Shifting Sands K.K. NO. 113

WHILE the Israelis by cold-bloodedly killing 106 blameless travellers and the Palestinian guerillas by executing three Western diplomats, may have created the impression that another serious Arab-Israeli crisis is around the corner, the manifold political strands within West Asia as well as those closely connecting the area with the big powers, point to quite different eventualities. Among all these strands, the two most constant and inter-related factors are the pervasive American stake in West Asia and Israel's complete military dominance in the area. The more fickle and changeable factors are the regimes of the Arab countries, not one of which can be regarded as being intrinsically stable; the composition and character of the various Palestinian guerilla groups, whose priorities and targets remain unfixed; the criss-crossing, fluid relationships between these regimes and guerilla groups; and Soviet interest in the region which tends to waver from one country to another, be it Egypt, Syria, Iraq or even Iran.

At a global level, there are signs of a transposition of the regional priorities of the Soviet Union and the United States. The Russians, like the Chinese, are intensely involved in the syndrome of Sino-Soviet confrontation. This suggests that the Russians, at least for the next few years, will be concentrating their attention on East Asia, particularly on improving their relations with countries on the periphery of China, that is, Japan and the nations of South-East Asia. This does not by any means imply a Soviet withdrawal from West Asia, but does indicate a shift in the area of concentration of interest.

The Chinese, who have so far taken only a limited interest in West Asia, may want to counter-balance Soviet gestures towards Japan and South-East Asia by stepping up the tempo of their arms supplies and training programmes for the Palestinian guerillas and the guerilla movement in Dhofar, which borders on the Persian Gulf. But they will take care to see that such aid never becomes more than a trickle, as they have no intention of alienating their new-found friend in the Pacific, the United States, by seriously working against its interests in West Asia. It follows that it is in the Chinese interest to maintain a fine balance between keeping up their radical image among Arab 'revolutionaries' while retaining cordial relations with a goodly number of Arab regimes, though excluding the most reactionary ones like those of Hussein and Faisal.

The United States, with a far larger economic stake in West Asia than in South-East Asia, with the slow but measured winding down of the conflict in Indochina, with its increasing dependence upon Arab oil, with its worries about having to compete with Japan and Western Europe for West Asia's oil reserves, with the permanent ethnic ties between a large and influential group of its own citizens and the people of Israel, cannot but be the big power most concerned with establishing conditions for stability in West Asia.

Since one of the prime conditions for stability — the creation of a Palestinian homeland — is beyond the realm of possibility in the foreseeable future, the United States is now likely to concentrate on the establishment of a *modus vivendi* between as wide a spectrum of Arab states as possible and Israel. A palliative would be needed by the Arab states in order to accept a *modus vivendi* with Israel. This is likely to be in the form of the handing back of some of the territory occupied by Israel during the 1967 war. Since Egypt remains the major Arab power and since the Sadat regime's continued — and moderating — presence in Cairo now depends so much on some token gain in Sinai, the Americans are likely to push the Israelis into withdrawing at least from the banks of the Suez Canal, so helping Sadat retain his position and at the same time gaining some goodwill among Arab regimes other than just the conservative ones.

In this wide sweep, Palestinian guerilla actions like the killing of American diplomats, while attracting a lot of attention, are not likely to halt the American impetus towards improving ties with Egypt and other Arab states, including Libya. In fact, in his most recent speech Colonel Ghaddafi sounds a plaintive note. He baldly says that, considering the present state of the Arabs, there is little that can be done against Israel. He also adds that if in any conflict with Israel, Egypt were to fall, all the other Arab states of North Africa would also fall to the Israelis. Notwithstanding his reputation as a hot-head, Ghaddafi is proving to be cautious in his actions — much like Nasser had become — under force of circumstance. At the moment, Ghaddafi is most worried by the growing anti-Egyptian sentiment among Libyans, which burst into the open at the funeral of the Libyan air travellers killed by the Israelis. Since one of the main planks of his policy is Arab unity, including union with Egypt by next September, he must find a means of quietening anti-Egyptian feelings which could next turn against him. Therefore, it should be in his political interest to

rates stable, is dictated by the farm price policy with its sub-and tariffs to equate farm prices within the community. It must be remembered that almost 90 per cent of a total Community budget, of 100 million, is spent on the agricultural sector. The need to keep exchange rates is not, however, dictated only by the requirements of the farm policy. The ECM countries are also aiming at a common European currency through the European Monetary Union (EMU). A first necessary step towards achieving the EMU objectives is maintenance of stable exchange rates in each other's currencies by stipulating a narrow band within which cross-rates would fluctuate.

The idea of a joint float of the ECM currencies had been strongly recommended by the West Germans as a "European solution" to the dollar crisis of 1971. At that time, the idea had been firmly opposed by both France and Italy. The ECM Commission was also against floating and, instead, favoured insulating the Community from speculative capital flows by harmonisation of administrative controls on capital movements with third countries. The West Germans, who were not in favour of rigorous capital controls, then went ahead to float the Deutsche mark unilaterally.

The situation at the moment has become a little more complex for the ECM, especially due to the entry of Britain with a floating pound sterling. The British are apparently sympathetic to the idea of a joint float, but are not sure whether they can afford to have a near fixed parity vis-à-vis other strong ECM currencies — as would be required under the joint float scheme. With the January trade deficit of £77 million still fresh in mind, the British are worried about strong pressures building up on the pound sterling which appears at present to be the weakest of the ECM currencies. But the joint float could be devised in such a way that, in the event of excessive pressure, any member could overnight alter its fixed parity vis-à-vis the other currencies and again rejoin the float against the dollar. But the British want further assurance that, in the event of excessive pressure on its currency, the rest of the ECM countries would offer unconditional and unlimited support.

Even assuming that the idea of a joint float is accepted, it may happen

in practice that if market pressures build up on any currency, it may be taken out of the joint float too quickly and may return to the float only after a long time-lag. It would be difficult to prescribe very stringent rules as to when an erring member may leave the joint float and rejoin it later.

If the joint float really materialises, by, say, next week, India would be placed in a peculiar situation, linked as it is now to the pound sterling. A European float against the dollar would result in an upvaluation of the rupee vis-à-vis the dollar since the rupee would get linked to a strong currency block. Can India afford this? With the foreign exchange reserves position rather precarious at the moment, and given the pent-up demand for imports to meet domestic scarcities, appreciation of the rupee vis-à-vis the dollar — in which nearly one-third of our exports are invoiced — would be a risky step. India would, therefore, be relieved if the sterling does not get involved in the joint float, or if it makes a quick exit from the float on one pretext or the other. If the float really materialises, India should try to take advantage of the provision of the wider band — and also be prepared to refix its parity vis-à-vis the pound sterling.

Indo-Soviet Protocols

Wrong Predication

Our Delhi Correspondent writes:

THE protocols signed under the aegis of the Indo-Soviet Joint Commission for Economic and Technical Co-operation cover a very wide field. If all the projects and exchange of goods envisaged in the protocols come through, further expansion of trade between the two countries would not encounter the difficulties experienced in recent years in balancing the bilateral trade. The trade imbalances had risen primarily because of the inability of the Soviet Union to supply such goods and services as India needed. The heavy engineering equipment which the Soviet Union could more easily offer, India found difficult to absorb since there has been a slowdown in fresh industrial investment and since large capacities in the sector have already been established with earlier Soviet assistance. The result was a fairly large favourable balance for India, that was covered partly by arms delivery from the Soviet Union and partly by advance settlement of old

Soviet credits. India has been trying to get the Soviet Union to enlarge its supply of non-project items, industrial raw materials, metals, and fertilisers, but without success. The new protocols will very likely smoothen these difficulties as they span areas in which the Soviets are well placed to supply.

However, while the protocols help to extend and enlarge the scope of Indo-Soviet economic co-operation and trade, and generally to balance the trade between the two countries, the inclusion of certain projects and the manner of Soviet participation in them may create lopsidedness in the development of the Indian economy. It is not clear, for instance, why Soviet participation has been accepted on the scale envisaged for the power programme. It is one thing to import generating sets on a short-term distress basis in view of the lags and shortages that have developed in the power economy, and quite another to plan for full-scale imports to underpin a whole power programme — especially when it is well-established that Indian capability is sufficiently developed for the requirements of the power programme over the longer run. The inclusion of an alumina project in which the Soviets are to participate may be questioned on similar lines. Of even greater significance is the implication of a change in the future steel programme in deference to the Soviet proposal for expansion of the Bhilai and Bokaro plants. Acceptance of the Soviet proposal would, of course, virtually foreclose any other steel development programme based on indigenous effort.

Particularly questionable is the protocol covering Soviet participation in the exploration and production of crude oil. The fact is that whatever worthwhile assistance the Soviets had to offer in this field has already been taken. Continuation of the same arrangements is at this stage more likely to prove harmful as it would tie the Indian effort in exploration to a single source of technology and equipment which may not be able to cope with all the tasks in this sphere.

As in the case of all foreign aid, the tendency of our system in relation to Soviet assistance, also, is to tailor development plans to aid availability. Rather than use foreign assistance to supplement indigenous enterprise the trend has been to allow such assistance to supplant local effort. It may not be wrong therefore to take a second hard look at the arrangements chalked out in the Indo-Soviet protocols, merely because India at present has excellent political relations with the Soviet Union.

Calcutta Diary

A M

IN Hindu epistemology, a category of individuals are designated as the knowing sinners, *jnanapapi*. There is not one sin that they will not commit, but they do so in full awareness of the gravity of what they are doing. Depending upon one's point of view, you can describe them as the great or noble ones, for they wade through the experience of sinning despite the fact that it would bring them eternal damnation. Or, again, you are perfectly at liberty to treat them with infinite contempt, since these individuals, despite possessing knowledge of the heinous nature of the follies they are about to embark upon, do not nonetheless try to garner the strength of mind to stay away from the temptation: for them, the flesh is always weaker than the spirit.

The Government of India obviously belongs to this species of knowing sinners. This year's Economic Survey is, almost to a fault, replete with economic wisdom and awareness. It says all the right things that need to be said. Not one heroic is missed, not one cliché is left unchurned. Here are two passages which one can pick in random:

If exports are to rise faster than output and incomes, sales abroad must become more lucrative than sales in the domestic market. As such, one can expect entrepreneurs to develop export markets vigorously, and to undertake the investment needed for adapting production to the more exacting requirements of foreign buyers, only if the pull exercised by a sheltered home market is resolutely restrained. For, it is not only high production costs but also internal demand and high prices which inhibit the growth of exports. Accordingly, adequately strong measures will need to be deployed to dampen the growth of domestic absorption, particularly the high income demand for non-traditional manufactures. (page 79)

... a well integrated policy approach is essential for reducing persistent inequalities in consumption levels for mobilising resources on a scale adequate enough to attain more rapid economic growth envisaged during the Fifth Plan period. The industrial licensing and other policy weapons will henceforth need to be wielded more purposively and effectively to discourage the demand and the expansion of capacity for manufactures which serve to meet the luxury requirements of a thin upper crust of our society. Industries producing

luxury goods involve a wasteful use of the available savings and foreign exchange. Obviously, scrapping of existing capacities in luxury industries will involve needless waste of scarce resources and avoidable unemployment. Accordingly, they must be speedily and progressively re-oriented towards production for the export market. (page 87)

One can make gentle fun of the plethora of the particular suffix which tries to convert the inert adjectives into roaring adverbs, but there is nothing *per se* unexceptionable in the two statements; they converge towards a common set of conclusions, namely, that there can be no salvation for the economy without a restraint on domestic consumption, particularly on luxury consumption. The catch is, however, in the operational measure which is recommended, so as to ensure that, while the domestic consumption of luxury goods might be subdued, the units producing these goods do not go to the wall. It is almost as if the economic problem has a moral facet, and one which can be reduced to a Khrushchevian parable: If a blister comes up with a head on the tip of the nose, since it has taken all this effort to come up with a head, it may conceivably be pleaded, it would not be quite polite to try to get rid of it through the application of specific drugs. Similarly, the Economic Survey almost appears to argue, the luxury industries having taken all this time and spent all these resources to sprout their capacity in the body economic, it would be the height of rudeness to liquidate them at one stroke. Hence the apologia of not letting resources go to waste, along with the urging that the capacity of these industries be earmarked for the export sector.

Have we not been here before? Since export is a matter of high priority, once the point about earmarking has been conceded, at the subsequent stage, a particular luxury industry will perhaps demand, and be granted, additional import licence for certain balancing investments. And, in this dynamic world, one could stumble upon the convenient discovery that industries, curse their luck, are condemned to a state of perpetual imbalance. Since no two pieces of equipment are likely to

balance perfectly, it might not then be possible to hold in leash the clamour for continuous imports. Further, once you have allowed the luxury industries to stay in business for the exclusive purpose of export promotion, they would be within their rights to come back and demand special cash incentives and other forms of subsidy. The process need not quite stop here. If, after a point, it is found that exports are not progressing satisfactorily because of the products being priced rather high, the argument could be advanced that the unit cost can be brought down if only production is enlarged to exploit the economies of scale, and the latter would be possible only in case demand could be expanded by allowing the affluent in the country to purchase a part of the total output. Thus high consumption standards of the rich would come to be justified on the allegedly patriotic, allegedly economic argument that otherwise it would be impossible to lower unit costs and expand exports. To clinch the issue, it would then be maintained, the government too would gain from such a rise in luxury consumption; by levying a heavy excise on the luxury commodities, the national exchequer would be so much the richer. If there were no rich to be taxed on their high consumption, so appears to be the purport of the argument, what would the poor government do, reminding one of the Maurice Chevalier song which plaintively asks: if there were no little girls, what will little boys do?

Some of the socialist countries had the answer to the conundrum long ago. They knew that whatever the degree of freedom which foreign trade offers, once a nation begins to produce luxury consumption goods, pressures will be generated all over the system to allow some consumption from out of these goods. They decided to take care of the problem at the source: do not produce such consumption goods, produce only capital goods, and that too, as far as is possible, for raising the output of further capital goods. Pieces of machinery cannot, after all, be either eaten up or smoked away: if you want to raise the level of savings, you therefore do not produce consumer goods, you produce machinery and equipment.

The knowing sinners here seem to have no use for such wisdom. If one were so minded, it should not be difficult to do a kind of project analysis for comparing the relative cost-benefits

of shutting down summarily the more obvious cases of luxury industries, and of allowing them to continue purportedly for catering to the export market. In working out these calculations, what should be brought in, and in an explicit way, is the impact of having a network of luxury industries on the domestic rate of savings. The units produce the goods; some are exported, the rest leak into the internal market for the rich to consume; the level of consumption of the rich thus moves up; but

since they are pace-setters, higher consumption on their part forces up the consumption expenditure of about everybody down the line of the social hierarchy; Jones second class gets ideas from Jones first class, Jones third class gets ideas from Jones second class, and so on till you reach the very end. If the *sahib* is going to go for a refrigerator exceeding 165 litres, little blame will attach to the Class IV employee if he demands a rise in his wages which will allow him the luxury of acquiring

a pair of gold bangles for his wife. No amount of adverbs-via-suffixing-of-adjectives will, in such circumstances, be of any avail. We are back to the issue of the foreign cars which the President and the Union ministers ride, the expensive foreign cigarettes which some of them smoke, the gaudy cuff links some of them flaunt. The Economic Survey cannot help them unless they help themselves. Or, should it be because they help themselves?

RESTRICTIVE TRADE PRACTICES

are you a distributor or retailer of goods in India ?

DOES the manufacturer insist that you should stock only the goods produced by him and not goods manufactured by any other rival producer ?

IF so, he is guilty of following a restrictive trade practice under the provisions of Section 33(1)(c) of the Monopolies and Restrictive Trade Practices Act.

PLEASE bring the facts supported by evidence to the notice of the Registrar of Restrictive Trade Agreements, Post Box 424, New Delhi, for initiating necessary action against the manufacturer.

COMPANIES

Sugar Lift Profitable

Hansavivek

WALCHANDNAGAR INDUSTRIES has applied for enhancement of licensed capacity for manufacture of water-tube boilers, high-speed centrifugals, milling plants, sugar plants, gears, gearboxes and pinions, chemical and nuclear machinery, sugar mill machinery, rectified and denatured spirit, and cement-making machinery. Government has so far allowed the company to step up capacity of water-tube boilers, high-speed centrifugals, gears, gearboxes and pinions. Progress of work on the Kinyala sugar project in Uganda has been hampered on account of nationalisation of the local establishment of the company's associates in this venture. Negotiations with the Ugandan authorities are going on for expediting the alternate arrangements for carrying out the erection work, and work is expected to be resumed soon. The company has secured another export order from Malaysia, worth Rs 450 lakhs, for the supply of a complete sugar plant with a daily crushing capacity of 2,500 tonnes. The project is to be completed by September 1974. During 1971-72, Walchandnagar crushed 1,71,060 tonnes of sugarcane and produced 1,76,443 quintals of sugar with an average recovery of 10.23 per cent. In the previous year, the company crushed 2,00,004 tonnes of cane and produced 2,18,765 quintals of sugar with a recovery of 10.9 per cent. Profitability of sugar factory suffered owing to lower quantity of cane crushed, lower recovery, and higher cost of cane — and in spite of better average price realised for sugar. The overall results have been better, nevertheless, owing to a marked improvement in the working of the industrial machinery division and satisfactory performance of the distillery and plastic divisions. Sales of industrial machinery shot up from Rs 546 lakhs to Rs 806 lakhs. The increased tempo of production will enable the company to expedite execution of pending orders for industrial machinery. During 1971-72, orders worth Rs 675 lakhs were secured. Orders at the year-end stood at Rs 1,704 lakhs, and at the end of January last increased to Rs 2,123 lakhs. With a higher profit, the company has provided about Rs 39 lakhs for arrears of depreciation and Rs 15 lakhs for arrears of development rebate. The board has also proposed payment of

arrears of preferential dividends for two years ended September 1971. Additional liability, if any, arising from the fixation of cane price by the Government of Maharashtra, in respect of sugarcane supplied by MSFC during the past four years, has not been provided for. The amount is unascertainable.

EAST ANGLIA PLASTICS (INDIA) recorded a more disappointing performance during the year to June last, compared to the preceding year, as a re-

sult of decline in production and sales and erosion of margins. Increased cost of production apart, the company had to bear a higher cost of interest on borrowed funds blocked in larger inventory consisting mostly of finished stock of plasticisers and imported raw materials which had to be carried throughout the year. The company is awaiting government approval to its application for an industrial licence for manufacture of PVA and PVA fibre. Meanwhile, the GRP division has found a new outlet in acid-proof lining of vessels, pipes, and ducts in the steel, copper, fertiliser and chemical (including petrochemical) plants. The supply is continuing of vinyl drain pipes to the different railways, for test and trial on the track.

MAHARASHTRA

Organising the Landless in Shahada

P B

SHAHADA and Taloda talukas, comprising about 300 villages, an area of 600 square miles and a population of some 2.5 lakhs, are situated at the foot of the Satpura ranges in Dhulia — the northernmost district of Maharashtra, close to the borders of Gujarat and Madhya Pradesh. Adivasis account for 40 per cent of the population in Shahada and 75 per cent of the population in Taloda. Most of the Adivasis are Bhils. The area may be divided into two regions: the fertile central plains which stretch through central and southern Shahada and through eastern and central Taloda; and the somewhat hilly periphery bordering Gujarat and Madhya Pradesh.

The river Tapi and a number of smaller rivers flow through the central region. Most of the soil is exceptionally fertile — excellent black loam which can yield two good crops without irrigation. This part is today monopolised by rich peasants, a majority of whom are Gujars or Leva-Patils. The Gujars migrated to this area over a hundred years ago and set themselves up in trade and moneylending; even today, they are often referred to as 'shahus' or 'sowkars'. Through usurious moneylending they systematically appropriated the Adivasis' lands by forcing them thus to settle their debts — given on impossible terms and often vastly inflated by manipulation of book figures which the Adivasis cannot read. Over a period of time, these immigrants achieved hegemony as the major landowners in the area. At the present time, these kulaks constitute 10-20 per cent of the population, owning 70 to 80 per cent of the land, mostly the best land in the villages. The rest of the land is divided into tiny plots among small peasants, though there are a few 'middle peasants'. Between 50 and 60 per cent of the population is landless.

Dhulia is not one of the IADP or IAAP districts. It was at the kulaks' initiative that the green revolution came here. The kulaks — educated, 'progressive', and aware of the benefits of the new technology — have "learnt to want more" and know how to get it. They have used their control of the district's co-operatives and the state machinery to bring in the capital, equip-

ment, and the knowhow for the green revolution. The new wheat varieties, brought in first in the mid-sixties by a group of rich Gujars and used on irrigated farms, have spread by leaps and bounds, together with expansion of irrigated area and use of fertilisers, pesticides, pumps, tractors, power tillers, and threshers.

For example, in Shahada the number of tractors was 0 in 1946, 150 in 1967, and 300 in 1971. The figure for 1971 is perhaps the highest for a taluka in Maharashtra. (It is reported that the kulaks have placed orders for about 400 tractors worth Rs 1 crore with one tractor manufacturing company alone.) The number of oil engines and pumps per thousand hectares in Shahada taluka was about 20 in 1963-64, 35 in 1966-67, and is more than 50 now. Also, the total irrigated area is increasing at a very high rate and now stands at some 20,000 hectares for Shahada. Nearly all of this, as also the pumps and wells, are concentrated in the central region, which is cultivated intensively by the kulaks through hired wage labour. Most of these irrigated farms are sown with the high-yielding varieties of wheat as well as other foodgrains; more recently, sugarcane and some highly profitable varieties of plants and grass used as cattle feed have also been cultivated. The latter are sold to the large, modern, dairies all over Dhulia which has now become a 'white revolution' (sic) milk-exporting district. Agriculture in the area has thus been oriented to the market and for profit. The kulaks seem to make between three and five times more today than in the pre-'green revolution' period. Land now costs over five times what it did just five years ago, testifying to the profitability of agriculture.

Also, where earlier a substantial section of the big landowners used to lease out their land to sharecroppers (since the Tenancy Act, tenancy had been of a concealed nature, the duration of the lease rarely exceeding one or two seasons), after the spectacular success with the new seeds the landlords have taken to self-cultivation. The big landowners are thus no longer semi-feudal landlords who lease out their land to tenants; with the coming of the 'green revolution', the system of *meta-*

yage (tenancy) was buried in. Shahada and Taloda and the unprotected 'temporary' tenants were evicted. Loans and subsidies from government agencies and co-operatives, supplemented by the economic surplus which had hitherto been hoarded or used for land purchase, moneylending, or conspicuous consumption, have since become the capital for investment in the new technology. A small section of the richer middle peasants — mainly Gujars, again — who have close ties with the kulak leaders have also gradually emerged as rich peasants.

The success of the new technology also encouraged leasing in, buying, and even grabbing of land from the small peasants who have been slowly pauperised. At the same time, the earlier class of middle peasants began to disintegrate, as the more affluent of them moved closer to the kulaks and the poorer ones were forced down into the ranks of the small holders-cum-agricultural labourers.

As elsewhere, for the poor sections here, loans are now even more difficult to come by, as the high profitability of commercial agriculture has diverted available agricultural credit to the successful farmers. This, in turn, has reinforced the poor peasants' willingness to part with their land and become agricultural labourers.

There is thus a process under way here which is rapidly transforming the old landlord-tenant relation into a capital-wage labour relation. The new technology has begun to displace labour in a big way with the pumps, tractors, tillers, threshers, etc; and the additional work created by the use of the new seeds, fertilisers, pesticides and irrigation does not compensate for this. The results are most evident when, for example, threshers, etc, are used at harvest time which is the only season when casual labour can get farm employment at slightly higher wages. Simultaneously, the 'reserve army' of the unemployed swells with the addition of small peasants-turned-landless labourers. The per capita income of agricultural labour in Dhulia district was estimated at about Rs 113 in 1965-66. In Shahada and Taloda it appears to be lower than the average for the district.

For the Adivasis, who are the most depressed section of the landless and poor peasants, the process of capitalist development has been particularly painful because of their social and economic backwardness. The literacy rate among the Adivasis of Dhulia was 1.4 per cent

My mother had to work

to my wife.

The Limited-Payment Life Policy With Profits The best form of life assurance to make provision for dependents

"When I got married at the age of 27, I took this policy for Rs. 15,000 for a term of 28 years. The monthly premium which I have to pay till I retire at 55, is only Rs. 38.70!

"I have the assurance that even if I should die during the 'term' of the policy, my wife will get Rs. 15,000 in hand, plus bonuses."

How about you? An LIC policy can guarantee your wife's future too. The 'premium' will vary according to your 'age', the 'sum assured' and the 'term' (number of years over which you pay premiums). No other form of saving protects your dependents from life's uncertainties.

LIC has other types of policies to suit your every requirement.

LIFE INSURANCE

ASP/LIC-Z-101

3 per cent among Adivasi women) against 19.4 per cent for the entire population in Dhulia. Few Adivasi children go to school. Even the Rs 10-Rs 20 that a 10- or 12-year old child may earn per month, say, as shepherd, would make all the difference to his landless family. Of the Adivasi children who do go to school, 42 per cent drop out between standards I and IV and only 8 per cent reach standard IV from standard I, and 4.6 per cent standard VII from IV.

There is no alternative source of employment for most Adivasis. There is little industry in the area, except for a co-operative sugar mill. This started functioning only in November 1972 and controlled by the kulaks. It employs very few Adivasis. In any case, the Adivasis possess few skills, there are few craftsmen or artisans in the Adivasi community.

In contrast to the fertile central plains, the hilly periphery of this region constitutes a small peasant economy. The green revolution has not reached this region. Landlessness is considerable here and the landless have few opportunities of employment on the small peasants' lands. Many of them carry a headload of kindlewood from the Khatpura forest every day, and walk to market places, which are 10 and 15 miles away, to sell it for 75 paise or a rupee. The region serves as a satellite to the more developed Shahu area, providing it with a reservoir of cheap labour.

There are, on the fringe of this region, thousands of acres of cultivable waste land which are officially 'reserved' for teakwood plantation by the Forest Department. In fact, there is no teak or for that matter any other forest on this land; attempts by the Forest Department to grow teak have consistently failed. The landless have been petitioning the Forest Department for a grant or lease of the land for cultivation, but without avail. Yet forest officials for many years have allowed middle peasants and richer farmers, who could bribe them, to cultivate some of the land.

But even here the small peasants are unlikely to be left to themselves for so long: the kulaks of Shahu are already making inroads into the area. The co-operative societies, which could be the only source of cheap credit for the small peasants, are bankrupt or their funds are being increasingly diverted to finance 'development' of the Shahu region. The stagnation and underdevelopment of this region, simultaneously with the development of the Shahu re-

gion, is therefore inevitable.

In such circumstances, it is hardly surprising that there have been a number of spontaneous movements of protest and revolt in recent years led by populist-reformist or Adivasi chauvinist leaders. The Patilwadi-Mahaswad incident is a case in point.* Many of these were localised occurrences, confined to a few villages, which did not challenge the existence of the system but aimed only at checking certain practices within it. The two usual forms of peasant rebellion, viz. social banditry and sporadic riots, proved to be only marginal irritants to the system. This failure has stemmed from the many limitations of peasant movements, deriving from the objective conditions of peasant life — their scattered population, their heterogeneity, their isolated existence, their role in the process of production, etc.

The whole situation, however, changed at the beginning of last year, when the growing discontent and militancy found organised expression and a leadership. A united front was formed, of a cadre of independent young radicals, the Maharashtra Landless Labourers and Poor Peasants Union (led by the Lal Nishan Party), and certain elements of the Sarvodaya movement who had been active in the earlier movements. The united front organised a movement which has already passed through various phases, corresponding to the different aspects of its programme.

In the first phase, the focus was on the recovery of the Adivasi peasants' lands which had been appropriated by the kulaks. As noted earlier, the kulaks had forced small peasants to mortgage and/or sell their lands at throw-away prices. Often this mortgage or sale does not appear on paper, since a great deal of this land is held under the system of New Tenure under which the title to the land is inalienable and impartible. Thus the kulaks' possession of the land is illegal in a number of cases. Such lands were recovered by the small peasants by forcibly harvesting the crops sown by the kulaks on their plots or by driving the kulaks off the lands. This was initially resisted violently, and with police help, by the kulaks. But the small peasants, who were supported by the landless, stood firm and forced the kulaks to yield. In this way, in three months, about 4,000 acres were recovered. But more important was the

fact that the poor had for the first time acted on the strength of their own organised effort and experienced a major psychological transformation.

The second phase saw the boycott of the Assembly elections of March 1972 in Shahada. This was in protest against the tyranny of the kulak-police alliance, an expression of the people's distrust of parliamentary democracy and the elections. The central issue in the boycott campaign was the torture by the sub-inspector of police in Shahada of an Adivasi on mere suspicion of complicity in a petty theft. The Adivasi, a watchman of the Crop Protection Society — a body formed by the kulaks — was held responsible for a petty theft of cotton from a Gujar's field (which had already been picked four times) and was brutally beaten in an attempt to extract a confession. When the third degree methods — including the administration of electric shocks — proved fruitless, the police officer sent the broken man away, 'satisfied' of his innocence. The man was very ill and badly needed medical help, but the first doctor he approached, a Gujar, refused to treat him. Eventually a doctor was found and the Adivasi had to be confined to bed for weeks.

The boycott of the elections focused the people's attention on this incident. Local youths campaigned vigorously for the boycott and organised meetings and processions all over Shahada. The campaigns opened up new contacts with scores of villages around, and provided a platform for elementary political education of the villagers who had experience of other such incidents of police brutality. The boycott itself was fairly successful. In spite of the kulaks' pressure, only 33 per cent polling took place, against the usual 55 or 60 per cent.

The third phase comprised bargaining for better terms by the saldaars, the annual contract labourers. Every year, in Vaishakh (i.e. April/May), the saldaars renew their annual contracts or enter into new ones with the employers. This time saldaars were organised into a union, the Shramik Sanghatana (Toilers' Union), which demanded a 50 per cent increase in wages (which ranged between Rs 400 and Rs 800 per annum), fixed hours of work (which depended on the whims of the kulak), a weekly holiday (the saldaars got no holidays at all; in fact, if, owing to natural factors like weather, etc., there was no work to be done on the farm, the saldaar would be considered 'absent' and his wages would be deducted proportionately), and proper

maintenance of books (the kulaks could exploit the illiterate saldaar by manipulating the books). The saldaars also insisted that they would negotiate separately for farm or domestic work, where earlier, the landlord would expect from them all types of domestic work. Alongside, a 50 per cent increase in the wages of day labourers was also demanded.

Initially, the kulaks refused to concede any of the demands. The saldaars went on strike. Some of the first strikes were spontaneous. They were joined by day labourers and small peasants, most of whom unemployed for part of the year and work as farm labourers. Soon the strike spread to over 70 villages. The strikes threw up an organisation structure: an elected five-member landless labourers' committee, subject to recall at any time, and the co-ordination of these committees at the taluka level through the Shramik Sanghatana. As the strikers held on, the kulaks yielded and, after negotiations with the saldaars' committee, conceded many of the demands of the saldaars and day labourers.

On May Day 1972, there was a rally in Shahada of over 8,000 saldaars, day labourers, and poor peasants. In contrast to most other May Day rallies in Maharashtra, this was no ritual. It was a successful meeting, in that, there was an open exchange of experiences, an attempt to understand what had happened and to formulate a general strategy, and programme of action. The meeting was addressed mainly by the landless, some of them women.

The fourth phase consisted of the first major struggle in the peripheral area. It was aimed at the abolition of the begari system and the acquisition of the cultivable waste land. 'Begari' is compulsory labour at very poor wages for the Forest Department. In April last year, however, begari labourers refused to work. The action was effective. The Forest Department officials have not tried to force the people to work. A few hundred acres of the waste land have been cleared for cultivation by 500 landless families organised over a dozen villages. This was deemed an encroachment on property and a tussle between the Forest Department/police and the people ensued. Over 150 people were arrested in July/August 1972, and sentenced to simple imprisonment of one or two weeks after being detained initially for a week or two weeks. The purpose of such prison sentences and detention is to break the people's spirit. But the result was quite to the contrary in this case. Political

workers, who were among those jailed, held classes in jail, explaining the significance of the imprisonment and the importance of more such struggles. It was evident at the end that those who came out of jail, far from being demoralised, were more determined to carry on the struggle (and were probably stronger in health too, as they got two meals a day inside!). The failure of the rains, however, prevented the sowing and cultivation of the land in the kharif season. On October 2, 1972, the landless launched a major open dharna on the land. Again, 200 people were arrested and sentenced. The plan for cultivation of forest land in the next season covers a wider area and envisages more militant struggles.

The fifth phase may be said to comprise numerous demonstrations and gheraos in various parts of Shahada and Taloda, involving thousands of people, demanding drought relief works from the government. For example, on August 22, a morcha of over 3,000 people gheraoed the Tahsildar in Shahada till he conceded their demand for half-a-dozen relief works to be started within 24 hours. Again, on November 18, about 1,000 persons demonstrated against a team of high-ranking Ministers (including the Union Finance Minister) who had gone to Shahada to inaugurate the new co-operative sugar mill. Morchas have also been organised before grain merchants' shops which have raised food-grain prices by anywhere between 50 and 100 per cent. In some instances the merchants have been compelled to lower prices.

With their participation in the many struggles, the political consciousness of the population is increasing. Their self-confidence is reflected in their defiance of the kulaks. Further, the new awareness has fostered a new culture: slogans and symbols, revolutionary songs and folk ballets. The movement is seen as part of their daily existence.

The kulaks have not been passive, of course. Their reactions and tactics have changed with the growing strength of the movement. They are class-conscious, shrewd, and politically farsighted, and they have strong lobbies in the Maharashtra government. They have among them their 'hawks' and 'doves'. Initially, when the 'hawks' dominated, their reaction was one of outrage and panic. In their desperation they spared no effort to smash the organisations of the landless and to harass the activists with police help. The activists were branded 'Naxalites'; goondas were set upon them; they were tried on absurd framed-up charges such as 'illegal tres-

pass of Shahada and Taloda police stations'. But as the political activity grew stronger, the 'doves' seemed to become dominant. They have begun to make concessions to the movement rather than attempt to smash it with armed force. Only four days after the big May Day rally, over a thousand kulaks deliberated and decided that it was best to concede some of the saldaars' demands rather than invite more trouble by obduracy. Their present tactic is to try to neutralise or buy off a section of the landless and to use subtle rather than crude means.

To sum up, the movement in Dhulia has taken the following course. Various sections of the landless and small peasants have been organised on the basis of demands for higher wages, land, etc. These organisations, based on collective action, have been consolidated as independent class organisations led by the democratically elected committees of the landless. In the process of their participation in the various struggles, the landless and small peasants are being politicised. A cadre of local youths, mainly drawn from landless families, is being formed to assume local leadership. It has become evident from the experience of the movement that caste and ethnic divisions cannot be an effective barrier to the growth of a revolutionary movement. Political education is necessary in order that, say, landless labourers from different castes and ethnic groups identify with one another as a class and coalesce into a strong organisation or union. But it can be done.

In the initial stages, the landless are less easily moved to organised revolutionary action than the somewhat better off small peasants. The initial short-term response of the small peasants may be better than that of the landless labourers, who, because of their dependence on the kulaks, and the existence of the huge 'reserve army', have less freedom of action, less political leverage, and may be wary of any open participation as may result in their victimisation at the hands of the kulaks. This is, however, true only of the initial stages. Later, the landless participate more actively and with more initiative than the small peasants.

It is often both tactically more useful and of greater revolutionary significance in the long run to organise the landless on wage issues and on the demand for employment rather than on the demand for 'land for the landless'. The latter demand is essentially petty bourgeois in character and is justified on tactical grounds alone and only under certain

* For a brief description of events upto February 1972 in this connection and for a description of the general socio-economic conditions in the area, see 'The Bhil Movement in Dhulia', *Economic and Political Weekly*, Annual Number, February 1972.

conditions. The long-established tactic of the Indian Left, of trying to mobilise the landless on the basis of the 'land for the landless', appears unlikely to work — especially in areas with a large concentration of landless labourers (most of whom may no longer aspire to own a plot of land) constituting, say, 50 per cent or 60 per cent of the popula-

tion, and engaged in labour on large capitalist farms.

It must be emphasised that, in Shahada, the rich peasants are no allies of the small peasants and landless workers. They are the principal enemy. This calls for a thorough re-examination of the Left parties' analyses, programmes and policies.

BANARAS UNIVERSITY

Part of a Pattern?

N K Singh

AFTER two months of closure, the Banaras Hindu University (BHU) reopened on February 5. The campus, India's largest, was closed *sine die* on December 2, 1972, after some 20 days of widespread violence, arson, looting, and assault on students and teachers.

In fact, periodic closures have become a habit at BHU. The latest one was the fourth indefinite closure to have taken place in the last four years. The Gajendragadkar report and other surveys have underscored that it is political parties which must bear the major responsibility for the lawlessness at BHU. This time, again, the situation had gone beyond control, according to the University authorities, because of "the organised efforts of groups of students, expelled students, and outside political and anti-social elements."

Indeed, a political tug of war is very much in evidence. The Vice-Chancellor, K L Shrimali — one time Congress Minister —, the University authorities, faculty members, and citizens of Banaras belonging to the CPI and Congress, have all openly blamed the RSS and its students wing, the Vidyarthi Parishad, for the current state of affairs on the campus. The VC charge-sheeted 34 students for alleged indulgence in violence and later expelled some of them; a majority of the 34 belong to the RSS-controlled Vidyarthi Parishad and Samajbadi Yuvjan Sabha (SYS) of the Raj Narain group. Meanwhile, the Jan Sangh, the Socialist Party, the Bharatiya Kranti Dal, the CPM, and the Shiv Sena (the last one is just a name in Banaras) also set up a committee — the 'Vishwavidyalaya Bachao Nagrik Samiti', which waited upon the District Magistrate and the Superintendent of Police to complain that the administration was biased in favour of the VC; the VC was branded 'double agent' of the Congress and the CPI and the Samiti joined the agitating students to demand his exit "if the

University was to be saved". On January 24, these parties went on to observe a 'Banaras Bundh' for the early re-opening of the university. The Vice-President of the BHU Students Union, Mahendra Nath Singh, an RSS man, filed a defamation suit in a local court against the VC, the Registrar, and the Public Relations Officer of the University. He alleged that Shrimali had unnecessarily blamed and defamed the RSS and the Vidyarthi Parishad.

Nearly four years ago, in 1968-69, the highly politicalised campus of the BHU had been in similar turmoil on account of the RSS; but with a difference. At that time it was the progressive students who were unitedly fighting against the pro-RSS VC, Amarchand Joshi. Today, however, the progressive students are split; indeed the RSS enjoys the support of the SP, the SSP, and the CPM. In 1968-69, the students were fighting for demolition of RSS Bhawan on the campus. Today, the main covert reason for the pique of the RSS boys is said to be precisely the move of the VC to demolish the RSS office.

There is no escaping the fact that, whatever its self-appointed role, the RSS is the main subject of controversy on the trouble-torn campus. And BHU is known to be the strongest base of the RSS-patronised Vidyarthi Parishad. The RSS maintains an office, and conducts 14 shakhas on the premises of the University. It must be remembered that it was the RSS-chief, Guru Golwalkar himself, a demonstrator at BHU at the time, who had acquired some land inside the campus for the paltry sum of Rs 2,500 and established the RSS office there. In 1948, after Gandhi's assassination, the RSS was asked to vacate the building; but in 1950, they managed to get permission to reoccupy it.

When, in 1968-69, there was a massive anti-RSS agitation in the University, demanding *inter alia* demolition of

RSS Bhawan, the government had appointed a commission of inquiry headed by P B Gajendragadkar, former Chief Justice of the Supreme Court. The Commission not only recommended demolition of the RSS building but also suggested a ban on RSS shakhas on the premises of the campus. Moreover, following the exposure of the nefarious activities of the RSS and the association of Vice-Chancellor Amarchand Joshi with the RSS, the late VC had to resign.

When K L Shrimali took over, he found he could not ban the RSS shakha. He moved for the demolition of the RSS office, but even this move failed in face of the then Samyukta Vidhayak Dal government's lukewarm attitude to the recommendations of the Gajendragadkar Committee. Shrimali thus had to move the court; the case is still pending.

The RSS took the opportunity to go on the rampage at the university. Its main objective has been to get the VC removed. The Jan Sangh daily, *Motherland*, commented on December 29, 1972, "So long as this political puppet plays his nefarious game in BHU it is not clear how peace and scholarship can return to the university". Agitations have thus been worked up on one pretext or another.

The first outburst of RSS violence during the Vice-Chancellorship of Shrimali took place in March 1970. A student was stabbed; the VC suspended two students; RSS leaders lead violent demonstrations on the campus which finally led to the closure of the university. In August, 1971, the RSS storm-troopers assaulted yet another student. The VC again expelled about a dozen RSS and anti-social students. At the Students' Union election of 1971, the RSS and its allies were trounced. But the newly-elected Union President, S K Kapooria, was murdered; and it is an RSS stalwart, B P Chaturvedi, who is standing trial in court. Towards the end of the year, in November, following the report of the Justice Desai Inquiry Committee, 29 RSS and SYS boys were either expelled or rusticated from the university.

All this angered the RSS. Its mouthpiece, *Panchjanya*, started a campaign in support of the expelled students and, against the university authorities. Meanwhile political equations also changed at BHU. On Raj Narain's initiative, the SYS forged an alliance with Vidyarthi Parishad which had been lying low following its exposure in the murder of Kapooria. The RSS got a new lease of life.

It is against this background that the

current agitation needs to be seen.

The 1972 BHU Students' Union election, held in October, was not without its usual tinge of politics. Ranged against the RSS-SYS alliance was the Congress-CPI alliance. A lot of money was spent by both sides, and political leaders visited the campus to canvass for different candidates. The Congress-CPI-supported Chhatra Sangthan candidate won the presidential election, but the posts of Vice-President and General Secretary went to RSS candidates. In the subsequent confusion, the RSS group concentrated its energies on getting the Union dissolved.

Meanwhile, the university authorities conceded the outstanding demand for student participation, without even waiting for the adoption of the forthcoming Amendment Bill of BHU. A student-teacher consultative committee was formed. Student representatives were even associated (as observers) with the board for selecting teachers.

The RSS tried to run down the consultative committee by opposing its decisions and creating hurdles in their implementation. They evidently feared that, if a dialogue developed between the students and the BHU authorities, the RSS might be edged out. The two RSS representatives, the Vice-President and the General Secretary of the Union, therefore, boycotted the meetings of the committee. The RSS also resorted to physical violence. A Harijan student was beaten up for daring to fight the election of the hostel union.

The RSS and SYS boys again resurrected the year-old demand for cancelling the expulsion order against their leaders. On November 17, 1972, at a public meeting, they got a 34-point charter of demands passed and took it to the VC as a charter officially put up by the Students Union Council. They asked the VC to fulfil the demands by November 25. Next day, the Congress-backed President of the Union also met the VC with his own 43-point charter of demands.

While Shrimali agreed to consider both charters, he also pointed out that some demands which were unreasonable could not be met. Among these were promotion of engineering and technology students who had failed twice, withdrawal of the expulsion order against those who had been found guilty of gross indiscipline, rotation of all the Heads of Departments, and the annulment of the regulations of the Bar Council of India as related to the Law Faculty. Two other demands were: financial assistance to students desirous

of visiting the Asia '72 Fair, and stopping of the 'malexpenditure' incurred on the Watch and Ward staff.

In a further attempt to stir up students, the RSS started propaganda that the Central Government was considering introduction of a bill in Parliament with a view to depriving the university of its traditional 'Hindu' character. Even as these attempts failed to rally the students round, the RSS students in collaboration with expelled students and other outsiders "continued to organise unlawful meetings in the campus, making unauthorised use of loudspeakers, disturbing classes and dislocating traffic inside campus." (Statement on the Closure of Banaras Hindu University, published by BHU authorities).

SIGNS OF ALARM

According to the Vice-Chancellor, "signs of alarm" began to appear on December 1, when he went to inaugurate the students' union of a local college and was assaulted by a section of the mob shouting slogans for readmission of all the expelled students. He was again gheraoed on his return to the campus, by a crowd of 500 persons, among whom were "several anti-social elements including an alleged murderer of S K Kapooria".

The Academic Council met in an emergency session at 4 p.m., and expressed its concern over the day's events. It assured the VC of its "full support" in all the actions he might take "in the interest of peace and normal functioning of the university". The Teachers Council of the university also met on December 2 and expressed concern at the previous day's incident.

The police, who had been called in on December 1, to protect the university, were withdrawn from the campus two days later, following an assurance from an office-bearer of the Students' Union that peace would be maintained. Observers in retrospect feel that this withdrawal gave trouble-makers a chance to reorganise themselves. Promptly on December 5, the Vidyarthi Parishad and SYS organised 'black day' and led a procession to the Town Hall. December 7, when the new Governor of UP, Akbar Ali Khan, was to come to lunch with Shrimali, was chosen for the next agitation. When it was learnt that student agitators had planned to gherao the Governor, the venue of the lunch was shifted from the VC's Lodge to a hotel in the city.

The procession organised by the RSS-SYS combination marched as scheduled to the VC's residence about 1.30 p.m. According to authorities, "Finding that the

VC was not at his residence, they gheraoed his lodge from all sides and some of the students had even climbed up the trees.... It was conveyed to the peon at the VC's lodge that if the VC did not return by 2.00 p.m. they will be free to take such action as they deem proper. Students were making fiery speeches and went to the extent of saying that, if their demands were not conceded, the whole university would be burnt. Under these circumstances both the Commissioner and the DIG of Police advised the VC not to return to his residence till the crowd had dispersed." The police entered the campus and dispersed the violent mob by using force. Most student leaders were arrested.

After this, the RSS went on a spree of violence, loot and arson. University offices were broken open. The branch of the State Bank was attacked and attempts were made to loot it. The cafeteria and the City Delegacy Office were broken open and looted. A tent near the telephone exchange was set on fire, and two headgears of the exchange were taken away. Attempts were made to set the post office on fire. The university dispensary too was broken open. A car of the University was badly damaged. A woman on the campus was robbed of her necklace; and there were many other sporadic incidents at different places.

The following morning, with the university roads still strewn with brickbats, violence erupted once again at 8.45 a.m. when Umesh Prasad, Reader in Economics, badly assaulted by the hooligans had to be hospitalised. Also mercilessly beaten up were: Hira Singh, senior research scholar and member of the Students Federation (CPI); Student Union President Harikesh Bahadur; and Congress leader Upendra Vikram Singh, who had contested the Vice-Presidency. The Red Cross Office, the BHU Co-operative Stores, Raj Stores, the Students Co-operative, and the PWD store were broken open, looted, and set on fire.

According to the university authorities, "the mass outbreak of violence, arson, and looting by unruly elements necessitated the closure of the University", and students were advised to vacate the hostels within 24 hours because "a large number of expelled students and quite a large number of other anti-social elements from the city had taken shelter inside the campus under the protection of the agitators."

It should be noted that, in a campus of about 34 hostels where 6,000 students live, apprehending the "lawless" ele-

ments was bound to be a difficult task. There may be some substance in the student leaders' allegation that, when the PAC constables were called in to the campus on December 8, they virtually ran amuck, beating up innocent students in their rooms and taking away valuables. Even the Congress-backed President of the Union stated, "Once PAC enters the campus, the situation deteriorates because only lawful and innocent students get beaten. I was surrounded with 20 innocent students who were beaten mercilessly by PAC". He, however, went on to pin "The responsibility for this whole tragedy" on the RSS/Vidyarthi Parishad and a section of misguided SYS (Raj Narain Group)...

According to Mahesh Sharma, Secretary of the state unit of the Vidyarthi Parishad, about "8000 students had collected peacefully to seek a clarification from the Vice-Chancellor on his attitude to their demands." But the police beat up more than 500 students, mainly of Birla and Brocha hostels, in Shriali's presence. The condition of 200 students was serious when they were forced to leave the campus and not allowed even to visit the hospital or to report to chief proctor's office. He, however, did not agree with the argument that the police entered the campus as there was a possibility of outbreak of violence, but claimed that if even a single instance of destruction of property or violence between November 17 and December 7 was proved "our members will quit offices in the Students' Union".

But the teachers, academicians and eminent citizens of Banaras had another view. Considering the attack on the VC and Umesh Prasad as "an assault on the entire academic community", on December 8, a meeting of over 1,000 teachers strongly condemned "the manner in which a group of students especially the Vice-President and General Secretary of the Students Union belonging to Vidyarthi Parishad in collaboration with the expelled students and outsiders, declared trespassers, put the whole university to ransom and created such ugly situation which ultimately led to violence, arson, loot and physical assault on members of the academic community." While appealing to the political parties "which are misguiding the youth not to interfere in the university affairs", the teachers asked the university authorities, the state government, and the Government of India, to take "such strong and effective steps against the miscreants so that normal functioning of the university may not be affected year after year."

A meeting of the citizens of Banaras, too, blamed the RSS, working in collusion with anti-socials, for the acts of violence and assaults on teachers and use of abusive language against members of academic community of EIU.

Following all this, the VC has appointed a three-member committee, headed by a former judge of the Allahabad High Court, Gyanendra Kumar, to inquire into the acts of indiscipline and misconduct by 34 students. The commission has already started its inquiry.

A POLITICAL PLAN?

An analysis of the events does lead one to believe that BHU is part of a larger political plan. Ever since the Jan Sangh was trounced in the 1972 Assembly elections, it has been trying to create trouble using one pretext or another even creating a pretext where none exists. Student violence has often

started on the basis of some just grievance, but soon got intermingled with some imaginary ones. The Delhi University where the union is in the hands of RSS-controlled Vidyarthi Parishad, is one such example. BHU is another. Reportedly, one of the main slogans of the RSS boys at BHU was "Dilli ka Badla Banaras main Lenge" ("we shall take revenge for Delhi at Banaras"). But while RSS may be the instigator, at both places, it has had active support from some 'Left' forces — such as the SSP and CPM. Quite often using the issue of the undemocratic set up of the University to launch agitations, the agitations culminate in large-scale violence, with the police being called inside the campus. This provides the students with the classic cause of "police brutality" The agitation is stoked up. Normalcy is disrupted, and the RSS gains strength in the process.

Larsen and Toubro

LARSEN and Toubro is acquiring 54,226 equity shares of Rs 100 each in Hindustan Brown Boveri at par from Brown Boveri of Switzerland. L and T already holds 5,500 shares in HBB and Engineering Construction 6,000 shares, which together is about 4 per cent of the equity capital of HBB. BBC holds about 50 per cent of the equity capital of HBB. With the proposed acquisition of shares, L and T and BB will become equal equity shareholders in HBB, with each holding approximately 27 per cent. L and T's increased interest in BB will benefit both companies. HBB's range of manufacture is complementary to that of L and T in the electrical field, and ability to make joint offers would

strengthen the position of both companies technically as well as commercially. Besides, advantages would accrue to both of them through streamlining of their marketing activities. Considerable scope for joint research and development, exchange of personnel for training and work, and the widening of opportunities to both companies, could be envisaged as a result of close collaboration. Moreover, it is hoped that for L and T co-operation with BB and HBB will open a "window" to the world and place it in an even more favourable position in regard to acquisition of knowhow, research and development for the manufacture of additional electrical, and electronic equipment.

VIETNAM JOURNAL

The Modest Victors

Harish Chandola

AN aerial Dien Bien Phu took place over Hanoi in the 12 days of December last, from 18 to 29. During this period the United States tried to implement its threat to bomb North Vietnam back to the stone age. And lost. It lost 81 planes in those 12 days to anti-aircraft fire and to the skilful and determined fight put up by the small North Vietnamese Air Force. North Vietnam's fighter planes broke formations of US bombers and fighter-bombers and its anti-aircraft guns and missiles tracked and brought them down. Among the 81 planes shot down over Hanoi, there were 34 B-52s and five F-111s, the latter being the most sophisticated, advanced, versatile and expensive aircraft in the US arsenal. (The total number of US airplanes downed over North Vietnam from August 5, 1964 to January 17, 1973 is 4,181, including 65 B-52s and 13 F-111s shot down in the later part of 1972.) This was just like Dien Bien Phu in 1954. To continue bombing would have meant drastic damage for the US Strategic Air Force, about whose devastating destructive power much had been said.

In Hanoi's zoological park, next to the cage of mocking birds, is an enclosure displaying the debris of a B-52 bomber of the US Strategic Air Force, brought down over the park itself. These day more people visit the zoo to look at the fragments of this monster bird of death than at the animals. In that enclosure are its three-storey high tail-fin, shreds of wings 50-feet long, with ailerons torn out of them, fuel tanks that could store water for a whole small town and engines as big as generators capable of supplying power to a small town. A poster hung from a tree over these pieces of the murder weapon shows young militia women rejoicing with cherubs, and is captioned: "Victorious Hanoi". Anywhere you go in Vietnam, the people you meet say: B-52s are nothing to be afraid of and F-111s cannot frighten us. We can root them all down". You have only to visit the various parts of the country, where fragments of B-52s and F-111s and Phantoms lie, to realise that this is not an idle boast.

The US applied the fiercest means to over North Vietnam by bombing the populated quarters of Hanoi, which it had spared until last year. But the Vietnamese had taken measures which

saved many lives. 1,318 persons were killed in the 12 days of carpet-bombing. (In the Korean war over 8,000 were killed by bombs in a single day.) Of Hanoi's 670,000, about 500,000 had already been evacuated to the countryside before the terror bombing started.

On the outer wall of the bomb-wrecked Quoc Doanh Det spinning mill of Nam Dinh, Vietnam's textile city, 80 per cent of which now lies in ruins, is displayed a poem of Ho Chi Minh. It says:

"The rivers, the mountains and the men are safe; We will build our country ten times more beautiful."

The Vietnamese have already taken the first step towards that. These industrious people have a remarkable capacity to recover. The first day I visited the bomb-flattened Kham Thien street, I saw a small girl of about ten crying and wiping her tears with one hand and with the other picking up whatever ruined property she could salvage from the spot where her house must have been before it was wrecked. Four days later when I went to the destroyed street again and passed the place where I had seen the whimpering girl, there stood at that spot a very small hut of piled-up bricks, without a door, and inside it I could see a family altar, with oranges and joss-sticks and a few twigs of peach with their first flowers. And in a corner of it the same little girl was performing some household chores. It was the beginning of a new life! Several other survivors had also piled up the salvaged bricks and unbroken roof-tiles in neat stacks in Kham Thien to build new houses from the wreckage of the old.

Wherever you go these days, the roads of are full of people returning to their homes from the countryside to which they had been evacuated before the bombing. They bring with them their meagre belongings: a chair, a bench, a bed, mattresses, a kerosene lamp, books and all kinds of household knick-knacks. They bring them back on trucks and on trailers towed by tractors and on bullock-carts. But most of them carry their things on carts drawn by the head of the family and pushed by its other members.

And to whichever city you go, you see salvage, repair and reconstruction work already in full progress, just a month after the bombing. In Nam Dinh,

the people are putting up pre-fabricated houses and also huts of bamboo-mats and thatch to accommodate those returning; because most of the houses have been destroyed.

The Vietnamese have a 4,000-year-old history of struggle against foreign invaders. During the first 2,000 years, the Chinese feudalists committed innumerable aggressions against them, but were always driven out and defeated. In the 13th century, Vietnam fought the Mongol invaders, the Spanish conquerors in the 15th and 16th centuries, the French colonialists from 1859, the Japanese fascists during the Second World War, Chang Kai-shek and British troops immediately after that War, and the US and its allies since 1954.

It is in this light that one has to view their present struggle against aggression. They have gone through untold sufferings and hardships during their long history but they have never given up their struggle. The French and the Japanese had together imposed a famine on them from August 1944 to 1945 to weaken Vietnamese resistance. In that one year two million Vietnamese people died of hunger, but those who survived never abandoned their struggle against foreign domination.

One has to visit the museum in Hanoi of the Central Commission of Investigation into US Crimes in Vietnam to see what North Vietnam has gone through during the past nine years of the war. There you can see the high-explosive bombs rained on it: the 250 pound bomb, the 500 pound bomb, the 750, 1,000 and 3,000 pounders; the six-foot-long delayed action bomb which blows up hours after the bombers have left and people have come out of shelters and are going about their business; anti-personnel weapons like the steel-pellet bombs and 'Guava' bombs, containing 154,000 to 192,000 pellets, each of which can kill a person; the spider mine which spews out gossamer-like plastic strings which explode when one touches them; the dragon-tooth mines, tiny seed-like things dropped densely on the ground to wound and incapacitate people; anti-tank rockets used against people inside shelters (the rocket produces a temperature of 3,000 degree centigrade and tremendous pressure to penetrate strong shelters); the phosphorus bomb; the napalm bomb to burn people; and the phosphorus-napalm-thermite bomb of very high temperature which burns people and leaves survivors with serious blood and liver ailments; air-to-ground missiles with which warplanes can damage cities from a distance and without flying over them; CS gas bombs and so on. The US has dropped 15 million

tons of such and other bombs and shells on Vietnam. In the entire Second World War only 6,103,000 tons of bombs were dropped and in the Korean War 3,290,000 tons.

In that museum you can also see the 'Tropical Plant', an electronic sensor dropped from planes, which buries its heavy base, containing instruments, deep in the ground and displays only its stem and branches over the surface, which look like a tropical plant, but are in fact receivers and transmitters picking up noises in the neighbourhood (people walking or going on bicycles, etc) and communicating them to planes flying nearby so that they can come in and bomb or strafe anything that makes a noise. This was part of the electronic war in Vietnam, a war which enabled US combat troops to go home, because it could be fought from the air with the help of such disguised devices on the ground.

In 1967 Johnson had ordered the narrow waist of Vietnam, from the 20th parallel down to the 17th (the dividing line between the two Vietnams), to be bombed, first to cut the supplies that flowed from there to South Vietnam and to turn this southern quarter of North Vietnam into a "white area". The bombing was intensified to cause terror. Nixon continued that policy. By day the area was bombed from the air and at night warships of the US Seventh Fleet shelled it. Villages and towns in Vinh Linh and Quang Binh provinces were completely destroyed. Hospitals in that area became special targets, so that bomb victims might not get medical aid and the population in despair might rise up against the government. In 1967, Hoxa Hospital, just north of the 17th parallel was completely wrecked. The leprosy hospital in Quynh Lap was attacked 34 times the same year. There was no hospital left on the ground between Vinh Linh and Thanh Hoa provinces. The object of the bombings was also to spread disease into the countryside. It was hoped that when the patients were evacuated from the destroyed hospitals to the countryside, they would spread their diseases. Hospitals therefore had to be built below the ground and in caves, safe from air attacks, and they are still functioning there.

Kindergartens and schools in that southern part of North Vietnam were attacked. Both students and teachers were killed in attacks on the Teachers' Training School in Vinh. Churches were also bombed. Under Nixon, extermination raids were conducted between 1969 and 1971 in Ninh Binh pro-

vince, the home province of many Christians. The purpose was to cause despair among the Christians and turn them against the North Vietnamese Government. Dykes and dams were bombed in 1972, during the rainy season from May to August, to create floods and drown the people in the countryside.

But all these tactics failed to cause an uprising or to compel the people to give up their resistance struggle, though many lives were lost and hundreds of towns and villages were laid waste. In the Historical Museum of Vietnam there is a 4,000-year-old large bronze funerary jar. On top of it, on all four sides in relief are couples making love. It displays the old faith that life will go on in spite of death. The Vietnamese demonstrate that faith. They have a remarkable ability to recover. No agent of death has been able to destroy life on this land.

★

One is likely to be misled in making an assessment of the Paris Agreement on Vietnam if one does not know how the Vietnamese people themselves view it. Let me therefore present, according to my own understanding, their own estimate of it and also describe how they evaluate their victory and what they think of their future.

Some superficial scholars have stated that the Paris agreement of January 27, 1973, takes Vietnam back to the point at which it stood just after the Geneva Agreements of 1954. Nothing could be further from the truth. If you compare the two agreements, you would see that the Geneva Agreements of 1954 called for the regrouping of all liberation forces of South Vietnam in North Vietnam (South Vietnam was then to remain for a while under French domination). According to the Paris Agreement of this year, the liberation armed forces of South Vietnam and also its Provinces, safe from air attacks, and they are stay on their own territory.

The implication of the 1954 agreements was to divide Vietnam into two zones and then to tackle the problem of reunifying North and South Vietnam. The Paris Agreement makes no mention of North Vietnam; it has been concluded mainly to settle the problem of South Vietnam. The 1954 agreements accepted that half of Vietnam (North Vietnam) had been liberated. The present agreement is to settle the problem of liberation of South Vietnam, the remaining half of the country.

The 1954 agreements mark the beginning of US domination in South Vietnam. The Paris Agreement inaugurates

the period of complete US withdrawal from it. The most important point of the Paris Agreement is the US acceptance to respect the sovereignty, independence, territorial integrity and unity of Vietnam. This is precisely what North Vietnam had sought in its four-point stand announced on April 9, 1965.

Two days earlier, on April 7, President Johnson had made a statement in Baltimore expressing US readiness to negotiate a settlement of the South Vietnam problem on condition that North Vietnam undertook to withdraw its troops from South Vietnam and recognised South Vietnam as a sovereign country and the Saigon administration as the only legitimate government of the people of South Vietnam. The Paris Agreement totally rejects this position. According to it, the US agrees to respect the sovereignty and territorial integrity of Vietnam and undertakes to withdraw its troops from it completely. The US had wanted to turn South Vietnam into its military base. It had signed some treaties with the Saigon administration, according to which the US was to keep its extensive military base in Cam Ranh Bay for 100 years and its immense Danang military base too. According to the Paris Agreement there will be no US military bases in South Vietnam and the US will have no right to stay even on the smallest island of that territory. This implies that the US must totally end its aggressive war there.

In the Paris Agreement the US undertakes to respect the right of self-determination of the South Vietnamese people. It accepts that at present there are two governments, two armed forces and two zones within it and it respects the right of the South Vietnam people to solve this problem without US interference. The US also accepts the responsibility of healing the war wounds of Vietnam and of helping in rebuilding the country.

Of course, there are many complex problems in carrying out the Paris Agreement. There are forces which want to break this agreement. That is why the Vietnamese say that their struggle has won great victories, but not complete victory. "We have to continue our struggle to get this agreement implemented", they say. They have to see that peace is maintained so that national concord can be carried out and the country is reunited peacefully.

The Vietnamese say their struggle to achieve the above aims will overcome hardships. They are optimistic, because, they say (1) they have already overcome most hardships. Some time ago there were half a million US troops in South

Vietnam and the US was bombing North Vietnam, which had to bear 15 million tons of bombs and shells. This war was a trial for the party which led the nation and also for its social organisation. The Vietnamese have overcome this and most other difficulties and they add that they fear none now.

(2) The balance of forces in Vietnam has changed much. At the time of the Geneva Agreements in 1954 there was no modern army in North Vietnam. It had hardly any assets. It had on its hands a country destroyed by war. Now North Vietnam has an Air Force, Navy, infantry, anti-aircraft weapons and a very solid defence. In South Vietnam the liberation armed forces have scores of regiments and divisions, which constitute its regular forces, plus hundreds of thousands of militia and guerillas. And they are all armed. Not like in 1954, when they had to fight with bamboo sticks. In 1954 the US had started interfering in Vietnam. Now it has to withdraw. There is therefore a great difference in the balance of forces now and that of 1954.

The other main point to understand is how the Vietnamese estimate their victory. They have a 4,000-year-old history. They have the experience of 40 centuries of struggle against foreign aggressors. All the great imperialist powers had invaded Vietnam and the Vietnamese had fought them. Since 1850 Vietnam fell under the domination of Western powers. In the last 113 years there was not a single day when there was no foreign invader in Vietnam.

If the Paris Agreement is sincerely and strictly carried out (less than one-and-a-half months are left now for carrying it out), for the first time after 113 years there will be no foreign invader on the soil of Vietnam. The Vietnamese will have ended a century of Western domination and opened a new period of their history. This is one significance of the Paris Agreement.

FIRST TOTAL US FAILURE

The second significance is that the Vietnamese have destroyed the aggressive aims of the most powerful imperialist country. This is the first time that the US has to withdraw from a country completely. It must not hold any part of this land. This is the first complete failure of the US.

At the inauguration of his second term of office, on January 20, 1973, President Nixon had to say that the US will no longer be the policeman of the world, and that it will no longer get involved in any war. For the last 25 years the US had functioned as the

international police force. It wanted to be the master of the world. But now it has to admit that it cannot be.

The US had devised and used many strategies and tactics to achieve its aims in Vietnam. Four successive Presidents came to the scene during the Vietnam war, each with his own strategy, each escalating the war higher than his predecessor. President Nixon had escalated it to the highest point, with utmost brutality, when he ordered the bombing of Hanoi with B-52s.

But in this war the US weakened its ground forces. Its naval force (Seventh Fleet) suffered damage. The awe in which the US Strategic Air Force was held in the world is now destroyed. What intimidating weapon has the US in its hands now? The H-bomb? But it dare not use it, because if it does, the whole world will rise up against it. The most modern weapon in the US Air Force was the F-111. But when it was sent to Vietnam, it was shot down by very young girls, with rifles.

The third significance of the Paris Agreement is that a small nation like Vietnam, with a small population, not rich and in fact poor, can with determination and correct policy defeat the greater imperialist power. It also proves that man is stronger than technology and that weapons cannot defeat the determination of a people to win independence and freedom. The Vietnamese were a determined people and they knew the way to fight successfully. They have made a great contribution to the capability of national liberation movements to fight successfully.

The fourth significance is that the Vietnam struggle has contributed to the strengthening of the forces of justice and humanity. The US carried out an inhuman and barbarous escalation of the war. The Vietnamese had also to escalate. But they escalated their faith in the ingenuity and dignity of man. And finally man's dignity and civilisation won over brutality and barbarism. The Vietnamese consider their victory as the victory of all the progressive peoples of the world, because they supported the Vietnamese and encouraged them. After the signing of the Paris Agreement, the great Vietnamese poet, To Huu, wrote a poem: "Vietnam: Blood and Flowers", of which one line says:

"Just as nobody's suffering is alien to all of us,

This Victory belongs to all of Man-kind."

The Vietnamese say that they have educated their people about the wholehearted support they have received

TASKS AHEAD

The Future: The Vietnam struggle has reached a turning point. From an armed struggle it now becomes a political struggle. From a dominated position the country arrives at an independent position. From war it turns to peace. That is why the Lao Dong Party (the ruling Workers' Party) a few days ago issued an appeal, which said that the great victory of their struggle against US aggression, for national salvation, opens for the Vietnamese nation a splendid period of development. The people will now march forward and take their country to a new stage of independence, democracy, prosperity and unity. It said the people will make Vietnam a model, with modern industry and agriculture, and with great development in the field of culture. Vietnam will have a historic period of ten years, during which the living standard of its people will be greatly improved, both spiritually and materially. It added that, with the clearheadedness and heroism of their people, they will make their country an advanced country. They will catch up with the advanced nations within a short period. They believe they can do this, because they have gone through many hardships and the world continues to support their people.

In outlining the task of the people, the Party said that they have to continue their struggle to get the Paris Agreement implemented seriously and strictly, because this will do good to the Vietnamese people. This agreement provides what the Vietnamese struggle had sought to achieve. The Vietnamese had to fight for 19 years to reach this agreement. That is why they want to carry it out. But in South Vietnam and the US there exist reactionary forces which want to destroy peace and that is why the Vietnamese people have to heighten their vigilance and seek the help of their brothers the world over to get this agreement implemented. If the agreement is carried out, peace in the area will be consolidated and preserved.

The second task given to the Vietnamese people is to do their best to achieve national concord. The policy of imperialism is to divide and dominate. But the policy of revolution is national concord, unity, solidarity, independence and freedom to build up the country

together. The people in South Vietnam have been told not to place importance on hostility between political elements there. They should consider that whatever the Saigon regime did was because of imperialism and not because of itself. The pro-American people in South Vietnam are victims of the US policy of neo-colonialism. That is why the other Vietnamese should love them. That is why they should struggle to achieve national concord. They should

BANGLADESH

Political Economy of Reconstruction

Angus Hone

THE results of the election of March 7 have confirmed that the Bangabandhu has an unparalleled hold on the people of Bangladesh, but these same results mark the beginning of serious economic planning and plan implementation for Sheikh Mujibur Rahman and the Awami League. The difficult tasks of translating political freedom into economic independence and growth must now begin. The First Five-Year Plan (1973/4-1977/8) will appear in late April or early May, and will provide a more comprehensive guide to national growth strategy and policy objectives. However, it is overwhelmingly clear that the period of *ad hoc* national reconstruction must be brought to a close and that longer-term economic decisions must be taken which will recognise the acute economic difficulties faced by the nation.

The economic situation in Bangladesh as Pakistan rule came to an end in 1970-71 was already bleak. The annual rice deficit averaged over one million tonnes and total production was growing very slowly; the jute yields per acre were low and jute was facing increasingly stiff competition from bulk handling and synthetics, particularly in the world market for sacking which was dominated by East Pakistan mills. The social overhead capital of the region was rundown: the railway system and roads were inadequate, power generation was insufficient, no adequate irrigation or flood control measures existed. Industry had developed slowly, and 80 per cent of the large-scale sector, along with still larger percentages of banking, insurance and shipping, were dominated by West Pakistanis.*

In early 1972, with cries of "Joi Bangla" still ringing in their ears, some believed that the economic prospects for

not allow the people to be divided on the basis of religion and between communists and non-communists. All attempts at division must be fought against. By achieving national concord, they will create conditions to preserve peace and end war.

The third task of the Vietnamese people will be to reunify the country, step by step, peacefully on the basis of consultations between the people in the two zones (North and South).

Bangladesh were excellent. I N Mukherjee's "Economic Development of Bangladesh: A Probe into Viability"*** represents such a view, which completely fails to take into account the food deficits, the impact of synthetic competition on jute, and the massive physical and administrative disruption caused by the Liberation War. Even the most thorough book on the planning problems of the Bangladesh economy, Aziz Rahman Khan's "The Economy of Bangladesh",† is much too optimistic about the resource base and underestimates the administrative problems of implementing even the best Plan in a predominantly rural nation, which had been misruled for almost 25 years.††

FOODGRAIN DEFICIT

The major problem remains agricultural. The crop year 1972-73 is estimated to have resulted in 2.5-3 million tonnes of foodgrain deficit against a 'normal' deficit of 1-1.5 million tonnes. Even a normal deficit in 1973-74 would be extremely serious as the railway link

* A very useful detailed but neglected account of the resource base is to be found in Nafis Ahmed's "The Economic Geography of East Pakistan" (Oxford, 1968), although it must be supplemented by the *Pakistan Development Review* and government publications.

** See I N Mukherjee in "Pakistan Political System in Crisis" edited S P Varma and Virendra Narain, Jaipur, 1972, pp 163-172.

† A R Khan, "The Economy of Bangladesh", London 1972.

between Chittagong and Dacca will be finally repaired only in July or August 1973, and as the losses of country boats during the Pakistan army action will take several years to be restored in full. The 'mini-bulkers' of the UN relief operation are now scheduled for withdrawal at the end of the year, though it is presumed that they can be leased or purchased during the 1973-74 crop year and beyond.

The task of improving agricultural output is immensely difficult. The areas covered by 'assured irrigation' and flood control are small, and the number of pumpsets, wells, etc, are no indication of those actually operating. Maintenance of all industrial and agricultural equipment, the provision of spare parts and essential inputs such as diesel fuel, grease, etc, is in most districts an endemic and unsolved problem. The improved varieties of IRRI rice (whatever their edible qualities) are highly susceptible to the depth of water, drought, fertiliser, pesticide, and herbicide application; in the circumstances of Bangladesh, it is almost impossible to get the right package to the right farmers at the right time. The results in 1972-73 were sharp falls in the per-acre yields in a number of districts, which had pioneered the new varieties. The full extent of the problem in rice production can be realised only if it is remembered that the three-year average rice production from 1963-64 to 1965-66 was 10.4 million tonnes, whereas the 1967-68 to 1969-70 average was only 11.5 million. An increase of only 10 per cent in the average rice harvest over 7 years — far below population growth rates at 2.8-3.0 per cent annually — is clearly unsatisfactory.

A further complicating factor is the rapidly deteriorating protein position. The outdated 1962-1964 nutrition survey has been recently supplemented by a UN/Government of Bangladesh survey carried out in 1972. Major protein intake is from rice (35 grams per day), animal protein from fish (6 grams per day), and protein from pulses is as low as 5 grams per day. It is hardly surprising that 45 per cent of children screened in the 1972 survey suffered from mild to severe malnutrition.

A final problem is the political commitment to co-operatives and to co-operative marketing — which is part of the Awami League's programme. An attempt to impose an immediate co-operative solution would disrupt the centuries' old distribution networks that rely on middlemen for the financing, buying, and grading of rice, jute, and fish. At the present time these difficul-

ties would be compounded by the inadequacy of inland water transport; but a long-term effort to establish viable co-operatives is justified.

