirable social and economic purposes". It was, therefore, suggested that urban land and buildings as also plant, machinery and other fixtures or those contained in a building and used for trade, industry education and similar productive activities should be treated differently from urban property used for residential purposes. This was considered to be in the interest of promoting economic activities. At the same time a cautious approach was recommended as exemptions on a large scale were likely to encourage attempts at avoidance and evasion.

Legislations on urban property ceilings

Subsequently, the government of India circulated to states a draft model bill on

MY SUCCESS STORY ! THE CHARTERED BANK SET ME ON MY WAY

I was just another young man, fed up with a ten-to-five job and wanting to go into some sort of small scale industry. My plans were perfect, but the capital? That was where THE CHARTERED BANK came in. They gave me the financial assistance I needed plus advice, help and confidence for the future. Now I provide employment for others as I expand. If you have a promising plan for starting a small scale industrial unit, why not visit your nearest Chartered Bank branch—as I did?

The Chartered Bank

AMRITSAR, BOMBAY, CALCUTTA, CALICUT, COCHIN, DELHI, KANPUR, MADRAS, NEW DELHI, SAMBAJJI.

defined in all the bills of state and the centre as all lands and buildings (including any rights therein) situated in the urban area. In view of the suggestion (contained in the following para) that the ceilings should not be applied to properties used for commercial and industrial purposes, as also shops, factories, offices, cinemas, hotels, restaurants and business establishments, the definition of "urban property" needs to be revised to include only "residential houses within the urban area".

3. Exemption of certain properties

A very important point that needs to be considered relates to exemptions necessary for economically and socially desirable uses of urban property. The Central Model Bill exempts only the following properties from the purview of the legislation:

(1) Properties held by widely-held companies i.e. public companies, the shares of which are quoted on a recognised Stock Exchange.

(2) Any public charitable or religious trust.

(3) Any co-operative society (registered under any law relating to co-operative societies) other than a co-operative housing society engaged in any business or industry.

(4) Any club formed by association of individuals on mutual non-profit basis.

(5) Government institutions and companies, etc.

(6) Any urban property, being a building built for the accommodation of the poorer sections of the society in accordance with the schemes approved by the government.⁶

Following the Central Model Bill, the states of Assam, Jammu & Kashmir, Punjab and UP⁷, do not grant exemptions even to such properties as are used or let out by the owner himself exclusively for such economic, commercial and business purposes as are in the interest of advancement of economic activity.

It will be recalled that even the Working Group which went into the question of ceiling on urban property had ex-

pressed the view that due to economic considerations, also urban land and buildings as also plant machinery and other fixtures or those contained in a building and used for trade, industry, education and similar productive activities should be treated differently from urban property used for residential purposes so that there is no likelihood of any disruption or slackening of economic activities. Further, as the requirements of land and buildings for these purposes depended on the nature and size of the urban centre where the activity was carried on, it was found undesirable to prescribe uniform separate ceilings and exemptions were suggested for properties used for such purposes.

The Working Group's recommendations in this behalf have, however, been incorporated by a few states,⁸ with some reservations. However, almost all the states⁹ follow the Central Model Bill insofar as inclusion of properties within the ceiling limit, by a Private Limited Company is concerned.

In fact, to have a rational basis for ceilings on urban property, a distinction need be made between residential and non-residential buildings. The ceilings should be imposed only on the residential buildings. All non-residential buildings used for the purposes of industry, commerce, trade or business, profession activity, whether by an individual, firm, private company, HUF, or a public limited company should be exempt. It is, therefore, suggested that all properties in the urban areas, used for the purposes of—

(i) Factories and industrial establishments,

(ii) Shops, godowns and commercial establishments,

(iii) Offices, hotels, restaurants, cinemas and other business establishments,

should be exempted from the provisions of the Act. It is necessary to treat such non-residential buildings differently than the residential buildings, in view of their use for productive purposes.

Similarly, individuals, firms

and companies etc. engaged in the sale and purchase of property or as colonisers and financiers, advancing loans against properties, and for whom urban property may constitute as their stock-in-trade, should be exempted from the purview of these limits.

4. Single Units of Residence

In view of the low monetary ceilings in some of the states and comparatively low ceiling proposed for the Central model Bill it is likely that many single units of residence may come within the purview of the ceilings. In quite a large number of cases it may be found that such units of residence are not capable of physical division without consequential damage to the value or the utility of the property or without disruption of the normal and regular activities carried thereon.

In this connection the provisions in the various State Bills and the Central Model Bill fall into four categories:

I. In some states (Madhya Pradesh, Rajasthan) the competent authority may allow such person to retain urban property in excess of the ceiling upto a maximum of five per cent¹⁰ of the limit. There is *status quo* in the ownership and the owner may be required to pay certain additional tax.

II. In UP there is no provision for a marginal increase in the ceilings. But in the case of all single units used immediately before the date of acquisition by its owner for purposes of any trade commerce business industry profession, or as a single unit of residence which is not capable of physical division, the owner has to make an application to retain the surplus property as a tenant of the government. The tenancy of the surplus urban property expires upon the said person or his successor-in-interest abandoning the use of such urban property for the said purpose.

III. In Assam, the provision is still more stringent. In all cases where the acquisition of the excess property is not possible without causing damage to

the base property, the state government has the right to acquire in addition the entire base property or such portion thereof so as to avoid damage to the urban property. Thus instead of giving some concession to the owner, the state will be competent to acquire even such property which is within the ceiling limit.

IV. Some other states (Bihar, Jammu & Kashmir, & Punjab) have not made any provision to deal with such indivisible units. The Central model Bill also did not deal with this issue.

In fact, the problem of single indivisible units deserves special consideration. The 5 per cent marginal increase allowed in the Madhya Pradesh and Rajasthan laws is negligible. In view of the low monetary ceilings, the marginal increase should be at least 20 per cent.

The provision in UP is far from satisfactory. The owners of single units should be allowed to retain their ownership after payment of some nominal additional tax.

The provision in Assam law may prove to be discriminatory inasmuch as in the case of single units of residence it takes away even that portion of the urban property which is within the monetary ceiling prescribed by law. The balance of convenience should be tilted in favour of the owner who has spent his hard earned money in the construction of such units, and by paying certain additional tax, he should be allowed to retain such indivisible unit, the value of which may be a little more than the prevalent monetary ceilings.

The centre is yet to deliberate on the subject of indivisible units.¹¹ It is, therefore, suggested that in the Bill a provision should be made so that the owner is allowed to retain such indivisible units by paying some nominal additional tax.

5. Monetary Ceilings

The Monetary Ceilings provided in the various bills of the state Legislatures range from a minimum of Rs two

lakhs for a family of five in Bihar to an overall ceiling of Rs 7½ lakhs in Jammu & Kashmir. It may be noted that property values vary not only from town to town but also from one area to another in the same town or city. Property values are also subject to frequent fluctuations depending on demand and supply. It is, therefore, suggested that the monetary ceilings should be fixed fairly high and in relation to the existing market values.¹² These should be subject to periodical review. The provision regarding periodical review is missing in the various bills passed/introduced in the state Legislatures. The same should be provided for and a 20 per cent increase in the monetary ceiling should be allowed at the time of every review so that the properties which are once within the ceiling, are not sliced off at the time of such review. The 20 per cent increase in the monetary ceiling will make for adjustment in value on account of rise in prices.

6. Definition of Family

Following the Central Model Bill the states of Assam and Jammu & Kashmir have provided that family will mean and include a Hindu undivided family. The definition is not realistic in view of the lower monetary ceilings sought to be imposed under the various property ceiling Bills. It is, therefore, suggested that a family should be defined to mean a person, his or her spouse and minor children. Adult sons or daughters whether married or not, should be considered as separate units. This definition has been adopted in the case of agricultural land ceilings also.

7. Share of Individuals in other Legal Entities

Following the Central Model Bill, the legislations proposed in the various states provide that in determining the monetary ceiling the right or interest of any person or family in the properties owned by HUFs, firms, societies, associations of individuals (whether incorporated or not),

closely held companies and private trusts shall be taken into account.

While it is understandable that an individual's share in the properties owned by the HUF may be taken into account in determining the monetary ceiling, it is patently illogical to reckon the individual's share in the properties owned by other entities. The anomaly of inclusion of individual's share in the properties owned by other legal entities may be illustrated.

(i) Individual's Share in Partnership Firms

For instance, a firm consisting of four partners own property worth Rs 20 lakhs. The share to be allocated to each partner works out to Rs 5 lakhs, which may be considered the highest monetary ceiling. This means that a partner cannot own, in his individual capacity any property even for his own residence. The provision proves to be harsher where the ceiling is below Rs 5 lakhs. In such cases, even if the partner may not own any individual property, government may still realise the excess property which he has as a partner of a particular firm. Consequently, the partnership firm will have to part with some of its property, leading to disruption of its business. This may affect overall trade and business in the country. It is therefore, suggested that a firm should be considered as an independent unit and the properties owned by it should not be included in computing the monetary ceilings of individual partners.

(ii) Private Limited Companies

Again, the provisions of almost all the state legislations (Save Madhya Pradesh) as also the Central model Bill, include in the monetary ceiling the share held by an individual in the properties owned by private limited companies. The position that a shareholder has no interest in the property of the company, though he has undoubtedly a right to participate in the profits, if and when the company decides to distribute them, has

been well established since the decision in the case of *Salomon v. Salomon & Co.* (1897). He has a further right to participate in the assets of the company in the event of winding up. Thus, the company has been considered as a juristic person which is distinct from the shareholders. The legislation regarding urban property ceiling seems to lift the veil of corporate entity by ascertaining the individual's share in the properties owned by the company and including the same in the computation of monetary ceiling of the individual. In fact, the Supreme Court has clearly laid down the cases where the veil of corporate entities can be lifted. In a recent case it stated that the exceptional cases where the Court is entitled to lift the veil of corporate entity and to pay regard to the economic realities behind the legal facade are very limited. It was stated that corporate entity will be disregarded if it is used for tax evasion or to circumvent tax obligations.

It is doubtful whether courts will allow that the provisions of the urban property ceilings disregard the legal entity of the company and consider the properties owned by the private companies as the property of the individuals, who are members of that company. It is, therefore, suggested that as in the case of Madhya Pradesh, the Central Bill as also the state Bills should not include the rights or share of an individual in the properties held by private limited companies, while computing the ceiling of that individual.

(iii) Widely held companies

"Widely-held Companies" have been defined to include only such public companies, the shares of which are listed on a recognised Stock Exchange in India, in accordance with the Securities Contracts (Regulation) Act, 1956 and the Rules made thereunder. The provisions may prove to be very harsh inasmuch as there may be many public companies which may not be listed on any recognised Stock Exchange in India but at the same

time the shareholding of such companies may be quite diffused, and could, by no stretch of imagination, be deemed as closely held companies.

It should, therefore, be provided that the share of an individual in the urban properties owned by all public limited companies, irrespective of the fact as to whether their shares are listed on a Stock Exchange or not, shall not be included while computing that individual's monetary ceiling.

8. Transfer of Excess Urban Property

In the various state legislations, it has been provided that individuals holding property in excess of the ceiling will submit a statement, *inter alia* containing the particulars of the urban property which such persons desire to retain, within the ceiling. It has been further provided that after hearing the party the competent authority shall decide the excess properties which may be acquired. The provision gives arbitrary power to the competent authority to decide as to which property within the ceiling may be left over to the individual and which property may be acquired by the government. In fact, there is need for a clear cut provision that an individual shall be entitled to retain the property of his choice (within the ceiling) unless there is any reason justifying the government not to accede to the choice.

9. Properties not required for Public Purpose

Again, when an individual files the statement of excess property held by him the competent authority has to notify to the owner its decision regarding acquisition of such property. In cases where the individual is notified that property is needed for a public purpose, the same may be acquired by government. But in cases where the government decides that no public purpose exist necessitating acquisition of such excess properties, an individual is free to dispose them of in such manner as he likes, fail-

ing which a rate equal to the rental value of the property is to be charged from the owner.¹³ This tax is to be levied over and above the other taxes like municipal taxes etc. Presumably, the owner continues to pay wealth tax on the excess property under the Wealth Tax Act. There is thus a double charge on the same property, one under the Wealth Tax Act and the other under the proposed legislation relating to ceiling. In fact, the total impact of all these levies will be that for all practical purposes the excess property will, in course of time, belong to the government without payment of any compensation or amount. The provision virtually amounts to confiscation. Property, the acquisition of which has not been considered in the interest of the public, should be allowed to be retained by the owner without payment of additional tax.

10. Valuation of Property

For ascertaining the value of property, the Central Model Bill and Bills of states provide that the competent authority may determine the same in such manner and by such means as may be prescribed. In this connection, it may be submitted that property is valued by a municipality every five years for the purposes of collection of house tax and water-tax. Property is again valued for the purposes of the Wealth Tax Act. The multiplicity of valuation is added by another valuation that may be adopted for the purpose of urban property ceilings. This multiplicity of valuation even now causes harassment to the property-owner and has a tendency to be computed on the higher side. A property-owner is driven to endless litigation merely because an inflated value has been determined for the property owned by him. It is, therefore, only appropriate that the valuation made by municipal authorities should hold good for all other purposes as well, including the urban ceiling.

11. Principles of Compensation

The various state legisla-

tions have adopted different principles of compensation. The modes of payment are also different. There should be uniformity in regard to principles of compensation and the mode of its payment. It is suggested that compensation should be paid for any excess over the ceiling acquired by the government on the basis of 20 times the rateable value of the property and that the payment should be made in lump-sum, in cash. In case the compensation is given in the form of bonds, these should bear interest on the basis of prevalent market rates. It may be noted that the current market rate of interest is more than 12 per cent.

12. Retrospective Nature of the Legislations

The various state Bills, save Madhya Pradesh, provide for regulating transfers of properties from some earlier date than the one on which the Act may come into force. The Assam Bill covers transactions relating to transfer of urban property, with effect from June 1, 1972, Bihar from September 9, 1970, Jammu & Kashmir from April 1, 1969, Punjab from August 29, 1971, Rajasthan from January 1, 1972, UP from April 1, 1969 and the Central Model Bill from April 1, 1969.

The provisions giving effect to the legislation from a date earlier than the date on which the legislation may come into force, will be harsh. For instance, a property may have changed hands during this period for some very genuine reasons, e.g. to pay off outstanding dues of income-tax or other liability, for a marriage in the family or due to illness and the like. In such cases, if the property transferred during this period were to be considered as the property owned by the individual who has transferred it, the provision would prove to be not only onerous for the individual but may not also stand the scrutiny of the courts.

In view of this any property which has been *bona fide* transferred for full consideration,

should not be taken into account in considering the ceiling to be applied to any family. In fact, there is no justification for prohibiting such transfers retrospectively, for if the concept of the ceiling is quality of wealth, then the transfer takes away from the family any accumulation of wealth in the shape of immoveable properties.

It is, therefore, suggested that the law should be made applicable as from the date of the coming into force of the enactment.

The legislation in respect of urban ceiling bristles with variegated problems. It may lead to inequity, harassment and injustice on many counts; also it may further widen the floodgates for corruption and favouritism. Since the governments are already committed to the concept of urban ceiling; it will be worthwhile if the matter is broached with moderation, caution and circumspection.

References :

(1) Article 252 of the Constitution reads as under :

"(1) If it appears to the Legislatures of two or more States to be desirable that any of the matters with respect to which Parliament has no power to make laws for the States except as provided in articles 249 and 250 should be regulated in such States by Parliament by law, and if resolutions to that effect are passed by all the Houses of the Legislatures of those States, it shall be lawful for Parliament to pass an Act for regulating that matter accordingly, and any Act so passed shall apply to such States and to any other State by which it is adopted afterwards by resolution passed in that behalf of by the House or, where there are two Houses, by each of the Houses of the Legislature of that State."

The Article also provides that such Act can be amended or repealed only by an Act of the Parliament passed or adopted in like manner and not by an Act of the State Legislature.

(2) The Working Group felt that these items are covered within the Entries 86, 87 and 97 of the subject on which the Union has the competence to legislate and Entries 6 and 7 which fall within the purview of the Concurrent List, where the law passed by the Parliament overrides that of the state Legislatures.

(3) Based on the figures of 1961

Census, it was estimated that land and buildings situated in about 1200 urban bodies out of 2007 would come within the scope of the proposed legislation. The number of such bodies would be much larger according to the 1971 Census.

(4) Unlike the criteria adopted for determining the ceiling on agricultural holdings, the criterion of income derived or likely to be derived from urban property was not looked into by the Group. In fact, in some cases a property may have a high potential value but income derived there from may be negligible.

(5) The state Legislatures of JK Bihar, Madhya Pradesh and Assam have already passed these Bills in their states.

(6) It is understood that this provision will cover low income group housing schemes.

(7) In UP industrial undertakings defined in Sec. 2 of the UP Public Moneys (Recovery of Dues) Act, 1972, cinemas and theatres have been exempted from the provisions of the Act.

(8) Bihar, Madhya Pradesh, Rajasthan.

(9) Save Madhya Pradesh.

(10) There is, however, no provision to deal with such indivisible units if the same is of the value of more than 5 per cent of the ceiling limited. In the circumstances, it is not clear whether the government would become co-owner with the person whose property is being acquired, and if so, would the rent of the property be recovered and the property otherwise managed jointly by the owner and the government, or how otherwise would the government become the owner of the excess.

(11) The existing clause 9, that the government shall acquire every urban property declared to be in excess of the ceiling limit needs to be modified, not only to provide for marginal cases but also where the physical division of a large indivisible unit may not be possible, without causing damage to the property.

(12) This point has a particular bearing when one considers the values of immovable properties in Bombay, Calcutta, Delhi and other large cities having commercial importance. It is understood that in Bombay even the government have recently agreed to transfer land at several thousands of rupees a square meter in a fast growing commercial locality.

(13) See clause 14 of Assam Immoveable Property (Ceiling) Bill, 1972, clauses 13 & 20 of the MP Urban Property Ceiling Bill, 1972.

ALUMINIUM CAN MAKE YOUR HOME LOVELIER AND LIVELIER

Sleek, elegant, light, bright, strong, durable, rust-proof, hygienic...one could go on listing the virtues of the wonder metal, ALUMINIUM. Every modern home uses versatile aluminium furniture, fixtures, utensils and appliances. Join the modern trend—use aluminium in your home too. Make sure that your furniture is made of Hindalco Aluminium. Hindalco does not make these finished goods but it supplies the much-needed aluminium (in primary & Semi-fabricated forms) for their manufacture.

The advertisement features a central illustration of a woman sitting in a modern, high-backed aluminium chair. To her left is a small aluminium table. To her right is a bed frame and a three-wheeled aluminium cart. Above the woman is another aluminium chair. The background is a simple, light-colored wall. The Hindalco logo, a shield with a stylized 'H' and the word 'HINDALCO' inside, is positioned to the left of the company name. The company name 'HINDUSTAN ALUMINIUM CORPORATION LTD.' is written in bold, capital letters. Below the name, the address 'WORKS : P.O. RENUKOOT, DIST. MIRZAPUR, U.P.' is printed.

TWA's NEW AMBASSADOR SERVICE. SAME PRICE AS OTHER AIRLINES' ECONOMY SERVICE.

We must admit that other airlines could offer you something like TWA's new Ambassador Service.

All we did was see what our competitors were giving in terms of comfort, meals, entertainment and ground services.

Then worked all year to give you something better.

Sometimes this cost a fortune (we

ripped out the insides of all our 707's and renewed everything from the floor up).

Sometimes this cost a little more trouble (offering a choice of three meals in economy rather than no choice).

And sometimes it cost nothing but a little thought (no-smoking sections, for example).

Next time you fly to America, ask your travel agent to book you a TWA Ambassador flight.

If it isn't considerably better than the service other airlines offer you, fly back with one of them.

They all charge the same as TWA's new Ambassador Service.

707 Economy.

Twin Seats in economy.
Only TWA gives you this twin seat on 707's in economy. It can be three across, or if the plane's not full, two across or even a couch.

The Ground Ambassador.
Whatever your problems, he'll help you from booking a car to getting a hotel to phoning your office.

New uniforms for hostesses.
We've given our girls a choice of three uniforms (including hot pants) designed by Valentino. It helps.

Choice of three to five meals.
Only TWA offers you a choice of three meals in economy, five in first class.

No smoking sections.
Many Ambassador features cost a fortune. This one just cost a little thought.

TWA's new terminal in New York.
For TWA passengers only. You can be through it, having cleared customs and immigration, in no time at all. Most airlines still share one old terminal.

Choice of films.
TWA offers you a choice of films (one for adults, one for everybody). Most airlines still show one, or none.

Working to a common purpose... By increasing exports

For nearly four decades we have carried on an intensive drive to develop export markets. Our interconnected concern, Indian Leaf Tobacco Development Company Limited, started tobacco exports in 1933, and our efforts in this direction have helped make unmanufactured leaf tobacco a traditional export item today. Our earnings have averaged over Rs. 10 crores annually. Exports of cigarettes—a non-traditional item—started in 1947, and today several of our brands have gained a foothold in international markets—proof of the international quality of Indian manufacture. As far as other non-traditional items are concerned, we started diversifying our export activities in this field over a year ago. In 1971-72 these exports which included cigarettes, reached a high of Rs. 2.33 crores. Our efforts indeed are humble : but if they go even a small way towards helping national interests, we shall have served our purpose.

India Tobacco Company Limited
—in pursuit of progress

Food and the priorities

THE GOVERNMENT of Maharashtra has been the first state government to hoist definite distress signals over the food situation. There have been uneasy reports for some time now that scarcity conditions are emerging in parts of this state, but even the regional press has not been particularly informative so far. The chief minister, however, is now applying formally and openly to the centre for relief operations. It is high time that the public, both within the state and outside, had been taken into confidence regarding the probable magnitude of the rescue effort that will have to be mounted for the benefit of the people in the drought-affected areas.

It should be easier to assess the extent of the food difficulties in Maharashtra than to evaluate the nature of the food problem the country as a whole may face due to a less-than-satisfactory kharif season. As a matter of fact the government's statistics have tended to gyrate crazily, with the shortfall in kharif grains being placed all the way down from 15 million tonnes to about half that quantity. The plain fact seems to be that the government has just not been able to decide which estimate to put its faith in or which figure to sponsor for public consumption. In the circumstances, both the treasury benches and the opposition groups in Parliament have been able to enjoy themselves hugely, playing politics with food statistics, even if not yet with food itself.

Meanwhile a bemused country has been left to make what it may of the possibility that the government may soon be casting about in world markets for dear grain supplies in the very year in which the prime minister has decreed that the country must be deemed to have become self-sufficient in food and the Planning Commission has dutifully proclaimed a newer and brighter era of national economic self-reliance. In the circumstances — and given the extreme vagueness and the air of unreliability about estimates of the kharif shortfall—the public is in no position to form an informed opinion on whether imports are needed and, if so, on what scale or, whether the imports, assuming that they are necessary, have become so not because of the weather damage to the kharif crops but simply because the government needs to cover up the bungling in the Food Corporation of India. Not very long ago, when fear of possible damage to the kharif harvest was more acute than it has been since, New Delhi was assuring the country that the Food Corporation had reserves of nine million tons of foodgrains with which it could not only help maintain an adequate flow of supplies throughout the country, but also stabilize prices at reasonable levels. About half of those stocks has been drawn down since and the government's self-confidence, too, seems to have diminished as much as fast.

This is the time for the public to keep a head over its shoulders. If, in the coming weeks, scarcity conditions were to break out in some other states as they have done in Maharashtra, the nation must accept the necessity, however bitter, of its having to import a certain quantity of foodgrains for warding off near-famine conditions in the affected areas. Otherwise, it must insist on the central and state governments husbanding domestic supplies as efficiently as possible so that its food economy may be enabled to hold out until the rabi grains are gathered in.

Above all, the country ought to make up its mind here and now that it will not tolerate continued institutional bungling by the government, central or state, in handling the food supplies of the people. This is not the time, surely, for the state to assume extended responsibilities for direct food distribution since it is just not in a position to discharge them honourably or well. Fortunately, the governments of Mysore and Gujarat have been quick to see the writing on the wall. The adventurists or opportunists in the more vocal circles of the ruling party would only be aggravating the food difficulties of the nation if they were to succeed in pressurizing the leadership to reiterate the unrealistic mandate to state governments to take over the wholesale trade in foodgrains and organize large-scale direct distribution or retailing. Considering that the resources of the state governments concerned are likely to be fully stretched in running relief operations in scarcity areas, while those of surplus states should be properly geared to mobilising surpluses for the use of deficit regions, it would be an act of unwisdom on the part of the central government to contrive deliberately the extensive dislocation of the normal trade channels for the alleged purpose of bringing down the general level of food prices or meeting the consumption needs of the poor and vulnerable sections of the population throughout the country.

Objectively, whatever the government may attempt to do or may not, food prices will tend to thrust upward until the anxious speculation about the food outlook which,

Industrial Growth :1969-72 1152

in part, has been artificially engendered, has subsided or the promising rabi prospects are realized. By the same token, there is no sense in talks of raising the food consumption levels of the poor throughout the country in a period when the government may well have to import grain in order to sustain relief operations

in drought-hit areas. The government's and the people's priorities, here and now, therefore can be only these: (a) organize drought-relief to the extent necessary; and (b) aid and assist farming communities to go after as large a rabi harvest as possible. All else would be irresponsible politics.

Drift in West Bengal

THE VISIT of Mr C. Subramaniam, the union Minister of Industrial Development, to Calcutta on November 10 and 11 provided an opportunity to the local chambers of commerce to exchange ideas with him on matters relating to West Bengal's industrial development. But the discussions do not seem to have produced any clarification from the minister about industrial policy or any assurance from him regarding measures to speed up the state's industrial growth. The industrialists complained about the severe handicaps arising from the scarcity of raw materials and power, and the operation of the monopolies legislation. But Mr Subramaniam could not say anything definite about these problems, beyond telling the chambers that the union cabinet would shortly consider his note on the proposed changes in industrial policy. The discussions revealed that neither the government of India nor the state government had really given serious thought to the industrial expansion of West Bengal where the problem of unemployment is daily becoming more acute.

Mr Siddhartha Shankar Ray, the chief minister, who also attended the meeting between Mr Subramaniam and the chambers, suggested that a definite and clear decision had to be taken on whether or not the monopoly houses in West Bengal should be allowed to expand when two-thirds of such large houses in the country existed in this state. He said that industrial expansion, increase in production, and employment for the jobless would be easier if the large houses were allowed to expand. Mr Ray gave the impression that while he was anxious to encourage the large houses, New Delhi was standing in the way. But the state government itself has been quite lukewarm in its attitude towards expansion by the large houses. In fact, the chief minister, by some of his recent speeches and actions, has given the impression that the state government is not going to take any initiative in creating conditions conducive to the expansion of activity by the large business houses. Mr Sanjoy Sen, a leading industrialist, told

Mr Subramaniam about the "crisis in confidence" that continued to prevail in West Bengal. To the creation of this crisis, the contribution has come not only from New Delhi but from Mr Ray's government. Mr Sanjoy Sen said that after the government had taken over the management of some viable units, the entrepreneurs felt shaky and many preferred to sit on the fence until a clear picture emerged. But neither Mr Subramaniam nor Mr Ray seems to be in a hurry to dispel these misgivings and create a climate of confidence in a state where there has been a prolonged and persistent stagnation in industrial growth.

Mr Subramaniam suggested that a new dynamism would have to be introduced in the industries in West Bengal and that priority should be given to activating them before setting up new units. He said that the industrial units should take up planned modernisation and diversification and stressed the need for spreading out industries in the rural areas. But the industrialists wondered how these objectives could be achieved in the present conditions of uncertainty. They told Mr Subramaniam that a decision on 160 licences was still pending with New Delhi. The minister declared that not only these but future applications for licences would also be issued expeditiously. Such assurances had been given many times before but delay continues to frustrate entrepreneurs.

Mr Subramaniam said that in the last six months there had been a definite improvement in the supply of raw materials especially steel to West Bengal. But Mr Tarun Kanti Ghosh, the state Minister for Industry and Commerce, promptly contradicted him by saying that the state was getting only 50 per cent of what it used to receive in 1966. An industrialist pointed out that of West Bengal's total requirement of steel, only 11 per cent was available. Mr Subramaniam commented that other states might be getting less than West Bengal. But is this any consolation to West Bengal where a large number of industries continue to work with considerable idle capacity due to want of steel and other raw materials?

The inadequate availability of electricity was also brought to the notice of the

union Minister for Industrial Development. Mr Subramaniam said that greater attention should be given to the proper functioning of the existing power plants and the transmission system and an equitable distribution of electricity. But the problem of maintaining the power plants has not been easy because of labour's reluctance to co-operate. Because of inter-union rivalry and a general sense of indiscipline, the power plants in West Bengal both in the public sector and in the private sector have been unable to operate efficiently. Mr Sachindra Chaudhuri, the Chairman of the Calcutta Electric Supply Corporation, said at its annual meeting held on November 10, this year that in 1971-72 the emoluments of the workers were increased by Rs 150 lakhs but their co-operation was not readily forthcoming. He pointed out that some sections of the company's labour force continued to resent the restriction of overtime "within reasonable limits". The workers were also opposing the installation of a modern computer and therefore the efficient working of the Corporation suffered. "Allocation of expenditure is still done manually and is consequently much in arrear", said Mr Chaudhuri. In the public sector power plants the labour situation has been much worse. The West Bengal Planning Board is reported to have calculated that the total deficit in power supply this year will be more than 350 MW. In this background, it is not clear to what extent industrial revival and expansion can take place speedily in the coming months.

The problem of unemployment in West Bengal continues to cause concern to the state government. But, unfortunately, the government seems to concentrate its attention not so much on the creation of new opportunities for employment as on compelling employers to give preference to the local people. The government does not appear to realise that the state's unemployment problem cannot be tackled so long as no fresh investment is taking place in a big way. Even professors of Economics who may be expected to view problems from a realistic angle have been pleading for giving preference to the local people in employment rather on measures to speed up the state's economic growth.

For example, the Society and Commerce Group which has been recently set up by some professors of Economics has suggested the constitution of a board by local chambers of commerce to give employment to the local people at least to the extent of 90 per cent of all appointments with emoluments upto Rs 800 per month. The Group has estimated that a minimum of 85,000 to 135,000 jobs can be offered annually to the local people in the existing establishments in the private and public sectors. The Group does not seem

to appreciate that the implementation of its proposal will create many practical difficulties, besides giving a fillip to petty parochial feelings. Advertisements for clerical and many other types of jobs bring in several thousands, even lakhs, of applications and it is extremely difficult to sort them out and make the selection. The employment exchanges continue to be ill-equipped even to perform their normal functions. How will they cope with the

Electronics : strategy for exports

THE CONVENTION on exports of electronics organised by the Trade Development Authority (TDA) in the capital on November 18-19 was a bold attempt to bring together all the associations of manufacturers of electronic goods in this country and the policy-makers in the government so as to discuss the ways and means for accelerating the rate of growth in exports of the products of this sophisticated industry. The value of exports of electronics goods in 1970-71 was about three crores of rupees out of a total production of Rs 175 crores i.e. less than two per cent of the total output. The world trade in electronic products is currently of the order of Rs 2,250 crores which implies that our share in this trade is almost negligible. Even the target of exports valued at Rs 75 crores for 1975 set by the TDA is not significantly large. If the world trade in electronic goods in 1975 remained unchanged at Rs 2,250 crores, and this country succeeded in attaining the target of exports set by the TDA, our share in world trade of this industry would be hardly 3.3 per cent.

The scope for increasing exports of electronics goods depends by and large upon the capacity of the industry to expand its area of production covering all the important sectors such as radio, television, computers, tape recorders, desk calculators, medical equipment, machine tool equipments, navigation equipment and many others where electronics has found new applications. The backbone of the electronics industry is still the entertainment sector, especially the radio industry which has experienced a prolonged stagnation. While the production of radio sets — including transistor sets — has not dropped in numbers over the past few years but the sale price per unit has been on the decline with the result that the money value of the transactions of

situation if employers are compelled to recruit only through them? All this shows that Mr Ray's Ministry though it has completed over six months in office has not yet given proper thought to problems of industrial development and employment. It is time that Mr Ray and his party tackled them with speed and realism so that some favourable impact can be made on the state's economy in the next few months.

this industry has been dropping year after year. The small-scale sector in particular received a setback after 1965 when the large-scale units were authorised to manufacture the low-priced sets — an area which had been reserved earlier for the small-scale manufacturers. Because the crisis in the radio industry was not resolved till 1970, the government of India appointed a special Electronics Commission under Prof. M.G.K. Menon, Director, Tata Institute of Fundamental Research, "to review the entire field of electronics with regard to research, development and industrial operations, with full authority to formulate policy in this field and to direct implementation on sound technical and economic principles". During the past 18 months the Electronics Commission has been trying to grapple with the numerous problems which the electronics industry faces currently though in the meantime the rate of growth of the industry has slowed down. It had been anticipated that the total value of electronics goods produced in this country would rise from Rs 175 crores in 1970-71 to Rs 225 crores in 1971-72. Latest estimates indi-

cate that the value of output in 1971-72 was not more than Rs 185 crores. This is indeed far removed from the pace of expansion anticipated by the Bhabha Committee which had indicated that the industry would double its production every five years.

The Electronics Commission has made some progress in regard to analysing the problems facing various sections of this industry. The chairman of the Commission, Prof. Menon, has started with the preparation of a data bank in the absence of which it was difficult for him to take any long-term decisions. He has moved cautiously and has taken some decision which may not hasten the expansion of the industry immediately but would certainly lay the foundations for faster growth in the next few years.

An important announcement was made at the convention by the Minister for Foreign Trade, Mr L.N. Mishra, regarding the electronics project at Santa Cruz. He said that the government had approved the 100 per cent export-oriented project evolved by the TDA for the establishment of an export processing zone near Santa Cruz airport. The chief merit of this project is that it lays great emphasis on technology rather than repetitive operations. It would encourage the manufacture of electronic products instead of their pure assembly. The foreign collaborators would bring in technical know-how and make use of the professional electronic skill which is available in abundance in this country. It was also made known that the sale of electronic products by

Eastern Economist 25 Years Ago

DECEMBER 5, 1947

What are the prospects of economy? It is rather unfortunate that the Finance Minister has not said anything helpful on this point. The only remark which he allowed himself was in fact definitely discouraging. If he seriously believes that the expenditure on civil administration is not unduly high and if he has nothing to say on the scope for economy in any other direction, we are constrained to remark that his assurance of tax relief loses a good deal of its validity. It is possible that Mr Shetty has not had time to address himself to this question of economy; in

which case, we would urge that it is among the most urgent issues, which should claim his attention between now and next February. If our analysis is correct, the mere reduction and ultimate disappearance of 'abnormal' expenditure on food imports and refugees—even supposing that this disappearance actually takes place in time to benefit the national fisc in the financial year 1949-50—will not automatically make it possible to provide tax relief to industry; it is of course needless to say that a deficit cannot be budgeted for mercy with a view to providing that relief.

Indian manufacturers to the Santa Cruz units would be deemed as exports. If this project turns out to be a success, the government is likely to set up four to five similar export processing zones in other parts of the country.

Discussing the role of the large-scale sector in the export of electronics, Mr S. Pandit (Director, Philips India) said that "export is a function of large-scale sector though in the context of exports, this sector as yet does not exist in India". He also hastened to add that even large-scale manufacturers in this country were indeed small-scale by world standards and not up to international standards in mass production techniques. He deplored the futile controversy between the large-scale and small-scale sectors because "the resources of large-scale sector can always be employed profitably to build the small-scale sector industry". He advocated a synthesis of the two sectors in the larger interests of the country which would help in creating a strong base for exports instead of relying on chance exports to such countries as the UAR and Sudan. He further urged that if this country had faith in exports, it must demonstrate it by establishing export-oriented manufacturing capacities and not treating exports as an after-thought for products not designed with an eye on the world market. He also stressed the need for building an image for such an export-oriented industry in the overseas markets.