The problems of the agricultural sector, moreover, cannot be solved in Dacca. A series of district and thana-level plans must be drawn up to enable the Ministry of Agriculture and the Planning Commission to monitor progress at the micro-level. The present provincial administration must be rapidly rebuilt at the district level and steps taken to recruit, train, and support, extension service officers in the rural areas. Similarly, an effort must be made to build up mobile maintenance teams, which will ensure that the electrical and diesel irrigation machinery is fully utilised and that new machinery does not remain unutilised because it cannot be repaired or because spare parts are not available. The question of inputs should be analysed on a district-by-district basis. The past experience in Bangladesh suggests that however inadequate overall national procurement of inputs has been, distribution at a district level has been far worse. The protein problem cannot be readily solved in the short term; efforts to gradually shift consumption from low protein rice (7 per cent protein) to wheat and other cereals (10-14 per cent protein) will continue, but the efforts to raise fish and poultry production through more scientific cultivation must be expanded. Fish production is approximately 800,000 tons per year, and yet this tonnage provides only 6 grams of protein per head per day. Vegetable cultivation must be encouraged too, but again, it will be a very long time before dietary habits change. One possible supplement is *fish protein concentrate* which could be imported or produced in bulk and distributed to all citizens as a low-cost dietary supplement. Its cost is substantially below any other source of protein immediately available, and in the longer run could be easily produced by the Bangladesh Fisheries Development Corporation as part of their Chittagong fish harbour development.*†

These policies in the agricultural sector need immediate study and implementation. The chief difficulty will be a shortage of cadres — trained and untrained — willing to live and work in the rural districts where more than 90 per cent of the population live. Agricultural reconstruction will not be pos-

*† I am indebted to Cato Aall's paper, "How to tackle the protein gap of Bangladesh" (mimeographed Dacca 1973), for information on the protein question.

sible without committed administrators, extension workers, and maintenance teams working in each district. They will have to be supported with inputs, but their commitment to rural development is essential.

FOREIGN EXCHANGE CRISIS

The second set of reconstruction problems relate to the foreign exchange position of Bangladesh. In the course of 1972-73 and almost certainly in 1973-74, the government will be forced to use foreign exchange reserves (over and above what is granted or supplied by the international community) to purchase rice on the world market. The critical nature of the foreign exchange situation is now fully realised. The value of the taka as an international currency is entirely linked to the future competitiveness of jute. Without the present level of total raw jute offtake (7,500,000 bales in raw jute as well as in the form of yarn, sacking, hessian and carpet-backing), the value of the taka will steadily fall in the free market. At present the prices of jute and jute goods are too high in relation to their synthetic substitutes. India would be well advised to cut or abolish the duty on secondary carpet-backing cloth, but Bangladesh must not only match and undercut Indian prices on carpet-backing, it must provide raw jute to the declining Western European and developing country industries at a price, which will maintain Bangladesh's total raw jute offtake and prevent any further inroads by kenaf or synthetics. Jute, in 1969-70, accounted for 91 per cent of East Pakistan's foreign exchange earnings (although only 65 per cent of inter-vening trade is included), and in 1972-73 the export target of 300 crore taka is still over 85 per cent dependent on jute and jute goods (250 crore taka). The non-jute exports — tea, leather, paper and pulp, spices and fish — require a clear incentive policy which cannot be discovered from the complexity of the exchange rate for jute.

These considerations are further complicated by the very weak position of the taka against the Indian rupee. In Calcutta and Dacca, 200 takas can be exchanged for 100-120 Indian rupees; and the growth of this disparity has caused limited, but politically embarrassing, smuggling of rice, jute, shrimps and leather, difficulties in completing the raw jute and fresh fish purchases under the 1972-73 Indo-Bangladesh trade agreement which ends on March 28, and a certain amount of capital flight through Calcutta.

The taka will have to be eventually

devalued by 20-25 per cent to enable jute and jute goods to remain competitive, while a major counter-attack is mounted jointly with India through 'Jute International', which will be responsible for marketing, promotion and technical support to jute users. Similarly, any expansion of the carpet-backing loomage would have to be very carefully considered in view of the surplus capacity available in India. Only the jute sector's competitiveness (assisted by rapid oil price increases from 1973-80) will ensure stability for the taka; but while that is being accomplished it should be possible to boost non-jute exports by payment of a 20-30 per cent cash subsidy, making raw materials available at internationally competitive price and giving full consideration to the export industry's requirement of balancing and modernisation machinery as well as new equipment. The rules on foreign investment should be still further clarified, and clear regulations evolved to attract local managers and traders from indenting into the export business. A study should be undertaken to examine the feasibility of an export processing zone at Chittagong (for certain selected labour-intensive industries such as leather, clothing, plastics and electronics). Whatever is done for non-jute exports, the economic future of Bangladesh during its First Five-Year Plan and the value of the taka will depend on maintaining the long-run competitiveness of jute and by implication on the present total raw jute offtake (in raw jute or its manufactured equivalent). The taka's value cannot be treated as a political variable, and the Prime Minister must bear in mind that the medium-term ability to pay for imports (above the levels supplied through national or international aid agencies) will depend for the foreseeable future on jute's earning power. Even in 1977-78, jute will represent 70-75 per cent of total export earnings.

A third problem undermining the planning framework and making reconstruction increasingly more difficult, is inflation. By January 1973, the index for clerical workers had risen nearly 30 per cent above the January 1972 level. But this index considerably understates the extent of inflation because it assumes that rice can be bought from government shops at taka 40 per majmd (82 li) against a free market price of 80-100 taka; it also ignores the fact that cigarettes have become a black market commodity, cotton yarn and cloth have risen 150-200 per cent, edible oils by 200 per cent, and fish by 100-150 per cent. There are also shortages of su-

gar, kerosene and petrol. Money supply has been sharply expanded from Liberation in December 1971 to March 1973, but its exact rate of expansion is difficult to determine because the Pakistan Army's destruction of currency notes and bank records before surrender has made estimation a dangerously hit-and-miss exercise. This inflation was partially caused by the gross underestimates of import requirements in key government agencies during the first half of 1972. Shortages of all commodities, given much of the present unpopularity of India, are somehow linked in the ordinary citizen's mind as resulting from India's demand and the opening of the border. The inflation is worsened by the uncertainty caused by government's lack of decision on the status of savings certificates, bonds, and other holdings of the urban middle class. The result is that no savings are being generated and everyone is converting the taka into goods or Indian rupees.

An inflationary spiral in 1973-74 would not only undermine the competitiveness of exports (only a series of devaluations of the taka could prevent this from occurring), but, far more seriously, it would bring the Prime Minister into direct conflict with the small, but politically important, middle and working class in the urban centres. The government will be forced to act immediately as continuing the present policies of benign neglect would only contribute to further inflation.

A first step must be a cut in the rate of growth in money supply, which will necessarily have to be linked to a policy of high interest rates for bank deposits and savings certificates. A scheme might be considered for compulsory savings, at 5-10 per cent of current wages, although these savings should be fully protected against inflation by being linked to a reliable consumer price index. The compensation promised for those businesses taken over from Bangladesh citizens (particularly in the jute trade) should be paid immediately and in full. Finally, the government should use, fair price shops and import policy to control any price increases, which threaten this policy of cutting back inflation. A most difficult area to handle is the problem of the rupee/taka parity and the taka's extreme weakness in the free market or 'black market' against other foreign currencies. The proposed devaluation will be only a partial solution, but if it is combined with a limited right to buy foreign exchange (Indian rupees included) at 100-150 per cent over the official parity: for foreign travel, education, etc, upto 1000/1500

taka per year, there might be some partial respite from the present rampant currency speculation.

PROBLEMS OF IMPLEMENTATION

The most serious problem is that of political and economic management and administration. Implementation in the absence of cadres is always a severe problem and the situation is worsened for Bangladesh by three factors. The present uncertainty caused by the forcible retention in Pakistan of a large number of the most senior Bengali civil servants, the extremely rapid promotion and appointment of younger officers with little prior training and administrative experience, and a fatal tendency in emergency to return to 'Pakistan ways' and bureaucratic procedures, which are a remnant of the 19th century British administration. Rules framed to maintain law and order and a colonial Raj are hardly appropriate or useful as development tools in Bangladesh today. Yet, there is little doubt that most Ministries are comfortably settling down to process files and to return to the dusty red-tapism of 'Pakistan ways'. These difficulties are worsened by the absence of any clear code governing 'Rules of Government Business'. This has meant that secretaries and Ministers are involved in petty decisions, Cabinet Ministers in minor decisions, and the Prime Minister in almost all decisions in every sphere of political and economic life.

The delayed take-over of the bulk of the industrial sector and the creation of the Jute Board and the Tea Board as well as the 10 public sector corporations has meant that 85 per cent of the industrial sector is under government control. The division of areas of responsibility between 'managers' and 'bureaucrats' has not been decided, government procedures and audits have been imported wholesale, and it is hardly surprising that widespread confusion and suboptimal working of industrial units is the result. It must be remembered that the take-over was imposed after the loss of almost all senior managers, who were largely West Pakistanis or expatriates, many of the technical staff, who were Biharis, and widespread labour indiscipline, which has been continuing. In these circumstances the recovery of the industrial sector and the gradual return to normal within the bureaucracy and administration, are excellent initial achievements; but the political leaders after the election must work towards an administration which gives priority to rural and agricultural development and which is willing to administer far more flexibly than is at present envisaged. The public sector

managers will have to give clear autonomy to manufacture, and price and market their products without being subject to bureaucratic interference on a day-to-day basis. There will be need for political direction and clear statements of Plan objectives and government policy.

During the First Five-Year Plan, the problems of agricultural production (rice and jute), foreign exchange (jute), and inflation will be critically interlinked. A failure in production will bring a balance of payments crisis and inflation at the same time. Only agriculture can provide real growth in per capita incomes and dampen inflation. Only a constant or slowly rising offtake of raw jute (or of jute goods in raw jute equivalents) can stabilise the value of the taka and provide the foreign exchange for consumption as well as for investment good imports. All policies will fail if inflation and rupee/taka parity problems create political instability and conflict. None of these problem-areas in the political economy of reconstruction are likely to be amenable to solution, unless the administration and the public sector managers improve their implementation of Plan targets, particularly in the districts, and get autonomy from political interference. A healthy link between the political and administrative spheres of influence will be achieved only if it is the subject of a clear directive from the Prime Minister.

There is very little in the above analysis on the corruption, party quarrels, political assassinations, profiteering, and resentment towards India. These factors are real and are not unimportant, and, if the Prime Minister is unable to begin eliminating them after his election victory, they will cause real rifts in the fragile social fabric of Bangladesh. These factors, however, are the superstructure and not the base of the political economy of Bangladesh. The key to the survival is not in the Secretariat building in Dacca, but in the fields and factories. Implementation at the district, taluk and village levels will depend on the people of Bangladesh. The important verdict of the First Five-Year Plan and the relevance of its objectives will not be passed by the World Bank or the aid donors. The reconstruction of Bangladesh will have to be relevant to the agricultural labourer, the small farmer, and the industrial worker. Any assessment of the First Plan should start from these criteria of relevance and not from its acceptability to the Harvard Development Advisory Service.

Politics of Defence

S Krishnappa

Our National Security by K Subrahmanyam; Economic and Scientific Research Foundation, New Delhi, 1973; pp 65; Rs 5.

THIS monograph by the Director of the Institute for Defence Studies and Analysis is a unique document in many ways. It is the first ever presentation of a viewpoint on national security which explodes the premises of the somewhat phoney debate on 'defence or development'. It seeks to emphasise that an integrated policy for national security must be part and parcel of the national plan for economic development, science and technology, and that such a policy needs total political direction, content and purpose. Subrahmanyam calls for a country-wide debate on national security, and distinguishes the rather bureaucratic approach of discouraging debate on defence-industrial efforts and politico-strategic policy from the need to keep confidential the information on actual deployment of forces and operational plans.

CONCEPT OF NATIONAL SECURITY

He himself discusses security in its wider perspective. This is a welcome feature, because hitherto articles as well as books on defence and security problems have kept very much to the straight and narrow path, maintaining the colonialist tradition of treating defence as a sacred cow that has a status which is exclusive and outside of public purview. This popular, conservative view of national security, as functioning mysteriously in some kind of a political vacuum far from the national mainstream, considers that it is better kept that way. Not so surprisingly, one of the instruments of national security, viz, the defence services, have also sought to foster the impression that national security could function in a vacuum.

Subrahmanyam has done well to define, at the very outset, a concept of national security that is total. According to him, national security does not mean merely safeguarding of territorial boundaries; it means, also, ensuring that the country is industrialised rapidly and develops into a cohesive, egalitarian, technological society. Subrahmanyam points out that, when

China occupied portion of Aksai Chin — a totally uninhabited and inaccessible area —, this was perceived as aggression against our country and a threat to our security. Yet the inroads on our national sovereignty through economic and diplomatic pressures, whether subtle or not, are not readily recognised as such. In many ways, the threat posed by such means is more pernicious than open territorial aggression. Foreign aid, particularly from the US, which has served to increase rather than decrease the dependence of the poorer nations on the US for further aid is an example. In other words, the ruling elites in many countries have welcomed US aid and have willingly surrendered to it part of their sovereignty.

Pakistan and China are easily identified as our adversaries; but they are only the small visible portion of the iceberg of our security problem. Examine the oil refinery agreements, the pharmaceutical and drug collaborations, and you perceive the more pernicious forms of foreign aggression. In particular, the United States by virtue of being the leading *status quo* power, clashes with and temporarily holds up development elsewhere, and in the process tends to be a threat to security the world over.

Subrahmanyam's contention is that, if India does not in the next two or three decades become a major power, external pressures will break it up. He assaults the ruling elite's priorities, softness, and behavioural patterns, and criticises them for opposing hard decisions which would lead to cutting of consumption and rapid industrialisation. He accuses it of functioning as a tool of neocolonialist policies, manipulated by *status quo* powers like the US.

Admittedly, external pressures will be exerted to keep us backward, and the problem of national security is intimately linked to facts such as that India has a majority of the world's illiterates and also that many in India are nutritionally deficient or diseased. But if China has been recognised as

a major power it is not because, as Subrahmanyam would believe, it has nuclear weapons and a large army, but because it has forced the recognition of its determined political will, self-respect, and self-reliance, and because everyone recognises that the masses of its people are on the move. Unless India demonstrates, in action, a purposeful commitment to mobilising the participation of all its people for national reconstruction, not only will the world be uncaring of its interests, but there will be the ever-growing danger that the country's problems could take it to breaking point.

One cannot disagree with Subrahmanyam, in that, Indo-Soviet collaboration is both necessary and desirable — particularly in areas where we need massive transfusion or transplantation of technology. But we cannot, as Subrahmanyam points out, be content merely to shift from being the client state of the Western world to being tied to the apron strings of the USSR.

If India is to be respected as being in control of its own destiny, it must have adequate military power.

SPECIFIC SECURITY THREAT

The new international environment is being determined by the logic of power and national interest; ideology, supposedly does not rate high any longer. Subrahmanyam is convinced that either nuclear weapons or enormous economic power like Japan's bestows the status of a major power on a country. Supposing then India were to develop into a nuclear power, would it — retaining its present percentages of impoverished, illiterate, diseased people, its feudal-capitalist economy, its illusory indices of growth — be regarded as a major power?

Subrahmanyam has brilliantly analysed American designs in Asia and in the Indian Ocean. He speaks of there being a specific security threat from the US to India, yet he stops short of spelling it out in military terms. He has done this, however, very incisively, in the sphere of our economic, social, cultural, and political life. The question that no one is even willing to ask is: Is there a threat of a Vietnam-type of intervention by the US in the decade ahead? Calcutta, after all, is only 600 miles from Bangkok, where

American troops are stationed and from where North Vietnam has been so brutally bombarded. Why is it that we Asians finally look at only fellow Asians as our enemies? History apparently has taught us nothing. Pakistan and China, even when Subrahmanyam has recognised the reality of US motives, remain our "adversaries" — even after he himself writes of the possibility of Pakistan being used as a base by the US for operations in West Asia! And why West Asia alone?

The elite in this country, as Subrahmanyam says, is closely connected with, and in fact willing to be a tool of, neo-colonialist design. The system of decision-making "subverts the interests of the ruling elite". Decision-making has been so compartmentalised as to serve to consolidate a *laissez-faire* system of economic administration eminently suited to the interests of the elite. The hope and expectation of the elite is that, so long as the industrial proletariat, the middle class, and perhaps some of the small farmers and the lower-middle class, are kept tolerably satisfied with expectations of mobility into higher income brackets, the system may remain manageable. In such a situation, one cannot hope for any sudden revolutionary change. And, as Subrahmanyam says, one has to look for a compromise solution. He, therefore, advocates a national security policy as a supplement to a national development policy — rather than as an integral part of it. In fact, Subrahmanyam's further suggestions are well within the ambit of this compromise. Unfortunately, it is perhaps the compromise that leads to ambiguity in concepts and to suggestions by Subrahmanyam for weapons systems which are very costly because they are not and cannot be the answer to the threats to our national security — in even an exclusively military sense.

BROAD CONCLUSIONS

Subrahmanyam's broad conclusions on the external threats may be summarised as follows:

Pakistan and China may continue to be our adversaries; the US may prove to be an adverse factor in our security calculations; at best it may prove neutral; the USSR is likely to continue to support us, though its own strategic preoccupations preclude this being taken for granted; West Asia is a potential area for conflict, as it is a world energy source; the Indian Ocean region may

hot up for strategic military considerations like basing of Trident submarines; big powers are likely to interest themselves in India's neighbours probably leading to repercussions on our security; internal unrest and economic difficulties will spur others to interventionist policies, particularly the US, which is not likely to be deterred by its defeat in Vietnam; to assume that there will be no attempt at nuclear blackmail by the US or China is to take uncalculated risks; but China is not considered as aggressive or as ready to sweep down on South-East Asia. Nor is communism *per se* considered a threat.

The neocolonialist threat has to be dealt with separately, as it needs to be countered primarily with political and economic weapons. Subrahmanyam earnestly believes in a formidable threat developing against this country. Perhaps he is right. One must be prudent and anticipate the worst. There is, in this game, no second prize for the loser.

Here, he brings basic issues to the fore. In his forcefully argued view, India cannot devote itself to development without paying adequate attention to its national security, even as the converse too is true. The slogan 'defence or development' is an ill-conceived one. Subrahmanyam rightly points out that defence expenditure is only a very small portion of the consumption sector. The redeployment of this small proportion will not make a significant difference to the growth rate. Of the GNP, 88 per cent is in the consumption sector; and to talk in terms of 'defence or development', when defence expenditure is only 3.4 per cent of the GNP, is really misleading.

But we have never even asked the question: National security against what threat, to defend what values? Nor have we ever asked the question: 'Economic development towards what kind of social order'. Unless we do, we shall be treated as a soft state by both the US and China. Our approach so far has been administrative and not political. We have believed that the international system and international aid, as personified by the Aid India Consortium, would help us to our feet. With a 15-billion-dollar debt, what kind of industrialisation has India been able to achieve? The US has meanwhile spent \$140 billion in committing genocide in Vietnam as against 60 billion 'aid' to the developing countries. Even now, our approach to development and national security has been non-ideological

and based on consensus — or, as some like to call it, 'pragmatism'. 'Socialism' is the nomenclature used to describe the approach. A consensus approach really means allowing the elite, conditioned by Western ideas and in constant touch with the West, to determine the country's strategy of development, its role in international politics, and the kind of society that will be aimed at.

The monograph takes some questionable positions. For one, Subrahmanyam says technology determines the power of a nation today. Yet Vietnam, only a thousand miles away from us, has proved otherwise. So has China. He refers to the green revolution, forgetting that, in fact, there has been little or no green 'revolution', the growth rate of agricultural output per annum having been less than that achieved in 1956-62. He speaks of our value system, declaring that "India" would not opt for the degree of violence that was adopted in China and USSR or for total elimination of dissent. Thus while he calls for revolutionary changes, he also accepts Western propaganda that there has been violence in China. Then somewhat as an anti-climax, he agrees that the experience of the Soviet Union and China is more relevant to this country than that of the Western world. More precisely, China's experience in the development of science and technology, is considered significant by Subrahmanyam.

COMPROMISE APPROACH

'Planning for Defence' is the final chapter of the monograph. In his summing up, Subrahmanyam finally adopts the compromise approach. He has to contend with the Hobson's choice of planning for defence against China and Pakistan; the rest of his earlier analyses of US intentions, of the West Asian scene, and the Indian Ocean region, are not now so cogently taken into consideration.

What is amazing is that all Indian security specialists have advocated bigger defence expenditure, bigger defence forces, bigger, better, and more sophisticated, weapons systems. Yet no one has even mentioned that we ought to study the Vietnam experience. Will the poor Asians always fight other poor Asians? Has Vietnam not taught us anything about war? After all, 9,000 aircraft have been shot down in seven years and hundreds of tanks and field-guns captured and destroyed; Vietnam

went through the heaviest bombing km that history has known. Yet the most sophisticated weapons systems lost their credibility there. In other words, technology was defeated by man's will, by his ingenuity and organisation. The Vietnam war is an example of brilliant improvisation, of the viability of the cheapest materials backed by human resources. That was a fight by a people standing together as one, knowing the basics of national security better than most civil and military experts in other countries. This, against the 'richest and mightiest' nation of 220 million people. Yet we in India have been planning our security machine and organisation without much attention to Vietnam. If this is not due to a neo-colonialist tradition, what is?

We go in for man-surveillance radars to guard our borders, we have built frigates for Rs 30 crores, and we have gone on spending a great deal on the development of one aircraft type with fair disregard for costs, in the name of

modernising our armed forces. Bangladesh has given wings to our muted arrogance and closed our minds. But Bangladesh was a very special, fortuitous case where the entire people were with us against an alien army separated from its bases by thousands of miles. Do we build our forces on experiences of this kind of good fortune?

The biggest gain of the 1971 war was that it gave our armed forces a confidence in their capability to plan and execute unconventional attacks — something which is not given in any Western textbook. There was the emergence at all levels of a searching enquiry to correct and re-examine our concepts. Sophisticated weapons systems have their place, yet the essence of national security lies in the participation of every citizen in it. We need not fight shy of emulating some of the features which have proved themselves, in China and Vietnam, when we plan for our national security. Both are poor Asian countries. Both are relevant to our

situation, the kind of situation K Subrahmanyam's analysis leads to. Let us not talk exclusively in money terms. Rs 9,260 crores for the five-year defence plan or a Rs 50,000-crore national plan may lead us nowhere, unless our concepts are clear and objectives firm.

Subrahmanyam himself suggests this. His approach is unexceptionable. His call for integrated planning for defence and development and an overall approach to national security at the political level is urgent and important. His suggestions for the organisation of study groups in important areas of integrated planning such as a 1975-85 plan for electronics, a nuclear-space programme related to India's future security, development of border areas, and utilisation of skills developed in the armed forces — all need attention at the political level. But perspective studies and their implementation have finally to be the responsibility of the political leadership of the country.

FROM THE CHAIR

Parrys Confectionery Limited

Statement of the Chairman, Mr H V R Iengar

The Eighteenth Annual General Meeting of the Company was held on 28th February 1973 at Madras. In his circulated Statement, the Chairman, Mr H V R Iengar, made the following points.

THE results for the year show a profit of Rs 8.90 lakhs. The profit after tax is Rs 2,43,809 compared with Rs 6,11,378 last year.

Complete dependence on high cost free market sugar together with the increase in prices of other major raw materials like Glucose pushed up the cost of production. It was not possible to increase the selling price correspondingly since this would have resulted in a considerable drop in sales.

In view of the lower profit this year, the Board decided to recommend a dividend of 14 per cent as compared with 18 per cent last year.

The profit available for appropriation including surplus brought forward from the previous year, is Rs 2,62,419 out of which Rs 1,09,000 has been set aside for Development Rebate Reserve, leaving a balance of Rs 1,53,419. Taking Rs 1,05,000 from the General Reserve and Rs 1,34,000 from Development Rebate

Reserve which is free for release and after meeting the proposed dividend, a sum of Rs 419 is left surplus to be carried over.

MANUFACTURING AND TRADING CONDITIONS

Although cellophane was available freely, higher prices had to be paid. Prices of other raw materials like sugar, milk, glucose, etc, also registered steep increases. In common with the rest of the confectionery industry in the country the plant is not being worked at full capacity. Added to this, there was an illegal strike by the labour lasting for 27 days in March 1972 and the Company had to agree to a settlement that cost Rs 1.65 lakhs as a permanent addition to the wage bill.

MACHINERY

During the year under review machinery worth Rs 3.56 lakhs was imported for purposes of replacement and

rehabilitation.

MALAYSIAN FACTORY

Production in the Malaysian Factory continued to be satisfactory. A dividend of 10 per cent was declared which yielded on the Company's investment an amount of Rs 30,000. The Company also earned a royalty of Rs 40,000.

PROSPECTS

Prospects for the industry as a whole continue to be bleak in view of the unsatisfactory sugar position in the country, the power cut in Tamil Nadu and recalcitrance of the labour. However, all possible efforts are being made to maintain the level of sales.

Note: This does not purport to be a report of the proceedings of the General Meeting. (The full text of the statement has been sent to all Shareholders.)

The Dollar Devaluation and India's Balance of Payments

Charan D Wadhva

Samuel Paul

This paper examines some of the consequences of the devaluation of the US dollar of February and the decision of the Government of India on the exchange rate of the rupee on the major items of India's Balance of Payments. The problems and opportunities emerging from the present devaluation of the dollar are analysed.

It is concluded that the new rupee rate, implying 3.7 per cent revaluation against the US dollar, is likely to affect Indian exports to the US only marginally. The effective depreciation of the rupee vis-a-vis major European currencies (excluding the pound sterling with which the rupee is linked at the present for defining the central rate of the rupee) and Japan is likely to lead to increase in our exports to these countries.

On the other hand, the total costs of our imports are likely to increase due to the substantial revaluations of these very currencies. Our trade balance may, therefore, actually show unfavourable change in the short run. This leads to the need for vigorous measures at promoting our exports. In view of the fact that many developing countries who are our competitors in the US market are likely to go along with the devaluation of the dollar by the same amount, we cannot afford to revalue the rupee substantially against the dollar.

We should wait and see the experience of the floating pound sterling and the performance of the dollar in the near future and also know more about the exchange rate decisions of our major competitors in trade before fixing the new parity of the rupee in terms of gold to serve our national interest in the best possible manner.

THE devaluation of the United States dollar should be an eye-opener to many, including political leaders in India, who associate monetary devaluation with loss of prestige. The Americans have shown that, if it is in their national interest to devalue, they would go ahead and do so. Nor do the stronger countries, such as Japan and West Germany, view revaluation as a symbol of prestige or power. In fact, they have resisted revaluation of their currencies all along. If, in spite of all these developments, our leaders and moulders of public opinion still live with the traditional attitudes towards devaluation and revaluation, it could only be attributed to the generally low level of economic literacy in our country.

The unilateral devaluation of the United States dollar by 10 per cent on February 13, in the wake of its earlier devaluation of 8 per cent just 13 months ago under the Smithsonian agreement on realignment of currencies of the Group of Ten countries, has once again shaken the stability of the international monetary system and underscored the need for long-term reforms of the system. Meanwhile, countries of the world are engaged in decision-making on the new parity rates in terms of gold or

in terms of an intervention currency, usually, either the US dollar or the British pound sterling. Five leading currencies of the developed countries of the world are still floating, viz, the British pound sterling, the Japanese yen, the Canadian dollar, the Italian lira, and the Swiss franc.

Under these conditions of fluidity in the international monetary situation, the Government of India has decided for the present to continue to adhere to the central parity of the rupee in terms of the pound sterling — at Rs 18.9677 to one pound as decided in December 1971 — and to allow variations in this central rate within the wider band of 2.25 per cent permitted by the International Monetary Fund. The rate of exchange between the Indian rupee and all other currencies will be fluctuating since the pound sterling, from which the rupee rate is derived for other currencies, is still floating.

The purpose of this paper is to examine some of the consequences of the new rupee rate — vis-a-vis the devalued US dollar emerging from the pound-dollar rate — on the Indian economy in general and on the major items of India's balance of payments in particular.

I

The Rupee Rate Background

Before the first devaluation of the US dollar, of about 8 per cent in December 1971, the rupee-dollar rate used to be pegged at Rs 7.50 per dollar. Following the Smithsonian agreement on the realignment of currencies of the Group of Ten Countries, the International Monetary Fund (IMF) gave the option to its member countries either to declare the new parity of their currencies with gold or to choose for the time being a central rate in terms of an intervention currency such as the US dollar or the pound sterling.¹ The IMF also permitted a wider band of fluctuations in exchange rates (2.25 per cent compared to the earlier band of 1.0 per cent) around the parity or the central rate as the case may be.

The Government of India then decided to break the traditional link with the dollar and to use the pound sterling as an intervention currency in terms of which the central rate would be chosen. It communicated to the IMF a central rate of Rs 18.9677 per pound and wished to make full use of the new wider band which was permitted. Since the UK announced its new rate vis-a-vis

RATAN BATRA

DBP/212-R

the US dollar at \$2.61 per pound, this worked to a cross rate of about Rs 7.28 per dollar.² At this new rate, the rupee was effectively revalued against the US dollar by 3.03 per cent. The day-to-day rupee-dollar rate was to vary as the pound sterling-dollar rate varied in London market using the conversion factor of £1 = 18.9677. The permissible range of variations at the central rate of \$1 = Rs 7.28 was from Rs 7.12 to Rs 7.44 per dollar.

However, this pattern of the rupee-dollar rate had a short life. The British authorities found it very difficult to defend the new pound-dollar parity in the face of speculative pressure on the pound sterling, which was basically a weak currency considering the balance of payments deficits and inflation in the economy. UK, therefore, decided to float the pound sterling in the last week of June 1972 and since then it has been freely floating against other currencies. Quite expectedly, the pound sterling went down in value in terms of all the major currencies of the world, including the US dollar. The rupee-dollar rate also correspondingly recorded a depreciation of the rupee against the dollar. The immediate impact of the floating of pound sterling was to depreciate the pound against the dollar by about 5 per cent. The dollar-pound rate hovered for some time around \$2.45 per pound (yielding a rate of Rs 7.74 per dollar). It was expected in market circles that the pound-dollar rate would ultimately settle around \$2.40 per pound, thus completely neutralising the impact of 8 per cent devaluation of the dollar of December 1971. In these circumstances, the central rate of \$1 = Rs 7.28 had no meaning. The rupee was floating as the pound was floating, leading generally to the depreciation of the rupee in terms of dollars. Had the pound returned to a relatively stable rate of \$2.40 per pound, the rupee might have been effectively devalued along with the dollar without it being officially said that the rupee was 'devalued'.

Then, in about 18 months, came the second dollar crisis. In the first two weeks of February 1973, there was a heavy speculative pressure on the dollar. In about nine days, over \$8 billion of hot money were converted into the mark and the yen, the Deutsche Bundesbank absorbing about \$6 billion to prevent the appreciation of the mark. Considering the basic weaknesses of the American balance of payments position in terms of a record trade deficit of \$6.5 billion in 1972 (compared to \$2.7 billion deficit in 1971), the massive flows

of speculative money, and the firmness of Japan and West Germany not to revalue their currencies, the US authorities preferred a straightforward devaluation of the US dollar by 10 per cent to cure the situation, pending other measures for trade negotiations and international co-operation to find ways to bring about stability in the international monetary system in the long run.

Just before the second devaluation of the US dollar, by 10 per cent on February 13, 1973, the prevailing rate of exchange of the pound had gone down to as low as \$2.38, giving an exchange

rate of about Rs 7.90 per dollar in the London market. The British government decided to continue to float the pound. After the markets reopened, the pound immediately appreciated by about 3.7 per cent in relation to the devalued dollar, rising to \$2.43 per pound, which implied Rs 7.60 per dollar at the central parity of Rs 18.9677 per pound. Thus the new dollar devaluation presented an opportunity for a review of the exchange rate of the rupee vis-a-vis other currencies of the world and thus for arriving at a new parity of the rupee.

The Government of India have decided to continue the central rate system,

in terms of the pound sterling as the intervention currency, at the same central rate as announced in December 1971, viz, Rs 18.9677 per pound, with variations of 2.25 per cent around this rate. The dollar-rupee rate (and the rate of rupee *versus* other currencies of the world) will vary from day-to-day as the market rate of the pound varies. Thus the rupee is indirectly floating along with the pound. As the pound has been appreciating against the dollar in the range of 3.5 to 5 per cent in the initial stages of the float, the rupee is effectively revalued against the dollar by the same magnitude.

II

Implications for India

We shall analyse below the implications for the Indian economy of the new rupee rate after the devaluation of the dollar, under two heads:

- (i) the immediate impact of dollar devaluation on the foreign exchange market in India; and
- (ii) likely impact on the major items in India's balance of payments in the near future.

In analysing the implications of the new rupee rate, the key question remains: will the pound sterling settle nearer the \$ 2.38 per pound rate, which it had reached just before the new devaluation of the dollar, or will it appreciate significantly against the dollar before reaching a relatively stable rate with the new dollar acceptable to the market? This would depend on whether the dollar itself can maintain the newly set parity. For the purposes of the following analysis, we assume that the new parity of the dollar will be acceptable to the market within the wider band now permissible, and that the pound will settle at a level showing a 3 to 5 per cent appreciation *vis-a-vis* the dollar.

IMMEDIATE IMPACT

As expected, the immediate impact of dollar devaluation has been to lead to confusion in the Indian foreign exchange market. The Reserve Bank of India suspended both spot and forward dealings in foreign exchange. The banks and authorised foreign exchange dealers offered the worst rates to customers in the absence of support from the Reserve Bank. The dollar ^{lost} premium heavily in the unauthorised market. And, travellers holding dollars and exporters holding dollar bills suffered as a result of these market trends.

This initial phase ended when the Reserve Bank announced its decision to

continue with the rupee-pound central rate of Rs 18.9677 per pound which was decided upon in December 1971. On the basis of this rate and considering the risk in managing a fixed parity with a floating currency, the Reserve Bank has announced its spot buying and selling rates for pound sterling and a cover to the commercial banks for dealings in US dollars at Rs 7.60 per dollar. There has been considerable delay in assuring forward cover on pound sterling and dollar. This has put the exporters in a somewhat difficult position and created uncertainties in their minds about the final receipts from exports. Compared to the previously prevailing rate, of Rs 7.90 per dollar, ruling just before the devaluation of the dollar, the exporters with dollar bills will realise less in rupee terms if the rupee-dollar rate settles near Rs 7.60 per dollar. Importers with confirmed unrevokable orders from the US and from the dollar area will find a windfall gain in terms of having to pay less in rupees by about 4 to 5 per cent for their import.

We may now systematically examine the somewhat longer-term effects of the new rupee-dollar rate, under our assumptions, on the major items of India's balance of payments.

IMPACT ON BALANCE OF PAYMENTS

We may first look at the balance of trade position. We begin with an analysis of the direction of India's trade and its trade balance with the different countries and regions of the world, with a view to assessing the overall impact on our trade with these countries and regions.

Table 1 presents the direction of India's trade in 1971-72 and also the trade balance with the various countries and regions of the world. It can be seen from Table 1 that the US is still our single largest trade partner. It accounted for 17 per cent of our exports and 23 per cent of our imports in 1971-72. Together with Canada, our exports to North America accounted for 19 per cent and imports from this region accounted for 29 per cent, in 1971-72. In addition to this, our trade with other countries of the dollar block is also invoiced in US dollars.

It is quite clear, that any substantial effective revaluation of the rupee against the dollar could badly hurt the competitive position of Indian exports. This is the more so because some of our competitors in the US market, like Israel for diamonds and South Korea for textiles and small machinery, have decided to devalue their currencies along with the US dollar. Bangladesh already has an

edge over us in jute and its exchange rate is already more favourable to US importers than is the Indian rate. Recently, non-traditional items, such as engineering goods and chemicals, have been finding their way from India to the US market. This segment of the market may be quite sensitive to price changes and even a small revaluation of the rupee may reduce the quantum of such exports. However, a major portion of our exports to the US still consists of traditional goods such as cashew, spices, fish, tea, jute, oils, handicrafts, etc, for which price elasticity is relatively low and our competitive position (except for tea and jute) is quite strong. A small revaluation of the rupee against the US dollar, of about 3 to 5 per cent, is on balance not likely to reduce India's exports much in the US markets.

On the side of imports, the US will get an edge over its competitors in the Indian market for goods which were earlier supplied by Japan and West Germany, owing to the effectively high revaluation of these currencies. India is likely to gain by lower costs of imports from the US. Indian exporters who obtain from the US a large portion of their import requirements are likely to benefit from the new parity. However, these gains are likely to accrue only as far as the free foreign exchange transactions are concerned. A large part (roughly 50 per cent) of our imports from the US is on account of tied aid, and chances are that the American suppliers will jack up prices of their goods which are exported on project aid basis. Even for the free foreign exchange transactions, there is already a movement by petroleum companies, shipping companies, and even airline companies, based in the US, to seek a price hike of 10 to 11 per cent to protect their earnings in dollars. These are likely to be given to them. It appears, therefore, that on the whole there may not be much advantage to India from the devaluation of the dollar.

Our largest trade deficit is with North America, particularly with the US. Thus, as can be seen from Table 1, out of a total trade deficit of Rs 237 crores in 1971-72, the US alone accounted for Rs 153 crores. As a result of the dollar devaluation and the new rupee rate, our exports are marginally likely to fall, whereas imports may rise — increasing our trade deficit with the US.³ The same is likely to be true of our trade balance with Canada.

As far as the ECAFE region is concerned, the importance of Japan in India's foreign trade has increased significantly during the last year or two. Our

imports from Japan have nearly doubled in the last two years. In 1971-72, Japan accounted for 12 per cent of our exports and 9 per cent of our imports. In view of the substantial effective revaluation of the yen, our costs of import from Japan are likely to go up. On the other hand, our exports to Japan should increase. There is one qualification to this conclusion. Most of our exports to Japan are invoiced in US dollars. A major portion of our exports to Japan consists of iron ore. In view of the lower realisation in rupees from exports invoiced in US dollars, Indian exporters are likely to ask for a price hike in dollar terms. This would lead to resentment on the part of the Japanese buyers who believe in hard bargaining. Moreover, if Japanese export activity is considerably reduced for containing their huge trade surpluses, Japan may not require as much of iron ore — or not as urgently as under normal conditions. On balance, however, our exports to Japan should increase.

India had a huge surplus in its balance of trade with Japan. In view of the substantially increased costs of imports from Japan, the increase in our import bill is likely to swamp the increase in our export earnings. Thus, the magnitude of our trade surplus with Japan is likely to diminish. As far as other ECAFE countries are concerned, there is not likely to be any significant influence on our balance of trade.

Our second largest trade deficit is with West Germany and the third largest deficit, as may be seen from Table 1, is with UK. With the inclusion of UK, the enlarged European Economic Community accounted for over 20 per cent of our exports and over 21 per cent of our imports in 1971-72.

The West German market has proved a very difficult one for Indian exporters to penetrate. However, exports to this country should increase. On the other hand, our import bill from this country may increase, in view of the effective revaluation of the mark, since most of our imports are either capital imports or maintenance imports urgently required for programmes of economic development. It is most likely that our trade balance with West Germany may not improve.

Since the rupee has been floating with the pound at a fixed central rate, there would be no effect on the trade balance on account of our rupee rate *vis-a-vis* the pound.

The impact on our trade balance with other countries of the world is likely to be favourable. The new rates of exchange are likely to favour our export-

ers who would have now gotten a competitive edge over Japan and other countries of Western Europe.

A significant part of our foreign trade is with the East European countries through rupee payment agreements (see Table 1). A revaluation of the Indian rupee *vis-a-vis* the dollar *per se* is thus not likely to affect our trade balance with these countries.

We may now look at the impact of the new rupee rate *vis-a-vis* other currencies of the world from the point of view of the commodity structure of our foreign trade. Table 2 gives the breakdown of our exports and imports in 1971-72 by value and percentage distribution.

A look at Table 2 will show at once that machinery, raw materials, and intermediate products, required as inputs for our installed industrial units, form the bulk of our imports. Since these are linked with our programmes of economic development and industrialisation, it is unlikely that the quantum of these 'essential' imports can be reduced by changes in the exchange rate. In view of the substantial effective revaluations of the mark and the yen, the cost of our imports from these sources is likely to go up. To some extent, the US will be able to substitute these countries in our import trade. However, American goods will not be much cheaper than the goods from these countries in view of the fact that the US was not the most competitive supplier of most of these goods to India. Thus, as a result of the new exchange rate structure of the currencies of the world, our imports cost us more.

In view of the above conclusion, the importance of export promotion in achieving the objective of self-reliance becomes even more important. Our exports have undergone a structural change in the last few years — particularly after the devaluation of the Indian rupee in June 1966 and more so after 1969-70. Thus, according to Table 2, exports of manufactured goods, including machinery and transport equipment and chemicals, accounted for about 50 per cent of our exports in 1971-72. As a result of the revaluations of the mark and the yen and some other currencies, our competitive position should improve as far as non-traditional exports are concerned.

As far as our traditional exports are concerned, we have to watch the moves of our competitors in their choice of new exchange rates. In textiles, our major competitor is Japan, and we should get some advantage here. However, textiles are subject to quotas im-

posed by developed countries, and there is not much fear of our losing exports of textiles due to our new rupee rate — despite competition from countries like South Korea who have devalued by full 10 per cent along with the dollar. In tea, we will have to await decisions on new rates of currencies of Sri Lanka and the East African countries who are our main competitors. Our jute exports are most likely to suffer, since half of our exports of jute are to the dollar area where Bangladesh has both price and exchange rate advantage over us in this commodity.

It appears, therefore, that whereas our exports are likely to grow, import costs on the whole are also likely to grow due to the new rupee rate *vis-a-vis* the US dollar and *vis-a-vis* other currencies perhaps leading to a worsening of our balance of trade in the short run.

The new rates of exchange of currencies of the world following the dollar devaluation are likely to have a favourable effect on our tourist trade. More European and Japanese tourists are likely to come to India. These trends have already emerged and are likely to be strengthened.

There is likely to be more capital inflow into India. The American multinational corporations may get a boost to set up projects in India since the import of goods from the US will become cheaper than imports from Japan and countries of Western Europe. The Indian investors may find joint ventures more feasible and profitable, in view of the lower costs of exporting machinery, raw materials, consultancy and technical skills from India to a host of countries compared to importing them from West Germany, Japan, etc.

If Japan and West Germany decide to reduce the balance of payments surpluses on official transactions (i.e. to reduce the accumulation of international reserves), they may set up foreign aid to India and other developing countries. Under these conditions, the aid climate is likely to improve. Otherwise, there is not likely to be any change on this front.

The burden of debt servicing has been mounting in India. Thus, debt servicing charges are estimated to have risen to Rs 503 crores in 1972-73, or to nearly one-third our annual export earnings.⁴ The major portion of our debt is in dollars. As a result of the new rupee rate, the total burden of debt servicing in rupees on account of loans repayable in dollars is likely to diminish marginally, but the burden on ac-

March 10, 1973

ECONOMIC AND POLITICAL WEEKLY

count of loans repayable in currencies of the Western Europe (excluding UK) and Japan will go up substantially. On the whole, there is not likely to be much change in the total burden of our foreign debt.

Finally, on the whole, the impact of the new rupee-dollar rate and exchange rates with other currencies of the world on our international reserves would be favourable. It is reported by a spokesman of the Finance Ministry of the Government of India⁵ that India's total international reserves stood at Rs. 712.99 crores in January 1973. Out of this sum, gold and special drawing rights accounted for 25.57 per cent, Deutsche mark, yen, and Swiss franc constituted 17.22 per cent, US dollars held were only 4.80 per cent, while various other currencies accounted for the remaining 0.89 per cent. Usually, in the past foreign exchange reserves held in US dollars accounted for about one-third. Thus at the time of the dollar devaluation of December 1971, the Indian government lost 8 per cent of value on the dollars held in terms of other currencies. This time, thanks to its improved management of international reserves the government has not lost much due to the devaluation of the dollar.

Conclusion

We have analysed, in this paper, the likely effects of the new rupee rate vis-a-vis the US dollar and vis-a-vis the other currencies of the world on the major items of our balance of payments and on our international reserves.

We conclude that the effects of our new rupee-rate, amounting to 3.7 per cent effective revaluation against the US dollar, keeping parity with the pound sterling and reflecting depreciation against Japanese yen, Deutsche mark, and other hard currencies of the world, by over 7 per cent, is likely to have only a marginal effect on our export trade with the US and favourable effect on our exports to the countries of the Western world and to Japan. The costs of our imports on the whole are likely to increase. In any case, we cannot afford to revalue the rupee vis-a-vis the US dollar substantially. We will have to await the actions of our competitors before deciding on the final parity of the rupee in terms of gold. It appears that the currencies of the world will float for quite some time more, and we will have enough time to make our choices taking into account the experience of floating currencies.

In this paper, we have not gone into

the problems of long-term measures for the reform of the international monetary system acceptable to both the developed and the developing countries of the world. This is the urgent task on which the Committee of Twenty, appointed by the IMF, is working at present. India and all other countries have a strong stake in a fundamental reform of the international monetary system which is essential for promoting growth with stability in the world.

Notes

- 1 The dollar crisis of August 1971 (which was instrumental in arriving at Smithsonian agreement) and some of the implications of that crisis for India were discussed in

our Paper on, 'The Dollar Crisis: Possible Solutions and Their Implications for India', *Economic and Political Weekly*, Volume VI, Number 39, September 25, 1971; pp 2063-69.

- 2 The rates of exchange of currencies in this paper are rounded to two decimal places.
- 3 The conclusion that our imports from the US may rise is based on the assumption that a major portion of our high-valued imports from the US are under project aid where prices are likely to be raised by the American suppliers.
- 4 Government of India, Economic Survey 1972-73 as reported in the press release, *Economic Times*, February 23, 1973.

ECAFE Region's Development Lagging

A REVIEW of the economic situation in Asia, prepared by the United Nations Economic Commission for Asia and the Far East (ECAFE), underlines that, considering the trends of investments, domestic savings, and foreign development assistance to the region's developing countries at the end of the 1960s and the beginning of the 1970s, there are reasons for grave concern about the region's future growth performance. The review is contained in Part One of ECAFE's annual *Economic Survey of Asia and the Far East, 1972* which will serve as a basic document for the forthcoming 29th Session of ECAFE, in Tokyo, between April 11 and 23.

The Survey states that while the growth rate of the region's developing countries accelerated during the second half of the First Development Decade, other trends in both developing and developed countries look much less satisfactory for the possibilities of fulfilling targets of the Second Development Decade. Pointing out that the United Nations international development strategy for the Second Development Decade called for an average growth target for developing countries of 6 per cent — a weighted annual growth rate of 6.8 per cent was achieved by the developing ECAFE countries in 1969 — the rate actually fell to about 5.6 per cent in 1971 and may even be below this level for 1972.

During the first half of the 1960s, the developing countries of the region generally increased the share in Gross National Product (GNP) of both investments and domestic savings. But from around 1965 the picture changed.

Gross investment for these countries as a whole remained stagnant until 1970 at a level of 17 to 18 per cent of GNP; there was no discernible improvement in 1971.

Stating that this development was closely related to trends in the flow of external resources to the region, the ECAFE review points out that from 1965 to 1970 the total net flow to south and east Asia together fell significantly in both nominal terms and in real terms. The fall in the total net flow of external resources, and their maldistribution, is one of the major adverse factors influencing the future growth possibilities of the region; it was certainly a major factor behind the stagnation of the share of investments (in GNP) in south Asia.

The report adds that, while the "green revolution" pushed growth rates up at the end of the 1960s the ground was laid in south Asia for a fall in growth rates during the first half of the Second Development Decade. In east Asia, the same has not yet happened, but, with investment shares leveling off around 1970 and adverse developments in the flow of external resources, the same situation could emerge later in the decade.

The Survey adds that, performances in regard to domestic savings have also been unsatisfactory. Domestic savings, which rose very substantially during the first half of the 1960s, came to a halt around 1965. For the developing countries in the region taken together the share of gross domestic savings in GNP fell slightly in 1970, as compared with 1965.

Initial Depreciation Allowance

A Note

N J Jhaveri

THE Union Finance Minister has announced, while presenting the Budget for 1973-74, that an initial depreciation allowance would be given on plant and machinery installed after May 31, 1974—the date after which the development rebate will no longer be available for new investments. The proposed initial depreciation (ID), at the rate of 20 per cent of the cost, would presumably be in addition to normal depreciation which would continue to be claimed on the basis of the written-down value without reducing the original cost by the amount of the ID. In that case, the total depreciation provision during the initial years of the life of an asset would be somewhat higher than under the development rebate (DR) in the case of other than priority industries whereas it would be lower than that in the case of priority industries.

While the augmentation of post-tax cash flows (internal resources) in the initial years is a common feature of the ID and the DR, there are two major differences. First, unlike the DR, which is available to all the industries, the grant of ID will be confined to selected industries which are yet to be announced. Second, while under DR the total depreciation provision, including DR, allowed to be set off against taxable income was equal to 115 per cent, 125 per cent or 140 per cent of the original cost (depending upon the rate of DR), in the case of ID the total depreciation will not exceed the original cost.

Despite this, for an expanding firm the grant of ID is no less helpful than the DR in generating internal resources for financing an expansion programme. Table 1 illustrates the proportion of cumulative depreciation funds (including DR) to new investment expenditure in years Y1 to Y4 assuming (i) investment of Rs 1,000 in the year Y0; (ii) constant annual rate of growth of 10 per cent in investment; and (iii) 20 per cent rate of depreciation. It will be seen that, as compared to normal depreciation and DR at 15 per cent, ID would provide relatively larger resources in the initial years. Larger cash flows in the early years of an asset's life is tantamount to an interest-free loan from the government.

The duration of the loan for a given capital asset, or a group of assets, would depend upon their life. The longer the life (i.e., lower than the rate of normal depreciation) the longer the duration of the loan and vice versa. An expanding firm can, however, postpone repayment of the loan for an indefinite period.

One way of indicating the benefits ensuing to a firm on account of an interest-free loan is through the size of its post-tax cash flows. If the internal resources of a firm do not earn any positive return, the total size of the firm's cash flows would be identical whatever may be the time-pattern of the accrual of depreciation, provided that the total depreciation provision does not exceed the original cost. If, however, internal resources of a firm are assumed to earn a return, which is a reasonable assumption to make, the total magnitude of cash flows would vary with the time-pattern of their accrual. For instance, assuming (a) original cost of capital asset at Rs 1,000, (b) rate of depreciation at 20 per cent, (c) pre-tax return on internal resour-

ces at 10 per cent, and (d) rate of tax at 55 per cent, Table 2 illustrates the magnitude of depreciation provisions together with return (not of tax) earned on them.

In terms of discounted present value, a criterion generally used to compare cash flows with different time-patterns, different methods yield similar results as Table 2 shows. To derive the present values, it is assumed that (a) original cost is Rs 1,000, (b) the rate of depreciation is 20 per cent and (c) the rate of discount is 10 per cent. Thus, though initial depreciation is not as beneficial a tax concession as development rebate, it has significant advantages over normal depreciation, particularly for growing firms. The loss to the exchequer, unlike in the case of DR, is indirect. Depending upon the coverage of the industries selected, in the initial years of the introduction of ID, tax revenues of the government would not rise to the full extent to which they would because of the abolition of the DR. The postponed tax collections will, however, be realised when the written-down cost of an asset under normal depreciation comes down to 20 per cent or less depending upon the scrap value. For instance, if the entire amount of the remaining depreciation is claimed in the year when the written-down value declines to 10 per cent or less of the original cost,

TABLE 1

	(Rs)			
	Y1	Y2	Y3	Y4
I DR plus normal depreciation				
(a) DR = 15 per cent	31.8	45.0	54.7	61.7
(b) DR = 25 per cent	40.9	54.1	63.7	70.8
II ID plus normal depreciation	36.4	49.6	59.2	68.2
III Normal depreciation	18.2	31.4	41.0	48.0

TABLE 2

	(Amount in rupees)			
	DR plus Normal Depreciation		ID plus Normal Depreciation	Normal Depreciation
	DR = 15 per cent	DR = 25 per cent		
Amount	1557	1719	1508	1314
Index	118.5	130.8	114.7	100.0

TABLE 3

	DR plus Normal Depreciation		ID plus Normal Depreciation	Normal Depreciation
	DR = 15 per cent	DR = 25 per cent		
Discounted Present Value (Rs)	810	902	782	674
Index	120.2	133.8	116.0	100.0

assuming a depreciation rate of 20 per cent the total cost would be written-off with ID (at the rate of 20 per cent) in seven years as against 12 years under normal depreciation. Thus tax collections which were postponed on account of ID are realised during the eighth to the twelfth years in this case. The interest-free loan in the initial years would be equal to 20 per cent of the cost of assets qualifying for ID but eventually when the postponed tax revenues are collected (during the eighth to the twelfth years in the above illustration) the net loan would get reduced. In due course, the amount of loan would tend to stabilise at a level equivalent to 20 per cent of the investment in plant and machinery and the rate of growth of such

investment. The cost to the exchequer, in the form of interest on revenue collections postponed, would also eventually stabilise.

In any case, the magnitude of such cost, although not easily measurable, is likely to be much less than the cost had the DR been continued. The grant of initial depreciation, like DR, would have the effect of reducing the cost of capital *vis-a-vis* labour. However, since the tax benefit under ID would be lower than in the case of DR, the extent of substitution of capital for labour would be less. Moreover, ID will be available to selected industries. If in the industries selected, substitution of labour for capital is not possible for technological reasons, the proposed initial depreciation may not re-

sult in tax-induced use of capital. While the priority assigned to the industries in the scheme of planned development will, of course, be the dominant consideration, one of the criteria for selection of industries should be that the capacities created in such industries can be translated into production soon after completion of the projects. Selection of industries in this manner would minimise the disadvantages of linking tax incentives to investment *per se*. It would be desirable to retain an element of flexibility in the matter of selection of industries, taking into account the period required for planning and implementation of projects. The selection of industries is thus a very important aspect of the problem.

Economics of Television for India

B D Dhawan

Considerable public interest has been evoked on the question of developing a nation-wide educational TV system in India. Both Indian and foreign scholars have made major studies on this question. These painstaking studies, spearheaded by space scientists and electronic engineers, have undoubtedly contributed to improved knowledge, especially pertaining to the satellite technology as applied to the particular circumstances prevailing in India. Government of India has already entered into a formal agreement with the US National Aeronautics and Space Administration (NASA) to have a pilot satellite TV experiment in India in 1974 or thereabouts.

Interest in the question has given rise to some controversy as well. Terrestrial telecommunication engineers, especially of the Indian Posts and Telegraph Department and All India Radio (AIR), are reported to have taken exception to the much-publicised claim of the space scientists that a satellite would enable India to erect a truly nation-wide TV system at a fraction of the cost which would arise in case traditional TV technology were to be employed. Likewise, the proponents of such media as can act as close substitutes for television — notably radio and movie projectors — have challenged the need for developing an expensive medium like television in India. Individuals have questioned the need for developing a nation-wide TV system on grounds such as (a) TV is a luxury not needed at the present juncture of India's state of development and (b) harmful side-effects of TV may follow as in the Western countries.

Yet, barring some debate in the press, the controversial questions about national television have not received any attention in academic circles. More notably, economists who can help settle controversy about choice of techniques are nowhere in the picture. The thinking in this article is based on the author's doctoral work, "Economics of Satellite TV for India", completed in May 1972.

THE focus of this article is on the economic aspects of a TV system in India. The following aspects of a nation-wide TV system are discussed here:

- (1) Capital costs, and their foreign exchange component;
- (2) Annual operating cost;
- (3) Production economics of TV software;
- (4) Satellite *vis-a-vis* other TV technologies; and
- (5) Television *versus* motion picture as medium.

For obvious reasons, the complete details of my computational calculus cannot be enumerated here; only the major assumptions are indicated.

Capital Costs

Various estimates of the capital and annual costs of an educational TV system, including those made by me, are summarised in Table 1. These estimates relate to either pure satellite TV systems (STRIDE, VEPA, ASCEND and ROSENBERG) or to hybrid TV systems, in which satellite technology is combined with terrestrial technology.

The most remarkable feature of the proposed educational TV system for India is that widely divergent cost estimates have emerged from the various studies. These range from \$144 million to

\$573 million. My own estimate is about \$900 million at 1971 prices. Two questions naturally arise: (i) Why do the estimates differ so widely? (ii) What precisely would a national TV system cost us? Evidently, the answer to question (ii) hinges on a clearer understanding of question (i).

Differences in cost estimates have arisen for a variety of reasons, of which four may be mentioned. First, differences in system parameters can result in differences in cost estimates. The most important system parameter is the number of TV receivers in the system. At the present and the prospective levels

TABLE 1: VARIOUS ESTIMATES OF CAPITAL AND ANNUAL COST OF A NATION-WIDE TV SYSTEM FOR INDIA

S No	Author or Name of Report	Capital Cost (\$ million)	Annual cost (\$ million)	No of Community TV Receivers (millions)	Remarks
1	STRIDE (1967)	200	12	0.50	Capital and annual costs lumped together
2	VEPA* (1968)	224	10	0.56	Quoted from USAID report

3 1 dollar = Rs 7.50

of family incomes in India, aggregate private demand for TV sets is bound to be low. Even if the production cost of this durable good is brought down significantly by utilising the latest technology of integrated circuitry, we should not anticipate more than a million TV sets to be owned privately by the end of the seventies. Since the bulk of this private demand is from urban people, the rural masses who really need public education would have to be provided community TV receivers at government expense. It is this peculiar aspect of the Indian educational TV system that makes it very expensive to instal and maintain. In point of fact, the estimated cost on account of community TV receivers alone may be 50 to 70 per cent of the total system cost, depending upon the number of TV receivers and their unit price of production and installation in rural areas.

There are about 563,000 villages in India. This number broadly determines the lower limit to the number of community receivers in the TV system. There is substantial difference in respect of required number of community TV receivers for India among the authors of various TV studies. The number varies from 500,000 in STRIDE report of West Virginia University, to 560,000 by Vepa; 853,000 in USAID report by Schramm and Nelson; 1,112,000 in ASCEND report from Stanford University; and 1,114,000 in ACME report from IIT, Kanpur. My own estimate is in the range 1.1-1.4 million. Though it is very near the ACME number, I may point out one important difference of

approach. In my system, I am providing for one TV channel capability, while the authors of ACME report envisage two TV channels for each state. Evidently, the number of TV sets is an exact multiple of the number of TV channels provided in the system. Therefore, the greater the diversity (in terms of TV channels) provided, the greater would be the system cost, both capital and operating. Those who are promoting TV medium for classroom instruction of a core curriculum in order to overcome the problem of shortage of trained teachers, should note this important cost relationship. One TV channel is not enough for teaching numerous core subjects to numerous classes and sections in a school. One TV channel, however, would suffice if television is deployed for strengthening the school curriculum with such educational programmes (historical and travel documentaries, dramas, skits, etc) as cannot be effectively taught by a classroom teacher with the aid of books and blackboards. Such programmes, unlike instructional programmes for core subjects, have the important attribute of flexibility, in the sense that, these do not require to be presented in any given order. Moreover these can cater to the needs of more than one class of students simultaneously. In short, these are neither order-bound nor class-bound programmes, so they can be conveniently fitted into the school timetables.

It will be prudent for India, both financially and otherwise, to plan for a TV system which offers only one TV

channel choice to the viewers. The question of the extent of population coverage desired would determine the required number of community TV sets. Obviously, one TV set for a place of 10,000 inhabitants as well as for a place of 1,000 inhabitants would not be appropriate for effective TV reception in larger villages. Likewise, it would be economically advisable to leave out over 150,000 villages which are without school buildings, thereby saving on the cost of constructing TV auditoriums in these villages. This would reduce the coverage of the system to less than 100 per cent. While enlarging the number of TV sets in the system offers the attraction of substantial economies of scale in the production of TV sets, we must not make the system prohibitively expensive to instal.

The second factor responsible for the large differences in the capital cost estimates is the number of TV production centres in the system. The TV studies with low figures of capital cost, are precisely those which have failed to take care of the diversity of languages in India. When we have 14 languages with constitutional status, our TV system must provide for production of TV programmes for each state and region separately. This is again a peculiar feature of Indian educational TV system, raising its capital and current costs of operation significantly.

The third factor which tends to make Indian TV system an expensive proposition is the low degree of electrification of rural areas. Therefore, provision has to be made for the electrification of the

majority of community TV receivers. At present, hardly 100,000 villages have electricity. Another 100,000 may be electrified in the current decade. Some have suggested wind-driven generators, some have provided bicycle-driven generators, and some animal-driven generators for TV sets in unelectrified villages. The unit capital costs of these various sources of power differ substantially, thereby bringing about differences in the overall estimates of capital cost of the TV system. Despite a detailed investigation for my dissertation, I still remain uncertain about the true cost of providing a power source to TV receivers in unelectrified villages. My estimate falls in the wide range Rs 13-47 crores, whose upper bound is the more plausible of the two.

The fourth factor is again peculiar to the Indian scene. It is the formidable problem of repair and maintenance of community TV receivers. Barring Rosenberg, the capital cost on this account has been neglected by other investigators. For obvious reasons, the system must incorporate the capital cost of a large fleet of mobile TV repair and maintenance workshops. The need for an elaborate and efficient TV repair and maintenance organisation becomes all the greater because of the sad plight of the community radio receivers installed in the rural areas, to which attention has been drawn by many reporters of the rural scene as well as investigative committees. For example, as many as 50 per cent of the radio sets on any given day were found to be out of use for want of repair and maintenance by the Vidyalankar Committee appointed by the Planning Commission. The promoters of educational television in India lack due appreciation of the gigantic organisational task of providing repair and maintenance for the community TV receivers. The high inaccessibility of Indian villages would require a highly decentralised organisation within each district if prompt repair and maintenance has to be provided for. It is estimated that the capital cost on this account may be as much as Rs 45 crores. To this has to be added the cost of training personnel for repair and maintenance.

What is the foreign exchange component of the capital cost? That this will be substantial is obvious and has indeed been explicitly recognised in every TV study on India. However, its precise magnitude has not been assessed. This author had to assess this component as it has important implications for choice among TV technologies which, in fact, have differing foreign exchange components. It is anticipated that, as much as \$200 million out of \$900

million would have to be incurred in scarce foreign exchange resource. This is on the assumption that TV sets would be produced in India. The foreign exchange component would rise to \$240 million if TV sets are imported. There is, however, a cost trade-off here. It is estimated that the cost of an indigenous TV set (23 inch screen for community viewing) would be \$300, compared to \$200 for an imported set. These costs are inclusive of the cost of antennas, and other installation costs (including transportation from factories or ports to villages). It is assumed that the foreign exchange component of a domestic TV set would be \$75, compared to \$110 for an imported set from Japan which is the cheapest source of external supply.

Annual Operating Cost

Normally, annual operating cost of a project does not receive as much attention from project evaluators as does the capital cost of the project. For one reason, since annual operating costs of a project are recovered from the sale of product flowing from the project, any underestimation of operating cost can be corrected later through suitable upward revision in product prices. The situation would be entirely different for the proposed educational TV project for India. Here, since no sale proceeds from public TV service are likely to accrue — unless TV commercials are permitted — an under-assessment of operating cost of the system could give rise to undesirable consequences. On the one hand, it can put the Central budget-makers in a straitjacket once the project is implemented. On the other hand, it can give rise to poor quality TV programmes when TV producers are not adequately funded. Therefore, there is great need to pay more attention to out-of-pocket annual operating costs of an educational TV system which have to be incurred year after year.

Barring ACME report by Prasada and Singh, the task of evaluating annual operating cost has been done very inadequately in other TV studies. One is struck by the disconcertingly large range in which the various estimates fall, viz, \$10-155 million. This is a serious situation calling for a careful probe because annual operating costs are essentially independent of (a) the number of TV receivers and (b) the transmission segment of the TV system. The unduly wide range of cost estimates is largely accountable, either in terms of errors of omission or errors of commission. The most conspicuous errors of omission have been neglect of (1) production cost of TV software or programming in more than one language,

and (2) large maintenance cost of community TV receivers and the cost of their power source in unelectrified villages.

On the other hand, a good example of an error of commission has been the averaging of temporal costs in the USAID study. But for this questionable procedure of averaging, Schramm and Nelson would not have been tempted to rush to the misleading conclusion that television offers a very attractive, relatively low-cost service. If this error of averaging over time is removed, their correct cost estimate might be somewhere between \$90 and \$100 million.

Rosenberg, too, resorts to the questionable procedure of computing the present values of annual project costs over the life span of the project. This unnecessarily deflates the annual operating cost. He has wrongly applied the tools of conventional benefit-cost analysis. Computing present values of the stream of capital and operating costs is meaningless unless these are contrasted with the corresponding present values of the stream of benefits from television.

My estimate of annual operational cost of a TV system is about \$160 million, which is far above the corresponding estimates which have emerged from other studies. As a percentage of the total expenditure (on revenue account) of the Government of India, the operational cost of the TV system works out at about 3.5 per cent. However, when major cost commitments of the government on defence, debt service, and the states' share in Central tax collections are excluded, the above percentage rises to approximately 14 per cent of the government's budget. Viewed thus, educational TV is an expensive proposition. Those authors, who have tried to relate annual cost to the number of students or to the total Indian population, have failed to reveal the expensiveness of the TV proposal because of the large deflator employed by them.

The foreign exchange component of the annual operational cost is about \$18 million for every TV system — except the satellite-aircraft combination, for which the corresponding figure is substantially higher.

Economics of TV Software

It is the high cost of producing TV software that makes television an expensive service. Before we look into why TV software is an expensive thing to produce, some illustrative figures may be cited. For commercial television in the US, the average cost of producing one-hour programming material is Rs 7,50,000. It is this high cost that forces many local TV stations in the US to fill their viewing time with movies, for

which they have to pay a nominal fee to the Hollywood producers. Likewise, the average cost of educational programmes produced by the National Educational Television (NET) of the US is about Rs 1,50,000 per hour of televised programming. The promoters of educational TV in the United States, notably the Ford Foundation, had apparently failed to appreciate the high cost of the TV software. Consequently, hundreds of educational TV stations in the US are in financial doldrums. The promoters have been liberal in providing one-shot aid for buying TV hardware but have not assisted with the same liberalness in the maintenance cost of these TV stations.

The United States, with the helping hand of the UNESCO and its well-meaning Foundations, has given assistance to many an underdeveloped country — especially in Latin America — to instal educational TV stations. Now, some political scientists in the United States as well as in these countries are complaining of cultural imperialism. For, these TV stations are found exhibiting US programming material — "Bonanza", "Lucy", and many other serials of entertainment value. A careful reflection on the matter would reveal that these stations have ended up by showing unwanted or irrelevant imported TV software because those who promoted television did not ensure adequate annual funding from the national budget-makers (who probably thought they were acquiring a prestigious medium for nothing).

The production cost of a TV programme varies with the type of programme. At one end are programmes like plays, dramas, travel and historical documentaries, which are very expensive to produce. Their production cost is no different from that of film documentaries and promotional films which do not have glamorous stars to inflate their production cost. In India, such film software has been produced, notably with the direct financial assistance of the Film Corporation of India, at a cost of Rs 2 to 3 lakhs for a two-hour screening time. Adjusting for the fact that TV software can be produced on 16 mm film instead of on 35 mm, the estimated cost of a TV play/drama/documentary of one hour duration can be placed at Rs 60-80 thousand per hour of programming.

On the other hand, the low-cost TV software consists of news and weather reports, instructional material, panel discussions, interviews, etc. While these can be produced at a fraction of the high cost TV software, they do not have as much merit of repeat broadcasting as does the other software. For,

they are, unlike dramas and documentaries, relatively dated in time.

Therefore, TV station managers may not really find any tremendous cost advantage in raising the composition of programmes in their favour. More often, such programming material is not very popular either with the audience — because its visual component does not add effectively to the message content. Sometimes, the viewer is unnecessarily distracted from the audio message when the message content of the video components is nil.

India has a large population which in fact could tremendously reduce the TV software cost per unit of audience reached. However, two factors will militate against such a realisation. First, there is multiplicity of languages and tremendous regional diversity in customs, manners, and general life style — thereby requiring production of programming material in numerous languages. Second, there is the inability of the population to own their own TV sets. Since provision and maintenance of community TV sets is itself expensive, a given programme cannot reach many persons.

My estimate of cost of account of TV software is Rs 32 crores. I may mention some salient assumptions behind this estimate. First, it is assumed that TV software is produced at 16 centres in 16 languages. Secondly, daily broadcasting time is 8 hours; 4 hours for the schools and 4 hours for public viewing in the evening. Thirdly, I have assumed that, on the average, a programme will be repeatable 5 times before it is discarded. As a result of these and other assumptions, the average cost per hour of actual programming broadcast comes to about Rs 6,500. This figure is far above (almost 10 times) the funds available for programming in the Delhi TV station. The disgusted viewers of TV in Delhi facetiously blame the whole thing on the lack of imagination on the part of the TV producers. There is a limit beyond which imagination cannot substitute for lack of money. For, skill and talent are no longer available on mere solicitation.

The author has costed up five types of alternative TV systems for India, viz, (i) wholly microwave-based system; (ii) wholly co-axial cable system; (iii) satellite-microwave-based hybrid system; (iv) satellite-cable hybrid system; and (v) satellite-aircraft hybrid system.

Three hybrid systems have been costed. One can conceive of more complex hybrid systems. Slow-moving aircrafts, flying at high altitudes, offer a TV technology that is intermediate between satellite and conventional TV broadcasting tower of a TV station. In

a wider sense, it is a proven technology. A few words would be in order to explain why a purely satellite-based TV system has not been costed up. I believe such a TV system, known as re-broadcast satellite service, does not fit into our regional diversity. For, it can offer us only 4 TV channels. Therefore, in the present stage of the satellite technology and institutional constraints, a satellite can be meaningfully deployed in the role of fixed satellite service, which would interconnect the regional sub-systems for a national hook-up whenever desired.

While combining satellite technology with microwave relays is found to be the least expensive way of establishing a nation-wide TV system in India, the cost differentials among the five TV systems are nevertheless far from significant.

System-wise estimates of annual opportunity cost are found to differ from one another by no more than 6 per cent — a difference that can be deemed well within the errors of estimation. There are two reasons behind the emergence of these negligible cost differentials. The principal one is the dominant position of common costs in all systems. For example, the common costs on capital account are 85 to 90 per cent of the total cost on capital account, in each system. Similarly, the common operational costs vary between 81 per cent in the case of a satellite-aircraft combination and 92 per cent in the case of a satellite-microwave TV system. Another reason for the emergence of insignificant system-wise cost differentials is the existence of underlying cost trade-offs within a TV system. Thus, while the satellite aircraft combination requires the least capital, its annual operational cost is comparatively high. Likewise, the advantage of relatively lower foreign exchange requirements of the purely co-axial cable TV system is eroded by its relatively higher capital and operational costs.

The foregoing comparative cost results do not decisively favour any one particular type of TV system. Indeed, one can choose among TV technologies on considerations such as (a) the speed with which a technology can help in establishing a nation-wide TV system, (b) the risk of failure associated with a technology and (c) flexibility offered by a technology in building a TV system gradually. Whereas terrestrial technologies of TV transmission have long gestation periods, the space technologies of satellite as well as aircraft offer speed in executing a large-scale TV system. But the latter are more likely than the former to fail during service. One has also to reckon with the risk at the

launching stage of a satellite. The probability of success at launch is about 0.8. What is of particular concern is the peculiar type of risk associated with the satellite TV; it is nothing-or-everything type of television in the matter of reliability. Of course, this risk can be eliminated substantially, if not wholly, by incurring extra cost of having a stand-by satellite in orbit. While the risk arising from a natural failure is taken care of a stand-by satellite, the vulnerability of the satellite to enemy action during hostilities is far greater than that of terrestrial TV technologies. But, then, natural calamities such as floods, cyclones, and earthquakes, do not affect the functioning of a satellite.

In respect of flexibility, all TV technologies except the satellite possess this attribute. A terrestrial or airborne TV system can be built gradually, and so offers an advantage when a large number of TV personnel have to be trained for a big nation-wide TV system. Further, any system that is established gradually offers scope for dynamic decision-making in the face of an unforeseen eventuality, such as resistance from a particular section of the community.

The considered view of this author is that the question of choice of TV technologies is a subsidiary one; the central question is that of the television itself. The combination of all technologies of TV transmission, without precluding any one, may be the right course to adopt in Indian conditions. Such a combination may offer some useful cost gains because of the large variations in topography and weather conditions in India. For instance, co-axial cables may be significantly cheaper to lay and maintain in the flat plains with a good network of roads and electricity grids (e.g. Punjab, Madras and UP) while microwave relays are less costly to erect and maintain in reverine or inaccessible tracts (e.g. Bengal and Central India).

Television versus Motion Picture

Among the possible substitutes for television, motion picture is the closest one. Radio can be a substitute for television where the message content of the visual component of a TV message is small. Otherwise, this single medium would be a poor substitute for the two-media (voice and visual) TV or motion picture. Here, we would examine the comparative cost of reaching Indian masses by motion picture instead of TV medium. We have costed two types of motion picture systems, mobile and fixed.