Almost all the speakers commented upon the sophisticated character of the electronics industry and the hazards faced by manufacturers due to the high degree of obsolescence. Mr Gurpreet Singh (Managing Director, Continental Device) referred to the small number of manufacturers in active electronic components and their incapacity to keep pace with technological developments abroad. There is no doubt that some units in this country have acquired capabilities for the manufacture of diodes and transistors (discrete devices) but there is no capacity for the development and manufacture of basic integrated circuits, MSI and LSI circuits. The absence of these sophisticated components and circuits, in the view of Mr Gurpreet Singh, "is a great impediment in encouraging exports. Moreover, in the

world market, every new electronic product has a life cycle; if a unit manufactures and exports it in the beginning stages of the upswing, there is a high margin of profit. Prices start declining as the product covers a part of the life cycle. It means that the Electronics Commission has to act quickly and take prompt decisions on applications of the manufacturers and the exporters. The semiconductor industry of this country entered the export market when the discrete devices had seen the best of their life cycles and were selling at rock bottom prices. "Delays in the implementation of programmes for manufacturing more sophisticated devices will make it increasingly more difficult for Indian manufacturers to be truly competitive at any level of sophisticated technology", added Mr Gurpreet Singh.

That this country is still lagging behind in the manufacture of sophisticated electronic equipment such as colour television, industrial electronics, computers, electronic domestic appliances and components is a fact and was stressed by more than one participant in the convention. It is now for the Electronics Commission to evolve

a strategy to raise the level of technical know-how in this country. Some decisions taken by it have had, without doubt, beneficial results. Its policy of licencing more than 60 manufacturers for black and white television sets has given a wide choice to the consumer though TV prices have not dropped so far. Regarding computers, it has sought to encourage indigenous manufacture and import from the USSR against rupee payments. It has also issued a number of licences for the manufacture of a wide variety of electronic equipments and components. However, in the absence of a broad strategy for exports in collaboration with the TDA and the manufacturers' associations, the efforts of the Electronics Commission may not result in the attainment of the targeted exports. And the strategy was spelt out in lucid terms by Dr B. H. Wadia (Consultant, Behram Wadia and Associates) who advocated that this country should start with a special drive for the export of consumer electronic articles utilising Indian components which should be followed by the sale of components and sophisticated electronics equipments. Perhaps this is a better way than trying to move on all fronts simultaneously.

Microfilm Edition of Eastern Economist

EASTERN ECONOMIST announces with pleasure that, for the benefit of its readers, both at home and abroad, it has made arrangements with University Microfilms of Ann Arbor, Michigan, USA, for the latter undertaking the reproduction of *Eastern Economist* on microfilm and through xerographic copies.

This arrangement covers for the present back issues of *Eastern Economist* starting from January 1971. The question of including issues from earlier years in this arrangement is under consideration.

University Microfilms will be sending the relevant literature to prospective microfilm subscribers soon. It is believed that this service will be of particular interest and value to libraries, business houses, firms, government offices and other institutions which may find it useful to maintain files of *Eastern Economist* for record and reference.

Prospective microfilm subscribers may address their enquiries to: Serial Publications University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106, USA.

POINTS OF VIEW

Social background of administration

Dr A. Appadorai

THE IMPORTANCE of public administration for the successful working of democracy is not a matter of debate; impartial and efficient administration is the *sine qua non* of success in a democratic state. Its importance has increased with the increased activity of the state. The modern state is a social service or welfare state; its functions have, therefore, increased enormously. As the scope of state activity widens, the civil service grows not only in number but in power, for every extension of the area of their activity increases the points at which officials and citizens come into contact with each other. In our own country, ensuring the impartiality and efficiency of administration has become a matter of crucial importance, for the criticism is widely heard that all the five-year Plans and the expenditure of vast sums of public money have hardly resulted in the improvement of the living conditions of the common man. Delay, corruption, the misuse of public funds and the ineffective implementation of well-conceived reforms such as the land reforms are cited to show that administration has not been geared to the task of fulfilling the rising expectations of the enfranchised masses.

best talent

The question may be asked, what are the factors which contribute to the efficiency of administration? Recruitment to the civil service of persons from the best talent available in the community is of course the first factor; coupled with this is the creation of conditions—of proper placement, advancement in the career, and rewarding of merit—which keep the administrators contented, nay, enthusiastic in their work. A dedication to the work is, of course, demanded of every one, but more especially of the civil servant. The Prime Minister has in recent months spoken of a committed civil service; the

* *Social Background of India's Administration*. A socio-economic survey of the higher civil service of India by V. Subramaniam (Publications Division, Ministry of Information and Broadcasting, Government of India, 1971. Price Rs. 22).

phrase used is unfortunate because it may be interpreted—and has been interpreted by those who oppose her—as commitment to the ideology and the programmes of the ruling party. But commitment, properly interpreted, should mean that the civil servant must be committed to the welfare of the common man and to the dedicated service of the community. "Commitment has two constituents", writes an administrator,—"one, a firm faith in certain fundamentals and, two, a firm resolve to achieve these fundamentals.

national goals

As a nation we have set to ourselves certain goals. These are embodied in our Constitution as the Directive Principles of State Policy. Our commitment has to be to social justice, to higher and better production, to the more equitable distribution of the produce and above all to the enrichment of the quality of life at all levels". Finally, the administrator has to develop the attitudes of impartiality and integrity; he has to be innovative and, in our revolutionary times, to evolve new techniques for dealing with the complicated problems which economic development with social justice is throwing up every day.

In the context of efficiency and impartiality which we are discussing, how far is the social background of the administration a relevant factor? In a brilliant book recently published,* Prof. V. Subramaniam has studied the socio-economic data (father's occupation and salary, the caste and religion, educational and regional background etc.) of some 2000 or so direct recruits to the Indian Foreign Service, the Indian Police Service, the Indian Administrative Service and various central services selected through the competitive examinations from 1947 to 1963; such a research study of the socio-economic data is "supplemented by a survey of all the promoted officers of the Indian Audit and Accounts Service and of a random sample of mature age recruits of the Indian Administrative Service."

It is interesting to summarize the conclusions Mr. Subramaniam has arrived at

as a result of his painstaking study. Broadly speaking, it is clear, according to him, that all the services referred to above are drawn in common from the urban salaried and professional middle class of India to the tune of 80 per cent and over. Their differences relate only to the respective share of the various sub-classes of this middle class. Thus, businessmen and business employees are less well-represented than civil servants and professionals. There are practically no sons of big businessmen and only a few sons of the business executives of large firms. Those who are drawn from a commercial background are mostly the sons of small-town merchants or the employees of small business houses. Outside the middle class, the farmers and agricultural labourers forming the bulk of the work force are grossly under-represented in all the services even more than the artisans and the industrial workers.

broadening of composition

In recent years, the social composition of the administrative class has been somewhat broadened, partly due to the larger intake of recruits and partly due to the recruitment of a quota of candidates from the Scheduled Castes and Scheduled Tribes (who are generally drawn from the houses of poor framers, artisans, school teachers or lower civil servants). This broadening of the social composition of the administrative class — though marginal — has been accompanied, Subramaniam points out, "by features such as a more even distribution of recruits from different states, different language groups and different educational institutions... and a simultaneous fall in the proportion of first class graduates." Nevertheless, according to Subramaniam, it would be true to say that the small middle classes in India. (roughly 10% of the population) has a virtual monopoly of contributing to the senior administrative class.

To revert to the question we earlier raised, what is the connexion between the

POINTS OF VIEW

social background of administrators and administrative efficiency and impartiality? On the one hand it is argued that as the civil service in the modern state wields great power in the formulation of policy and in its implementation, the more equal representation of the various classes in society — farmers, industrial labour, professionals, etc. — in the civil service would make for a truly representative and, therefore, responsive civil service; the interests of the unrepresented or inadequately represented classes will otherwise go by default. A representative bureaucracy must, therefore, consist of a reasonable cross-section of the body politic in terms of occupation, language, class, geography and the like, and must be in general tune with the ethos and attitudes of the society of which it is a part.

free from prejudice

On the other hand, it has been contended that, there is hardly any evidence to show that administrators, when recruited as such, carry any prejudice against classes other than their own or that they do not have the aim of promoting the general good of the community. Unsocial conduct is not a monopoly of any one class or group in society. The present writer, as a member of the Union Public Service Commission, had to deal with a variety of cases of disciplinary action against members of the civil service for malpractices, illegal use of power and the like; and the cases included members of the socially advanced classes as well as the socially less advanced classes. Nevertheless, Subramaniam is on strong ground when he states his view that a representative bureaucracy—i.e. civil service having a broad social composition—makes a modest contribution to the stability of the body politic by promoting a general feeling that the interests of all groups and classes are not forgotten in the increasing number of decisions made by the bureaucracy.

The rise of the non-Brahmin movement (the Justice Party) in Madras in the twenties of the present century against the practical monopoly of government service by the Brahmins is a pointer to the fact that a broader social composition of the bureaucracy may be called for to generate the feeling of contentment and stability in the body-politic. Nevertheless, it cannot be too strongly urged that such broadening of the social composition of the civil service is best attained not by reducing the qualifications laid down for entrance to the civil service but by giving greater

opportunities for the unrepresented classes through government scholarships and the like to come up educationally and compete on equal terms with those classes already represented in the civil service.

The present writer would make an observation on the interview (conducted by the Public Service Commissions) which Subramaniam apparently considers "short and desultory", which he would like to be replaced by planned tests of personality and aptitude. There is, clearly, room for research here; but let us not forget an advantage of the interview as now held: it gives scope for the articulated expression of one's inner personality and intellectual integrity. Years ago, when the present writer was a member of the Union Public Service Commission, he asked a candidate if he had heard of Wodehouse's famous character Jeeves, and he unhesitatingly replied, "yes, of course, I have read dozens of Wodehouse's novels." When probed further and asked to give an instance of where Jeeves had saved his master from unpleasant situations, he not only could not name any but showed by his answers that he had not read any of the novels. The candidate's intellectual

integrity was clearly tested.

Before we close this article a brief reference may be made to another useful contribution made by Prof. Subrahmaniam to an allied subject—*The Management Class of India*.* In this book, he studies the background of managers in five highly management conscious firms—the Shell, ICI, Hindustan Lever, Indian Aluminium and the Tatas—and also in a large group of 19 other firms such as the Associated Cement Cos. Ltd, Dunlop etc. It is clear that a separate management class has been developing in India in recent years; Subramaniam comes to the conclusion after a study of the social background of the managers in these firms that "in regard to social origins, the large majority (over 85%) comes from the professional middle class (but for a few landowners) and more than half from the upper middle class at that".

Both the books by Prof. Subramaniam are worth careful study by those interested in public administration and business management.

**The Management Class of India* by V. Subramaniam (All India Management Association, New Delhi, 1971, Rs 10).

RECORDS AND STATISTICS

Editor: R. V. MURTHY

A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.

The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.

Inquiries regarding subscription and advertisements may be addressed to:

The Manager,

The Eastern Economist Ltd, Post Box No. 34, New Delhi-1.

Raj committee on taxation

S. S. Johl

THE NEED to tax agricultural incomes cannot be questioned at this stage especially when there exist wide income disparities in the farm sector. In 1970-71, 0.79 per cent of the rural house-holds in India earned Rs. 20,000 per annum or more and accounted for 9.78 per cent of total agricultural incomes. The Raj Committee has rightly emphasised that considerations of equity demand that top 10 per cent of the households in India should be taxed appropriately because they account for 25 per cent of the total private consumption, over 40 per cent of the total households income and not less than two-thirds of the privately owned wealth. Thus the Agricultural Holdings Tax suggested by the committee rests on a sound logic. The implementation of the scheme has also been dealt with competently. There are, however, a few points which demand a more thorough consideration.

average yield

The average yield has been suggested to be worked out on the basis of preceding ten years. This is too long a period, especially in the situation of a fast changing production technology. Five year averages are enough to take account of the year to year climatic variations. Again, the average of three years' post-harvest prices does not make any sense in the case of commodities such as wheat, jowar, bajra and paddy where the support and procurement prices are guaranteed (now before even the sowing time). The procurement prices guaranteed to the farmers for such crops can be used directly for working out the rateable value.

The report did not deal with the issue of incomes derived from livestock enterprises. The poultry enterprise has developed to a considerable extent in some parts of the country and promises handsome gains. The dairy enterprise competes profitably with other crops at many places. These enterprises are expected to expand fast in the near future and should not be, therefore, excluded from the scope of agricultural taxation. There also does not appear to be any

Mr Johl is Professor of Economics, Punjab Agricultural University, Ludhiana.

justification for excluding fodder crops from rateable value of the holdings to the extent the fodder crops are raised for feeding commercial dairy animals.

The marketing of fruits is one of the major and special cost item for fruit growers. Some special allowance, over and above the 60 per cent general cost deductions, needs to be provided for in working out the rateable value of lands. While discussing the elements of direct taxation, market fee has been considered as a charge on farmers. In the case of regulated markets, in Punjab which have been quoted as an example in the report, this charge is on the buyer, not on the producer-seller.

easier estimation

There is a suggestion to develop some crop groups in order to make the estimation of rateable values of farm holdings easier. It is a cumbersome process to develop crop-group costs and yields than to work out the same for individual crops. Crop groups would sure introduce more complexities and will make assessment of the rateable value in no manner easy. An operational holding has been made the basis for assessment of the rateable value and Agricultural Holdings Tax (AHT). One of the objectives listed is that it will discourage illegal or concealed lease of lands. This seems to be a misplaced hope. Instead, it should carry more chances of illegal and concealed leases and evasions than in case of assessment based on ownership holdings. Ultimately the incidence of AHT will be borne by the owners of land or tenants depending upon their holding power and supply and demand forces. The operational holdings will vary in size more frequently from year to year than the ownership holdings would do, especially when operational holding is made the unit of assessment. It will involve tremendous amount of accounting and verification work. Ownership holdings with a provision for recording tenancy status (which in any case is assumed in the Raj Committee approach) is a better basis of assessment for AHT. The committee estimates a revenue of Rs. 200 crores from AHT, for which no sci-

entific basis is given. Such figures are anybody's guess especially when the assessment is made on the basis of operational holdings which have a high degree size flexibility.

canon of equity

There does not seem to be any logic for taxing the holdings with rateable value below Rs 5000, when an exemption up to this level is given for non-farm incomes. The canon of equity demands that the holdings below Rs 5,000 rateable value should not be taxed even later on 'at the convenience of states' so long as such exemptions exist in the non-farm sector. Some interesting calculations have been made by the committee for a person obtaining Rs 23,000 as non-agricultural income and Rs 8,000 as agricultural income. If a person derives whole of his income i.e. Rs 31,000 from non-farm sources he has to pay Rs 6,500 as income tax. If, however, the same amount of income is derived with Rs 8,000 from agriculture, he has to pay Rs 5,490 (an advantage of Rs 1,010). Why should this advantage exist simply because a part of the income is received from agriculture? This would leave ample scope for non-agricultural earners to show part of their incomes originating from agriculture. The committee has ignored the other side of the coin also. Actually a person deriving Rs 31,000 as non-agricultural income is entitled to many exemptions under the existing law and can reduce his liability to pay taxes to Rs 2881.90; yet for a person deriving income from agriculture alone, there are no such provisions and he will have to pay an AHT of Rs 4,500. Thus in balance a person deriving income solely from agriculture will remain at a disadvantage.

On the whole the report is an intelligent attempt at roping in the substantial earners of income from the agricultural sector. With some further refinements and modifications the approach of the committee can yield handsome revenue to the state without having to ignore considerations of equity and justice in the farming sector.

Railway accidents

L. G. Bapat

ON THE 25th anniversary of our Independence Day, the Madras-bound Super Express from Trivandrum collided against a Trivandrum bound passenger train at Kadayannallur station, 26 km. from Tenkasi junction. Thirty-five persons were injured, five of them seriously. This is a strident reminder to the new Railway Minister Mr T.A. Pai, that even after two decades of planning, all is not well with our railways.

According to the Review of Accidents on Indian Railways for 1970-71, published by the Railway Board, the railways handled a traffic of 298.2 million kms in 1951-52 (Table I). Last year, the traffic had gone up to 466.54 m. km. Thus, there was an increase of 57 per cent in the traffic handled by the railways during the last two decades. On the other hand, the total number of railway accidents declined by 70 per cent from 16,142 to 4,918 in 1970-71.

However, the total number of accidents does not give a correct picture about the safety of railway travel as, in the railway parlance, even a failure of railway engine is considered as an accident, even though it causes nothing more than a few hours' delay to the passengers. Hence, it is necessary to concentrate attention on consequential accidents which involve risk to the life and limb of the traveller. Such accidents have also declined by 56.6 per cent from 1,939 to 840 during this period. As a re-

sult of it, the incidence of consequential accidents per million train kms declined from 6.5 to 1.8.

Statistics published by the Secretariat of

the Union Internationale de Chemin-de-fer (International Union of Railways) Paris, of the incidence of collisions and derailments per million kilometres run on 15 railway systems of the world show that

TABLE I
Indian Railways : Some Basic Data

Year	Traffic handled i.e. train k.m. run (in millions)	Total No. of acci- dents	Incidence per million train kms.	Total No. of conse- quential accidents	Incidence of consequential accidents per million train kms.
1951-52	298.2	16,142	54.1	1,939	6.5
1952-53	304.1	12,783	42.0	1,686	5.5

India ranks among the first five, so far as the safety record is considered. This can be seen from Table V.