The mobile system is a blown-up version of the existing mobile units of the

Field Publicity Department, Ministry of Information and Broadcasting. In this system, mobile vans fitted with 16-mm movie projectors go round the country exhibiting publicity and information material. In fact, family planning programme organisers have lately shown increasing preference for such mobile vans over person-to-person communication through social workers. There are, indeed, plans to have one such mobile van for each district for disseminating family planning information only. Recently, some press advertisements by the Ministry of Health and Family Planning indicate interest in 8-mm movie projectors which could be placed, like TV sets, in villages.

The alternative motion picture systems turn out to be more costly than the TV systems. The estimated capital cost of a mobile van system, is \$2 billion if it is to be comparable with the TV system in terms of the duration of programming and the coverage of population. On the other hand, the capital cost of a fixed movie project system is far less (\$300-500 million).

The estimated annual operational cost of the mobile van system is \$1.3-1.4 billion, whereas the corresponding cost for the fixed movie projector system is in the range \$423-540 million. In terms of annual opportunity cost, the estimate ranges from \$470 to \$650 million in the case of the fixed movie projectors, and \$1.63-1.86 billion in the case of mobile van system. The comparable estimates for the TV systems are in the range \$207-432 million. In computing these opportunity costs, we have shadow-priced foreign exchange at 50 as well as 100 per cent above the official foreign exchange rate for Indian rupee. Likewise, interest charge is provided at the rate of 5 as well as 100 per cent — the former reflecting the cost of long-term loans and the latter indicating the social rate of return on capital.

A final remark about the mobile van system would be in order. While this system is very expensive, it offers the great advantage of divisibility and flexibility in installation. By reducing the daily duration of programming, the mobile van can reach a couple of villages. This can proportionately cut down capital costs. Likewise, it can be built gradually, offering the advantage of learning by doing.

Summary of Main Findings

(1) A full-scale nation-wide educational TV system for India has high capital and operational costs. This is irrespective of the TV technology employed. Our estimate of capital cost is

about \$900 million, which is well above other estimates that have emerged from several major TV studies. The foreign exchange component of this is anticipated at \$200 million, provided India undertakes substantial manufacture of TV sets in India. Capital costs can be reduced by about \$140 million by importing TV sets from Japan. But then the foreign exchange component would rise by another \$40 million.

(2) The educational TV system is anticipated to cost Rs 120 crores annually. This is out-of-pocket annual cost, and is exclusive of both depreciation charge and interest charge on capital assets. The main components of this cost are as follows:

TV software	Rs 32 crores
Repair and maintenance of community TV sets	Rs 18 crores
Power source for TV sets	Rs 47 crores

Therefore, the expensiveness of the TV system arises from three factors which are specific and peculiar to India: (a) multiplicity of languages, (b) low private demand for TV sets and (c) lack of rural electrification.

(3) The considered view of this author is that the question of choice of TV technologies is a subsidiary one; the central issue is one of the television itself. A combination of all technologies of TV transmission, without precluding anyone, may be the right choice in Indian conditions. Such a combination may offer some useful cost gains because of the large variations in topography and weather conditions in India.

(4) A nation-wide television service in India would be an expensive proposition, irrespective of the TV technology employed. Before creating such a service, Indian planners must make sure that its benefits would be commensurate with its costs. If its benefits are not so generally recognised that they command continuing budgetary and political support, inadequate funding of the project may arise. Such an inadequate funding may lead to undesirable consequences, such as (a) actual operation being far below capacity and (b) aberrations in the TV service (e.g. use of unwanted, imported TV programming and pressure for advertisements on the TV system).

(5) Motion picture systems turn out to be more expensive than a television system.

[This work would not have been possible without the resources of the Centre for Development Technology at Washington University. This interdisciplinary Centre has not only all the mimeo copies of major TV studies on India but also proved conducive for collecting the myriad of technical details for costing a vast project like educational TV system.]

OPERATION EXPORT

The inside story of how the Coca-Cola organisation found a new market for an Indian product in the U.S.

Mango finds a new market

In 1970, the Coca-Cola organisation began to use its worldwide resources and its 84 years of expertise in the production and marketing of quality soft drinks to develop new products that would help boost India's export efforts. Its first major success has been in the United States' own highly competitive soft drinks market.

Alert to the need for expanding non-traditional exports, the Research and Development unit of the Coca-Cola organisation in India, went to work. It evolved a stable mango beverage base and from then on it was an exercise in international co-operation.

Extensive consumer research indicated that a mango-based beverage stood a fair chance of acceptance in the large Latin-American sections of the U.S. Several product possibilities were developed and sampled among groups of Latins and non-Latins.

Further exhaustive market tests showed a distinctive preference for a mango-pineapple mix. Substantial investment was therefore made in the development by the Coca-Cola organisation of a drink of this type which it was felt would be exactly right for the United States market.

'Alegre' launched

The result was a nectar-type fruit beverage to be marketed under the trade-mark 'Alegre'.

'Alegre' got instant acceptance when it was introduced in Miami. The Latins were happy to find a product they were used to in their

home land; non-Latins liked its unique taste. Already 'Alegre' is well past the test market stage and will soon be introduced to other parts of the U.S.A.

STOP PRESS

Mango beverage base demand expected to hit Rs.25 lakhs

Latest reports indicate that, by the end of this year, Rs. 25 lakhs worth of mango beverage base per annum will be needed to cope with the demand for 'Alegre'. This figure will considerably increase as 'Alegre' is introduced to still further areas.

Making things go better — worldwide

The international development, production and marketing team which created a breakthrough in the highly competitive American soft drink market with 'Alegre' is already seeking ways to boost India's export trade still further. By their efforts, and through the dynamic distribution network of the Coca-Cola organisation, other Indian products may soon be reaching new world markets to earn yet more foreign exchange.

Issued by the Coca-Cola Bottlers' of India.

'Coca-Cola' and 'Alegre' are the registered trade-marks of The Coca-Cola Company.

You are incurring liability for payment of gratuity with every year of service put in by your employees. What will you do to meet this liability?

Join the LIC Gratuity Scheme

Benefits to employers

- By making regular contributions to the scheme, the employer is in a better position to meet the liability as and when it arises.
- Premiums paid under this scheme are based on actuarial calculations; therefore, contributions are determined on a scientific basis.
- Contributions to the Scheme of Insurance are deductible as business expenses.
- By arranging the scheme with LIC, administrative work of the employer is practically eliminated.
- By providing additional security of life insurance cover through this scheme at little extra cost, better employees are attracted and retained.

Benefits to employees

- On normal retirement—the employee will receive gratuity as per rules of the employer.
- In case of untimely death—the scheme provides life insurance cover based

on total service from the date of joining to the date of normal retirement.

On premature retirement (or change of job)—the gratuity payable will be in accordance with the existing rules of the employer. Where there is nothing laid down, the basis may be fixed in consultation with LIC.

Contact any of our Divisional Offices for further details.

The Payment of Gratuity Act 1972

The Payment of Gratuity Act 1972 is applicable to all institutions in the country, which have 10 or more employees and which are governed by the Shops and Establishment Act. It makes gratuity payment compulsory for employees getting less than Rs. 1,000 per month.

R.R.NO.1709/73 Red Herring

THE resumption of direct US arms supplies to Pakistan is significant not because it immediately poses a serious threat to India's security nor because it will touch off an arms race on the subcontinent. In this case, for once, there appears to be considerable merit in President Nixon's statement that "India's military superiority is so enormous that there is no possibility of Pakistan being a threat to India". The real significance of the American move is that it marks the return of the US to an open active role in India and Pakistan. The collapse of its long-term policy of maintaining a balance of power between India and Pakistan, as well as more immediate miscalculations, had left the US in the position of not being able to exercise a decisive influence on the events of the latter half of 1971 in the subcontinent which culminated in the break-up of Pakistan and the emergence of Bangladesh. Inevitably, there followed for the US a period of waiting and watching. In any case, during this period the US Administration was preoccupied with Vietnam.

The US's return to a more active role in the Indian subcontinent began, interestingly enough, with Bangladesh. In 1972 American assistance to Bangladesh was as much as \$ 319 million or over Rs 200 crores of rupees, all of it given as grant. This put into the shade, in monetary value at least, anything provided by any other country. Recent visitors to Dacca have testified to the pervasiveness of the American presence in that country. And now, in the last week, Nixon has loosened the largely self-imposed restrictions on American relations with the rest of the subcontinent. Of course, the character of the governments of India and Pakistan ensures, indeed requires, that American influence in the two countries is very considerable at any time. There is a point beyond which, say, Chinese influence in Pakistan, or Soviet influence in India cannot grow. But that apart, the developing situations in the two countries had begun to generate strong pressures for a more active involvement by the US. In Pakistan the influence of the army appears to be growing in proportion with President Bhutto's political troubles and pressure for beefing up the defence forces must be becoming very strong indeed. American supplies are essential for maintenance and expansion of a military machine largely acquired from the US. Of course, considerable supplies were already coming in through third countries, but his inability to reopen direct channels of military supplies from the US must have begun to appear to the army in increasingly intolerable failure on Bhutto's part. Now, after repeated petitioning, most recently by a special team, consisting of the Governor of Punjab and the Minister of State for Foreign Affairs and Defence, which was in Washington earlier this month, Nixon has been persuaded.

But if Bhutto's need for military supplies from the US is acute, so is the Government of India's need for US economic assistance. The economic mismanagement of the last few years has made mallow of relatively large foreign funds imperative for both bolstering the drooping level of government saving and financing import of a wide range of commodities in short supply. The Budget for 1972-73 had expected Rs 138 crores of DLF/AID loans against which only Rs 46 crores were actually forthcoming. It had also hopefully provided for 'new credits' from unspecified sources of Rs 165 crores, none of which materialised during the year. Evidently Nixon was not ready to oblige yet.

Now he is. Along with the decision to supply military equipment and spare parts worth rather less than \$ 15 million to Pakistan, the US has announced the release of \$ 87 million of economic assistance to India which, according to Nixon, will be available for importing items like fertilisers and power generating equipment. The Communist Members of Parliament, who should have been expected to take the government to task over the resumption of American economic assistance, have been cleverly manoeuvred into concentrating their fire on US military supplies to Pakistan. The simultaneous announcement of US economic assistance to India has gone practically unnoticed. No doubt this is exactly as the government wanted it. Hence Swaran Singh's feigned alarm and anger over the military supplies to Pakistan of which the Government of India must have been formally told by the US well before news of the move became public. That apart, a little uproar in Parliament, obligingly provided by the opposition parties, may also help the Government of India to persuade Nixon that rather more than \$ 87 million will be needed to assuage public sentiment in the country outraged by US arms sales to Pakistan.

Bangladesh

Sheikh's Success

THE elections in Bangladesh, it had become increasingly clear during the past few months, were going to be scarcely more than a formality. There was not the least doubt that the Awami League was heading for a massive victory; it was only the extent of the massiveness which was still at issue. That has now been resolved. Some strong-arm methods were perhaps used here and there by the minions of the ruling party. But not even the most antagonistic of Sheikh Mujibur Rahman's opponents would claim that electoral malpractices have been on any major scale — as, for example, were alleged to have taken place across the border in West Bengal last year. The diverse opposition groups — often more critical of one another than of the Awami League — lacked credibility as much as cohesion. Bengalis, particularly on the eastern bank of the Padma, have long been used to the phenomenon of creeping authoritarianism of which the Sheikh has been accused. Many among them are in any case incapable of sifting it from benevolent paternalism, which has a characteristic indigenous flavour. Admittedly, economic conditions have been difficult in recent months. Prices have kept on soaring, there has been a general scarcity of clothing and other essential articles of consumption; food has not always reached the spots where demand has been acute; hordes of opportunists, including shady elements who have been carried along by the ruling party, have lined their pockets in total disregard of the welfare of the masses.

But none of this made any difference at the hustings. The people of East Bengal have navigated through many bizarre situations in the course of the past quarter century; and the resulting experience must have given them a foundation of wisdom which can separate with facility the political wheat from the political chaff. Opposition parties have lacked the imagination and organised purpose necessary to grasp the political opportunity offered by the Awami League's failures. Among opposition groups, Maulana Bhashani, who has always despised the shackles of organisation, has now reduced his statements to the level of vague absurdities; alas, to be ancient has long ceased to be the equivalent of to be wise. Of the rest, the ideologues have remained prisoners of their own make-believe; honesty of purpose has never been, and

is unlikely to be in any foreseeable future, a worthwhile substitute for down-to-earthness. The Jatiya Sramik Dal, containing breakaway elements from the Awami League, certainly tried hard; but it was a condemned playground; liberation was still too near an event, and in the present climate and in the conservative soil of Bangladesh to talk ill of a father figure — at the market-place and under the mid-day sun — is a sin only a shade less heinous than patricide.

All that is over now. The assorted opposition groups have gone with the wind. The really interesting — and intriguing — phase in Bangladesh starts from this hour. Electoral success can go to the head of both the Sheikh and his party. Between the demagogue and the messiah, the dividing line is often thin. The four principles of the Bangladesh constitution, which have in fact for quite a number of years been the League's campaign capsules, could mean both everything and nothing. The Sheikh's declamation regarding his post-election programme — "My first task will be to emancipate the people from hunger and misery" — has an embarrassing pitch of banality. No doubt, the sweeping electoral victory will enable him to demand an extra measure of respect as much from India as from Pakistan. The world beyond, though, has suddenly grown very much bigger, and very much more cynical. Bangladesh has of late been cultivating, for obvious pecuniary reasons, both the United States and Japan. But unless the prisoners-of-war issue is sorted out in a manner which satisfies a much wider range of countries — certainly China not excluding — funds from external sources are unlikely to start gushing in. Besides, the corrupt elements have already had time to carve out a comfortable niche for themselves in the country's economy. As Pakistan's rather sad example shows, an excessive dependence on foreign funds encourages these elements, and leads to postponement of crucial domestic reforms of social institutions as well as of the administrative structure.

The opposition is for the present dead, but it could be resurrected in no time if the Awami League takes eternity for granted; the Sheikh may not be there on the scene for long. As Bhashani's example suggests, beyond a point, patriarchs too may become dispensable. What the future holds will thus depend much upon who imbibes what lessons from the elections. And not to give quarters to the vanquished

adversaries — as would seem to be the developing style, going by the indications surfacing in the post-election week — might be a theme of folly, around which tragedies might unfold in the not too distant future.

World Money

Menace of Speculators

THE Ministers of Group-14 are certain to formalise the decision reached at the level of officials at the beginning of this week to keep the major world currencies floating. As the much-talked-of joint float of the currencies of the enlarged ECM has not finally materialised, the ECM itself would have to cope once again with the complexities introduced by the independent floating of the Italian lira, the pound sterling and the Irish pound and the mini-float of the currencies of the remaining six ECM countries. The West Germans were able to secure a mini-joint float only after conceding the French demand that the German mark should be revalued. They have raised the value of the mark by 3 per cent. The French were understandably afraid of aligning themselves with a strong currency like the mark, which is still regarded as the strongest among the ECM currencies. An under-valued mark in the proposed regime of floating currencies would have resulted in excessive pressure on the French franc which is, perhaps, the weakest of the six currencies participating in the mini-joint float.

Though the proposed float is seen in some quarters as being a solution to the current currency crisis, it is difficult to understand why the G-14 countries took over two weeks to agree upon a regime of floating currencies. The severity of the current crisis as well as the wide ranging differences of approach among the G-14 countries could be seen from the need felt by a number of them to keep their exchanges closed for over two weeks. Despite the experience gained by these countries during the 1971 currency crisis in hammering out the Smithsonian arrangement, it is strange that the approaches of the major industrial countries to solving the recurring currency crises have not yet been harmonised.

In all probability, the mini-float of the Six ECM countries will soon run into rough weather if these countries do not introduce exchange control measures to put a brake on massive hot money movements. The West Germans, wedded as they are under American in-

fluence to the philosophy of permitting relatively free flows of capital, will once again face massive speculative capital inflows despite the half-hearted attempt to curb such flows through the 100 per cent deposit requirement with the Bundesbank in respect of non-resident deposits. Such measures, or the threat held out by the Deutsche Bank to charge 10 per cent negative interest on non-resident deposits, are unlikely to deter speculators, since the potential gain from the massive capital flows will take care of all such paltry costs. The speculators have already gained over \$780 million when they moved \$6 billion into West Germany before the latest dollar devaluation. As they are still convinced that the mark can be pushed upwards further, there is likely to be a rush to push in speculative capital into the countries participating in the mini-float. Secondly, as the gains will be higher to those that are the earliest to secure positions in the mini-float currencies — especially the German mark, because of its weak exchange control machinery as well as its inherent economic strength — countries like France with the relatively weak currencies will have to share the costs of the speculative capital inflows for the sake of their stronger parties.

The gross deposits of all the Euro-currency banks are well over \$100 billion and most of these are dollar deposits. The short-term liquid financial assets controlled by the multinational corporations, primarily of American origin, were \$268 billion at the end of 1971. The dangerous potential of these short-term liquid assets held privately becomes clear when one realises that they are twice as big as the international reserves of the central banks of all the non-communist countries. The total official reserves at the disposal of even such countries as West Germany (\$25 billion), Japan (\$16 billion), the UK (\$7 billion) and France (\$10 billion) are small in comparison with the short-term liquid funds at the disposal of the American multinational corporations. It is by now well known that the American multinational corporations are primarily responsible for creating the recurring currency crises during the last two years.

Many financial experts feel that after the recent 10 per cent devaluation, the dollar is no longer an over-valued currency, but that actually it now stands somewhat undervalued in relation to the world's other major currencies. And yet speculators have been able to disrupt the newly-arranged international currency alignment in a period of less than

three weeks. This proves abundantly that unless it is adequately equipped to deal with the menacing power gained by speculators and the onslaughts of massive capital flows from one currency to another, especially in the last few years, the international monetary system will crumble even after being reformed along the most appropriate lines.

Procurement

Wot, No Records-of-Rights!

THE Union Minister of State for Agriculture could not have thrown a politer hint than he did last week while answering a question in Parliament. He has nothing *per se* against the idea of imposing a levy on producers in order to improve the rate of procurement. He does not, however, consider the present moment opportune for imposing such a levy, since the records-of-rights are not quite up-to-date. This fact notwithstanding, if a state government dares to go ahead with the producer levy, the Centre will not mind; it will offer "all help".

There could be no better way of pouring cold water on an idea. Altogether, it is an amazing spectacle. At one end, the Prime Minister laments at a congregation of state Chief Ministers that procurement in the current year has fallen way behind what it was even in 1966; she finds this inexplicable and inexcusable. At the other end, she retains in her government this particular minister, who, along with his immediate superior is responsible, more than anybody else, for the failure of procurement. This minister indulges, in response to a parliamentary question and therefore on behalf of the government as a whole, in a strategem clearly intended to sabotage the cause. Nobody, it seems, is bothered.

If we are to wait for the records-of-rights to be corrected upto this coming Monday or Tuesday or Wednesday or whatever day in the week it is going to be before a producer's levy is launched, there will then not be a producer's levy ever. None should know this better than the minister who made the statement. During the difficult days of the 1960s, a producer's levy had been imposed with respect to several grains in a number of states, and substantial procurement had been accomplished under the levy. Then, as now, records-of-rights were neither up-to-date nor perfect, but few seriously raised this issue to stall the acquisition of grains under the levy. If the minister has now

thought it fit to rake up the issue; the purpose could not be more obvious: he must at all costs protect the interests of the larger farmers who must be allowed to save their grains which could then be disposed of in the open market at skyrocketing prices.

In this country, which has at least 350 districts and perhaps one hundred times that number of *tehsils*, setting right the records-of-rights has to be a continuous process. It is well known that those whose interests are apparently so dear to the minister are constantly at work to thwart the progress of recording of land rights in the states; instances are not lacking when state governments have passed executive orders to prevent district officials from proceeding with the task, on the alleged ground that this would lead to breach of peace, instigated no doubt by their own henchmen. On this basis, the rich producers could carry on merrily from here to eternity; they would not permit the revision of records-of-rights, this would therefore prevent the introduction of a levy upon them, and this in turn would permit the minister to keep answering the stock question with the stock apology.

Small Car

Public Design for Private Assembly?

Our Delhi Correspondent writes: THE Maruti car project of the Prime Minister's son is hitting the headlines these days, but the issues the Opposition parties have been raising appear to be rather peripheral though they are embarrassing enough. They concern primarily the irregularities in the lease of land for the Maruti factory by the Haryana government. The record of the Central government on this matter was certainly shown to be rather tarnished during the heated exchanges in Lok Sabha. In the lobbies there is talk also about all manner of other assistance and considerations that have been drawn upon to proceed with the project. But there are other issues of principle which have not attracted due attention.

The small car idea was first conceived nearly a decade and a half ago by the former Commerce Minister Manu-bhai Shah. Interest in it has waxed and waned over the years, but throughout it was thought of as an undertaking in the public sector. The controversy at no time questioned this basic premise. Rather, the question under discussion was whether the project

should enjoy any kind of priority in the plans. While the administrative ministry pressed for its inclusion under plan priorities, the Planning Commission turned it down from time to time.

With the overall erosion of the status of the Planning Commission, the Industrial Development Ministry acquired the upper hand in the matter and went ahead with its plans to launch the small car project. About a year ago, the Ministry finally came forward with its proposals and presented them formally to the Union Cabinet. This obviously implied that all other clearances had been made and that only the final decision of the government was called for. It thus came as a big surprise to the Ministry when the Cabinet, on the initiative of the Prime Minister herself, turned down the proposal on the ground that it could not be regarded as a priority project in the prevailing economic conditions in the country. This should have been the end of the small car project but for the fact that soon after the proposal of the Ministry had been turned down, the Maruti proposal began to loom large — indicating that the decision to give up the project in the public sector was somehow connected with the proposition of the Maruti enterprise. Otherwise, how is it that a project regarded as running counter to plan priorities — and therefore unfit for the public sector — may be allowed to be launched in the private sector? After all, at least in the case of large projects the same priorities should inform investment decisions both in the public and in the private sectors.

Notwithstanding the public statement of the Prime Minister that the public sector car project did not enjoy priority in the scheme of the Plan, the Planning Commission has been again asked to go into the question of the relative costs and benefits to the economy of public transport *vis-a-vis* passenger cars. A final decision on the car project is to be taken only after this examination is over, but it seems likely that while the Planning Commission will give a higher rating for the public transport system it will not rule out the small car in its second order of priorities. Since the public sector car project has been formally shelved, and the Maruti has been making headway, the latter would no doubt get the necessary blessings. Meanwhile, the letter of intent to Maruti company, which was first issued towards the end of September 1971, has been extended for the third time after the required intervals of six

months; the project will thus take considerable time before it goes into production on a commercial scale.

Another issue of interest is the claim of Maruti that it will be totally indigenous and that no foreign collaboration or foreign consultancy arrangement will be involved. Thus the letter of intent issued in favour of Maruti stipulates that no import of capital goods or of raw materials or components will be allowed. This is a very commendable intention, but the question that naturally arises is, if it is going to be possible for Maruti to produce a car on these terms why was it necessary to seek foreign collaboration for the car project in the public sector? Surely, Government of India is able to command more resources and talent than a private individual can for a project of this kind. Either the government went astray in seeking foreign collaboration since the car could be built with local capability, or there is some snag in the Maruti proposal. Reports have it that the prototypes of Maruti so far constructed — numbering over 40 — have involved no more than assembly of car-parts and components which any competent mechanic can accomplish and that they do not represent any new design for the purposes of mass production. A lot of imported material may in fact go into the production of Maruti, and the required imports may be arranged indirectly through subsidiaries and connected enterprises — which may be designated 'ancillaries' and would feed the Maruti assembly in the main factory on the sprawling 297 acres of land it has acquired.

Egalitarianism

New Dimension!

A Correspondent writes:

WITH so many from such diverse quarters gunning at the Approach to the Fifth Plan, perhaps the Planning Commission deserves a respite. Perhaps it is also bad manners to hit one who is already down and out, but the proposals in the Railway budget are almost tailor-made for posing a specific question to the Commission. Whichever of the variants of the Fifth Plan model is finally favoured for bringing down the consumption standards of the top 30 per cent of the population — essential for implementing the Plan goal of reducing interpersonal disparities in income levels — a heavy dose of taxation on the upper income-groups and, correspondingly a relatively benign fis-

cal treatment of those who are below the poverty line, will have to be the adjuncts of policy. One would have thought that, since the early bird gets the worm, a beginning will be made in that direction with the Railway budget. Several new proposals in respect of passenger fares are of course there in the budget, and are supposed to yield as much as Rs 26.20 crores. The Railway Minister has gone to great lengths in claiming a certain egalitarian logic in the manner in which the new passenger fares have been worked out: the discrimination, all along the line, is supposedly against the rich. Unfortunately, since as much as Rs 21.25 crores out of the Rs 26.20 crores would be realised from third class passengers, the Minister's claims ring altogether hollow. Proportionate to population, the Railway budget imposes as much on the third class passengers as on the upper class ones; no amount of clever-by-half arithmetic can alter this uncomfortable fact.

A more honest stance would be to mention that an overwhelming proportion of those who travel by the third class belong to the highest 30 per cent of the population whose consumption level it is intended to reduce drastically. Three decile groups from the top can cover a lot of heterogeneity in India, and third class railway passengers will be in the net. Does not this merely bring into focus the nature of the *non sequitur* which the Planning Commission's formulation in respect of goals of social justice is? A scheme which fails to distinguish between the filthily rich and the basically poor and has to make them a common target of attack must have something inherently wrong in it. The same difficulty arises at the other end of the Planning Commission's re-distribution model, where the pronounced intent of policy is to improve the per capita consumption of the lowest 30 per cent of the population. Within the ambit of this lowest 30 per cent, there will be those whose monthly consumption would be as low as Rs 5, as also those who might be spending ten times as much. To talk of an average level of consumption, and of an internally undifferentiated target of improving the level of living for this global category, makes little sense. It is always possible to draw an imaginary poverty line and allocate a certain quota of funds for ameliorating the conditions of the multitude subsisting below this line. But amongst these, there will be both those who are only marginally poor and those others who are abysmally so. A free-wheeling middle peasant in the countryside, if he possesses around 10 acres of land

and has six or eight members in his household, would, by a stroke of bureaucratic logic, might then come to belong to the same category as an unemployed landless labourer; since the same standard would be applied to judge the state of economic viability of both, egalitarianism of a new dimension would indeed be ushered in. But could planning be more trivial, or pretension and sillier?

Israeli-Arab Killings

Twisted Moral Calculus

A Correspondent writes:

THE contrast in reactions to the recent acts of terror in West Asia is nauseating. When the Palestinian guerrillas nabbed the American and Belgian diplomats the conscience of Sophists the world over was piqued and there was an indignant outburst of self-righteous anger and hatred. Nixon, as could be expected, reportedly lost his balance and demanded the summary execution of the guerrillas. Apart from the Western world, the Arab capitals also condemned the Khartoum killings. Predictably, the government and most of the news media of this country also joined the chorus. Compared to this searing passion, the reaction to the cold-blooded, calculated shooting down of the Libyan airliner, killing 106 innocent passengers was sickly, though the ritual show of grief was exhibited. Typical was a comment by *Newsweek*: "Only a week earlier, the Israeli attack on a Libyan airliner that took the lives of 106 civilians had whipped up new tensions in the Middle East. But tragic as it was, the Sinai disaster was clearly not in the same league with the calculated terror and callously executed atrocity in Khartoum." This international newsmagazine slyly chose to forget the deliberation with which the Israeli Phantoms were personally ordered to shoot down the Libyan plane by the Chief of Staff of the Israeli Defence Forces, General David Elazar, whose reputation for courage has no doubt been enhanced! Even less heed has been paid to the Israeli attack on the Palestinian refugee camps in Lebanon where the Israeli adventurers killed off women and children while Tel Aviv blandly stated that the raid was directed against guerrillas contemplating mischief.

Even a rudimentary knowledge of West Asian history shows that this orgy of violence is an after-effect of the creation of the Zionist State of Israel in what was formerly Palestine, thanks to the machinations of the US, France,

Britain and also the Soviet Union. The dispossessed Palestinians can hardly be blamed for having failed to reconcile themselves to the arrangement and for taking vengeance on their dispossessors. Perhaps, the Palestinian tragedy is best echoed in the words of Mark Twain:

"There are two 'Reigns of Terror', if we would but remember and consider; the one wrought murder in hot passion, the other in heartless cold blood; the one lasted mere months, the other had lasted a thousand years; the one inflicted death upon thousand persons, the other upon thousand millions; but our shudders are all for the 'horror' of the minor Terror, the momentary Terror so to speak; whereas, what is the horror of death by axe compared with the lifelong death from hunger, cold, insult, cruelty and heartbreak?"

In this sulphuric atmosphere, calling for restraint among the Palestinians seems presumptuous. But it must be asked whether their terrorist acts will help them reach their goal. There is no alternative to violence to overthrow a ruthless enemy; but if the acts of violence are not carefully directed and become pointless, the achievement of Palestinian objectives will become more remote. Many a promising revolution has degenerated into senseless throat-slitting because of the failure to distinguish between anarchic and revolutionary violence. Serious reorganisation, rethinking and a widening of the base of the guerilla organisations are long overdue. But this does not mean that while being critical of the Palestinian guerrillas one can forget that Richard Nixon, Golda Meir and their ilk are the ones who perpetuate the violence system.

Spices

Need for Organised Export Effort

EXPORTS of spices rose from Rs 32 lakhs in 1960-61 to Rs 25 crores in 1968-69, and further sharply to Rs 34.50 crores in 1969-70. In 1971-72, exports reached an all-time high of Rs 37 crores, giving India a pre-eminent position in the Rs 125-crore world trade in spices. However, of late there have been signs of an impending setback. During April-August 1972, only 17,600 tonnes of spices valued at Rs 10.34 crores were exported, against 28,600 tonnes valued at Rs 13.67 crores in the same period of 1971.

The decline is to be attributed to the keen competition in important items. Indonesia has emerged as a formidable competitor in pepper in the US market

— which has been one of India's major markets for spices. Indian ginger and turmeric face competition from Taiwan, China, Nigeria, Japan and Ceylon who, though they supply inferior qualities of ginger, offer compensating price differentials. Moreover, the quality-conscious Western (particularly US) markets prefer Jamaican ginger which is of even better quality than Indian ginger. In chillies, India faces stiff competition from Thailand, Mexico and Ethiopia.

There are problems from the supply side as well. At present, there is a multiplicity of organisations dealing in various spices, among whom there is little co-ordination and many of whom are ill-equipped to meet the specific preferences of importing countries. Countries in the Middle East, for instance, prefer green cardamom but Indian suppliers have only partially met this demand so far; similarly, in some countries there has been a shift in favour of white pepper but, while Indonesia has steadily captured that market by producing white pepper on a large scale, India has failed to vary its pattern of supply.

However, in terms of production India is in a strong position. Of the world's production of pepper, it accounts for 30 to 40 per cent, of cardamom 60 per cent, of turmeric 80 per cent, of ginger 50 per cent and of chillies 60 per cent. Relative to these proportions, India's share in world exports of spices is small. Part of the reason is the growing and attractive domestic market. Since there has been no significant increase in production domestic prices have been rising, whereas international prices are subject to severe fluctuations.

It is here that a Spices Board has a role to play. The Board could look after problems relating to regulation of production and international marketing. It could also make better use of the research work on spices being done by organisations such as the Indian Council of Agricultural Research, the Central Plantation Crops Research Institute, the Central Food Technological Research Institute, and the state government agricultural departments. Research is also necessary on diversification of production, processing, grading and packaging to suit the requirements of the importing countries especially the processed foods industry in these countries.

So far India has exploited its ability to supply a wide range of spices. This advantage is now slowly disappearing. Now a more organised effort is needed in order to retain the country's share in the international market.

A Kathmandu Diary

A M

IT is pure Kafka: wherever you go, whichever way you turn, never mind which poor country you are currently in, there is no escape from courses and seminars on economic development. The more the frequency of such courses, the less perhaps is the rate of economic growth in the country concerned. But such cynicism cannot deter the style of a world suffering from an excess supply of economists, quite a number amongst whom, on a fair guess, must also be moonlighting as espionage agents for this or that nation. The other day, at one such course catering to officials of the Nepalese government, there was an intense debate over the motion: 'If I were not born in the heavenly Kingdom of Nepal, I would then rather be born in China than in India'. The motion failed to carry, but just by the skin of the teeth: the verdict "of the" congregated bureaucrats was six for and seven against, with two abstentions. The minions of the Indian embassy, anxiously waiting in the wings, must have heaved a sigh which reverberated beyond Raxaul.

POLITICAL BALANCE

The vote on the motion about sums up the situation here. The Indian presence still tilts the political balance, but just marginally. Once more, it is pure Kafka: whichever way they turn, the people here cannot get away from India. Ninety per cent or more of the country's recorded exports go to India; more than four-fifths of the recorded imports come from there. More than one-fifth of the government's budget is contributed by aid funds from India. The vast, uninterrupted stretch of the lower *terai*, all five hundred and odd miles of it, beckons to India, shades off into India, is enticed by India, is repelled by India. It is a smugglers' bonanza. Nonetheless, you talk with politicians and government officials, they cannot quite make up their mind whether to hate or hug the smugglers: rice is spirited away to India, which is bad, since scarcities develop on this side of the border, but which is also good, since there is an accretion of India rupee balances. Smugglers also bring in quantities of raw jute from India, which again leave the country dressed up as exports, and provide one major source of non-Indian rupee foreign exchange earnings. There is of

course also the well-known case of smuggled synthetic yarn — and of Chinese pens and textiles. Nepal thus survives, quite substantially, on the wit and resourcefulness of seedy smugglers. And, going by the articulations of the ruling elite, Nepal hates it; she hates her state of helplessness. At any given moment — was it Cyril Connolly who once made a smart comment of this sort? — one hates oneself; the sum of these moments is in one's life. Scratch the heart of Nepal: the chances are you will find more or less the same inscription etched all over.

NIGGARDLY IN OFFERING

This feeling of claustrophobia on the part of a land-locked country has psychosomatic sanction. But sustained boorishness across the border from the south has aggravated the phenomenon. Indians as a community have tended to take for granted the only Hindu Kingdom in the world, particularly one where the roost has been traditionally ruled by waves of migrants led by the Rajputs and the Kumaon Brahmins. Jawaharlal Nehru, having extricated the hereditary King from the clutches of the scheming Ranas, gave no further thought to Nepal, which, for the residual duration of his life, became as insubstantial as any distant outpost of, say, the Gorakhpur division. Now that the so-called democratic revolution has been unwrought and the Nepal National Congress mercilessly cast away, those entrenched in power never cease enjoying a few tangential shafts at India's expense. Any Indian discomfiture, whether in the war with China or in hockey with Pakistan, provides an emotional release. This is therefore scarcely the prodigal son who is straining to return; distant history is distant history, and who migrated from where is an episodic accident Nepal's establishment would rudely brush aside; they demand proper respect for their separate personality, something which, they suspect, ingratiating occasional visits by Indira Gandhi notwithstanding, India is altogether niggardly in offering.

And yet, Nepal has so little options. For a country hemmed in by alien land on all sides and high mountains on most, and whose major exportables consist of boulders and timber, blind fury is an expandable luxury. A Nelson eye has therefore to be turned upon the marauding of the Rajasthani merchants;

however brusque the demeanour of the Sardars who have taken charge of almost the entire road transport, it has to be put up with. For, as far as one can look ahead, developing the counterpoise of a meaningful economic relationship with China will remain a pipedream. The road to Lhasa, despite recent attempts to improve transport and communications, is remote enough; but the goods the Nepalese are interested in have to travel from much further north, from the eastern heartland of China. Whatever wares have been coming in recent years from China have in fact travelled by sea via Hongkong to Calcutta, and from there in sealed wagons to the Nepal border. These too have come mostly under unilateral commodity grants by the northern neighbour, or in lieu of the local currency grant for road projects sponsored by her. There is a 'multiplier' effect of the Chinese gesture, for the fountain pens and textiles thus received have been sneaked into Bihar and West Bengal, adding to Nepal's Indian rupee balances. But this is small change. For the present, there is scarcely one commodity which China would be interested in picking from here; even if any such commodity could be located, the transport cost is bound to pose an insuperable problem.

DEEP PERIL

Nepal, weary and dejected, therefore returns to India. Every few years, the hassle over the trade arrangements heightens the tension, purposeless disputations occur over the space to be kept reserved at the Calcutta docks for goods in transit to Nepal or over what constitutes, or does not constitute, trade deflection. These alarms have a pre-ordained ending: in the manner of a small-time operator in an Eric Ambler novel, Nepalese officials grab whatever little additional dispensations the big neighbour chooses to throw their way, and come home to sulk. Bangladesh perhaps offers an attractive outlet to the sea, but she would be in no position to offer better terms than India, and would take a much less kindly view of any shennanigans along the border involving raw jute. The Americans could have come, but did not, and, instead, went to that other kingdom, Thailand, which was next to both Vietnam and the open sea. The Soviet Union would, in other circumstances, be a worthwhile surrogate, but the Chinese, unfortunately for Nepal, would not like it. Even if one were to ignore the negligible nature of the likely economic pay-off, a closer involvement with China too has

ECONOMIC AND POLITICAL WEEKLY

complex political implications; for suppose China catches on and develops into a domestic epidemic, the kingdom might then be in deep peril. Till now, Shahs have monopolised all the fertile tracts in the lush *terai* regions and in the Kathmandu valley, they are entrenched in the bureaucracy and in the professions. Till now, the tribes such as the Gurungs and the Gorkhas and the Thakalis have continued to be treated like serfs and have not demurred. But nobody knows what might happen in case the northern wind starts to blow, particularly since, meanwhile, many members from these tribes had been abroad, serving in the ranks of the army and the police in other lands, and travel can broaden the mind. The ruling oligarchy in Nepal cannot afford to take the risk.

DISTURBING REPORTS

The dominating mood in Kathmandu is therefore one of sullen despondency. There is as much squalor here as you

can discover in Katihar or Kidderpore; that does not yet touch the palace-dwellers nor the transient foreign advisers ensconced in Hotel Soaltee, but one never knows how late it is. The American boys and girls — who in any case represent the dreg of the tourist traffic — still come by the plane-load in search of *hashish*, but, here too, diminishing returns have obviously set in. Disturbing reports flock in of the galloping price rise in India. Nepal has theoretically an average annual surplus of around three hundred thousand tonnes of rice, which goes to India and pays for the import as much of luxury and semi-luxury consumer goods for the rich as of essential articles. In this year of scarcity, there is a developing fear that India might suck in more foodgrains, which would leave so much less for the tribal peoples in the inner *terai* region and up in the distant hills. In the past, a shortage of food for the servile poor did not matter. From now on, it might.

earlier, I see other concentrations as well, e.g. business, cultural agencies of developed nations, etc. (September 9, p 1856). His exclusive preoccupation with government alone can be based upon the hope that these others will be more benevolent or less all-powerful. Both ways he will find me sceptical. If it is his assessment that governmental totalitarianism is emergent here, he may be rightly assessing the wishes of some people — and which powerful group does not seek to be all-power? But he is not so right in assuming that the people of this society will permit such totalitarianism to emerge. Their resistance to its endemic and sharpening inequality will hardly permit that. Of course, this is a little more evident today than when Sudhir Chandra wrote in June. And in any case, it is a little more apparent to those who pursue the "myth" of equality! To state the point in terms which should make most meaning to those who value freedom, the defence of freedom cannot be built except in the struggle for equality.

A statement by a group cannot but represent the consensus of the group of the population it typifies. Nor can it be ideally acceptable to any one member of it — either Sudhir Chandra or myself. It is clear that there is no agreement even among intellectual and cultural workers of socialist and egalitarian persuasions on precise strategies of struggle for the sort of society and culture they want. To demand this of the Simla statement is unrealistic and even incorrect. But even more incorrect is it to minimise what it did achieve. To give only one example, contrary to the impression Sudhir Chandra's letter conveys, the statement did say "A self-reliant and egalitarian social order and fundamental institutional reforms can only be achieved through sustained struggle. A new alliance of working people and intellectuals promoting the emergence of organic intellectuals from the working people is needed for urgent action along a broad front". Certainly, as he rightly points out, "not one speaker at the Seminar said the policy was not for the India that he lived in but only for the India he dreamed of". Because none thought fundamental social change must only come in 1992 or 2022. How — and how soon, 1876, or any other date before or after that — such change will be initiated was, as I said, something we were not agreed upon. Nor was it the main subject of endeavour, discussed, therefore, mostly in inter-session exchanges.

If Sudhir Chandra's "Minority Viewpoint" of June 24 was unclear in its

LETTERS TO EDITOR

Towards a Cultural Policy

I HAVE read Sudhir Chandra's letter ("Towards a Cultural Policy", October 7, 1972, p 2049). I am unpersuaded that the Simla statement (which, incidentally, you might profitably publish) is not as convenient to the powers that be as Sudhir's Chandra's communications might suggest. The Rs 200-crore cultural plan of the Government of India while acknowledging the existence of the Simla exercise states that a truly meaningful effort of this kind is yet to be made. The Rs 3,200-crore blueprint of the Education Ministry not only rejects Sudhir Chandra's *bete noire*, non-elitist education, it actually creates four categories of educational privilege — or the lack of it.

It is good to be assured at the end of his letter that he does not talk of freedom in order to forestall social reconstruction on egalitarian lines. But his scepticism on equality (and no corresponding doubts on freedom) leave me uncomfortably suspicious once again. Freud and the psychoanalysts dealt the last blow to three "myths" of the French Revolution when they illuminated the obstacles to *fraternité* which arise in the human psyche. And yet man continues to pursue all the three, i.e. *liberte* and

egalite as well. And so he must. None of these can be fought for to the exclusion of the others. If power, to quote Sudhir Chandra again, has been systematically abused — and worse — in the past 25 years, was that for want of freedom? — or of freedom alone? The basic point I wish to insist upon is that no freedom can survive a situation of gross inequality. The defence and enlargement of freedom — not only for the deprived, but also for undeprived intellectual workers like Sudhir Chandra and me — is contingent upon the struggle for equality. The only freedom that man can attain on any widespread and sustained basis is the one that is consistent with this struggle, even though it may appear less attractive to him than that which some humans enjoy in certain periods of history. This to me is as important a lesson of history as any to which he has drawn our attention.

This brings me to what he calls "the basic thrust" of his argument, *viz.* that we are "faced with totalitarianism ... have to fight against the concentration and abuse of power by the government and for the freedom and dignity of the individual". As I said

thrust — freedom and the gradual actualisation of equality being the maximum one could extract out of it — his letter of October 7 errs in failing to appreciate the relationship between programmatic statements and concrete socio-economic struggles. The former do not constitute utopian naivety, but aids the latter and, therefore, bear continuous repetition. The problem of reconciling freedom and individual and cultural variety rightly raised by Sudhir Chandra has not received definitive attention in the Simla statement. Though it has not been totally ignored either. It is a fundamental task which does not even lend itself to a *a priori* futuristic blueprinting beyond a point but which must engage — as it has done in the past — the best active efforts of socialist and egalitarian societies and of cultural and intellectual workers. We all have to be concerned that, in his words, "men and women [do not] cease to be persons and become mere means". But our concern also is that men and women, all of them, do become persons, more than most of them today are, and do not remain mere means as most of them today, again, are.

S SHUKLA

New Delhi

India Office Library

ASWINI K RAY ("European Scholarship on India", September 9, 1972) refers to "the new regulations of the India Office restricting the use of the records for only two days a week". Unfortunately, he has confused the India Office Records (that is the official archives of the East India Company, the Board of Control, the India Office and the Burma Office) with the India Office Library's collection of newspapers. Both the India Office Records and the main collections of the India Office Library continue to remain open daily (Monday to Friday) from 9-30 a.m. to 6 p.m. and on Saturdays from 9.30 a.m. to 1 p.m. The only exceptions to this longstanding rule are as follows:

- The Library's Newspaper Collection is out-housed and is open to the public on Tuesdays and Thursdays.
- Special facilities such as the use of fragile and unbound materials, and the use of the Readers' Typing Room are not available on Saturday mornings.
- The Library and the Record Office are closed on public holi-

days and for two weeks at the end of September.

The scholars who use the Library and the Record Office are aware that the collection of printed books, periodicals and manuscripts are being added to all the time and that there is, therefore, some congestion in the building. To relieve this congestion, arrangements were made to move the collection of newspapers six months ago to Bush House, Aldwych (very near the offices of the Indian High Commission). The area in Bush House provides not only improved storage for the newspapers but also a specially designed reading area for twelve readers — three times the numbers it has been possible to accommodate in the past. It is not possible at present to provide reader services at Bush House for the full working week, but a decision on opening times was reached as a result of survey of the incidence of newspaper use. The needs of scholars working on newspapers are however being kept constantly under review. The arrangements and the reasons for them have been explained to readers, and most of those who use newspapers have found that they can restrict their work on them to two days a week, devoting the rest of their time to other research materials in the India Office Library and records which are available for study throughout the week.

American Academics in India

V SUBRAMANIAM's 'American Academics in India' (December 16, 1972, p 2449) raises a number of interesting, and for the most part, valid points. As one of those American academics, I found the article painful reading. I wish to elaborate on a few points here. The one criticism on which Subramaniam is entirely unjustified concerns the lack of influence which American academic specialists on India have had on American foreign policy concerning the subcontinent. He is entirely correct in his assessment that American "India specialists" have been almost entirely without influence. But, in the American context, there is no reason to expect such influence to exist. There is little tradition in the US of *ad hoc* intellectual influences on foreign policy. Academics are often called to Washington as 'experts' but policy decisions have, until

recently, been made by State Department bureaucrats and, in the Kennedy and Nixon eras, by White House staff members and there has been no academic "India expert" on these staffs. Furthermore, there are many competing interest groups within policy-making circles in the US. Thus the influence of those favourable to India is often nullified by opposing views of pro-Pakistan elements or hardline cold warriors who have never forgiven India's non-alignment during the depths of the cold war. The basic fact is that there is no reason to expect that those American academics who take an interest in Indian affairs would have much impact in Washington. It is also quite unlikely that even major efforts (which were made during the Bangladesh crisis) would alter this situation.

Subramaniam is more correct concerning his other points. The general thrust of American scholarship in India has been along the 'mainstream' of American social science, with its general emphasis on stability, the key role of the middle classes, and its adherence to dramatic (and radical) social change. The bulk of this research, combined with the widespread use of American textbooks in the social sciences, has had an impact on the direction of Indian research. But it seems to me that, rather than exclude American researchers, a much wiser policy would be to do as the Indian authorities were beginning to do prior to the Bangladesh crisis — viz, to scrutinise research projects much more carefully through such agencies as the Indian Council for Social Science Research and to insist that the research be relevant to India and designed in such a way as to involve Indian counterparts. Further, I have been appalled over the years that many Americans who have 'minded' India for data have published the results of their research in obscure American journals and that the material was never made available to Indians. I, for one, am convinced that there must be a 'rich data base' on which more adequate theories concerning Indian development may be based. And, if American scholarship can help to develop such a base, so much the better. Of course, such scholarship must be subjected to critical scrutiny.

This issue, in sum, is a complex one which deserves extended discussion. Subramaniam's article begins such a discussion which I hope can be continued in these pages. But let us not throw the baby out with the bathwater.

PHILIP G. ALTBACH

Poor Results Despite Higher Turnover

Hansavivek

AUTOMOBILE PRODUCTS OF INDIA has produced disappointing results for the year ended July 1972, with a sharp contraction of margins despite a 17.4 per cent increase in turnover. Gross profit declined from Rs 95 lakhs to Rs 78 lakhs, even though 'other income' contributed Rs 25 lakhs more than in the previous year. This performance is ascribed mainly to rise in costs and unchanged selling prices. Equity dividend is nevertheless maintained at 10 per cent with the aid of withdrawal from reserves. M A Chidambaram, chairman, points out that operations in the current year, both at Bhandup and Lucknow units, have been affected by power shortage. He fears that the situation may get worse in the coming hot weather and may result in curtailment of production. The company has set up a new plant at Aurangabad for the clutch and brake division; also, the pace of

research activity for new scooter models has been accelerated. These efforts should show results in the coming years.

During 1971-72, the company produced 24,038 scooters and 2,986 three-wheelers. It has secured a 'letter of intent' for expansion of installed capacity for scooters and three-wheelers to 48,000 units per annum. It has been stipulated that the price of scooters and three-wheelers will be reduced by Rs 75 per unit when production reaches 36,000 units per annum, and by another Rs 75 when the output reaches 48,000 units per annum. The company has developed a 175 cc capacity scooter, which is to be introduced in the market shortly. Also, a four-wheeler light-utility vehicle has been developed, using a more powerful scooter engine. The company is seeking a licence for manufacture of this vehicle. A large portion of machinery for the clutch and

brake division as well as new equipment have been installed at Aurangabad. The company has been granted expansion of capacity of clutch assemblies from 50,000 units to 1,50,000 units per annum and of brake assemblies from 30,000 units to 1,00,000 units per annum. The company has made a beginning in the export market by shipping spare parts to Iran, Mauritius, Singapore, Kenya and Fiji Islands.

There was a lot of labour unrest at the Lucknow unit culminating in a strike which lasted three months. The outlook for this division continues to be gloomy. A project has been finalised in a tripartite agreement concluded among the Government of India, Innocenti of Italy, and API, for the transfer and installation of the entire plant and machinery of Innocenti at Lucknow. A new public limited company under the name and style 'Scooters India Ltd' was incorporated in September 1972 for this purpose. This is proposed to be a joint venture, with government holding 51 per cent of the share capital, Innocenti about 21 per cent, and API

* 18 Months

and the public holding the balance. This new company has agreed to pay API Rs 15 lakhs towards reimbursement of the preliminary expenses incurred by it in connection with the establishment of the joint-sector project.

The tractor project has made considerable progress. The 'letter of intent' for the manufacture of tractors has been converted into an industrial licence and approval has been received for import of capital goods worth Rs 225 lakhs. A scheme is being worked out to transfer this activity to a separate company. In the meanwhile, API has negotiated for the import of 500 tractors in skd and ckd conditions as preliminary step to popularise the tractor in India. In fact, 250 numbers of tractors have already arrived and are being assembled.

During August and September, there was a strike also at the Bhandup and Thana plants, over the interpretation of an agreement entered into in 1968 on the question of dearness allowance. The company declared a lock-out which lasted 25 days. The stoppage of work made a dent in the company's financial position, which would affect the current year's results. Notes annexed to the accounts show that, last year, the company spent Rs 76,000 on advertisements in brochures of a political party.

STANDARD BATTERIES is going ahead with its project for manufacture of marine-duty special cells. A multi-storey building to house the project is ready for occupation and imported machinery is being cleared. The company intends to withdraw its application made to ICICI for a loan to finance the purchase of machinery and plant required for the project, as a nationalised bank has agreed to grant a term loan of Rs 50 lakhs. Last year, the factory had to be closed for 43 days due to strike by employees, followed by a lock-out declared by management. The company had also to contend with rises in cost of raw materials, chemicals, stores, and transport charges. The expansion programme for automotive batteries enabled the Madras unit to produce more. Also, improved method of production has geared this unit to meet competition in miners' cap lamps. The unit is now expected to turn out better results. The engineering division at Bhandup, in Bombay, has started to build machinery for the battery-making industry. The company's application for a licence to manufacture these machineries is pending with government. Meanwhile, the division has developed a battery charger of good quality. The

management has taken steps to minimise the ill-effects of the power-cut. Unless there are further cuts in the supply of power, the Bombay units are expected to show better results, but there is uncertainty about the performance of the Madras unit, which is facing a power-cut of 40-70 per cent. Last year's accounts revealed a sharp rise in the ratio of inventory to sales compared to in the preceding year. Total sales increased from Rs 636 lakhs to Rs 681 lakhs. The company paid, by way of commission, Rs 24 lakhs against Rs 21 lakhs in the previous year. Of this, payments to sole selling agents amounted to Rs 17 lakhs (Rs 13 lakhs). Notes annexed to accounts reveal that expenses incurred on behalf of the company by sole selling agent (for which details are awaited and have not been produced to the auditors) amounted to Rs 2,28,434. Also, as in the previous year, Rs one lakh were paid to sole selling agent, South Indian Export, a company in which Jesudasan, a director of the company, is the managing director, for use of its city office, at Madras, secretary, office staff, and other office facilities. At the same time, during the year, payments to the trustees of the excluded employees provident fund were delayed.

BASF INDIA, which changed its accounting year, has produced very good results for the 18 months ended December 1972. The board has recommended a total equity dividend of 18 per cent, with a final of 10 per cent. The performance reflects benefits of better capitalisation of manufacturing facilities, despite the fact that production was hampered by difficult supply position of indigenous raw materials in the last 2-3 months of the 18-month period and the power-cut. Early in the current year, availability of indigenous raw materials improved, but the directors feel that this position may not continue, in which case the company's performance in the current year may be adversely affected. The company is varying the terms of agreement entered into in 1965 with the National Research Development Corporation of India which has granted it a licence to use know-how for manufacture of certain synthetic tanning agents. According to the original agreement, the company has been paying royalty at 2.5 per cent on the net ex-factory sale price of the material manufactured by it. After negotiation, it has been agreed that it should pay royalty either at the rate of 2.5 per cent on the total net ex-factory sales value of Basyntans VG, FCBJ 3, JZ and FC, or at 2.5 per cent of 25 per cent of the next net ex-factory sales value of the entire range of

Basyntans, "whichever is higher." The directors say that, "having regard to the circumstances", it is in the interest of the company to vary the agreement as above.

MADRAS RUBBER FACTORY has stepped up installed capacity, from 3,60,000 numbers of tyres and tubes to 6,10,000 numbers per annum. The company's Goa plant, under erection, is to commence production during the current year. Production at the bicycle tyre plant at Arkonam will start as soon as restrictions on power use are lifted. During the year ended September 1972, the company produced 4,91,820 numbers of automobile tyres and 6,33,446 numbers of automobile tubes and 65,43,202 kg of tread rubber. Net sales advanced, from Rs 15.57 crores to Rs 23.55 crores and, in line, gross profit leapt from 149 lakhs to Rs 216 lakhs. Net profit doubled to Rs 100 lakhs. Total exports increased from Rs 47 lakhs to Rs 91 lakhs, and exceeded the company's commitment on export obligation.

SWADESHI POLYTEX's project cost has exceeded the original estimate by Rs 267 lakhs, owing to increases in customs duty and cost of indigenous equipment and revaluation of Deutsche mark. The increased capital outlay is being financed by additional foreign currency loan sanctioned by ICICI (Rs 27 lakhs), additional rupee term loans from IDBI, IFCI, ICICI and LIC (Rs 100 lakhs), issue of right shares (Rs 106 lakhs), and loans to be procured by promoters (Rs 34 lakhs). Right shares will be issued after obtaining consent of the Controller of Capital Issues. While agreeing to grant additional rupee loans, the financial institutions have stipulated that they will have the right to convert, at their option, exercisable during 1976 and 1977, a sum not exceeding Rs 20 lakhs into equity share capital at par. Meanwhile, in order to avoid delay in completion of the project, the company has availed itself of bridging finance from commercial banks. Construction and erection of the entire project has been completed in less than 1½ years of effective working. Trial runs of the plant have already commenced and commercial production is expected to start soon. The company's product, to be sold under the trade name 'Jailene', will be backed by efficient service to customers. The directors visualise high growth potential for polyester fibre, since it can substitute imported long-staple cotton; but they point out that "very high" excise duty is a major deterrent to its growth.

No Commitment to Disinflationary Policies

(From a Special Correspondent)

THE Budget is an annual ritual. It is an understandable part of this ritual that certain reaffirmations of broad government policy on major social and economic points are made by the Finance Minister at the time of presenting the Budget. But it is unrealistic to use these broad reaffirmations as yardsticks before the actual contents of the Budget are appraised. The Budget for any particular year ought to be adjudged principally in terms of its success or failure in meeting the immediate stresses and strains through which the economy is going, for that is precisely how the annual budgetary exercise dovetails with longer term development planning.

What, we might therefore ask, are the immediate stresses and strains through which the Indian economy is passing right now? The Finance Minister himself referred to "the abnormal increase in prices" during 1972-73 and showed awareness "that movements in prices during the current year have added greatly to the hardships suffered by the weaker and more vulnerable sections of our society".

There is also the serious problem of drought which keeps recurring ever so often. As the Finance Minister has said in his Budget speech, the year 1972-73 was "the second year in succession that the production of foodgrains during kharif season suffered a serious setback". The Economic Survey, however, builds its projections for 1973-74 on the hope that the weather gods will be more mercifully disposed when the next kharif season sets in. If this hope materialises it would not only reduce the demands on the Central Exchequer on this score but also help the economy in facing the other immediate problem, namely, that of rising prices. If, however, this hope is falsified, the problem of rising prices is bound to take on very serious proportions.

This does not exhaust the list of urgent problems which the country is facing but if one were to identify the problem among problems which can be said to demand immediate government action, there can be no two arguments that this problem is that of inflation. How adequately does the Budget attempt to meet the problem of inflation?

It is true that the Finance Minister himself lists inflation as the most pressing of "the tasks for the economy", which he has kept in mind in framing his budget proposals. But does his Budget give one the confidence that the government will, in the coming year, be able to arrest the price rise?

The Finance Minister has no doubt come forth with a Budget which shows an overall deficit of only Rs 85 crores for 1973-74 compared to the comparable deficit of Rs 550 crores estimated for 1972-73. This smaller figure of Rs 85 crores has been arrived at after taking credit for the various tax proposals which are expected to yield additional revenue to the tune of Rs 305 crores a year. The Central revenues are however, expected to benefit to the extent of Rs 250 crores in 1973-74.

It ought to be noted here that of this Rs 250 crores of additional tax revenues, as much as Rs 156 crores is expected to accrue from customs duty. Most of the rest comes from excise duties. However well justified the increase in customs duties may be in the interest of giving "a further impetus to import substitution", under normal conditions of relatively stable prices the fact cannot be ignored at this juncture that the way India's imports are now structured, the bulk of this additional revenue will be borne by intermediate and capital goods. If, as they must, prices of intermediate and capital goods go up, there can be no preventing such price increases from reflecting themselves in the prices of final goods. Since customs duty increases affect virtually the whole spectrum of imports, the consequential price increases are bound to be quite widespread.

Even when one refers to the possible price impact of commodity taxation, one need not be unaware of the aggregative disinflationary impact of taxation, just as when a government spokesman puts the possible price increase directly related to tax proposals in the Budget at only 0.4 per cent he is doing so with precisely the same awareness. The point, however, is that in the matter of commodity taxation since the immediate impact of commodity taxes is gradually on prices of items immediately affected, the government has to ensure

FROM OUR CORRESPONDENTS

that whatever additional commodity taxation it imposes, its aggregative disinflationary effect is realised fast enough so as not to allow demand pressures, deriving from the price increases of individual items directly affected by additional taxation, to build up. That is where the additional imports proposed for customs duties runs into a serious risk.

OMINOUS STATEMENT

Strange though it may sound, even though the present Budget is supposed to have imposed the highest additional taxation in recent years, the suspicion still lurks that the Budget is not sufficiently disinflationary. It must be said, however, that this suspicion rests less on the fact that the additional taxation takes on the form principally of commodity taxation and more on the impression which the budget as a whole leaves behind that it is lacking in genuine commitment to a disinflationary policy.

The Finance Minister talks rather ominously, one feels, of reconciling "the requirements of growth with the requirements of stability". He won't cut down expenditure "which adds to the production capacity of the economy" for the sake of stability. While he shows no concern for the erosion of his development targets in the absence of stability, he seems to be quite aware of the highly regressive aspects of inflation when he talks of hardships imposed by it on the weaker sections of the community. But it would be considered cruel to ask him straightaway whether for the sake of growth he is prepared to let these weaker sections continue to suffer disproportionately.

When the Finance Minister uses the above sort of argument posing growth against stability to justify stepping up of development expenditure in the last three years of his stewardship "notwithstanding the severe stresses through which the economy has had to pass in this period", the impression is unavoidable that this sort of argument would again be used by him to justify expenditure increases during the next year far beyond the estimates now presented. One can almost wager that when the Finance Minister presents his budget next year, he would start by saying that in spite of his herculean efforts to raise additional tax revenues, he could not keep down the overall deficit to the level of Rs 85 crores because of the inescapable increases in non-development expenditures on the one hand and the demands of growth on the other.

As far as the latter are concerned, he has even provided for "advance action" outlay of Rs 150 crores to prepare the economy for the launching of the Fifth Plan. Evidently, this provision is not covered by the Fourth Plan. But how, it might be asked, could a Finance Minister so strongly wedded to development refuse such a reasonable demand?

After all, in his latest Budget speech the Finance Minister did not consider it necessary to offer even one word of explanation for the defence expenditure rising by 14 per cent (Rs 192 crores) in the current year over the budget estimates. What is the guarantee that he will not allow the defence expenditure to go beyond Rs 1,600 crores next year. If President Bhutto keeps obliging, the sky would be the limit for defence expenditure! How could Chavan "seek stability by cutting down expenditure"

WEST BENGAL

A Year of Congress Rule

A RATHER suggestive commentary on the one year rule of the revamped Congress in West Bengal was recently provided by the Deputy Home Minister, F H Mohsin, on the floor of the Lok Sabha. He revealed that on January 31, 1973, as many as 2,449 persons were detained under the Maintenance of Internal Security Act (MISA) in this state as against 104 persons in Assam and one each in Bihar and Orissa. The Minister also stated that as on February 1, there were 49 companies of the Central Reserve Police (CRP) deployed in West Bengal as against 65 companies in the riot-torn Andhra Pradesh. The outstanding amount recoverable from this state on account of the deployment of the CRP was Rs 7.30 crores as against Rs 1.59 crores from Assam, Rs 1.07 crores from Andhra Pradesh, Rs 6.38 lakhs from Maharashtra and Rs 84,000 from Tamil Nadu.

The massive presence of the CRP battalions and the large-scale detentions are sought to be justified by the powers that be with claims of improved law and order situation. Even if the cases of continued violence against Left cadres are ignored — although there cannot be any valid reasons for ignoring them and even the front rank CPI MLA, Somnath Lahiri, who is not particularly known for softness for his erstwhile comrades, felt constrained to deplore at least one of these atrocious incidents — the trenchant criticisms made by a number of Congress backbenchers during the recent debates in the state

which adds to defence capability? We are deliberately referring to defence expenditure in this context because this is the one area where any Finance Minister's job of applying the brake is the hardest. But if a Finance Minister is unwilling to restrain expenditure in areas other than defence, he is unlikely to be obliged by the Defence Minister.

Of course, the Finance Minister himself does not believe that the deficit next year can be kept down to Rs 85 crores. He has already given notice that he has not provided for the additional expenditure which the Pay Commission's award will entail. But his deficit for the next year will most likely be much bigger and the suspicion is that it will be so notwithstanding the favourable weather. The question to ask is: Will the deficit next year exceed Rs 550 crores, the watermark reached this year?

Assembly knock the bottom out of the claims of improvement in the law and order situation. Some of the Congress Legislators complained of collusion between the police and the anti-social elements. One Congress MLA from the district of Hooghly produced in the House some spent cartridges reportedly found at the scene of an armed dacoity and voiced his suspicion that they had been fired from police guns. He further alleged that his life had been endangered twice and demanded the transfer of some local police officials.

The Chief Minister, who holds the Home portfolio assisted by Ministers of State, sought to counter the complaints about the unsatisfactory law and order situation by referring to cases in which persons arrested on criminal charges had to be released due to representations made in their behalf. Though he did not name the powerful intercessors, he left no doubt in the minds of his audience that they came from the ranks of the ruling party.

If the success stories on the law and order front fail to bear scrutiny, the government's record in other spheres is not much different. For instance, the West Bengal Land Reforms Act 1972 imposed a lower ceiling on agricultural holdings on the family basis, as distinguished from individual ownership basis under the previous Act. Under the new law, only 50,000 acres of land have vested in the state within the stipulated date, out of the nearly 200,000 acres estimated by the Land Revenue Depart-

ment officials to be falling under the purview of the new Act. The reasons are obvious. In a recent probe jointly conducted by the State Congress Chief Arun Maitra and CPI leader Biswanath Mukherji, a jotedar in 24 Parganas was found with about 1,500 acres of land in his possession. With reference to this finding, the State Land Revenue Minister revealed that the government had started settlement proceedings to recover the surplus land in the man's possession, but the process was restrained by court injunctions. Already injunctions in over 60,000 cases pending in courts had prevented the government from obtaining the ownership of 1.45 million acres of land under the Land Acquisition Act of 1955. So, the new Congress regime continues the old tradition and cannot claim to have achieved any breakthrough in the crucial sphere of agrarian reforms.

On the contrary, the disarray of the Left seems to have emboldened the jotedars to launch a new offensive against the share-croppers, as may be glimpsed from a pathetic story cited in a recent official study. The story of Indra Lohar, a sharecropper in the village Vora in the district of Bankura, who was not only evicted from the land he had been cultivating for more than 20 years, but was also subjected to many other forms of persecution, has been recounted in these columns by A M in his Calcutta Diary (January 6, pp 6-7). In the course of his dispute with his jotedar, Indra got involved in five judicial proceedings, including a contempt of court proceeding in the Calcutta High Court. The end-product of it all was that Indra Lohar stood dispossessed of his land.

In the industrial sector also, the employers seem to be on the offensive. On February 12, according to the State Labour Department officials, there were 32 unresolved lockouts in West Bengal as against 12 strikes. The number of closures had also marginally increased — from 137 in 1971 to 151 in 1972. As for some other sidelights on the performance of the West Bengal Government, not only has the quantum of the ration in the Greater Calcutta ration area been cut, but the official committee set up by the state government has recently confirmed the complaint about supply of substandard rice 'beyond tolerance limit' from ration shops.

Soon after assuming office, the Chief Minister had held out the prospect of immediate recruitment, to 17,000 low-grade jobs in the state administration. More than a million applications for these vacancies flowed in. In January 1973, the Chief Minister apologised for

his failure to implement his promise and assured more expeditious action in this regard. It is not known whether he has been able to fulfil his promise about government jobs, although he was indeed instrumental in indirectly providing a sort of employment to a large number of youths — as vendors for selling privately printed blank application forms for government jobs at railway stations and street corners.

BOMBAY

Congress Debacle

THE setting of the elections to the Bombay Municipal Corporation last week could not have been more different from that of the last elections in 1968. The Congress in 1968 was a party badly shaken by its country-wide reverses in the previous year's general elections. In Bombay the party was then led by S K Patil, the archetype Tammany Hall politician. Even his most ardent admirers could not have discerned an excess of mass enthusiasm either for him or the party of which he had been the unquestioned boss for long, boring years.

Now consider the contrast this time. This was an altogether new Bombay Pradesh Congress with not merely a new leadership but a new type of leadership. The President of the BPCC, Rajni Patel, had been hand-picked by the Prime Minister. Here was a man who had had no part in the murky politics of the Bombay Pradesh Congress of yesteryears. Indeed, he had once been a member of the Communist party. And even after that particular God had failed him, he had continued to be linked, professionally as a lawyer and otherwise, with trade unions and organised labour. After his elevation in the Congress he had gone on to wrest control of the Rashtriya Mill Mazdoor Sangh, the recognised trade union organisation of textile labour, the city's largest single body of industrial workers. Consider also the position of the Congress party in the city. In March 1971 it won every one of the five Lok Sabha seats from Bombay. A year later, in the elections to the Maharashtra Assembly, the party won 24 out of the city's 28 seats. The Bombay Pradesh Congress's popularity was thus tested twice and found to be overwhelming.

The BPCC leadership had the correct Leftist image, a far cry from S K Patil's reactionary days. The BPCC president could claim — as indeed he has been wont to do at the slightest opportunity

Of course, it would be unjust to put the entire blame for all the omissions and commissions on the West Bengal government. Much of this failure directly stems from the national socio-economic milieu of which this state is a part. But what matters is that the brave new world promised by the Prime Minister to the people of West Bengal, if they voted for Congress, still remains beyond the horizon.

— that he enjoyed the special confidence of the Prime Minister. And, finally, once again unlike in the bad old days, relations between the Bombay Congress and the Maharashtra Congress appeared cordial enough, with Rajni Patel missing no opportunity to praise the state Chief Minister for his "efficiency and integrity".

This, then, was the appearance of things on the eve of the Corporation elections when Rafiq Zakaria, Maharashtra's Minister for Public Health, had declared, in the sychophantic style so much in vogue in the Congress these days, that "the BPCC President is the uncrowned king of this great city and he will soon be crowned with one hundred seats in the Corporation". How different reality was from appearance was to be revealed when the results of the Corporation elections began to be announced on Friday night. The expectations of one hundred seats vanished into thin air, as did even those of a simple majority. When the counting was finally over, the Congress was found to have lost fully one-quarter of the seats it had in the Corporation, scraping through with 45 seats against the 61 it held before the elections.

It is useful to consider some of the more significant aspects of the reality, as distinct from the appearance, of the Bombay Pradesh Congress. It is commonplace by now that the so-called new and different leadership of the BPCC consists but of a cabal of rich and upper middle class lawyers and doctors and contractors and businessmen. The businessmen and contractors have ignored the party's Leftist slogans to flock to it in the, not unwarranted, hope of licences, contracts and other lucrative business pickings — available, as before, for a consideration. In that one crucial respect nothing has changed. The overt style may be different but — for all the socialist, and occasionally even Marxist, talk — it has taken the party

anywhere but near the people. Boys girls in bell-bottoms from affluent families were conspicuous among the party's campaign volunteers for the Corporation elections. The party's posters similarly were smartly designed — the work of professional designers no doubt — and expensively printed. The Union Minister of Health and Family Planning, R K Khadilkar, recently claimed that under the new regime in the BPCC "the Congress has left the affluent Malabar Hill, Walkeshwar and Ridge Road and has come to stay permanently in Girangaon [the mill workers' locality in Central Bombay]". The voting pattern in the Corporation elections revealed precisely the opposite: the Congress got votes and seats in Malabar Hill and other affluent areas and lost out to Shiv Sena in the labour areas.

If the Bombay Pradesh Congress's Leftist pretensions have cut no ice, its secular credentials too have been under attack from many directions. The bulk of the Maharashtra population sees the BPCC leadership as being dominated by Gujaratis. In this regard they see a perpetuation of the situation which prevailed in S K Patil's days. At the same time, the Congress appears to have lost the traditional support of the Gujaratis who have been antagonised both by the displacement of old, loyal Congressmen by the 'new' Congressmen in the BPCC and by the Communist or near-Communist antecedents of some of the leading lights of the BPCC, including its president. But the Congress's most spectacular failure has been in wooing Muslim voters. Here the pitch was queer-ed for it by the controversy over the singing of Vande Mataram in all Corporation and government-aided Urdu schools. The Muslim League is bitterly opposed to this. In an attempt not to alienate Muslim voters, the Congress tried to soft-pedal the issue and to give the Muslims the impression that it was opposed to the singing of Vande Mataram being made compulsory. The Muslims, it is clear, were not convinced by this, especially since the Maharashtra government chose — to be sure not accidentally — this particular time to make a policy statement in the state Assembly, through the Minister of State for Home, that Vande Mataram was a sacred song for all Indians and that it should be sung in all schools. This had the expected effect on Muslim voters and contributed significantly to the spectacular success of the Muslim League in the predominantly Muslim areas. At the same time, the Jan Sangh was able to show up the Bombay Pradesh Congress as being soft towards the Muslims and ready to compromise on an issue of principle like the singing

of Vande Mataram for the sake of Muslim votes. Thus the Vande Mataram issue helped both the Muslim League and the Jan Sangh, at the expense of the Congress.

As for BPCC's relations with the MPCC, what appeared to be cordiality was in fact part of a clever manoeuvre by Chief Minister Naik. It is well known that there was much hostility to the BPCC President within the Maharashtra Congress leadership, especially from Yasantrao Patil who had been ousted from the Rashtriya Mill Mazdoor Sangh by Rajni Patel's men. In fact Patil is known to have threatened to resign from the state government unless the Chief Minister acted to curb the BPCC President. Naik gave the impression of not taking these complaints seriously and in fact encouraged Rajni Patel to feel that there was close political rapport between the two of them. At the same time, in a number of specific cases he acted decisively to undermine the political standing of the Bombay Pradesh Congress. The state government's role in regard to the Vande Mataram issue has been referred to above. Similarly, in respect of the civic employees' demand for bonus, the state government, by firmly turning down the demand, caused a complete loss of face for the BPCC leadership. Further, Chief Minister Naik is said to have tacitly approved of the election alliance between the Republican party and the Shiv Sena in an effort to sustain the latter as a formidable counterweight to the Bombay Pradesh Congress. Through his tactics of overtly appearing to support Rajni Patel and covertly opposing him, the Chief Minister has not only inflicted some crushing political defeats on the BPCC President but has also discredited the latter among his own followers.

Apart from the Congress debacle, the most significant aspect of the Corporation election results is the success of the Muslim League and the Jan Sangh. The Shiv Sena, while its strength in the Corporation has been marginally reduced from 42 to 39, has demonstrated its continued hold on the Maharashtrian middle and working classes. In fact the Shiv Sena might have won a few more seats, but for the intervention of the Jan Sangh and the splitting of the Maharashtrian anti-Congress vote. The Muslim League, which won 16 seats against the 2 it had held, campaigned on a straight communal platform exploiting, apart from the Vande Mataram issue, the sensitivities of the Muslims on such issues as the reform of Muslim personal law, discrimination against Muslims in employment and the rela-

tively worsening of the economic status of the Muslim community. The success of the Jan Sangh, which increased its strength in the Corporation from 6 to 15, is to a great extent a negative victory, in that the party appears to have benefited significantly from the traditionally Congress Gujarati vote which, for reasons mentioned above, did not go to the Congress this time. However, poised as these three parties — Muslim League, Shiv Sena and Jan Sangh — are, the portents for communal harmony in the city are far from reassuring.

Industrial Relations Miracle

(From a Special Correspondent)

THE trouble with a personality cult is that it becomes difficult to keep it within the limits of tolerance. The other day, responding to a question in the Rajya Sabha, the newly installed Union Minister for Labour, K Raghunatha Reddy, was heard to make an extraordinary statement. The number of man-days lost due to industrial unrest was perceptibly lower in 1972 compared to 1971; strikes and lock-outs were on the decline. The reduction in the number of man-days lost, the Minister told the Honourable Members, presumably with devout sincerity, was on account of "the imaginative policy of the Prime Minister and the willing co-operation of the working class", in that order.

Does this herald a new kind of cultural mores which will soon breathe down our necks? In China, during the wilder days of the Cultural Revolution, when the Red Book was riding high, both common cold and intricate esoteric problems of quantum physics were reported to have been cured through the invocation of Mao Tse-tung's name. Those in this neighbourhood who then poked fun at the versatile potency of the Chairman's being, could have little imagined that we ourselves were barely six years away from that state of beatitude. One can sympathise with the poor Union Minister. He would have his reasons for feeling a little insecure in his new position, and must have concluded that by taking recourse to the rather novel *deus ex machina* of offering homage while answering a parliamentary question, he would succeed in frustrating the current actuarial projections in regard to his ministerial longevity.

It is little use lampooning Raghunatha Reddy. It is the Prime Minister herself who must bear the full responsibility for the state of demoralisation to which the utterly ridiculous answer to the parliamentary question bears witness.

Interest also centres on the effect of the Corporation election failure on the BPCC leadership. Two of the Chief Ministers hand-picked by the Prime Minister — those of Orissa and Andhra Pradesh — have already lost office and some others, such as Oza in Gujarat, Pande in Bihar, Urs in Mysore and Tripathi in UP, are facing storms of varying intensities. The Corporation elections have seriously weakened Rajni Patel's position in Bombay Congress. It will be interesting to watch whether the Prime Minister will continue to bolster him up.

The answer was ridiculous on two counts; one of them is obvious, and the other is related to the fact that all replies to parliamentary questions are replies on the Prime Minister's behalf, she being the principal spokesman and policy-maker of the government: it was thus as if, through the mouthpiece of the Labour Minister, she was beating her own drum. If responsible ministers now assume that their survival in office hinges not on any objective assessment of their performance, but on the quantum of adulatory sycophancy displayed toward the Prime Minister, it is exclusively on account of the kind of atmosphere which, sedulously or otherwise, has been fostered in New Delhi in the course of the past two years.

This can boomerang. In the final analysis, Indira Gandhi and her government will be judged by what they are able to achieve on the economic front: success here calls for a lot of hard work — and a lot of hard decisions — on the part of both ministers and civil servants. In case both these tribes honestly come to the belief that once the Prime Minister and her entourage are kept propitiated, the rest of the things do not matter, so much so that crucial issues are sloppily pushed aside, the government's collective economic performance could not then but take a further dip. And, thanks to the peril of suggestiveness embedded in the propagation of the personality cult, the blame for the failures would, at that stage, be squarely ascribed to the Prime Minister by the plebeians as much as the plutocrats: if it is her 'imaginative policy' which is currently being credited with all the miracles taking place in the world around us, it would be the poverty of her imagination which would then be voted as being responsible for all our misfortunes.

TAMIL NADU

Spent Passions

MUCH blood has flowed in Tamil Nadu since the Madurai conference of the DMK in June last year when Mu Ka Muthu, the actor-son of Karunanidhi, riding a horse, led the procession in place of M G Ramachandran, the actor-politician, and when Karunanidhi, rising to speak to a crowd which had become restive after MGR had just finished speaking, ended his talk almost before he began due to "sudden illness". The simmering conflict of ego between the "world poet" and the "revolutionary actor" had burst open. MGR's sudden discovery of corruption in his party, his consequent suspension by the DMK's executive, and his forming the Anna-DMK, the scramble for defections, and the memoranda to the President, all followed in quick succession, introducing a new element in the political scene of Tamil Nadu, which was already shaken by the Simpson struggle and the students' and agriculturists' agitations against the government.

All the pent-up discontent and frustration inside the ruling party due to the mounting unemployment, soaring prices, and indifference of the party bosses, found a rallying point in the matinee idol fallen from grace. While MGR could wean away only 9 MLAs and 2 MPs and very few DMK functionaries, the vast majority of rank and file thronged to him creating a powerful political force which swayed like a rudderless ship, unsure of which direction to go.

Karunanidhi, who had at first underestimated the popular response to MGR, quickly recovered from the setback to consolidate his hold over the party machinery. A skilled political manipulator, he outmanoeuvred his rival, keeping intact his party organisation and most of the legislators.

The disarray inside the DMK was a boon not only to Kamaraj, who was biding his time, but more to the CPI, which ever since it got off the DMK-led seven-party electorate front of 1971 alongside its mentor the New Congress has been nervously looking for shadows to hide in. In the none-too gentle politics of Tamil Nadu, where the Congress embrace — so comforting in West Bengal — is cruelly absent, it rushed in to the shelter and security of MGR's millions. Basking in the ovation of MGR's fans, CPI's Kalyanasundaram declared that the "revolutionary army of MGR" and his own

"idealistic army" would wage an epic struggle against the "Right reactionary forces" in the state and promptly followed MGR to Delhi to plead for a Central inquiry commission on the corruption charges against DMK ministers. The Congress, which is yet to find an address in Tamil Nadu, gave its moral support — all that it can muster today — to MGR. C Subramaniam and Mohan Kumaramangalam — both of whom, as Karunanidhi moaned recently, might not have been in Delhi today but for his original "sin" of getting them elected to Parliament — are making frequent trips down South, driven by the pious urge to save their state from the dirt and muck of the politics of corruption. CS challenged the Chief Minister, "Are the DMK ministers willing to resign and face a commission of inquiry? I am willing to do so if similar charges are made against me". He did not say that Bansilal would do so. But unmindful of that bit of honesty, DMK posters scaled the walls, "What about Bansilal?"

Karunanidhi's *sang froid* was not a mere facade to hide his jitteriness on the positive moves of his opponents. He had good reason — apart from Bansilal and the Maruti Ltd — not to be unduly alarmed at the corruption charges: The opposition to him was divided. Kamaraj, the "great leader", saw in the rise of ADMK as a sizeable opposition, a threat to his own traditional mass base and to his mantle as the premier opposition force. Pouring more vitriol on MGR than on Karunanidhi, he has been saying to the lakhs that throng to his meetings that tarred hands cannot point accusingly at others.

The CPI(M), the lone survivor of the anti-Congress front of 1967 — which had stood alone in the 1971 elections, and had a bad drubbing — was more cautious in its approach to ADMK. Alternatively accused of being in secret collusion with Kamaraj in 1971 elections and being a hand-maiden of DMK by refusing to join the landlord-cum-rich peasant led agitation of last year, it was bracketed once again with the DMK when it criticised the ADMK for its repeated appeals to Indira on the corruption issue. It demanded, therefore, that the masses should be mobilised to force Karunanidhi to institute a judicial inquiry to determine in the first place whether a *prima facie* case existed against the ministers. Refusing to ac-

cept the corruption charges as the sole political platform against the DMK, P Ramamurthi wrote to MGR a public letter asking him to spell out the policy of his party. An indignant and embarrassed MGR demanded why the question could not have been raised in private and Kalyanasundaram asked: "Is this the time to raise policy matters?" as if aghast at such frivolity. In the mindless drama of shifting alliances in Tamil Nadu politics, nobody has even noticed that P Ramamurthi's question has remained unanswered.

All this is past history and the details are already fading from public memory. What still lingers, however, is a part of the past that is also the present and might well be the future — the length and weight of the police lathi, the tear gas, the arrests, the disruption of opposition parties' meetings. Since the firing on the Wimco workers in 1968 the DMK's police has had no dearth of practice in target shooting, be it in Neyveli or in Annamalai University. The mass shooting of 14 poor peasants occurred in June 1972 during the landlord-led agitation. Even the judicial inquiry into the killings was forsaken, when the wily Chief Minister persuaded the Syndicate-CPI leadership of the agitation to give up that demand in return for a few crumbs to the landlords.

The days of duels and man to man fist fights are long past in India as a means to settle scores between political bosses. The leaders cannot be touched, but the *chelas* are always ready to bear the cross. The lathi fell again and again on all suspected admirers of MGR. Indeed, the ex-fighter for separate Tamil Nadu called in the CRP. The students, mostly school children were up in arms and educational institutions were closed for months. Was the CM, who had only eight years ago led students in a most virulent anti-Hindi agitation against the Congress, going to let them turn against him? Lourdhanadan, a college student at Palayamkottai, was driven by the police into the river: "How could the police know that he could not swim?", the Chief Minister asked. Clive hostel in Tiruchi was made the scene of an unprecedented police orgy. The list is endless. And the breaking up of opposition meetings in a hail of stones and soda bottles, with the police standing by immobile, has come to be the rule rather than the exception.

What is MGR's response to all this? Having climbed the high horses of public morality, and called a bandh and a few demonstrations and made the re-

quired number of pilgrimages to Delhi, and having breathed fire and brimstone against DMK violence, he seems now to be at a loss to know what to do next.

Corruption has not proved to be a soul-stirring issue in Tamil Nadu. Four months ago it seemed as though it could flush out the DMK ministry. Today the ministry seems more like an unremovable stain, even if it stays only with the aid of the red caps and the steel helmets. No one, not even a DMK devotee doubts that corruption exists. The question still remains, "who cares?". There is only a half-joke in the statement that corruption got socialised and better distributed under the DMK.

The moral of the political history of these few months, which is too inconvenient for the anti-corruption crusaders to see, is that their campaign, unless rooted in its source — viz, the unequal distribution of social wealth — and expanded to embrace the anti-democratic content of the DMK regime, just will not take them very far.

All this does not negate the fact that MGR still draws lakhs of men, women and children, who wait till the dew-soaked hours of the morning to catch a glimpse of the screen-hero and if possible to steal his touch. In the Madurai conference, MGR had demanded passionately, "would any of you here say that there is corruption in the DMK?". The people had screamed back indignantly, "No, no, there isn't". Two months later, he put the same query with no less passion and the people rose to the occasion by shouting back, "Yes, there is, yes". MGR has their solid backing. Tremendously at ease when flooded with neon lights and mobbed by his fans, MGR seems at a loss to know what to do with them off-stage. With no alternative policy to offer, a zero organisational ability, and an ambition that carries him no farther than the Fort St George, MGR presents an awkward figure overwhelmed by his followers demanding direct and daring actions which their leader seems to be capable of only on celluloid. Apart from the *bandh* and the few processions and marches, there has been nothing else going.

It was at this point, when MGR was hitting the headlines less and less even in the vernacular dailies and the movement was in great suspense waiting for the next big move that had been long in coming, that the power crisis burst on Tamil Nadu. The 75 per cent cut imposed by the Tamil Nadu Electricity

Board caught the common man totally unawares and even the opposition parties took a few days to react. As thousands of industrial workers have come to be laid off, as agriculture has slowed down, as lakhs and lakhs of small farmers and farm labour find their livelihood disappearing, as kerosene goes underground, as prices of all articles including edible oil, pulses, rice, and even salt have started the inevitable climb, a certain numbness and futility have come to settle on the political scene. The realisation has grown that nothing can really be done to save the situation for the next few months. In fact, the hydel resource is so precarious that a total cut for industries in April or May cannot be quite ruled out.

A nervous DMK Government is now politically confronted with yet another charge, more enduring and more easily provable than corruption. A joint action committee has been formed with ADMK, CPI and the New Congress. The CPI(M) walked out when the committee refused to apportion part of the blame on the Central Government for its failure to work the Neyveli plant to capacity. As it has often happened in the past, the CPI(M) carried on a separate agitation, holding both the Centre and the state governments responsible for the crisis. And Kamaraj has promised that his own show is just around the corner.

The power cut has given the much-needed shot in the arm to the sagging MGR crusade. Through the action committee, ADMK and CPI have intensified their campaign, baying for Karunanidhi's blood and true to form, demanding an expert committee from the Centre to probe the power muddle in Tamil Nadu. Ludicrous as it might sound, the Central ministers, Subramaniam and Mohan Kumaramangalam, have gone around waxing eloquent on the DMK ministry's total culpability in the crisis, disclaiming any Central responsibility, and glossing over the power crisis in all the Congress-ruled states. Mohan went so far as to claim that he learnt of the coal shortage in Tamil Nadu only from Press reports.

To queer the pitch has come the by-election to the Assembly from Dindigul. With New Congress making eyes at the Old, with Kamaraj seeking the support of CPI, and CPI holding fast to ADMK, it is anybody's guess what contours the new alignment will take.

Throughout all the shifts and changes in the Tamil Nadu political scene, one constant trend is evident since 1967: the *volte face* of anti-Congress-

ism. DMK, the once great fighter of "Northern imperialism" put up its very last show of strength against the Centre, by observing a "rebellion day" in 1968, demanding the Salem steel plant and the Tuticorin harbour expansion. Since then, excepting for a few verbal acrobatics meant for the party's internal consumption, the DMK has been extremely wary of even offending Indira — let alone antagonising her. Anti-Congressism was given a formal burial in the 1971 electoral alliance. The toppling moves by the New Congress emissaries, CS and Kumaramangalam, have been shrugged off as minor irritants. Karunanidhi said in his picturesque style, referring to the Congress election symbol, "it is the calves that are straining at the leash while the cow looks calm and serene as ever". All the efforts of the Marxists, to stir a little of DMK's past anti-Congress passions and to egg it on to a confrontation with the Centre, have come to naught. Karunanidhi continues to show remarkable restraint in criticising the Centre, even on the power issue where the Centre's culpability is enormous.

As for the CPI's anti-Congressism or the lack of it, little needs to be said. In the absence of a strong Left movement in Tamil Nadu — unlike in Kerala or West Bengal, which could draw a vacillating Party into its fold at least for temporary periods — the Tamil Nadu unit of the Party has never had a genuine anti-Congress tradition. During the Party's united days, that role was given away to the DMK, which reaped rich political harvest from it. Today, in Tamil Nadu, where Indira's party lacks a base of any kind, the CPI, ever ready to bear the former's cross and to strengthen its hands, is slaying away, to find a standing place for it.

Kamaraj, who is taking a long respite from his king maker's role as the queen has said that she will go only when she has completed her job and that might take some more time, has thrown himself entirely into regional politics — which has made it easier for him to forget that there is, after all, a name-board for the New Congress in Tamil Nadu. The main thrust of his fury now is directed against the DMK and its splinter.

Only the CPI(M) has persisted in its uncompromising anti-Congress stance, but because it is still a small force in Tamil Nadu, Indira is having it real good in this state right now. Which is why, much to the chagrin of MGR, she is not likely to tilt the apple-cart for Karunanidhi.

Heads I Win, Tails You Lose

ON the foggy morning of Thursday, March 1, members of the Orissa Legislative Assembly — including some ministers, armed with official papers for the day's business — arrived at the state Legislature in Bhubaneswar to participate in the day's deliberations which were scheduled to start at 8 a.m. To their great amazement, they were presented with a three-line circular on behalf of the Speaker of the Orissa Legislative Assembly, notifying that the Governor, B D Jatti, had prorogued the state Assembly. It was then that the bewildered legislators learnt that Chief Minister Nandini Satpathy had resigned at 6-45 a.m. that morning and that it was on her advice that the Governor had suddenly prorogued the House in session.

The legislators' amazement on the occasion notwithstanding, it was known that trouble had been brewing in the Congress party in Orissa almost from the very day that Nandini Satpathy, with the blessings of the party's High Command, had assumed office on June 14 last year. Ironically, the collapse of her 250-day-old ministry has followed the same dramatic pattern as was evident in that of the downfall of the Biswanath Das ministry in June. It was mass defections by legislators that had swept the Satpathy ministry into the seat of power in Orissa, and it is mass defections again that have unseated it. The Congress has thus been paid in its own coin after barely nine months. It must be recalled that, in the 1971 mid-term poll, the Congress party was returned to the Assembly as the single largest party with 51 seats, but without a clear majority in a 140-member House. It decided then to stay in the Opposition; and a coalition government, consisting of the Swatantra party, the Utkal Congress, and the Jharkhand party, was formed, headed by non-party leader and former Chief Minister, Biswanath Das. The strength of the government and Opposition benches was 77 and 63, respectively — Government bench: Swatantra party 36, Utkal Congress 35, Jharkhand party 3, and Independents 3; Opposition bench: Congress 51, PSP 4, CPI 4, CPM 2, Jharkhand Rebel 1, and Jana Congress 1. For all practical purposes, however, the Das ministry had the support of the two CPI(M) members and one Jana

Congress member inside the House. The ministry carried on till June last year when the Congress party struck.

In early June Congress masterminded defections from the Swatantra party, through the then Forestry Minister and Adivasi leader, Gangadhar Pradhan. Pradhan set the ball rolling by resigning from the Biswanath Das ministry. He was followed by nine other members of the Swatantra party who deserted the United Front Legislature Party, bringing the 14-month-old ministry to the brink of collapse. The Das ministry tried to bring about a confrontation with the Congress through a trial of strength on the floor of the House. Indeed, a date for summoning the Assembly was fixed by the state cabinet. But events behind the scenes were outpacing the Das ministry. The Congress High Command secretly connived with the then Home Minister, Nilamoni Routray, one of the founders of the Utkal Congress, to bring about merger of the Utkal Congress with the Congress. It must be remembered that the Utkal Congress had been formed in May 1970 by Biju Patnaik as an aftermath to the split in the national Congress party in late 1969; the Utkal Congress had claimed that it owed allegiance to neither Congress(R) nor Congress(O). At its eventful meeting on June 9, 1972, however, the Executive Committee of the Utkal Congress unanimously passed a resolution as a result of which the state-based party merged *de facto* — but not *de jure*, to quote the Congress General Secretary Chandrajit Yadav — with Congress(R). Not entirely, however. On the recommendation of Nandini Satpathy, the Congress High Command did not admit seven Utkal Congress legislators into the fold; among them was no less a personage than Biju Patnaik, together with five former ministers. This became the seed of discord and future upheaval. As it now turns out, it was this decision which boomeranged on the ruling party in Orissa and on its leader.

Soon after the merger of the Utkal Congress with the Congress, the Jharkhand party too decided to liquidate itself, and its three legislators joined the Congress benches. The Orissa unit of the PSP, led by Banka Behari Das, had already merged with the Congress, and

its four legislators had been admitted to the Congress party. In this way, by manoeuvring defections, the Congress almost overnight raised its strength from 51 to 99 in the 140-strong House.

Overriding the claims of former Chief Minister Harekrushna Mahatab as well as of the then leader of the Congress legislature party Binayak Acharya, the Congress High Command transplanted Nandini Satpathy from the Centre to head the Congress government in the state. This imposition of a leader on the state unit was, as it now appears, yet another political error on the part of the Congress High Command. As in Andhra Pradesh, in Orissa, too, the scaffolding of leadership gave way under political pressure. Immediately, however, with the formation of the Congress ministry in Bhubaneswar on June 14, the party returned to power after five long years in the wilderness. The last Congress ministry had been headed by Sadashiv Tripathy and it had been forced out of office by the Congress rout at the 1967 poll. For the state itself, the Satpathy ministry was the twelfth since Independence, and Nandini Satpathy was the eighth Chief Minister. With 99 Assembly members in the party's register; this could have proved to be the hour of strength for the party and its young leader — had they been able to grasp its opportunities.

But the glory was shortlived. It is ironical that, the very two people — Nilamoni Routray and Gangadhar Pradhan — who had helped Nandini Satpathy assume high office also helped to unmake the Congress ministry and oust Nandini Satpathy from her political perch. They did this by assisting Biju Patnaik in engineering re-defection from the ruling party. Again they set the ball rolling by resigning. It was according to them, primarily their grievance about Nandini Satpathy as leader of government that made them resign. In their letters of resignation both leaders accused Satpathy of running the government "by coterie". Routray also held Satpathy guilty of "poor leadership rank opportunism, personal motivations unfounded suspicion, parochial approach, deceitful dealings and scan and contemptuous behaviour with cabinet colleagues". Routray further pointed out that, contrary to "assurances" given by both the Congress High Command and the local leadership of the party, all the erstwhile Utkal Congress legislators had not been admitted to the Congress; this had prevented "wholesale and total merger" of the Congress and the Utkal Congress. Routray underscored

that had Biju Patnaik and six other excluded Utkal Congress MLAs been admitted into the Congress in June last year, the Utkal Congress would not have been revived in the following November. He considered this a direct insult to himself because it was he who had played "a key role" in bringing about the merger between Utkal Congress and Congress. He now pointed out that this "betrayal" had taken place because of "opportunism and personal motivation of some Congressmen in Orissa who had no political background and standing". Routray further emphasised that the *garibi hatao* programme of Indira Gandhi, which had drawn him and others to the Congress fold, had become a "mockery in the hands of a leadership which had failed to create a sense of urgency". In the circumstances, any attempt by him to "further redeem the situation created by the Chief Minister would be of no avail". His nine-month experience as a member of the Satpathy Ministry, he said, was "unpleasant, frustrating and embarrassing". The die was cast.

What was the genesis of the rift between Chief Minister Satpathy and her Industry Minister Routray? Despite the pivotal role he played in helping the Congress party to gain power last summer, Routray was never quite accepted by Satpathy. Certainly, Routray's seniority, his organising ability, administrative acumen, direct contact with the top leadership of the Congress party, years in public life, and popularity with the masses particularly in coastal Orissa, had marked him out as a potential rival to Nandini Satpathy. Routray has an image, moreover, which makes the charge of intrigue, levelled against him by Satpathy, lack credibility. The antipathies between the two surfaced over the 'kendu leaf affair'.

For quite some time, both Routray and Pradhan in their respective capacities, as Ministers for Public Undertakings and Forests, had been urging for nationalisation of the kendu leaf trade — which was finally given effect to, at least on paper, on January 14. Two colleagues of Satpathy, known to be closer to her than either Routray or Pradhan, had stoutly opposed the measure as "impractical". Among them was the Finance Minister. Opposition leaders such as Swatantra Party's leader and former Chief Minister R N Singh Deb, levelled charges of "corruption" against the Finance Minister, and accused him of "stalling nationalisation of the kendu leaf trade under pressure from the mer-

chants". A series of letters were meanwhile exchanged between Routray, on the one hand, and the Chief Minister and her Finance Minister, on the other. In course of time, however, the secret letters found their way into the Press, causing great embarrassment to the Chief Minister and her two colleagues who had opposed the proposal for nationalisation of wholesale kendu leaf trade. Reacting sharply, Satpathy stripped both Routray and Pradhan of the key portfolios of Public Undertakings and Forests, as part of her first Cabinet reshuffle. The event marked the beginning of the end.

At midnight of February 28, there was a secret *rendezvous* in an obscure place on the outskirts of Bhubaneswar, among others, were present Biju Patnaik, Harekrushna Mahatab, Nilamoni Routray and Gangadhar Pradhan. Before sunrise, 25 Congress legislators presented themselves before the Orissa Speaker, Nanda Kishore Mishra, at his residence. They submitted their letters of resignation from the ruling party and declared they had joined the Orissa Pragati Legislature party, led by Biju Patnaik. The strength of the Congress party, which had slumped from 99 to 80 as a result of the revival of the Utkal Congress in November and the birth of the Mahatab-led Independent Congress party after the Cuttack by-poll, slumped further to 55. It was the most dramatic downward journey of the past 25 years for the Congress in Orissa.

Nandini Satpathy acted swiftly in the new situation. Within half an hour of the Speaker's recognition of the resignation of 25 legislators from the ruling party, she had summoned a cabinet meeting at her residence at the unusual hour of 6.30 in the morning, to which neither Routray nor Pradhan were invited. It is said that, because of short notice, those cabinet members who were invited by the Chief Minister over the phone could not make it. Satpathy then wrote to the Governor suggesting that Routray and Pradhan be dropped from the Council of Ministers. She also "advised" the Governor to dissolve the state Assembly and order fresh poll. The communique from Rajbhavan was quick in accepting the resignation of the Council of Ministers; it also requested Satpathy to continue till alternative arrangements could be made and prorogued the state Assembly until New Delhi decided the next course of action. The Governor's decision of proroguing the Assembly had an electrifying effect on legislative circles. Satpathy seem-

ed to have avenged her potential defeat; the topplers were toppled — at least for the time being.

Pragati Dal leader Biju Patnaik, however, refused to accept the position. He called on the Governor, and demanded that he, as the leader of 72-member-strong Orissa Pragati Party and by virtue of the declared support of the two CPI(M), two Jharkhand party, and two Independents, be invited to form a ministry. Indeed, Patnaik paraded 75 MLAs before the Governor on the same day (March 1); two others might have been present, he said, but were unable to report because one was bed-ridden and the other was out of station. The Governor sought time and sent his report to the President through special courier.

The ball was thus predictably put in the court of the President — which meant the Union Government and, more precisely, the Congress High Command. True to expectations, the Assembly was dissolved. Questions have been raised about the constitutional validity of the Governor's action on the "advice" of a Chief Minister "who had been reduced to a minority". The subsequent action of the President has also figured in Parliament, with Congress(O) leader Mahavir Tyagi, former Union Minister, demanding in the Rajya Sabha that the President be "impeached" for having acted as "rubber stamp" in disgraceful violation of the Constitution. In the Lok Sabha too the Opposition (excepting CPI) made bitter attack with Swatantra MP Piloo Mody remarking that the "sole beneficiary" of the 23rd proclamation issued by the President was the Congress party. The Congress(R)'s argument, that the Pragati party had mustered its strength by causing defections, flies in the face of the ruling party itself which only last summer proved itself adept at the task. But how does all that matter? The pattern of arriving at Presidential rule is not new.

Meanwhile, undaunted, Biju Patnaik has further fortified his position, by initiating the "total merger" of the Utkal Congress, the Orissa unit of the Swatantra party, and the Independent Congress of Mahatab. By the time this piece gets into print, polarisation of these three parties or a solid electoral alliance of them would have been struck in New Delhi where leaders of three parties are currently meeting. In the Congress camp, on the contrary, fresh fissures have surfaced with 11 out of the 17 Congress MPs from Orissa having demanded change of state leadership, thus throwing the party into further disarray.

Wage Freeze, Profit Increase

Farrukh Dhondy

ELECTION time breeds election talk, but in Britain today the necessity for electioneering forced on Heath and Wilson by a restless country, may breed a general election. The calculating guessers are beginning to fly their kites. Tory backbenchers are reported to have picked up the scent of the chase. Harold Wilson, that stocky thermometer of Heath's moods, has quickly raised the tempo of his attacks against the government to electioneering pitch. Just in case.

"PUBLIC OPINION"

For the last year the Tory party has been threatening the country with an election on the industrial relations issue. It is said, by editors who ought to know better, that the Tories can expect a vast and enhanced majority on this issue and can rally the public behind them and thrash hell out of the unpatriotic unions who will not do their bit for Britannia. The question is always posed: "Who rules the country, the government or the unions?". The truth is slowly beginning to dawn, a truth that may prevent a snap election, that the workers in the unions and their families are the country. Yet one of the current mysteries of Britain is a mythical "public opinion" which the news media constantly call upon to oppose the workers and their actions.

The latest call came at a rally against the gas workers who began a go slow and a ban on overtime work last week. They threaten, if their demands are not met, to call out particular sectors of the gas industry on continuous and total strike, imposing a freeze on the homes and hearths of this country to fight the wage freeze. Heath is endeavouring to take into its second phase. The gas workers have an excellent case. This is their first strike. Over the last few years they have suffered massive redundancies in the trade, owing partly to the switch to natural gas. The electricity workers, in a comparable industry, received a £ 3.05 increase a few months ago, days before the freeze fell on old promises. The gas workers are not even allowed, under present wage-freeze legislation, to negotiate the rise they've been patiently waiting for three years. Under the Tory Phase Two of

the freeze, they will be entitled to a maximum of £ 2.24, which will cause a further widening in the gap between them and the electricity workers.

Their pay claim brings the gas workers union into direct confrontation with the state. There is no distinction between their claim from the management of the Gas Board and an assault on the class law of this state. They know it. Their leaders have called, not for an early settlement, but for a fight against the government's freeze and general policies. The alliances they have made in the last week are also clearly on this political basis. The Ford workers at Dagenham and in other plants are also putting in for an increase which they want before Phase Two of the freeze begins to operate. The footplate men in the railway industry have filed their claim as a special case. Already the civil servants union and the hospital workers union, and last but not least, the teachers of London, have made explicit their demands for pay increases. The claims of the last three unions are for public sector employees who the nation knows are paid badly. There is no absence of sympathy for them and they, like their co-workers in industry, see that they are fighting the government's anti-inflation policy.

UNION-BASHING

The Tories cannot afford to let any of these unions win. It is their last ditch and they must hold it, or call a general election and follow through their claim that the country is for union-bashing. That is presuming, of course, that in an election called on a class issue people will not vote along class lines and cause the Tory party to lose its deposits, putting God knows whom in their place.

Though industries can expect to be without gas for the coming weeks, and London commuters will have to drive or walk to town, and stories about freezing old age pensioners will be circulated by the press, everyone, including the government, knows that the situation can't be allowed to go on indefinitely. No one has an alternative or an emergency plan which carries any conviction. The Trades Union Congress has given its backing to the gas workers

by threatening to call a one-day general strike. And then? The Labour party, in a posture of reflexive readiness, begins making speeches about all the other issues, apart from the industrial one, on which an election could be held. At present they can do no better, because their record of attempted wage control is just as bad as this government's, and the one thing Wilson doesn't want the Labour party to be is the parliamentary voice of the unions. This ambivalence on Labour's part, makes predictions of the election results a difficult business. At present the Labour party is leading by seven per cent in the national polls. The Tories threaten an election on the unions issue, but what guarantee have they that the people will vote on that issue alone — after all it isn't a referendum. And if they do vote Tory, will that mean that they are against the unions or merely that the Labour party has succeeded in fragmenting itself and has failed in trying to stand up without the backbone of a programme?

The most real indication of the probable result of an election at this stage will be the Greater London Council elections in spring. Ninety-two of the British parliament's six hundred-odd seats fall within this area, and the election of councillors will give us some indication of which way the wind blows. Even here the Labour party has had a bout of two-facedness. Ten days ago it published a brave new manifesto promising to abolish the private landlord in London if it were elected, promising free rail and bus transport, a new educational building programme. Now it has come out with an embarrassed statement saying that it would cost too much to do all that, but that it's a good target to work towards.

Nationally, it promises annexation for several profit-making industries into the public sector. It has never been known to do it. The Labour party's nationalisation programme has always been for the public acquisition of basic industries like coal and steel which run at a loss and are then paid for out of public money so that the private sector can continue being supplied with cheap coal and steel and make a profit on finished goods. No Tory in his right mind would oppose this form of national ownership.

PARALLEL FREEZE

The freeze can be expected to continue for about three years, if there is no general election, and it means that wages will be restricted to a pound a year plus four per cent for the lowest

'Once again we have sold more UNICHEM products than ever before'

Shri A. V. MODY

PRODUCTION

The company had a satisfactory year of Production at all the three units. Our Protein Division at Ghaziabad has made good progress. Every efforts were made to meet the substantial demand for our Protein Food Product — PROPAC Salties — our new protein enriched product is becoming a popular snack in the sophisticated urban market.

SALES

The Company's sales have reached a new higher level at Rs. 593.7 lacs. Domestic Sales have recorded an overall increase of 20% over that of previous year. The Company's Export performance is also satisfactory. The export Sales have exceeded Rs. 23.5 lacs.

PROFITS

Despite a substantial rise in the Sales, the Profits have not kept up pace. The increase in wage bill and cost of raw materials coupled with unchanged and controlled selling prices are the major causes responsible for this situation.

BONUS ISSUE AND DIVIDEND

As resolved at the 9th Annual General Meeting 9,000 Bonus Shares of Rs. 100 each were issued during the year. Allocation for Dividend amounts to Rs. 6,30,000 Previous year Rs. 5,40,000.

PERSONNEL

The relations between management and employees at all units of the Company during the year were very cordial and satisfactory. The employees untiring co-operation, loyalty and devotion has been largely responsible for the substantial progress during the year.

CHAIRMAN'S REMARKS*

"We are meeting at a very critical time when the economic crisis is enveloping all around us in the country and particularly in the State of Maharashtra. Rural Maharashtra is in the grips of acute scarcity conditions. Your company has contributed towards this relief effort in its own way. Some of the employees of the company are personally looking after the relief efforts from the collections from

amongst the employees on a sustained basis. The scarcity conditions prevailing in large part of our country have a much deeper significance from the point of view of growth of sales. We are sparing no pains to forge ahead but the results may not be good. This year may just turn out to be a year of consolidation.

It appears from the reports appearing in press that the Bureau of Industrial Costs and Prices has submitted its report to the Central Government and it is receiving their attention. It is likely that the government may appoint a review board to consider this report before arriving at their conclusions. It is not possible to offer any comments till all the details are available. However it is evident from the recent price approvals by the Government that erstwhile markups in fixing selling prices are not allowed. They are being scaled downwards. The costs however are increasing. Two way cut thus continues. All this makes uncertainty as the only certain factor.

I feel that the basic curriculum of undergraduate as well as post-graduate pharmaceutical education needs redesigning to suit the requirements of the industry. Research subjects for M. Pharm, Ph.D. degrees need to be oriented to the theoretical investigation as also to meet requirements of the Indian pharmaceutical industry. To that end, I suggest that our industry as a whole should institute annually at least 250 junior and 100 senior research fellowships to various academic research Institutions. Its potential benefit to the industry through a regular supply of trained research workers, would be managers and building of bases on which developmental efforts could be focused in co-operative. Governmental and private R and D organisations would be substantial.

The new managerial challenge in the foreign trade in drugs is to narrow the gap between exports and imports. To this end, not only aggressive salesmanship would be needed abroad but we would have to export bulk drugs to advanced countries on the basis of advantages. Of course, we would then have to put up optimal size plants instead of sub-optimal ones existing now.

Another practice, which have started following in small way, is to form consortia to export in substantial quantities, mostly to cater to the orders placed by various foreign governments. Even for private trade, I feel that these export consortia could be developed, which could deal with under-developed countries and East European countries better than individual exporters can. I feel that competition in sales should be limited to the home market. It should be supplanted with co-operative salesmanship in foreign markets.

SUMMARY OF RESULTS FOR THE YEAR ENDED ON

30TH SEPTEMBER	1972	1971
	(Rs. in lacs)	
Sales	593.71	195.36
Exports	24.11	20.99
Profit after tax	17.8	13.8
Depreciation	12.50	9.80
Development Rebate	1.20	1.18
Dividend	6.30	5.40

paid workers and nothing for the better paid. Even though a parallel freeze has been imposed on prices, they have crept up three per cent since the imposition of the freeze without the government being able to do anything about it. Not that it cares. In all their anti-worker propaganda, the newspapers and surveys have failed to mention that the top fifty firms in Britain last year made a record average profit of £61 million. The only placatory answer that the government has come up with is a pay board to which the unions can take their claims. So far it hasn't been set

up and will be when Phase Two of the freeze, which is supposed to be a thaw, comes into play next month. The unions have refused to consider voluntary restraint and say they will talk to the pay board when they see what its about. They only have to look at the government's parallel controls on dividends and company profits to know that the anti-inflation measures work on the assumption that wages cause the inflation spiral and that the spirit of free enterprise for the Tories is now secondary to controlled and increasing profits for the monopoly sector.

ECAFE

New Brooms Sweep Clean ?

M R

ECAFE's headquarters in Bangkok — eagerly awaiting its new, Indonesian Secretary-General, Maramis, and the permanent representatives from mainland China in the place of the expelled Taiwanese—is known as a big paper mill that churns out pointless reports known for their volume rather than for their relevance to the continent's problems. The ECAFE Secretariat costs some six million dollars annually and there is the clammy feeling in many quarters that the sum is spent rather wastefully. The poor performance of ECAFE is the principal reason for this belief. The visit to the ECAFE headquarters in Sala Santitham of UN Secretary-General Kurt Waldheim prompted a local English daily to venture the hope that "the long process of ossification" which the outfit had undergone might be reversed. The paper regarded the timing of Waldheim's visit excellent for several reasons, but the first reason it mentioned was in the nature of a left-handed compliment: "You yourself have just become Secretary-General and your ideas are unlikely to have solidified".

POSSIBLE CONSEQUENCES

The countries of South-East Asia are worried about the possible consequences of the post-Vietnam war tapering-off of United States dollar spending in the region. This would affect the balance of payments position of the countries which had hitherto benefited from the dollar fall-out. Their main hope now is that the huge funds likely to be available for Vietnamese reconstruction will help them to some degree in overcoming the balance of payments problem.

But there are more serious imponder-

ables for these nations. Their exports, mostly primary products, are at a disadvantage while their limited range of manufactures face tough tariff barriers in developed countries. The domestic markets are too small to absorb the manufactures. The United Nations has not helped these countries to achieve self-sustained growth; their dependence on aid continues and the dominance of the multi-national corporations increases.

OPEN TO THE CHARGE

ECAFE's preoccupation all these years has been with foreign aid and not self-sustained growth within these countries. The investment climate for foreign capital has been the main obsession reflected in the efforts of the ECAFE Secretariat. In fact, the Secretariat has now laid itself open to the charge that it has degenerated into one of the instruments through which the detested multi-national corporations operate to gain control over the economies of the member countries.

The ECAFE Secretariat has hardly any faith in the ability of the member countries to set themselves on the road to self-sustained growth. As a consequence, the Secretariat has bothered little about regional co-operation and has tended to indulge in unrealistic thinking about mythical pan-Asian development while ignoring the exigencies of unequal development. Nevertheless, the Secretariat has been talking loudly about sub-regional co-operation, almost to the point of being perverse, because it has never bothered to help existing sub-regional groupings like the five-nation ASEAN.

There have been serious complaints of a built-in 'non-regional' bias in the Secretariat, compounded by the poor quality of the Secretariat itself under the outgoing Secretary-General, Burma's U Nyun. In the corridors of Sala Santitham one often hears about the need for a thorough overhaul not only of the Secretariat but of the Commission itself. The qualifications and competence of many old-timers in the Secretariat have been questioned and this calls for a clean sweep to eliminate the sycophants who over their long stay here have acquired vested interests. It is alleged that even the projects are so chosen that they advance the personal interests of the various chiefs of divisions and are in no way related to the needs of the region. There is a marked reluctance to undertake a cost-benefit study before taking up a project. So much so that a great deal of ECAFE's work is either pointless or just lacking in efficiency. In the name of country quotas, it is alleged, an organised kind of mediocrity has been institutionalised at the ECAFE Secretariat and this has had a deleterious impact on the utility and efficiency of the Commission's functioning.

Kurt Waldheim's visit to Sala Santitham itself will not make much difference to the utility or the quality of ECAFE's functioning. Nor will the advent of ECAFE's own new Secretary-General, who might attempt a little spring-cleaning because new brooms are supposed to sweep clean. But successive Secretaries-General have achieved little in the past. The die seems to have been cast and the pattern perpetuates itself. It would, however, be interesting to await the Chinese reaction to the manner in which ECAFE functions.

SINGLE CHALLENGE

The biggest single challenge ECAFE now faces is the reconstruction of war-ravaged Vietnam but little home-work on this seems to have been done at its headquarters. It is business as usual and will be so until China makes its debut at the annual ECAFE ministerial conference in Tokyo in April and sends its permanent representatives to Bangkok. A fierce Sino-Soviet clash in attitudes to economic development of the ECAFE region is indicated in the months to come and the Secretariat, given its time-honoured ways, may find itself shaken into a new reality. Whether this will make for a more purposive ECAFE is another question.

On Industrial Societies

Satish Saberwal

The Crisis of Industrial Society by Norman Birnbaum; Oxford University Press, 1969; pp xi + 185, bibliography, index; \$ 1.75.

"CRITICAL" analyses of modern society ... seek new possibilities, new dimensions of freedom, in its inner movement", says Norman Birnbaum in a superb example of this genre. This critique focuses primarily on Western Europe — Britain, France and Germany — and the United States and secondarily on Russia and the state socialist countries of Eastern Europe. The broad rubrics of "class", "power", and "culture" allow Birnbaum to cover a very wide range of issues.

Since the working class in the Western countries has failed to organise itself for changing society at large, Birnbaum anchors his "classes" to occupational groupings: peasants, workers, technical intelligentsia, technical elite, bureaucratic and political elites, university and other intellectuals, students, industrial managers, creative artists, and so forth. With these categories he explores the social history of England and France to make the point that the particular tenor of the class relationships in a society can be understood adequately only with reference to the political and cultural traditions evolved in it over the centuries. Overall, he converges with Ralf Dahrendorf, T B Bottomore and others to suggest that the crucial problem affecting class relations today is not that of ownership but of control over property (though he discounts the differentiation between the owners and managers in the West) which enables the managers to be socially dominant in the workplace. To challenge this dominance on behalf of a more participatory ethos will require "not unrefined experience alone but conscious reflection upon it, not the immanence of an historical situation but the cultural perspectives with which a new generation interprets it..." (p 40).

Concerning "power", Birnbaum examines first the sources of "consensus" in industrial societies and then the inter-relationships between the state and specific interest and power groupings. The apparent consensus in industrial societies has diverse sources: a substantial amount of state violence continues to be used to enforce compliance; the very opacity of the larger social process persuades a great many people unreflectively to com-

ply with suggestions emanating from seemingly authoritative sources; the habits of obedience are bred in diverse institutions — schools, universities, factories, army, and bureaucracies; and then "there are ... instances ... in which a publicly acknowledged framework and an implicitly held one of a different kind together constitute a form of consensual schizophrenia in the body politic". (In other words, doubletalk and doublethink — and doubleplan — were apparently not invented by those who rule India today; but it would seem that they have created near-perfect conditions for political sociologists to examine the sources, the modes, and the consequences of this kind of "consensus".)

Birnbaum sketches for several countries the failure of the state apparatus, even when controlled by nominally socialist parties (such as Labour in UK) to "attack ... the efficacy of large-scale property". Indeed, for the US, the national foreign policy cuts a furrow very close to that of private enterprise. True, political technicians often operate the key levers but "they share social background, common educational experiences, perspectives, and often careers with men in the other bureaucratic systems": this class position influences their political values which influence

their technical choices. The state and private bureaucracies can together "pursue long-term strategies"; parliamentary careers tend to have shorter lives. Welfare measures ensure steadier performance by labour, at little cost to concentrated property; in any case these contribute much less to "welfare" than full employment would.

For the future, then, Birnbaum sees some promise in the student activists, symbolised in the May 1968 student-worker uprising in Paris. Of political structures, the state socialist ones have been used by the partymen in control for their own purposes as much as the Western systems: so he would back the Yugoslav sort of socialist liberalism with "pluralist control of the administrative and productive process: producers' collectives, workers' councils, autonomous agencies of cultural production, rotation of leadership in each" (p 105).

His chapter on "Culture" — examining the industrialisation of culture, the stratification of the cultural apparatus, the performance and the potentials of the university system — is in some ways the most stimulating, but I have said enough to show the application of a critical intelligence to overarching concerns. The bibliography lists some 400 items, mostly books in French and German as well as English, but there are no references (or footnotes) in the text. Happily, however, his purpose is not to satisfy a nitpicking thesis committee but to raise very broad questions and suggest some answers concerning the industrial societies. Birnbaum has done his colleagues proud.

Labour and Productivity in the Tea Industry

Manorama Savur

India may be the largest producer and the largest exporter of tea and tea may be one of the two major foreign exchange earners for the country, but what is forgotten totally is that the labour force, particularly the female labour force, is the backbone of the tea industry.

Labour, and female labour especially, is most exploited in the tea industry. Its is the most significant contribution to the profits of the industry; yet the returns to it in terms of wages are abysmally low. The share of labour compares very unfavourably with the profits of the proprietor, the dividends of the shareholder and the earnings of the manager. And the share of the female worker compares unfavourably even with that of her male counterpart in the same plantation.

The reasons for this absurd discrimination are historical and its persistence after Independence, while inconsistent with the government's professed ideology, is perfectly understandable given the country's economic system.

This paper seeks to show how labour, particularly female labour, is made to create surplus value in the tea industry in two ways:

- (1) by unfair techniques used to raise the productivity of labour; and
- (2) by underpayment of wages.

I

NOT many are aware of conditions in the tea plantations. One may be vaguely aware of the stranglehold of a handful of British interests over the tea industry and the international tea market. One may even be aware of the fact that the profits of the tea industry are syphoned out of India.¹ But one never stops to think how these enormous profits of the tea industry were made and why these conditions still persist.² At the base of this is the exploitative relationship which persists till today. A brief history of the development of the plantation industry in India will throw light on this.

British capital had two methods of exploiting Indian resources; one was industrial activity and the other the plantations. Textiles were highly developed in India. Control and manufacture of this commodity appeared as the most fruitful source of investment. Meanwhile, power driven machinery had revolutionised both the methods of manufacture and the means of transport at home in England.³ Therefore, competition in textiles by primitive methods of manufacture became irrelevant. Englishmen then turned their capitalist interests in the second direction. Investment in plantations in the West Indies at about the same time was yielding large returns. There was no reason why it should not in India. The first plantations to be developed in India were indigo, then tea, coffee and, much later, rubber.

"Planters seldom came from Europe

with capital. By 1830 none had done so. Rather, they raised capital by borrowing from Indians, from the European servants of the Company or from 'agency houses' in Calcutta."⁴ Production of tea was unknown to both Europeans and Indians. In 1815 the tea trade with China was the major source of profit of the East India Company. In the eighteenth century the Company officials suggested growing tea in territories controlled by them. The Court of Directors turned down the proposal. The most obvious reason for the decision was that they held a monopoly of British trade with China and the principal item of this trade was the import of tea from China. When the monopoly came to an end in 1833 they quickly perceived the advantages accruing to them by establishing a new industry in India. "In 1834 a committee was set up to consider and submit plans for the introduction of tea culture in India."⁵ Seed and plants were brought from China along with a number of Chinese labourers and a number of experimental gardens were started in the southern slopes of the Himalayas and in Assam. Forests were cleared for this purpose, but the government did not care to adequately "protect the rights of the wild tribes inhabiting these jungles".⁶ Lands were given by the government on very liberal terms. Estates ranging from a hundred acres to ten thousand acres were given on 45 years' lease and the rent-free period varied from five to 25 years. In 1861 the system of 'fee simple' grants was introduced. The price of land ranged from Rs 2½ to Rs 5 per acre.⁷

In the early days an estate could be cleared and brought to bearing stage for £ 40 to £ 50 sterling per acre.⁸

Today, there are many small tea gardens, but the typical one is large. Tea is a large-scale plantation industry. Tea companies were started very largely as proprietary concerns by retired British civil or army officers. Many of these individuals were unsuccessful and when they found it difficult to carry on their work, particularly during the years of financial stress between 1866 and 1868, they handed over their estates to managing agencies. Some were registered in India and some in England. "The typical unit of the industry took the shape of a sterling company in UK owning plantations in India."⁹ But a company located in London usually had agents or secretaries in Calcutta to carry out the policy laid down by the board of directors. Even as late as 1956, 13 agency houses in Calcutta "controlled over 75 per cent of tea produced in North India". With the development of joint stock companies in India, Indian business houses also began to take an increasing part in the plantation industry. The earliest Indian-owned plantation "is said to date from 1876".

HEREDITARY SERFS

Tea is a labour-intensive industry, but local labour was hard to come by except in the Darjeeling district in the North and Mysore in the South. Tea plantations were opened in underdeveloped areas, jungles and hills. The labour force had to be enticed from the

plains — an inelegant term, pimping, was used to describe this. Pimping was undertaken by the labour contractors who promised the workers high wages and comfortable living. Difficulties on the way during the journey gave the workers an idea of what was to come, but they could not escape and "till the time they reached their destination they were often guarded not unlike prisoners".¹¹ Poverty at home impelled labour to leave their homes and go to the unhealthy tea districts. Many of the recruits had debts to be cleared before they could leave. The planters through their agents, the labour contractors, cleared these debts. The debt obligations generally ranged from Rs 50 to Rs 500. In the South another factor operated. The Gowdas and the farmers in Mysore, Malabar and elsewhere had practised advancing money to agricultural labourers who were to work for a definite period and were not entitled to leave their employers until they had paid off the debt. As most of them never succeeded in paying off their debt, they became in practice hereditary serfs. When the planters wanted labour they too had to resort to the same practice and in return got the same terms of service.¹²

Both in the North and in the South whole families came under contract. Their position was that of virtual serfs for the term of the contract. Serfdom was hitched on to the new capitalist system of production. If they ran away they could be arrested¹³ and brought back and imprisoned for refusing to work. "To this legal coercion were added many illegal practices such as flogging."¹⁴ The conditions of the workers were so appalling that the government appointed a commission to study the situation and passed the Act III of 1863. The law completely failed in its purpose and the death rate continued to be high. Between the years 1865-67, the death rate was anything from 140 to 556 per thousand.¹⁵

The labour force was technically engaged by labour contractors, the sirdar in the

North and the maistri in the South, and not by the planter. Every plantation in the South was supplied labour force by several maistries, in return for which they were paid a commission. The maistri had his own labour gang which averaged 20-40 people and he was responsible not only for their "welfare" but also their discipline. No plantation manager, therefore, wanted to put an end to this repressive practice known as the kangani system. It was abolished only in 1951. The agitation to abolish the kangani system came mainly from trade union leaders. Twenty years after the abolition of the system it is still possible to meet the progeny of the maistries who now work as field supervisors, not any longer on the old commission system but on fixed salaries. The mode of payment might have changed and so too the designation, but habits die hard. One can, therefore, appreciate why field supervisors even today are recruited from the old cadre of labour contractors. They do not look very different from the rest of the workers but continue to be management men. The workers, whatever their misery, however appalling their condition, have survived and become habituated to the new, hard way of life.¹⁶

II

The problem today is no longer shortage of labour but surplus labour. The situation of surplus labour is a grave problem for the worker. The managements have manipulated the situation to their advantage and the state machinery has aided them in this. The planters may not openly share this viewpoint; they may even have their little differences with the government; but a few relevant facts need to be mentioned even at the cost of side-tracking the main issue.

Take, for instance, the Indian government's first step, after Independence, to aid the tea planters. It set up a top heavy Tea Board. Although the Tea Board is not a financial institution

it provides financial assistance in the form of loans at a low rate of interest of only 6% per cent.¹⁷ The Reserve Bank has indicated its willingness to extend its facility of concessional credit rates to plantations engaging in exports.¹⁸ But more interesting is the Tea Board's extravagant spending of public money on publicity; and the costs of publicity abroad have to be met in foreign exchange.¹⁹ The overseas propaganda expenditure of the Tea Board in 1955-56 was Rs 53.80 lakhs and by 1966-67 it had risen to Rs 1.17 crores.²⁰ Incidentally, the Tea Board's expenditure on internal propaganda in 1955-56 was Rs 21.47 lakhs and in 1967-68 Rs 6.70 lakhs.²¹ One may also mention that the terms of reference of the plantation enquiry commissions periodically set up by the Government of India are concerned with the profitability of the industry, its marketing and finance but not with welfare of its labour.

To come back to the main issue, in a labour intensive industry the most potent way of reducing the cost of production is by increasing the productivity of labour and simultaneously reducing the labour force. The demand for labour varies seasonally. At the height of the season a large labour force is necessary for picking leaves. Picking cannot wait. Leaves have to be picked at a particular stage of their growth; any delay implied a loss. The managements have resolved this problem of surplus labour without creating any difficulty for themselves. They take advantage of the fact that plantation labour has become residential labour for several generations. The minimum labour force that is necessary in the duller season is registered on the plantation's rolls and made to over-work by fraudulent means — known technically as payment of incentive wages. In the Nilgiris, for instance, when the season picks up, extra labour is drawn from the 'dependants' of the resident labour force. These dependants also live in the 'coolie lines' in the plantations. In other words, the whole labour force is

not assured permanent work all the year round.

Reduction of the labour force in the tea plantations began long ago, but earlier figures are not available. The daily average of 9,80,238 workers in 1958 fell to 7,55,729 in 1968.²² Table 1 shows the pattern and trend of reduction. One does not see any steps being taken by the Labour Ministry to protect labour from retrenchment. On the contrary, the government-appointed enquiry committee has suggested that both government and labour should be willing to face the problem of retrenchment arising from increased productivity.²³ To take one dramatic instance, the labour force was reduced in Assam by 36 per cent in 1954 when the minimum wages Act was applied.²⁴

One wonders why, when plantation labour is organised, the temporary labour and/or the so-called dependants do not militantly agitate for permanent work. The answer to this strange situation was unwittingly given by a junior manager in a plantation. "The permanent workers themselves", he said, "act as a buffer against this situation." This is again achieved through the practice of incentive wages for additional picking beyond the base quota. Any extra hands would reduce one's own earning capacity and earnings which border on the starvation level (this aspect will be dealt with later). In the season the problem of rivalry does not arise as the quantity of leaf to be picked is beyond the capacity of the small permanent labour force. In other words, the additional labour force does not cut into the earning power of the permanent workers.

TECHNIQUES OF EXPLOITATION

The average land under cultivation has increased, but the number of workers employed has decreased (see Table 2). The land-man ratio has increased. The productivity of labour has increased as a result of greater intensity of exploitation of labour. The methods used are greater vigilance and subtle techniques of coercion. Statistics cannot completely reveal the actual methods of exploitation but they do reveal the objective facts of increased productivity of labour. Again, earlier figures are not available, but production per labourer has increased from 468 kg in 1966 to 533 kg in 1968. In Nilgiris production per person was as high as 721 kg in 1968.²⁵ It must be even higher today but statistics are not available. The yield per hectare has also risen from 327 kg in 1885 to 1,221 kg in 1970-71. In

Tamil Nadu it is as high as 1,619 kg.²⁶ Only Japan, where it was 1,803 kg in 1969, exceeds this. Tamil Nadu's figures for 1969 are not available for comparison. Even in Kenya where greater exploitation is possible and where a greater degree of modernisation has taken place, the yield per acre was only 1,015 kg per hectare in 1969.

What then are the techniques used by the management to raise the productivity of labour? For the pickers incentive wages and for the male field workers piece work or task work, as it is known in plantation parlance. The task or the specific quantum of work is always decided and set by the management "according to tradition" and it is to be expected that the quantum of work fixed would be to their own rather than to the workers' advantage. The wage boards accept this and the trade unions keep out of it. It is to the immediate advantage of the worker to get his "task work" done as fast as possible, say in 4 or 4½ hours, and then attend to his own work which supplements

his meagre daily wages. One can now appreciate a senior manager who said that the management can do nothing if the workers choose to "go slow". This is because they generally do not. If the workers do, it would cut into their income and they would miss the only possibility of earning a little more to supplement their meagre wages. But the less sophisticated junior managers give the game away. They admit that the practice of "go slow" is rare, but if the workers choose to indulge in it a strict watch is kept on the "trouble-maker" and he is made conscious that he is being watched. He must take care not to trip. If he does, even the most trivial lapse, which would be normally ignored, is made an issue. For instance, a "watched" man cannot afford to arrive late for his work even by five minutes. If he does he is sent home. This implies loss of a day's wage for the worker. The more "difficult" workers are in for rougher treatment — they are charge-sheeted.

These coercive techniques apart, the

Source : "Tea Statistics", 1969-70, pp 110, 111.

very fact that there is readily available surplus labour in the estate hangs as a constant threat to the security of employment of even the permanent worker. Still another junior manager confirmed how this factor operates. He agreed that there was very little labour trouble and few attempts by workers to lower productivity. If there was, the management planned a "counter trick to teach them a lesson". To quote one instance, the management brought men from another division and put them to work in an area contiguous to the troubled one and demonstrated that the quantum of work put in by the new group was four times that of the old. The manager claimed: "the confused workers learn their lessons soon and begin to behave themselves".

III

The second method of manipulation and raising the productivity of labour is through the modes of payment of wages which continue to be the most primitive — daily wages, piece rate, wage differentials based on age and sex, no scales of pay and no increments. What is particularly interesting is that certain primitive practices are very consciously cultivated, such as, for instance, that of the manager himself, and not a clerk or an accountant, doling out the pay. The personal touch is intended to build up a single directional sentiment of loyalty. The results are dramatic. Consider the local practice in a plantation: during a religious festival of the workers, the manager, a mere invitee according to our version, is garlanded first and only then the god. The workers have arrived at the conclusion that their livelihood, their very survival, depends on the manager and only in a more remote sense on god. Portraits of the gods are, however, still displayed prominently. The management does not permit them to be discarded, for the gods are its passive allies.

To return to the main issue, wages used to be arbitrarily determined by the management, since the indentured labour had little capacity to revolt. After Independence wages have been determined by government-appointed wage boards, but one is not sure whether wage determination is less arbitrary than it used to be. The wage boards prescribe the primitive minimum wage, which in practice falls short of the subsistence level given the continuous inflationary trend.

In the case of male labour, minimum wages are generally related to tasks and "tasks are decided by the management

according to custom, and where customs have changed in consultation with labour". It is necessary to remember that these customs were colonial customs, under which the management-labour relations were frankly repressive. "Customs" could be changed by organising labour but unfortunately the trade unions have not made much headway in exerting pressure on the wage boards. The arguments of the wage board are interesting. It does not interfere with task rates as this is likely to create difficulties for the garden managements.²⁸ In other words, the wage boards continue to ignore even the basic needs of labour. After 20 years, they have still not taken note of the view of the chairman of the Tea Association who found the "system of plucking rates not only unsatisfactory but also unfair".²⁹ The Plantation Enquiry Committee had suggested³⁰ that the system of plucking rates "should be fixed in such a way that it enables a worker to earn at least a minimum wage for a normal working day" and that "it should be higher in cold season or for bushes recently pruned when the quantity of leaf is small" and, finally, that "the rate should be equal for men, women and adolescents".

The minimum daily rates now fixed by the wage boards indicate how ill paid is the labour in the country's oldest industry, although the industry's gross profits as percentage of sales com-

pare well with those of the most advanced industries like pharmaceuticals and engineering (Tables 3, 4 and 5). But wages lag far behind those in these industries (Table 6). The figures for 1969-70, the latest available, show the regional variations. In the North the highest payment is in the Assam valley, Rs 2.58 for men, Rs 2.40 for women and Rs 1.25 for children. The lowest payments are in Garhwal district (UP) where there is a flat rate of Rs 1.20. In the famous Darjeeling district in West Bengal, the rate is midway at Rs 2.07 for men Rs 1.96 for women and Rs 1.11 for children. In South India the rates are a shade higher. The highest are in the larger estates of Nilgiris, where it is Rs 3.00 for men, Rs 2.45 for women, Rs 1.89 for adolescents and Rs 1.62 for children. Wage rates are lower in Kerala and Mysore. All the three states have incentive rates for plucking. Again this is the highest in the Nilgiris, 9 paise per kg above the minimum base output of 10 kg.

WAGE DIFFERENTIALS

The wage boards, apart from calculating wages at the minimum rate, continue to prescribe wage differentials. From the management's point of view wage differentials are useful for two reasons. First, it means a saving in the total wage bill. Second, it divides the labour and prevents the growth of a labour movement.

The saving in the wage bill occurs

because the number of women workers exceeds that of men and plantations continue even today to engage substantial number of adolescents and children who are paid less than the minimum wages paid to men.³¹ In the early years of the plantation industry, wage differentials were understandable. Men were put to the hard tasks of cutting and clearing forests. The wages used to be a mere Rs 2-5 per month.³² In order to make up for the low wages the worker was permitted to cultivate small patches of land either within the plantation which was not brought under tea or encroached land on the periphery of the tea plantation, which involved no monetary loss for the planter. On the contrary the patch of land cleared free was a gain. This practice still continues. Also, workers were enticed into plantations not as individuals but as families, mainly from the scheduled castes and tribes. Women and children joined in the clearing work doing lighter jobs and so were paid proportionately lower wages. But once a plantation begins to bear tea leaves, say in four years, at that stage, as the Plantation Enquiry Commission states, the major part of the success of the industry depends upon plucking. This operation involves two-thirds of the working days and the tea pluckers are always women. But women continue to be paid wages that are lower than those paid to men. They can neither protest nor escape. The law and the police were frankly on the side of the planters and the unorganised labour had no bargaining power. The custom of wage differentials established under these conditions has been continued by the government-appointed wage boards, in spite of the warning given by the Plantation Enquiry Com-

mission. The Commission states: "Owing to wage differentials between men and women, the latter though more efficient in plucking, also get a less wage".³³

Plantation labour remained practically unorganised till the end of the Second War. The planters, on the other hand, shrewdly formed associations to consolidate their rights; this was done also partly in anticipation of the birth and development of labour movements which were to grow with the slow growth of political consciousness in India.³⁴ However, in South India a single association of the middle level staff and white collar workers was formed in 1929. One of the office bearers of the association frankly admitted that recently it had broken a strike of workers. Not only does it have no common interest with labour, it actually collaborates with the planters. Even its office was situated in the premises of the planters' association till 1954.³⁵ Now that labour is organised one may ask what the trade unions are doing for their members? In certain regions labour has become conscious and militant, but in others, especially in the remote areas which are isolated by distance from centres of trade union activity, it is still very docile. These regions are the planters' haven. What is surprising is that the trade unions are unaware of the intensity of exploitation practised by the so-called incentive wage system. Their efforts to improve the workers' lot are all made within this system of wage payments. For instance, in Nilgiris in March 1972 a joint action council of six unions was formed to fight for higher incentive rates.

INCENTIVE WAGE SYSTEM

The incentive wage system raises the productivity of the worker and provides a saving on the wage bill and is, therefore, a straight gain for the management at the expense of the worker. Consider the working practice in Nilgiris. The men are assigned task work which is completed by noon, viz, 12 or 12.30. The work assigned for women is plucking of tea leaves. The statutory hours of duty are 8 a.m. to 5.30 p.m. with one and a half hours' break for lunch. A woman is expected to pick 10 kg of leaves whatever the condition of the bush, whichever the season. But wages are so meagre that they force themselves to work more to earn the incentive wage. By an intense effort a woman worker can pick as much as 30 kg. Some can even pick as much as 40 kg. In order to earn the extra money the women cut short their lunch

break by one hour. The extra earning appears to be a reward for the work put in. In fact, the reward is plainly for the management.

The management frankly admits that it has introduced incentive rates to cut the cost of production and even demanded that government should give them greater freedom to discipline their workers.³⁶ But the unions do not seem to understand this strategy. But picking 30 kg of leaves in one day instead of 10 kg — the standard set by the wage board in consultation with the management — the worker puts in three days of work in a single day, but gets 1.7 days' wages instead of three days' wages. An extra efficient worker who picks 40 kg of leaf in a day puts in 4 days' of work in a day and in return is paid a little more than 2 days' wages. In other words the management saves nearly half the wage bill on female labour. Or, in other words, a female worker is paid half the so-called minimum wage determined by the wage board. Large industries in urban areas also pay overtime rates, but the rate of payment for overtime is often double the normal time rate. By playing with words and by substituting the word *incentive* for overtime, or rather *over-work*, the management, with the aid of the government wage boards, cleverly exploits the worker and appropriates the surplus value to itself. Industries which make profits are expected to pay bonus to workers. In one of the largest tea plantations in the South, last year's bonus was divided according to a strange pattern. The management staff (a tiny cadre) was given 3 months' salary as bonus, the middle level workers 2 months' salary and the workers only one month's wages.

If incentive wage is a double gain to the management, it is a triple loss to the worker: (1) her actual wages are cut; (2) physically she exhausts herself which tells on her health and she is also compelled to neglect her home and family; and (3) it hampers the growth of the labour movement. On paper a woman need not work for more than 8 hours nor pick more than 10 kg of tea leaves. But other subtle factors operate which compel her to work: (1) Low wages and the continuous rise in the cost of living force her to earn as much as she can. (2) Pickers are rigorously supervised. As one picker said, it was an unknown for them to stop to talk to a visitor. A supervisor hovers around and swoops down on anyone who takes her hands away from the tea bush. (3) Victimisation of 'laggards' is not unknown.

The incentive payment system is positively detrimental to the worker, even if the worker chooses to do extra work so on her own without "external compulsion". The hours of work are lengthened beyond what may be regarded as tolerable. The gardens are located in the rain belt and many of them are on hill slopes. The workers are, therefore, constantly "exposed" to the cold wind and rain and the most frequent complaint is that the cold chills them to the marrow. This was confirmed by a resident doctor in one of the more enlightened plantations. According to him, lung disease is one of the commonest ailments in the plantations. He put this down to malnutrition and exposure. Intestinal disease, due to unhygienic conditions, is another common ailment.³⁷

THE PICKER'S LONG DAY

The picker's day is a long one. She has to finish her household chores long before 8 a.m. when the plantation work begins. She rushes in at noon for a brief half an hour to feed herself and her family and rushes back to work to earn the extra money which is a mere pittance. Back home in the evening, exhausted from over-work, she cooks for the family. Besides the three major ailments mentioned above, the pickers also suffer from headaches as a result of carrying heavy baskets. Although the basket is carried on the back, it is supported by a thick strap on the forehead. The workers' hands are stained, bruised and gnarled as a result of continuous picking of tea leaves throughout the day in all seasons from rough tea bushes. Picking is difficult and slow in bushes that are not well tended. Many of the gardens which have come under Indian ownership are careless about the maintenance of the bushes,³⁸ which incidentally also results in the quality of the tea going down. The worker thus suffers for the owners' negligence. This is ignored by those who suggest that the government, the industry and the unions should undertake joint action and agree to a wage freeze to facilitate replanting in the interest of the healthy growth of the tea industry.³⁹

The present mode of wage payments is disastrous to the labour movement. The low wages combined with payment of incentive wages splits labour between the permanent workers and the vast ranks of the unemployed who are engaged as temporary labour. While the resident unemployed become the safety valve to provide a continuous supply of labour for the benefit of the industry, the monetary needs of

the permanent worker act as a buffer to counter the temporary workers' demand for permanency of employment. The maintenance of wage differentials cuts in another direction also. It splits labour on the basis of sex. Productivity of a woman worker in a tea plantation is higher and therefore she is legitimately entitled to not only equal but higher wages than a man. But since the inception of the industry men have been paid higher wages than women.

Incidentally, the fact that the worker is permitted to cultivate tiny plots of land must not be considered as a non-wage benefit accruing to him. The plantation worker has no security of tenure; on the contrary, the land given to him to cultivate can be used as a lever to coerce him. The area under such cultivation is progressively increasing and so too are the number of workers in the estates — employed and unemployed. There is no reason why the government cannot reclaim the encroached land any time and if it does it would be no concern of the management's. So the "task work" practice is not necessarily a permanent gain for labour. But it is for the management, for the worker gets the feeling that he is being paid "full" wage for just four hours of work and is also being permitted to cultivate his "own" land.

MYTH OF NON-WAGE BENEFITS

The management may also argue that low wages are compensated for by such useful non-wage benefits as free housing, free land for cultivation, free school for children, creches for infants, free hospital service and free fire-wood. Each of the above listed items can be examined very briefly to find out whether the labour force really 'benefits' from these free services and whether they can be considered non-wage benefits.

Free housing is now a statutory obligation. In plantation vocabulary, the cluster of houses where workers live is even today referred to as a 'coolie line'. It is an apt description. The workers' houses are monotonous, barrack-like, tiny one-room kitchen tenements, often smoke-filled, with a common tap and a common trench lavatory for every 'line'. Houses are not provided with bathrooms. They are over-crowded with an average of ten persons to a tenement. The workers constantly complain of over-crowding, but the management has a different version. The management claims that the older workers plead that their adult sons should not be allotted separate houses as it divides their income and reduces their

future security. The present writer heard an old man pleading for a separate house for his adult son and the manager immediately promised the worker that he would look into the matter. The explanation given by the manager later was that adult workers in a family ask for separate houses but want to live in the same 'line' — which the management thinks is an unreasonable request. The 'lines' are dotted all over the estate, a fair distance from each other. Official reports show that by and large the planters have stinted on the expenditure on statutory house-building activity.⁴⁰ So far no action has been taken by the government against defaulting planters.

It has been shown already that the so-called free land given for cultivation is not free and that this is merely a cunning device to keep wages low.

A free elementary school within an estate is also a statutory obligation. But the schools within the estate, like village schools all over India, are a total failure. The management's belief that free food in the schools would entice the children or at least induce parents to send their children to school is not borne out by facts. There are other factors which prevent the children from attending school. An explanation given by one worker seems plausible. This worker is classed as very intelligent by the management and also appeared very conscious of the need to educate his children. His explanation was that his oldest son, a boy of twelve, could not be sent to school that year as he had to look after a baby and two younger children. The mother, a tea plucker, is away from home the whole day. This son would be sent to school the next year, he said, when the second child would take his turn at looking after the kids. The creches are empty except for the *ayaks* in charge. This observation is confirmed by Griffith.⁴¹ The parents' version is that the babies are not well looked after in the creches, yet they leave them behind at home with only an older child. One can now appreciate the workers' simple demand to have homes in the same lines, so that they can pool their manpower resources in the matter of looking after young children when the parents are away at work.

The older children also saddled with such other work as collection of fire-wood. The management's claim that they supply free fire-wood only means that they connive with the workers in robbing fire-wood from government forests. This at any rate is the workers' version. Now and again the shade trees in the estates are cut down and periodically the

tea bushes are pruned and workers are permitted to make use of the wood. The management, of course, gets large quantities of free dry fire-wood. The fires burning in the fire-places of the managers' bungalow on a chilly evening make cosy pictures, but wet fire-wood burning in the chimney-less houses of workers quickly drives someone unaccustomed to smoke out of the house. This no doubt contributes to the high incidence of lung ailments among plantation workers.

Hospital services appeared satisfactory in the large estate visited by the present writer. One does not know how they are in the smaller gardens. A government report points to the general inadequacy of hospital services.⁴²

This, then, is the bleak picture of the so-called non-wage benefits offered to workers, though the managements' constant refrain is that they are a drain on their resources for which they get nothing in return.⁴³ The management is indifferent about the workers' comforts. For instance, even in Nilgiris the 'coolie lines' are not electrified. Ironically, the major hydro-electric power station, Pykara, is in Nilgiris district and the DMK government boasts that every village in Tamil Nadu has been electrified.

The major part of the money shown as being spent on providing fringe benefits goes to the small management cadre. Not even the largest plantation has more than four or five *covenanted* officers. The benefits accruing to them include free-housing (often furnished), electricity, a car and an annual holiday at home. Some benefits go to the white collar workers. For instance, the middle level workers in the plantations in the South have recently fought for transport expenses for their annual holiday. Nothing much is thus left for the workers. The same pattern of distribution of the money supposedly spent on providing non-wage benefits to workers is not unknown in other manufacturing industries.⁴⁴

A very conspicuous non-wage benefit, it needs to be mentioned, is the temple-building activity in the plantations. In a single plantation of about 1,000 acres, for instance, there are more than two dozen tiny shrines of local deities and sprits to be propitiated. As these are built by the management, the gods in all fairness favour them and neglect the working class — as does the State.

IV

The final aspect to be considered is the relationship between effort and re-

ward. It is fashionable to relate wages to productivity, but to be fair one must compare the wages of labour with the profits of the proprietor, the dividends of the shareholder, the commission of the managing agents and the salaries of the managers and see whether they are all commensurate with the effort put in. No attempt will be made here to find a direct correlation between effort and reward, for productivity is the outcome of a complex relationship between various factors — man, money, machines, markets and management. Here it is only possible to find out, very broadly, how much each factor contributes to productivity and whether the present pattern of effort and reward is fair or unfair.

Man: The labour power of man is the most important factor of production in a labour-intensive industry. However, labour's contribution to productivity will be considered last as it is the major concern of this paper.

Money: As indicated earlier, the initial investment in tea plantations was very small, for land grants were made by government at prices which were only little more than nominal and wages were as low as Rs 2 to Rs 5 per month. Yet most of the proprietors, unable to cope with the problems of management of the plantations, handed them over to managing agents. In other words, investments were small and effort nil. Yet they appropriated the profits which were as high as 9 per cent even in the initial period.⁴⁵ They are even higher today, in spite of the taxes, excise duty, etc (see Tables 3, 4 and 5). Griffith reports that dividends in the first five years amounted to 5 per cent, 11 per cent, 13 per cent, 36 per cent and 39 per cent, respectively.⁴⁶

Machinery: By its very nature the tea industry is a labour intensive industry. The factories can be modernised to increase productivity, as some of the automated but practically unused green tea factories in the South have been.⁴⁷ Most of the factories, however, are still primitive. Capital investment has been small even in recent years. The use of machinery has thus not raised productivity very much. The bulk of the work is in the garden — tending bushes and plucking leaves — and the rewards should go to those who put in the effort.