TABLE V
Incidence of Railway Accidents

Railway	Incidence of collisions and derailments per million train km.
1. Italian State Railways	0.41
2. French National Railways	0.96
3. Swedish State Railways	1.68
4. German Federal Railways	1.73
5. Indian Government Railways	1.97
6. Norwegian State Railways	2.06
7. Spanish National Railways	2.24
8. Danish State Railways	2.65
9. Belgian National Railways	2.95
10. Japanese National Railways	3.20
11. Canadian Pacific Railways	3.20
12. Yugoslav Railways	3.41
13. Canadian National Railways	3.87
14. Finnish State Railways	5.34
15. Portuguese Railways	6.27

Since the publication of the above statistics, there have been further improvements. By 1970-71, the incidence of accidents on Indian Railways had gone down still further to 1.56. The average number of persons killed or injured per consequential railway accident is also slowly coming down (Table VI). It was 0.89 in 1966-67 and 0.40 in 1970-71. However, in 1961-62, this average was only 0.37. Excepting 1969-70, in all the four years, the average had been above the 1961-62 level. However, it shows an erratic trend, which leads one to suspect that a fall in this average in any year may be due to fortuitous reasons rather than an improvement in the railway administration.

So also, the average per accident cost of damage to the railways has been rising rather rapidly. It was Rs 872 in 1961-62 and Rs 4,362 in 1970-71 (Table III). These figures are however gross understatements in that they omit various relevant costs such as those on account of hours of interruptions, diversion of trains by the

longer routes till the mess is cleared. The compensation paid to the sufferers is also not included in them. Some accidents such as failure of railway engine do not cause any direct damage to the railways. But inclusions of such accidents brings down the average figure showing the damages per accident.

The severity of an accident is directly

related to the weight and the speed of the train. It is argued that the railways at present run much heavier and faster trains than those in 1951-52. The damages sustained by the railways as well as casualties in an accident, therefore, tend to be heavier according to the railway administration. However, this can hardly be a consolation to the railway users. The railways must give up this complacent

TABLE III
Cost of Damage Due to Accidents : 1961-62 to 1970-71

Year	Total No. of accidents	Total cost of damage to the railways (Rs in lakhs)	Average cost of damage per accident (in rupees)
1961-62	9,184	80.1	872
1962-63	9,132	128.0	1,402
1963-64	7,428	83.5	1,124
1964-65	6,465	81.1	1,225
1965-66	6,057	100.2	1,654
1966-67	5,819	108.2	1,888
1967-68	5,502	160.6	2,919
1968-69	5,033	131.3	2,609
1969-70	5,033	134.7	2,676
1970-71	4,918	214.5	4,362

TABLE IV
Collisions and Derailments Caused by the Failure of the Railway Administration 1961-62 to 1970-71

Year	Collisions plus derailments	Collisions and derailments caused by the failure of the Railway Administration	Percentage of 3 to 2
1	2	3	4

FROM THE PRESS GALLERY

POINTS OF VIEW

attitude. It is, of course, conceded that the railways are carrying a heavier load at present. This has imposed a heavier strain on the railway track than was originally provided for when the track was laid. For tackling this problem, the railways should increase the frequency of repairs and replacements, as well as, inspections of the track. The neglect of the track appears to be on the high side in recent days.

Usually one notices an excessive bumping action of the track at the level crossing immediately after the train has passed. This is invariably the case where the sleepers are eaten up. In this connection, the increasing arrears of track renewals make distressing reading. There are arrears of 6,291 km of through track renewals, 2,170 km of rail renewals and 2,165 km of through sleeper renewals. The overaged locomotives in service are about 25 per cent of the total stock in service on the broad-gauge and 20 per cent on the metre-gauge sections. There are hundreds of "problem" and "vulnerable" bridges demanding immediate strengthening and protection. However, the exact position in this respect is not known.

Out of 31,600 level crossings, about 19,000 are unmanned.

More than two-thirds of the total accidents at level crossings take place at unmanned level crossings as can be seen from Table VII. No doubt, the railways will have to incur additional expenditure to man these level crossings. But it would be more than compensated by lower total costs of accident damages and by better safety all round. The railways are certainly in need of economy measures to improve their finances. But this is a wrong type of economy which is at the cost of safety.

The most disheartening feature is that between 64 and 73 per cent of the accidents result owing to the failure of the railway staff and hence are avoidable (Table IV). The number of railway servants against whom punitive action was taken for being guilty of dereliction and/or gross neglect of duty was 1,408 and 1,648 in 1965-66 and 1966-67 respectively. These figures speak for themselves.

"Thefts on trains and of other railway material" is another known cause of accidents. Wilful tampering with the

railway track is alleged to have increased greatly in recent years, though item No. 3 of Table II does not support this allegation. That item shows accidents occurring owing to sabotages. Anyway, an energetic patrolling of the railway track is necessary to tackle this problem. The Railway Accidents Committee (Chairman: Dr H.N. Kunzru) in its first report submitted in 1962 had suggested two steps: (1) A better co-ordination between the union ministries of Home Affairs and Railways and the state governments; and (2) welding of rails which makes mischievous tampering extremely difficult. The second recommendation though accepted by the government, has not been fully implemented as yet.

The need for fitting speedometers on all trains is being emphasised for about 35 years now. This was first suggested in 1938 by the Bhita Committee. It was re-emphasised by the Railway Inspectorate in 1955 and the Railway Accident Committee, 1960 in 1962. Still, over 40 per cent of the trains have not been fitted with speedometers as yet. These reasons have cumulatively led to more disastrous accidents in recent days than those in the past.

TABLE VI
Casualties Per Consequential Accident

Year	Killed	Injured	Total No. of accidents	No. of consequential accidents	Average No. of casualties per consequential accidents
1966-67	209	762	971	1,097	0.89
1967-68	138	478	616	1,111	0.55
1968-69	62	462	524	908	0.58

1	2	3	4	5
1969-70	36	75	111	67.6
1970-71	31	90	121	74.7

THE WORKING of railways and Indian Airlines came in for sharp criticism in Parliament this week. While the discussion on the affairs of the latter was raised in the Rajya Sabha by the Swatantra member, Mr Lokanath Misra, those of the former came to be deliberated upon in the Lok Sabha during a debate on the demands for excess grants for railways relating to Rs 21.11 lakhs expenditure in 1970-71. Among the other important economic subjects which were discussed in the two Houses were the growing power shortage in the country, the alarming unemployment situation and the "rags scandal".

clogged movement

Replying to the debate on the demands for excess grants for railways, the Railway Minister, Mr. T. A. Pai, made out a case for increasing passenger fares, although he did not indicate when he proposed to step them up. He, however, announced that the demurrage charges in respect of goods traffic would go up from Rs 150 to Rs 240 per wagon per day with effect from December 1. He further disclosed that the registration fee for wagons might be raised. Large orders, he pointed out, were often placed for wagon by traders and businessmen and when the required wagons were offered, the orders were quite often cancelled. This clogged the movement of wagons. The situation, therefore, called for remedial measures. In a particular month, the minister revealed, as many as 80,000 registrations for wagons had been cancelled.

The railway finances, Mr Pai said, would be affected this year by the interim relief which will have to be paid to railway workers. There were also demands for an upward revision of the pay scales of railway employees. If the members of Parliament would support him in raising passenger fares, he would have no hesitation in meeting the railway employee's demands, added Mr Pai.

Referring to the shortage of wagons, the Railway Minister, besides indicating the raising of registration fee and enhancement of the demurrage charges, revealed

led that an order for 40,000 wagons had been placed on manufacturers. These supplies are to be effected in the next three years. The wagon supply position for the movement of general goods, he said, had been affected in the recent past by various factors. These included increase in the movement of foodgrains to the drought-hit areas, even water had to be moved by railways to these areas.

Mr Pai did not think that pilferage on railways was unduly high. He pointed out that it amounted annually to about Rs 14 crores, while the goods moved by railways aggregated to as much as Rs 3,500 crores and the revenue from freight was of the order of Rs 750 crores. He, however, assured the House that all efforts would be made to check pilferage. For this purpose, the railway protection force, he said, was being reorganised.

Mr Pai rejected the demand voiced by some members that the Railway Board should be abolished. When holding companies were being formed for other public sector companies, he said he did not understand why the Railway Board should be abolished. All the members of the board, he stressed, were engineers and technicians. It was not the framework that mattered; what mattered was how it functioned. Delegation of more powers to the general managers of the various railway zones, Mr Pai added, could be considered so that decisions about the functioning of railways in the different zones could be taken on the spot and the Railway Board could become largely a policy-making body.

ticketless travel

Dealing with ticketless travel, Mr Pai revealed that, according to a sample survey, about nine per cent of the ticketless travellers were students, nearly 12 per cent beggars, 23 per cent agriculturists and 30 per cent small traders. The total loss through ticketless travel was estimated around Rs 22 crores annually.

The minister expressed great concern over the railways being made a special target in any agitation in the country. He sought the co-operation of all the political

parties for dissuading agitators from destroying railway property, which was national property.

During the debate, the railway administration came in for scathing criticism from both the opposition and treasury benches on many counts—corruption, lack of punctuality in the running of trains, bad catering service, pilferage of railway consignments and property, sense of insecurity among passengers on account of acts of gangsterism in running trains, lack of adequate amenities for third class passengers, etc. Some members also pleaded that railway employees should be entitled to bonus according to the Payment of Bonus Act. The usual pleas for the extension of railway network in some areas were also heard during the debate.

top-heavy management

During the Rajya Sabha discussion on the working of Indian Airlines (IA) Mr Lokanath Misra charged that out of the total investment of Rs 44 crores in this public sector undertaking, the top management had eaten up Rs 18 crores. He alleged that there were too frequent changes in the top management of IA which was characterised by nepotism and favouritism. He expressed himself against the system of part-time chairmen of public sector undertakings. Mr Misra also alleged that although advice was in favour of buying AVRO planes of the 532 series, the corporation had purchased the 531 series. The purchase of land for the Jammu airport at an allegedly unduly high price was also referred to by the Swatantra member.

All these allegations, however, were stoutly refuted by the Minister for Civil Aviation, Dr Karan Singh. The minister revealed that Indian Airlines was likely to break-even or even throw up a small surplus this year. He also stressed that Indian Airlines was a public utility service and profit making was a secondary consideration for it. Out of 95 routes on which it operated, the Indian Airlines, he pointed out, was losing on 75 routes. Should the Airlines not operate on the losing routes, it may make even a profit of Rs 25 crores a year. About the pur-

chase of land for the Jammu airport which, it was stated, belonged to the minister himself, Dr Karan Singh said that the land in question was only 0.22 acres. It was in the name of one of his children. Because of this, he had written to the Prime Minister for her advice on the matter.

A good deal of concern was voiced in the two houses over the present power crisis in the country. The most important point made by the opposition was that greater reliance should henceforward be placed on the generation of thermal power than on the production of hydro-electricity. The present ratio between the two (40 : 60), it was felt, was not the appropriate one, as during years of below normal rainfall, power scarcity would continue to recur, creating complications for the economy. The familiar pleas of the members from Punjab for the curtailment of power supply to the Nangal fertilizer factory and those from Uttar Pradesh for a cut in electricity supply from the Rihand dam to Hindustan Aluminium's Renukoot works were heard. But that was not expected as these two pleas appear to have political overtones.

power for HINDALCO

In his replies to the two discussions, the Minister for Irrigation and Power, Dr K.L. Rao, however, did not agree with any of the above three suggestions. He considered the 40 : 60 ratio of thermal and hydel power generation to be the most economical for the country. In regard to the demand for cut in the supply of power to Hindalco, the minister pointed out that the manufacture of aluminium was as essential for the country's economy as stepping up of production in the agricultural sector. The power supply in Uttar Pradesh, he pointed out, would be augmented considerably with the commissioning of the first 100 MW unit of the Obra thermal station expansion scheme in January. Supplies of power for UP, he added, were also being arranged from Bihar and Madhya Pradesh. The peakload problem of this state was being tackled by imposing reasonable restrictions on consumption. Already power cuts had been imposed on urban consumers in Uttar Pradesh, except continuous process industries, hospitals, defence installations and essential services. These cuts would be restored after November 30, but thereafter industrial consumers would be required to make do with a six-hour cut in power supply daily.

Referring to the demand from Punjab that power supply to the Nangal fertilizer factory should be reduced further and ultimately the unit should switch over to naphtha or furnace oil as feedstock, Dr

Rao observed that not only the manufacture of fertilizers was very important at the present juncture, when a crash programme for stepping up agricultural production was being pushed through, the Nangal fertilizer factory was also producing heavy water which was used for the generation of nuclear energy. Any further expansion of the Nangal factory, Dr Rao assured the House, would, of course, be based on naphtha or fuel oil.

Dwelling upon the long-term power requirements of the country, the Minister for Irrigation and Power emphasised that the fifth five-year Plan would have to provide for four or five 500 MW power stations and the sixth Plan might well see the setting up 2,000/3,000 MW capacity units. He hoped that the present 17,500 MW capacity in the country would be raised to 41,000 MW by 1979 and the vexed problem of getting the states to agree to a central power generation and distribution system would be settled in the near future. The minister deplored the delays in the execution of power projects. The supply from the Bhakra system, he observed, would have been much better if only the works diverting the Beas waters to Gobindsagar had been completed in time.

Replying to a half-hour discussion in the Lok Sabha on the sugar policy of the government, the Minister of State for Agriculture, Mr Sher Singh, informed the House that the report of the Bhargava Commission on the nationalisation of sugar industry would be available by February-end. The central government would take a decision in the matter after considering this report. Mr Sher Singh, however, reiterated that the states were competent to take action in respect of nationalisation of sugar industry in their areas. He cited the advice of the Attorney-General and the Solicitor-General in this regard.

special levy

Mr Sher Singh also revealed that the government was considering steps, including the possibility of levying a special tax to mop up any extra profits resulting to factories from the policy of partial decontrol of sugar, if the manufacturers did not share them with the cane-growers through payment of higher cane prices than the minimum prices stipulated by the government. Suitable alternative machinery, he said, was being contemplated to find out the real recovery of sugar from cane in various parts of the country. About the non-utilisation of the full capacity sanctioned for the manufacture of sugar, which was one of the main targets of attack by the opposition during the short debate, the minister pointed out that all

new licences had been issued to the co-operative sector which had its own problems. Corrective measures were being taken.

The Minister for Foreign Trade, Mr L. N. Mishra, assured the Rajya Sabha this week that efforts were being made to release the seized stocks of used woollen garments imported in the garb of rags "as soon as possible" so that hosiery manufacturers did not suffer for long. He promised that the guilty importers would not be granted new licences. He agreed to a suggestion from an opposition member that the State Trading Corporation should handle the auction of the used imported woollen garments so that there was no profiteering in their sale by private traders.

A non-official resolution urging the central government to work out in co-operation with state governments a time-bound, phased programme to solve the massive unemployment problem in the country, received wide support in the Lok Sabha. Members from all parties who participated in this debate warned the government that the country would face serious trouble if positive and concrete steps were not taken immediately to tackle the problem. Several opposition members squarely blamed the ruling party for the widespread unemployment in the country.

farm wages

Winding up the Lok Sabha debate on the 1969-70 report of the Commissioner for Scheduled Castes and Scheduled Tribes (briefly reported in this column last week), the Minister for Education and Social Welfare, Mr Nurul Hasan, disclosed that the government would fix the minimum wages for agricultural workers during the fifth Plan. It would also take steps to stop alienation of Harijans and tribals from their lands by upper castes and non-tribals. The number of post-matriculation scholarships for the Harijan and tribal students was proposed to be increased. Intervening in this debate, the Prime Minister promised that the government would do everything to improve the lot of Harijans and tribals.

The Food Corporation (Amendment) Bill was adopted by the Lok Sabha this week. During the debate on the bill, the working of the corporation came in for sharp criticism from both the Congress and the opposition members. Several members referred to the enquiry into the charges against the chairman of the corporation, Mr Iqbal Singh. The Minister of State for Agriculture, Mr A.P. Shinde, stated in this regard that the government was waiting for the report of the Central Bureau of Investigation which was inquir-

ing into the affairs of the corporation. The House would be taken into confidence when the government considered the report of CBI and came to some conclusions. Mr Shinde also revealed that the government would not import foodgrains from the United States under the PL 480 concessional programme. "We are likely to make some marginal imports from abroad, but these will be purely on commercial basis", he said. Mr Shinde, however, did not disclose how much wheat or other foodgrains were intended to be imported by the government.

The following important information was provided by the various ministers during the question hour in the two Houses.

(1) The imports of foodgrains which are being contemplated at present will be on normal commercial terms. The earlier estimate of a short-fall of 15 million tonnes in kharif production has now come down to between five and seven million tonnes.

(2) The government has decided to import 20,000 tractors. Import of tractors as gifts to Indians from their relations abroad has also been allowed. Permission has been given for the import of spare parts for tractors to some extent.

(3) We had a trade surplus of Rs 21.7 crores during the January-August this year, with imports amounting to Rs 1147.6 crores and exports aggregating to Rs 1169.3 crores. The trade deficit in 1971 was Rs 277.4 crores. The foreign exchange reserves of the country (including SDRs) on October 31, 1972, aggregated to Rs 778.5 crores. The reserves showed a decline between January and August to the tune of Rs 75.6 crores. The decline in reserves was mainly on account of larger debt servicing payments and delay in the effectiveness of the third replenishment of the IDA.

(4) The government has decided to canalise the exports of shoes and semi-tanned skins through the STC.

(5) The government has permitted the import of 40,000 tonnes of alcohol to augment the supplies from indigenous sources.

(6) The government's industrial policy will be governed by the need for promot-

ing industrial growth consistent with socio-economic objectives, including the prevention of concentration of economic power. The government's policy in regard to the joint sector was derived from the Industrial Policy resolution of 1956. Participation of the states with private enterprise, whenever required in the national interest, would be subject to an effective voice for the government in the policy and operation of such undertakings.