Markets: Market conditions have their influence on production patterns rather than on productivity directly. Markets are therefore not our main concern and have no place in our calculation of effort and reward, but are referred to here because of the role they play in the pattern of tea production

in India. The tea market is not a free market,⁴⁸ but is controlled by a handful of British tea brokers who operate from London. As a consequence, production of tea fluctuates according to the rise and fall of tea prices at the London auction.⁴⁹ The fact that auction houses have been set up in Calcutta, Cochin and Coonoor does not mean that the stranglehold of the British tea brokers has been loosened. The most powerful brokers in the Indian auction are still the British. Nor has the entry of Russia as a buyer of Indian tea radically changed the picture.

"In India the selling brokers perform some additional functions". They pay "freight charges in advance, undertake quota transactions and assist in financing tea production, particularly of small Indian producers against hypothecation of crops".⁵⁰ Apart from this stranglehold of the brokers there is another aspect to be considered. The government is particularly interested in the foreign market for tea because tea is one of the biggest foreign exchange earners for India. The Indian government, therefore, aids planters with financial and other assistance to develop the industry and offers various incentives and a tax rebate on exports of tea. The government, however, ignores the fact that the profits of the dominant sterling companies are drained out of the country. What is more significant for our present discussion is that there has been a sharp decline in the volume of tea export, in spite of the incentives. For instance, it has fallen from 213.7 million kg in 1967 to 168.7 million kg in 1969,⁵¹ though in 1971 it rose to 212.63 million kg.⁵² The production of tea is, however, on the increase and the export market is being substituted for by the Indian market. This is largely because the producers took the decision to exploit the potentially profitable Indian market and "changed their production pattern to suit the Calcutta Market". This happened immediately after the fall in prices in London in 1968. As long as profits are untouched does earning of foreign exchange matter to the producers?⁵³

DISPROPORTIONATE REWARD FOR MANAGEMENT

Management: Production and productivity are directly related to the degree of efficiency of management. The efficiency may be due to either the application of scientific principles to management or various extraneous factors. In the early history of plantations, extraneous factors played a dominant role. As pointed out earlier,

the law and the police were then on the side of the management. They still are, but in a less blatant way. In the first days, a single European manager controlled a thousand workers or a thousand-acre plantation. The ratio has now risen to about 4. What is interesting is that a commission used to be paid to the managers. In the early fifties, for instance, the non-Indian companies paid Rs 3 to Rs 4 for every 100 lbs of tea.⁵⁵ Compared to this payment to the managers, the incentive payment that a tea plucker would get today, 20 years later, for picking 100 lbs of tea is only Rs 4.15 in the highest paid district, viz, Nilgiri. These are the persons who actually put in the effort to raise productivity, perhaps not voluntarily but out of sheer necessity. The management's role in raising productivity consists of devising and using various deceptive techniques to make the worker put in greater effort. Even the Plantation Enquiry Committee pointed out that "high managerial overheads are not necessary for high productivity."⁵⁶ But the wage differentials continue to be as high as 1:50 or even more. The Committee also complained that the "commission to the managing agents is one of the items which increase the cost". Besides the various types of commission, the agents draw a fixed office allowance which now ranges beyond Rs 2,500 per month.⁵⁷ If rewards are related to effort, then one must also take note of the fact that the management draws payment from multiple sources, whereas the worker is paid only his wages.

As indicated earlier, in spite of the bonus Act, the workers' share in the bonus falls far short of what the management gets. And the non-wage benefits are also weighted heavily in favour of the management.

In a labour intensive industry, the wage bill should be the major component of total costs. But in the tea industry it is not so. No recent data are available, but earlier figures give an indication of the situation which has not changed. For instance, in 1953 the wage cost was only 32.5 per cent and 35 per cent of the total cost in North and South India, respectively. It must also be noted that plucking — which is a woman's job — constitutes two-thirds of the total number of mandays. Yet its share was only 15.6 per cent of the total cost in 1953.

The necessary statistical data are not available to compute the productivity of labour and relate it to wages. Some

recent figures do show an increase in the productivity of labour. For instance, the labour productivity has risen from 468 kg per person in 1966 to 533 kg per person in 1968. There are sufficient data to show that this trend was a continuous one from the earliest times.⁵⁸ It has been shown earlier that instead of rewarding the worker for increasing productivity, the management in practice pays him less through the system of the incentive wage and the piece wage. Neither the trade unions nor the wage boards protect the workers.

Our analysis shows that in the tea plantations (as elsewhere) the interests of the proprietors and the managerial class which serves them runs counter to those of the working class. The state is not an impartial arbitrator, but aids the former class by various legislative enactments and with statutory bodies, such as the wage boards, the Tea Board, the periodic plantation enquiry commissions and finance commissions.

True, there is some welfare legislation but it is not backed by sanctions to compel defaulters to fulfil their statutory obligations. One is, therefore, compelled to conclude that in a mixed economy workers cannot expect justice; only some concession under pressure, but no more. A total structural change is the only way for workers to get a fair deal. Workers themselves, as a class, along with the other exploited categories, must organise to bring about this transformation.

Notes

- 1 The fact that export of tea to Russia is on the increase and to Britain on the decrease must not distract one from this basic fact.
- 2 The trend of Indianisation has not stemmed the tide of the drain. This is either because the British owners refused rupee currency for sale transaction or because the Indians who have foreign currency reserves abroad prefer to maintain the plan-

Separatist Movement in Andhra Pradesh

Shadow and Substance

G Parthasarathy

K V Ramana

G Dasaradha Rama Rao

The facts relating to employment show beyond doubt that only a small fraction of the people of Andhra Pradesh, that is, those who are in or seek state government employment, have a stake in the operation of the mulki rules or otherwise. It is this section which has successfully managed to give the appearance of having a wide social interest to a movement which obviously represents the sectional interest of a small group.

In the course of the fight for the competing claims of the petty bourgeois of the two regions of Andhra Pradesh the wider interests of the state and the nation are being forgotten. The preservation of the integrity of Andhra Pradesh calls for the burden caused by the mulki rules to be shared by the country as a whole. The cost in terms of loss of jobs to the people of the Andhra region, due to the implementation of the mulki rules, cannot number more than 2,000 per annum and the financial costs of off-setting this loss would roughly amount to a maximum of two crores of rupees per annum. Over a five-year period the burden of the Government of India would be Rs 10 crores and this is very little for the Centre to bear in relation to the gains of an integrated Andhra Pradesh for the country. The petty bourgeois in Telengana should be told unequivocally that at the end of this period, they will not be entitled to the privileges which are not conferred on other backward regions. A dialogue, on this basis, between the leaders of both the regions under the auspices of the Central leaders could contribute to the restoration of normalcy in Andhra Pradesh.

THE agitation for a separate Andhra state is now sweeping over the entire Andhra region paralysing administration and disrupting civil life. The association with this agitation of people drawn from varied professions and with different political creeds gives it the semblance of being all pervasive. The bankruptcy of the political leadership in authority, lack of any sustained and able effort to explain the need to compromise for larger ends, and the absence of a strong leadership with the capacity to persuade and the ability to hold divergent sections together in the interests of long cherished values — these have provided free ground for the agitation getting the appearance of being socially purposive. The threat of force implied by the presence of the Central Reserve Police has made the separatists into heroes of a great cause and the involvement of wider sections of the community has given the agitation a momentum which dons the garb of a liberation struggle.

The roots of the agitation could be traced to growing unemployment and unrest among those who seek jobs in the organised sector. In fact both the protagonists and the antagonists of mulki rules have stakes in the limited job opportunities available in the organised sector. The organised sector — which includes the central government,

state government, quasi-government, local bodies and private sector groups employing ten or more persons — accounts for only a small fraction of the total labour in the state. When the states in India are ranked by the proportion of workers in the organised sector to total workers, Andhra Pradesh holds the last but one rank with only 5.28 per cent (see Table 1). The adverse or favourable influence of mulki rules has direct and immediate effect not even on this small fraction, but only on a part of it, i.e., those employed in state government service.

In Andhra Pradesh employment in the organised sector is negligible and within the organised sector, employment in the private sector forms only a minor proportion. When the percentage of employment in the private sector is ranked, Andhra Pradesh gets the tenth rank with 29.95 per cent (see Table 2). The low proportion of employment in the private sector leads to a scramble for scarce jobs in the public sector. The issue of mulki rules is, therefore, of genuine concern to job seekers in the public sector from both the regions.

But it is known that the application of mulki rules is limited only to state government jobs and even among them only to certain categories. Therefore, it is relevant to consider the magnitude of workers likely to be either favourably

or adversely affected by the operation of mulki rules by focusing attention on the proportion of workers employed in the state government to total workers. Whichever way we look at the figures, employment in the state government forms only a small proportion of the total. Even as a proportion of employment in the public sector the number of state government jobs forms roughly one-third of the total. In the organised sector as a whole, employment in the state government forms only one-fourth. The insignificance of state government jobs in relation to the total employment situation is sharply brought out when employees of the state government are looked on as a proportion of total workers. Only 1.25 per cent of the total workers are state government employees and even within this category not all will be affected either favourably or adversely by the operation of mulki rules (see Table 3).

The facts relating to employment show beyond doubt that only a small fraction of society, i.e., those who are in state government employment, have a stake in the operation of mulki rules or otherwise and this section has successfully managed to give the appearance of having a wide social interest to what is obviously a sectional interest of small groups.

The objective circumstances that

contributed to this metamorphosis need to be understood in proper perspective. It is not without a valid material base that student bodies both in Andhra and in Telengana were found to take the lead in agitations for or against the mulki rules, finally culminating in the separatist movement. Employment in the private sector is not only small but has not been growing. It is to employment in the public sector to which the educated look. The employment exchange data, with all their defects, indicate the deteriorating employment situation. While the applicants on the live registers have more than doubled between 1960 and 1970, the placements have hardly increased by 24 per cent and the position of placements has worsened particularly since 1967. Since then there has been a continuous deterioration in the position of placements with only minor relief in 1970. The axe of unemployment fell very heavily on engineering graduates. The agriculture graduates continued to suffer for want of jobs despite the need for agricultural development. The medicos whose position has not been so bad in the earlier years are beginning to feel the burdens of unemployment. The arts and science graduates who are not so vocal as the engineering graduates have been facing serious unemployment for quite some time. The spectre of unemployment haunts the current student community and the scramble for jobs results in agitations which have no relation to the root cause of the trouble. This scramble increases with the growing out-turn of the educated. Backward regions which had lagged behind in education in the past now show high rates of growth, particularly in respect of graduates and post-graduates. This was exactly the position in Telengana and the out-turn of graduates and post-graduates exceeded that of Andhra between 1960 and 1970. The pangs are not those of stagnation but those of imbalanced growth. The graduates of Telengana find themselves entering into the job market in large numbers in a period when job market opportunities are shrinking and seek to protect the limited job opportunities available in their region from encroachment by others who, in their opinion, have had an edge over them in the past both in education and in the job market. The educated in the Andhra region who find themselves shut out due to peculiar legal safeguards given to the Telengana region — which do not exist anywhere else in the country — nurse a grievance. What is forgotten in the scramble for jobs is that neither the application of

TABLE 1: TOTAL WORKERS AND WORKERS IN THE ORGANISED SECTOR—STATEWISE

mulki rules nor their total abolition can have a substantial impact in giving relief to the educated unemployed. Application of mulki rules either in toto or in its modified form might get a few jobs for Telengana at the expense of Andhra. Its total abolition might give a wider opportunity to a few in Andhra but neither their abolition nor their implementation can make a material difference to the fast deteriorating employment situation in Andhra Pradesh.

The university educated in Andhra Pradesh, it is known, form only a small proportion of the population. But between 1960 and 1970, thanks to a large number of educational institutions (see

Table 4), there has been a phenomenal growth in the out-turn of the educated. Taking only those at the PUC (Pre-University Course) and the level above, the index of the university educated has risen from 100 to 188 — the index for Andhra being 169 and for Telengana 238 (see Table 5). There is a vast reservoir of newly developed talent that seeks opportunities for productive absorption (see Table 6). But the trends in employment particularly in state government employment present a gloomy picture. Annual placements in state government employment show a decline since 1965. Overall employment effected through employment exchanges shows a

similar picture (see Table 7). No readjustments in employment, given the overall stagnation, obviously can solve the problem of either the Telengana educated or the Andhra educated and agitation for separation on either side cannot but be a cry of despair.

Since the root cause of the agitation is traced to stagnating employment opportunities for the job seekers the solution could be found only in measures which expand employment opportunities particularly for the educated job seekers. Obviously separation *per se* is no solution and the costs of bifurcation are not even given a moment's thought in the current mood. The history of the struggle for 'Visalandhra' goes back to more than half a century and the Telugu speaking people rejoiced when in 1956 that goal was achieved. So much was this goal desired that the leaders of Andhra were prepared to concede an unusual privilege to a region which was then generally felt to be backward. The process of cultural integration has not been smooth but traces of it are in evidence to a keen observer. Despite occasional outbursts from regional factions the common heritage is the cherished pride of both the regions. When passions cool down, people of both the regions will realise how strong these bonds are. It may be said that there may be moments in the history of a society when deeply cherished values are sacrificed for material compensation but the material compensation in the present situation appears negligible while the material costs of separation for both the regions are great.

Repeated drives for the re-arrangement of the polity of the country in response to purely emotional outbursts result in diversion of resources from developmental effort with chain effects

not limited to Andhra Pradesh alone and with intra-state disputes being transformed into inter-state disputes resulting in heavy economic costs in addition to social costs. Periodic readjustments in the existing polity result in diversion of energies and time — which could otherwise be used for planned development — to reconciliation of conflicting claims of contending parties. Concessions which are granted with no regard for the material base generate similar demands and introduce a continuous climate of uncertainty in the polity. Considering the costs of separation both for Andhra Pradesh as well as all India, a compromise by both sides for a temporary period, with certain prospects of unlimited and unhindered movement of labour and flow of capital between the regions, offers better prospects for development and employment. It will be a sad day for both the regions if in the frenzy of the separatist mood the goals of employment, development and social justice tend to be bypassed.

Our analysis has shown that the roots of the agitation could be traced to interests of the petty bourgeois class in both the regions. To identify this as general interest is a mistake. What gives it the character of a social interest is the principle for which the petty bourgeois apparently is fighting for. In Andhra, equality of employment opportunities and service conditions is the slogan and the slogan justifiably has a wider appeal. In no other state in the country is there anything similar to mulki rules and the application of mulki rules in Andhra Pradesh alone appears as unjust discrimination against the petty bourgeois of Andhra. In Telengana the slogan of the petty bourgeois is protection of a backward region against encroachment by more advanced communities. This too gains a mass appeal in that region particularly against the background of the widespread belief that the assurances had been repeatedly violated by chief ministers drawn from Andhra. Therefore, the petty bourgeois in both the regions acquire the role of defenders of genuine social causes. The problem thus is how to ensure equal employment opportunities for all within the integrated state without going back on the assurances given to Telengana. The denial of employment opportunities within the state for people of Andhra is tantamount to imposition of a cost which is borne by no other comparable group in any other part of the country. The total abolition of mulki rules within the framework of an integrated state is not an immediately feasible proposition. The preservation of the integrity of Andhra Pradesh is a necessity not only in the interests of the people

of this state but also in the long-term interest of the country in view of the chain effects that the bifurcation of Andhra Pradesh might bring about. For this reason the costs which are now borne by the petty bourgeois of Andhra alone, due to implementation of mulki rules, should be a burden of all India. This burden is not great for the country as a whole. The cost in terms of loss of jobs to people in Andhra cannot be more than 2,000 in number per annum and the financial costs of this roughly amount to a maximum of two crores of rupees per annum. Over a five-year period the burden on the Government of India will be ten crores of rupees and this is very little for the Centre to bear in relation to the gains of an integrated Andhra Pradesh for India. The petty bourgeois in Telengana region now, thanks to the assurances given, are enjoying a double privilege. They have privileges which no other backward region in the country has. Secondly, the ratio of 2:1 envisaged under the 'five point formula' confers an advantage to the educated class in that region which is more than proportionate to their ratio among job seekers. It is unjust to make a temporary privilege into a permanent virtue. The petty bourgeois in Telengana should be told unequivocally that at the end of the period stipulated they

will not be entitled to privileges which are not conferred on other backward regions. A dialogue between the leaders of both the regions under the auspices of the central leaders, on this basis, we hope, could contribute to restoration of normalcy in Andhra Pradesh.

What appears to be a social movement is in reality a petty bourgeois movement. The petty bourgeois in both the regions has succeeded in giving it a social character since they appear to champion general principles in which there is wider interest. In Andhra the general principle is equality of employment opportunity. In Telengana the general principle is protection of a backward group against an advanced group. In the course of the fight for competing claims of the petty bourgeois of the two regions the wider interests of the state and the nation are being forgotten. The wider interests could be safeguarded by seeing the movement in its proper perspective and removing the legitimate grievances of the petty bourgeois class. Since the operation of mulki rules in any form imposes a cost on the petty bourgeois of Andhra they will have to be compensated and the cost should be borne by the Centre by assuring them of the jobs which they would otherwise lose. This cost is not much in terms of the benefits to the country as a whole.

The Wild Life (Protection) Act of 1972

A Critical Appraisal

M Krishnan

The grant of statutory protection from being hunted, trapped or otherwise directly harassed, which is what is practicable in an act, will go only some way towards conserving our fauna, even in sanctuaries. All human activities that are not directed at the fauna with hostile intent (like hunting) but which have a no less depletive potential (such as deprivation of habitat, overmuch disturbance by humanity, competition for fodder by domestic animals being permitted to graze in the preserve and the risk of such cattle conveying epidemic diseases to the wild herbivores) must be eliminated from a sanctuary area before the word 'protection' can have any value in actuality, and this cannot be achieved entirely by a comprehensive enactment adopted by all states, but also needs the co-operation of the people and the governments in other ways, even the reorientation of the attitude of most of our state governments towards their forests.

For these reasons, we cannot expect the Wild Life (Protection) Act of 1972 to be fully comprehensive in its scope and application: it can, at best, prohibit direct aggression towards certain animals wherever found, provide punitive sanctions for breaches of such prohibitions, lay down that in preserves, in addition to the prohibition or direct aggression towards the animals, certain human activities should be barred, and provide for adequately diminishing, or extinguishing altogether, existing human rights in the area. An act can also prescribe or specify the administrative set-up necessary for the fulfilment of its objectives and provide for contingencies and specify exceptions.

The Wild Life (Protection) Act does all this, but not always with that informed awareness of our wildlife crisis that one might reasonably expect of it, and not without the weakness of an avoidable provision for compromise. Nor is it wholly free from formal deficiencies.

THE Wild Life (Protection) Act of 1972 seeks, in the face of constitutional difficulties not set out in it, to protect and preserve our dwindling fauna. The need for such a Central act is obvious, even urgent. We have no uniform or even integrated national wildlife policy: we do have a National Forest Policy, evolved long after independence, a policy more honoured in the breach than in the observance, and almost totally lacking sanction in view of the fact that we have no national forests, an important fact that may be explained briefly here to provide the background needed for a fuller and better appreciation of the present act.

Until the attainment of independence, though the governments of most Presidencies and other regions of British India had independent charge of their forests, there was a measure of effective Central control. Under the Constitution, 'Forests' are specifically designated a state subject, and each state has sovereign power over its forests. This does not merely mean that the Forest Department of each state does what it thinks best with the forests under its control (rather than in its charge), and that the Centre has merely an advisory and suggestive capacity in the matter — it means that the state Forest Department, which is only a government department, does what the government in power directs it to do, although it is no doubt con-

sulted in all matters; it means that the ultimate directive and decisive power in the management or mismanagement of a state's forests does not depend on the wisdom of a technically qualified department, but on the secretariat above it, the ministers in office, and of course the politicians and (necessarily in our democratic set-up) the people.

As long as 50 years ago, Eardley Wilmot who was then IG of Forests, pointed out that the forests of India could not be exploited solely on the basis of benefit to the people or monetary gain, or on the basis of popular demands, but had to be conserved, often against such demands. Old departmental names (current still) such as Chief Conservator, Conservator, Ranger, Guard, and Watcher, and some meaning in the bad old British days. Today, owing to the failure of our democracy to realise that even a popularly elected government has the basic duty to safeguard the future of the people and the country against the clamorous demands and abuses of a rapidly growing present population, our wonderful and unique heritage of wildlife (which, more than our culture or racial integrity, sustains the Indian quiddity of India) has been recklessly depleted within the past 25 years.

Among the major depletive factors that have caused this steep faunal and floral decline should be mentioned the usurpation and destruction of wild-

life habitats for human uses (including popular, industrial and departmental exploitation of the forests, the establishment of human settlements and enterprises within the reserved forests and the grazing of cattle with in them), hunting, snaring and poaching of all kinds, the great and consequential disturbance caused to the wild animals by human presence in their homes, the introduction of exotic plant into the environment, and pollution.

It will now be seen that the grant of statutory protection from being hunted, trapped or otherwise directly harassed, which is what is practicable in an act, will go only some way towards conserving our fauna, even in sanctuaries. All human activities that are not directed at the fauna with hostile intent (like hunting) but which have a no less depletive potential (such as deprivation of habitat, overmuch disturbance by humanity, competition for fodder by domestic animals being permitted to graze in the preserve and the risk of such cattle conveying epidemic diseases to the wild herbivores) must be eliminated from a sanctuary area before the word 'protection' can have any value in actuality, and this cannot be achieved entirely by a comprehensive enactment adopted by all states, but also needs the co-operation of the people and the governments in other ways even the reorientation of the attitude of most of our state governments towards their forests.

For these reasons, we cannot expect the present act to be fully comprehensive in its scope and application: it can, at best, prohibit direct aggression towards certain animals wherever found, provide punitive sanctions for breaches of such prohibitions, lay down that in preserves, in addition to the prohibition of direct aggression towards the animals, certain human activities should be barred, and provide for adequately diminishing, or extinguishing altogether, existing human rights in the area. An act can also prescribe or specify the administrative set-up necessary for the fulfilment of its objectives, and provide for contingencies and specify exceptions. The Wild Life (Protection) Act of 1972 does all this, but not always with that informed awareness of our wildlife crisis that one might reasonably expect of it, and not without the weakness of an avoidable provision for compromise. Nor is it wholly free from formal deficiencies.

However, before detailing these criticisms specifically, it should be said that the enactment of such a Central act is itself something of an achievement. We do not lack acts, and notifications under statutory powers, seeking to protect a species or class of animals; there are many such acts in many states, diversely conceived and drafted, and with a very few exceptions they have achieved little, and even been forgotten at times. In the present act it is stated that Parliament, having no power to make laws for the states in the matter "except as provided in articles 249 and 250 of the Constitution", has enacted this wildlife protective law for the states of Andhra Pradesh, Bihar, Gujarat, Haryana, Himachal Pradesh, Madhya Pradesh, Manipur, Punjab, Rajasthan, Uttar Pradesh and West Bengal whose legislatures have passed resolutions enabling the Centre to do so "in pursuance of clause (1) of article 252 of the Constitution". The enactment of a uniform, comprehensive Central law that will apply to no less than 11 states (and also to all the Union territories) is certainly an achievement, and this act may well be extended to other states in future.

The formal deficiencies of the act may be considered first. It is an established legal principle that, since statutes must be construed strictly, unexceptionable clarity and precision is necessary in their statement of objectives, definitions, prescriptions and schedules. The language of this act is not free from redundancy and ambiguity in some small ways. Perhaps only

the carping critic will take note of such trivial things (*de minimis non curat lex*),^{*} but having said this, an instance must be cited. The word 'animal' is defined in section 2(1) to "include amphibians, birds, mammals and reptiles"; the scientific, and even the established statutory, scope of the term is much wider; only in colloquial or lay language is the word 'animal' used to signify 'mammal', and scientifically all living organisms that are not plants are animals; even the Indian Penal Code defines the term much more scientifically and comprehensively than the present act, and it is no credit to the century of scientific study of nature since the coming into being of that code that an act of 1972 should be less accurate in its definition of the term. That apart, the very first line of the act says that it provides for the protection of "wild animals and birds", a needless redundancy even according to its own definition of animals. No doubt this is a trivial defect, but there are more substantial defects in the definitions of the act.

Even the splitting of the word 'wildlife', against the trend of modern scientific English, into two words could have been avoided, especially as the term spelt 'wild life' gets into difficulties the moment one wishes to use it adjectivally. The act leaves one with the impression that it is entirely faunal in its concept of wildlife, but its definition of 'wild life' at section 2 (37) reveals that its unjustifiable limitation of the term only to certain forms of life is, in fact, faunal and not floristic; As per the definition 'wild life' "means any animal, bees, butterflies, crustacea, fish and moths; and aquatic or land vegetation which forms part of any habitat". Take this in conjunction with the definition of 'animals' already referred to, and it is seen that in this act the term 'wild life' is limited to mammals, birds, reptiles, amphibians, fishes, only bees and butterflies and moths of the insects (the largest and most populous class of animals in the world), and crustaceans among animals; so worms, ants, beetles, wasps, dragon flies and a host of other creatures are not considered part of our wildlife by this act. But the entire natural flora of the country is included in it. Everyone knows that plants do not grow floating in the air (though on occasion they may be airborne) but are found on the land and in the water, and all terrestrial. and

^{*} *de minimis non curat lex* = 'the law does not take note of little things' — a well known tag of jurisprudence.

aquatic plants that are not artificially introduced but natural to the environment in which they are found are, therefore, included in the term 'wild life' as defined.

The only possible reply to this criticism is that while the term 'animals' has been defined to include amphibians, reptiles, birds and mammals, it is nowhere said that other animals are excluded! Then why have a definition at all? I am afraid both the definitions of 'animals' and 'wild life' are needlessly inept; it is not as if satisfactory definitions of these terms that could have been adopted were not readily available. For instance, the definition of wildlife in the Expert Committee Report of 1970, which says that the term denotes "the entire native uncultivated flora and fauna of the country", could have been adopted usefully.

The act offers no protection to the floral part of our wildlife, except incidentally.

HUNTING NOT PROHIBITED

The act does not seek to prohibit the hunting of all animals, but only their unlicensed poaching. Except in preserves, i.e. sanctuaries and national parks, many animals can be hunted on licence, and when it is realised that the total preserve area in our country today is well under 1 per cent of the total land area (including all existing and proposed preserves), or under 5 per cent of the total area under the control of our Forest Departments, it will be seen that no wholesale ban on hunting has been imposed. This is reflected in the repeated use of the anachronistic term, 'game', in the act.

There are five schedules appended to the act, all lists of animals. Schedule V could also have followed the rest in providing the scientific name of the species listed after its vulgar English name, to render its identity unmistakable.

Schedule I lists 42 species of mammals, 3 species of reptiles, and 24 species of birds which may not be hunted wherever found. It includes some species unlikely to be found now within Indian limits, such as the cheetah or hunting leopard (extinct in our country now) and the Tibetan gazelle and Tibetan wild ass, presumably, as the lawyers say, by way of abundant caution. All the species listed in this schedule are species threatened, now on the brink of extinction (one or two actually extinct). A feature of our wildlife decline in the re-

cent past is that animals well known in many parts of the country only some 30 years ago are now locally extinct or reduced to rarity. When this is so, the only reasonable and constructive legislative protection that can be accorded to them is to include them in Schedule I here, and, if any such species is locally too abundant or turns a crop-raider in some exceptional non-sanctuary areas, to license their hunting in those areas as can be done under this act. Sections 11 and 12 empower the Chief Wild Life Warden (who is something of a plenipotentiary under the act) to sanction the hunting of any animal in Schedule I when it becomes a proscribed 'rogue' (to use a popular, well-understood term) and a threat to life and limb, and all such animals, as also crop-raiders in Schedules II, III and IV. Considering all this, surely the Crab-eating, Stump-tailed and Pigtailed macaques, the Nilgiri Langur and the Capped Langur, the Hog Badger, the leopard, the Sloth Bear, and the Nilgiri Tahr should have been included in Schedule I. Incidentally, excepting for the leopard and the Sloth Bear, none of the animals listed above can be a threat to human life, or to crops.

When any animal is hunted as a rogue or a crop-raider on licence, it should have been stipulated (as it is stipulated in section 11(3) regarding animals killed in self-defence or in defence of another person) that its carcass would become government property.

Schedule II concerns Special Game (sic.) nearly three dozen species (mainly mammals, a few reptiles) which may be hunted on licence issued by the Chief Wild Life Warden. Presumably, these are considered less acutely threatened than the species in Schedule I; but for the reasons of local extinction and rarity already explained, and even otherwise, many of the species listed here are no less threatened — for example, the sun bear (*Helarctos malayanus*) the occurrence of which within our territorial limits is restricted to two or three instances — and I doubt very much if the wild yak is to be found at all in India.

Schedule III (Big Game) lists 20 species of mammals, which are obviously considered even less threatened than those in Schedule II. The wolf and the sloth bear from this schedule should have gone into Schedule I. One can imagine the smile on the face of our nimrods when they find

from this list that the ratel, the mouse deer, and the hyena are big game animals.

Schedule IV lists classes and species of Small Game.

Schedule V lists 6 mammals and the 'common crow' as vermin. Whether, in most urban areas of the country the common crow is the House Crow or the Jungle Crow is debatable, but perhaps both are meant. What shocks one is to find the charming little Indian Fox (*Vulpes bengalensis*), an exclusively Indian and nocturnal animal that is the farmer's friend, listed as vermin! It is one of the authentic animals of our plains forests and coastal flats, now very much on the decline because of human usurpation of its territory, and should unquestionably have gone into Schedule I.

Some common Indian animals are not mentioned in any list, for example the Rhesus and Bonnet Macaques (the commonest monkeys of the country — the former, now on the decline, perhaps the best known monkey in the world and the latter exclusively Indian) and the Common Langur, the only monkey with an all-India distribu-

tion. Is it to be taken that, in certain parts of the country at least, these animals are not in need of protection?

An avoidable weakness in the act was mentioned. A century of forestry in our country has amply demonstrated the pernicious influence of permitting wood-poachers to compound their offences. Perhaps there is some monetary gain to the government by compounding such offences, but it only encourages poachers to commit offences, since the mobile patrol squads and protective personnel of our Forest Departments are, at best, able to apprehend some 15-20 per cent of those actually committing offences, and a poacher finds it lucrative to pay the compounding penalty when he gets caught only once in five times. The justification for imposing punishment for offences is that it is deterrent, and compounding offences by payment of a fine to government (unknown to criminal law as an option) definitely undermines the very object of prohibiting any depletive action. It is most unfortunate that in this act, section 54 specifies quite easy terms for compounding offences.

ECAFE Report Underscores Relevance of Chinese Experiment

AN assessment of Asia's progress towards the social and economic targets of the Second Development Decade, recently released by the United Nations Economic Commission for Asia and the Far East (ECAFE), cites the experience of the People's Republic of China in these fields as "of extreme importance" for developing countries. Reviewing the progress in institutional structures and reforms in the region, the Survey says that, while some differences of opinion over "basic institutions — such as the private ownership of means of production — may be irreconcilable for some countries", these differences "should not be allowed to obscure the fundamental fact that the problems to be tackled are much the same and that organisational forms that have proved successful in one type of society may well be adjusted to the other type, without necessarily conflicting with ideological requirements." The survey argues that the advantage of the mixed system is precisely that it can draw extensively on the experience of both market economies and centrally planned economies.

In this context, it underscores that China's experience in the social and economic field is of extreme importance. The impressive effectiveness of

certain pragmatic and logically simple steps provides an important lead for similar action in other countries. Some of these measures could be adjusted to the mixed economy framework without ideological implications, "although their effectiveness may be constrained by the different institutional framework in these countries and the nature of the problems to be solved", (italics added).

The ECAFE report lists the following among "important aspects of the Chinese institutional framework, which have crystallised after the 'cultural revolution': self-financing of regional development; decentralisation of decision-making to the lowest level; a high degree of flexibility in planning and target-setting; need-and-action-oriented education, training and research; persuasive methods to give local and rural motivation to the trained personnel; and co-ordinated and balanced development of production, personnel and infrastructure."

The Survey feels that all these developments are of crucial relevance for the other developing countries of the region. It goes on to point out that the institution of a 'revolutionary corps' in Iran, and 'land reform teams' in Nepal, are based on similar motivation.

Tax Incentives for Saving and Investment

M P Chitale

In a situation where a large variety of inessential consumption articles are purveyed to the people with the help of high pressure selling and where possessors of black money every day set new styles in high living, the pressure to consume is almost irresistible. To counter this pressure, effective measures have to be devised to induce people to save and invest.

However, under the existing system of tax incentives, the amount of tax benefit depends not so much on the volume of saving as on the level of the individual's taxable income. The result is that higher tax bounties are offered where the sacrifice involved in saving is almost nil or negligible.

This perverse system should be replaced by one under which the rate and quantum of the tax benefit would depend on, and be directly linked to, the volume of savings generated in such a way that the larger the amount saved, the larger the tax benefit.

HOW to raise the rate of saving when the level of production is insufficient to meet the bare requirements of life is a persistent dilemma before the developing countries. The experience of developed countries shows that two conditions are essential to place a society firmly on the path of economic progress: First, continuous improvement in the rate of investment and, second, effective use of available resources and development of attitudes and methods calculated to improve productivity.

Anxious to raise the level of investment without causing undue inflation, the Central Government levied in the 1972-73 Budget additional taxes estimated to yield Rs 183 crores. This was done with the full knowledge that in 1971-72 taxes fetching Rs 500 crores had been already imposed. In spite of this substantial increase in the tax effort, which helped secure an increase in gross tax revenue of Rs 4,300 crores over the level in 1970-71 (Rs 4,538 crores against Rs 3,206 crores), the revised estimates show an overall deficit of Rs 550 crores in 1972-73. Deficit financing of this order was found necessary even after borrowings and other capital receipts had provided Rs 500 crores more than the budget estimates.

Over the last seven years, since 1965-66, gross tax revenue has increased by about Rs 2,500 crores. Yet, development expenditure on education, health, industries, export promotion, etc., and the revenue surplus in the Revenue Budget have improved by less than Rs 100 crores (Rs 670 crores against Rs 577 crores). In other words, although gross tax revenue increased by 120 per cent, the resources available for development showed an increase of only 15 per cent. Out of every Rs 100 collected by way of additional tax, hardly 4 per cent could be devoted for development purposes and that too in terms of the falling value of the rupee. Almost all the increase in tax

revenue has thus been swallowed up in expenditure on general administration, defence, interest payments, grants to states, et al.

As the increase in tax revenues and borrowed funds has not been sufficient to meet Plan outlays, recourse has been taken to deficit financing. Over the last three years, 1970-71 to 1972-73, close to 20 per cent of the Plan outlay has been financed by Reserve Bank credit to government. The upshot has been the steady and continuous rise in money supply and prices of about 10 per cent every year.

Recourse to additional taxation and deficit financing is required every year because savings otherwise not adequate to finance the Plan outlay or investment. Consider, in this context, the Fifth Plan objective of achieving self-reliance. When it is noted that as much as Rs 2,250 crores or 23 per cent of the Plan outlay in the three years 1970-71 to 1972-73 have been financed by external assistance, the imperative need to ensure adequate growth in the rate of domestic savings becomes obvious. But for this should we continue to use the same old tools and methods which have proved ineffective? The purpose of this article is to question the efficiency of the old methods and to plead for rethinking and development of new approaches.

REGRESSIVE SYSTEM

Take, for example, the new proposal to increase the deduction available on savings made in the form of life insurance premium, contribution to provident fund, etc. In respect of the annual savings made in this form an individual or HUF was entitled in computation of taxable income to a deduction equal to 100 per cent for the first Rs 1,000 of saving, 50 per cent for the next Rs 4,000 and 40 per cent for the balance amount of the qualifying savings. The change proposed in

the Finance Bill 1973 will enable a taxpayer to get a deduction equal to 100 per cent for the first Rs 2,000 of savings. The amount saved in excess of the first Rs 1,000 will thus get a deduction equal to 100 per cent instead of 50 per cent as till now. A taxpayer who saves Rs 2,000 in this form will get a deduction of Rs 2,000 instead of the existing deduction of Rs 1,500. On the Rs 500 the taxpayer will get tax relief at the marginal rate of tax applicable to his income. If the taxpayer's income is Rs 10,000, the new proposal will reduce his tax by Rs 55 (11 per cent of Rs 500). If the taxpayer's income is Rs 30,000 he will obtain a tax deduction of Rs 287 (57.5 per cent of Rs 500). If the income exceeds Rs 1 lakh, the tax deduction will be Rs 460. Thus although the amount saved is the same, say, Rs 2,000, the benefit by way of tax deduction is not the same.

The amount of tax benefit depends not so much on the volume of your saving but on the level of your taxable income. Under the present system a taxpayer earning over Rs 1 lakh gets a tax benefit of Rs 920 on the paltry amount of Rs 1,000 which he can save without any hardship. In a large number of cases where life insurance policies have been already taken and where contribution to Provident Fund takes place almost automatically by way of deduction from the monthly salary or where, under the amendment provision of the payment of Bonus Act, a portion of bonus will be credited to the Provident Fund straightaway, and in all cases where saving in the form of life insurance premium or provident fund contribution is Rs 2,000 or over, the new proposal will really mean a gift from the government ranging from Rs 55 to Rs 488, depending on the level of the taxpayer's income. This gift will be made by the government though there is no extra effort on the part of

the taxpayer to enlarge his saving. It is futile, therefore, to expect any improvement in the volume of saving because of this new proposal. How the existing method of giving tax benefit to encourage saving is regressive and ineffective and even damaging to its intended objective can be realised from the following illustration.

If the taxpayer's income increases, say, from Rs 15,000 to Rs 25,000, ordinarily he should be expected to save a larger sum. Under the existing system of making weighted deduction, although his savings may remain at the previous year's level, say, Rs 2,000, the tax benefit will be larger because he will get a tax deduction at the rate of 34½ per cent (the marginal rate of tax applicable to an income of Rs 25,000) instead of at 18.7 per cent (the rate applicable at the level of Rs 15,000). Further, he will get this larger deduction even if he spends away the entire amount of his additional income without making any addition to the country's savings pool. The fact that a person who can save Rs 1,000 or Rs 2,000 in the ordinary and natural course because his income happens to be large, should get a bounty from the government at higher rates highlights the irrationality of the present method by absence of any consideration for cost benefit calculation.

It needs to be reiterated that in the existing conditions when a variety of fancy and inessential commodities are purveyed before the public with engaging appeals through newspapers, films and other mass communication media and when possessors of black money symbolise a new style of living inflaming the desires of others, there is so much pressure on every household to spend that, to counter the natural tendency to spend, an effective countervailing measure has to be devised to induce people to save and invest. Extra saving involves a larger sacrifice. The rate and quantum of the tax benefit should, therefore, depend on and be directly linked to the volume of savings generated in such a way that the larger the amount saved, the larger is the tax benefit. The perverse method, prevailing at present, of offering a higher bounty where sacrifice is likely to be almost nil or negligible should be replaced by a method which will make available tax benefits at a progressively higher rate on the extra amount saved and invested. Just as rates of income-tax are progressive, the rates of tax benefit or tax credit should

also be progressive so as to induce a person to save and invest the largest possible portion of his income.

INCENTIVE FOR INVESTMENT

Mention must be made of another shortcoming of the existing scheme of tax incentive for promoting saving. The existing tax benefit is available only in regard to saving made in specified forms such as life insurance, provident fund, etc. These media are not suitable for numerous taxpayers who would like to hold their saving in the form of investment in their own proprietary and partnership business or shares in limited companies. According to the All-India Income-Tax Statistics, 1966-67, there were one lakh assessments concerning income from proprietary business or from partnerships, covering a gross income of about Rs 1,400 crores. During the same financial year, 1966-67, assessments concerning salary income were 7.5 lakhs covering a gross income of about Rs 600 crores. It will be observed that a significantly large number of assesseees having the potential to save have no suitable tax incentive encouraging them to save and invest in a field of their choice. When the policies of the commercial banks and the state financial institutions are being geared to assisting industry on the basis of viability rather than security, it is all the more desirable to encourage individuals to take risk and directly participate in contributing risk capital to industry and business. Moreover, apart from the common need of saving for old age, sickness and education, in the case of businessmen there is an additional need of saving, namely, saving for investment in one's own business or industry. When prices are rising every year, working capital needs of business and industry become larger even to maintain a given level of activity. A growing business requires still larger working capital. At the existing tax rates there is no room for saving for investment in business after meeting consumption needs. Neither are our banking practices such that almost the whole of the increase in working capital can be financed by banks. This situation leads to large-scale suppression of stock and tax evasion.

A significant change in the environment will take place if persons in industry and trade are enabled to save and invest in an open manner. After all, these are the fields where opportunities for making black money and tax eva-

sion are more pronounced. Moreover, there is a greater likelihood of small and medium commercial and industrial ventures being run with economy, imagination and watchfulness if they are managed by persons having a stake in the business.

If the tax measures intended for reducing inequalities of income and wealth impede the application of resources for improvement in productivity, such measures become ineffective and self-defeating. The development of countries not blessed with significant natural resources, like Switzerland and Japan, shows that wealth is not a static quantity. Moreover, the concept of egalitarianism need not be extended to sharing of machines or the productive apparatus. So long as the productive apparatus is used for social development and not for personal consumption, the choice as to who should use it should be determined primarily on consideration of improvement in productivity. Gandhiji's concept of trusteeship in regard to wealth is indeed constructive, particularly in its application to wealth in the form of means of production. The gift tax, estate duty, wealth tax and even the expenditure tax can be used to take care of widening income disparities. In other words, so long as income earned is devoted largely to saving and investment and not spent on personal consumption, very wide disparities in personal and household consumption would disappear. This also can be viewed as a first step in checking black money and tax evasion. If saving and investment can be made in an open manner, resort to tax evasion at least for the purposes of effecting saving will be eliminated.

There is a view that exempting all savings in financial form from income-tax, so that the high rates of tax would impinge not on savings but on personal consumption, is not a very practicable proposition. It is argued that when checking of income-tax evasion poses such difficult administrative problems it would be all the more difficult to keep a check on consumption. When income-tax was first introduced similar misgivings must have been expressed about its efficacy and the difficulties of spotting and computing income. The Wanchoo Committee has recommended that the income-tax return be accompanied by a statement giving broad particulars of personal and household expenditure and a statement of assets and liabilities. If legitimate saving and investment are encouraged

without attracting unduly high rates of tax, the attention of the tax administration can be directed to watching the levels of consumption. This will tend to create a climate more conducive to promotion of saving and checking the rapid spurt in lavish consumption.

TREATMENT OF CAPITAL GAINS

One cannot get away from the fact that inability to collect adequate saving remains the only justification for government's resort to deficit financing, leading to inflationary pressures all round. In this situation, it is difficult to appreciate the policy of giving concessional treatment to long-term capital gains. It is proposed in the Finance Bill, 1973, to narrow the amplitude of long-term capital gains eligible for tax concession. A capital asset will be treated as a long-term capital asset only if it is held by a taxpayer for not less than 60 months (instead of 24 months till now) prior to the date of transfer. Although the scope of capital gains entitled to concessional treatment is being restricted, the basic fact remains, namely, that the concessional treatment will be available even if the capital gains and the sale proceeds of the capital asset are utilised wholly for purposes of consumption. There is nothing that links the concession to the manner in which the income is used. In order to augment the savings pool, it is desirable to give concessions on the basis of the amount saved and invested. Instead of giving concessions on the basis of the holding period of the asset it would be desirable to give incentives calculated to encourage new entrepreneurship.

The industrial licensing policy has been geared to promotion of small and medium enterprises and to directing established big business houses to use their skills and resources in the core sector. The emergence of new entrepreneurship and the undertaking of new ventures, small or big, would involve investment in new fields and activities. This also involves withdrawal of old investments in established industry and utilising the same for investment in new ventures. Prospective entrepreneurs may want to dispose of their immovable or movable property and invest the proceeds as risk capital in a business venture. It is the individual having substantial wealth who can be expected to take interest in new ventures which may not yield a profit for a long period. Individuals from the

low and middle income groups can be induced to invest their savings in established industries solely on the basis of their attractive yields. Those having comfortable levels of incomes and wealth should be encouraged to switch from investment in established industries to investment in riskful new ventures. The wealth tax and capital gains tax can be used as significant instruments in securing such a switch. Exemption from wealth tax for a specified period for investment in new ventures in a particular field and treating capital gains like ordinary income, but eligible for exemption, or a tax incentive in respect of the amount saved and invested will transform and strengthen the structure of our capital market.

The retention of the capital gains tax and the amendments of the nature proposed in the Finance Bill 1973 make an investor reluctant to change his investment and so discourage the flow of capital into new ventures. This not only fails to enlarge saving but also obstructs the flow and mobility of investible funds. Our tax structure has for far too long bestowed favourable treatment on investment in gold, jewellery, life insurance policies or provident funds. Actually, it is invest-

ments carrying an element of risk that should receive favourable treatment. It is desirable that an increasingly large number of persons should be encouraged to take risk and turn into entrepreneurs or job-givers instead of being job-seekers.

SEMI-MONOPOLISTIC POSITION

Similar considerations should prevail in designing the corporate tax structure. How business firms can be encouraged to effect economies and improvements in productivity, how promotion of new companies can be fostered and facilitated and how wide participation can be promoted and encouraged need to be thought out anew. Treading on the same old path will further impede the emergence of new competing units and make it possible for the existing companies to acquire a semi-monopolistic position. The high rates of tax today have merely acted as an in-built lever for padding of costs and pushing up prices. The experience of the past several years has exposed the unsuitability of the existing method of taxation for the primary task of improving the rate of saving and investment and encouraging the forces of productivity.

Molins of India

MOLINS of India — a subsidiary of Molins of the UK — which manufactures cigarette-making and -packing machinery and spare parts thereof, is making a public issue of 83,052 equity shares of Rs 10 each for cash at par under a Prospectus. Besides, 2,50,300 fully paid-up equity shares, owned by two large shareholders, viz, India Tobacco and Vazir Sultan, are being offered for sale out of their own holdings. After this issue and offer for sale is completed, the holding of the foreign and foreign-controlled companies in the equity capital will be reduced from 85 per cent to 60 per cent — in compliance with the government of India's policy of Indianisation. MIL has manufacturing facilities at Behala near Calcutta and also at rented premises at Chandigarh. The latter are being replaced by a factory building under construction at Mohali in Punjab and is due for completion around April next. Started in 1960, the company originally catered for the spares needed by the cigarette industry, but is now cap-

able of manufacturing a complete range of cigarette-making and -packing machinery. The first completely indigenous cigarette-packing machine has just been completed. The import content of raw materials and piece parts have been reduced in successive batches. Sales have steadily grown, from Rs 36 lakhs in 1967 to Rs 166 lakhs in 1971. Sales in 1972, upto the end of August, were Rs 129 lakhs. According to the directors' estimate, turnover for the full year should be Rs 181 lakhs and pre-tax profit Rs 45 lakhs. An interim dividend of 8 per cent has already been declared and no final payment is intended to be made for that year. The managing director, A J G Ellis, expects the company to pay a dividend of 10 per cent for the current year. The company suffered losses in 1967 and 1970 due to strikes and closures, but it earned profits in 1968, 1969, and 1971. As at the end of 1971, it had reserves of Rs 10 lakhs against a capital of Rs 92 lakhs entirely in equity.

The Industrial Credit and Investment Corporation of India Limited

H T Parekh

ICICI Chairman

refers to improved working of industry in 1972

☆ Dangers of standing still

☆ Need for speedy decisions by Government

☆ Call for Pragmatic Approach to Industrial Growth

THE following is an extract from the Statement of the Chairman, Shri H T Parekh, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1972.

The end of the year 1972 has not maintained the euphoria which one saw at its beginning. Early 1972 saw a new confidence in India, arising out of the emergence of Bangladesh as a new independent country — an event to which this country contributed not a little. In the aftermath of this event, India withdrew its military presence in the newly independent country, and the Bangladesh administration was able to inspire confidence in its nationals who had migrated to India for safety, to return to their homeland. We had also carried out elections in most of our States, thus reaffirming the faith in the democratic process.

The whole series of events lent a certain strength to the country's political and economic position. Politically, the emergence of Bangladesh as a friendly nation has helped to improve India's status in the region; the new alignment has brought about a geo-political structure in the region which is in keeping with India's peace-loving policy. India has also tried to consolidate this situation by friendly gesture to the new administration in Pakistan, resulting in the holding and successful conclusion of the Simla summit.

ECONOMIC SITUATION

Considered in the light of this situation, the economic gains made by the country during 1972 must be considered unsatisfactory. After a series of five years of good harvests, our luck with the monsoon seemed to have run out in 1972: the *kharif* crop has been substantially lower than in the previous year, and the loss, despite the energetic

steps taken by the Government to increase output in the *rabi* season, is likely to be only partially made good by the *rabi* crop.

A failure of monsoon, on the scale we had in the 1972 season, has wide repercussions on the economy despite our attempts to insulate our economy from them. Given the dependence upon hydel power, such failure has a direct impact on power supply, and the country is faced with power cuts in several States. One of the major factors in the present power crisis is the poor maintenance of power generating units. Considerable progress has been made in the matter of preventive maintenance in advanced countries, and we need to bring to the management of our power generating units modern management techniques.

A failure of monsoon has also indirect repercussions on the economy. Firstly, it involves import of foodgrains and a consequent drain on our foreign exchange reserves, though fortunately such imports are likely to be marginal in relation to our domestic production and consumption. Secondly, a shortage of foodgrains leads to a rise in their prices, and consequently, to a rise in wages and a difficult labour situation. Finally, the extensive power cuts are likely to have an adverse impact on the rising trend in industrial activity, which was noticed in the first nine months of 1972.

After its poor performance in 1971-72, industry had begun to show signs of an upturn in the first three quarters of 1972. This upsurge was led by cotton textiles where plentiful and cheap supply of cotton helped to stimulate both production and demand for cotton textiles. However, this would have given only about a 2 to 2.5 per cent gain to the industrial production index; the

much larger rise in the index suggests that recovery in industrial production is more broad-based. Gradually, it is becoming apparent that demand is catching up with production facilities in a number of industries. The Government should try to bring about the rapid rehabilitation of sick cotton textile mills, and provide for expansion of the cotton textile industry to provide for greater domestic availability and increasing exports. It should also consider the possibility of extending the existing list of industries in which it has allowed freedom of production above licensed capacity.

The picture in the tertiary sector is not so satisfactory. The level of railway traffic and wagon-ordering remains low, though currently steps are being taken to improve the working and efficiency of railways. Power generation, as I mentioned earlier, has been affected by poor rainfall; its impact will be felt on industrial production during the period September 1972 to June 1973.

India's exports have shown a welcome rise in the first nine months of 1972, though it must be recognised that the rise reflects essentially a fulfilment of the aid commitment to Bangladesh; it is only to the extent that we are able to consolidate the gains out of aid in the form of long-term commercial entry into the Bangladesh market that we would benefit from this trade. On the other hand, with renewal of foodgrain imports, our import bill is likely to rise substantially in the first half of 1973, and the comfortable foreign exchange reserve situation which we have so far enjoyed is likely to be impaired to some extent in the coming months.

At no time in the last 20 years has the banking system shown such liquidity as during 1972. To some extent, this was a result of the more rapid ac-

cretion of banking deposits. However, the main factor in the considerably relaxed credit situation throughout 1972 was the low demand for credit from the industrial and trading sector. In fact, the Government sector seems to have been responsible for whatever little expansion has taken place in demand for bank credit. With a poor harvest and continued increase in money supply, the price situation worsened, the average rise in price level being 12 per cent in 1972.

Summing up, I would consider that except in industrial production, there was a marked setback in the economic situation in 1972; moreover, the aftermath of this setback is likely to be felt at least till the middle of 1973.

NEED FOR FRESH THINKING

The Government needs to determine its economic policy in the light of this situation and its long-term goals. Gradually, thinking is getting crystallised on the long-term objectives. The Planning Commission has come out with an Approach Paper on the Fifth Plan. It accepts the basic philosophy of having a time-bound programme for providing minimum subsistence to all as the main objective of planning, and proposes a development strategy intended to achieve this objective. This represents a major advance in our planning effort.

However, increased welfare is clearly related to enlargement of the national cake, and it is on policies related to this aspect of planning that the achievement of the new planning objective depends.

It is in this field that we need to do fresh thinking on planning and policy issues. The experience of the last four years shows that hesitation in taking policy decisions leads to a situation of drift. While we could afford such drift in a situation of expanding agricultural production and relatively stable price level as during the last four years, we can hardly afford to stand still in the context of increasing supply of labour, and demand for creation of employment opportunities. The only means of creating employment opportunities is revival of investment activity.

In development, time is the commodity in shortest supply. As expectations rise, the dangers of standing still, of letting time pass, multiply. This is particularly so in a democratic set-up where the Government has to be responsive to, and keep up with, people's expectations. A situation of immobilism creates its own counter-action in the form of restlessness.

There is no worse example of the cost of delay and indecision than our oil programme. Oil exploration has been going on at a slow pace, and a

firm decision on drilling at Bombay High was avoided for a long time. As a result, our import bill on oil has been increasing rapidly, and, given our requirements of oil under the Fifth Plan, is likely to increase even more rapidly during the coming years.

Further, the impact of any investment decision is felt on production only after a lag of time. The impact of the failure to invest during the last three years will be felt in production which would be lost in the coming three years. Taking only one example of cement, during the last two years cement-machinery-making plants have suffered from excess capacity owing to lack of orders. Simultaneously, cement is beginning to get in tight supply, and in the next two years, there is likely to emerge a sharp shortage of cement. The recent decision to seek foreign help for setting up five large fertiliser projects is another consequence of the failure to make the most of time when it was available. Such alternate bouts of investment, famine and excesses lead to waste of industrial capacity through non-usage, loss of market opportunities and a distortion of planning decisions.

MANAGING THE ECONOMY

The long run problem of development will be taken care of by decisions now being taken on the Fifth Plan. The coming twelve months will see the emergence of a broad policy framework within which such decisions will be taken.

Since 1951 when we commenced planning, the country has come a long way: from being a producer of a few industrial goods, we have built up a vast industrial structure which is inter-related. This is evident from the fact that while a shortage of steel would hardly have had any impact on the country in 1951, today it has widespread repercussions on production in different sectors and thus on the economy. Secondly, apart from its general powers, the Government now controls, through banks and finance institutions, most of the financial resources flowing within the economy.

In a sense, these changes have brought about a situation where the Government has acquired powers which could deal with the situation it seeks to control. For, it has to be realised that the task of controlling an economy becomes more complex as the economy becomes larger and its production structure gets integrated. Formerly, a stoppage of investment in, say, the cement industry meant that imports of cement machinery were stopped, thereby also saving foreign exchange; today a

stoppage in cement expansion has a chain reaction on the domestic industry, leading to idle capacity in cement machinery units, their ancillary suppliers and so on. Shortage of cement also affects road and other construction activities, and thus retards the growth of employment opportunities. This has actually happened in the case of coal and railway wagon demand, and is responsible for the slackness in the engineering sector. In fact, the economy has so developed during the last twenty years, that the minimum level of investment required to keep it fully operative has increased considerably. The present slackness in the economy indicates that investment is not taking place at the level required.

Given these inter-relations, the task of managing economy has also become more difficult. Any official decision at one point — for example, import of components — has far-reaching repercussions all along the line. Moreover, the number of decisions needed to be taken is far larger and far more complex than in the early days of planning. If the administrative decision-making machinery is not clogged up today, it is mainly because, with the economy operating at a low pace, the pressure on it is less. The number of industrial licences issued in early-sixties was about 1,500 per year. Even after the recent increase in exemption limit, given the rise in prices and increase in the size of the economy that has occurred, even to maintain the relative rate of investment, the number of industrial licences required to be issued today would be about 2,000 against less than 500 actually being issued.

Whatever the objectives — and let us recognise that there is little difference of opinion within the country on the objectives — ultimately it is on production and investment policies and their effective implementation that the attainment of the objectives depends. Experience has shown that the period of implementation — of gestation — of projects has been unduly long, and that plan achievements have been at least 10 to 15 per cent below targets. This is not because the targets were ambitious; by any standards the targets have been modest. What has held up implementation is the slow pace at which the administrative machinery functions.

With the vast degree of Government intervention in the economy — the latest examples are amendments to the company and foreign exchange laws — it is necessary to recognise that the Government has become the fifth factor of production. It is necessary that the Government carries with it the support of the industrial community in the va-

rious measures it proposes for industrial revival and reforms.

The need to maintain over-all supervision over, and direction of, the economy will continue in future. The broad contours of the development strategy would be laid down by the Planning Commission. Within this framework, the Government needs to consider whether the procedural machinery and administrative restraints are in consonance with the requirements of the economy and whether the Government cannot achieve the same objectives through different means.

Rate of Investment

It is here that the Government, through its control of financial resources, can make its policies more effective without making the administrative machinery more cumbersome. Today, no large investment proposal, whether for a new project or expansion of an existing undertaking, can go through without the banks and finance institutions being involved in its financing. It is necessary that the Government takes specific measures to improve the climate. In this connection, I am glad to note that the Government is examining the problem regarding resumption of forward trading in shares.

If the economy is to take off, the rate of investment in industry will have to increase manifold over its present low level. In terms of existing administrative machinery, it will involve issue of 2,000/2,500 industrial licences per year, an increase (though not to the same extent, thanks to the development of local production facilities) in import licences for capital and current goods, and capital issues consents of Rs 300 crores per year (against about Rs 100 crores at present). It is necessary that we adapt our policies and gear our administrative machinery to deal with this volume of business, if it is not to act as a bottleneck to industrial expansion. Government proposes to generate larger incomes in the low-income groups. This will have its impact on the demand pattern in the economy. In the field of industry this requires that the Government takes responsibility only for laying down targets for key or core sectors of industry. The industrial sector should be left free to respond to the demand situation created by the Government's development and income policies, and to propose investment programmes in the light of the market conditions in the economy. Project costs have been rising, particularly over the last four years which have seen inflationary trends persist even in advanced countries. Under the existing exemption limits, the number of projects needing industries licensing would be large when

industrial investment picks up; I suggest that the Government consider the possibility of increasing the investment limit for industrial licensing from the present Rs 1 crore to Rs 3 crores letting all investment below Rs 1 crore free. This will reduce the burden on administrative machinery and facilitate the flow of administrative decisions.

In this context, it is also necessary for the Government to adopt a clear policy on industrial growth. The rate of investment required in industry and the rate of growth of industrial production envisaged under the Fifth Plan are much greater than have been achieved during the past five years. If these targets are to be achieved — and the situation hardly allows the Government any choice in this matter — it is not possible to continue with a drift in industrial policy. In this connection, I welcome the recent announcement of the Government redefining the large houses and widening the scope for its operation by enlarging the core sector. With this clear enunciation, I do hope that new investment will be resumed vigorously.

In the past, established houses are estimated to have been responsible for approximately half of the industrial investment in the country. The Government cannot expect to decapitate this sector without filling the gap so created by finding other entrepreneurs. This will take time; in the meanwhile, what the Government should try to do is to lay down the conditions — like broadening of shareholding — under which investment by established houses would be allowed and to provide appropriate incentives to smaller entrepreneurs to enable them to grow faster.

The Government has recognised the need for a more flexible, pragmatic approach in respect of off-shore oil exploration. Foreign capital does not bring in only finance, but it also gives the country access to new technology, management and marketing techniques. It is to be hoped that the Government will gradually extend this pragmatic approach to other sectors of the economy.

One other aspect of the current inflationary trends is the rising cost of projects. Apart from creating problems of raising finance, it also creates problems of viability of projects — particularly in the context of a price freeze, formal or informal, on the products of the industries. The Government does need to give thought to the inhibiting impact of such price freezes on investment, in the light of the growth requirements envisaged for the industries concerned.

Implementation of an industrial programme is not only a matter of wishing it or of setting targets. Hard decisions have to be taken in respect of choice of agencies, allocation of resources, and

giving of administrative sanctions. This is the time when the Government, learning from the experience of the recent past, should work out a clear policy for industrial growth. Planning can be effective at the implementation to the extent it involves people in the planning effort.

ICICI's Operations

During the year under review, the Corporation augmented its rupee resources by an issue of debentures of Rs 7 crores. This was our third debenture issue on the capital market. As regards foreign currency resources, we have approached the International Bank for Reconstruction and Development, the Kreditanstalt fur Wiederaufbau and the British Government for further lines of credit; we hope to receive them during the current year.

Income of the Corporation from interest, dividends, underwriting commission and other resources amounted to Rs 1,373.62 lakhs in 1972 (Rs 1,152.59 lakhs in 1971). Interest paid on loans and other expenses during the year amounted to Rs 992.55 lakhs (Rs 817.51 lakhs in 1971). Profits before tax amounted to Rs 381.07 lakhs (Rs 335.08 lakhs in 1971). Out of this, provision for taxation has been made at Rs 191.74 lakhs (Rs 155.81 lakhs in 1971). Of the balance of Rs 189.33 lakhs (Rs 179.27 lakhs in 1971) carried to the appropriation account, Rs 111.33 lakhs (Rs 104.27 lakhs in 1971) has been transferred to the General Reserve, Rs 30 lakhs (Rs 30 lakhs in 1971) to Reserve against Doubtful Debts and Rs 48 lakhs (Rs 45 lakhs in 1971) to Special Reserve; in addition, the whole of the capital gain of Rs 43.77 lakhs (Rs 48.69 lakhs in 1971) after taxation has also been transferred to Capital Reserve Not Available for Dividend. The directors are glad to recommend a dividend of 10 per cent (10 per cent in 1971).

Shri. Kasturbhai Lalbhai, who had been a Director of the Corporation since its inception, resigned his directorship in January 1973. The Corporation benefited considerably from his advice and guidance. His keen business acumen, understanding of industrial and financial problems, and a broad vision of the tasks facing the Corporation in its infancy have raised its stature to the present level. I wish to record our sincere appreciation of his valuable services to the Corporation and his mature judgment and sober counsel in the affairs of the Corporation since its inception 18 years ago.

Finally, I would like to mention that this Corporation has continued to receive from its staff devoted service; I take this opportunity to express my sincere thanks to them.

February 15, 1973.

A Policed Democracy?

THERE is a certain pattern here. At one end, newspapers carry pictures of how state governors are busy taking the salute at police parades and how — with the ghost of British colonialism lurking all over — in such parades, even the dog squad is not left out. At the other end, there are increasing reports of indiscriminate firing, indulged in on apparently the flimsiest of pretexts by the police, including the CRP, on unarmed crowds, whether it be in Andhra Pradesh, Orissa, Madhya Pradesh or Gujarat. As prices soar, discontent among the masses of people, particularly those who are pegged to fixed wages or those who are denied any means of livelihood, begins to mount. The discontent finds expression in diverse manners. The particular incident which brings about a confrontation between the police and the people varies from place to place, but it is passion germinating from the scarcity of essential commodities and the rising tempo of inflation which is working itself out. There is little attempt on the part of officialdom to squelch this passion with an understanding sympathy. Trigger-happiness would appear to have taken over. In a country with 570 million odd people, of whom the majority live in unspeakable squalor and poverty, a unit of human life is, on occasion, in financial terms not worth even a quarter of what is annually spent on an individual member of the police dog squad. Once the creeping virus of authoritarianism spreads among the ruling circles, the message travels down fast among the ranks of the police. As those in power become insensitive to the mainstream of popular sentiments, the predictable response mechanism makes them fall back on the matrix of impatience. Impatience, in turn, nurtures the temptation to resort to summary solutions, including the invocation of the forces of law and order. From that point, it is a short haul for the police to take the cue and spray just any demonstrating crowd with bullets.

A statistical analysis would provide evidence of a gradual shift in the sentiments of ruling politicians towards the police. Apart from other things, there has been in recent years a sharp increase in the number and frequency of awards to the members of the police force; *sewa padaks* of this or that kind are experiencing an inflation of their own. There is also a developing pattern of lionising individual police officials, which goes ill with the supposedly democratic character of our system.

This in a way complements the continuous pampering of the defence forces. General Manekshaw has not only obtained his elevation as Field-Marshal; he is also now entitled to a special additional pension of sixteen hundred rupees per month; similar dispensations are being arranged for the chiefs of the naval and air commands of the Bangladesh operations. There are two separate aspects of the matter which deserve comment. First, an impression is being sought to be created that the service chiefs, in their individual capacity, had something special to contribute to the victory over Pakistan; the fact that it was a mere quirk of accident that these particular individuals were in charge of the respective commands in November-December 1971, is being conveniently brushed aside. Second, there is no mention of whether along with the chiefs, the contribution of the rank and file of the services, too, would be recognised and rewarded. If the vanquishing of Pakistan is a glory which devolves almost exclusively on the defence services, the rewards to go with this glory should be evenly shared by each and all belonging to the services. To pick only the three defence chiefs for showering favours not only indicates a blatant anti-egalitarianism, but also lends ground for suspicion that all this is part of something else.

If one adds the expenditures under the current as well as the capital accounts, this country, it will be seen, is spending away on the police and the defence services an aggregate sum which is even greater than the overall developmental expenditure each year. There is scarcely any justification for this order of expenditure on the forces of law and order in a developing country which calls itself a democracy. Gratitude is not an inconsiderable virtue, but an excess of it may have other implications.

French Elections

The 'New Liberalism'

FRENCH and other hearts went pit-a-pat, it now seems, for altogether unfounded reasons. The innate conservatism of the bourgeoisie re-asserted itself in the final round of the French elections; the Gaullists are back in power with a comfortable even if reduced majority. Those of the commentators who were waxing eloquent on fundamental shifts that had allegedly taken place in French political attitudes in the course of the past five years have thus been robbed of their avocation. The so-called combination of the Left — consisting of the Communists, the Socialists, and the Radicals — has but one meagre solace yet; in terms of aggregate votes cast, they polled as much — 46 per cent — as the Gaullists and the Centrists who banded together against 'totalitarian communism' on March 11. However, given the gerrymandering of the constituencies — which was done in 1958 in order to whittle down the possibility of the Communists being elected — in too great a strength — the Left would have needed a clear advantage of something like six to seven per cent of aggregate votes over their opponents to obtain a majority in the French Assembly. This was not to be. Irrespective of how they voted on March 4, on the following Sunday, several thousands amongst the bourgeoisie in constituencies where the Left candidate was a Communist failed to come to the aid of the anti-Gaullist cause.

In final sum, the results of the French elections highlight once again the absurdities which embellish the various definitions of parliamentary democracy. As a proportion of total votes polled, the Socialists got two per cent less than the Communists; but they have ended up having sixteen seats more — eighty-nine against seventy-three — than the Communists. You can institute a proportional representation system, and yet obfuscate it by so many limiting clauses or constraints that it can work out to be even more inequitable than a straightforward simple majority system. For, it is altogether possible that, if it were a question of a simple majority and only one round of voting, the different parties in the just-concluded election in France would have joined the fray

without any mutual arrangements among the relatively like-minded ones. The outcome then might well have been a much larger number of seats for the Left groups than has actually been the case.

But all this is infructuous speculation. What matters perhaps even more, is that perhaps nothing matters: whether it is a combination of the Left which comes to power in France, or whether it is the Gaullists and their conservative allies. The Soviet Union has been one of the first nations to express 'satisfaction' over the Gaullist victory. Apparently, according to Moscow, this would lend stability to the political arrangements worked out in Europe in recent years. International alignments between communist parties have become increasingly tenuous over the past decade. The reaction to the results of the French elections indicates that they have almost ceased to matter. One should, therefore, be hardly surprised if a communist regime discovers its best friends amongst assorted fascist or neo-fascist governments in other lands and other climes. This, presumably, is what is meant by the statement, often heard, that a new liberalism is abroad.

Currency Crisis

Multinationals' Mischief

THE world money markets reopened at the beginning of this week, after remaining closed for over two weeks, with a general agreement among the G-14 countries. The agreement, however, appears to relate only to the ground-rules to be observed during the regime of floating rates. The feeling seems to be gaining ground, especially in Europe, that floating exchange rates are not going to be a temporary phenomenon but might soon get established as the centre-piece of a new international monetary order capable of dealing effectively with the menace of speculators.

But whatever the merits of a regime of floating exchange rates in making life somewhat difficult for speculators, it is unlikely to be accepted as a long-term alternative to the par value system. A system of floating rates will expose speculators to risks only if they are unable to push a country's exchange rate in the direction they want. But given the vast amounts of liquid funds

with the multinational corporations, which are estimated to total over \$268 billion, and the Eurocurrency deposits amounting to \$ 100 billion, it would be dangerous to leave exchange rates at the mercy of speculators. They could cause great harm to world trade and payments arrangements by distorting exchange rates. Once the speculators acquire enough expertise to manipulate it to their advantage, a regime of floating rates may also soon prove to be unworkable.

The Committee of Twenty which is meeting in Washington will have to take its job more seriously than it has done so far. What has been said at the press conferences of the Chairman of the Deputies is enough to indicate that progress towards agreement on even some elementary issues has been exceedingly slow. The Committee of Twenty would now have to give the highest priority to the problem posed by speculators. Other issues like the ideal adjustment mechanism or the characteristics of the basic reserve asset and the asset settlement mechanism are important, but discussion on them will prove to be of academic interest only so long as the conditions necessary for the working of such an ideal system are not created.

The basic conflicts between the Americans on the one hand and the other developed countries on the other are likely to find greater expression in the forthcoming deliberations of the Committee of Twenty. The US government, sweetly disposed as it is towards the multinational corporations, would not like to check the dangerous games they play at the cost of the European countries and Japan. The US government has often categorically stated that it wants to earn a trade surplus of \$ 8-12 billion a year to finance its export of capital which it intends to make more liberal. This outflow of US capital is leading to the progressive takeover of European industrial and trading companies by Americans. The total value of output produced by American multinational companies in foreign countries is around \$ 300 billion a year which is much more than the GNP of any of the OECD countries, excluding the US.

Given the state of relations between the US and the European countries, the latter may be prepared to accept the free flow of long-term investment capital among the OECD countries. But they are unlikely to be persuaded that

the multinational corporations should be left free to disrupt the world monetary system at their cost. The Europeans as well as the Japanese are afraid of the likely retaliation by the US and so, while they resent the role of the US multinational corporations in creating currency crises, they cannot afford to be too blunt. The NATO, under which the US annually spends over \$ 15 billion for European security and the nuclear umbrella provided by the US to Japan all come in the way of action being taken against the large US corporations which have a decisive voice in American politics. Moreover, as foreign trade accounts for a relatively small proportion of its GNP, the US can afford to start a trade war without much damage to its economy. All the same, the Japanese so far have ingeniously managed to keep out the flood of American capital through numerous devices, including impregnable exchange control measures.

Whether a reformed international monetary system would in the end prove to be viable would depend on whether it contains sufficient provisions for countries to defend their currency parties against the onslaught of massive capital flows. The Bretton Woods system did provide for controls on hot money movements, though these were not put to much use during the 1960s when payments arrangements were greatly liberalised. Now finally the Bretton Woods system has broken down primarily because it did not provide a proper adjustment mechanism for correcting untenable exchange rates and imbalances in payments. Even if the current discussions on international monetary reform succeed in evolving a better adjustment mechanism, the reformed system will still not succeed unless it is able to provide more clear-cut guidelines for controlling the vastly increased powers of the multinational corporations as well as the destabilising influence of the Eurodollar markets.

The Committee of Twenty will find its discussions dragging on unproductively unless the Americans on the one hand and the Europeans and the Japanese on the other are able to settle their differences. The American proposal put forth some time ago that the level of official reserves should serve as the indicator for automatic exchange rate changes is loaded with mischief. If hot money movements are not brought under control, the Americans will be able to force changes in the exchange rates of any country, under the manda-

tory automatic rule requiring exchange rate changes in response to variations in the level of reserves, by manipulating capital flows to that country.

Given the pre-condition that successful working of a reformed international monetary system would depend essentially on an agreement to bring under control destabilising short-term speculative capital flows, the deliberations of the Committee of Twenty will be fruitful only if the leading industrial countries settle the differences among themselves on this point. The less developed countries who are members of the Committee can hope to contribute hardly anything to these discussions. As happened at Bretton Woods, this time also the basic framework of the reformed international monetary system will be worked out by the developed countries and presented to the developing countries as a *fait accompli*.

Natural Rubber

Not without Restructuring

RUBBER is one of the strategic materials for industry; its products range from giant tyres for jumbo jets to hair-thin washers for pharmaceutical packings. Problems of production and supply of rubber should, therefore, be receiving the constant attention of governments as well as industry. In a monograph entitled "Natural and Synthetic Rubber: Perspective for the Seventies" (Economic and Scientific Research Foundation, New Delhi, pp 96, Rs 15), V P Chitala and P K Roy have attempted to focus attention on some of these problems.

Demand for rubber is not likely to pose a problem in India in the long term. In 1969 per capita consumption of rubber in India was only 0.22 kg as against 1.17 kg in Brazil and 12.96 kg in the US. Even in developed countries like the US and UK, the demand for rubber has been steadily increasing. In India it has almost doubled between 1960 and 1970.

The real problem is inelasticity of supply of natural rubber in response to short-term fluctuations in demand. After planting, rubber takes seven years to start yielding and another three years to reach maximum production. Further, more than 50 per cent of our production of natural rubber comes from thousands of small holdings, with the result that it is difficult to ensure quality and to stabilise prices. The synthetic rubber

industry, on the other hand, is capital intensive, oligopolistic in character, and very often vertically integrated. It has been maintaining stable prices since 1954 and has also been supplying tailor-made products for specific uses. It is true that for a few uses there is as yet no synthetic substitute for natural rubber. But countries or areas within countries whose economies are dependent on natural rubber cannot ignore the changing pattern of consumption. From 4 mn tonnes in 1960, world consumption of rubber rose to 7.8 mn tonnes in 1970. The share of natural rubber in total consumption, however, came down from 60 per cent to 40 per cent. In India natural rubber's share in total consumption is still high at 65 per cent. This is because the production capacity for and imports of synthetic rubber are regulated by government to ensure adequate offtake of natural rubber.

But this protected market which the natural rubber industry enjoys today may not last forever. The natural rubber industry will not be able to increase its production beyond a point, as very little new area is available for planting with rubber. And the limit may be reached by the end of the Fifth Plan. After that it would be difficult to resist the demand for setting up more plants for manufacture of synthetic rubber. As the synthetic rubber industry is capital intensive, the capacity of an economic unit would be a minimum of 30,000 tonnes per annum, if not 50,000 tonnes. One such unit would thus be enough to upset the present ratio between natural and synthetic rubber in total consumption. Again, new synthetic rubber units which come up in future will have petroleum products as raw material unlike the existing one which uses alcohol. If that results in a significant cost advantage for synthetic rubber, the natural rubber industry may be in trouble. The prices of natural rubber in India are nearly double that in Malaysia where it was found that with every 100lb increase in yield, there was a reduction of 2 to 3 cents in cost. In India, on the other hand, higher yield is being absorbed by increasing costs.

The natural rubber industry in India is concentrated in the south, 92 per cent of the planted area being in Kerala. It is one of the important commercial crops of Kerala. It gives employment, direct and indirect, to more than 2 lakh people and the total value of its

production is about Rs 40 crores. The industry's record in the last decade was exceptionally good. Production increased from 27,644 tonnes in 1961-62 to 101,210 tonnes in 1971-72. The Rubber Board expects production to go up to 200,000 tonnes by 1978-79. Neither the state nor the country can afford to neglect such an industry. It will be unwise to belittle the competition which the industry is likely to start facing by 1980 and to fail to reorganise it in time. It has been claimed that ethrel, a chemical, may help to increase the production of natural rubber. But while it may stimulate production, it has not been established that it increases the total rubber in the tree. For that, high-yielding planting material itself would be required.

The real problem, then, is how to organise replanting on a systematic basis. Replanting would have to be done in such a manner as to avoid big upsets in production and revenue. For that, replanting should be a continuous process with not more than 10 per cent of the area being under replanting at any one time. There are practical difficulties in the way of this. Of the 203,098 hectares under rubber, 68,472 hectares are holdings of two hectares and less and are held by 95,414 small growers. These holdings are mostly interplanted with perennial as well as seasonal crops. Only 66,673 hectares come under 649 estates of 20 hectares and above. Of these, again, not more than 50 are organised as public or private limited companies. The largest estate is owned by a sterling company with 9,000 hectares. The big estates have been under the shadow of nationalisation with little incentive for fresh capital investment.

In the circumstance, will the natural rubber industry be able to continue to expand production at least till 1978-79 and then maintain it at that level while at the same time continuously bringing down prices to compete with synthetic rubber, without a restructuring of the ownership pattern of the rubber plantations?

Sugar

Unmopped Profits

A FORMER President of the Indian Sugar Mills Association had once bemoaned that the sugar industry had lost millions in 1969-70 and would lose even more in 1970-71. As a matter

of fact, in 1969-70 profits of 59 sugar companies showed a 30 per cent increase over their 1968-69 level; and the profits of 42 sugar companies in 1970-71 were about 2.5 times higher than in the previous season. The industry's profits for 1971-72, it is expected, will turn out to be still higher; available results of 12 sugar companies show their profits in 1971-72 to be between 50 and 300 per cent higher. The higher profits are partially reflected in dividend payments: for example, Kesar Sugar Works, whose results were recently published, stepped up dividend from 16 per cent in 1969-70 to 24 per cent in 1970-71 and further 30 per cent in 1971-72.

It has to be borne in mind that profits have risen in this way even as there has been a fall in sugar production over this period—by almost 46 per cent. Government has occasionally admitted that the industry has made sizeable profits. On November 24, 1972, Sher Singh announced that "Government was examining how the extra profit could be mopped up". Since then, the Budget has been presented and passed; it has left sugar untouched—ostensibly on the ground of holding the price line of essential commodities. Meanwhile in order to benefit from the excise duty rebate, sugar factories had begun to crush early in November 1972 and have accumulated a rebate of Rs 5.16 lakhs.

What has the consumer gained from the good fortune of the sugar industry? Despite 1969-70's record production of 4.26 mn tonnes prices did not decline overmuch—thanks to government's release policy. In fact, industry was left with a stock of half the annual production, and the government promised a buffer-stock scheme to bolster the supply in a year of shortage. However, it later shelved the scheme. Production in the next season, viz, 1970-71, declined to 3.7 mn tonnes, and it declined still further to 3.1 mn tonnes in 1971-72. Stocks declined from over 2 mn tonnes to 0.6 mn tonnes at the beginning of the current season—hardly sufficient to meet eight weeks' demand. Industry used the decline to create an atmosphere of impending sugar famine. Government co-operated by increasing the minimum price of sugarcane as well as the levy prices. It also granted substantial rebate in excise duty.

The current season's output was placed by government in October last at 4 mn tonnes at least. The estimate

was reduced to 3.6 mn tonnes in November 1972. Industry, on the other hand, estimated output at 3.6 mn tonnes in October, and in December revised it to below 3 mn tonnes. With four months' production figures announced a few days ago, it is now clear that production during the year will total at least 3.6 mn tonnes. The food Minister announced that, going on the basis of a demand of 3.7 mn tonnes, requirements of sugar would be fully met this year. In any case, since government controls the monthly release of sugar, the equation between demand and supply is formally established. The average monthly release of sugar—both for levy and the free market—has been progressively cut so that the annual total has declined from 4 mn tonnes to 2.75 mn tonnes. At this rate, it is quite likely that the year's closing stock will be about 300,000 tonnes more than its opening stock. Meanwhile, the free market average annual price of one quintal of sugar had gone up by about Rs 100 in 1971-72, and has since remained almost unchanged. Indeed, free market prices declined from Rs 385 in October 1972 to Rs 380 by the middle of March 1973. There was an attempt to bolster up prices prior to the Budget in the expectation of an increase in the excise duty on sugar. But since the Budget left the excise duty on sugar unchanged, the price slipped back to Rs 3.30 per kg. It is possible that if the free market price of sugar has not risen it is the result of the continuous rise in prices of other essential commodities which has eaten into the budgets of middle class consumers.

Vietnam

Claiming Credit

A Correspondent writes:

MAO TSE-TUNG was reported to have told Madame Binh, Foreign Minister of the PRG of South Vietnam, that by humbling the US imperialists the Vietnamese people had rendered a great help to China. The Soviet Union, by contrast, seems to be keen to parade the Soviet contribution to Vietnam's victory. *Soviet Review*, one of the periodicals published by the Information Department of the USSR embassy in New Delhi, reproduced in its issue of February 26, 1973, a recent *Izvestia* article, written by Dang Quang Minh, ambassador of the PRG of South Vietnam in Moscow, under the caption "Victory of Vietnam is the Victory of

Soviet-Vietnam Friendship". It has also circulated a backgrounder entitled "Soviet Contribution to Vietnamese Victory".

In his article, Ambassador Minh of course acknowledges the "noble, all-round and effective aid and support" from the land of the Soviets, but, and very rightly, only after registering the more basic contributions of (i) the Vietnamese people, (ii) the correct political line of the leaderships of both North and South Vietnam, and (iii) the cohesion, heroism and militant solidarity of the peoples of the three countries of Indochina. He also brackets the Soviet support with that from "other socialist countries, all progressive mankind including the American peace partisans", before singling out the USSR for expressing his gratitude.

The backgrounder is simply a string of nine excerpts from messages and speeches of Vietnamese leaders, including Ho Chi Minh, Le Duan and Le Duc Tho. Seven of these were delivered

on ceremonial occasions like the Soviet Party Congresses, Lenin's birth centenary, 50th anniversary of the November Revolution, etc, and all of them had been delivered during the period beginning from the 23rd CPSU Congress in 1966 and ending with the session of the 24th Congress on April 2, 1971. The last two are dated January 30 and 31, respectively, i.e., after the signing of the ceasefire agreement in Paris. Significantly, there is not a single piece in the collection of excerpts that refers to the Soviet role during the entire period between April 3, 1971 and January 29, 1973.

Nobody can deny the importance of the material contribution from the Soviet Union and China to Vietnam's war of resistance and liberation. But if the Soviet propaganda efforts are designed to disarm critics of the Soviet role during Nixon's barbarous escalation of bombing and blockading of Vietnam, the exercises of the Soviet embassy in New Delhi are a case of *non sequitur*.

CREDIT POLICY

A Bundle of Trivia

(From a Special Correspondent)

FOR quite some time it had been in the air, that the Reserve Bank was having a fresh look at its credit and monetary policies. While announcing the credit policy for the current busy season in November 1972, the Governor of the Bank had promised "a mid-season review at a meeting with bankers towards the end of January or beginning of February 1973". More recently, the Finance Minister had told the Lok Sabha that "a detailed study of the interest rate structure of the banking system has been undertaken by the Reserve Bank with a view to evolving guidelines for preventing unhealthy competition among the banks for large accounts". The expectation that the Reserve Bank was up to something was strengthened also by the putting off of the meeting of bankers for the mid-season review of credit policy, which the Governor had slated for end-January or early February, till the middle of this month.

And, given the trends of monetary expansion and price rise, some signs of thinking and action from the country's central bank had definitely become overdue. In the current financial year, upto March 3, money supply had expanded by as much as Rs 943 crores

(11.6 per cent) as against Rs 814 crores (11.3 per cent) in 1971-72. Almost the entire expansion has been due to a continuous rise in net bank credit to government which has gone up by Rs 1,120 this year, or over Rs 250 crores more than the increase of Rs 855 crores in 1971-72 which itself had been abnormally high. The government and the Reserve Bank have been making pointless distinctions between government borrowing from the Reserve Bank and from the commercial banks, from the standpoint of its impact on monetary expansion. The distinction might have had some justification if government were resorting to commercial bank credit so as to minimise its reliance on the Reserve Bank. Actually, government borrowing from both has expanded faster this year than in any year in the past. Thus net Reserve Bank credit to government has risen by Rs 630 crores so far compared to Rs 565 crores last year and commercial bank credit to government has gone up by Rs 490 crores compared to Rs 300 crores last year.

BUSY SEASON DEVELOPMENTS

While this is the picture for the financial

year as a whole, developments in the current busy season have further accentuated the disquieting monetary trends. First, during the busy season so far commercial bank credit to government has contracted by Rs 110 crores, but against this government borrowing from the Reserve Bank has bulged by Rs 416 crores compared to Rs 232 crores in the 1971-72 busy season. Second, net bank credit to the commercial sector, which had exercised a moderating influence on money supply for the last two years, has already expanded by Rs 439 crores as against Rs 271 crores in the 1971-72 busy season.

The credit expansion in the busy season has been beyond everybody's expectations, and certainly beyond the Reserve Bank's. Net of food procurement, the Reserve Bank had placed the likely expansion in bank credit in the busy season at Rs 500 crores. On the eve of the busy season it had thought that developments during the season would not "materially effect the generally high liquidity position [of the banks]". On the other hand, it had felt that "banks would be in a position to add further to their investments". Even after reviewing the credit trends upto the middle of January, the Government's Economic Survey for 1972-73 had found "no evidence as yet that busy season pressures had started straining the resources of the banking system" (p 57). The sharp pick up in credit thereafter has, however, caught both the government and the Reserve Bank napping. As a result, during the season upto March 9, the expansion in scheduled commercial bank credit has been Rs 720 crores (13.8 per cent) which is more than double that in the comparable period of the last busy season (Rs 314 crores or 6.5 per cent). The rise is seen to be even sharper if food procurement credit is excluded—Rs 691 crores (14 per cent) against Rs 281 crores (6.3 per cent).

This unprecedented expansion of bank credit in the current busy season calls for some explanation. The official explanation leans heavily on the rise in industrial production. The index of industrial production (base: 1960=100) rose by over 7 per cent in the first nine months of 1972 compared to a rise of a little over 2 per cent in 1971. These statistics are unimpeachable, but the question is: would a 7 per cent increase in industrial output over a low base, even if it were spread over a wide range of industries, justify such a steep increase in bank credit? Besides, the rise in the index of industrial production had started as early as in January

1972. The price level in 1972 was also higher than in 1971. Yet demand for bank credit remained subdued for full one year, upto the end of December 1972. In the first four months of 1972 bank credit (net of food procurement) expanded by Rs 135 crores as against Rs 223 crores in the corresponding four months of 1971. The following slack season period (May to October 1972) saw an increase of hardly Rs 33 crores in credit for purposes other than food procurement. The first two months of the current busy season also saw hardly any credit expansion. In fact, more than half the increase in bank credit in the current busy season so far (Rs 369 crores out of Rs 720 crores) has taken place in the six weeks from the beginning of February to March 9, which is phenomenal compared with the increases of Rs 48 crores, Rs 82 crores and Rs 145 crores in the corresponding six-week periods of the busy seasons of 1971-72, 1970-71 and 1969-70, respectively. Thus, the pick up in credit has intriguingly coincided with the widespread power shortage in different parts of the country.

If the rate of growth of industrial output does not adequately explain the credit spurt, neither does any possible improvement in industrial investment in the private sector. The overall picture of industrial investment in 1972-73 is one of lack of buoyancy. The disbursements of term-lending institutions in the first nine months of 1973 were lower than in the same period of 1971. The volume of capital raised (other than by bonds issue and excluding two very large debenture issues) was almost the same as in last year. The value of licences for import of capital goods approved in the first nine months of the current fiscal year is, according to the Economic Survey, only marginally higher than that in the corresponding period of 1971-72. Thus all indices of the levels of activity in the private industrial sector point away from a surge of demand for bank credit from this sector. At the same time, it is well known that there has been no sharp rise in credit to the priority sectors.

CREDIT TO PUBLIC SECTOR

The conclusion is thus inescapable that a very large part of the rise in bank credit has gone to public sector units of different hues: state electricity boards, state financial and industrial development corporations, national and state textile corporations, the Cotton Corporation, among others. The bank-wise distribution of bank credit (other than for food procurement) also pro-

vides some indirect evidence in support of this presumption. Thus credit expansion by the State Bank and its subsidiaries during the current busy season so far has amounted to Rs 290 crores, i.e., 45 per cent of the total expansion of Rs 640 crores for all the scheduled commercial banks. The figure for the 14 nationalised banks taken together is only Rs 286 crores, or less than that of the State Bank. It is, of course, possible that the State Bank has managed to snatch some big, as well as small, accounts from other banks. But the major explanation appears to be that government bodies and corporations have a heavier weightage among the State Bank's clientele than in those of other banks.

In sum, the current credit and monetary situation can be summarised thus: (a) there has been a persistent and large increase in money supply; (b) whereas hitherto net credit to government was mainly responsible for this increase, net bank credit to the commercial sector has also become an expansionary factor in the last few months; and (c) within the commercial sector, it is credit to public sector bodies that is mainly responsible for the steep increase in the bank credit. Given this situation, the prospects for the next few months are of a continued expansion of bank credit. The sanction of credit limits to public sector bodies is not subject to even the perfunctory scrutiny which banks exercise in respect of credit demands from the private sector. Then there is food procurement; even if a modest 7 mn tonnes of wheat are procured in the coming rabi season, the level of food procurement credit would go up from Rs 314 crores (on March 9) to over Rs 800 crores by July. It is against this background of the current and prospective monetary situation that the Reserve Bank's credit policy measures, announced at its meeting with the commercial banks on March 17, have to be viewed.

The salient features of these measures are: (i) raising of the minimum net liquidity ratio (NLR) for determining the interest rate at which a bank can get refinance from the Reserve Bank, from 37 per cent to 36 per cent, and an increase in the Reserve Bank's refinance rate from 7 per cent to 8 per cent for the first one percentage point fall in the NLR; (ii) liberalisation of Reserve Bank refinance at the Bank rate for food procurement credit by raising the norm from one-third of the incremental credit to one-half, over the level at the end of October 1972; (iii) bringing of advances to government bodies under

the Credit Authorisation Scheme; and (iv) raising of interest rates on deposits of selected maturity periods.

IRRELEVANT CHANGES

None of these measures except the one to bring credit limits to government bodies within the purview of the Credit Authorisation Scheme (CAS) is relevant to the existing credit and monetary situation. In respect of credit limits to public sector units, prior authorisation from the Reserve Bank will be necessary for working capital loans, of Rs 3 crores and above and for term loans of Rs 1 crore and above (The corresponding limits for loans to the private sector are Rs 1 crore and Rs 25 lakhs, respectively.) It remains to be seen whether this will result in the imposition of a measure of financial discipline on public sector bodies who have so far taken free recourse to commercial bank credit to finance activities which should be, and were being financed by budgetary allocations from state governments. At the very least, the CAS might delay somewhat the sanctioning of over-liberal credit limits. Also, the commercial banks may be able to use the CAS to resist to an extent pressures from local politicians (not, of course, that the Reserve Bank is impervious to such pressures.)

As for the changes in deposit interest rates, a comparison of the proposed rates with the existing ones brings out the irrationality of the whole exercise. First, a uniform interest rate of 7 per cent is prescribed for deposits for periods ranging all the way from two years to five years. The difference in interest rates on deposits for two years and on those for five years and over is a mere 0.25 percentage point. Second, the logic of raising interest rates on short-term deposits upto 9 months, while maintaining the existing rate of 6 per cent on deposits for 1 to 2 years, is also incomprehensible. A major proportion of deposits with maturities upto one year (which account for 60 per cent of all fixed deposits) is held by institutions and the case for raising the interest yield for this group of 'depositors' has not been explained by the Reserve Bank. While the cost of deposits to banks has been raised, savers as a class will derive hardly any direct benefit.

If the Reserve Bank's purpose is to push banks to raise their lending rates by making deposits costlier, it is unlikely to be achieved immediately. On the contrary, the prospect is that there may be a sharpening of the competition among banks for the larger accounts. For the State Bank, for instance, cur-

rent accounts comprise 37 per cent of total deposits, compared to just 25 per cent for all banks. The State Bank also enjoys a number of other advantages, such as the availability of treasury balances. The existing differences in the cost of deposits to different banks are thus likely to get accentuated and, in the absence of a minimum lending rate, big banks like the State Bank will be in a position to offer relatively lower lending rates without impairing their overall profitability.

It is incomprehensible why the Reserve Bank has not sought to put an end to the competition among banks for the larger accounts by a straightforward measure like a minimum lending rate. The existing restrictions on transfer of accounts are reported to be by and large inoperative. Since most large borrowers have credit limits with more than one bank, they can play one bank against another and secure a reduction in interest rates without actually moving their account from one bank to another. The Reserve Bank's reluctance to face the problem squarely has given rise to the impression that its policy-making machinery is unduly influenced by the bigger banks like the State Bank.

NLR INEFFECTIVE

As for the attempt to raise the cost of borrowing from the Reserve Bank by operating on the NLR, it is now well known that banks are not all that sensitive to the working of the NLR mechanism. The exact NLR position of

a bank gets known to it and to the Reserve Bank after a time-lag of six months or so. And particularly when the overall level of borrowing from the Reserve Bank is low and there are liberal refinance facilities available against advances to particular sectors, the NLR mechanism is not taken too seriously. Banks get refinance irrespective of NLR for a part of their export credit, advances to primary co-operative credit societies and food procurement credit. Scheduled commercial banks' borrowing from the Reserve Bank were Rs 198 crores on March 9. Of this, about Rs 120 crores would not impinge on the revised minimum NLR. The current NLR position of the banks stands approximately at 35 per cent, i.e., about 2 percentage points below the new minimum. The banking system as a whole may, therefore, have to pay 2 per cent more only on about Rs 60 crores of its existence borrowings from the Reserve Bank. Even this situation will continue only upto mid-April when food procurement credit will pick up and on every Rs 100 crores of food procurement credit, banks will get Rs 50 crores of refinance at the Bank rate. The banks can thus expect to get at least Rs 250 crores as additional food procurement refinance from the Reserve Bank by July. While the liquidity position may be made somewhat tighter for particular banks, for the banking system as a whole, the changes in the NLR mechanism will not work as an effective brake on credit expansion.

The Third 'R'

(From a Special Correspondent)

THE elaborate exercise the Reserve Bank has undertaken to modify its credit policy for the busy season ending April shows that the central bank still believes it possible to ease the severe monetary pressures arising from the government's sustained and reckless deficit spending by trying to influence components of money supply other than net bank credit to government.

In his last Saturday's letter to bank chairmen, the Reserve Bank Governor points out that "since budgetary deficits are persisting, the aim of credit policy should be to see that net bank credit to the commercial sector does not stimulate further expansion of money supply". In the current busy season net bank credit to the commercial sector has indeed increased more than net bank credit to the government. But what is the con-

text of this net bank credit to the commercial sector?

It has been inflated by at least Rs 120 crores, which is the amount the banks gave the Food Corporation to repay the Corporation's age-old loans from the government and which will not result in even a kilogram of additional grain procurement. This amount should straightaway be deducted from net bank credit to the commercial sector — which would as a result stand reduced for the season to Rs 319 crores — and added to net bank credit to government — which would correspondingly rise to Rs 426 crores. Further, account should be taken of the fact that the Food Corporation has actually repaid the government Rs 200 crores. In other words, FCI has tapped additional credit of Rs 80 crores. This has been done presumably by crediting the proceeds of sales

of foodgrains to the government instead of adjusting them against outstanding commercial bank credit. That is to say, commercial banks have given a further loan — technically, a "roll on" arrangement against foodgrains in transit or grain on the high seas — of Rs 80 crores. Net bank credit to the commercial sector then should stand reduced by fully Rs 200 crores and that to the government enlarged by an equivalent amount.

This is not the end of the story. The Reserve Bank Governor's letter to bank chairmen states: "Certain state governments have of late been turning to banks for some of their commercial/financial requirements, including food procurement. Before making any funds available on such requests, banks have to ensure that the approval of the Government of India is obtained by the concerned state government under Article 293(3) of the Constitution of India." Judging from the sharp phrasing, state governments have been tapping ways and means advances from the commercial banks. One could continue in this vein and ask if bank credit given to state government agencies such as state electricity boards has not been used by them in lieu of funds they should normally have got from the respective state governments. In sum, incremental net bank credit to the commercial sector contains a very large element of direct and indirect ways and means credit to the central and state governments.

VITAL ISSUES EVADED

The mix up serves to conceal the true extent of deficit financing. Commercial credit, even if negative in net terms, since it contains a large element of deficit financing, has to be curbed. Thus the Reserve Bank Governor states in his letter that credit to the commercial sector should not stimulate "further expansion of money supply". However, two questions arise. First, is it the Reserve Bank's view that the stimulation that has taken place so far is justified and that further stimulation is to be avoided? (In other words, is it saying that outstanding credit to the government sector should not be cut?) Second, how is further stimulation to be avoided: by choking which portion of commercial credit — the portion that is non-commercial or the portion that is commercial?

The Reserve Bank has not allowed these questions to surface — as that would have meant a straightforward decision on the Bank rate. A Bank rate hike would have straightaway made cre-

Between Now and September

Romesh Thapar

WE, in Delhi, take everything in our stride. The scandals, or attempted scandals, with which Parliament is sought to be rocked. The Budget, which surprisingly leaves the *status quo* broadly undisturbed. The crime wave, which grows in dimensions in all parts of the country and particularly in the Capital. The US resumption of military supplies to Pakistan, even as Ambassador Moynihan presents his credentials in Delhi. Karan Singh's resignation, which has put the skids under a lot of his colleagues who have forgotten what "moral" responsibility is. And the passing of men like Pitamber Pant who helped mould many of the critical decisions of the last twenty-five years. Probably, our sensitivities have been dulled by a casual and cynical contact with power.

But there is a question-mark which disturbs the tranquillity of the Capital. Will the situation remain manageable during the critical months ahead, until the rains break fully and make hoarding a risky pastime? Between now and September is a problem-crowded period. The drought-cum-famine is being tackled with a fair amount of success: indeed, the more depressed sections are persuaded almost to pray for a perpetual crisis! The break-down in electricity generation is very much more serious, with the possibility of widespread damage to industrial pro-

duction; here, drastic steps are called for, and there are no signs of a stirring.

The Government of India is, not without reason, somewhat overwhelmed by the prospect of handling the ramified and complex grain trade. The reason is quite simple. There is a continuing failure to stress the need to establish a parallel distribution system and to outlaw private dealing in foodgrains. The mass media have to be geared to this task during the coming months — to educate, to enlighten and to motivate. And the reliable cadres of the ruling party have to be activated to realise that failure in this area could be disastrous for the ruling party.

It wouldn't be a bad idea to collect the names of all the IAS officers in the states who have refused to be cajoled and bullied by MPs, MLAs and local politicians, and who are written off as "uncontrollable", "difficult" and "rigid". They should be mobilised to set up the distribution machinery for foodgrains in their states. It is for the Prime Minister herself to take some such step if the whole concept of State trading in foodgrains is not to become a self-defeating operation.

Confidence must be infected into the system, for even socialists like Jaya Prakash Narayan are having second thoughts about banning private

trading in foodgrains. In fact, scratch a few of the more vocal radicals in Parliament and you'll get similar responses.

As for the electricity crisis, with all its many repercussions, the truth is slowly dawning that it is more than a creature of the present water scarcity or coal dislocation. Minister K L Rao is well-liked, but this should not become an obstacle to a major overhaul of an obviously incompetent and corruption-corroded electricity management system. The need urgently to re-think the balance between hydro and thermal plants, and to plan for precisely the kind of water scarcity and coal dislocation that occurred this year, is beginning to be realised.

Urgency is stressed because the motivated elements within the GOI know that once the rains take over, every one will go to sleep, to wait for the next crisis. If anything gets done, it will be between now and September. Of course, there is a long and dreary parliamentary session ahead of us, which goes on into May, but that should not hold up action in crisis areas.

Once again, let it be mentioned, the lack of information about what is being done increases the uncertainties about the future and makes the going until September more hazardous. This gap in information has to be massively corrected. In other words, the Centre's credibility can no longer be taken for granted. It must be built during these summer months.

March 19

dit dear all round, including credit to the government. But this the Reserve Bank has avoided with great effort through a chain of substitute measures.

It has raised the minimum net liquidity ratio from 36 to 37 per cent. Apparently, this is intended to cut banks' general access to the Reserve Bank for accommodation at the Bank rate. It has also prescribed an interest of 8 per cent against the earlier 7 per cent on banks' borrowings which lower the NLR the first percentage point below the minimum. However, all that this apparent credit squeeze will ensure is that banks pre-empt funds for the Central government loans due in May. And that would be credit to government.

Second, the impact of the NLR choke and the rise in cost of Reserve Bank accommodation to banks would have to be distributed among non-government borrowers, leaving out the large houses and the big accounts since, as any banker will tell you, they are first class customers. After all, when big houses accept banks' discipline they should be rewarded with a lower interest rate. There is also export credit at concessional interest to borrowers, large and small. The rise in banks' lending rates would also not touch the public sector accounts which, being guaranteed by the government, are rated high security-wise. That is the reason why banks, who are competing for public sector accounts, asked the Reserve Bank to prescribe a minimum lending rate last weekend. The request, not surprisingly, was turned down.

True enough, the Reserve Bank has announced that it would tread the ground that banks avoid, and has brought public sector accounts within the ambit of the Credit Authorisation Scheme. But past experience with the CAS does not suggest that the measure will achieve very much. Rarely, has the Reserve Bank turned down a proposal that has come to it for approval. Can one hope that the CAS will be operated less perfunctorily for bank credit to the non-commercial sector?

OPEN DOOR

This criticism of the tightening of NLR might seem less than convincing. Attention therefore needs to be focused on refinancing for food procurement. These advances are estimated to rise by Rs 580 crores to Rs 870 crores by mid-July. The incremental advances for food procurement would now be entitled to refinance at the rate of 50 per cent against 33 per cent hitherto. In other words, banks will get Rs 290 crores of refinance at the Bank rate against Rs 190 odd crores under the

old one-third formula. They will thus get Rs 100 crores of extra accommodation against the loss of about Rs 85 crores arising out of the one percentage point hike in the minimum NLR to 37 per cent. While one door has been shut, the other has been thrown ajar.

So much for the attempt to stem the growth of net bank credit to the commercial sector, a major component of the expansion in money supply. The attempt to control the other components of money supply, as seen from the Reserve Bank's direction to banks to raise deposit interest rates, is even more ingenious. A major component of money supply is demand deposits which increased by Rs 480 crores during the current financial year upto March 2, contributing just over 51 per cent to the incremental money supply. The expansion in the corresponding period a year ago was Rs 329 crores or just 40 per cent of the increase in money supply.

In order to control expansion of money supply, the growth of demand deposits needs to be slowed down, so seems to run the Reserve Bank's reasoning. It is not for the Reserve Bank to ask why demand deposits is not a consequence of the runaway expansion in overt and covert net bank credit to government. The Reserve Bank's task is to evade a confrontation and launch technical exercises. So the interest rate on deposits for 15 days to 45 days has been raised (from April 1) from 2 to 2.75 per cent (the proposal was to take the rate to 3 per cent). The higher rate is designed to attract house money — from LIC, UTI and the large corporations. Thus, if a shift takes place from demand to time, that is 15-day deposits, the pressure on money supply would stand reduced!

The conversion of demand deposits into time deposits would also yield a second result, namely, the slowing down of the expansion of net credit to the commercial sector. Now, during the current busy season to March 2 net bank credit to the commercial sector expanded by Rs 439 crores as follows: Reserve Bank credit Rs 12 crores, plus commercial banks' claims on the commercial sector which expanded by Rs 733 crores, minus time deposits which rose by Rs 306 crores. If time deposits could be inflated, net bank credit to the commercial sector would stand correspondingly deflated. This arithmetic has also led the Reserve Bank to raise interest rates on 46-day deposits from 3 to 3.25 per cent, on 91-day deposits from 4.25 to 4.75 per cent; on six-month deposits from 4.75 to 5.25 per cent and on two-year deposits from 6.50 to 7 per cent. To give the devil its due, the Reserve Bank has kept the

interest on 5-year deposits unchanged, thus avoiding distortions in the relationships between deposit interest rates, the unchanged Bank rate and the long-term yield on the government loans due to be offered in May.

What is conspicuous is that the interest rate on savings deposits has been maintained at 4 per cent. Since savings deposits have a large demand component, a hike in savings interest rates would only boost demand deposits. The interest differential between this class of deposits and short-term deposits has, therefore, been widened, apparently with a view to bringing about a shift of the demand component of savings towards term deposits. In fact, a move to widen the differential even further by reducing the interest on savings deposits to 3.50 per cent was scotched by New Delhi.

The modified credit policy is thus heavily the third 'R' oriented. There is no strategy, no policy, there is only arithmetic: arithmetic to slow down an expansion in money supply without effectively checking runaway bank credit to government, arithmetic to bring about certain shifts in the components of money supply without bringing about a basic change in the propensity to save which is being rapidly eroded by inflation, arithmetic to window-dress the lack of policy initiatives.

In the calculus, there is no place for stray thoughts on whether the nationalised banks, which since mid-1969 have fanned out into the countryside, can stem the tide of a likely emigration of farm labour from the vast drought affected areas in April-May; nor on a strategy for mopping up funds that would be diverted, following the take-over of wholesale grain trade, by the big foodgrain traders into speculation in scarce commodities, including grain; nor on whether food procurement would match targets; nor on measures to boost savings through, say, a rise in savings deposit interest rates — banks, after all, pay interest only on the time component of savings deposits —; nor on the need for an escalation in the cost of credit to government.

Arithmetic is all. And, should things go really wrong, and monetary pressures rise following the reckless deficit spending in 1972-73, the option to raise the Bank rate and tighten selective credit controls would be there. The present is not the time for taking alarm, the 19-per cent rise in the wholesale price index for food articles during the year ended March 2 notwithstanding. When the situation gets really hopeless, one can always resort to socialist gimmicks. Till then, the prescription is arithmetic and a gamble in the monsoon.

US releases \$87m worth of economic assistance to India

"This alms deal is part of an old commitment..."

Calcutta Diary

A M

IT is always the weighted average of your guess and my guess and our next door neighbour's guess, but, according to one set of statistics, there are at present, nearly five hundred poetry magazines and fifteen thousand practising poets in West Bengal. Determining the current number of poetry magazines can be a matter of semantic exercise. Some of these magazines may appear only once in five years, or appear only once and fade into oblivion. A whole lot of others are supposed to be monthly, bi-monthly, or quarterly publications, but their actual periodicity varies with the financial straits of the managing editor at any given moment. There is that other specimen, representing a genre which is a cross between love of poetry and love of entertainment; for example, the daily poetry magazines which usually assert their existence every year during the week or fortnight when Calcutta celebrates Tagore's birth anniversary. In one or two stray years, one has also heard of hourly poetry bulletins. The births, deaths and periodicities of these magazines are afflicted by an acute stochasticity, and bands of budding mathematician economists, if they are so interested, can have a whale of a time in trying to fit a simulated Markov process or some such thing to the phenomenon.

Even were one frustrated by the random nature of the data on the number of Bengali poetry magazines, one is perhaps on much firmer ground while estimating the number of practising poets. There is a definitional problem here too; it can however be got over by adopting the point of view that a practising poet is one who has at least a dozen poems published in journals or magazines during a single year. Alternatively, he could be one who, while appearing in journals only rarely, still manages to publish at least one volume of poetry every two years or thereabouts. Since an average issue of a poetry magazine carries poems by fifty poets — give or take a few — allowing for overlapping and multiple appearances, there is a kind of coherence between the estimated number of poetry magazines and that of practising poets.

In the room serious people come and go, talking of Keynes, Marx or Pareto. But, meanwhile, what does one do with this furious rash of poetry, what does one do with West Bengal's reserve

army of poets? Is it at all impossible to convert this obsession with poetry into an economic proposition? Even in a society violently gone over to the pursuit of economic growth, it would be worse than philistinism to question the role of poetry. Poetry enlarges the stock of imagination for a nation; investment in poetry, along with investment in other branches of literature and philosophy, ought to pay off by enlarging this stock. It is this stock of imagination which helps a country to produce brilliant engineers, brilliant technologists or brilliant planners. One can thus make a perfectly economic case for the State taking an increasingly positive role for expanding the availability of poetry in society. And if it could be shown that, given organisation and a fund of goodwill, the publication of poetry is viable even on narrow financial terms, to vote for the poets would become respectable even without recourse to shadow prices and social rates of discount.

Assume that roughly half of the fifteen thousand practising poets would have a volume ready for publication every year. That is to say, if finance were not the stumbling block, as against the current average of three to four hundred, seven thousand five hundred volumes of poetry could have been annually published in West Bengal. If demand is assumed to stay put at the current level, it should be possible to sell six hundred copies of each volume. Since about one hundred extra copies may be kept for complimentary distribution, a print order of seven hundred copies would be called for. Given the estimated costs on the basis of accepted specifications, including specifications in regard to quality of paper, lay-out and get-up, and the average length of a volume, an expenditure of approximately one thousand rupees would be necessary to print this number of copies. For seven thousand five hundred volumes, therefore, the cost would come to around Rs 75 lakhs. If the average price is fixed at Rs 2.50, gross sales should net Rs 1.25 crores. If the Government or the banks help the authors with marketing outlets, the cost of distribution could be drastically pruned from what it is at present. Even were a 15 per cent margin allowed for distribution, one should be able to end up with a rate of return of around 30 per cent or more from this

venture into organised publishing of poetry. In case this return is now evenly spread between the poets and those who finance them, the latter would still end up with a rate of return of 15 per cent which should be able to meet the test of nearly all the dogmas — including the corniest one among them — with respect to project efficiency.

A tongue-in-the-cheek exercise? Leading the good-intentioned ones up the slippery path of lyrical vacuity? One can straightaway list the difficulties which would be mentioned in the way of pushing such a project through. For instance, if seven thousand five hundred volumes of poems are to be published each year, even the impossible Bengalis, it could be said, would reach the point of surfeit; diminishing returns would fast set in; beyond the third or fourth year, the sales would register a sharp decline. But this could be a fear without basis. There is no end of poetry in the world, particularly in this part of the world. There is, similarly, no end to generations of poetry-lovers; they follow close upon the heels of one another. As population expands, so does, at least at a proportionate rate, the number of poets, and the number of readers who read what the poets compose. The crucial problem is organisational: educating the poets into the economics of it; persuading them to agree to band together in co-operatives so that they are able to negotiate, in an effective manner, with the banks or whichever other institutions would finance them; taking care of problems of production and distribution; cajoling the financial bodies to forget their standardised notions about collateral. These institutions would have to be persuaded to accept the published copies as collateral and to forget the rest of their dehydrated regulations. With kindness in their hearts, they would also have to conduct the poets to the strange universe of accountability and economic viability, and, where necessary, organise them into marketing co-operatives so that distribution does not suffer.

Ultimately, it is a matter of judgment on the part of the financial institutions. Financing the poets is merely an illustrative category: there could be umpteen other creative activities which could be shored up if only some investment is thrown their way. Many multiples of seventy-five lakh rupees are being frittered away every year by the banking establishment here, there and everywhere. It could well

be that one or two volumes of poetry would turn out to be what the Americans call lemons, and sell badly. But there is an elementary statistical proposition concerning the inertia of large numbers; seven thousand five hundred is a pretty large number.

There could be other objections though. For one watching the current scene in West Bengal, the realisation may suddenly dawn that the pity is in the poetry. Even revolution-monogering here has become a species of

lyrical effusion; an excess of poetry has numbed almost all possibilities of activism. In these circumstances, to preach the notion of poetry as a marketable commodity could be akin to offering hostage to revisionist fortune. Between the Scylla of lyricism and the Charybdis of economism, the Bengali poet will thus have to make an awkwardly difficult choice. And, in the resulting frustration, he might perhaps end up by producing some more poetry. Which is where we came in.

COMPANIES

Where the Boom Is

Hansavivek

MAHINDRA AND MAHINDRA holds an industrial licence to expand capacity to 25,000 numbers of Jeep vehicles per annum. In 1968, owing to the recession, the company had decided to proceed with this expansion in stages. As a first step, a new one-tonne forward control truck was added to the product-range, orders were placed for some additional equipment, and erection of a new foundry was undertaken. The company has now embarked on the next phase, of raising capacity to 18,000 vehicles and a sufficient quantity of spare parts to service the growing numbers of Jeep vehicles. This, coupled with the capital requirements of the electronics division, which has received industrial licences for manufacture of capacitors, DC calibrators, and foetus monitors, would entail a capital cost of about Rs 10 crores. The company received Rs 2.90 crores as a result of the merger of the Union Bank of India Ltd with it. A rupee loan of Rs 2.50 crores is being sought from IDBI, ICICI, LIC and UTI, and a foreign currency loan of Rs 150 lakhs from ICICI. Government permission is also being obtained to make a rights issue of equity capital of Rs 1.10 crores and 9.5 per cent redeemable preference shares of Rs one crore. The balance of the funds will be provided through internal generation.

During the year ended October last, M and M produced 13,504 numbers of vehicles, against 11,377 numbers during the previous year; sales were 12,876 units, against 11,472 units. The installed capacity was 12,500 numbers. The other manufacturing divisions also registered good progress, and the steel

and machine tool divisions too fared better. There was a slight decline in orders secured for import by the steel division, from 271,705 tons to 255,558 tonnes, but despatches of indigenous mild steel rose sharply, from 18,680 tonnes to 79,099 tonnes. Orders secured for special steel also showed a significant increase, from 29,855 to 37,025 tonnes. Total business secured by the machine tools division for both indigenous and imported machines was Rs 1.29 crores. Production in the instrumentation division was hampered by power shortage and turnover slipped from over Rs one crore to Rs 93 lakhs. With a spurt in demand for pneumatic positioners and power cylinders, the division has secured government sanction for increase in the licensed capacity, under the scheme for fuller utilisation of capacity. The electronics division established commercial production of temperature controllers, oil meters and gear-box controllers. The agro-aviation division covered slightly lower area of aerial spraying, owing to severe drought conditions and accidents to two of the helicopters.

The export division shipped Jeep vehicles and spare parts to Ceylon, Jordan, Indonesia and Yugoslavia. Total exports, including sales to UNICEF, which are paid in hard currency, exceeded Rs one crore. Orders have been received from Bangladesh, Ceylon, and UNICEF, for supply of vehicles. Exports of trailers, diesel engines, and sintered bearings, manufactured by subsidiaries, are also expected to go up. The company has negotiated proposals for setting up joint ventures in Indonesia and Thailand for manufacture of

domestic water meters.

M and M has produced very good results for 1971-72, with impressive rises in turnover and earnings. Dividend has been stepped up to 12.5 per cent, which is payable on a much larger capital consequent on the amalgamation of the Union Bank of India Ltd with the company. During the first quarter of the current year, sales of Jeep vehicles rose by about 39 per cent over the corresponding period last year, while production was higher by only 6.5 per cent. Production and sales in the current year are expected to be maintained at a slightly higher level than in the previous year.

ANDHRA SUGAR expects to commission its second caustic soda unit in the latter half of the current calendar year. A part of the imported equipment has already arrived, and the rest is likely to be received as scheduled. The existing unit produced 10,396 tonnes during the year ended September last, against 10,462 tonnes during 1970-71. Despite the erection of rectifier and liquefaction plants for higher capacity, the output could not be stepped up owing to power shortage. During the current year, too, production is expected to be of the same order, or even less, on account of the shortage of power. The newly commissioned chlorosulphonic acid plant produced about 100 tonnes last year, but it is expected to yield better results this year. Shortage of alcohol reduced production of acetic acid from 642 tonnes to 325 tonnes, acetic anhydride from 557 tonnes to 446 tonnes, and ethyl acetate from 454 tonnes to 315 tonnes. Production may increase this year if the company gets increased allotment of alcohol from the AP Government. The distillery produced slightly higher quantity of industrial alcohol, but the acetic acid plant could be issued only 16.50 lakh litres against 25.90 lakh litres during the previous year. The sugar factory showed a much better performance, producing 3,50,310 quintals of sugar with an average recovery of 10.14 per cent, against 2,57,201 quintals with a recovery of 9.8 per cent. Total quantity of cane crushed amounted to 3,45,362 tonnes, against 2,62,320 tonnes. Two numbers of 36" x 72" mills were installed for dewatering purpose and the crushing capacity was increased. Net turnover advanced from Rs 7.28 crores to Rs 10.46 crores, with sugar accounting for 75 per cent of the total against less than 66 per cent previously. Gross profit leapt from Rs 1.52 crores to Rs 2.70 crores, but the gap

NEW DELHI

Cover for Import of Technology

THE Central Engineering and design Bureau (CEDB) is being detached from Hindustan Steel to be made an independent company under the aegis of the Steel Authority of India (SAIL). CEDB's first initiative as an independent company has been to sign an agreement with Bharat Aluminium (BAL), for detailed engineering work on some of the off-site facilities for the Korba aluminium project. This is claimed to be a major breakthrough for CEDB. Two interesting aspects of the construction of the Korba project came to light at the time of announcement of the CEDB-BAL contract: first the time-lag between the completion of the alumina stage of the project and the commissioning of the aluminium smelter and the rolling mill facilities and, second, the background to the induction of the CEDB.

The alumina part of the Korba project is at last nearing completion. It is due to be commissioned next month. But the facilities for conversion of alumina into metal will not be ready for at least two years and it will take a further year for the full rated capacity of 100,000 tonnes to be erected. The rolling facilities are to be set up in phases and will take still more time to come up. The first part of the project is being built with Hungarian collaboration and the second with Soviet collaboration.

ALUMINA GOES ABEGGING

The problem of disposal of alumina, created by the delay in the commissioning of the smelter, is proposed to be solved by offering a part of it to Birla's Hindalco in UP and by exporting the rest. The BAL management has no explanation for the long time-lag between the completion of the alumina stage and the erection of the smelter. When questioned the Chairman suggested that at one stage the idea was that alumina from Korba would also be used by the Koyna project where the smelter was proposed to be set up before alumina-making facilities. But the fact is that it was never the idea that the entire alumina production at Korba would be used in this manner. In any case, the Koyna project received a setback when the collaboration arrangements with the West Germans fell

through. This happened nearly five years ago and there was all the time to suitably adjust the project schedule at Korba. There is, therefore, no reason why the erection of the smelter at Korba could not have been co-ordinated with the alumina making part of the project — unless the explanation is that the Soviet collaborators did not find it convenient to speed up their part of the project.

A significant point to note here is that the collaboration deal with the West Germans for Koyna did not click because of differences over the design and engineering arrangements. The West Germans did agree to enlarge the share of Indian agencies in providing these services nor to the use of a larger proportion of indigenous equipment. Those were the days when feeling was running high in favour of giving a larger role to Indian agencies in designing and engineering work and using a larger proportion of indigenous equipment. In the case of aluminium, practical experience had shown that there were in fact considerable possibilities in these directions. It was against this background that the Hungarian share of the alumina part of the Korba project was considerably scaled down. The Hungarians did not like this, but had to accept it because of the firm stand taken by the National Industrial Development Corporation which was the Indian consultant for the project. The NIDC was then highly regarded for its competent and effective performance; so it was all the more surprising that it was told to stay out of the smelter and the rolling mills part of the project which were to be built with Soviet aid. This was followed by the induction of the CEDB on the scene.

CEDB'S HEAVY LOAD

The CEDB's entry into the Korba project followed immediately after it had signed an overall collaboration agreement with Gipromaz, the well known Soviet design and engineering organisation specialising in the ferrous field. The collaboration arrangements between the two took a long time to be finalised because of reservations, both inside the government and outside, about the wisdom of an omnibus

agreement of the kind envisaged which would make the CEDB virtually a subsidiary of Gipromaz in India. At the stage of finalisation of the agreement, a reference was introduced in it to non-ferrous technology as well. Earlier this had never been regarded as falling within the scope of the collaboration deal since both CEDB and Gipromaz were supposed to concern themselves with and specialise in ferrous technology only. The inclusion of non-ferrous technology within the scope of the agreement was apparently contrived to make way for the ouster of NIDC from the Korba project and its substitution by CEDB. The Russians evidently felt they would be more comfortable dealing with CEDB at Korba rather than with NIDC.

There is much talk these days of the heavy load of work that the CEDB has to carry in the implementation of the steel programme. The CEDB has indeed been assigned a lot of work on the steel projects. Its responsibilities will multiply if the expansion of Bokaro and Bhilai become the major elements in the expansion of steel capacity in the next few years. Since these projects will be Soviet-aided, the CEDB will be the natural understudy of the Soviet agencies working on them. The already heavy load on CEDB's shoulders has been advanced as the main reason for asking Nippon of Japan to prepare the feasibility report for the expansion of TISCO (which, incidentally, should have been well within the capabilities of one of the other Indian steel consultants). Now, if the CEDB is so fully occupied that Japanese consultants have to be brought in, why should it stray into aluminium and that too by displacing another Indian public sector consultancy organisation which had acquired some competence in the field?

SUB-AGENTS OF FOREIGN FIRMS

The CEDB has been placed in an extremely awkward position also because of its inability to make use of its other controversial collaboration agreement arrived at about the same time as that with Gipromaz — the agreement with United Engineering of USA for rolling mill design and engineering. The CEDB is not concerned with the manufacture of rolling mills and so there was no justification for this agreement. Under the agreement it could at best function as a sales department of United Engineering catering to the requirements of manufac-

was narrowed at the net level, since the tax liability syphoned off Rs one crore more than in the last year. Even so, dividend raised by two points, to 12 per cent, showed a better cover. Inventories were brought down considerably, and the percentage of wages to sales also declined. The subsidiary, Andhra Farm Chemicals, intends to manufacture hydrazine hydrate in collaboration with Regional Research Laboratories, Hyderabad. Hindustan Allied Chemicals, the other subsidiary, is exploring new avenues for the manufacture of chemicals.

KESAR SUGAR earned a higher profit during the year ended September 1972, although it could produce only 1,38,154 quintals of sugar against 2,44,273 quintals in the preceding season. There was a substantial fall in cane acreage; and the factory worked for 128 days and crushed 14,82,960 quintals of cane compared to 28,19,450 quintals crushed in 220 days previously. The average recovery was better at 9.31 per cent (8.66 per cent). With a higher realisation, total net sales advanced from Rs 382 lakhs to Rs 493 lakhs, and gross profit was a fourth better at Rs 50 lakhs. Al-

cohol production was lower owing to shortage of molasses because of lower sugar production. Increased overhead and fuel costs rendered the working of the distillery uneconomic. Production and sales of the chemicals factory improved, although progress was slow owing to difficulty in obtaining adequate supplies of raw materials (such as soda ash) and lower demand for certain chemicals. Net profit showed a fair improvement despite increased tax liability. The inventories as well as borrowings were brought down sharply. Net dividend income increased by about Rs 3 lakhs to Rs 10 lakhs. The company's investment in shares of other joint-stock companies amounted to Rs 86 lakhs. Of this, as much as Rs 80 lakhs are invested in Synthetics and Chemicals. Equity dividend, stepped up six points to 30 per cent, found a better cover than last year. The company spent Rs 50,000 on advertisement in brochures of political parties. Prospects of cane production for the current season are rated "much better" than for the previous season.

CENTURY ENKA is awaiting government approval for its application for ex-

pansion of capacity to 6.5 tonnes of nylon yarn per day. The company's present installed capacity is 1.6 million lb per annum. During the seventh year ended September 1972, production amounted to 915 tonnes. Yarn prices declined. Net sales were Rs 45 lakhs lower than last year's and gross profit was Rs 277 lakhs compared to Rs 334 lakhs. With the tax provision demanding more, net profit amounted to Rs 97 lakhs against Rs 165 lakhs. Equity dividend was stepped up two points to 17 per cent, but the cover was almost halved to 2.14 times. A part of the distribution is expected to be exempt from tax. The company exported art silk fabrics of the value of about Rs 34 lakhs "at a considerable loss" to fulfil its obligation against import of plant and machinery for the nylon plant. Development rebate reserve has been created to the extent of 100 per cent of the amount as allowable under the Income-tax Act. Depreciation has been provided on the 'straight-line method'. Had it been calculated on the 'diminishing-balance method', as per the income-tax rules, the cumulative amount therefor upto 1971-72 would have been about Rs 392 lakhs as against Rs 230 lakhs as provided in the accounts.

turing firms in India, the most important of which is the Heavy Engineering Corporation at Ranchi. But the HEC has a parallel agreement with Soviet agencies in this field and the Russians have made it perfectly clear that there will be no American intrusion into the HEC. In the circumstances the CEDB pays the agreed fees to United Engineering without being able to make any use of the facilities to be provided by the American firm under the agreement.

WIDESPREAD CRAZE FOR FOREIGN COLLABORATION

The experience of the CEDB is not unique. The craze for collaboration with foreign agencies is widespread among consultancy organisations. Another case in point is the agreement entered into by Engineers India with an American firm for heat exchangers used in the chemical industry. EIL had sometime ago offered its services in this field to Fertiliser Corporation, only to be told that FCI had developed its own

knowhow in heat exchangers and that it had no need for the assistance of the foreign firm in question through the good offices of EIL.

Another trend that appears to be gaining ground among consultancy organisations is to spread their work very thinly and enter fields which do not belong to them. The idea appears to be that a design and engineering consultancy organisation can pick up odds and ends all over the place by simply entering into collaboration arrangements with outside agencies. This is clearly inimical to the growth of specialisation and development of indigenous knowhow which should be the primary consideration at this stage of the development of our design and engineering services. As matters stand at present, our consultancy organisations, with a few exceptions, are becoming virtually sub-agencies for foreign firms or sales agents for foreign equipment manufacturers instead of evolving as competent design and engineering bodies in their own right.

WEST BENGAL

Growing Rash of Schisms

ALARMED perhaps by the fate of Narasimha Rao and Nandini Satpathy, another of the Prime Minister's chosen *subedars* seems to be sensing trouble. At least, this is the explanation of a recent display of nerves by the West Bengal Chief Minister on the floor of the state Assembly. The acrimonious flare-up in House, following a sharp exchange between S S Ray and a veteran leader of the party, B S Nahar, was no sudden or accidental outburst. It was the natural consequence of steadily accumulating inner-party tensions. The reported comment by the Chief Minister, that Nahar had better cross over to the Opposition bench, in retort to a rather routine criticism of the tardy changeover from the use of English to Bengali in the official work of the state was more than a delayed reaction to Nahar's demonstrative denunciation some weeks ago of the Government's sluggish response to the Congress-CPI(M) clash at Ranigaunje in the Burdwan district. Ray's wrath may be an indirect measure of how far his inner-party opponents' attempts to subvert his position have progressed. Recently, some of the opponents, including a Minister, are known to have held talks in New Delhi with Central leaders, including the Congress President and the

Union Home Minister, about their demand for a cabinet reshuffle in West Bengal. The Chief Minister, who visited New Delhi immediately after these palavers and had to overstay his earlier schedule in order to retrieve his position in the confidence of the Central leaders, has apparently taken out his ire on Nahar — known to be a principal figure in the combination opposing Ray's leadership in the state party.

WAR BY PROXY

While a war by proxy between the two opposing combinations in the state Congress rages intermittently in the political correspondent's columns in the two leading Bengali dailies of Calcutta — *Ananda Bazar Patrika* and *Jugantar* (the latter being a family concern of the Commerce and Industry Minister, Tarun Kanti Ghosh) — there are also frequent and unambiguous public demonstrations of the inner-party bitterness. For instance, on March 10, when the Speaker of the Assembly read out the names of MLAs and the numbers of starred questions standing in their names, it was found that most of the Congress members concerned were not present in the House; afterwards, the Minister of Parliamentary Affairs had to go out into the lobby to persuade the

Congress members to come back. This was reported to be a demonstration of the disaffection among a section of Congress MLAs, who complained that ruling party MLAs who are critical of the Government's performance are denied proper opportunities to speak in the House.

INDEPENDENT MASS ACTION

The growing schisms in the Congress Legislature party are extending into the mass fronts. The process initiated by the Prime Minister during the Bidhannagar plenary session, for patching up the differences among student and youth leaders, seems to have petered out after showing some initial promise. The powerful Chhatra Parishad seems to be heading for a split. Though the Minister of State in the Home Department, Subrata Mukherji, made some gestures towards placating his opponents in the recently — held plenary conference of the State Chhatra Parishad — such as, vacating the post of the organisation's President in favour of one of his own nominees, himself accepting, in its lieu, the chairmanship of the newly created Advisory Board, and offering some of the other posts including the Vice-Presidency to his rival's nominees — the rift has not been bridged. The bulk of the opposition to him walked out of the session, as their demands were not met. They had insisted not only on a larger share of posts, including that of the General Secretary, but also a restoration of the district committees earlier dissolved by the group in power. Mukherji's opposition also pressed unsuccessfully for the formation of the General Council on the basis of, it appears, a version of Mao Tse-tung's famous three-threes principle — i.e., one-third of the members from each of the two rival groups and the remaining third from the non-aligned elements. These opposition forces, linked as they are with a faction in the Congress Legislature party, are now going ahead with a programme of independent mass action under an *ad hoc* campaign committee.

On the trade union front, the objective of unifying the separate trade union centres led by factions of Congressmen has not made any headway. Moreover, factional squabbles within INTUC have intensified. A section of INTUC leaders, again including some Congress MLAs, are reported to be moving for a requisitioned meeting of the state INTUC working committee for what would amount to a censure of the leadership.

★

In contrast to the cases of murders

and murderous assaults on CPI(M) activists in Greater Calcutta and elsewhere in West Bengal, the recent murder of an RSP cadre in a remote hamlet in the forests at the foot of the Himalayas got rather wide publicity in the Calcutta and national Press, forcing the state Government to bestir itself — at least outwardly. On March 9, the leader of the RSP group in the state Assembly led his two other party colleagues out of the House in protest against the murder of an RSP worker in North Bengal. He alleged that the late Kader Ansari had been dragged by a gang of Youth Congress activists out of a police camp where he had gone to lodge a complaint against some Congress workers. When Kader

was kidnapped and whisked away in a jeep from the police camp, the policemen present did nothing to prevent the crime. Kader was found dead at a distant place some time later. The RSP leader alleged that the Youth Congress members involved in the crime were the proteges of a Congress Minister. As a result of the exposure in the Assembly, highlighted by the wide Press publicity, the Government had to act. The policemen accused of collusion were suspended and some arrests were made. The Inspector-General of Police has been asked to conduct an inquiry. At the same time, the Chief Minister has asked the police to be non-partisan and to disregard unreasonable requests, even from Congress MLAs.

BANGLADESH

Father, Nephew and Son

(From a Special Correspondent)

IT was, as expected, smooth and swift sailing for the Awami League boat, with Sheikh Mujib at the helm. The opposition was in the nature of minor ripples which did not divert the boat from its destined course to a commanding position in the parliament. The Awami League has won 292 of the 299 seats which were up for electoral decision. Such an overwhelming triumph is unprecedented in a parliamentary democracy if one overlooks the record of elections on the tiny island state of Singapore.

Looking at the positive factors first, violent incidents were not very numerous and there was no boycott by any party. Of course, this is a matter of relative judgment, because, for example, it would be futile to apply Swedish or Danish standards of behaviour in electioneering and polling to a country in South Asia, and especially one which had just undergone a war of liberation. The first general elections of Bangladesh were certainly less marked by violence than those in West Bengal or Bihar in the latter part of the sixties.

CASUALTY LIST

A check with the central offices of the various parties in Dacca showed this correspondent that the maximum claims added up to 52 persons dead in political clashes in the month preceding polling day. Of these, 26 belonged to the Awami League, 20 to the Jatiyo Samajtantrik Dal (National

Socialist Party), five to the pro-Moscow Muzaffar Ahmed group of the National Awami Party and one to the Bhashani group of the NAP. The JSD president, M A Jalil, an ex-major who came to fame as a guerilla leader in the Mukti Bahini claimed that two attempts were made to assassinate him. The JSD chief's allegations were, however, an insult to the musclemen in the Awami League because all that Jalil could show to his admirers and newspapermen were a couple of bruises on his knee which would not bring forth a whimper from a skip-roping schoolgirl of eight.

Anyway, Jalil stayed on in the race, hale and hearty, to fight and lose in seven constituencies, the maximum permitted for a single candidate under the electoral laws. It was only in this exercise that Jalil was one up on the Prime Minister, Sheikh Mujib, who was returned unopposed from two constituencies and was elected with more than one lakh votes each in his favour from two other constituencies. In a straight contest in Dacca city, Sheikh Mujib faced Jalil who did not keep even a full-time polling agent in the area. Still, Jalil ran up a score of more than 15,000 votes. In another constituency in Dacca, the opponent of Sheikh Mujib was a former business executive who is in jail awaiting trial on charges of corruption. This caged bird too piled up some 17,000 votes against the Father of the Nation. The much-maligned Mostafa Gazi Golam,

the chief of the Bangladesh Red Cross, was one of the two others to hit the one lakh votes mark.

None of the opposition parties alleged the use of firearms on polling day. The only credible complaint came from Muzaffar Ahmed in Comilla where some goondas entered a polling booth reserved for women. Here too, the opposition parties did admit that the army intervened quickly and restored order. There were enough photographers toting tele-lenses strewn around the country to snap from a safe distance gun-wielding gangsters of the Awami League if many had been up and about.

SPREAD TOO THIN

Unlike the Communist Party of India (united) which gained a number of seats with a small percentage of votes in the first Indian general elections, the Bangla opposition parties dissipated their energies by spreading themselves thin over hundreds of constituencies. Eleven seats having gone to the Awami League uncontested, 795 opposition party candidates and independents contested for 288 seats for which polling took place on March 7. Between them, these candidates polled 27 per cent of the 184.65 lakh votes cast, to win a meagre seven seats. Five hundred and sixty-four of the opposition candidates lost their deposits. The total strength of the electorate in these 288 constituencies was 337.9 lakhs, and the polling was 55 per cent, only a little higher than the turn-out for the 1970 elections to the National Assembly and the Provincial Assembly called by General Yahya Khan. In 1970, the Awami League polled 75 per cent of the votes for the National Assembly and a little over 70 per cent of those for the Provincial Assembly. This time, the Awami League got 73 per cent of the votes polled, to win 98 per cent of the elective seats in parliament.

In 1970, the biggest party, other than the Awami League, was the communal Jamat-e-Islami, with nearly seven per cent electoral support. The Bhashani group of the National Awami Party was not in the picture in the 1970 elections. The Muzaffar Ahmed group of the NAP won one seat in the East Pakistan Provincial Assembly with 3.27 per cent of the votes in 1970. This was the only member not belonging to the Awami League who sat in the Bangla Constituent Assembly which met in April last year. This time, the

Muzaffar NAP put up 223 candidates, to get a little over eight per cent of the popular vote and no seat at all. The Bhashani group won five and a half per cent of the votes and drew a blank, although it contested 169 seats and had arrangements with five other minor groups covering a total of 232 seats. The Jatiyo Samajtantrik Dal initially said it would be contesting all the seats and ultimately had 236 men in the field, to secure 6.6 per cent of the popular vote and one seat.

The best vote-seat ratio went to the Bangladesh Jatiyo League which polled just 61,541 votes and bagged a seat in the name of the veteran politician, former East Bengal Chief Minister, Aatur Rahman Khan. Aatur, a senior lawyer, and an early guru of Sheikh Mujib who was a Minister in his Cabinet in the fifties, has been a daring man in Bangla politics, taking upon himself the unpalatable role of defending in court those accused of collaboration. Aatur will be the most seasoned parliamentarian on the opposition benches.

The Chittagong Hill Tracts returned two independents, proving that the Buddhist and tribal population there has no sense of identity with the mainstream development of Bangla politics. The three other independents who won were all defectors from the Awami League, who were denied tickets by the ruling party.

Sheikh Mujib went to the polls as the Father of the Nation, referring to himself in the third person as Bangobandhu. Appropriately, therefore, he has declared that the election was a victory for "my" 75 million people. Mujib had said that he wanted a mandate on his four points — nationalism, democracy, socialism and secularism. But the election was really on one relevant point, the person of Sheikh Mujib. Russian pilots and Russian-gifted helicopters helped Mujib reach the far corners of the country, while some of the opposition candidates trekked their way, muddying their feet, through the swamps and the plains of Bangladesh. The Prime Minister managed to get back home and to his office almost every evening of the campaign to do his stint of administrative work which daily awaited his return to the capital.

EXIT OF THE CALIPHS

The outstanding rabble-rousing orator — if Mujib is taken out of consideration — was A S M Abdur Rab, one of the four caliphs of the

post-liberation months, who split away from the Chhatra League saying that Mujibbad was not enough and that what was needed was "scientific socialism". Along with Rab had gone Shahjehan Siraj, into the arms of the man behind the split, Serajul Alam Khan, a maulana-looking ideologist whose pride is the biggest personal collection of Leftist literature in Bangladesh. (According to Sheikh Moni, Rab and Siraj were on the point of being purged out of the Chhatra League when they made their dramatic exit.) Serajul Alam Khan cemented Rab and Siraj with the adventurist freedom fighter Jalil to form the Jatiyo Samajtantrik Dal which attracted under its wings a diverse group of youngsters among whom were devotees of the cult of Che Guevara. Jalil brought anti-Indian overtones to the party. Immediately after liberation, Jalil had wrestled with an Indian brigadier whom he accused of trying to take away arms surrendered by the Pakistani army and some capital goods from a small-scale factory. Jalil was detained by the Bangladesh authorities and kicked out of the establishment by the army chief of staff, Osmany. The Awami League leaders call Jalil a dacoit — a dacoit who was admittedly useful during the liberation struggle — and heap ridicule on the boys in the JSD. Sheikh Mujib himself described them as being so childish that if you pressed their cheeks the milk they drank the previous night would ooze out. The JSD retorts that Sheikh Mujib rode to independence and power along the trail of blood shed by these young men in their thousands.

The JSD says that its only aim in the elections was to get the party known the country over — a good excuse to forestall criticism of their irrelevance to parliamentary politics at the moment. The JSD could become a party of the future, if Sheikh Moni and the vandals at his beck and call would give democracy a chance in Bangladesh. Much also depends on whether the JSD, which is reputed to have thousands of followers with arms, decides to go in for extra-parliamentary activity without the use of violence. Sheikh Moni proved the power of his punch when he cracked down on the followers of the NAP (Muzaffar group) soon after the firing before the USIS on new year's day, reacting to charges of the pretentious pro-Moscow intellectuals that Mujib had become a bed-fellow of 'Vietnam killer Nixon'. Muzaffar Ahmed had waited in the

corridors outside the seats of power (with the reported blessing of Durga Prasad Dhar) hoping to be absorbed into a "national" government. Muzaffar Ahmed little realised that Mujib, like de Gaulle, considers himself to be the only authentic voice of the Bangla nation and has at no time felt the need for outside partners to dress up his image.

TOWARDS SHEIKHDOM

Sheikh Mujib, as one of his aides told this correspondent, started his election campaign on January 10 last year, the day he flew back to his independent country, after being released from a Pakistani prison and after making a thank-you-India-and-Indira halt in Delhi. The second Bangla leader to start his election campaign long before the constitution had been framed was Maulana Bhashani, who began his attacks on the Awami League as early as April last year. Bhashani's party did not win a single seat, but he did give some fright to Sheikh Mujib's colleagues as he took up one issue after the other. Bhashani spent election week in a hospital in Dacca, being courted by Sheikh Mujib and the Bangla President.

There is something pathetic about the pro-Moscow NAP group which certainly was one party which could lay claim to be the pioneer secular group in Bangladesh, having several non-Muslim intellectuals at its top. The membership of the Muzaffar NAP and the communist party are intermixed, and the people at large little know where Moni Singh ends and Muzaffar Ahmed begins. The Muzaffar NAP claims to be the only organised mass party on the Bangla political scene, with ten lakh ten-paisa-paying full members. But all it could poll was a total of fifteen-odd lakh votes. And, ironically for this secular-minded party, the support its candidates received included thousands of communal votes which could not find open expression in view of the constitutional ban on the formation of parties based on religion.

The mainstream of the political tide, swelled to great heights by the electoral mandate, is towards Mujibbad a still ill-defined mixture of worthy ideals. But as the soldiers of Mujibbad march, stepping to strictly Bengali tunes, moved by the passions of language and nationalism, the road, some fear, may lead to a Sheikhdom — Mujib at the top already, Moni on the prowl and Kamal to come later, the father, the nephew and the son.

SOUTH

Sagging Separatism

Mohit Sen

THE separatist storm in some of the districts of Andhra has lost its fury, and the separatists are now hoping that what they face is only a lull — though, in fact, it is the sagging of their fortunes that has descended upon them. Life returns to normal and even peaceful picketing is over. The attempt at large-scale bomb assaults and blow-ups has also not succeeded. The rampaging gangs are slinking back to their lairs.

Is another flare-up precluded? This cannot be said with full certainty. It may be that some last desperate acts of folly would be perpetrated. But anything like a storm seems to be a matter of the past. The NGOs have not officially decided to return to whatever work they were doing but their *elan* is over, their illusion that a separate Andhra was round the corner destroyed.

DEVELOPING REVOLUTION

The students, especially the college students, are still out and there is every likelihood that they will lose a whole academic year. Their fate is not very different from what happened to the college and high school students of the Telengana region some three years ago. Misled, nursing some genuine grievances, and believing that one push was enough, they abandoned their studies — only to find their leaders either back in the Congress or in the legislatures; Telengana was nowhere in sight. It is significant that, this time, right in the heart of Hyderabad, relatively more senior students broke up some of the relay hunger strikes organised by their juniors. It is a great tragedy that the students are often still in the Luddite phase of the movement. None can deny that they are among the victims of the present society, yet it is not against this society that they go into action but against their fellows and under the leadership of some of the worst representatives of the *status quo*. Quite wrongly, they believe that the separatist leaders are in tune with their sentiments since they, too, want some change. After all, they argue, a separate Andhra is a change from the existing integrated Andhra Pradesh. Quite true. But not every change represents advance. It is this distinction which the students of Andhra have yet to learn to make. Change in what direction? Change that changes what? Even on the limited question of

jobs, how would the separation of Andhra provide them with greater employment opportunities? Honour! Where is honour in the company of the decadent and the grasping? And can there be honour for the students without the uplift of the downtrodden and the oppressed? On whose side are these submerged sections? It is essential that the students should not in their desire for change forget to ask themselves these questions. Their future depends on it, including their role in these days of the developing revolution.

WRANGLING AMONG SEPARATISTS

The most tangible evidence of the dip in the fortunes of the separatists is the wrangling that has begun among them. First, there is the wrangling between the Congress and the non-Congress elements in the separatists' front. After the period of wild outbursts against the Prime Minister, some of the Congress separatists are now again proclaiming their allegiance to her personalities and to her person! They are trying to demarcate from the RSS, Jan Sangh, and Swatantra groups; and with their latest protestations of devotion to Indira Gandhi the non-Congress elements are hurling far from complimentary phrases at them. There is any amount of mutual recrimination among the Congress separatists as well. The Rayalaseema representatives are having any number of doubts about what the future of their region would be in a divided state. There is dismay among some that negotiations should at all have begun in Delhi without a clear mandate having been previously worked out. Still more interesting is the fact that among the non-Congress separatists, as well, a tussle has come out in the open. It can be said that the splitters are split.

The most heartening feature of the entire situation is the resurgence of activity among the integrationists. The CPI had been in the forefront of the campaign of explanation among the masses. There was a period of some weeks when this campaign had to be conducted by it mainly in its own bases. Now Red Flag demonstrations are the order of the day in the four delta districts, which the separatists had imagined comprised their undivided and unchallengeable kingdom. Attempts at

attacks on these meetings and demonstrations are met by firm counter-attacks which have dismayed the various *senas* and *vahinis*. But it is not only the CPI that is campaigning. The Congress integrationists have also come out on to the streets and fields. Conventions and meetings are being held by the score. A debate, a battle for the minds of the misled masses, is on in a manner that the state has not known for quite some time. And all this is paying dividends.

INTEGRATION STAYS

One cannot, of course, be absolutely sure but the balance is now definitely tilted in favour of the integrity of Andhra Pradesh. It looks as if victory is within reach for those who stood up to the most ferocious offensive that Right reaction had launched on a mass scale since the Hindu-Muslim riots of the past decades. It looks as if the counter-offensive has been contained. The anti-Right forces have every reason to congratulate themselves.

It must be added, however, that this justified feeling of joy should not lead to any complacency. Nor must it come in the way of a searching examination of the causes of the Right being able to mount such a challenge and acquire such a menacing mass base.

The failure to push ahead with development and to carry out the radical structural reforms without which such development is not possible, is the basic cause which allowed the Right counter-offensive to acquire its sweep and striking power. Without the removal of this basic cause, the Right cannot be contained — much less countered — in Andhra, or anywhere else for that matter.

Specifically, in Andhra Pradesh, there can be little progress for the state and its people unless the power of the landlords, of the old and of the new type, is struck at and then broken. They have not only wealth but wealth in a form and in a kind of preference which is economically counter-productive and atrociously reactionary, socially and politically. It is medievalism seeking to acquire a capitalist base exactly similar to the reactionary way of capitalist development, which Marx had analysed in *Capital* Volume III and which Lenin had so trenchantly written about when he made the famous distinction between the Junker and the American paths of development of capitalism in agriculture. The combination of medievalism and limited capitalist development is menacing, and has to be uprooted if there is to be slightest prospect of democratic advance in Andhra, or anywhere else for that matter.

BANGKOK

The Insurgency Equation

M R

THAILAND'S ruling elite is in search of convincing reasons to make the United States military presence on its soil credible — and to prolong the presence indefinitely. In February, when Spiro Agnew and Henry Kissinger visited Bangkok, it tried to psyche them into believing that the Chinese were directly participating in the communist insurgency, besides stepping up military aid to it, and that the problem had taken on a new dimension with the end of the Vietnam fighting. The visitors were left unimpressed because the United States has better reasons than countering countries communist insurgency for its military presence here.

Estimates of how big the insurgency problem is vary. But one has to take the Director for the Co-ordination of the Communist Suppression Operations Command at his word. He said there are about 4,000 Thai communist insurgents and 3,000 have been captured and another 3,000 arrested. Which means, had there been no arrest and no surrender, the country (with a population of about 30 million) would have 10,000 insurgents. The figures underline one fact — the communists have been able to recruit guerillas with success. According to the Director, the communists have changed their strategy. They now help people to solve their economic problems and engage in a big recruiting programme. But this was exactly what the government had tried to do to prevent the people from joining the communist ranks.