(7) The government has decided to set up three units for the manufacture of paper and pulp under Hindustan Paper Corporation, a public sector concern. One of these units will be set up in Nagaland and other two in Assam at Nowgong and in Cachar. The Nagaland paper and pulp project will have a capacity of 30,000 tonnes per annum. The Nowgong unit will produce 80,000 tonnes of pulp and 50,000 tonnes of paper a year. The Cachar venture will have an initial capacity of 50,000 tonnes of pulp per annum, which may be raised later on to 80,000 tonnes. A crash programme for increasing the capacity of the existing paper units has been sanctioned. The programme would generate an additional capacity of 1.23 lakhs tonnes of paper a year. Several other proposals envisaging setting up of new units and expansions of the existing units for an additional capacity of 8.58 lakhs tonnes have also been approved.

(8) Eleven state governments have constituted planning boards in response to a directive issued by the Planning Commission. The Planning Commission has received good response from state governments in its efforts to involve the common man in the process of planning.

(9) Out of about Rs 51 crores alloca-

ted by the central ministries for providing employment to the educated unemployed, including engineers, during 1971-72 and 1972-73, nearly Rs 47.95 crores have already been allocated for these schemes.

(10) It is proposed to import this year about a million tonnes of steel. The value of iron and steel imports in 1971-72 increased to Rs 245 crores from Rs 149 crores in 1970-71. In 1969-70, steel imports aggregated to Rs 83 crores. The country imported 13.82 lakh tonnes of steel in 1971-72, a little over seven lakh tonnes in 1970-71 and 4.23 lakhs in 1969-70.

(11) All the states had cleared their overdrafts with the Reserve Bank of India as on November 1, 1972.

(12) The union government has not found it feasible to have a common management cadre for all central government undertakings, since such a cadre, it is felt, would abridge the operational autonomy of industrial enterprises. There is, therefore, no proposal under the consideration of the government to make further recruitments to the industrial management pool cadre. The personnel of this cadre were recruited in 1959-60.

(13) The gross profit earned by foreign companies in India in 1970-71 amounted to Rs 52 crores, as against Rs 39.9 crores in 1969-70 and Rs 33.2 crores in 1968-69. The total assets of these companies for the three years from 1968-69 were Rs 1234.7 crores, Rs 1411.5 crores and Rs 1468.6 crores, respectively.

(14) There is no proposal before the government to ban strikes and lockouts. It is hoped that the impending legislation on industrial relations will make them redundant.

GDR: a reliable trade

H. Sachse

partner

UN STATISTICS show that the GDR has been one of the countries having the most consistent economic growth during the past two decades. Today the GDR is a highly-developed, modern, industrialised country with a mechanized, intensive agriculture.

With her population of about 17 millions the GDR holds the 31st place in the world. According to the size of her territory, she ranks 92nd. Measured by her industrial production, she is one of the ten leading industrial countries in the world.

Due to her accomplishments in the fields of economy, science and culture as well as due to her efforts in shaping stable and

framework of the programme of socialist economic integration the wide range of products manufactured by each of these countries has been reduced and thus there has been achieved a more effective structure of industrial production.

This exerted a positive influence on the further development of foreign trade turnover. While gross industrial production of the GDR rose by 72 per cent from 1960 to 1969, its exports increased by 88 per cent.

Reflecting the close economic co-operation between the GDR and the other member states of the CMEA the share of these countries in the foreign trade turnover of the GDR amounts to about 70

in the early fifties from year to year, the total turnover of exports and imports in both directions has increased considerably. It shows the effectiveness and the advantage for both sides that the turnover in foreign trade in 1971 amounted already to about Rs 60 crores. The most advantageous step in strengthening the economic relations was made in 1957 by changing the pattern of trade to the system of so-called rupee-payment. There is a double advantage for Indian business engaged in foreign trade with the GDR or with other socialist rupee-trade-countries in this system:

- the problem of availability of foreign exchange does not arise, as all imports can be paid for in rupees.

- all export earnings of these countries in rupees are to be spent in India for the purchase of Indian export goods and services.

For our country the rupee-payment system guarantees that we can pay all our imports of Indian goods completely by the export of products manufactured in the GDR.

increased co-operation

The rupee-payment mechanism is not only efficient in the field of foreign trade, it refers to all fields of economic and scientific-technical co-operation between our two countries. The best proof of its efficiency is the number of collaboration agreements with India; the GDR has 60 approved collaborations placing it 8th in the list of the collaborating countries.

In the last few years, the economic co-operation between the two countries increased to cover not only foreign trade and technical co-operation but also technical-scientific activities. This was started by the signing of the Agreement on Scientific and Technical Cooperation in February 1971 and was continued by signing several protocols for its implementation covering different fields such as applied research in technology and veterinary medicine.

With the establishment of diplomatic relations on October 8, 1972, between the GDR and India, there were created conditions for further developing the stable and good relations in all fields and especially in the economic field. As an important step in this direction, we con-

der the protocol signed on November 2, 1972, in the framework of the long-term trade and payment agreement concluded in November 1971 between our governments. In this protocol, both sides have endeavoured to meet as far as possible the mutual requirements. Thus it has been agreed from our side to increase the supply of potash, urgently required by Indian agriculture and to continue the traditional supply of X-ray films, scientific and techni-

cal equipment, and printing and agricultural machinery.

In this protocol there has also been fixed a considerably increased volume of Indian exports of engineering and consumer goods, the so-called non-traditional items, to GDR in the years to come.

I would like to stress, that in the last few years, culminating in the establishment of diplomatic relations between our countries in October 1972, there were

created all necessary political and practical preconditions in the form of a number of agreements as well as of close business relations between foreign trade enterprises, different scientific-technological institutions in the GDR etc. and the corresponding partners in the public as well as in the private sector in India for continuously expanding our co-operation. It is now a question of taking further practical steps to implement these agreements.

Vienna.

The death of EFTA?

THE CHANGES that will take place in west Europe within little more than a month's time will be more in the nature of the beginning of a new, hard period of bargaining than the culmination of a long effort to bring Schumann's post-war dream of a united Europe into effect. This concept, born in the mind of an Alsatian Frenchman, very largely as the result of the series of misery that have plagued Europe for centuries and sharpened since the imperial concepts of Napoleon, Bismark, of the Central and Allied Powers of 1914-18 and, later, of Hitler's Germany, was that of the non-Slav western half of the continent united in economics and, except for national domestic affairs, in politics. Like most dreams, it ran into snags very quickly.

The creation at the Stockholm conference in 1958, very largely at Britain's initiative, of the alternative European Free Trade Association (EFTA) was the first serious setback; de Gaulle's insistence of the "Europe of Nationalities" and the long-drawn refusal to allow Britain to transfer its membership from EFTA to the Common Market was the second. Now that the Market's Six are to become the Nine, the Schuman dream might seem to be coming nearer to realisation except for several contradictory factors.

The only significant addition to the Market is that of Britain, but it is occurring at a time when Britain is in acute and internally angry economic difficulties, when its money stands internationally at the lowest value it has ever experienced and when class and economic conflict within Britain itself is sharper and more bitter than almost any differences known on the continent, apart from the great cleft of communist and non-communist. The other two, Denmark and the Irish Republic, are both economically very weak and only Denmark is a loss to EFTA since Ireland has so far not been a member of either European economic group. Britain's farewell to EFTA at that organisation's ministerial

meeting in Vienna this week was characteristically graceless and Market may well consider whether it is not taking to itself an aggressive but sickly partner. EFTA continues with all of Scandinavia except Denmark (which always regards itself as more continental than Scandinavian), with Austria and Switzerland, Portugal and Iceland and is open to further membership. The enlargement of the Market is not the death of EFTA.

What is of more long-term significance is the fact that, as January 1 approaches, all nine Market countries are making it clear they do not intend to allow Brussels to interfere with or influence overmuch their domestic politics, although the effects of Market taxation and tariffs will be far-reaching and, so far, are not precisely predictable. The weak link in the Market chain of control is the European Parliament in Strasbourg which, although it is sited in France, was consistently ignored by de Gaulle, is not highly regarded by Pompidou who will certainly not yield one jot of Paris authority to the Alsatian capital just as London, from different points of view according to the party concerned, is jealously anxious about both Strasbourg and Brussels. The European socialists are dismayed at the British Labour Party's reluctance to send MPs to Strasbourg and the Brussels Market Commission is preparing to do battle with new British colleagues; in any case the European Parliament, as much a part of the original Schumann Plan as the Common Market, will acquire control over no more than four per cent of the Common Market budget which means that the Market will continue to be bureaucratically controlled, the only question now being by which bureaucrats?

Most significant of all is the fact that the two other large power-groups, the USA and Japan on the one hand and the communist economic group of east Europe on the other, recognize this fact. East Europe, since it has grown persuaded during the past year that west Eu-

rope is becoming a united economic power, has tacitly dropped its hostility and, indirectly through the Polish Foreign Minister, who travels westwards far more than most of his colleagues, has indicated it is prepared even to be friendly but only after the slowly approaching international conference on European security has proved successful—that is, has approximately fulfilled east Europe's wishes. The most likely circumstance in which the rest of east Europe would officially recognize and directly deal with the Market would be when the Market recognizes Comecon just as NATO officially recognizes the Warsaw Pact organization.

This development is made the more probable now that the USA and the Soviet Union have begun trading officially and may fairly soon be trading in a significant degree. Washington and Poland have also just signed an agreement intended to triple existing trade levels in two years.

It is the United States' attitude that will be the determining factor and which will lead to the bargaining which may well last for four or five years. The opening up of the USA to the Soviet Union and to China in trade and politics will make a considerable difference to the percentages of world trade handled by the respective blocs. One reason for the United States' relaxation of its frozen attitude to the communist countries is its determination to add to its own 16 per cent share of the world trade and to reduce the 40 per cent share at present enjoyed by the west European Common Market.

The fields of argument and bargaining that lay ahead will be influenced by the fact that, through NATO, west Europe still needs US protection on its own soil against the USA's new trading partner whose military arm is the Warsaw Pact. There will be intense pressure for zero tariff or for reduction of Market tariffs on imports of US agricultural products,

WINDOW ON THE WORLD

friendly relations with other peoples, the GDR has gained international respect and recognition.

In developing her external economic relations, the GDR has achieved considerable success. The foreign trade turn-over rose from 2,700 million marks in 1949 to 39,000 million marks in 1970. According to the profile of her industrial production, the traditional export goods of the GDR are engineering goods, industrial equipment and plants, chemicals and electro-technical products. In these fields the GDR has achieved a leading position among the highly-developed industrial countries in the world.

By means of agreements on co-operation and specialization concluded between the GDR and the USSR as well as between the GDR and other socialist countries — member states of the Council of Mutual Economic Assistance — within the

per cent. The co-operation within the CMEA has made it possible for the GDR to raise her productive potential in the key branches of her national economy and to considerably increase her total exports and systematically step up her imports.

Due to this fact, the turnover volume in trade with the developing countries rose from 790 million marks in 1960 to 1440 million marks in 1969 i.e. by 82 per cent. Highly appreciating and supporting their struggle for economic and political independence, the GDR has always based her relations with these countries firmly on the principles of equality and mutual benefit.

The development of the economic relations between the GDR and India reflects in an impressive way the general development which has taken place in the relations between the GDR and the developing countries.

From a poor turnover in foreign trade with India of about two crores of rupees

Mr H. Sachse is GDR's Commercial Counsellor and Trade Representative in India.

an area made the more sensitive by the fact that the Market is just taking to itself two predominantly agricultural countries in Denmark and Ireland. The USA will hold over Europe the threat further to reduce the value of its dollar if Europe does not help it to reduce its very unfavourable balance of trade. In Washington's opinion, the dollar must remain a pillar of American world power.

West Europe will reply with demands for relaxations of American protectionism, of its restrictive practices over the American selling price for manufactured chemicals which it maintains despite agreement to abolish it reached during the Kennedy Round. But one of the principal effects of the Common Market's enlargement will be that it is bigger and easier to hit, not least by the continuing

influence of masses of expatriate US dollars in the west European and central European markets and financing much west European industry. At a time when the whole of west Europe is plagued by inflation, which the Market's Commission and Council of Ministers have done nothing to assuage, this money power is of menacing proportions that makes mere market enlargement appear puny.

SAVE A LOT OF MONEY AND A WHOLE LOAD OF TROUBLE...

GET *Standard* ELECTRIC VEHICLES WORKING FOR YOU

Now available on
D.G.S. & D. Rate Contract—
'Standard' electric truck.

Why put up with the noise, the fumes, and all the nagging maintenance worries of petrol or diesel powered vehicles when you could be using STANDARD ELECTRIC VEHICLES?

Electric vehicles cost only 1/3 as much to run as other powered vehicles. They don't make a noise, fume or vibrate; their solid and simple design makes for easy maintenance and unrestricted manoeuvrability; and this means they last longer—you can reckon on 50% longer life expectancy.

And if your vehicle is in Bombay, you get a BONUS advantage with STANDARD—we'll service

your vehicles free for one year. But wherever you live, our factory trained and experienced personnel will service your vehicles and batteries at the same time, to save you the bother of two separate operations. So wake up from the vehicle nightmare with STANDARD's range of electric vehicles. They are made to cater for any load up to 3 tons and there is a whole range of trucks and tractors to choose from.

For further technical and engineering information, write to: The Commercial Manager, The Standard Batteries Limited, Vakola, Santa Cruz, Bombay 55 AS.

With friends like some

of the friends the prime minister has got, she hardly needs enemies. Mrs Gandhi, evidently, did try her best to keep her birthday this year a private, personal and family affair. *The Times of India* noted on November 23 as follows:

"Correctly anticipating that the more thick-skinned among the professional sycophants might turn up at her house on the day before her birthday, the prime minister decided to leave for Bhatkal (Bhatkal lake near Faridabad in Haryana, not far from New Delhi) on Saturday. They vainly sought permission to present their bouquets on Friday!"

Mrs Gandhi's valiant effort at temporary self-abnegation, I am sorry to say, did not meet with the complete success it so richly deserved. I quote a PTI report dated November 21 (Mrs Gandhi's birthday was on November 19):

"Amidst cheers in the Lok Sabha on Tuesday, the Speaker wished the prime minister a happy birthday.

"Mrs Gandhi had spent her birthday outside Delhi on Sunday, when the House was not in session.

"The prime minister suddenly disappeared and we have the opportunity only today to congratulate her", the Speaker remarked."

Not even Mrs Gandhi, one might say, can successfully rebel against fate. Although she did manage to avoid the bouquets on Friday, she could not save herself from being cornered in, of all places, the Lok Sabha a few days later and this, too, by no less a person than the Speaker himself.

Shades of Potti Sri

Ramulu, the patron-saint of visala Andhra! Once again it has been proved that the Andhra people are in a position to deal a body-blow to the central government whenever the mood (or the madness) seizes them. The nation's rail communications between its southern part and the rest of it are now established to be New Delhi's most vulnerable spot in dealing

with political agitations in the Andhra region. One may wonder, however, whether the latest episode of violent assaults against railway property or operations was really needed to alert the central government to this uncomfortable truth. It is, in fact, proper to raise the much larger question whether the central cabinet should have been waiting on events to the extent it has been doing. Weeks of inertia or indifference and, therefore, inaction have tragically led to the agitation over the mulki rules climaxing into as near a people's revolt as could be conceived within the framework of a democratic political system. Even if the prime minister were to succeed ultimately—and without much further loss of life or public property—in reconciling the sharp conflict of regional interests in Andhra Pradesh and bringing about a settlement of the controversy over the mulki rules, her prestige and the prestige of the central government have both suffered irreparable damage. As for the Andhra government and the chief minister of the state, the gravest doubt must persist about the fitness of Mr Narasimha Rao and his senior colleagues to continue to hold any position of responsibility in government or public life. Politicians so bereft of the right political instincts constitute a grave hazard to the very lives, let alone the welfare, of the citizens.

From *The Hindustan Times* of November 23 :

"India's economy may be in a bad shape but it is not hopelessly out of line," says Prof Sir John Hicks, who shared this year's Nobel Prize for Economics with Prof K. Arrow of Harvard University.

"Many Latin American countries were worse off than India, he said. In Argentina, for example, the cost of living had increased more than five times since 1963. In India it had risen by nearly one and a half times during the same period.

"Prof. Hicks thought the devaluation of the rupee was one of the factors contributing to inflation. 'But then I am not in love with devaluation anywhere,' he said."

Sir John Hicks could have added, of course, that, in Chile, inflation has been

reportedly soaring this year by over one hundred per cent. But, even without mentioning this, he has no doubt provided a more or less complete answer (?) to those who have been asking why India's economic progress should have been so modest, not only in comparison with the Japanese economic miracle, but also in terms of the advance made by, say, Singapore or Hongkong in south-east Asia or Iran in west Asia. All that remains is for us to wonder whether the good professor's certificate will be carefully filed away in the prime minister's secretariat for use when Mrs Gandhi's economic speech writer next casts about for a useful quote.

One should hesitate to join issue with a Nobel Prize winner on a question which is very much his subject, but is Sir John justified in attributing any significant measure of blame for our current inflationary problems to the devaluation of the rupee in 1966? Is *post hoc ergo propter hoc* ever all that convincing? Especially as so many gross blunders have been made since 1966 by the government in its management of the economy.

Since I have been rash enough to start arguing with Sir John, I may as well get on with it. As reported in "An Economist's Notebook" in *The Statesman* of November 24, the professor is of the view that goods have got to be provided so that "you can have employment," for "unless you have the goods to give the people something to spend their wages on," you cannot have employment. I agree that goods will have to be provided if there is to be more employment, but not, surely for the reason primarily that people must have something to *spend their wages on*. Rather, in the context of employment, what seems to me to be of importance is that goods must be provided for the people to *work with or work on*. Without more capital goods and more raw materials, there just is not any chance of more people being set to work or the same number of people doing more work. It follows that I also differ from Sir John when he suggests that "it is quite possible India has devoted too much attention to what might be called heavy growth." He is now here on a short stay and I do wish that he would come back after he has duly received his piece of the Nobel Prize in Stockholm and spend some time studying what really are the facts. Is the Indian economy dragging its feet because too much attention has been paid to basic or capital goods industries or because, for the last five years or longer, not enough resources or effort had been put into the production of more of energy, steel, cement, fertilizers, transport equipment and the like?

DECEMBER 1, 1972

TRADE WINDS

Assistance From Canada

AN AGREEMENT for a new Canadian development loan of \$1.9 million (Rs 1.33 crores) was signed on November 23, 1972. This loan will provide for the purchase of fertiliser bulk handling equipment for the port of Haldia. An earlier loan of \$1.7 million for similar equipment for the port of Kandla was given in August last year. In addition to these two loans for a total sum of \$3.6 million, Canada has expressed its willingness to consider similar assistance for Bombay, Madras and other Indian ports. The bulk handling equipment for fertilisers results in savings on account of elimination of bagging and a quicker turnaround of ships. The loan granted is on the soft terms which have applied to all Canadian loans to India during the last six years. They are repayable in 50 years, including a ten-year grace period, and there are no interest, service or commitment charges. In addition to the development loan for the Haldia port, the Canadian International Development Agency has engaged the services of Howe International Ltd as consultants for the Calcutta Port Commissioner in the layout, design, procurement, and installation of the various equipments to be purchased in Canada. These services are covered by grant in aid and therefore involve no cost to India.

Another agreement signed recently provides for a Canadian grant of \$300,000 (Rs 21 lakhs) for a feasibility study of the Hindustan Copper Limited's Rakha project in Bihar. The grant will be used to engage the services of a Canadian firm of Consulting Engineers (Watts,

Griffis & McQuat) to recommend development of the mine and production operations at the Rakha project. This will further promote India's drive for self-sufficiency in non-ferrous metals.

Nangal Expansion Project

The union government is entering final negotiations with the World Bank for a \$55 million credit for expansion of the existing Nangal Fertilizer Unit. The World Bank has agreed in principle to negotiate this credit after a complete appraisal of the Nangal Expansion Project of the Fertilizer Corporation of India. A team of officials of the Ministry of Petroleum & Chemicals, the Ministry of Finance and the Fertilizer Corporation of India is due to leave for Washington in the first week of December to hold discussions with the World Bank and finalise financing of the project with IDA funds. The team is also expected to conclude a project agreement between the World Bank and the Fertilizer Corporation of India. The team's visit is a sequel to a series of discussions with the World Bank on various aspects of the project, which now envisages use of heavy petroleum fractions as feedstock for production of 900 tonnes of ammonia per day. Out of this 300 tonnes of ammonia would be diverted to the existing plant to replace ammonia now being produced by electrolysis of water. The project also envisages production of 1000 tonnes per day of urea.

Since ammonia production will no more be based on electrolytic hydrogen, the power requirements of the expanded

Nangal unit would come down to about 36 MW instead of 169 MW required for the existing unit alone.

The Fertilizer Corporation of India and the World Bank have already agreed on the mode of implementation of the expansion project. The FCI will have the overall responsibility for the project and will also design and engineer the urea plant based on the Montedison process. Offside facilities also would be designed and engineered wholly by the FCI. The total capital cost of the Project is expected to be about Rs 76 crores, of which a little over Rs 39 crores would be in foreign exchange. The foreign exchange requirements are expected to be covered by IDA credit.

Korba and Amarkantak Thermal Stations

The Planning Commission has approved the schemes for the extension of Korba and Amarkantak thermal power stations in Madhya Pradesh for implementation during the fourth five-year Plan. The thermal stations at Korba and Amarkantak are already tied to Madhya Pradesh Grid. The Korba extension scheme involves installation of one thermal generation set of 120 MW capacity together with the steam generator, accessories and other appurtenant facilities at Korba thermal power station. The scheme, estimated to cost Rs 18.36 crores, will be commissioned in 1976-77. The extension scheme will be based on supply of coal from Manikpur quarry and Kusmunda blocks of Korba coal fields. The project will draw cooling water supplies from the lake formed by the existing barrage on the Hasdeo river.

Amarkantak extension scheme, estimated to cost Rs 18.61 crores, involves installation of one thermal generation set of 120 MW capacity together with the steam generator, accessories and other appurtenant facilities at Amarkantak thermal power station. The scheme will be commissioned in 1976-77. Coal supplies for the extension scheme will be

from neighbouring Rewa coal fields. The project will draw cooling water supplies from the existing lake created by the dam on Suthna river.

Payment for Nationalised Coal Mines

The union government has appointed Mr Justice Krishna Ballabh Narayan Singh as Commissioner of Payments under the Coking Coal Mines (Nationalisation) Act, 1972 for the purpose of disbursing the amounts payable to the owners of the coking coal mines and coke oven plants, which have been taken over by government. Initially, he will function from Patna and later on will move to Dhanbad. His address in Patna is C/o Patna High Court, Patna. The date by which parties, who have claims against the former owners, should file applications before the Payments Commissioner will be notified later.

General Insurance Corporation

The General Insurance Corporation of India has been registered as a government company with headquarters at Industrial Assurance Building, Churchgate, Bombay. The corporation will superintend, control and carry on general insurance business. A small board of three persons has been constituted; and this will soon be expanded. The General Insurance Nationalisation Act 1972 came into force on September 20 last. Section 9 of this Act provides for the setting up of the General Insurance Corporation of India.

Valuation of Assets

The Central Board of Direct Taxes invited applications for registration of valuers for different classes of assets. Fresh registration has become necessary because of the amendment of the Wealth-tax Act, 1957, by the Taxation Laws (Amendment) Act, 1972. Valuers appointed earlier under the Estate Duty Act, 1953, have ceased to be competent with effect from November 15 to compile valuation reports for the purposes of

proceedings under the Income-tax Act, Wealth-tax Act and Gift-tax Act. However, valuers registered now under the Wealth-tax Act will also be competent for the purposes of the Gift-Tax Act, 1958, and the Income-tax Act, 1961.

MMTC to Buy Palladium

A contract worth about Rs 17 lakhs was signed at the USSR Pavilion recently to buy Palladium. Palladium is a high priced metal and the Soviet Union is the sole supplier of this strategic raw material to India. The contract was signed by Col. A. P. Sharma, General Manager on behalf of the MMTC and Mr L.N. Shalimov and J.H. Kasaymov on behalf of the USSR. MMTC is likely to treble its imports of Palladium during the next year.

Central Loans for Rs 100 Crores

The union government has announced the issue of the following two loans aggregating Rs 100 crores: (i) 5 per cent Loan 1984 to be issued at Rs 99.50 per cent and repayable at par on June 1, 1984; (ii) 5½ per cent Loan 1988 to be issued at Rs 99.50 per cent and repayable at par on June 1, 1988. Subscriptions to the above loans will be received from December 1 to 4, 1972 (both days inclusive) but the subscription lists may be closed earlier without notice as soon as the total subscription amounts to Rs 100 crores. Government reserves the right to retain subscriptions upto ten per cent in excess of the notified amount. If the total subscriptions received for the loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the subscriptions received and the balance refunded in cash as soon as possible.

Interest will be paid half yearly on June 1 and December 1. Interest on the loans now issued together with interest on other previous government securities and income from other approved investments will be exempt from

income-tax subject to a limit of Rs 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from Wealth Tax Act up to Rs 1,50,000.

India-Japan Trade Talks

Indian and Japanese businessmen will meet in New Delhi on December 7 and 8 to study the possibilities of expansion of trade between their countries and of increased Japanese investment in India. The Japanese delegation to the two day meeting of the business co-operation committee will be led by Dr Nagano and the Indian delegation by Mr Madanmohan Mangaldas, president of the FICCI. The 50 member Indian delegation will include representatives of leading public sector undertakings in trading and shipping fields. The agenda for the business co-operation committee includes a general review of economic situation in India and Japan, investments in joint ventures for shipping, agriculture and fisheries mining and infrastructure development.

Planning Boards of States

Eleven state governments have constituted planning boards in response to a directive issued by the Planning Commission in formulating the fifth Plan with the involvement of the common man up to the district level. The Planning Commission had received good response from state governments in its effort to involve the common man in the process of planning.

Road Development Fund

A study group on the improvement of highways has recommended the government to create a special fund for the promotion of wayside amenities. The fund to be called

"the Roadside Development Fund" should be created on the lines of the Central Road Fund and it should be administered by the central government, recommended the group. The eight member group, which was appointed by the government under the chairmanship of the Director General (Road Development) in the Ministry of Shipping and Transport, has also suggested that the establishment of restaurants, motels and eating places should largely be left to the private sector "though state governments or the road authorities should provide land for this purpose where available." Details of the recommendations made by the group were given to the Rajya Sabha recently by the Minister of State for Shipping and Transport, Mr Om Mehta. The minister told the House that the state governments and the concerned ministries of the union government were being consulted in the matter.

New business of LIC

New business, including group insurance, transacted by the Life Insurance Corporation

during 1971-72 amounted to Rs 1639.89 crores with an yearly renewal premium of Rs 71.38 crores, according to the annual report of the corporation. The amount represents an increase of Rs 336.81 crores over the sum assured in the previous year. The total number of policies issued were 1.90 million as against 1.62 million in 1970-71. Nearly 600,000 policies assuring Rs 375.9 crores, 23.1 per cent of the total new sums assured in the country, were issued in the rural areas.

Railway Revenue

Passenger traffic on the Indian Railways has shown an increase during September, 1972, in comparison with the corresponding month of the last year, the approximate number of passengers booked being 6.57 per cent more. The total number booked from April 1 to September 30, 1972 was 8.03 per cent more than during the corresponding period of last year and 5.03 per cent more than the budget target.

The revenue-earning freight

Government of India

5 PER CENT LOAN 1984 TO BE ISSUED AT
Rs. 99.50 PER CENT AND REPAYABLE AT PAR
ON 1ST OF JUNE 1984.

5-1/4 PER CENT LOAN 1988 TO BE ISSUED AT
Rs. 99.50 PER CENT AND REPAYABLE AT PAR
ON 1ST OF JUNE 1988.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs. 100 crores. Subscriptions may be in the form of cash/cheque. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

2. If the total subscriptions received for the loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the subscriptions received and the balance refunded in cash as soon as possible.

3. Interest will be paid half yearly on the 1st June and 1st December. Interest on the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs. 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in Government Securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs. 1,50,000/-.

4. Subscription lists will open on the 1st of December 1972 and close on 4th of December 1972 or earlier without notice.

Applications for the loans will be received at:

- Offices of the Reserve Bank of India at Ahmedabad, Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;
- branches of the subsidiary bank of the State Bank of India conducting Government treasury work except at Hyderabad; and
- branches of the State Bank of India at other places in India.

5. For full particulars please apply to any of these offices or branches.

traffic of the Railways in September, 1972 was 14.0 million tonnes, which indicates an increase of about 1.44 million tonnes approximately compared to September, last year. The total revenue-earning tonnage lifted by the Railways from April 1, 1972 upto the September 30, 1972 was 83.5 million tonnes representing an increase of 2.15 million tonnes as compared to previous year but a short-fall of 2.64 million tonnes against the proportionate budget target. The increase as compared to last year has been in respect of coal for public users, raw materials for steel plants, pig iron and finished steel from steel plants, iron ore for export and "other" goods. Table below gives the relevant figures.

Consultancy Services

In his inaugural address to the seminar on Consultancy Services in India, organised by the Industrial Credit and Investment Corporation of India, Mr. Y.B. Chavan the union minister for finance called for increased effort in the area of research and development and reliance on indigenous technology and consultancy services. Mr. Chavan pointed out that due to the shortage of foreign exchange, imported technology often proved very costly. He said that professional consultancy service could be of great assistance in reducing the handicaps faced by young and new entrepreneurs. The minister expressed satisfaction that a number of independent consultants had proved their worth internationally.

In his welcome address, Mr. H.T. Parekh, Chairman of ICICI, expressed satisfaction with the substantial growth in

consultancy services since Independence. In this process the public sector had also given a lead by establishing several firms of high quality. He revealed certain imbalances that exist in the development of these services, particularly in the need for developing technical consultancy. Mr. C.D. Khanna, Chairman of Industrial Finance Corporation outlined the role of financial institutions in evaluation of projects and the contribution that could be made by consultants for the purpose. The latter could play an important role in the information gap that existed in the submission of proposals to the institutions. Mr. K.B. Rao, Director General of DGT, drew the attention to the fact that during the fifth Plan there was likely to be considerable scope for indigenous consultancy services in the area of power supply, fertilizers steel and engineering industry. Mr. J. Channugam of the World Bank noted the growth of consultancy services in this country but felt that there was scope for their improved performances.

ONGC Wells

The Oil & Natural Gas Commission had drilled 982 wells in the country by the end of September, 1972. Out of these completed wells, 597 indicated the presence of hydrocarbons, 266 turned out to be dry, 26 were water injection wells and the remaining 93 had yet to be tested fully. The total number of structures on which these wells had been drilled was 110, of these, 71 were in Gujarat and 12 in Assam. Six structures had been drilled in Tamil Nadu followed by five each in Rajasthan and Himachal Pradesh and Punjab. Structures in UP,

Total for all classes ('000)

	Cumulative from April 1, to September 30, 1971	
	Number	Percentage increase over last year
Suburban	682,652	+13.3
Non-suburban	641,091	+2.89
Total	1,323,743	+8.03

Pondicherry, Bihar, West Bengal, Jammu and Kashmir and Tripura had also been tested.

Employment Programmes of Assam

Five additional schemes costing Rs 18.96 lakhs have been approved by the Planning Commission for inclusion in the Special Employment Programmes of Assam during the current year. These are in addition to the eleven schemes, involving a total outlay of Rs 50.78 lakhs, approved earlier. An important new scheme pertains to investigation of Nonoi, Borolia, Kapili and Dhansiri South projects in the Flood Control and Irrigation Wing of state government.

Names in the News

Paul H. Leman President of Alcan Aluminium Limited, the

world's largest international aluminium company, is on a brief visit to this country. A French Canadian by birth, Mr. Leman has been a director of Alcan Aluminium Limited since 1968 being named executive vice-president, smelting, in the same year. Early in 1972, he was elected President of Alcan Aluminium Limited, the principal shareholder of Indian Aluminium Company Limited. Mr. Leman is a director of Canada's Export Development Corporation, which agency has administered Canadian aid to several major development projects in India, both in the private and public sectors. From 1962 to 1964, Mr. Leman was a full-time member of the Canadian Royal Commission on Banking and Finance.

Readers' Roundtable

Politics in Banking

"ALTHOUGH nearly two years are over since the rules for appointing boards of nationalised banks were framed, to date they have not been appointed.

Mr. Mohan Dhar, union Minister for Planning, has publicly criticised his own government in this connection saying that the delay "cannot be justified".

It is understood that the real difficulty is not the appointment of employee representatives but the enormous pressure by politicians to get on the boards or in the alternative to put their nominees. The other difficulty is the pressure mounted by officers in the ministries to be appointed as chairmen of new boards displacing the existing professional bankers.

Our Association has made a demand upon the Finance Ministry that when the boards are appointed the following information should be made public.

"It is very important that the depositors as also the general public should know the following details about the directors you are appointing to

these public institutions.

1. What is his/her achievement in any sphere of life?
2. What are the educational qualifications and work experience?
3. Does he or she have any banking knowledge or managerial skill?
4. The annual income, and assets (this must be disclosed every year).
5. Whether he or she knows any one in the Reserve Bank of India or Finance Ministry or the ministers at union or state level.
6. Whether the nominee has been or is a member of any legislature of the country or has been active in politics during the last five years; if so, whether he or she has been defeated in any election.

COMPANY AFFAIRS

Kothari Sugars

KOTHARI SUGARS and Chemicals Ltd has been able not only to wipe out the entire loss brought in from previous years with the earnings for the year ended August 31, 1972 but also to resume handsome payment of dividend on ordinary shares. The directors have recommended a final equity dividend of six per cent and a cash bonus of three per cent for 1971-72. With the interim dividend of six per cent the total dividend for the year comes to 15 per cent. During the year under review the company has earned a substantially higher profit, the profit before depreciation being Rs 67.82 lakhs as compared to only Rs 23.14 lakhs in 1970-71. The allocation to depreciation reserve was enhanced from Rs 16.41 lakhs to Rs 17.47 lakhs while a sum of Rs 4.54 lakhs was set aside to development rebate reserve as against no provision in 1970-71. On the last occasion, after providing for depreciation and expenses relating to previous years the debit balance of Rs 24.10 lakhs was reduced to Rs 18.05 lakhs and this deficit has been completely eliminated during the year. Out of the disposable profits of 1971-72, a sum of Rs 15 lakhs was transferred to dividend reserve as against no allocation in the preceding year. An amount of Rs 4.38 lakhs as against Rs 88,201 in 1970-71 has also been earmarked for expenditure relating to previous year.

Sakthi Sugars

Sakthi Sugars Ltd proposes to capitalise Rs 38.40 lakhs out of its reserves and issue bonus shares, subject to the consent of Controller of Capital Issues, in the ratio of two shares for every five equity shares held. Besides the company is step-

ping up its equity dividend to 15 per cent for the year ended June 30, 1972 as compared to 12 per cent for the previous year and six per cent for 1969-70. With a jump in sales from Rs 6.48 crores to Rs 10.55 crores, gross profit before depreciation and taxation recorded a spectacular rise to Rs 135.34 lakhs from Rs 55.06 lakhs in 1970-71. The gratifying results for the year under review were due to a substantial increase in cane crushed to 5.26 lakh tonnes from 4.35 lakhs tonnes in 1970-71 while the sugar produced was significantly higher at 50063 tonnes as against 40159 tonnes with recovery moving up from 9.23 per cent to 9.52 per cent. The quantity of cane crushed for the whole of 1971-72 season was of the order of 5.91 lakh tonnes with a recovery of 9.42 per cent, and it is claimed to be the largest for any single unit in the country during this season. The directors have enhanced, appreciably the appropriation to all reserves.