Communist insurgency in Thailand's north (the Thailand, Burma, Lao tri-junction) and the north-east (the border with Laos) mesh with ethnic movements of the Meo tribals. In the south, on Malaysia's border, it dovetails with the Muslim irredentist movement. But the old theory that communist insurgencies are mere ethnic revolts and are confined to ethnic tension spots is dying. The movement is extending to the central plains and to the ethnic Thais.

The government had adopted two major strategies for countering insurgency. In the north-east where most of the guerrillas are local Lao or Thai, it tried to strengthen government-to-village relations using community

development and village defence programmes. In the north where the insurgents were believed to be mainly the hill tribesmen living high in the mountains, guerilla warfare has been prescribed to kill off or isolate the insurgents. But by the government's own admission there are more insurgents in Thailand now than say five or ten years ago.

The Accelerated Development Programme launched with fanfare ten years ago is part of the pacification programme in the "sensitive" provinces. The targets were improved living standards so that communist propaganda did not appeal to the people. But the government now ruefully admits that the communists are now trying to snatch the people's goodwill from the government. The communists appear to have succeeded despite the Accelerated Rural Development Programme and the suppression operations which take the form of a sophisticated war.

Five years ago, the suppression operations were launched, ironically on the basis of belief in Mao Tse-tung's famous aphorism on guerilla warfare about the guerilla among the people being like fish in water. So side by side with military operations, an attempt was made to drain water off from the fish, i.e. to cut the guerillas off from the people by shifting the people to new areas. This was the plan tried in Malaya during the 1948-1960 emergency. It was known as the Briggs plan after the British expert who devised it. By removing and shifting whole communities and populations from their environs and settling them in new areas, it was thought the guerillas could be deprived of their base, isolated, and annihilated through military operations. This technique was tried unsuccessfully against Montagnards in Vietnam. In Laos, it not only failed but threw up a new problem, of refugees. But the SEATO which has its headquarters in Bangkok and is a vital factor in the operations to suppress communists in Thailand still believes in the "draining the water off the fish" method. As a result, Thailand's insurgency problem has acquired a new dimension. Forced resettlement of people has covered such large areas in the traditional com-

munist pockets that it embraces the creation of a free-fire zone along the Thailand-Laos border.

A scholar who studied the results of the resettlement efforts has found that the refugees living in the new settlements add up to less than half of the population of the villages that were forcibly evacuated. More of the tribal people, especially the young males, went farther into the mountains than came down. Despite generous aid by volunteer groups and Thailand's SEATO allies (many of the areas would not have got roads but for the communist activity there) these resettlement schemes are poorly administered. For instance, at Rong San, the settled villagers were promised a dam which has not yet materialised after many years. No wonder the people are unenthusiastic about the operations to suppress communists. At Moi Ron Yen, scrapers used to clear the land also cleared the thin top soil. Corn planted there grew a few inches and withered. Obsessed with containing communism, the Thai government does not see the need to find adequate land to meet the requirements of the hill tribes or, alternatively, to modify the cultivation pattern to enable better use of land. Forced evacuation of people from the critical areas is no solution.

As an American correspondent who toured one of the insurgency areas reported, "in this area it is warfare *a la* Vietnam — complete with free-fire zones, helicopter gunships, refugees and a foe who won't leave his dead behind". The tactics of the government forces in this war are those worked out by the Americans in Vietnam. In 20,000-square kilometres of heavily foliated mountains at the trijunction of Phitsanuloke, Petchabun and Loi near the Laotian border, 4,000 government troops have not been able to get the better of 400 guerillas. The government forces operate from fortified camps and are equipped with the most advanced electronic communications equipment. The inaccessible camps are supplied by helicopters. United States weapons are there for keeps — M16 rifles, M79 grenade launchers, 50 calibre machine guns. Heavy military trucks are in common use. The forces can call in air strikes by T-28 singleprop bombers, OV-10 Broncos or helicopters and C-47 gunships. But the problem is to find something to shoot at. The hit-and-run guerillas do not leave any trace and the government forces cannot recognise a guerilla when they come across one be-

cause it is so difficult to tell them from the villagers. After sporadic encounters all that can be seen are blood trails leading off into the jungles.

The guerillas no doubt are poorly equipped. At best they might have the famous AK-47 rifles made in China, a proven guerilla weapon. They might also have a few M-1s, carbines and possibly a few heavy machine guns and B-40 rocket propelled grenades. In terms of weaponry, it is an unequal war. But the government forces comprise soldiers belonging to the central plains while the guerillas belong to the people, like fish in water.

So over a wide front, the Thai government fights its desultory war

against the communist insurgents who are gaining new adherents and are moving into new areas. The presence and the growth of the insurgency problem is a perfect alibi for many things for the Thailand's ruling elite. Thirty-five of the country's 71 provinces are affected by insurgency, to a lesser or greater degree. The government is reluctant to admit that the insurgency extends to the thirty-sixth province too because that happens to be the province of Chiang Mai. Chiang Mai is the king's resort and a big tourist draw and is known for its beautiful girls. But it looks as though Thailand would have had to invent an insurgency problem if one did not exist.

VIETNAM JOURNAL

A New Society through Education

Harish Chandola

HOW could a small and poor country like Vietnam of about 35 million people (the population of both North and South) defeat the massive aggression of the United States, a country of wealth, great resources and the most modern military equipment?

On the battlefield, the American soldier was a large, well-built, beef-eating, beer-drinking, gum-chewing man, going into attack on helicopters or in tanks or armoured vehicles with artillery and air cover. The Vietnamese soldier was a small man, often smaller than an average Indian, who travelled great distances at night, then spent hours digging trenches, ate a part of the ball of rice he carried which was his ration for the day and often longer, and then either waited for the attacking force and tore it into shreds or launched a surprise attack himself. And won.

The basic difference was that the Vietnamese was the product of a new society. The new society had educated him in military science, had provided him with the most valuable experience of its past struggles, particularly the fairly recent one against the French colonialists, had developed his initiative and had taught him new tactics. The entire activity of his society was geared to winning the war.

The fighter did not have to worry about his mother and father or wife and children back home. Because at home there existed a social system which looked after them as well as he himself would have, or even better. That system upheld and constantly

emphasised values, like faithfulness to the country, to one's husband or wife and family, all of which were a great assurance to the fighter. He came from a society where he was not a mercenary but a highly valued and respected member, where by fighting he was not serving somebody else's interests, but his own, his family's and his country's. (In contrast the army of the Saigon administration would just not exist if the United States did not provide the funds to pay for it.)

What were the essential ingredients of this society, which created a new Vietnamese man, a good peasant, a good worker, an able fighter and an able defender? These were: education for all, freedom for women from old bondages and then their participation in all activities as a new working force, and liberation of productive forces through new relations of collective ownership and of production.

Education has been the most essential factor of this relationship. The Vietnam Workers' Party felt that it would not be able to communicate with its people and build a new society if the people remained illiterate. When it first came to power in 1945, after the Second World War, 95 per cent of the Vietnamese people were illiterate. In 1955, after the defeat of the French and the restoration of peace in Indochina, there were only 716,000 students in all the primary, secondary and high schools of Vietnam, Cambodia and Laos. Last year, at the height of the US bombing, the number of students in the schools of North

Vietnam alone was 6,054,000, excluding those in night schools or doing spare-time courses and in institutes and universities.

To wipe out illiteracy, a mass campaign was organised by the Government of North Vietnam, after the war against the French ended in 1954. The slogan was that everyone who could read and write was a teacher. In each family those who could read and write had to teach others who could not. Children going to school had to teach their parents. Parents if they were literate had to teach their neighbours. It was the task of the literate to find the illiterate in his circle and educate him.

A mass propaganda campaign was launched to tell the people about the lives of slaves under foreign domination. The benefits of literacy were explained. The people were made to feel proud that they were now citizens of a free country. No free citizen could remain illiterate. A slogan painted everywhere said: "To study is to love the Fatherland."

Elementary classes were opened in every hamlet, village and locality; both day classes and night classes, so that the people could study everywhere, easily and at the time they were free. Millions of textbooks were printed for beginners and also for the teachers to learn new and fast methods of teaching. Self-study was encouraged. Learning the alphabet was made easy. Blackboards were put up everywhere: in market places, on roads, in village corners, displaying the alphabet so that the people could look at it and familiarise themselves with it while working. It was painted on water-buffaloes so that children looking after them could learn them.

A few years later, mild forms of discrimination were practised against those who refused to learn. Discrimination that did not deny much, but did hurt one's pride. Like when a family went to see a movie. Those who could read the line written above the entrance could go in and others not. The result was that the wife who learnt the alphabet went in with the children. And the husband who did not, remained outside.

In this manner illiteracy was wiped out in the five years between 1954-59. In the remote mountain regions and forests a few old men of some minority groups remained illiterate, but 99 per cent of the people had learnt to read and write.

(This should be a good example for us in India. We are busy creating new universities and institutions of

higher learning, like the Institute of Advanced Studies, etc, when after 25 years of independence nearly 70 per cent of our population remains illiterate. For whose benefit are these institutions of higher learning? Certainly not for the Indian people, most of whom, remain illiterate.)

The second important task taken in hand was to wipe out the feudalist and colonialist system of education and build up national, democratic and popular education. Teaching in the mother-tongue (Vietnamese) was introduced in all schools, and that played a major role in wiping out the colonial system of education. In the past, the medium of instruction in all secondary schools and universities was French. Even some primary schools taught in French. North Vietnam changed that totally and began using the Vietnamese language at all levels. That gave education its national character. It called for a great effort on the part of teachers and intellectuals to rewrite textbooks, work out new scientific and technical terms and compile dictionaries. If education had not been given its national character, Vietnam would not have won the victories it has. (Here lies another lesson for us in India).

The French colonial regime had instituted a primary, then senior primary, then secondary levels of education, corresponding to the differentiation of social classes. This was replaced by a three-level general education of ten years: the first level for children from 7 to 11 (4 forms), the second level for those from 11 to 14 (3 forms), and the third level for those from 14 to 17 (3 forms). Complementary education for adults was provided on lines parallel to regular general education. Any adult could join the spare-time courses of the level he desired.

The purpose of general education was to have healthy people with a good political consciousness and with a good knowledge of science and technology who could become good workers, good peasants and good fighters, capable of building up the country and defending it. From general education, students could go to higher institutes or universities.

Schools had to prepare pupils for the tasks that would be entrusted to them by society. A system was adopted according to which students studied in classrooms for half the day and spent the remaining half working, in agricultural co-operatives or in factories or workshops where they learnt rudiments of technology in conjunction with the scientific notions learnt at school.

The student who participated in production work produced material wealth and helped his family and the state cover part of the expenses on his schooling; this made it possible for most children to continue their studies. But production work was first of all a basic educative factor; it was not considered advisable to let young people engage in purely bookish studies upto an advanced age without using their hands.

In practice, tasks given to the pupils were in accordance with their ages and with local conditions of production. They started with the most simple work; cleaning and repairing school buildings, tree-planting, animal breeding, collection of scrap iron, etc, to be followed by more complex and technical work. In the mountain regions many boarding schools had their own collective farms. The aim was that education received at school must bring about a harmonious development of all human qualities and not result in an encyclopaedic overburdening of the memory.

New courses were devised all the time. In mathematics, for those going to anti-aircraft defence and artillery. In physics, for those going to work in power houses. In chemistry, for those going to specialised factories. In agriculture, animal husbandry and hydraulics for those going to farm co-operatives. The courses depended upon the requirements of the state.

I have myself seen workers from a Hanoi power house studying physics and mathematics at a night school. To improve the knowledge of the workers, factories sent them for higher education in their spare-time and even for full-time study courses on full pay. In this manner the tasks of production and higher learning went hand-in-hand. Many factories and farm co-operatives now have managers who had joined them as labourers and had then studied and improved their knowledge while working.

During the American bombing, schools became particular targets. Many of them were beautiful tile-roofed buildings easily visible amidst the green of the villages. Between 1964 and 1968, 1,589 schools were destroyed. Hundreds of others were destroyed last year. In southern provinces like Thanh Hoa, Nge An, Ha Tinh, Quang Binh and Vinh Linh, more than 30 per cent of the schools were destroyed. In Quang Binh every single school was bombed. But in the midst of the war of destruction, education was not only continued but made progress. Schools had to be dispersed, even those in villages. Each school

was split into small groups which were easily housed under trees in small hamlets.

Many students and teachers were killed in the bombing. However, school enrolment increased by nearly half a million every year. Braving the bombs, more than one million adults attended complementary education courses in their spare time. The educational system was not only maintained, it was also rapidly developed. At present all villages have their own schools upto the fourth form, and many, upto the seventh form. And all districts have schools upto the tenth form. Infant classes run by agricultural co-operatives have multiplied in the villages and, at the moment, North Vietnam has over 160,000 teachers teaching infant and pre-school classes.

Measures were taken, so that studies were not interrupted. Hundreds of thousands of students were transferred from the cities to the countryside and to forests, where new and smaller schools were built. Teachers and students were trained in protecting themselves from bombs and many were taught methods of treating bomb-victims. Every school was provided with medicines and implements to dig bomb-shelters.

Methods of teaching and organising studies had to be changed to suit war-time conditions. For instance, morning exercises were taken out of school time-tables. Students were told to perform them near their homes, in small groups under the guidance of teachers. The attempt was not to let the students concentrate at one place or in the school for a long time. Instead of the practical work done in schools before, students were sent out to fields or factories set up in places of evacuation under foliage, to limit their time in class-rooms. The time for self-study and group-study was increased.

Class-rooms were dug into the earth. Protective earthwalls two metres high and a metre thick were built around schools. Roofs were made of earth and grass, one-third of a metre thick to avoid pellet bombs, of which schools were particular targets. Some schools had ten kilometre-long trenches connecting them with hamlets, so that children could come and go back protected. Many had air-raided shelters five metres deep. This required great skillfulness in organisation and use of manpower.

With these and several other measures, too many to write about here, the US attempt to destroy the system of education in North Vietnam through bombing was completely foiled.

A Skeletal Approach

J DSouza

Models of Political Systems, by Morton R Davis and Vaughan A Lewis; Macmillan Press, 1971 by Pall Mall Press; pp 182.

IF variety and change are any measure of the importance of a discipline, then political science must surely rank high. Some idea of this variety may be gauged from the book under review "Models of Political Systems" by Morton R Davis and Vaughan A Lewis. The authors aim to provide an introduction to recent attempts at model-building in the study of political systems; or more explicitly to present some frameworks for a comparative study of political systems. The book is in four parts: introduction to modern political theory; structural-functional analysis; general systems theory; communications theory; typologies of political systems; and power.

In Part One, the authors provide a brief sketch of the genesis of modern political theory: the failure of and the dissatisfactions with the older approach; the new situation during the inter-war period and after World War II and some of the major figures who contributed to a widening of horizons, particularly Bagehot, Graham Wallas, and Max Weber. The lines of thought of these thinkers and the emphasis on scientific procedures by American political scientists, have given rise, according to the authors of this book, to a variety of methodological approaches. The authors then proceed to examine the underlying assumptions of these new approaches.

This is the least satisfactory part of the book. Since the work is meant to be an introduction to the writings of various thinkers selected for the purpose, its examination of the basic concepts of the modern approaches in political science — essentially political science as developed in the United States, as the authors affirm — could have been attempted in greater detail.

This was all the more necessary, as the emphasis among the model-builders examined is predominantly on science, empirical studies, and the systems idea. Though the authors mention some of the difficulties which arise in applying the methods of the 'hard' sciences to social phenomena (like the notion of a law), their treatment is inadequate. The fact is that social life is more in the nature of a seamless web and the very categories

that one employs are in the nature of mental constructs. As such, each investigator's assumptions, or theories, are of fundamental importance in the definition and marking out of categories. If there is some measure of agreement among social scientists, this could very well be accounted for on the basis of the sociology of knowledge — rather than with reference to the similarity of the phenomena itself.

Again, while general concepts like 'system', 'theory', 'law', 'model', are readily used, there is far from general agreement on their use. Though the authors present some of the difficulties in the use of these terms, it would have been far more helpful if they had not been so brief. They mention that the concept of a system gives rise to problems in political and social science, particularly with regard to marking out the boundaries of the system. But this is only one of the difficulties; more fundamentally, critics have even questioned the very advisability of using the concept of the 'system' in these fields. Often the term creates more problems than it is likely to solve. Seeing that the controversy about holism versus individualism has not been satisfactorily resolved, it is surely premature to accept one of the polarities without some consideration of the other. These and other questions have led critics such as H A Simon to query the necessity of using the term

and R C Buch to ask, "so what?" when confronted with the analogies of the systems theory.

Although the book contains a brief discussion at the beginning about theories, models, and law, this too would have borne elaboration. The different meanings given to the word theory, for instance, among social scientists, is bound to confuse. Moreover, the connection between theory and model is by no means as clear as one would like it to be. Van Dyke considers 'model' to be associated with imitation, explanation, and prescription. Herbert A Simon once took 'model' as a synonym for 'theory', and preferred the latter term. Others would regard 'model' as the wider, and theory as the narrower, term. Meanwhile, it is pertinent to enquire whether a model can be set up without a theory; to ask what the connection of these is to 'laws'; and further to consider whether laws are possible at all in dealing with human activities. A more detailed and clearer expression of these issues was certainly called for in a book which concerns itself with an exposition of the various models relating to political phenomena.

It is relevant to note that the model of one of the foremost advocates of the systems theory in politics, David Easton, has given rise (as the authors observe) to few attempts at being operationalised. With most of the proponents of the systems concept, there is in fact a sort of self-defence clause — in that, they say the concept of the system is an analytical device rather than an attempt to describe or reflect a concrete system. It can be questioned whether it is even as such necessary.

Can one explain the complex by the simple? The authors mention that the interactions which interest political scientists form only a part of the total interactions of a society, and that the world system is used by the latter for this part. They also say that the 'concrete' system is made up of the totality of interactions, but that such a comprehensive model is too unwieldy to be operationalised meaningfully by empirical social scientists. Even with such a proviso, are terms like inputs, outputs, feedbacks, etc., as significant then as they are made out to be? A major question regarding the use of the concept of system, is whether it is in the mind of the social scientist only or in that of the actors themselves. If individuals — i.e., political and social actors — do not think of themselves as part of a system, or as acting to maintain one, how relevant is it to speak of it in this way? Does not the marking out of boundaries then become arbitrary? The whole problem of the nature of social reality rears its head at this point, and though it would be an oversimplification to think that it can be satisfactorily solved. Nevertheless, a clarification of the issues involved would not have been out of place.

This need is better appreciated when one remembers an observation such as that by Inkeles in connection with sociology, viz., that the models that sociologists prefer often become Procrustean beds to cut away all facts which do not fit. It would have been relevant, in this context, also to relate terms which are now in vogue, with traditional terms like State, Government, etc., which seem to be out of favour with systems theorists. Thus Almond, speaking of the political system, refers to it as "that system of interaction to be found in all independent societies which performs the functions of integration and adaptation...by means of the employment, or threat of employment, of more or less legitimate physical compulsion". Easton considers that what makes an act specifically political, is its "relation to the authoritative allocation of values for a society". The questions that arise are: Is the widening of the frame of reference a gain? Can one separate the legitimate, from the normative or the ethical? The questions become all the more critical in the face of serious difficulties in the way of making empirical generalisations about social phenomena. Could not empirically oriented political scientists be chasing a will-o'-the-wisp? Or, in speaking of equilibrium states and the requirements of the system, is there not a

danger of deifying the concept or falling into organismic fallacy? Hence a tracing of the differences and similarities between the newer concepts and models, and the traditional ones, might have helped place the more recent ones in their perspective.

In the exposition of the various models, however, the authors have done a competent job. Probably limitations of space (the book has only 161 pages, if one leaves out notes, bibliography, and index) have necessitated a great deal of compression; yet the reader would benefit by a careful reading of it. Part two deals with the analysis of G A Almond and associates, David Easton, David Apter and K W Deutsch. Part Three under the heading of 'Typologies of Political Systems' presents E A Shils and Modernisation, and G A Almond and Political Culture. Part Four dealing with Power considers R A Dahl's analysis and that of H D Lasswell.

Since at least three of the above authors deal specifically with the political aspects of development and modernisation, these sections should be of particular interest to students of such phenomena in the developing countries. Apter and Shils, in particular, should be quite stimulating and profitable, especially as the section on Shils is fairly detailed.

Crash Scheme for Rural Employment Evaluation of the Programme in a District in Maharashtra

D P Apte

This paper summarises the findings of a study of the Crash Scheme for Rural Employment in a district in Maharashtra between June and September 1972. The objective is to note the difficulties experienced in the implementation of the programme and assess the role of the CSRE in creating employment opportunities in rural areas.

The implementation and functioning of the programme were studied for the purpose. In addition, a survey of a sample of 97 families of labourers engaged in two road works under the CSRE was conducted to get some information about their socio-economic conditions and the impact of the CSRE on them.

IN recent years Government of India has introduced various schemes to provide employment opportunities in rural areas. These include the programme of the Small Farmers Development Agency (SFDA), the scheme for Marginal Farmers and Agricultural Labourers (MFAL), the Crash Scheme for Rural Employment (CSRE), and the like. The schemes are formulated by the Central Government, and are implemented by the state governments at the district level through the Zilla Parishads.

Each of these schemes tries to cover a particular section of the rural population. For instance, small farmers are covered under the SFDA, while the MFAL scheme extends to marginal farmers and agricultural labourers. The schemes under the SFDA and MFAL do not provide employment directly, but enable the beneficiaries to receive loans for productive purposes thereby enabling them to secure additional income and employment. The CSRE is different from the SFDA and MFAL, in that, it was introduced in April 1971 'for alleviating the prevailing conditions of unemployment and underemployment in rural areas by generating additional employment through additional rural works'; it is intended to provide employment to persons belonging to families where no adult is employed or which suffer from inadequate employment.

An evaluation of the CSRE in a district in Maharashtra State was carried out, in the Agro-Economic Research Unit located at the Gokhale Institute of Politics and Economics, Poona by the Ministry of Food and Agriculture, Government of India, between June and September 1972. The implementation and functioning of the programme were studied for the purpose. Information available in the correspondence, circulars, records, etc., at the Zilla Parishad's

office, was used for the enquiry. In addition, a survey of a sample of 97 families of labourers engaged at two road works in the CSRE, was conducted in June 1972 in order to get some information about their socio-economic conditions and the impact of the CSRE on them.

The present paper summarises the findings of the study with a view to noting the difficulties experienced in the implementation of the programme and assessing the role of the CSRE in creation of employment opportunities in rural areas.

OBJECTIVES OF SCHEME

The basic objective of the CSRE is to generate employment in productive works for a thousand persons in each district, on an average, per year during the three years ending March 31, 1974. The scheme envisages that, if a year is taken as consisting of 10 working months and a month as consisting of 25 working days, on an average 2.50 lakh man-days of employment should be generated in every district. Considering the total number of landless labourers or persons with inadequate employment, in a district and considering the administrative organisation and resources required for the planning and execution of the programme, the creation of additional employment for a thousand persons in a district under the CSRE appears to be a very modest attempt to tackle the problem of unemployment and underemployment in the rural areas.

The other objective of the scheme is production of assets of a durable nature in consonance with local development plans, so that all-round development of the district is assisted through the execution of the projects which are essentially labour intensive. The projects may relate to road building, land development, minor irrigation, afforestation,

construction of additional class-rooms to the school building, or any other such works.

In the directives given, it is stated that the selected rural works should be located in areas of each district (i) where other special programmes such as the SFDA, MFAL, Drought Affected Small Holders, etc., are not in operation, (ii) where the percentage of landless labour and the incidence of unemployment is relatively high, and (iii) which are relatively less developed. The scheme emphasises that there is on the one hand need to generate employment for the rural people and on the other the equally important need to ensure that the fruit of their labour is durable and assists in the development of the district.

Two types of works, viz., construction of percolation tanks and roads, are included in the CSRE in the sample district. On completion of the works, the percolation tanks may help to add to the productivity of land and employment in agriculture; in addition, some of the 1,000 labourers participating in the CSRE may get further employment in agriculture after the expiry of the CSRE. It is doubtful, however, whether and to what extent the road works included in the CSRE will help all-round development of the district and generate additional secondary or tertiary employment — particularly since many of these roads may remain *kachha* roads and may become unusable if not properly maintained. It is feared that many of the labourers who get work in the CSRE at present may again face the problem of unemployment and low income at the expiry of the present programme. What then is exactly the objective of the government in launching this kind of an *ad hoc* programme for employment which does not assure continuity of employment beyond March 1974?

**Every time
a tree is felled,
the country dies
a little**

A country has no chance of survival if at least one-third of its area is not covered with trees. This has now been scientifically proved.

Trees are more than just raw material to be carved into furniture or logs to make fire. They enrich and hold the soil, convert carbon dioxide into oxygen, attract rain clouds, soften the light glare and heat.

Trees are also of tremendous scientific use. They are indicators of conditions which cannot be measured otherwise—conditions like depth of water.

So, let the trees live, if you love your country.

Issued in the public interest by
TATA STEEL

FINANCIAL PROVISION

For the purpose of the CSRE the Central Government has sanctioned for each Zilla Parishad, through the state government, a sum of Rs 12.50 lakhs per year — i.e., Rs 37.50 lakhs for a period of three years, from April 1, 1971. When inviting proposals for the CSRE, the Government of Maharashtra asked the Zilla Parishads to submit proposals worth about Rs 50 lakhs. The government approved proposals worth about Rs 49 lakhs in the case of the sample district. It was, however, understood that the government's grant would not exceed Rs 12.50 lakhs per year. Due to the considerable time taken — in surveying and preparing plans, alignment, and estimates, and in obtaining sanction from the concerned government authorities — and also because the Zilla Parishads have simultaneously to carry out a number of other schemes, a substantial portion of the Rs 12.50 lakhs remained unspent during 1971-72. It is, therefore, desirable that the government carries forward to the following year the unspent grant from the previous year to enable the Zilla Parishads to complete the works proposed and approved in the scheme. Otherwise, the scheme will come to an end by March 31, 1974, leaving some of the works incomplete and without having had any significant impact. It was understood that, only in an exceptional case, a Zilla Parishad showing success in the implementation of the CSRE may receive from the government a grant to the extent of the full amount of the estimated expenditure on the works included in the CSRE and approved and sanctioned by government.

FORMULATION OF PROGRAMME

In the following paragraphs a brief account of the formulation of the programme is given.

From the time towards the end of February 1971, when the Secretary to the Government of India, Ministry of Food and Agriculture, wrote to the state governments, the Government of Maharashtra took about a month to write to the Zilla Parishads. Naturally, the Central Government's desire to receive the proposals in a consolidated state report by the middle of March 1971 did not materialise.

Though the state government wished to receive proposals from the Zilla Parishads within a week from the time they received its letter, the first proposals in the desired form could be formulated only after the conference of the Presidents and Chief Executive Officers of Zilla Parishads and District Collectors at Bombay in the third week

of April 1971, and the circulation towards the end of April 1971 of the guidelines approved by the State Level Co-ordination Committee.

It took another month to process the proposals, and the Government of Maharashtra communicated its sanction to a part of the proposed works in the sample district in the first week of June 1971. The process of revising and resubmitting the proposals in the prescribed form, consistent with the guidelines continued from June 1971 to February 1972. In between, a number of letters, telegrams, and telephone calls were exchanged between the state government and the Zilla Parishad. The proposals submitted by the Zilla Parishad in the third week of February 1972, were forwarded by the Government of Maharashtra to the Government of India in the first week of March 1972. Thus the process of formulating, finalising, and formally approving the proposals, took one full year after the Government of India circulated the scheme in February 1971.

It may be observed that the time limit, of a few weeks, set by the Central Government to receive the proposals from the state government and by the state government to receive the proposals from the Zilla Parishads, was too short. The formulation of a scheme, which has to include several works in different parts of a district and which is to be drawn up in consultation with the various officials of the Zilla Parishad and the District Co-ordination Committee, is bound to require some length of time. The CSRE is to remain in force for three years, and a period of three months may be considered reasonable for formulation of proposals in the desired form. The officials of the Zilla Parishad indicated that the fact that they have to implement a number of other programmes, such as the SFDA, MFAL, Scarcity Works, etc., must also be taken into account while requesting them to submit new proposals within such a short time.

WAGE RATE

In the outline of the scheme, circulated by the Ministry in February 1971, it was stated that "the persons who find employment under this Scheme through various work projects are to get wages according to local off-season rates... While these rates will no doubt vary from state to state, it is hoped that, by and large a per diem payment of more than Rs 3 should not be necessary. In any case, wages are to be contained within Rs 100 per head per month. The amount paid in wages is very crucial in determining the success of the Scheme; a wage that is

even marginally higher than the prevailing off-season rate will draw out people from their existing avenues of employment and thus frustrate the purpose of the Scheme. On the other hand, a perpetually lower wage may prove a disincentive even to the unemployed and it may not be possible to muster the minimum number of persons for the various work projects. Besides, the nature and location of works should be such as would generally provide continuous employment for a period of 10 months in a year. While it is recognised that there may have to be some deviations from this depending upon local conditions and employment pressures that build up during the peak agricultural seasons, a certain minimum measure of continuity in the implementation of work projects would nevertheless be necessary on considerations of efficiency and costs." A subsequent clarification from the government stated that, "since the employment is to be taken with reference to the locally prevailing wage rates, it follows that if people are not willing to work at the rate offered by the CSRE it is not unreasonable to assume that the problem of unemployment is not acute. Where private employers and others are prepared to offer high rates to attract labour, there is no need for operating the CSRE with an in-built lower rate in such area... It is possible that still some workers may on account of factors like low nutritional status, inexperience, general apathy, reluctance to work for full number of hours, etc., turn out, in a day, less work than the quantity assumed in the new schedule and thus earn in practice less than the daily off-season wage rates; this cannot be helped. It is hoped that most of them will improve their turnover with experience. If there are a larger number of cases that do not respond to experience and continue to earn significantly low amount, the matter may have to be reviewed with a view to devise suitable remedial measures, if possible... Rs 100 per month is not a ceiling and does not mean that an efficient worker should be asked to stop work or go slow if he earns by piece rate of Rs 100 in less than a month. The maximum is by way of a guideline for preparing estimates and laying down norms."

The guidelines from the government neither made any specific distinction between the wages to be paid to male and female labour — presumably because of the emphasis in the guideline to the local off-season rates — nor referred to the employment to children or old people. The wages normally paid to male labour in the sample district and in many parts of the state are

about 50 per cent more than the wages paid to female labour. However, the Zilla Parishad decided to pay wages at a uniform rate, of Rs 3 per day, to both male and female workers. The uniformity in wage rates results in attracting females in larger numbers and consequently in lower output as women are not able to work as hard as the men.

ATTENDANCE AT WORK

A scrutiny of the attendance musters for a period of about nine weeks between March and May 1972 in respect of two road works, showed that at one of the works only 20 per cent of the workers attended the work regularly and about 50 per cent of the workers attended the work for only about half the number of working days during the reference period. At the other works also, here were several instances of inadequate and irregular attendance and the officers of the Zilla Parishad had to warn the Block Development Officers and the village servants to see that the workers turned up in adequate numbers.

From the data collected through the survey of the 97 families of labourers participating in the CSRE, it was found that a majority of them were landless labourers or small farmers with less than four acres of land. Their annual income was also low, being less than Rs 1,000 in a majority of the cases. There were wide fluctuations in day-to-day attendance of the labourers in the works undertaken in the CSRE. It was not possible to find out the reasons for the absence of continuity in attendance of the labourers, as it would have taken considerable time to contact the labourers. During the course of a visit to one of the road works, however, the research staff enquired as to why some of the labourers who had reported for work on the day prior to the visit did not report for work on the day of visit of the research staff. Our staff was told that most of them had to go to the district headquarters, which was situated at a distance of five miles, for purchases of grocery, etc. If the labourers could not afford to miss a day's wages in order to make purchases for some festival, it means that they are really not pressed. Or it may be that their attachment to life is less ambitious and they are content with whatever they can earn by working in the CSRE. It never occurs to them that they should never feel like working. The vision of an assured employment at Rs 3 per day in the CSRE really amounts to encouraging this attitude on part of the workers. In such circumstances, it will be necessary to decide whether such labourers should be pena-

lised for irregular attendance or be refused employment in the CSRE.

For economy and efficiency in the execution of works, continuity in employment of a certain minimum number of labourers is necessary. If it is not possible to penalise the labourers for absence and irregularity of attendance, it should be considered whether it will be possible to reward the labourers who show regularity in attendance. Rather than pay Rs 3 per day, the administration could decide to pay Rs 2.50 per day or Rs 18 per week in respect of attendance for six days in a week. Maybe, in order to get a paid holiday on Sunday, the workers will be tempted to report to work regularly for six days in a week and payment of Rs 18 per week in such cases will in effect come to Rs 3 per day. If properly planned and implemented, the CSRE has a definite role to play in helping landless labourers and small farmers in the region to add to their income at least upto March 1974 by participating in the CSRE.

PREPARATION OF LIVE REGISTERS

Regarding the persons to be employed in the scheme, the following directive was given in the outline of the CSRE circulated by the Ministry in February 1971. "The Scheme is designed to provide employment primarily to those who belong to families where no adult member is employed; the Scheme has, however, also to take note for employing others, keeping in view the problem of underemployment and seasonal employment." In the outline of the CSRE circulated by the state government in May 1971, also, it was stated that, "the 1,000 persons to be employed under the Scheme have to be identified in a carefully prepared list which should be kept under constant scrutiny. The labour should be local, and not migratory, contract, or imported labour, because the objective is to create local employment for the local people."

The Chief Executive Officer asked the Block Development Officers to prepare live-registers as per the criteria contained in the guidelines. They were asked to include persons who were residing in the villages located within a radius of 3 to 5 km from the worksite and who are not likely to find employment anywhere. A systematic preparation of the live-register required visiting every family in the village to find out whether they did not have any adult member employed as also to know how many members were underemployed or seasonally employed. The Block Development Officers prepared the live-registers with the help of the Extension Officers, Overseers, Gramsevak and Sarpanch.

While comparing the actual attendance with the number of persons on the live-registers, it was found that at a number of works less than half the number of persons on the live-registers reported for work. It was not possible to verify whether the live-registers included some persons who really were not eligible for inclusion therein; nor was it possible to know the reasons for not reporting of those whose names appeared in the live-register.

It was noted from the records, that the Deputy Engineer and the overseers watched from time to time the live-registers and if there were any fresh applicants the Block Development Officer, after verification, arranged to get their names included in the live-register. The office staff, if it came across any deviations from the live-register, warned the concerned supervisors.

DIFFICULTIES IN IMPLEMENTATION OF PROGRAMME

The difficulties in implementing the CSRE in the sample district were those associated with the initial stages and responsible for causing delay in starting the work, as also difficulties which appeared after the work was started including those relating to the administrative matters.

For the road construction project, it is necessary to get approved the alignment of roads from the competent authority — in the case of the sample district, the Superintending Engineer, B and C from the neighbouring district. The detailed plans and estimates are then prepared, which also need to be sanctioned by a competent authority. Hence the delay in starting the road construction works. In respect of percolation tanks, in many instances a large part of the land where the work was to be started was under standing crop. The work could be started only after the crops were harvested. Hence the delay. The shortage of overseers and supervisors in the initial period also caused delay in starting the work.

In some cases, the delay was due to unwillingness of villagers to give up the land required for the work or due to villagers objecting to the proposed alignment as it affected the land owned and/or cultivated by them. There is no case, in the sample district, of compensation being given for acquisition of land for CSRE. Sometimes, the delay was due to the villagers either wanting the proposed road to pass through the residential parts of the village or not wanting it through the residential area.

At some of the works, the female workers reported for work in larger numbers as compared to the male

workers. As there was no formal guideline indicating the ratio of male to female workers, women from the live-register who sought employment were employed even though it resulted in higher proportion of females to males. There being no upper limit regarding age, it was difficult to reject old persons even if they were not capable of doing hard work. The payment of a uniform wage rate to male and female workers as well as to the young and the old, created a sense of dissatisfaction among the able-bodied persons. Besides, such a heterogeneous composition of workers resulted in the output not being commensurate with the wage rate of Rs 3 per day. The officers of the Zilla Parishad stated that in a number of cases the males in the family had migrated to Bombay, to the district headquarters, or to neighbouring towns, in search of employment, resulting in a higher proportion of females at the works under the CSRE.

At some of the works, the attendance of labourers was irregular and much below expectation considering the number of workers listed in the live-register. The Executive Engineer and the Deputy Engineer had to warn the overseers, supervisors and Block Development Officers to muster adequate number of labourers, whereupon they approached the Sarpanch and the labourers warning them that the works would have to be closed if the labourers were irregular in attendance and did not report in adequate numbers. At some of the works, the overseers and supervisors had to go round and invite workers to come to work when their number dropped considerably.

In the construction of some road works, even though a large number of persons from the villages within the specified distance from the proposed works had been listed in the live-register, workers from some of the villages do not report for work — the reason being that they live in the villages in the hilly part of the region or located at the other end of the road work. It was stated that they would report for work when the section of work at their end is taken up. However, at that time, workers at present engaged in the work may not report for work as they would not find it worth their while to walk up and down everyday a distance of 6 km in the hilly part. This partly explains lower attendance as compared to the persons on the live-registers.

When the output was not commensurate with the wage rate of Rs 3 per day, at one of the road works it was reduced to Rs 2 per day in respect of female workers for a particular fort-

night. Such action resulted in general dissatisfaction, go-slow methods, and threats to go on strike — sometimes bringing the work to a standstill.

During the summer, it is necessary to fetch from a distance the drinking water needed for the workers engaged in the CSRE. In the Scarcity Works there is a regular provision of workers for fetching water. In the CSRE, a few workers have to devote themselves to fetching water. The supply of drinking water is necessary to maintain the efficiency of the workers. If the wage rate is to be related to output, then it will be necessary to provide separate staff under the CSRE projects to fetch water.

In respect of the percolation tanks, after a certain stage, the required material is not available nearby and has to be carried over long distance. As a result, the output is not commensurate with the wages paid.

A jeep is neither purchased nor placed exclusively at the disposal of the CSRE staff. Sometimes it is difficult to get a jeep from the Zilla Parishad. If a jeep was to be placed exclusively at the disposal of the CSRE staff, it would enable frequent visits to project sites and better supervision; some works are either not connected by ST buses, or the buses make only one trip each way per day so that the overseer has to spend a full day if he wishes to visit the work.

The workers complained of the time-lag between the day of work and date of payment. The payment in respect of the work done during a particular fortnight is received after about two weeks. It is desirable to arrange for a weekly payment to enable the workers to make their purchases at the weekly market.

ROLE OF THE CSRE

The CSRE is one of the few schemes introduced by the Government of India to generate additional employment in the rural areas. The CSRE has a very limited role to play, as it is expected to generate employment to only about 1,000 persons or about 2.50 lakh man-days in a year in each district. In view of the experience of the CSRE, gained so far, it is necessary to consider whether the CSRE programme should be confined to just a few works in a district, or whether it should extend to some 15 to 25 works scattered over a few talukas in a district. It is felt that concentrating on a few works rather than thinning out executive resources over a number of works, will enable the authorities to implement the programme more efficiently and successfully. Even if a large number of works are included, they should be located in clusters. It will

be possible then to take up one work after the other, to provide continuous employment without requiring the participants to migrate from the villages of their residence.

In the outline of the scheme circulated by the state government, it was stated that "the effective employment of 1,000 persons in each district or 25,000 in the state on a continued basis for three years, would make this group of workers almost analogous to the experiments of 'Land Army' or a 'Rural Development Corps' tried in some other countries". The experience of the CSRE in the sample district is that the workers are irregular in attendance and report in inadequate numbers and that there are disproportionately larger numbers of females in some cases. In the circumstances it is not possible to raise anything like a 'Land Army' or 'Rural Development Corps' from the CSRE.

The failure on the part of a large number of workers to report to work or to report regularly, at the wage rate of Rs 3 per day, may be due to any one or more of the following reasons.

The live-registers may be faulty and many of those enlisted in the live-register may really not be on the lookout for employment in the CSRE. For the preparation of live-register, a visit to every family in the village is a prerequisite to ascertain whether any member in the family fulfilled the qualifications prescribed for inclusion in the live-register. This is a time-consuming work. In view of the limited time and staff available for the work, it is possible that the live-registers were not prepared with necessary diligence.

The failure could also be due to the labourers feeling disinterested because the wage rate in the CSRE is not attractive. Was the wage rate of Rs 3 per day less than the local off-season wage rate in the region? This is true to a very limited extent, in the sense that, at the district headquarters in the sample district, non-agricultural employment in the town was available at Rs 4 per day for male workers so that those who could afford to migrate to the district town would consider the wage rate in the CSRE unattractive. On the other hand, the wage rate for females at the district headquarters was Rs 3 or less. Consequently while there was a tendency among the male labourers to seek employment in the CSRE whenever they found it convenient, the female workers sought work in the CSRE at Rs 3 per day. Thus the wage rate of Rs 3 per day for females which is higher than the local off-season wage rate needs downward revision. Since the CSRE is

not a programme for giving relief to the unemployed, it is reasonable to suggest that the wages should be linked to the output and that wherever output is not commensurate with the wage rate of Rs 3 per day, the Officers should be authorised to sanction an appropriate lower rate. The need arises particularly because at present in some cases females and old men appear in larger proportion and are unable to do hard work.

Considering the workload in respect of the implementation of various schemes in relation to the executive staff available at the district level, it is desirable to consider whether the various employment schemes such as the SFDA, MFAL, CSRE, and the like, should be consolidated into a single scheme with a view to organising more effectively the overall development and employment programme for each district.

The formulation and implementation of the CSRE raises some fundamental problems. The works selected for inclusion in the CSRE are mainly percolation tanks and roads. If, however, the object of the scheme is to provide continuous employment to 1,000 workers in a district it will be necessary to organise the works in such a way that the persons considered eligible for employment in the CSRE will get employment for the duration of the scheme without being required to migrate from their village. Either the works included in the CSRE should be sizeable enough to provide employment for three years to the expected number of participants or it should be possible to take up new works nearby after completing the first one, so as to offer continuous employment.

The failure of the workers to seek continuous employment could also be due to the uncertainty about the future — since present scheme does not indicate any plan beyond March 1974. The present programme is *ad hoc* in this sense, and the Government should consider a long-term programme. In this context, it will be necessary to improve the existing set-up for planning at the district level. The experience of the CSRE shows that Zilla Parishads really have not thought about feasible work for economic development. The Zilla Parishads should prepare a list of works for creating assets, durable in nature, in consonance with the local resources and local development plans. This will require careful feasibility studies, with detailed plans — both engineering as well as administrative — for execution of the works. It is felt that Zilla Parishads would be then better equipped to utilise fruitfully any assistance that may come from the state or Central governments in the future.

Prim, proper...and plural

A singular woman who obdurately remained plural was Queen Victoria. "We are not amused," she would exclaim when told funny stories, including others in the audience who rather thought them jolly good.

Prim and proper—that was Victoria. And clean, too. This despite Buckingham Palace lacking the basic amenity of a bathroom in 1837, the year she became queen.

In the years following, however, her subjects would seem to have got into hot water. Bathing was in and soap sales so soared that production hit a new high of 96,000 tons, in 1851. Two things helped: (i) The problem of alkali supplies had been solved by Leblanc developing a new process for producing caustic soda from common salt. (ii) Advertising, another essential (sic) in the soap business had had its first brush with art. Sir John Millias, a future President of the Royal Academy created around this time his famous "Bubbles" poster for Pears Soap... bringing his work and the soap to the notice of the queen and the great unwashed.

Respectively, rather than vice versa.

At Mettur, we make caustic soda, both rayon and commercial grades. In solid, flakes and lye.

Here's the full range of the chemicals we produce:

INORGANIC CHEMICALS:

Caustic soda • Stable bleaching powder • Hydrochloric acid • Liquid chlorine • Calcium chloride • Aluminium sulphate • Potassium chlorate • Silicon tetrachloride

ORGANIC CHEMICALS:

Methyl chloride • Methylene chloride • Chloroform • Carbon tetrachloride • Chlorinated paraffin wax

Proletarian Internationalism and the Socialist Camp

Lajpat Rai

Since the warm, honoured-guest treatment given last year to Nixon in Peking and Moscow by the leaders of the communist parties of China and the Soviet Union, at a time when American B-52 bomber planes were blasting life out of existence in Vietnam and when his navy had just ruined and blockaded the major supply ports of North Vietnam, many people have begun to wonder if the classical concept of international proletarianism has not become obsolete, a mere slogan, an idea worthy of no respect. Some have even begun to question the veracity and correctness of this idea on which Marx and Engels had based their epoch-making Communist Manifesto and on the basis of which they had brought into existence the first viable international organisation of the working class.

It might, therefore, be worthwhile to examine the importance and the objective roots of the concept of international proletarianism, its vitiation and betrayal by the Soviet bureaucracy after the death of Lenin, and its vulgarisation and misuse by Stalin and his present-day successors, with a view to restoring some of its lost lustre by exposing those who have converted it into a convenient tool for harnessing the world working class and communist movement in the service of their narrow national interests.

WHEN in his famous message to the *Tricontinental* magazine, Che Guevara spoke of developing a "true spirit of proletarian internationalism with international armies" and of the duty of an American, Asian or European revolutionary to fight and "die under the flag of Vietnam, Venezuela, Laos, Bolivia..." he was laughed at and ridiculed as a "visionary" in the European socialist countries, just as Fidel Castro was called a "political charlatan" for demanding in the name of socialist solidarity that "no socialist state will lend financial and technical assistance to governments that are engaged in suppressing the guerillas fighting for freedom and socialism".² And when Castro exhorted the socialist camp to "take all necessary risks for Vietnam" and equated the Cuban revolution with the Latin American revolution and the Latin American revolution with the world revolution, he was dubbed a "dogmatist" and "immature petty bourgeois" who had yet to qualify as a Marxist, in the capitals of Eastern Europe. This reaction is indicative of the changed ideological climate prevailing in the socialist camp in which the concept of proletarian internationalism has been reduced to a mere cliché and where nation-states imbued with the spirit of political opportunism are fighting desperately, singly or in groups, for preserving their own peace and advancing their own economic interests even at the cost of each other and the peoples of the third world, often in co-operation with imperialism.

There was a time when the Cuban leaders were not only invoking the spirit of proletarian internationalism, but were also practising this basic

principle of the world communist movement in Latin America, by actively helping the guerilla movements (both with men and material resources) in Venezuela, Colombia, Peru, Bolivia and even Brazil. In its 'position paper' at the OLAS conference, the Cuban delegation while emphasising internationalism had quoted Lenin — the head of the newly born workers' state — who had declared:

"We do not fight for power... we do not defend national interest. We state clearly that the interest of socialism, the interest of socialism in the whole world would come before our national interest, before the interest of the Soviet state".³

But Lenin's successors have turned this principle up-side-down, namely, the interests of the Soviet state now come before the interests of socialism, the interests of socialism in the whole world. And the 'visionary' Che Guevara, when he spoke of the international proletarian armies "fighting to redeem the sacred cause of humanity", had perhaps in his mind the appeals and statements of the First Congress of the Communist International in which the Red Army was presented as "the army of the international working class" and in which it was stated that "the moment is coming near in which the international red army will be created".⁴

But the winds of change have even swept away the Cuban exuberance for international solidarity, whose leaders have now washed their hands of the guerilla movement of Latin America and declared supinely that they have "utmost faith" in the foreign policy of a socialist country which was not too long ago accused by them of having forsaken the idea of internationalism.

Since Nixon's visits to Peking and

Moscow in February and May 1972, where that imperialist chieftain was given warm, honoured-guest treatment by the leaders of the communist parties of the two countries, at a time when his B-52 bomber planes were blasting life out of existence in Vietnam and when his navy had just ruined and blockaded the major supply ports of this brave little country of the socialist camp, many people have begun to wonder if the classical concept of international proletarianism has not become obsolete, a mere slogan, an idea worthy of no respect. Some have even begun to question the veracity and correctness of this idea, of this great concept, on which Marx and Engels had based their epoch-making Communist Manifesto and on the basis of which they had brought into existence the first viable international organisation of the working class. It might, therefore, be worthwhile to examine the importance and the objective roots of the concept of international proletarianism, its vitiation and betrayal by the Soviet bureaucracy after the death of Lenin, and its vulgarisation and misuse by Stalin and his present-day successors, with a view to restoring some of its lost lustre by exposing those who have converted it into a convenient tool for harnessing the world working class and communist movement in the service of their narrow national interests.

According to Lenin, nationalism has an intermediate social content and can serve as a vehicle both for bourgeois chauvinism and revolutionary self-determination. The early Bolsheviks, particularly Lenin, were closely concern-

ANNOUNCEMENT REGARDING ISSUE OF BONDS OF RS 2 CRORES FOR CASH AT AN ISSUE OF RS 99.75 PER CENT

This is only an Announcement and NOT a Prospectus. Persons interested in full details may obtain copies of the Prospectus and Application Forms from the Bankers to the Issue or the Registered Office of the Company hereinafter mentioned.

WEST BENGAL INDUSTRIAL DEVELOPMENT CORPORATION LIMITED

(Government of West Bengal Undertaking)

Registered Office: 23A, Netaji Subhas Road, Calcutta-1.

HISTORY AND ACTIVITIES

The Company was incorporated on 6th January, 1967 in the State of West Bengal under the provisions of the Companies Act, 1956 as a private company but was converted into a public company on 14th November, 1972. Since its inception, the entire share capital of the Company is held beneficially by the Government of West Bengal and consequently it is a 'government company' within the meaning of the Companies Act, 1956.

The Company was incorporated with the objects stated in its Memorandum of Association. Its main object is to secure and assist in the expeditious and orderly establishment, growth and development of industries in the State of West Bengal.

The Company started functioning with special emphasis on the development of medium and small enterprises and till the end of 1971 its activities were confined to providing financial assistance of various descriptions to the existing undertakings in the private sector.

Since then a special emphasis has been laid both by the Central Government and the Government of West Bengal on accelerated industrial development in the State of West Bengal. The Government of West Bengal decided that the Company should work as a promotional institution for the development of industries in the State of West Bengal as well as the authorised agent of the Government of West Bengal for the purposes of the West Bengal Incentive Scheme, 1971.

Consequently, the Company has been working in the state of West Bengal in close co-operation with other financial and banking institutions. In West Bengal, certain projects are being sponsored by the Company as its own and many more are being sponsored by it in the private sector.

PRESENT ISSUE

800 6 per cent BONDS [to be called "6 Per Cent West Bengal Industrial Development Corporation Limited Bonds 1958 (First Series)"] of Rs 25,000 each for cash at an issue price of Rs 99.75 per cent, payable in full on application Rs 2,00,00,000*

*The Company has, however, the right to retain additional subscription to the extent of 10 per cent of the amount mentioned above.

The principal amount of the Bonds will carry interest at the rate of 6 per cent per annum (subject to deduction of tax at source at the rates prescribed from time to time) payable half yearly on 15th October and 15th April each year for the periods ending on 30th September and 31st March respectively except that the initial proportional payment of interest will be made on 15th May 1973 in respect of the period from the date of application to 31st March, 1973. Bonds will be redeemed at par plus accrued interest thereon, if any, on 28th March, 1985. The issue of the Bonds has been approved by the Controller of Capital Issues, the Reserve Bank of India and the Government of West Bengal. The Company has been authorised by the aforesaid Authorities to retain subscriptions received to the extent of 10 per cent in excess of the sum of Rs 2 crores.

The repayment of the principal amount of the Bonds and payment of interest thereon at the rates and in the manner referred to above are guaranteed by the Government of West Bengal.

Applications for Bonds must be for a minimum nominal value of Rs 1,00,000. Applications from persons resident outside India or their nominees will not be considered.

OPENING AND CLOSING OF THE SUBSCRIPTION LIST

THE SUBSCRIPTION LIST FOR THE BONDS WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 26TH MARCH, 1973 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 28TH MARCH, 1973 OR EARLIER AT THE DISCRETION OF THE BOARD OF DIRECTORS OF THE COMPANY.

ECONOMIC AND POLITICAL WEEKLY

March 24, 1973

ed with relations between the national and social revolutions in backward and oppressed countries and were first to analyse their inter-connections. Thus, in his last 'testament' Lenin decried the great Russian chauvinism displayed by Stalin and Dzerzhinsky and expressed the apprehension that it would permeate the Soviet state apparatus. Such chauvinism, Lenin feared, would do infinite harm "not only to us, but to the whole international, and to the hundreds of millions of people in Asia who are destined to come forward on the stage of history, following us".⁵ The early Bolsheviks considered their national triumph the mere beginning of an era of world revolution. "To the Russian proletariat has fallen the great honour of beginning the series of revolutions which the imperialist war has made an objective inevitability", wrote Lenin in March, 1917,⁶ and as noted earlier he emphasised after the victory of the Bolshevik revolution that the interests of the Soviet state would be subordinated to those of world socialism. For the Bolsheviks, proletarian internationalism was not, therefore, a mere sentimental notion which "falls apart at the first rumbles of a war" or can be sacrificed at the altar of petty economic or political advantage. For them it was a fundamental concept, the very basis of the international revolutionary movement telescoped in a single slogan by Marx: "Workers of the World Unite".

In this famous phrase, the Communist Manifesto had proclaimed that the worker had no country; that those like the workers, who lacked property, also lacked bourgeois rights and representation and were "outside bourgeoisie society" and thus had no stake in the bourgeoisie 'nation'. The Manifesto's declaration that the workers had "nothing to lose but their chains and a whole world to win" merely expressed the revolutionary side of the same social pattern. The historic Communist Manifesto (now a forgotten document in the socialist camp) also laid emphasis on the fact that the developing productive forces break out of the national framework, create the world market as well as the proletariat whose mission is to destroy the capitalist world system. Pointing out the specific features of the working class struggle, the Manifesto declared:

"Though not in content, yet in form, the struggle of the proletariat with the bourgeoisie is first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie".⁷

Thus, for the founders of scientific socialism, while the form that class

struggle takes is primarily national because the proletariat has to win power in separate countries, yet the content of this struggle is international because its objective — creating a socialist society — is international in character. Later, at the time of the founding of the First International Marx emphasised: "that the emancipation of labour is neither a local nor a national problem, but a social problem embracing all countries in which modern societies exist".⁸

Marx reaffirmed the same positions in his critique of the Gotha Programme which was directed against those who "conceived the workers' movement from the narrow nationalist standpoint".⁹ Marx severely castigated Lassalle for ignoring the international functions of the German working class in the programmatic document of the German labour movement by pointing out that it contained "not a word about the international functions of the working class whose professions of internationalism are even infinitely below that of the Free Trade Party".¹⁰ The First International disappeared, but it was reconstructed and until 1914, its theoretical and political necessity as well as its authority was never seriously challenged. The outbreak of the First World War marked the failure of the Second International as a revolutionary rallying point for the world working class. The Second International's betrayal of proletarian internationalism in August, 1914, flowed from the opportunistic degeneration of this organisation and its various sections. The First World War exposed the fundamental feature of reformism in the international working class movement — reformism based on the adaptation of working class parties in each country to their respective bourgeoisie in the name of national interest. In defending revolutionary Marxism throughout the First World War, Lenin and also Trotsky and Rosa Luxemburg reaffirmed the fundamentally international character of the class struggle and the necessity of putting proletarian internationalism above all else in order to prevent any recurrence of the betrayal of August 1914.

They all declared themselves for reconstructing an International in which the so-called national interest would be subordinated to the needs of world revolution anywhere. Any tendency that might encourage "social patriotism" would be rooted out. With the victory of the October Revolution, the question of proletarian internationalism took on new dimensions and thereby much greater complexity. The Second Inter-

national had attacked the revolutionary politics of the successful Bolsheviks and in effect had joined forces with the international counter-revolution. Lenin's call for a Third International was, therefore, equally a call for solidarity with the existing Soviet regime and an affirmation of its specific violent revolutionary path to power. The workers of world mobilised their forces against imperialist intervention on Soviet territory, and the Soviet regime and the Third International, while practising a certain separation of tasks supported all revolutionary actions of the workers against capitalist rule taking place throughout the world.

But soon after Lenin's death and with the ascendancy to power of a bureaucratic regime in Soviet Russia around 1922-24, new conceptions made their appearance leading to the distortion of proletarian internationalism as well as the perversion of the policy of the communist International and its sections. This began with the acceptance of the theory of "building socialism in one country" which introduced a dichotomy between the development of the Soviet Union and the advance of the revolution in the rest of the world, for according to this theory socialism could be built in Soviet Russia irrespective of what happened to movements in other countries.

Defence of the USSR in isolation from the revolutionary developments in the rest of the world became a prime element in the policy of the communist International and its sections. From there it was only a short step, and one quickly taken, to subordinate the policies of their organisations to the needs of defending the Soviet Union as conceived by the Stalinist bureaucracy. This led "not to the lessening of the nationalist emphasis, but to its intensification in international communism".¹¹ Russia's insulation also gave rise to a leadership with a sharply nationalistic and bureaucratic orientation, for whom internationalism soon became a one way affair, with the Marxist parties straining to the utmost in defence of the first workers' state. The combination of these factors led to a reformist orientation among the parties of the Cominform who in their anxiety to avoid collision between the bourgeoisie states and the Soviet Union confined themselves within the bourgeoisie stage of the revolution instead of pushing it towards the socialist stage, adopting thereby a reformist posture towards bourgeoisie power and the capitalist status quo. And this primary emphasis on external co-existence with the bourgeoisie nation-states inevitably led to a policy of co-existence between social classes within these nation-

states. Thus, the roots of reformist deviation in the world communist movement can be directly traced to the abandonment of the concept of true internationalism by the Cominform parties at the behest of the Soviet leaders who dominated this international organisation. The Cominform and its sections did not base their policies on the objective course of the struggles of the world people, but on the exigencies and requirements of the Kremlin's diplomacy.

For the Kremlin, the future of the Soviet Union no longer depended on revolutions in other countries but on maintaining the *status quo*. As a result more than one mass revolutionary movement (the German revolution of 1923 and the Chinese revolutionary wave of 1925-27) was sacrificed and abandoned to suit the needs of Kremlin diplomacy. The case of China is highly instructive. China was a typical semi-colonial country economically more backward than Czarist Russia. At the same time, the relationship of forces in China was more advantageous for a proletarian victory as its belated bourgeoisie-democratic revolution had already demonstrated its feebleness and inability to solve the urgent questions of national and democratic development. Yet the Comintern imposed on the Chinese CP a diametrically opposed strategy which led to disastrous results. Anxious to preserve the *'detente'* with the west, which was by then the sheet-anchor of Soviet foreign policy, and in contrast to the essence of Lenin's approach in Russia, it ascribed to the Chinese bourgeoisie the leading role in the anti-feudal and anti-imperialist struggle and ordered the communists to join the Kuomintang and submit to its discipline. Although a bourgeoisie nationalist party, the Kuomintang was even allowed representation in the communist International with rights of an associate member, while Chiang Kai-shek was given an honorary seat on the Comintern's executive. The tragic denouement of this class-collaborationist and opportunistic line imposed on the Chinese Party came in 1927 when Chiang Kai-shek proceeded to massacre tens of thousands of disarmed (disarmed by the CPC at the orders of Stalin) Shanghai workers and party activists, including the help-less communist leaders.

This purge of the communists by the Kuomintang was carried well beyond the Shanghai events as were the Kremlin-dominated attempts by the Chinese communists to continue to collaborate with Chiang by helping him to stem the leftward surge of the Chinese masses. In the end the Communist

Party of China took years to recover from this deadly blow and re-emerged as a political force only after disregarding the Comintern's advice and by re-discovering in its own terms the theory and practice of the Chinese revolution under the leadership of Mao Tse-tung. Discounting the possibility of a successful socialist revolution in China, a scepticism maintained until 1948, the Kremlin leaders, dominated in their outlook by the short-term security and diplomatic interests of the Russian state, were rapidly led to subordinating revolutionary internationalism to *raison d'état*. They never gave up invoking 'internationalism', but always to demand the loyalty of the communist parties on the fallacious premise that the interests of the Soviet state and the world revolutionary movement were and are the same and could never be in conflict with each other. And, as Isaac Deutscher has put it, "Russian nationalism was thus elevated to the position of revolutionary internationalism and a myth was created according to which the highest duty of a communist was to act in the defence of Russian national interests, beginning with the defence of the Soviet Fatherland."¹² This led to, what E H Carr calls, "internationalism becoming an 'internationalism' of a very 'special type', expressing as it did solidarity with a particular national expression"¹³ of the world revolution.

The concept of international proletarianism propounded by Marx and Engels and nurtured by Lenin and his Bolshevik colleagues was thus vitiated by Stalin and the successive Soviet bureaucracies and sacrificed at the altar of the Soviet state's strategic, political and diplomatic interests. Today, this line is expressed, allowing for new circumstances and relationships of power in the post-World War II period, in the Soviet Union's limited support to Vietnam, where the objective is not victory for the Vietnamese revolution but merely a *modus vivendi* with imperialism within the framework of economic co-operation and peaceful co-existence.

III

Despite the fact that Stalinist policy at the end of the Second World War successfully blocked the revolutionary upsurge in Western Europe, new socialist states emerged in Eastern Europe independently of that policy and sometimes even in opposition to it. In addition, the post-War world saw a new spirit of resurgence in the colonial and semi-colonial countries. The question of proletarian internationalism thus had to take account of these new factors

arising as a result of the changed balance of forces in the post-War world. It was obviously natural for the leadership in the colonial and semi-colonial countries to lay strong emphasis on the national side of their struggle, whose international aspect lay in world-wide solidarity against imperialism — a solidarity which often waned after the achievement of independence, especially when the revolution did not go on to the socialist stage.

But matters appeared in a scarcely better light even for those movements which claimed they were socialist or Marxist. Now for them the question could no longer be one of defending an isolated workers' state — the Soviet Union — as before the War. An attempt was made to replace the slogan, "Defence of the Soviet Union", with the concept of "Solidarity of the Socialist Camp", in which the interests of the Soviet state were once again to prevail over the rest. This was witnessed first of all by Stalin's indulging in a policy of pillage in the territories occupied by the Red Army, a policy modified only slightly among countries which eventually fell into the "socialist camp". The same trend was witnessed when Stalin established "normal trade relations" with the newly formed workers' states. This "normal trade" later called "mutually beneficial trade" was conducted on a basis which meant that in commercial relations between socialist states — as between capitalist ones — the economically more developed countries absorbed part of the surplus of the less developed ones. This fact was pointed out firstly by the Yugoslavs and then the Rumanians and later by the Cubans. Che Guevara in his characteristically frank manner made a scathing attack on the rich industrially developed socialist countries who were indulging in the exploitation of the less developed ones in the name of "mutually beneficial trade". He appealed to them to abandon their selfish practices of international trading — practices no better than those of western capitalist exporters — and come to the aid of the poor third world countries in the name of proletarian internationalism.

In his famous speech at the Economic Seminar in Algiers in 1965 Che Guevara said:

"How can one describe as mutual benefit the sale, at world market prices, of raw materials produced with infinite suffering in the third world and the purchase at world market prices, of machines produced in the great automated factories of today? If we make this kind of comparison, then we are forced to

conclude that the [rich] socialist countries are, to some extent, accomplices in the crime of imperialist exploitation... The socialist countries have a moral duty to end their tacit complicity with the exploiting countries of the West".¹⁴

Che did not limit himself to this accusation. He declared quite openly that in the name of proletarian internationalism and solidarity "the development of countries on the path of liberation must be paid for by the established socialist states".¹⁵ This was, however, a cry in the wilderness by an idealist, though a statement in conformity with the true internationalist spirit. Even among the socialist countries themselves, complaints were raised about "taking economic advantage", "subordinating interests", "forcing of decisions" by the more advanced ones against the backward members of the socialist fraternity. The Yugoslavs denounced Soviet misuse of the mixed trading companies set up by Stalin to exploit the resources of the East European socialist countries. In June, 1964, the Rumanian press openly criticised the Russian plan, advanced through Comecon, which envisaged a single electrical grid for Rumania, Bulgaria, Hungary and the Soviet Ukraine.

It described the plan as "injurious to Rumania's independence and working against Rumania's economic self-sufficiency". The Rumanians were also critical of the so-called Danube Scheme and later refused to participate in any of the Comecon's regional development schemes. They advanced the slogan of self-sufficiency to counter Khrushchev's advocacy of "socialist integration" and "international division of labour" within the socialist camp. Similarly, the North Koreans complained of pressures applied on the Workers Party to accept a Russian sponsored plan in which the Koreans were to concentrate on agriculture, light industry and housing at the cost of building their heavy and basic industries. In 1966, Kim-il-Sung addressing a party meeting said:

"A group of Korean flunkies supported by foreign revisionists talking about international division of labour [within the socialist camp] opposed our party's line of building heavy industry and maintained among other things that our country did not need to develop the machine building industry but would do well to produce only minerals and other materials... of course could not follow their views".¹⁶

Instead Kim-il-Sung advanced the idea of *Juche* which means self-reliance in the economy, defence and ideology, the last meaning the taking of indepen-

dent positions on political-ideological issues confronting the socialist countries and the world communist movement.

By the late fifties the Russian bureaucrats had thrown all pretences towards the concept of proletarian internationalism to the winds. They resorted to breaking relations and withdrawing Soviet technicians as means of blackmail to pressurise parties and leaders expressing serious differences with them. In 1960, Moscow cut off all economic aid to the Chinese, at a moment when the Chinese economy was going through severe economic strains due to the failure of the second phase of the 'great leap forward'. It thereby arrested industrial development in China in several key fields. It refused assistance in the development of nuclear weapons previously promised to the Chinese, thereby objectively contributing towards the imperialist nuclear blackmailing of China. It went so far as to give military aid to the Indian bourgeoisie at a moment when it was likely to be used against a 'brother socialist country'. Later they openly sided with India against socialist China providing the former with more military assistance, moral aid and diplomatic support. Here one might also recall Castro's denunciation of Khrushchev's action in unilaterally withdrawing the Russian missiles from Cuba on US terms which the Cubans had rejected as they constituted an infringement of Cuban sovereignty. All this is reminiscent diplomatic, economic or political relations among states regardless of the social regimes they represent, where narrow nationalist interests dominate over all other considerations. The lowest ebb of this fast degenerating situation was reached when the Russians and the Chinese clashed militarily over the disputed border on the Ussuri river, killing several border guards of both sides, thus desecrating the classical concept of proletarian internationalism in full view of the whole world and to the joy of the imperialists. It was this disgrace that prompted Castro to say that perhaps "imperialists were more internationalist than some socialist states".

IV

Thus while the Russians reduced proletarian internationalism to a doctrine which was honoured more in the breach than in its observance, it was thought by many that the Chinese Communist Party led by Mao Tse-tung would uphold this doctrine and be its new standard-bearer. In fact, in the early period of the Sino-Soviet schism, the Chinese opened their attack on the

Russians by accusing them of the exploitation of the socialist camp" in direct contravention of the Marxist-Leninist principle of proletarian internationalism. In March 1964, *People's Daily* published a detailed report which the New Zealand communist party leader, V G Wilcox, had given in China of the negotiations he had with the Russian leaders in Moscow. According to this report, Wilcox upbraided the Russians for trying to "advance at the cost of exploitation of other countries of the socialist camp" and "growing fat and happy on the backs of socialist peoples and communist parties of other countries".¹⁷ In the same month the Chinese Communist Party had published its "Sixth Comment on the Open Letter of the Central Committee of the CPSU" which was a devastating attack on the Russian thesis of peaceful co-existence and on their "unprincipled compromises" with imperialism. The "Comment" accused the Russian revisionists of "reviling and vulgarising" the Marxist-Leninist principle of proletarian internationalism and embarking on a policy of "national chauvinism and betrayal of the international working class movement".¹⁸ According to the Chinese, the US imperialists through a policy of "accommodating the Soviet Union" sought to tie the hands of the Soviet Union and other socialist countries and forbid them to support the revolutionary struggles of the peoples of the capitalist world particularly of the peoples of Asia, Africa and Latin America.

The Chinese maintained that the heart and soul of the general line of peaceful co-existence pursued by the leaders of the CPSU was the "Soviet-US collaboration for the domination of the world", in which the Soviet Union was a junior partner. The Chinese Sixth Comment ended with a "A Few Words of Advice to the CPSU" which were:

"The United States is an imperialist country and the Soviet Union is a socialist country. How can you expect co-operation between two countries with entirely different social systems... How can you imagine that the imperialist United States will live in harmony with the socialist Soviet Union?"¹⁹

This was two years before the Chinese declared, the USSR to be a society based on "state capitalism"; a year later they described it as "social imperialism". Soon after the publication of the "Sixth Comment", *Red Flag* published an article entitled "A Wolf Is a Wolf", describing an old Chinese parable about the "Chungshan Wolf and Schoolmaster Tungkuo". The school-

master once found a wolf wounded by hunters and saved it by hiding him in his bag. Instead of showing gratitude the wolf wanted to devour the schoolmaster, but was killed by a passing peasant who understood well the nature of a wolf. The lesson of the parable as stated by Red Flag was:

"A wolf is a wolf and its man-eating nature does not change. The modern wolf is US imperialism which will always retain its predatory nature and will be killed by the people thus saving the modern schoolmaster Tungkuos".

The reference was obviously to the Soviet revisionists. The same article accused the leaders of the CPSU of "abandoning proletarian internationalism" by letting down the peoples of Indochina. The Russian-American *detente* based on appeasement of imperialism was "a standing invitation to American aggression" and if the Russians had acted over Vietnam with anything like the firmness with which President Kennedy had acted on the Cuban missiles issue, the Americans would not have dared to be so aggressive in Vietnam. It also charged the Russians with being "lukewarm" and "mean" in allocating aid to Vietnam while giving liberal grants to the bourgeoisie governments, and asked the Russians: "Can *detente* with imperialism flourish on the poisoned soil of American aggression?" The Chinese urged the Russian leaders to adopt "principled positions vis-à-vis imperialism — positions of confrontation rather than seeking *detente*, of international class struggle rather than all-round co-operation".²¹ They appealed for the unity of the socialist world on the basis of "revolutionary internationalism" — "a unity which will be the corner-stone of the broader unity of the oppressed people all over the globe". Later they spoke of imperialism as the "paper-tiger" and in 1967 Lin Piao came out with his thesis of guerilla warfare on a world scale (people's war) in which the "countryside" would surround the "cities" — the citadels of imperialism. "The cities are the capitalist strongholds of Europe and North America, while the countryside is the underdeveloped world".

The Chinese leaders thus appeared on the scene as the defenders of the pristine purity of Marxism against revisionism, defenders of international proletarianism and the idea of world revolution. Their watchwords, "countryside surrounding the cities" and "Eastwind prevailing over the Westwind", caught the imagination of people all over the world, particularly in the third world, whose hopes, having been belied

pinned on Peking. But the hopes these new Messiahs had raised by their theories and revolutionary pronouncements were once again to be frustrated by their actions and compromising practices.

In 1958, while the United States and China were "eye-ball to eye-ball" over the question of the Formosa straits, Washington was inviting Premier Khrushchev to visit the US for talks. For, as Moscow continued to develop its economic and nuclear power and its missile capacity, the United States was more and more compelled, despite Dulles' opposition, to accept the necessity of accommodation and co-existence with the Kremlin. At the same time, US policy towards China remained as implacably hostile as before, as unrecalled to Chinese rights (e.g. Formosa), as determined to impose the maximum tension and strains on China. It was also designed to deny China the much needed external respite in its fierce struggle with economic scarcity, cultural backwardness and the immense problems of industrialisation of a backward country. Indeed, as US-Soviet relations improved, the United States intensified its hostility towards China, which now began to replace Russia in US strategy and cold war rhetoric as the primary menace to American global security.

To the Chinese, the growing understanding between the US and the USSR looked like rank betrayal by Moscow, while the growing divergence in US policies towards the Russian and the Chinese regimes — accommodating one and seriously threatening the other — deprived the communist states of the basis of their previous unity and eventually provoked a split. In the underdeveloped world, the combination of US dominance and hostility and China's industrial and military weakness (especially in strategic weapons) served to maintain Peking's isolation, thereby inducing China to seek security in revolutionary agitation against imperialism and a hostile *status quo*. But even then, despite its rhetoric of irreconcilable struggle, its disposition to co-exist with those capitalist regimes that were willing to accommodate themselves to its presence (e.g. France, Pakistan) was already manifest and also its willingness, like that of the Russians previously, to subordinate revolutionary principle to *raison d'état*. When France recognised China and established diplomatic relations with Peking in January 1964, the Chinese propagandists began to speak with an undertone of admiration, almost of tenderness, about France's brave Pre-

defy American imperialism". It was suggested by Chinese propaganda organs that by proclaiming the right of every nation to have a nuclear capability, Charles de Gaulle had acted as a champion of "equality of all nations and races".²² The Chinese leaders even urged their supporters in the Afro-Asian countries to treat French nuclear tests, carried out either in the Sahara or in the Pacific with indulgence and to muffle their protests against them, reserving their full-throated indignation for American nuclear armament. Another curious twist in Chinese policy could be seen with regard to Malaysia. At first Malaysia was treated in all communist capitals (including both Peking and Moscow) as a sinister creation of British imperialism. In view of China's close relations with Indonesia this was understandable. But suddenly the Chinese leaders changed their mind and advised their adherents to soften their opposition to Malaysia. In 1965, the Chinese rashly declared their support for Colonel Boumedienne, who had overthrown Ben Bella through a military coup, while most of the Algerian left was still desperately resisting Boumedienne's onslaughts — all for securing the Algerian dictator's help in the convocation of the Afro-Asian conference in Algiers and in excluding the Russians from it. Then, during the conflict between India and Pakistan, the moral support that Peking gave to Ayub Khan outraged many of its leftist friends and supporters who wanted it to take a neutral position in this conflict between two reactionary bourgeois states.