The allocation to depreciation reserve was raised from Rs 20.05 lakhs to Rs 29.89 lakhs, to development rebate reserve from Rs 7.22 lakhs to Rs 13.50 lakhs, to general reserve from Rs 17.19 lakhs to Rs 72.50 lakhs, and dividend reserve from Rs 10.56 lakhs to Rs 12.95 lakhs. The gratuity fund is credited, for the first time, with a sum of Rs 6.50 lakhs. No provision has been made in respect of taxation. The estimated liability of Rs 50 lakhs on this account will be met of the general reserve as the need arises. The future prospects are quite promising as a distillery with an initial capacity of two million gallons annually has started functioning since June this year and will be making a sizeable contribution to the earnings for 1972-73. Schemes

are under way to expand the capacity of this unit to three million gallons.

Hindustan Sugar

The directors of Hindustan Sugar have proposed to issue subject to the consent of the Controller of Capital Issues bonus shares in the ratio of one share for every three shares held by capitalising a sum of Rs 84 lakhs out of the company's reserves. They have also recommended payment of a dividend of 10 per cent for the year ended June 30, 1972, the same as in 1970-71. With a jump in sales from Rs 14.48 crores to Rs 20.98 crores the gross profit has moved up steeply to Rs 2.56 crores from Rs 1.69 crores in 1970-71. Out of the gross profit the directors have allocated a sum of Rs 52.26 lakhs to depreciation reserve and Rs 2.03 lakhs to development rebate reserve against Rs 55.49 lakhs and Rs 2.07 lakhs provided respectively in 1970-71. An amount of Rs 1.26 crores was appropriated to taxation reserve as against no allotment in the preceding year.

Acme Manufacturing

Acme Manufacturing Co Ltd has made satisfactory progress during the current year with sales in the first four months of the current year being higher by over 50 per cent as compared to the similar period of last year. The company is making vigorous efforts to secure orders at economic prices in spite of severe competition, their value at present exceeding one crore rupees as against only Rs 36 lakhs at the end of June 1972. In fact with the seasonal increase in sale of diesel engines, improvements in sales management for specialised job work and rapidly increasing sales of engine valves

the overall sales volume is expected to reach new highs during the current year. The company has been intensifying its research and development efforts in product lines that have so far accounted for relatively small portion of the company's total volume but which doubtless offer more promising opportunities for long term growth than diesel oil engines. At the same time the management is exploring possibilities of diversifying into new lines of manufacture so as to ensure optimum utilisation of resources. The company because of its association with Walchand group was registered as an interconnected undertaking under MRTP Act. The company has made an application to the Company Law Board for delinking and once approved by the government the company will be able to carry on its activities in the normal way. Its application for the manufacture of road rollers and paver finishers are pending with the government.

International Computers

International Computers and Tabulators is keeping the equity dividend unchanged at 11 per cent for the year ended September 30, 1972. The company has earned during the year a handsome profit of Rs 29.17 lakhs, recording an improvement of as much as Rs 1.12 lakhs over 1970-71. The appropriation to depreciation reserve was stepped up from Rs 13.75 lakhs to Rs 17.30 lakhs while an amount of Rs 7.91 was transferred to development rebate reserve as against Rs 8.10 lakhs in 1970-71. No provision has been made for taxation against Rs 1.25 lakhs in the previous year.

Hypine Carbons

Though there are some units producing activated carbon for the oil industry Hypine Carbons is the only sophisticated unit manufacturing high grade activated carbon required by the chemicals, dyes and pharmaceutical industries.

The company's plant is now complete and trial runs have yielded gratifying results. Ma-

als produced were supplied to such leading consumers as Indian Drugs & Pharmaceuticals Ltd, Hyderabad and Rishikesh; Maize Products, Ahmedabad; Glaxo Laboratories (India) Ltd., Bombay; and Hindustan Organic Chemicals, Rasayani, all of whom have since placed their orders with the company. Apart from these leading companies repeat orders have also been received from Hindustan Antibiotics Ltd, Pimpri, Roche, Sandoz, Sarabhai Chemicals, Mac-Gan Ravindra. Products samples have been approved by, and long term contracts are being negotiated with, Atul Products, Ciba, Pfizer, Synbiotics and Tata Fisson. Samples have also been sent to countries in east and west Europe, and other countries abroad, and it is hoped to finalise major orders shortly from the USSR and Japan.

The carbonizer, which is now ready, will enable the company to manufacture pine charcoal, instead of purchasing it, thereby ensuring a superior quality in the ultimate product. The carboniser will also release pine-tar as a by-product, and increase the profitability of the company in the process. It is heartening to note that production is well under way and over 250 tonnes have been produced already. The capital of the company was further increased by another Rs 15 lakhs by offering Rights Issue and out of Rs 15 lakhs offered, nearly Rs 10 lakhs were taken up. Arrangements are being made to get the balance amount subscribed.

Colour-Chem

Colour-Chem's performance in the current year is expected to be far better than in 1971-72. Thanks to a marked increase in demand for several of its products the sales are expected to be well above the record levels reached in the previous year. Its plant for the manufacture of dyes-intermediates was commissioned in 1970 when the demand for its products was much lower than the installed capacity. However with the rise in demand the plant is being better utilised.

The company has also paid increasing attention to research and development. Over 30 new items within its licensed capacity were developed and placed in the market during 1971-72. During the current year the company has developed entirely on its own research an important new dye-intermediate which will be manufactured for the first time in the country. A new research centre is under construction aimed primarily at substituting essential raw materials which until now were imported. For exports the company has been directing its main efforts to the sophisticated markets of Europe, the USA, and Canada where it has achieved a substantial export volume with the help of its collaborators, Bayer AG and Hoechst AG.

Bayer

Bayer (India) Ltd, a leader in Asia in the field of pesticides, rubber chemicals and pharmaceuticals, is now embarking on an ambitious expansion of the production capacity in respect of basic pesticides as the demand is fast growing. It is also planning to expand further the capacity for the manufacture of rubber chemicals as the demand for these, especially by the tyre industry is growing on account of the rapid increase in transport. The erection of the plants will begin in the middle of 1973 and enhanced production will become available from the middle of 1975. Besides the company has received a letter of intent for the manufacture of aromatic di-isocyanates (TDI), a basic raw material for polyurethane foams used for mattresses, thermal insulation and other purposes. It will involve a total capital expenditure of about Rs 15 crores.

CAFI

The report of Chemicals and Fibres of India for the year ended September 30, 1972 states that despite firm export orders the momentum gained in the first half of the year could not be maintained latter because of a prolonged ban on export to Sudan, a major market for 'terene' blended fabrics. The

total shipments at Rs 63 lakhs were lower than those for the previous year although the export of garments, particularly trousers, to western Europe was encouraging. However, the company is confident of meeting its larger export commitments imposed in connection with expansion of the plant capacity to 6100 tonnes per year. The demand for 'terene' recorded a significant improvement in the second half of the year with the recovery of the textile industry from recession. The severity of the excise levy on polyester fibre and polyester blended fabrics, and garments, however, continues to restrict the growth of the market.

Tensile Steel

The directors of Tensile Steel Ltd have decided to capitalise Rs 15 lakhs from its general reserve by issuing bonus shares in ratio of one share for three shares held subject to the consent of CCI. The company's paid up capital will now stand at Rs 60 lakhs by the proposed issue. The company's working during the current year is considered satisfactory especially when severe power cut and consequent loss of production is taken into account. The sales for the seven month-period ended October 31, 1972 amounted to Rs 168.62 lakhs as against the sale of Rs 168.94 lakhs for the similar period last year. The company's expansion programme is making satisfactory progress. The company expects to receive shortly a letter of intent from the government of India for the production of 7,500 tonnes PC wire, which when fully implemented would bring the PC wire capacity to 17,500 tonnes from the present licence capacity of 10,000 tonnes.

Unit Trust

The sale and repurchase prices of the units of the Unit Trust of India were raised by 10 paise each to Rs 10.80 and Rs 10.50 per unit respectively with effect from November 21.

News and Notes

(Expansion and Diversification)
Ramon Group of Industries

is setting up three ambitious projects with public participation for the manufacture of gear cutting tools, cylinder heads, and universal joint kits, etc. The total financial requirements for the projects would be of the order of Rs 7 crores. The Gear Cutting Tools Project will be in collaboration with a world-reputed Italian manufacturer and will be located at Thana, Bombay. The Factory will manufacture hobs, shaping cutters, shaving cutters, gleason blades, which are now being imported to a great extent and consumed by automobile ancillary industries tractors, machine tools, textile machinery, earth moving equipments, printing machinery and aircraft industry. It will involve a capital outlay of approximately Rs 2 crore with an equity capital of Rs 1 crore and the balance to be raised by way of loans. Sale would be to the tune of Rs 7 lakhs and the installed capacity per annum would be—hobs 2500 nos, shaping cutter 2500 nos, shaving cutters 600 nos, gleason blades 500 nos. From very conservative estimate it is possible that company's factory would be able to generate adequate profits from the third year of its operation. The Cylinder Heads Project will be with French collaboration to be situated at Tanti in Surat district, Gujarat state. The cylinder heads to be manufactured would be for automobile industry in general but mainly for trucks, cars and tractors. The total cost of the project would be around Rs 2 crores inclusive of equity capital of Rs 1 crore having public participation. The annual production of the plant would be around 18,000 cylinder heads with sales valued at Rs 1.80 crores. The return on capital is estimated to be 2 per cent from the second/third year of production.

The project for the manufacture of universal joint kit, propeller shafts, axle shafts would also have Italian collaboration and will be located at Tanti in Surat district, Gujarat state. The financial requirements of this project would be around Rs 3 crores including issue

capital of Rs 1 crore. The production target of the plant would be 1,25,000 nos, UJ Kits, 50,000 nos, Propeller Shaft Assembly and Axle Shaft Assembly 40,000 nos. per annum to be reached by methods of graduation and is expected to meet the future increase in domestic demand for end-products as well as replacements in addition to earning foreign exchange by way of exports. Installation of latest automatic machinery and the operational economies with the expected not sales value of production of Rs 2.58 crores assure of a steady return to the investor from the third year of its operation.

Capital and Bonus Issues

Consent has been accorded to nine companies to raise capital amounting to over Rs 10.66 crores.

The Indian Oxygen Ltd, Calcutta, has been accorded consent, valid for three months, to capitalise Rs 1,54,00,000 out of its free reserves and issue fully paid equity share of Rs 10 each as bonus shares in the ratio of one bonus share for every three equity shares held.

Western Bengal Coalfields Calcutta, has been given permission for the issue of Rs 55 lakhs in debentures of Rs 1000 each carrying interest at the rate of 8.5 per cent per annum and redeemable at par after ten years but not later than eight years from the date of issue, for cash at par to be subscribed privately. The proceeds will be utilised for financing the development programme of the company within the licensed capacity for production of coal. The consent is valid for 12 months.

Chandan Metal Products Baroda, has been granted consent for issue of bonus shares worth Rs 5 lakhs.

Graphite India, Calcutta, has been accorded consent for the issue of Rs 170.84 lakhs divided into Rs 25.84 lakhs in right equity shares, Rs 25 lakhs in 9.3 per cent redeemable cumulative preference shares to the public through a prospectus and Rs 120 lakhs in 8.5 per cent debentures to the Life Insurance Corporation and Unit

Trust of India for cash at par. The proceeds will be utilised for setting up a new plant at Bangalore for the manufacture of graphite electrodes, anodes, carbon paste and miscellaneous graphite and carbon products. The consent is valid for 12 months.

The Tata Iron and Steel Co. Ltd, Bombay, has been given permission for the issue of convertible debentures of the value of Rs 100 lakhs carrying interest at the rate of 8.5 per cent per annum, for cash at par to the Unit Trust of India. The proceeds will be utilised for financing the replacement and modernisation programme of the company. The consent is valid for 12 months.

Bhilai Wires, Bhilai (MP), has made a statement of proposals for Rs 52.50 lakhs in equity share and the same has been acknowledged by the government. The proposed issue, is to be utilised for setting up a plant in the industrial area at Bhilai.

Shri Bhawani Cotton Mills Ltd, Calcutta, has been accorded consent for issue of bonus shares worth Rs 17.50 lakhs.

The Patna Electric Supply, Calcutta, has been accorded consent, valid for 3 months, to capitalise Rs 11.69 lakhs out of its general reserve and issue

fully paid bonus shares of Rs 10 each as bonus shares in the ratio of one bonus share for every three equity shares held.

Ashoka Paper Mills Ltd., Calcutta, has been granted consent, for issue of equity capital of Rs 500 lakhs for the purpose of setting up factories for manufacture of pulp and paper in the states of Bihar and Assam.

New Issue

Blow Plast will be entering the capital market sometime in February 1973 with a public issue of Rs 51 lakhs comprising equity capital worth Rs 36 lakhs in equity shares of Rs 10 each and preference capital worth Rs 15 lakhs in preference shares of Rs 100 each. The company's present paid-up capital is of the order of Rs nine lakhs. It is seeking government's permission to capitalise Rs 27 lakhs and issue bonus shares. After the bonus issue the company will issue fresh capital of Rs 24 lakhs in equity shares and Rs 15 lakhs in preference shares, both at par. In addition to the fresh capital issue, the directors will offer for sale equity shares of Rs 12 lakhs at par from the holdings of the existing shareholders. Thus the offer of equity shares to the public will to the tune of Rs 36 lakhs.

The company, which is now a private company, will shortly be converted into a public limited company. After the capital issue the company will get its shares listed on the Bombay stock exchange. Engaged at present in the manufacture of PVC footwear, suitcases and briefcases and plastic moulded products at its factories at Bhandup and Nasik. The company plans to manufacture plastic chairs, PVC sheetings and plastic fire extinguishers. The proceeds of the issue will be utilised partly to finance the growing business and partly to implement the diversification programmes. The company has made significant progress in the past few years. It has achieved a turnover of Rs 6.15 crores and earned a gross profit of Rs 24 lakhs in 1970-71. The company's sales are expected to increase to about Rs 7.3 crores in 1973-74 and further to Rs 10 crores in 1974-75. The gross profit too is expected to go up from Rs 50 lakhs in 1972-73 to Rs 70 lakhs in 1973-74 and touch the Rs one-crore mark by 1974-75. The directors are hopeful of declaring a dividend of 10 per cent for 1972-73 on the increased capital. The new shares to be offered to the public will rank for dividend from the date of allotment.

ALUMINIUM CAN MAKE YOUR HOME LOVELIER AND LIVELIER

Sleek, elegant, light, bright, strong, durable, rust-proof, hygienic... one could go on listing the virtues of the wonder metal, ALUMINIUM. Every modern home uses versatile aluminium furniture, fixtures, utensils and appliances. Join the modern trend—use aluminium in your home too. Make sure that your furniture is made of Hindalco Aluminium. Hindalco does not make these finished goods but it supplies the much-needed aluminium (in primary & Semi-fabricated forms) for their manufacture.

**HINDUSTAN ALUMINIUM
CORPORATION LTD.**

WORKS: P.O. RENUKOOT, DIST. MIRZAPUR, U.

COMPANY MEETING

TATA CHEMICALS LIMITED

Speech delivered by the Chairman, Mr J.R.D. Tata, at the 33rd Annual General Meeting of the Company, on Thursday, 23 November, 1972.

Ladies and Gentlemen,
A decade of progress

It does not happen often that a Company can report to its shareholders uninterrupted progress in output, revenue and profit for ten consecutive years during which it has produced over Rs. 100 crores worth of vital industrial raw materials and saved an equal amount of foreign exchange, provided nearly Rs. 14 crores in wages and benefits for employees, paid nearly Rs. 17 crores in taxes to the exchequer and saved the consumer nearly Rs. 3 crores in the form of lower prices than those charged by its competitors.

2. The performance of the Company over the last decade is all the more creditable in that it has been achieved entirely on its own without any outside assistance in an especially difficult field of basic chemicals.

3. The Company's success in overcoming the grievous initial difficulties which for some time threatened its very survival, in developing its own know-how and technology and in achieving its present undisputed technical and commercial leadership has been mainly due to the self-reliance, determination, technical competence, high spirit and morale of its personnel from top management downwards.

4. In no industrial venture in the country of which I know is management more highly professionalised than in Tata Chemicals. "Ten out of twelve of our top executives are technocrats", and all of them have risen from the ranks and grown deep roots in the otherwise arid soil of Mithapur.

5. Tata Chemicals thus provides a significant example of what Indian private enterprise can achieve for the country when led by high calibre professional management imbued with pioneering zeal and a patriotic spirit. This is the

kind of commitment we want in the economic and industrial managers of our economy, whether in the public or private sector and not a commitment to any ideology.

Dedication to the public interest

6. We hear a lot today about the evils and dangers of concentration of economic power in large-scale private enterprise. Your Company provides on its own an answer to these forebodings. With its dominant position in soda ash and with the freedom it has to control the quality, price and distribution of its products, there are, no doubt, those who would consider it guilty of a dangerous concentration of economic power. The exemplary manner in which your Company has exercised such economic power for the common good, and not to the common detriment assumed so freely by those who can see nothing good in free enterprise, has, I hope, helped in correcting the adverse image which much of the private sector has deservedly acquired in the country.

7. Tata Chemicals has throughout lived up to the most stringent criteria that can be established to assess the performance of a business concern in the socio-economic context of the day. It has throughout safeguarded and promoted the interests of its consumers by providing them with products of the highest quality at prices lower than those of its competitors and distributing them in such a manner as to ensure that they could not find their way into the black market; of its employees by paying them the highest wages in the industry, providing them with the best conditions of work and health, housing and educational benefits for themselves and their families, and giving them the maximum job satisfaction reflected, year after year, in excellent labour relations; of its shareholders by providing

them with increasing dividends, and a growing market value for their shares; and finally, of the community by a sustained programme of support to the people of Okhamandal, where its works are located, and particularly to those in need of relief and help. With such resources, physical and human, and with such an unsurpassed record of performance and social consciousness, the Company has been for some years poised to play an even bigger role in meeting the country's needs.

Fertiliser Project

8. While we have been permitted to undertake a substantial expansion in the manufacture of soda ash and other marine chemicals at a fraction of the cost in rupees and foreign exchange at which it could have been achieved by others, we cannot but deeply regret that our efforts to extend our activities to the development of the all important fertiliser industry have so far been frustrated. The fate of the great and imaginative project which we submitted to Government five years ago, is too well known to need recapitulation.

9. It is good to know, however, that the premises on which the project was based, many of which were contested and opposed in official circles, have all been vindicated with the passage of time.

10. Let it also be known that if the project had been cleared, as originally planned, it would already be today at that stage of its eight-year development programme when it would be producing annually 800,000 tonnes of balanced fertilisers valued at about Rs. 70 crores which the country is compelled instead to import at heavy foreign exchange cost.

11. Weary, but not defeated, we persisted in our efforts and I am glad to say that at long last, it now seems that the project, though considerably curtailed in its scope, will ma-

terialise. We filed our application for the conversion of the letter of intent which was issued to us last May into an industrial licence and, by the time we meet next year, I hope that the project will be well on its way to fulfilment.

12. Short only of endangering the economic viability of the great national asset that our Mithapur base is today, we will do all within our power to implement the project as expeditiously as possible. While, as stated earlier, the project has been considerably curtailed in scope by comparison with that of the original project, I have every hope that in view of the great benefits by way of increased efficiency, lower costs, and larger savings in foreign exchange that will accrue to the country through the use of the most advanced technology, Government will in due course themselves wish us progressively to expand and diversify the project and thus enable Mithapur to realise its full potential in the allied fields of alkalies, fertilisers and marine products.

13. In the meantime, as stated in the Report, we are proceeding expeditiously with the recently licensed expansion of our soda ash capacity to a thousand tonnes per day, which we expect to complete by mid 1974 and I hope that Government will soon convert into an industrial licence the letter of intent they have issued to us for a further expansion which would bring our total capacity to about half a million tonnes a year.

14. I am sure that in the light of the Company's sustained record of progress, the shareholders will approve of the proposal before them for an issue of equity capital, subject, of course, to the approval of the Controller of Capital Issues.

15. With the continued growth of its activities in its own field of soda ash, alkalies and marine chemicals, and its long hoped for entry into the entirely new field of fertilisers, it is clear that the Company must enlarge its capital base. On the basis of its past record of achievement, I have little doubt that such expansion of capital will be, in both the short term and long term inte-

rests of the shareholders.

Ventures abroad

16. It is now two years since shareholders were first informed of the Company's decision to compete for a project for the establishment of soda ash industry in Argentina, in response to an invitation by the Government of that country for worldwide tenders. Last year we reported that the commission appointed by the Government to assess the bids had rated the Tata bid as the best, but that they had decided, for various reasons, to enter into negotiations with the bidders.

17. Although progress has been slower than was originally anticipated, I am glad to be able to report that the matter now seems fairly near a final decision. It is likely, however, that because of a desire to accelerate the industrial development of an area of that country different from the one in which we had planned to establish the Tata sponsored project, the final schema will take the form of a collaboration with one of the other tenders, the proposed location of whose project was in the region now apparently preferred.

18. Shareholders may be interested to know that we have also initiated negotiations with an industrial group in a European country for the establishment of a soda ash plant, but on a somewhat smaller scale than the Argentinian one.

19. The fulfilment of either or both of these schemes will establish beyond doubt in other parts of the world, the high competence and leadership of your Company in this difficult field of basic chemicals, and open the door, I hope, for further beneficial developments abroad.

20. We shall continue our efforts in that direction fully aware of the many-sided difficulties involved in undertaking such large commitments abroad, but with the confidence derived from the self-reliance and experience we have built up over the years.

Prospects for the current year

21. As four months have passed since the close of the year under review, and share-

holders are usually anxious to have the latest information on the progress of the Company, I am glad to inform you that the Company is continuing to make good progress in the current financial year. Although for the four months ending 31 October, production has been only slightly higher than during the corresponding period last year because of the unexpected trouble with the High-Pressure Boiler which has since been rectified, I have every hope that, barring unforeseen circumstances, the results for the current year will for yet another year be better than those achieved during the previous year.

22. I am sorry to say however that Okhamandal is in the grip of a severe drought. The Company has launched a major programme of assistance to the Okhamandal community by way of supply of drinking water to every village which needs it, medical care, child care, cattle fodder, supply of seeds etc. In addition, the Company is offering about 1,000 additional jobs—at regular wages—to the Okhamandal community so long as the present drought conditions persist.

May I, as usual, on your behalf and mine extend to our Managing Director and all other members of Management and Staff, our grateful thanks for the manner in which they have conducted the Company's affairs during the past year to the continued and growing benefit of all concerned. The apparent ease and continuity of their success in producing each year better results than in the previous one, should not however mislead us into believing that their's has been or is today, an easy task. From personal knowledge, I can vouch for the tremendously hard work, ingenuity, and unremitting efforts required to achieve such results. It is very much to their credit that they have not allowed success during the past few years to damp their zeal to outperform themselves, and I hope they never will.

(Note: This does not purport to be a record of the proceedings of the Annual General Meeting of the company.)

"You don't look as if you've spent a long hard day at the office," said my wife.

(Suspicious, that's what women are!)

Why doesn't somebody tell her about Blue Star Packaged Climate Systems?

Understandable. A working woman would know better but the housewife seems to take it for granted that a day in the office ought to make a wreck of any man. Obviously, nobody's told her about highly productive modern offices and Blue Star Packaged Climate Systems!

The result of 30 years' experience and know-how these Packaged Climate Systems are designed to give you perfect working climate throughout the year. So that you work better... harder. And still have energy left to confuse your wife after a long hard day at work!

India's first and finest:

Blue Star Packaged Climate Systems

- Ideal for Banks, Offices, Showrooms, Department Stores, Restaurants, Hotels, Clubs, Canteens, Hospitals, Beauty Parlours.
- Reasonably priced and quality-built to work with amazing efficiency, economy, flexibility.
- Available in 3 capacities—5, 7.5 and 10 H.P.
- Choice of water or air cooled models.
- Dependable and trouble-free in performance; backed by Blue Star's warranty and free service for one year, and a countrywide network of service centres.

BLUE STAR

MYSORE HAS THE PERFECT INDUSTRIAL CLIMATE

- Low cost power, water, labour.
- Industrial sites.
- Efficient network of railways, highways, telecommunications, airports and seaports.
- Sales tax refund on capital equipment, building and raw materials for 5 years.
- Initial exemption from electricity tax.
- 33 1/3 % of all government purchases reserved for small industries.

and finance from MSFC keeps it equable

Industrial finance from the Mysore State Financial Corporation is available to industries engaged in • the manufacture, processing and preservation of goods • the hotel, cold storage and transport business • the generation or distribution of electricity • the development of a contiguous area of land as an Industrial Estate. MSFC advances 75% of the project cost to small industries and up to 50% to others (relaxable up to 10% in special cases). In March 1972, MSFC's total

investment in some 1000 industries located throughout the State was well over Rs. 15 crores. Stimulating greater industrial development and production, MSFC's integrated finance program is specially mapped out for new and expanding industries; in collaboration with the Mysore Small Industries Corporation and the Small Industries Service Institute which offer facilities like locating sites and buildings, obtaining licences and project evaluation for your industry.

RECORDS AND STATISTICS

Industrial Growth : 1969-72

THE AGENDA papers circulated by the Ministry of Industrial Development for the 24th meeting of the Central Advisory Council of Industries included a review of the industrial scene in the country; the review showed that the index of industrial production in the first five months of the current year had recorded a rise of 7.5 per cent over the corresponding period in 1971. Such important industries as cotton textiles and transport equipment had made a distinct recovery. However, shortages in power, coking coal and transport bottlenecks had continued to hinder acceleration of the industrial growth rate.

The review is given below in full:—

The year 1971-72 was characterised by severe strains brought to bear on the national economy. The economy continued to grow during the year, but at a slower rate than was envisaged during the fourth five-year Plan. The growth rate of national income during 1971-72 was expected to be no more than 4 per cent as compared with 5 per cent achieved in 1970-71 and 5.5 per cent in 1969-70.

The year 1972-73 began with hopes of higher economic growth, though there are some disturbing trends (particularly as to agricultural output and to prices). The growth rate in industrial production has

picked up. The index of industrial production during the first five months of 1972 was higher by 7.5 per cent as compared with that of January-May 1971. Important industries like cotton textiles and transport equipment which had shown a decline in production during 1971 have made a distinct recovery during the current year and other industries like chemicals, basic metal industries, and non-electrical machinery have shown continued growth in production. However, power shortages in certain areas, shortages of coking coal (for the steel industry) and transport bottlenecks have hindered the acceleration of the industrial growth rate.

In the field of investment, the trends of registration of new companies and their proposed share capital as well as of issue of new capital, are encouraging.

However, in the agricultural field, hopes of a bumper crop have been belied due to the delayed, and in many areas insufficient rains. Some cash crops may still fare well, but some others may be adversely affected. Thus, while sugar production may be better than last year, it may still not reach the levels attained in 1970-71. The prospects of the cotton crop have improved with the late onset of the monsoon, but groundnut production has been seriously affected, which may affect the prices of edible oils and vanaspati.

As to prices, during September 1972, the index number of wholesale prices has reached the peak of 208.7, which is 9.1 per cent higher than the position a year ago. The liquidity position of commercial banks is comfortable.

Against the unprecedented growth in money supply and monetary resources (arising from Government deficit spending), the Reserve Bank has had to enforce general restraint on credit, and at the same time ensure the availability of credit to meet the requirements of production. Special emphasis has been given to both agricultural credit and credit to the small-scale sector.

India's exports during the first five months of the year have shown an impressive increase of 18 per cent over the corresponding period of the last year. The foreign exchange position is comfortable in spite of a drop in the reserves. However, owing to growing import needs in respect of steel, fertilizers, petroleum products and other essential requirements of the economy, the need for accelerated emphasis on export growth, and of import substitution efforts, is more than ever of urgency and importance.

2 (a): Index of Industrial Production, 1971:

The general index of industrial production at 186.1 for the year 1971 registered a disappointing percentage increase of some 3 per cent over the previous year as compared with the modest increase of 4.8 per cent recorded in 1970 over 1969.

An analysis of the 1971 index of industrial production by industrial groups and sub-groups indicates that apart from 'electricity generated' which rose by 7.3 per cent and 'mining and quarrying' which rose by 3 per cent, the major group 'manufacturing' show-

ed a growth rate of only 2.3 per cent.

The major growth leaders in the group 'manufacturing' were as follows:—

	Per cent
Wood and Cork Mfrs.	12.8
Woollen Textiles	12.4
Rubber Products	12.1
Electrical Machinery	11.6
Jute Textiles	11.3

Industrial groups that have maintained a reasonable growth rate (say between 4 to 10 per cent) include:—

Non-metallic Minerals	9.7
Beverage & Tobacco	7.3
Mfr. of Metal Products	7.0
Mfr. of Chemicals	6.8

Petroleum Refinery Products	6.6
Paper & Paper Products	4.2
Mfr. of Leather Footwear	4.2

The major areas of concern where production levels had either declined or had just been maintained include:—

Leather & Fur Products	—15.3
Transport Equipment	—7.5
Cotton Textiles	—5.9
Basic Metal Industries	+1.5
Non-electrical Machinery	+1.0
Food Manufactures	+0.1

In the group 'transport equipment', the decline can be attributed to a fall in the production of railway wagons (due to lack of firm orders); a decline in orders executed for ship building and repairing (from Rs 1174 lakhs in 1970 to Rs 962 lakhs in 1971) and a fall in the production of bicycles and motor cycles.

In the group 'cotton textiles',

there has been a decline in the production of both cotton yarn and cotton cloth mainly due to a shortage of raw cotton.

The low growth rate in the 'basic metal industries' can be traced to a fall in the production of finished and semi-finished steel, steel ingots and pig iron.

The comparatively static picture observed in the 'manufacture of non-electrical machinery' can be ascribed to a fall in the production of power driven pumps, vehicular diesel engines, tea machinery, air compressors and tractors.

2 (b): Index of Industrial Production, 1972 (January-May)

The official index for the first five months of 1972 (January-May) stands at 198.2 showing an increase of 7.5 per cent as against an increase of 1.4 per cent registered during the corresponding period of 1971. The major group 'manufacturing'

has registered an encouraging increase in production, by +6.8 per cent as compared with +1.1 per cent in the corresponding period of 1971.

The major contribution to this resurgence in industrial production can be traced back to a healthy revival in the manufacture of cotton/woollen/jute textile, paper products, rubber products, manufacture of chemicals and electrical machinery.

There have also been encouraging increases in the production of leather footwear, petroleum refinery products, non-metallic minerals, basic metal industries, non-electrical machinery and transport equipment.

It may be mentioned that of particular importance is the step-up in the amount of electricity generated, which has increased by 12.5 per cent during January-May 1972, as compared to only 7.3 per cent

Table A (Rs crores)

	Jan-Sept 1970	Jan-Sept 1971	Jan-Sept 1972
I. Total Equity	45.23	41.30	52.56
(a) New issues	8.21	8.96	27.66
(b) Rights	17.3	4.45	5.85
(c) Bonus	29.14	18.81	15.87
(d) Others	6.15	9.08	3.18
II. Preference	4.43	1.92	7.45
III. Debentures	5.10	6.22	44.48
Total Consents	54.76	49.44	104.49

The Table B gives some indicators of investment activity over a longer period :

Table B (Rs crores)

	Capital raised by non-govt companies (calendar year)*	CG/HEP Licences Issued (April-March)	Assistance disbursed by all term lending financial institutions* (April-March)
	96.4	83.8	85
	92.7	73.2	111
	86.7	127.1	133
1971-72	77.7	252.2	162

*Source: Annual Report of the IDBI.

during 1971. This increase is likely to have been moderated in the succeeding months owing to the delayed monsoon (and consequent low level of water supply for hydro-electric power generation).

3. Production of Selected Industries, 1972 (January-July)

While data on the official index are available only up to May 1972, provisional production data are available for 125 selected industries for the period January-July 1972.

Industries that have recorded creditable increases in production include steel pipes and tubes (47 per cent), sugar mill machinery (36 per cent), weighing machinery (32 per cent), motor cycles (41 per cent), three-wheelers (89 per cent), electric fans (28 per cent), VIR and PVC Cables (30 per cent), nitrogenous fertilizers (28 per cent), phosphatic fertilizers (21 per cent), calcium carbide (25 per cent), bicycle tyres/tubes (25 per cent), tractor tyres (31 per cent), aluminium conductors (22 per cent).

Industries that have recorded appreciable increases in production (ranging between 10 and 20 per cent) include machine tools, tea processing machinery, ball and roller bearings, bicycles, dry batteries, electric lamps, cotton cloth/yarn, soap, bleaching powder, liquid chlorine, petroleum refinery products and leather footwear.

Industries that have recorded reasonable increases in production (ranging between 5 to 10 per cent) include tractors, steel castings, room air conditioners, hurricane lanterns, caustic soda, paints and varnishes, viscose filament yarn and jute manufactures.

4. Industrial Licensing & Investment

The total number of Industrial Licences and Letters of Intent issued during the current year is indicated below, together with the figures for the corresponding period of

last year, and for the full years from 1968.

Year	Industrial Licences issued	Letters of Intent issued
1968	222	158
1969	221	331
1970	363	438
1971	625	1015
Jan-July 1971	410	618
Jan-July 1972	252	531

In so far as industrial investment is concerned, it appears from available indicators that there has been some step-up in the rate of investment. It appears from available information, however, that this step-up is entirely based on increased assistance from financing institutions.

The number of new companies registered has increased of late as follows:—

Year	No of new companies registered
1968-69	1115
1969-70	1510
1970-71	1927
1971-72	2524
1971-72 (1st Qr)	548
1972-73 (1st Qr)	774

There has also been a step-up in the "consents" for the capital issues during 1972, the increase being mainly in the form of debentures as given in Table A.

It will be seen that there are indications of a step-up of investment in private industrial sector, particularly if import licensing of Capital Goods be taken as an index of matching investments which would have to be made. However, it will also be seen that while there has been a substantial increase in the amount of financial assistance disbursed by the term lending institutions — the amount disbursed having nearly doubled in the last four years — the capital raised by non-government companies has been stagnant. This points to the need for an acceleration in the pace of resource raising from the private sector for private industrial investment.

TABLE I

Production of Selected Industries: 1969-72

why do we search for new styles of tobacco

We have exported flue cured virginia tobacco for years at a steady level. Yet we are speeding up our search for new varieties of tobacco. Why?

To respond to international competition. We treat it as a primary responsibility. New sources of tobacco have emerged overseas. At the same time the consumer's taste has changed. So far the emphasis was on brightness in colour. It favoured our flue cured virginia tobacco in the world market. With the swing towards filter tips, international customers now prefer ripe, open-grained tobacco with more positive characteristics and filling qualities. To satisfy this new taste we are developing alternative areas for tobacco cultivation in Andhra Pradesh and Mysore. Soon this search for new varieties should bring results.

Meanwhile our export—currently a third of the country's total tobacco exports—must resist the pressure of overseas competition. There has to be someone to face it.

if we export traditional varieties successfully?

N72-58
i) that different species of wood, hitherto used only as firewood, are now used as raw material in the manufacture of RAYON-
GRADE PULP?

ii) that GWALIOR RAYONS, MAVOOR, was the first and foremost to find out the suitability of such species of wood for the manufacture of Rayon-grade Pulp?

iii) that MURUKKU (Erythrina Indica) and UPPOOTHY (Macaranga Peltata), among those woods, are outstandingly good as raw material for Pulp?

69338
iv) that GWALIOR RAYONS, MAVOOR, will be pleased to receive orders for such species of wood for producing Rayon-grade Pulp?