In fact Peking's leaders were now anxious to meet their Russian counterparts on the latter's own ground — in diplomatic manoeuvring for peaceful co-existence. Most important was the case of Indonesia where Soviet and Chinese policies converged tragically. It was the Chinese who had encouraged the Communist Party of Indonesia led by Aidit to subordinate its class orientation to a bourgeois nationalist regime which pursued a "progressive" foreign policy in accord with China's own narrowly conceived national interests. For years the Indonesian Communists, supported by the Chinese, cultivated the so-called Front of National Unity under Sukarno, hailing him as Indonesia's "national and revolutionary hero". Even at the height of 1965 army coup, triggered by the reactionary officers, in which an estimated one million communist leaders, sympathisers and members of mass organisations were massacred, the Indonesian CP did not

tion. "This triumph of the Right and the sudden destruction of the largest communist party in the non-communist world" writes David Horowitz, "only served to illustrate once more the fatal shortsightedness of the communist states — even from a purely national point of view — in basing their policies on the *status quo* in an era of permanent revolutionary instability and change".²³

But the policy that the Chinese leaders adopted towards Ayub's government after he got himself elected as the President of Pakistan in 1966 and later in 1971 towards the dictatorial and murderous regime of General Yahya Khan beats even the Kremlin leaders in their game of serving narrow national interests at the cost of revolutionary and leftist movements of other countries. Since there is no Chinese equivalent of the Comintern, it is not possible to speak about 'wrong advice', 'let down', 'betrayal' in the official sense. But any discerning student of Sino-Pak relations would be compelled to reach the conclusion that the policy of the Chinese government has been one of class collaboration on an international scale in the true Khrushchevian sense. This policy resulted in utter confusion in the leftist ranks in Pakistan, leading ultimately to their open and shameful collaboration with the dictatorship of Ayub Khan. This process got accentuated after Maulana Bhashani visited Peking in 1963 as the leader of a government delegation to the October Day celebrations. In his well-documented and analytical work, "Pakistan: Military Rule or People's Power", Tariq Ali quotes from a tape-recorded interview he conducted with the Maulana in East Pakistan in June 1969:

"... I asked the Maulana during the course of a tape-recorded conversation: When you went to China what did Mao discuss with you when you met him? The Maulana's reply was quite unequivocal... 'Mao said to me that at the present time China's relationship with Pakistan was extremely fragile and that the United States, Russia and India would do their utmost to break this relationship. He [Mao] said, 'you are our friends and if at the present moment you continue your struggle against the Ayub government it will only strengthen the hands of America, Russia and India. It is against our principles to interfere with your work, but we would advise you to proceed slowly and carefully. Give us a chance to deepen our friendship with your government...'".²⁴

"It was no coincidence that after the Maulana's return from Peking a section of the NAP adopted an ambivalent attitude towards the Ayub government and turned down its opposition",²⁵ con-

cludes Tariq Ali.

Nobody in his right mind can object to Chinese endeavours to build up relations with Pakistan with a view to breaking the imperialist encirclement, but to do so at cost of the weak socialist movement in that country is to follow in the footsteps of the "Soviet revisionists" and to infringe the principle of proletarian internationalism in a most blatant and cynical manner. But the worst was yet to come in 1970-71, when the Chinese leaders gave unconditional and blanket approval to the Yahya Khan regime in its attempt to crush the resistance of the Bengali people. In a fulsome personal letter²⁶ to the Pakistani dictator, dated April 13, 1971, Chou En-lai openly accepted and defended the right of the Pakistani army to trample on the aspirations of an oppressed people. He also accepted the charge that the whole upheaval was the work of a handful of separatist leaders of the Awami League conspiring in concert with the Government of India. The Chinese government thus deliberately aligned itself with a murderously reactionary capitalist state against a popular upsurge which included many supporters of the Chinese revolution. Moreover, China did not limit itself to merely vocal support for the Pakistani dictatorship. Its military and economic assistance was crucial to Yahya's regime. The tanks used to raze workers' districts in Dacca were Chinese made. When Islamabad confronted a grim economic crisis because of the war, Peking stepped into the breach with a generous loan of \$100 million, delivered to Yahya without any interest.²⁷ There could be no doubt that this moral and material support given by the Chinese to the Pakistani rulers benefited the cause of counter-revolution in Pakistan and in Asia. The same story was repeated in Ceylon in April 1971 when Ceylonese youth led by their organisation, the Janata Vimukti Peramuna (JVP), challenged a repressive and corrupt government — a combination of right and pseudo-left parties. The Chinese leaders once again rushed economic and military assistance to a government which had murdered in cold blood thousand of Ceylonese youth during its punitive measures against the insurgents. And this time the Chinese were in the company of US and British imperialists, Russian revisionists and Indian and Pakistani reactionaries. Once again the exigencies of diplomacy and national interest prevailed over the spirit of revolutionary solidarity. Commenting on this dubious role of the Maoist leadership, a generally sympathetic jour-

nal of Calcutta commented thus:

"A section of the Ceylon Maoists are now with the Che Guevarists impervious to what Peking has to say about the movement (they called it CIA inspired). The closest parallel in the immediate situation one can think of is in East Bengal where Maoists led by Toaha are in the struggle despite Peking's dubious stance. Maoism sans classic loyalty to the CP of China might be a new Asian development...".²⁸

'Leninism sans loyalty to the CPSU' and 'Maoism sans loyalty to the CPC' is the lesson communists not only in Asia but all over the third world are drawing from the cynically nationalistic postures of both the Russian and the Chinese leaders. This attitude was reinforced by the recent spectacle of Nixon's welcome in Peking and Moscow when his air force was systematically and mercilessly pounding Vietnamese cities and towns, killing and wounding thousands, and when his navy had just blockaded Vietnamese supply ports by mining its waters.²⁹ This was nationalism run amok and a blow at the classical concept of proletarian internationalism, if it still had life left in it to receive one.

It was this ideological and political sell-out that compelled the Vietnamese in their anguish to remind the "parties of Lenin and Mao" of their "crime by default" in the Vietnamese struggle for liberation and their duty towards the principle of international proletarianism. A recent article in *Nhan Dan*, the organ of the Workers' Party of Vietnam, warned the erring Chinese and the Russian leaders:

"For a country to care for its immediate and narrow interests while shirking its lofty internationalist duty, not only is detrimental to revolutionary movement of the world but will also bring unfathomable harm to itself in the end. The vitality of Marxism-Leninism manifests itself in revolutionary deeds, not in empty words".³⁰

Commenting upon the perfidious nature of the *detente* developing between US imperialism and the Chinese and Russian leaders, *Nhan Dan* stated:

"The imperialist pursue a policy of *detente* with some big countries in order to have a free hand to consolidate their forces, oppose the revolutionary movements in the world, repress the revolution in their own countries and stamp out national liberation movements while never giving up their preparation for a new world war".

The Vietnamese were thus clearly accusing the communist chieftains in Peking and Moscow of becoming accomplices in imperialist efforts to stamp out national liberation movements (includ-

ing the Vietnamese one) through their policies of what *Nhan Dan* called "unprincipled *detente*".

Distinguishing between a "genuine *detente*" and betrayal of world revolution, the article commented thus:

"Genuine *detente* between the nations rests on respect for independence, sovereignty, unity and territorial integrity of all countries, big and small. But for US imperialism *detente* is but a perfidious policy aimed at carving out schemes of aggression, enslavement, subversion, and peaceful regression... To achieve *detente* in certain concrete conditions in order to push forward the offensive of the revolutionary forces is correct. But if in order to serve one's own narrow national interests, one is to help the most reactionary forces stave off dangerous blows, one indeed is throwing a lifebuoy to a drowning pirate; this is harmful compromise advantageous to the enemy and disadvantageous to the revolution."

Throwing a life-buoy to the drowning pirate Nixon, is exactly what the Russians and the Chinese have been doing during the past few months, in order to serve their "own narrow national interests". This open accusation of betrayal levelled by the heroic Vietnamese Workers' Party against the rulers in the Soviet Union and China will be an eye-opener to millions of militants fighting against imperialism, all over the world, particularly in the Third World countries. Further, teaching them a lesson in international proletarianism the article stated:

"The triumph of revolution in one country does not mean the end but the beginning of the thousand league road leading to world communism... The revolution is a path strewn with fragrant flowers, opportunism is a fatal quagmire. We communists must persevere in revolution and not compromise with our adversaries."

The above passage clearly tells the self-styled leaders of the international communist movement that the revolution in Russia, China and a few other countries is not the end, but a beginning for the impending world revolution. It asks them to rise from the "quagmire" of opportunism in which they are wallowing at the moment by compromising with the adversaries of the world liberation movement.

This charge of perfidy levelled by the Vietnamese Workers' Party, made in no uncertain terms, against the leadership of the two greatest socialist states will go a long way in opening the eyes of those who, having fallen victim to political 'flunkeyism', had blindly supported the policies pursued by them in their own selfish interests and to the detriment of the revolutionary cause. It

will also go a long way in refuting the theory which equated proletarian internationalism with the interest of either of these socialist nation states.

In this above analysis one point stands out with sterling quality. It is that there exists a fundamental contradiction between the concept of proletarian internationalism and building socialism in separate countries as nation states. Marx and Engels, and later Lenin and his early Bolshevik colleagues, understood the significance of this concept in the background of the 'permanent revolution' overtaking the world. For them socialist revolution was 'national' only in form but in content it was international. They placed the interests of socialism in the whole world above the interests of the newly born Soviet state. But this classical doctrine was put on ice when Stalin, after liquidating the entire Bolshevik old guard, decided to build socialism in Soviet Russia irrespective of what happened to the revolutionary movements elsewhere, and invoked international proletarianism in his rhetoric only to be used as an instrument for rallying the international communist movement in defence of Russian national interests — military, strategic, political. This was the negation of the principle of international proletarianism telescoped by Marx and Engels into a single phrase "workers of the world unite" to which Stalin and his successors had added the words "in the interest of the Soviet state". History repeated itself when Chinese Communism rose in Asia on the crest of a successful civil war led by the communist party and won the admiration and support of the people especially in the Third World. The same happened when the Cuban revolution made its revolutionary impact in Latin America. Threatened by US imperialism and blockaded in their island fortress, the Cuban leaders too emphasised international solidarity and the idea of continental revolution. They became the most outspoken champions of the "continuing revolution" in Latin America and openly declared that it was not only their 'duty' but also their 'traditional right' to give moral and material support to the armed guerilla contingents on the continent which were fighting for liberation and socialism, much like the great "Libertadores" such as Bolivar and Higgins who liberated not only their own countries but also other countries from the Spanish yoke. "Internationalism is in the very veins of Latin American history" declared the Cuban leaders. The Conference of Latin American Solidarity (OLAS) which de-

cided upon a continental armed revolutionary programme for Latin America was conducted in Havana Libre Hotel's Ambassador Hall with a backdrop of a huge portrait of Bolivar. Later they conducted, in Havana again, the Tri-continental Conference to emphasise the idea of the 'unity in struggle' of the peoples of Asia, Africa and Latin America. They not only helped the armed guerilla 'focos' with men and money in Venezuela, Columbia, Peru and Argentina, but also created such focos themselves with Cuban personnel and resources, such as in Bolivia. Internationally the Cubans considered imperialism to be a "world system [which] must be defeated in a world confrontation". The aim, thinking retrospectively, of this display of solidarity and emphasis on internationalism was to break the Cuban isolation which imperialism had imposed on it. Their full-throated solidarity for Vietnam too was given with the understanding that the Vietnam war, by keeping US hands tied in Asia, was diverting its attention from the blockaded island, giving it breathing space — hence the slogan "create two, three... more Vietnams". The Cuban leaders also launched a vigorous public attack on the Soviet leaders' policy of peaceful co-existence and *detente* with US imperialism and repeatedly accused the Soviets and the Chinese of dereliction of duty towards Vietnam by not uniting to confront imperialism in order to save a brother socialist country.

But once Cuban security was assured with an understanding between the Russians and the Americans (on the condition that the latter will not invade the island and Cubans will not promote 'trouble' in other Latin American countries), the Castro leadership made a surprising *volte face* . They fell in line with the Russians, suddenly acquiring confidence in the Soviet leadership and taste for their 'revisionist' policies — policies which they had condemned so vehemently only a short time ago. Castro too paid lip service to the principle of proletarian internationalism in his subsequent speeches but became more and more silent on the fate of the armed guerilla forces which languished without Cuban aid. The great rebel, Castro, ended up by getting official recognition from the Russian bosses in the form of the Order of Lenin which they conferred on him in a Kremlin ceremony last year. Along with him was decorated Tito, whom the Cuban leader had described (in 1965) as an agent of imperialism.

This cynical betrayal of international

Proletarianism by the leading socialist states and communist parties will, however, in the long run cost them dear. Imperialism has been, and will in future too, exploit the sharp differences and contradictions between socialist states resulting from their intensely nationalistic postures. They must heed the warning of the Vietnamese communists contained in the above quoted *Nhan Dan* editorial:

"For a country to care for its own immediate and narrow interests while shirking its lofty internationalist duty, not only is detrimental to revolutionary movements of the world, but will also bring unfathomable harm to itself in the end..."

A Test of Hypothesis of Rational Allocation under Cobb-Douglas Technology

Amal Krishna Dey
Ashok Rudra

IN the following are presented the results of some statistical tests conducted to test the hypothesis that Indian farmers are rational resource allocators. The theoretical basis of the tests has been presented in an earlier article ("Allocative Efficiency of Indian Farmers", January 20, pp 107-112). We consider two aggregative input items, namely, all material inputs (in current prices), M_r , and human labour (in man hours), L_r , the suffix standing for the farm. From formula (15) of the article referred to, it follows that if the farmers are subjected to a common Cobb-Douglas production function and a common wage rate, then, whether the material input prices are same for all farmers or not,

$$M_r = \theta_1 Y_r \quad (1)$$

also if there is a common wage rate applicable to all farmers:

$$L_r = \theta_2 Y_r \quad (2)$$

where Y_r stands for output of r th farm and θ_1 and θ_2 are two constants.

Hence one can write

$$M_r = \theta L_r \quad (3)$$

where θ is a constant.

This indicates that if the farmers are indeed all operating under a common Cobb-Douglas technology and indeed if they are optimally allocating material and labour resources, then observed material input and labour input figures may be expected to fall along a straight line passing through the origin. Based on this theoretical result we have designed a test which has the following specifications:

Assumption

$$E(Y_r) = B_r (L_r)^\beta (M_r)^{\alpha_1} (M_r)^{\alpha_2} \dots (M_r)^{\alpha_l} \quad (4)$$

where, Y_r is output of the r th farm

M_r^s is s th material input in quantity ($s=1, 2, \dots, l$)

L_r is labour input in man hours and B_r is a term not involving material or labour inputs.

Profit maximisation subject to different budget constraints for different farmers gives for the r th farmer:

$$M_r = \sum_{s=1}^l M_r^s p_r^s = \sum_{s=1}^l \frac{\alpha E(Y_r)}{\lambda_r} \quad (5)$$

$$= \frac{E(Y_r)}{\lambda_r} \sum_{s=1}^l \alpha_s \quad (5)$$

$$L_r = \frac{E(Y_r) \beta}{\lambda_r W} \quad (6)$$

where λ_r is the Lagrangian multiplier for the r th farmer, so that

$$L_r = \theta M_r \quad (7)$$

where θ is a constant.

Null Hypothesis

$$\frac{L_r}{A_r} + \eta_r = \theta \frac{M_r}{A_r} + (-r) \quad (8)$$

$$= \bar{L}_r + \eta_r = \theta \bar{M}_r + (-r)$$

where η_r and $(-r)$ are error terms assumed to be independent and normal with constant standard deviations and A_r is the farm-size. Reduction of the variables L_r and M_r to per size-unit terms, $\bar{L}_r$ and $\bar{M}_r$ is done to make more realistic the assumption of constant standard deviations for the two error terms.

Alternative Hypothesis

(a) No well defined relation between

$$\frac{M_r}{A_r} \text{ and } \frac{L_r}{A_r}, \text{ or}$$

(b) linear relationship with non-zero intercept:

$$\bar{L}_r = \theta_1 + \theta_2 \bar{M}_r + \delta_r \quad (9)$$

or, (c) some non-linear relationship, e.g.

$$\bar{L}_r = \theta_1 + \theta_2 \bar{M}_r$$

$$+ \theta_3 (\bar{M}_r)^2 + \delta_r \quad (10)$$

where δ_r is an error term with the usual assumed properties. Tests for null hypothesis against the specific alternatives were carried out with the help of data collected from 142 farms belonging to 15 villages of Hooghly district of West Bengal for agricultural

year 1970-71. The observations are presented graphically in the Diagram. Table 1 presents the results of the following four fits:

$$H_0: \bar{L}_r = \theta_2 \bar{M}_r$$

$$H_1: \bar{L}_r = \theta_1 + \theta_2 \bar{M}_r$$

$$H_2: \bar{L}_r = \theta_2 \bar{M}_r + \theta_3 (\bar{M}_r)^2$$

$$H_3: \bar{L}_r = \theta_1 + \theta_2 \bar{M}_r + \theta_3 (\bar{M}_r)^2$$

WE PROTECT YOUR SAVINGS PLAN

Suppose, an adult opens a 5-year Cumulative Time Deposit or Recurring Deposit account of Rs. 5 or Rs. 10 denomination in a Post Office and makes 24 monthly deposits into it. If ill luck disturbs the Savings Plan, the Government will pay to the heir or nominee the entire amount, with interest, as if he had paid all monthly deposits up to the end of the fifth year. See how:

dayp 72/513

C. T. D. Rs. 10 saved every month Brings Rs. 675
R. D. Rs. 10 saved every month Brings Rs. 710

TABLE 1: RESULTS FOR REGRESSION CO-EFFICIENTS WITH THEIR STANDARD ERRORS AND R²

Form of the Fits	θ_1	θ_2	θ_3	R ²
$\bar{L}_r = \theta_2 \bar{M}_r$	0	3.34 (0.0412)	—	0.4540
$\bar{L}_r = \theta_1 + \theta_2 \bar{M}_r$	357.92 (57.25)	1.95 (0.1582)	—	0.5320
$\bar{L}_r = \theta_2 \bar{M}_r + \theta_3 (\bar{M}_r)^2$	0	2.65 (0.2040)	0.00041 (0.00027)	0.5805
$\bar{L}_r = \theta_1 + \theta_2 \bar{M}_r + \theta_3 (\bar{M}_r)^2$	400.54 (142.24)	1.58 (0.2062)	0.00039 (0.00017)	0.7034

Standard errors are in the parentheses.

TABLE 2: RESULTS OF ANALYSIS OF VARIANCE FOR $H_1: \bar{L}_r = \theta_1 + \theta_2 \bar{M}_r$

Source	Sum of Squares (S S)	Degrees of Freedom (d f)	Mean (S S)	Observed F	F at 1 Per Cent
Linear Regression	3530.20	1	3530.20	149.69	6.85
Deviation from Regression	3302.10	140	23.59		
Total	6832.30	141			

See Computational Formulae in the Appendix Note.

two Analysis of Variance exercises carried out to test whether hypothesis H_1 explains the data significantly better than hypothesis H_0 and whether H_3 makes for any further improvements. The Analysis of Variance are of course equivalent to the t-tests that may be carried out for the nullity of θ_1 in H_1 and θ_3 in H_3 with the help of the standard errors that are presented in Table 1.

Answers to both the questions are in the affirmative. Thus, the estimate of θ_1 of the H_1 fit is significant at the 1 per cent point and similarly the estimate of θ_3 of the H_3 fit is significant at the 1 per cent point. It may further be noted that in each case R^2 is pretty low.

Hence the following conclusions can be drawn:

(a) The association between L_r and M_r is not very strong. The model under test, namely, Cobb-Douglas technology plus profit maximisation, can explain no more than 45 per cent of the observed variation in per acre labour inputs, given the per acre material inputs. Even the addition of two more parameters does not take the explained part of the variation beyond 70 per cent.

(b) Whatever association there is cannot be best represented by a straight line passing through the origin. As a matter of fact, the scatter can be better fitted by a straight line with a positive intercept on the L axis and gives an even better fit to a quadratic with a positive intercept term. Hence, if the observations are assumed to satisfy (but for error) the Cobb-Douglas functional form, then the hypothesis of profit maximisation stands rejected.

The Variables

The variables used in carrying out the tests are results of measurements carried out on the basis of the following definitions:

M_r the value of all material inputs of the r th farm. The input items included are seeds, manures, fertilisers, oilcakes, and pesticides. The home produced items are imputed by the ruling village prices. For fertilisers, oilcakes and pesticides no imputations are involved. The cost of irrigation water had to be excluded as no suitable method could be found for imputing the value of irrigation water, especially that applied by the farmer himself by various country methods, e.g. with the help of "donga".

L_r the manhours of total human labour used on the r th farm, obtained by adding together

TABLE 3: RESULTS OF ANALYSIS OF VARIANCE FOR $H_3: L_r = \theta_1 + \theta_2 M_r + \theta_3 (M_r)^2$

Source	Sum of Squares (S S)	Degrees of Freedom (d f)	(S S) Mean	Observed F	F at 1 Per Cent

Total	6832.30	141			

See Computational Formulae in the Appendix Note.

family labour and hired labour of all categories (i.e. farm servants' labour, casual labour and contract labour), and labour received gratis or by the way of exchange. Only the following farm operations are considered: preparatory tillage, sowing, interculture and harvesting. This means that all other activities connected with agriculture, namely, post-harvest processing of crops (e.g. pounding, dehushing, etc), transportation, purchases, marketing, etc, are excluded along with all activities, economic and otherwise, not connected with agriculture.

Results

The nature of the association between per acre labour input and per acre material input may first be visually examined on the scatter Diagram showing L_r against M_r in the arithmetic scale. The scatter does not seem to lie closely along any straight line passing through the origin. As a matter of fact, the scatter does not lie closely along any smooth curve whatsoever.

If an unconstrained straight line is fitted, the estimate of θ_1 turns out to be 357.92, the 't' value (6.251) of which is significant at the 1 per cent level. This differs significantly from zero, which means that our data do not give acceptable fit to a straight line with zero intercept. Hence with this test alone we can reject the hypothesis of profit maximisation under Cobb-Douglas technology.

The further experiments with fittings were carried out with a view to explore what functional form might best explain the data. The co-efficients and their standard errors presented in Table 1 were computed by the Doolittle method. It may be noted that the co-efficient takes a small but significant positive value, i.e. 0.00039, which implies that the use of labour input increases at a faster rate than that of material inputs. Then dropping θ_1 from the quadratic form the values of θ_2 and θ_3 were recalculated. θ_3 again took a small positive value of 0.00041, but R^2 diminished substantially.

The last result highlights the fact that a considerable proportion of farms

produce with practically no material inputs, depending only on labour input. Of course material input cannot be zero, for there has to be seed if not anything else, and as such a positive intercept is economically meaningless. However a polynomial upto second degree made to pass through the origin would pass below rather than through most of the points with low values of M . It would be pointless to try higher degree polynomials given that the data anyway are not such as would give very good fit to any smooth curve and a

polynomial of a high degree with characteristic twists and turns would not be amenable to any economic interpretations.

Conclusions

The results presented here concern the relative proportions in which labour and material inputs are used in farm operations as a whole. As was indicated in Ashok Rudra's earlier paper, several other tests are possible. Thus it is possible to compare the ratio between any one of the input items and output for different crops sown by the same cultivator. Some such tests are being carried out presently and it is hoped to present the results subsequently.

[Thanks are due to Bela Bandopadhyaya for her contribution to the processing of raw returns into variable values.]

Appendix Note

The well known formulae for Analysis of Variance are as follows:

TABLE FOR ANALYSIS OF VARIANCE FOR $H_1: y_i = a + bx_i$

Source	SS	d f	MS	F
(1) Linear Regression	$b^2 \sum_{i=1}^{142} (x_i - \bar{x}_i)^2$	1		
(2) Deviation from Regression	$\sum_{i=1}^{142} (y_i - \bar{y}_i)^2 - b^2 \sum_{i=1}^{142} (x_i - \bar{x}_i)^2$	n-2		
Total	$\sum_{i=1}^{142} (y_i - \bar{y}_i)^2$	n-1

Total	$\sum_{i=1}^{142} (y_i - \bar{y}_i)^2$	n-1		

where p is number of parameter.

My mother had to work 14 hours a day after we lost father. That shall not happen to my wife.

The Limited-Payment Life Policy With Profits
The best form of life assurance to make provision for dependents

"When I got married at the age of 27, I took this policy for Rs. 15,000 for a term of 28 years. The monthly premium which I have to pay till I retire at 55, is only Rs.38.70!

"I have the assurance that even if I should die during the 'term' of the policy, my wife will get Rs.15,000 in hand, plus bonuses."

How about you? An LIC policy can guarantee your wife's future too. The 'premium' will vary according to your 'age', the 'sum assured' and the 'term' (number of years over which you pay premiums). No other form of saving protects your dependents from life's uncertainties. LIC has other types of policies to suit your every requirement.

Secure their future through LIFE INSURANCE

what have
CARBORUNDUM UNIVERSAL
got to do with

IAS?

Plenty!

**'I' is for
INTEGRATED**

...the key word in systems engineering. What it means? Integrating all the factors, from choice of raw material to use of the right tools and techniques. What it achieves? Finished products of the highest quality at the lowest unit cost. This is the 'system' we promote — Carborundum Universal offer you abrasives, contact wheels and machines, all properly matched to your operation...to give you predictable and profitable results every time!

**'A' is for
ABRASIVE**

...produced to meet your precise needs, equal in quality to the best manufactured anywhere in the world. What's more: we offer you the widest range. Remember, there's a Carborundum Universal abrasive to suit your every grinding operation... always guaranteed to produce the exact results you want.

**'S' is for
SYSTEM**

...and the comprehensive service Carborundum Universal is best qualified to offer you. Advice on latest tools and techniques. Methods to cut down costs and improve quality. This is service from us—backed by the vast experience of our world-famous associates: the Carborundum Company, U.S.A. No matter what your grinding problem is—call the man from Carborundum Universal. He is always ready—and qualified—to help you.

IT was a tragic incident, though by no means a unique one. According to newspaper reports, on March 20 in Chhatnandra in Aurangabad district of Maharashtra, Gopinath Wadar, an Adivasi, was burnt alive by some people of the village, including allegedly the upa-sarpanch of the village panchayat. Wadar's crime had been to threaten that if fair-price shops indulged in black-marketing they would be looted. Earlier the village fair-price shop, owned by the upa-sarpanch, had refused to supply the government-fixed quota of jowar to Wadar. Not that jowar was not available at all; it was, but at a multiple of the official price.

An excess of outrage at the incident or of compassion for the hapless Wadar was, of course, not to be expected from the government of Maharashtra. Yet few would have been prepared for the tone of the statement of the Minister of State for Home, S G Pawar, in the state Assembly on Wednesday. The Minister's primary concern appeared to be to discredit Gopinath Wadar, almost to the point of suggesting that he deserved what he got. Thus, according to press reports of the Minister's speech, Wadar had been drunk on the day of his murder; he had gone about extorting 'holi bakshish' from fellow-villagers; he had threatened to burn down the entire village (not just the defaulting fair-price shop); why, he had even misbehaved with some women before finally wending his way home in the evening. This was the Minister's theme; he also thought it necessary to suggest that possibly Wadar had not been burnt alive, by speculating — on the basis of nothing precisely — that he was perhaps already dead when his body was thrown into his burning hut.

Atrocities against Harijans and Adivasis are almost a daily occurrence in some part of the country or the other. The Annual Report of the Union Home Ministry for 1972-73 virtually acknowledges as much. If the murder of Wadar had belonged to this genre of incidents, Maharashtra's Minister of State for Home might have to take it in his stride with the customary assurances about bringing the culprits to book. What seems to have provoked the Minister to the superlative display of callousness in the Assembly is that at the bottom of the tragedy lay the failure of the government's food distribution system which makes it possible for political notables, like our upa-sarpanch, to sell in the black market grain meant for distribution through the so-called fair-price shops.

It is, however, a little too late in the day for Minister Pawar to be overly sensitive on this score. Report after report on conditions in the drought-affected areas of the state have shown that notwithstanding the fair-price shops which exist on paper and the foodgrain quotas which are nominally fixed by the government, much of the foodgrains that the people actually eat comes to them through the black market, at prices comparable to the Rs 1.70 a kg of jowar (twice the official issue price of wheat) which was what had been demanded of Gopinath Wadar. Just the day before the Minister of State for Home made his statement in the Assembly, the tehsil office in Malegaon in Nasik district had been besieged by a large crowd of local people protesting against the failure of fair-price shops to supply the stipulated quantities of foodgrains. Collectors of many districts have frankly confessed that they dare not interfere with the black market in foodgrains since more often than not it was the major source of foodgrain supply. In other words, the trade in foodgrains has become the conduit for channelling into the pockets of the local political bigwigs all over the country the hundreds of crores of rupees shown as having been paid out by government as wages to the drought-affected.

A system so well entrenched is obviously not to be trifled with. May be it was foolhardiness on Gopinath Wadar's part; may be it was courage born of innocence; may be he was drunk; but most likely, it was sheer despair. But whatever it was, the opposition parties' responsibility for driving him to his fiery grave is not inconsiderable. The only thing which can give the Gopinath Wadars any chance at all against the system is political organisation. This the opposition parties, who are ever-ready with their crocodile tears and their adjournment motions in Parliament and in state assemblies, have conspicuously failed to provide — in Maharashtra as in most other parts of the country. Indeed, if Wednesday's discussion in the Maharashtra Assembly on Gopinath Wadar's murder exposed the callousness of the government, it underscored even more emphatically the hypocrisy and the irrelevance of the opposition parties.

Manipur

Handle to Populism

WITH the dissolution of its 60-member Legislative Assembly, Manipur once again comes under Central Government rule. It was only in January, last year, that Manipur — along with Tripura and Meghalaya — became a full-fledged state, assuaging, to some extent, deep local resentment against rule from New Delhi. This resentment has led to sporadic demands for full independence for Manipur and occasional talk of a 'greater Manipur' which would include adjoining areas of Assam and Burma. There is a miniscule underground movement for independence and overground, the Pan-Manipur Youth League has demanded independence. So far these groups have not received strong support from any quarter.

The Manipuris themselves have for long been divided between the tribal hill peoples and those who live in the central valley where the capital, Imphal, is situated. The biggest segment among the hill peoples, many of whom are Christians, consists of Tangkhul Nagas, with the Kukis making up the second largest segment. In the election, last March, the Naga Integration Council — which wants certain tracts of northern Manipur to be integrated with Nagaland — won three seats. But this demand is opposed by the Kukis and other hill tribes as well as the predominant people of the valley and of Manipur, the Meiteis, who number about 600,000 out of a total population of 1,072,000 and almost all of whom are Hindus. The Meiteis, isolated in their valley for hundreds of years, have firm local roots and a strong insular tradition.

This traditional insularity has been reinforced by the fact that a substantial part of the business and commerce of Manipur are concentrated in the hands of Punjabis, and Marwaris from Assam and Bengal, who are all disparagingly referred to as Mayangs. The former have come in during the past 20 years while the latter are somewhat earlier migrants. As is happening in so many other states, the economic backwardness of the locals (tribals as well as Meiteis) has been turned to political-electoral advantage by a populist, regionalist party, the Manipur People's Party, whose slogan in the last election was "Manipur for the Manipuris". It won 15 seats and formed around itself a loose coalition called the United Legislature Party.

The coalition broke up recently due

to the defection of several MLAs to the Congress-led opposition. This has led to the imposition of President's Rule as no stable legislative majority was in sight. The Governor, B K Nehru, had recommended suspension of the Legislative Assembly, but he has been overruled by the Central Cabinet and the Assembly has been dissolved. If President's Rule continues too long, the small groups who have been demanding independence will be given an additional handle to further their demand. Meanwhile, given the climate of suspicion of New Delhi and the manoeuvrings of the local Congress which led to the re-imposition of President's Rule after a break of only a year, the Manipur People's Party is likely to gain many additional seats in the next election.

Monetary Reform

Heat without Light

THE communique issued at the end of the second meeting of the IMF's Committee of 20 on international monetary reform has nothing more to offer than a set of platitudes urging the need for a major currency reform. The Committee had its first meeting in September 1972 to discuss the IMF Executive Directors' report on monetary reforms. The Deputies of the Committee of 20, a body appointed to expedite the work of the Committee, started their work in November 1972 and held two meetings before the devaluation of the dollar in February. At the end of their first meeting in November 1972, Jeremy Morse, their Chairman, had told the Press that the Deputies "have only just begun the debate". It is now clear that they got no farther.

Considering the context in which the deliberations of the Committee of 20 were held, it is surprising that no serious attempt was made even to indicate broad measures for dealing with the highly de-stabilising flows of speculative capital that led to the collapse of the second major realignment of currencies. Most of the world's important currencies are floating and nobody is clear as to how long the floating regime would continue. The communique of the Committee of 20 says that floating exchange rates of the European currencies and Japan "could provide a useful technique in particular situations" — as if the experience of the floating of a larger number of currencies in August-December 1971, of the floating of the Canadian dollar for a number of years and of the floating of the pound sterling since June 1972 have not been

educative enough. It is ironical that in the same breath the communique calls for fixed but adjustable exchange rates under a new world monetary system. The Committee of 20 should have tried to resolve at its level the political issues involved in the speculative capital flows and come out with at least some tentative guidelines for minimising the de-stabilising impact of these flows on world exchange rates.

Instead, after going over all the ramifications of the problems of monetary reform, the Committee has come out with statements almost identical to those made by it nearly six months ago at its first meeting. As regards the exchange rate adjustment mechanism, the need for objective indicators like movements of reserves and changes in prices levels is recognised, but the debate still continues over whether these signals should bring forth mandatory exchange rate changes or whether they should be used only for initiating consultations between a member country and the IMF for necessary action. After all the voluminous material released by the Fund on this problem, one more technical group is going to be asked to go over the question of how the objective indicators can be used to improve the adjustment process.

The problem of reserve currencies, the role of gold, etc, have been revived again and the Deputies have been asked to study further the conditions for the general resumption of convertibility, including questions relating to the consolidation of excess reserve balances and methods of settlement. By now it is sufficiently clear that the issues relating to reserve assets and convertibility cannot be settled unless a decision is taken at the political level on the future role of reserve currencies and gold and on whether the SDR is going to be the sole reserve asset. As regards the SDR-aid link, it is clear that the proposal is as good as dead. The US has indicated that it has serious reservations about the whole proposal and a number of developing as well as developed countries, towing American line, are totally opposed to it. However much India may champion the cause of the links, its efforts will be fruitless, since the US, with its 22 per cent voting rights, could alone kill the proposal.

The issues involved in international monetary reform need to be faced at the political level before any progress can be achieved. At the technical level, various solutions have been worked out by numerous experts and the report of the executive directors of the Fund, released nearly six months ago, bring

together the choices available in respect of almost all the important issues involved in the reform. If the leading industrial countries are prepared to face the problem squarely and resolve their most acute differences themselves, the discussion on monetary reform would proceed rapidly and the Committee of 20 might be able to stick to its target of presenting the basic framework of the reformed system by the September 1973 annual meeting of the IMF. However, in the absence of serious intentions and efforts in that direction, the discussions of the Deputies will drag on endlessly and generate much heat and little light.

Employment

Crash Scheme for Doles

THE Minister of State for Agriculture claimed in Parliament on Monday that the employment target under the crash scheme for rural employment would be exceeded in 1972-73. The entire outlay of Rs 48.40 crores provided for the scheme would be spent during the year and the employment generated would surpass the target of 87.50 mn mandays. According to the latest information available with the Minister, during the year so far 86.29 mn mandays of employment had been created with an expenditure of Rs 32.52 crores. 1972-73 is the second year of the crash scheme. In 1971-72 Rs 32.71 crores were spent on the scheme and it has been claimed by the government that 81.72 mn mandays of employment were created.

What is one to make of these statistics? While the government is able to reel off very precise figures of the expenditure incurred on the scheme and the employment generated, very little is disclosed about the types of projects taken for execution and the nature and quantum of productive assets built up. This is a significant omission since the government has always claimed that the crash scheme is not intended to dispense doles to the rural employed but to generate employment in productive development works. On the strength of this claim, the crash scheme, introduced as a non-Plan programme in 1971-72, was upgraded to the status of a Central Plan programme in 1972-73.

But despite its classification on paper as productive and developmental, there are strong reasons to believe that the scheme has worked by and large as a device for paying out doles to a section of the unemployed and the underem-

ployed in the rural areas. Consider, first, the aggregate figures of expenditure and employment generation. The figures given by the Minister of State for Agriculture for 1972-73, quoted above, give an expenditure of slightly over Rs 3.70 per manday of employment. If allowance is made for a minimum of administrative expenditure and for the leakages ubiquitous in public works of any sort and if it is assumed that the rates of wages paid under the scheme are broadly in line with those prevailing for agricultural labour in the respective areas, the expenditure of Rs 3.70 per manday of employment created leaves very little for spending on implements and materials. While it is only right that projects taken up under the crash scheme should be labour intensive with a high wage component in total expenditure, productive works designed to create durable assets would necessarily involve a certain minimum expenditure on tools and implements and materials.

Second, figures of the progress of expenditure during the financial year suggest that the overriding concern of the state governments and the authorities lower down in charge of the execution of projects is with using up the sanctioned allocations fully. Thus, till the end of January, the expenditure under the scheme in 1972-73 was put at Rs 23 crores by the Minister of Food and Agriculture speaking in the last week of February. Last Monday, just a month later, the Minister of State for Agriculture quoted a figure of Rs 32.52 crores as the expenditure on the scheme "so far". He had no doubt either that, by the end of the financial year, the entire outlay of Rs 48.44 crores provided for the scheme would be spent. The sharp acceleration of the pace of spending in the last few months and weeks of the financial year does not exactly make for faith in the productive character of the projects taken up.

Thirdly, it was officially disclosed at a seminar on the progress of the crash scheme in New Delhi last month that between 70 and 80 per cent of the expenditure on the scheme so far had been on rural roads. Now, it is well known that road building is the first resort of district bureaucracies with money to spend and with nothing particularly worthwhile to spend it on. The list of the types of programmes expected to be taken up under the crash scheme is a long one and includes minor irrigation, soil conservation, flood protection, and even construction of school buildings and housing colonies for the poor. It is

significant that, with such a wide range to choose from, almost four-fifths of the outlay under the scheme should have been on so-called road-building.

Finally, the fairly large sums of money which have been made available to the district administrations under the crash scheme appear to have had very little impact in terms of efforts to devise suitable organisational machinery to formulate, select and execute projects, as would have been necessary if concern with the productiveness of projects had been less perfunctory. Nor does much thought appear to have been expended on how to recoup, in part or full, the cost of productive schemes from their beneficiaries, which may, again, suggest that there has not been a surfeit of such schemes. The Kerala government's innovation of the labour-cum-development bank, which is about to be launched in one of the districts of the state, appears to be very much the exception to the general pattern.

Indo-US Relations

Much to Live Down

A Correspondent writes:

AN adviser can influence the modulations of policy; he is rarely, if ever, the progenitor of policy. Subject to the myth of Henry Kissinger's immortality, those who had contrary notions about Richard Nixon's competence and power of imagination should, therefore, start revising them. India, to its cost, is now at the receiving end of the well-seasoned Nixon treatment. The shipment of arms is being resumed to Pakistan, but the blow has been deliberately softened by the withdrawal of the order suspending economic assistance to India. Ample hint is being thrown toward the direction of India that the bounty would proceed even beyond the frozen amount in the aid-pipeline — if it remains on its best behaviour in the coming period.

Given the anticipated steep decline in the country's foreign exchange holdings and with the ensuing monsoon still altogether an unknown contingency, Indira Gandhi has not many options left. She can murmur mild protests to Ambassador Moynihan regarding the resumption of arms aid to Pakistan; but she can hardly afford to raise her voice — the element of sorrow has necessarily to outweigh the element of anger in the note of protest. This is an awkward exercise, particularly in view of her not too ancient fulminations against the CIA and her somewhat condescend-

ing attitude towards the Pakistanis at about this time last year. The hawks and the illiterates at home have to be kept in good humour as well as on proper leash. She should have realised by now that, in the light of her reluctance — or inability, if you will — to initiate vital political and institutional reforms at home, and the US being the only country in the world with enough wheat to spare under more or less reasonable terms, she will have to be at least for a while a prisoner of American-foreign policy. President Nixon knows as much, and is making the fullest use of this knowledge.

This could be merely the thin end of the wedge. If the economic situation does not improve in India and there is a repetition of last year's drought, the US administration might gradually try to push India into an impossible corner. We would then have a large number of statements to live down and a large quantum of *braggadocio* to swallow. The hassle over the prisoners-of-war captured in Bangladesh could then become a matter of major concern. Even now, instead of our trying to influence the nuances of Bangladesh's policy on this question, we seem to have through sheer force of circumstance converted our own policy into the dependent variable. Perhaps too many objectives have been sought to be furthered through a single instrument of policy; and, as the games theoreticians would say, the system has become under-determined. For instance, our goals in Kashmir have tended to get mixed up with issues related to Bangladesh; we might find it increasingly difficult to extricate ourselves from the current impasse with dignity and honour in case President Nixon decides to adopt a hard stance. But then it is little use blaming others: we made the bed and we have to lie on it.

Cotton

Soft-Headed or Over-Generous?

WHEN it was set up on September 15, 1970, the Cotton Corporation of India was assigned the task of taking over the import trade in cotton; it was also to undertake purchases of domestic cotton by way of price support and to provide a ready market for the indigenous extra long staple varieties at 'fair prices'. The first Board of Directors consisted of eight members — four officials and four non-officials; an official was chairman. How effectively has CCI performed

these tasks?

Its share of the cotton import trade has gone up progressively from 26 per cent in 1970-71 to 56 per cent in 1971-72 and to 82 per cent in 1972-73. After Partition, imports which used to account for about 13 per cent of the total requirements of undivided India, began to account for 40 per cent of our requirements. Efforts were therefore directed to increase cotton output, particularly of the long staple and extra long staple varieties. Since there was a nominal specific duty on imported cotton, and as cotton prices in India were much higher than international prices, the Indian Cotton Mills Federation used to charge a premium of about Rs 475 per bale, collecting in the bargain about Rs 25 crores. The amount was used to subsidise cloth exports. However, the industry itself has been consistently more inclined to make short-term gains on its purchases of cotton than to adopt measures that might ensure increased cotton production in the future.

When the country had a record crop in 1971-72, the industry behaved with its usual shortsightedness. Though firm figures are not available even today, government estimated the 1971-72 crop to be 6.5 million bales; on March 21, 1972, Deputy Commerce Minister A C George put it at 6.8 mn bales; and on March 24, CCI placed it at 7.0 mn bales. Trade and industry put forward its own estimate at 7.4 mn bales; and it was generally suspected that the figure was intended to depress the market. In any case, the record crop did have its impact on prices. The cotton price index (1963-64 = 100) declined from 253 at the beginning of September 1971 to 162 by end of April 1972. Government thus asked CCI to enter the market from May 1972. Between May and August 1972, CCI purchased 517,364 bales valued at Rs 55 crores. As a result, the price improved, and the index finished the season at 168.

With the failure of the rains in 1972-73, the early months of the current season were marked by apprehensions of a cotton shortage. The price index moved up to 196 by November 1972. But with the monsoon failure, resulting also in a power shortage in various parts of the country, the demand for cotton was subdued. It is now granted that, even with a shortfall in production, the season will end with about the same carryover stock of over 2 mn bales. From the beginning of December 1972, prices of most varieties of cotton have

consequently been on the decline. The heavy import duty of 40 per cent imposed on imported cotton recently resulted in a rise in the price of extra long staple varieties; but even that rise proved shortlived. In its support operations, CCI has had little help from the industry which though it complains about instability of cotton supplies is also unwilling to build up inventories, preferring to take up supplies when it can at lower prices for short-term gains. During the current season, by February-end, CCI had purchased 320,000 bales in the North and at ruling market rates — though it is not supposed to enter the market except when prices threaten to sink below the minimum rates stipulated on January 24, 1973. Interesting, too, is the fact that it has purchased these quantities mainly with a view to providing a ready market for the extra long staple varieties which go into the finer types of cloth. Even during 1971-72, when the country had a record crop, it must be remembered that production of the extra long staple varieties had declined by about 120,000 bales. During the current season, production will be still lower notwithstanding that the heavy import duty on imported cotton was probably aimed to stimulate production.

Now that it is clear that the cotton supply is comfortable for the scaled-down demand, government has asked CCI to wait and watch the market. It has even appointed an 'action Committee' to watch price trends, particularly of the superior varieties. Special measures are to be taken if the price situation appears to warrant them. CCI therefore has not made any further purchase during the last two months. But how serious is government itself about developing a systematic procurement and price support policy? Except in Maharashtra, no procurement price has been fixed anywhere else in the country. Even the monopoly procurement scheme of Maharashtra has been successful at a high cost. On March 17, Y J Mohite, State Minister for Co-operation, claimed that the scheme was a success: the market season in Maharashtra is about to end, and the state has already procured 1.06 million bales of cotton; only 'vested interests' were launching the propaganda against the scheme. What Mohite failed to mention is that, in spite of two price reductions, the state has not been able to sell even 200,000 bales. At the last auction, held just a few days ago, not a single bale could be sold. The state government is in for a huge loss, which will be known only at the end of the season.

Calcutta Diary

A M

CERTAIN themes are conventionally popular, certain others are not. There is also the matter of the Defence of India Rules, anything and everything might come under whose purview: the 1971 war lasted exactly fifteen days, but, so what, the D I Rules and the emergency would seem to go on for ever, for is not the nation riding from one crisis to the next? That apart, one must also be wary of not stoking parochial passions; already there is a sufficient stock of these to last, conceivably, for the next couple of generations.

But should not one nonetheless occasionally wonder about the morphology of the mounting defence expenditure? From the way the ministers flaunt their view, it would be almost a sacrilege to question any element of the defence outlay: others might abide the question, but this segment of public expenditure is free from parliamentary — or extra-parliamentary — probe. Thus nearly four per cent of national income annually disappears — merely with the leave of the Central Cabinet. In terms of per capita income, we may come right at the bottom of the list of United Nations members; in terms of defence outlay, however, we cut a much more distinguished figure, and appear close to the very top — in ordinal ranking, the sixth or seventh position. If one were to make the same inquiry with respect to the overall size of developmental expenditure, the answer would be quite different: we would be struggling hard to retain even a middle-order position among a cross-section of one hundred twentyfive and odd countries around the world.

To each nation, it could be argued, its sovereignty. Given all the deficiencies — known as well as unknown — of the democratic parliamentary system, the people have chosen a government; it is this government which has decided in its wisdom to maintain a certain level of defence expenditure. If this order of military outlay erodes the scope for expanding productive public investment, which in turn constricts the possibilities of even productive private expansion, while voices of dissent may crop up here and there, nothing much else can be done. If people decide to prefer the relative waste of defence outlay to the relative tangible gains which could stem from a quickening of the pace of economic growth, it is their funeral. As long as

you continue to be a part of the system, you have to lump such seeming absurdities.

But caricaturing the academics, cannot one say that even where the macro elements are taken for granted, there still remain the micro elements. What about the income distribution effect of the defence budget? How does one assess the national worth of a pattern of fiscal outlay which may seriously distort every year the regional distribution of incomes, besides providing comfort and nourishment to a segment of the population who, because of the nature of their training and upbringing, have usually a built-in contempt for the normal democratic processes?

This is scarcely a rhetorical question. Even a rough and ready exercise sheds interesting light. Of the total — and revealed — outlay on defence, currently running at around Rs 1,600 crores, perhaps as much as quarter consists of 'leakages', in the sense that it goes for the import of military hardware and equipment. For the domestic economic system, therefore, this segment of the aggregate defence expenditure has no particular distributional implication. A further Rs 400 crores, again on a rough reckoning, would represent expenditure for the purchase of goods within the country, either directly through the instrumentality of defence production or from private parties via agency arrangements. The remaining half of the allotted outlay — Rs 800 crores — would consist of wages and salaries.

For strategic reasons, the defence production units are fairly evenly distributed over the country. Who however gets the defence contracts? Would one be hopelessly wrong in assuming that at least two-thirds of the total purchases of goods by the Ministry of Defence are purchases confined to an area within a radius of, say, two hundred and fifty miles centring on New Delhi? What the Americans call the fall-out of this part of defence expenditure would therefore by and large benefit the citizenry of Punjab, Haryana, Rajasthan and western Uttar Pradesh. Even if one were to inquire into the regional distribution of wages and salaries disbursed out of the defence budget, there too the tilt would be heavily in favour of Punjab, Haryana, Rajasthan and western Uttar Pradesh, even though Maharashtra, Tamil Nadu and certain areas of Karnataka would also not be entirely

left out of the picture. One wishes one could potter around with the data and see whether some kind of statistical correlation exists between the wage bills of the various wings of the Ministry of Defence and the destination pattern of postal remittances from locations with sizeable defence establishments. Moreover, here we are dealing not only with just one flow, but several ones. Pensioned-off defence personnel perhaps are as numerous a category as those who are at any given moment on the rolls of the Ministry. Since the age of retirement is fairly early in the services, proportionate to the population, pensions are drawn by a much larger number than in the case of civilian employees of the Government.

This is however only one part of the story. It would be almost impossible for any outsider to discover the special additional privileges that go with employment in the defence services. A Pay Commission, set up every dozen years or thereabouts, may, if it so wills, attempt to ferret out some of the facts, but the process could wear it out, for there is bound to be layers and layers of discovery. Thus one has heard of the custom of precious public land being freely distributed to retiring defence personnel, of special superannuation schemes, and other privileges. One or two residential areas in New Delhi, where real estate has appreciated two to three thousand per cent over the last twentyfive years, have been the exclusive by-product of Government munificence to members of the defence services. Facilities for special loans, most of which are in any case never returned, reflect another facet of the Government's revealed preference.

Even were the leakage through imports excluded, the rest of the defence budget would be equal to nearly three per cent of our national income. Where the involvement of the government in the national economy does not exceed fifteen per cent of GNP, and aggregate public investment wobbles around five per cent, three per cent of national income is no negligible category; the manner in which it is allocated between the different parts of the country cannot but have enormous consequences for regional income distribution.

There is a certain autoregressive character in the process that is unleashed. Deep calls to the deep; defence personnel, currently serving or retired, similarly call to other defence personnel, again currently employed or retired. If you are keen on obtaining a defence contract, all you may have to do is to catch hold of a retired brigadier

Early warning signals or no, a policy of *dirigisme* here can well be ruinous for the polity. Manifestations of alienation may, and do, take diverse forms; if things are allowed to slide, an explosion can occur even in an altogether unexpected quarter. One has to tackle the problem at its source: unless the rules and procedures for recruitment in the defence forces are turned upside down, regional jealousies may in any case spread with increasing intensity.

Lost Battles

THE International Press Institute has just published its annual review of press freedom in various countries of the world. Of India it has this to say: "The press in India continues in general to be free, although there is evidence of attempts to guide the press by various groups".

The plea not to raise the issue lest it gives rise to sectarian emotions would then become infructuous.

Naturally, there will be fierce resistance to the introduction of changes in recruitment rules. The entrenched ones will try to keep out those who have till now been not successful in obtaining any share of the defence gravy. The almost obstinate persistence with which certain minimum physical specifications have been prescribed for entry into the defence services has gone to strengthen the suspicion that a conspiracy is afoot to exclude people from some parts of the country. The emphasis is on maintaining the closed shop, despite the fact that the craft of waging war, whether on land or sea or in the air, has been so overwhelmingly mechanised that norms handed down by the British more than a century ago are now ridiculously irrelevant. We are back to the cliché about justice not merely being done, but also of appearing to be done. And a cliché need not be ignored only because it is cliché.

First it was the ownership diffusion bill which sent shivers down the proprietors of big newspapers. Then it dawned on the powers-that-be that the proposed bill would place the big newspapers under the control of journalist trade unions supported by political parties of various hues. Since this was not a very palatable idea, the diffusion attempt was given up. Next came the newsprint control order. This time the big newspapers fought a legal battle and won. Now the idea of diffusion of ownership of big newspapers appears to have been revived, but in a modified form which will keep the journalists unions at a safe distance from editorial policy and management matters in big newspapers. The thinking of the Information and Broadcasting Ministry in New Delhi appears to be that it is easier to deal with newspaper proprietors than with journalist unions. Thus the Indian Federation of Working Journalists was not very far from the truth when, at its recent Patna session, it alleged collusion of a sort between the proprietors of big newspapers and a section of the government.

Well-Covered and Expanding

CAMPHOR AND ALLIED PRODUCTS has negotiated with the state government of Meghalaya for forming a company in the joint sector with it to exploit the forest resources of that state. It is proposed to utilise cinnamon leaves, lemon grass, epicac roots, etc, which are found in abundance in the state, for manufacture of eugenol, lemongrass oil, emetine hydrochloride, vanillin and derivatives, and citral and derivatives. It is also intended to exploit the pine forests, in the second phase, to establish a factory for manufacture of rosin and turpentine. The entire project, in two phases, is estimated to cost Rs 50 lakhs, inclusive of fixed assets and working capital. The issued capital of the new company is expected to be around Rs 22 lakhs, of which Camphor will be required to invest Rs 9 lakhs. The essential oils and other chemicals manu-

factured by the new company will provide basic raw materials for certain perfumery chemicals in which Camphor is interested. Rosin and turpentine, to be manufactured in the second phase, are also raw materials for camphor and other products of the company.

The designing and layout of the plant for Camphor's expansion project of terpene resins and para-menthane hydroperoxide — delayed owing to certain technical problems — is now expected to be ready by the end of 1973. The company has obtained a 'letter of intent' for manufacture of 500 tonnes of toxaphene. The total project cost, it is estimated, will be around Rs 35 lakhs and negotiations are in progress with an Indian party for obtaining the know-how. Camphor has agreed in principle to provide the technical knowhow and to render continuous technical services

to Terpene Industries, registered in Himachal Pradesh, for manufacture of terpineol and pinene. It is proposed to charge the knowhow fees of Rs 2 lakhs and royalty on production. Detailed terms and conditions of the agreement are being negotiated.

Camphor's results, for the 12th year ended December last, have been encouraging with advance in sales and profits. Wit a reduced tax liability, net profit has shot up from Rs 33 lakhs to Rs 61 lakhs, and the maintained equity distribution of 15 per cent was covered more than 6 times by earnings. The board has also recommended issue of gift shares on a one-for-two basis. These results were obtained, despite a 10-day strike by workmen on "very flimsy demands". The 9.23 per cent cumulative preference shares, of Rs 10 lakhs, have been redeemed. Last year, the company obtained a foreign exchange loan equivalent of over Rs 18 lakhs from ICICI, and a term loan of Rs 20 lakhs from a nationalised bank. A trust for the establishment of a hospital in Clut-

terbuckganj has been created by the company by an initial donation of Rs 25,000. It is proposed to donate another Rs 2 lakhs during the current year.

MADURA MILLS' directors propose an amalgamation of their company, A and F Harvey, and J and P Coats (India). A and F Harvey was associated with Madura from its inception, as its managing agents, until December 31, 1969, and holds a substantial share in it. J and P Coats (India), which has a sewing thread factory in Koratti and is a wholly-owned subsidiary of J and P Coats of Glasgow, has been for years one of the principal customers of the company, buying practically its entire requirements of yarn from it. It is argued that the vertical integration of the businesses and the association with Coats of Glasgow would be advantageous for the shareholders as well as for the country by way of the export potential generated by the amalgamation. As the three companies are interconnected undertakings and their amalgamation would require government's approval under MRTP Act, an application was jointly submitted to government in November. Details of the scheme of amalgamation will be placed before the shareholders as soon as an indication is received of government's willingness to let the proposal go forward. Madura received expansion licences for 100 industrial looms and 400 civil looms last year and proceeded with the implementation. Certain equipment is expected to be received and installed this year. Requisite licence for reopening the Pandyan mill unit at Madurai was received and the modernised mill was reopened in July last. However, the power-cut prevented it from being as productive as expected. Further progress was achieved by the company in modernising its mills by installing several new equipment. Overall activity during 1972 was lower, compared to in the previous year, mainly owing to labour relations and partly owing to the 25 per cent power-cut from October last; nevertheless, production in civil fabrics was higher than in the previous year. Workers of the company's units at Madurai and Ambasamudram went on strike for 10 days in March 1972, in support of the agitation by textile workers at Coimbatore. There were also major stoppages of production at Madurai for over 40 days in May/June, and again for 25 days in October. The man-days lost due to these stoppages totalled as much as three lakhs. The company's working, however, showed a fair

improvement over the previous year owing to an improved supply position and consequent fall in prices of Indian cotton, despite considerable increase in the wage bill. The ratio of inventory/sales showed a notable fall over the year, and profit margins also looked up.

BOMBAY DYEING is replacing the old plain looms of its textile mills by Sulzer weaving machines along with ancillary machinery. The company has received the first licence for 56 machines under government's policy for imports of sophisticated machinery for exporting units. The project, estimated to cost Rs 410 lakhs, will be chiefly financed by a foreign exchange loan which ICICI has agreed to provide. A new shed to house these looms is expected to be ready by the end of May this year, in time for arrival of the looms. This will be the first time that Sulzer machines will be installed in a cotton textile mill in India. On these new looms, the company will produce chiefly fabrics of synthetic blends. In keeping with its policy of modernisation and rehabilitation, the renovation of speed frames and ring frames of the textile mills was almost completed last year. A few machines, however, are still to arrive. The waste plant has been closed down from July last, as it had become obsolete and uneconomical to run. An additional high pressure beam dyeing machine for dyeing terry-cot fabrics, four new automatic dyeing jiggers, and a hot flue drier, have been installed at the new bleach works to meet the demand for dyed goods. Also, three screen printing tables with trolleys have been purchased to meet the growing demand for printed goods. An additional diesel generating set has been purchased and installed at the spring mills to offset a part of the power-cut. The company will have to fulfil its obligation for manufacture of controlled varieties of fabrics by either getting other mills to undertake the obligation or by making payment of a contribution to the Export Promotion Fund Consumer Subsidy Fund. Its maximum liability for 1973 is estimated at Rs 61 lakhs. The company has had a very good year to December last, with fair increases in sales and profits. Total production of cloth aggregated 781 lakh metres — some 50 lakh metres more than the previous year. Even considering that profit on sales of assets brought in Rs 16 lakhs more at Rs 63 lakhs, the advance in gross profit looks quite impressive, since it has been arrived at after providing a substantially higher amount of Rs 108 lakhs for gratuities,

for which only Rs 6 lakhs were set aside last year. The advance, however, has been almost nullified at the 'net' level by the larger provisions for depreciation and taxation. Cover on the dividend — stepped up 3 points to 16 per cent — is, therefore, thinner. The company was able to reduce its borrowings considerably. Both inventory and wages in relation to sales were lower compared to the previous year and profit margins improved. The company's exports amounted to Rs 804 lakhs, against Rs 548 lakhs in 1971 and Rs 420 lakhs in 1970.

ARUNA SUGARS has increased its crushing capacity from 2,000 to 3,000 tonnes of cane per day, at a cost of about Rs 99 lakhs. On the recommendation of the government of Tamil Nadu, the company has been issued a 'letter of intent' to further increase capacity to 4,000 tonnes per day. The new expansion is estimated to cost about Rs 200 lakhs. Ways and means of finding finance for this expansion are being considered. Meanwhile, efforts continue to be made to expand the area and increase the yield of cane per acre in the surrounding area. IFCI and ICICI have sanctioned term loans of Rs 40 lakhs each, and have stipulated that they would have the right to convert upto Rs 6 lakhs each out of the loan amounts into equity shares of the company. The right will be exercisable during the two years ending September 1976, and Rs 10 shares will be purchased at Rs 12 each. Aruna has produced good results for 1971-72, with higher sales and earnings. Dividend was stepped up 8 points to 20 per cent, which too enjoyed a much better cover than in the preceding year. The board has also recommended issue of bonus shares on a two-for-five basis. The workers and the staff were paid 20 per cent of their total wages by way of bonus and an extra 16 per cent as ex-gratia payment. The factory crushed 2,69,949 tonnes of cane and produced 2,54,401 quintals of sugar with a recovery of 9.39 per cent during 1971-72, as compared to 2,47,036 tonnes of cane crushed and 2,31,288 quintals of sugar produced with a recovery of 9.27 per cent in the previous year. The subsidiary, Arvind Distillery, commenced construction work in December 1971 and commissioned its distillery in April last year. Its present capacity is about 18,000 litres of rectified spirit per day and it has expansion schemes on hand.

No Answers in "Babaism"

Romesh Thapar

SATYA SAI BABA is back with us. This time, with Cabinet Minister Pai presiding, the miracle man took off on the question of socialism. "It's all a question of the 'I' being transformed into the 'We'". Indira Gandhi, back from a rather verbose meeting of Congress chieftains in Patiala, pondered on this latest babaism. For those who possess the secret power to command the materialisation of physical objects at the flick of a finger or the movement of a hand, socialist transformations may appear miserable little exercises in the totality of miraculous activity. Indira Gandhi perhaps knows better. We've had enough of babaisms.

Of course, this is not to suggest that babaism is not rampant in the highest circles. There's always a Cabinet Minister to act patron to one or another Baba — religious, mystical, secular, ideological and what have you. Some imagine that they themselves are Babas of a sort. How else can cynical word-spinners like D P Dhar — sorry, P R Dhar — wax eloquent about the present as the moment to purge and purify the Congress Party. He's obviously hoping that he'll have the power to decide what's healthy and what's rotten. A pathetic hope. Even a cursory look at the Planning Commission is enough to warn the Prime Minister of what to expect.

Visitors to the Capital are beginning to comment in a somewhat disturbed frame of mind about Delhi's euphoric mood. The political rulers are talking about "international conspiracies" to disturb the stability of the subcontinent and of "grander alliances" acting at the behest of these conspirators. The administrators speak of things "under control" and "decisions in the pipeline" about wages and prices. Golf championships and flower shows are under way. There are festivals of films and music and theatre. Tourist specialists from distant corners have been gathering for parleys. Roads are being re-surfaced. Bridges for speedier traffic movement are being opened. There are no crises — yes, not even a shortage of water and power. How relevant is this Capital scene against the traumas facing agriculture, industry and urban settlements throughout the subcontinent.

Are we suffering from a serious attack of what the Chinese call "mountain-topism"? Have we become so obsessed

in Delhi with the business of power manipulation that we are unable to focus on matters which need our urgent attention? Is this why the Capital's elite talks of little else except the doings of Sanjay Gandhi, compelling the Prime Minister to become what many think rather too involved and over-sensitive? Is it possible that we are actually insensitive to the significance of the profound changes sweeping the subcontinent or wish to ignore the embryonic revolution that they represent? Is babaism the natural escape from reality?

There is a point to all this questioning. For the first time in 25 years of freedom we have become in New Delhi intolerant of sustained self-critical assessment. Self-criticisms, re-assessments, rebel thoughts are the essential fertiliser of free societies. We, who are in the process of complex development, cannot afford to become complacent. The Prime Minister is right when she castigates those who make mechanical comparisons between India and China, but she has yet to head a movement to examine some of the assumptions by which we have lived and worked these last 25 years.

Clearly, this was the task to which the Planning Commission should have addressed itself. From the public declarations of the Minister for Planning it appears that our ever-obliging press is on the verge of being persuaded that the corrections have to be carried out elsewhere. We are, there-

fore, talking of a "cadre-based party", of "purges" and of "purifications", even before we have clearly enunciated the objectives before the nation and now they are to be achieved. The Approach Paper is not such a document; it is merely a corrective of a sort to some of the confusion. A very much more precise elaboration of objectives must be attempted, and we must be shown with equal precision how these objectives will be achieved. Word-spinning by the political Babas in public (and private!) should be kept to the minimum — in fact, eliminated.

The sad fact remains that, given the ministerial team she has assembled, the Prime Minister will have to order such an exercise. We are drifting, and the drift has to be halted. This excessively talkative country is at last tiring of talk. It wants to see silent action. Is this possible between now and September, when the rains are expected to solve all immediate problems, including those of food prices? The "I" and the "We" are all very well, but the struggle for genuine socialism in democracy consists of very much more complex transformations.

Will the Prime Minister whip her Planning Commission, and its garrulous chief, into silent action or shall we have to plod along in confusion from one monsoon to the next? There are no answers to this question in babaism. What we need is a simple decision, or order. A difficult demand, for too many of the PM's senior colleagues would have her sit still and do little else than talk. A new financial year is about to begin. Let's inaugurate it well.

March 26

LETTERS TO EDITOR

Imperialism and Social Transformation

THE participation of Jose Rodriguez Elizondo of the Communist Party of Chile and myself in the International Seminar on Imperialism, Independence, and Social Transformation in the Contemporary World, held in New Delhi in March 1972 with the attendance among many others of Harry Magdoff, has given rise to an ideological (non) debate in Chile. Rodriguez Elizondo published in *El Siglo*, the official newspaper of his party, an article taking exception to my participation in the New Delhi seminar. The essential parts thereof are

quoted or summarised in my answering letter to *El Siglo*, which, after the latter declined to publish it, appeared in the Chilean bi-weekly *Punto Final*. Thereupon, Rodriguez Elizondo rebutted with another insertion in *El Siglo* and subsequently extended his critique in a two-page article in *Plan* and a twenty-page article in his party's theoretical journal, *Principios*. *El Siglo* also refrained from publishing an open letter addressed to it and other Santiago newspapers, signed by 36 people who took exception to the terms of Rodriguez Elizondo's

insertions in *El Siglo*. By virtue of the origins and implications of the issues involved, which reach beyond the confines of Chile, may I ask you to open the pages of your correspondence section for the reproduction of the following item of this debate:

"El Siglo
Santiago, Chile
Dear Editor,

Beyond disagreeing with the version presented by comrade Jose Rodriguez Elizondo about the seminar on Imperialism, Independence, and Social Transformation, held in New Delhi, which you published during my absence from Chile in your edition of April 18, 1972, I am sorry to say that I find myself obliged to deny categorically the affirmations made therein, concerning my alleged role in the above-mentioned seminar. Rather than invoking the protection of the bourgeois press law, which is still in effect in Chile, I urge you to publish my letter of refutation out of respect for the revolutionary truth that must guide us, and out of consideration for the revolutionary comradeship to which we aspire.

Comrade Rodriguez's claim that I made a diversionist motion allegedly for the purpose of excluding Chile from a resolution expressing solidarity with Vietnam and other countries is totally false. On the contrary — as the records of the final session of the seminar show — my motion expressly included Chile, together with the Palestinian and black North American liberation movements, all of which I proposed to add to the Vietnamese and others. In fact, one of the participants had proposed the addition of Chile to the original motion of solidarity with the peoples of Indochina, but the author of the original motion refused to accept this amendment, claiming it to be irrelevant. My motion, on the other hand, included Chile and, far from being diversionary as comrade Rodriguez alleges, it was passed by the assembly as a whole, including, I assume, Rodriguez himself. Thus, it is strange to find on my return to Chile that I supposedly tried to avoid or minimise expressions of international solidarity with the Chilean people at the time of the revelations concerning the ITT conspiracy.

It is totally false that "Gunder Frank attacked" the Communist party of Chile and that I termed the victory of the Unidad Popular coalition "ridiculous." In my statement — which was mimeographed and is available to any interested persons — I maintain that the drop in wages together with political mobilisation generated progressive electoral movements in Chile, Uruguay, Venezuela, and Argentina, which syste-

matically tried to give nationalism a class, and even an anti-bourgeois, character, and that in the case of Chile the Unidad Popular government had already suffered four attempted coups — and, at the time I drew up my statement, a fifth was being prepared. My statement maintains, furthermore, that the fascist menace grows to the extent that the Left puts its trust in constitutional guarantees and fails to prepare the masses to defend themselves. I did not violate the sense of the seminar in referring to the French and Italian Communist parties. Representatives of these and various other Communist parties had already intervened, in order to challenge the statement of an Indian who said, among other things, that the Communist parties were not always to be found in the political vanguard. Because of circumstances which made it impossible for the author of this statement to attend the seminar, and because half a dozen speakers rose to criticise him on this point alone, I considered it correct to express my solidarity (and that is the word I used), when I spoke during his absence. My intention was not, either in the aforementioned report or in my commentary, to attack the Communist party of Chile.

Inasmuch as the secretary of the seminar asked each speaker to present a written summary of his remarks on the reports, it may be opportune to reproduce my remarks here:

The principal question is the winning of state political power by the working class and the peasants. This has to be done by stages, but the alliances and changes and economic benefits of a period must be used in such a way as to broaden political support and strengthen political organisations among the masses, thus facilitating the advance to the next stage. Lacking this essential political mass line, the "noncapitalist" way leads to the possibility of neocolonialist and neofascist reverses. In Chile the short-term economic programme of redistribution of income, employment, and popular consumption has been very successful in itself, but it is approaching its inherent limits. The statements and documents of the parties and leaders of the Unidad Popular coalition all express concern over the fact that the first fifteen months of the regime were not used profitably by the people's parties, which were organising mass support to facilitate the transition from the economic short-term programme to the structural transformation of the Chilean economy, society, and politics as envisioned in the programme of the Unidad Popular.

The reader can see that this statement, which is the only summary of my

intervention as delivered to the secretary of the seminar for eventual publication as part of the proceedings, has a tone and content very different from that attributed to it and employed by comrade Rodriguez.

Challenging comrade Rodriguez in a closed session, in which he attempted to borrow Fidel's authority in qualifying the Chilean process as revolutionary, I said that to the extent that it lacked sufficient people's mobilisation — as Fidel himself had observed in his speech at the National Stadium — it was not revolutionary.

The version of my intervention as presented by comrade Rodriguez contains other distortions. For example, as far as Ceylon is concerned, I suggested — in the context of a discussion of the international political situation — that the possibility exists (as can be deduced from the summary above) that the political process in Ceylon is arriving at neofascism. A formulation very different from that which comrade Rodriguez attributes to me, i.e., that Ceylon is fascist. (I might add that two weeks later the General Secretary of the Communist party of Ceylon explained to me, as we dined in his home, why he had just voted in Parliament against the new repressive law passed by a majority which included the party of Prime Minister Bandaranaike and the Trotskyist party, and why the imminent resignation of the Communist party from the government coalition seemed to him to be a good thing, inasmuch as the party could then give leadership to the growing opposition to the government.)

Finally, and even more serious, comrade Rodriguez's claim that I "spoke in the name of a [Chilean] political group" is absolutely untrue. I never made such a claim nor even hinted at it anywhere, because it is not the case. Very much to the contrary, when in India I stressed the fact that I spoke for myself alone. It is clear that anyone who claims that he or someone else speaks in the name of a political group or "represents" such a group would be lacking in respect for his listeners or readers were he not to identify the group in question — something which comrade Rodriguez does not dare to do.

I invite comrade Rodriguez's collaboration in the future in our common task, in a spirit of greater fraternalism and revolutionary truth."

Santiago, Chile ANDRE GUNDER FRANK

Towards a Cultural Policy

S SHUKLA (March 17, pp 535-36) seems to have missed the central point of Sudhir Chandra's comments on the

Simla seminar on cultural policy. The point at issue is not that there are powerful concentrations in the country, or that they are capable of imposing their will on the people. The essential point is whether any of those concentrations should enjoy such power in a democracy. Shukla seems to have side-tracked this issue almost completely.

Shukla's letter seems to convey the impression that cultural regimentation is acceptable when it is sought to be promoted by the ruling elite of the country, but quite unacceptable when promoted or advocated by any of the other agencies or political groups out of power. (Or, there would not have been so much clamour about the policy of Indianisation advocated by Balraj Madhok and accepted by Jan Sangh.) I am afraid that this is a dangerous doctrine and can boomerang against us. If we concede that a political group in power has a right to regiment or impose its will on the people, we would be closing our eyes to the fact that the dynamics of power fluctuate easily and those out of power today may well be in it tomorrow.

It is equally difficult to accept Shukla's suggestion that every powerful group tries sooner or later to become all-powerful. Be that as it may, successful survival of democracy (and by that I mean more than the periodic exercise of franchise) depends on impediments to a powerful group becoming all-powerful. Without them, the corrupting influence of power would be untrained and a little power, not absolute

power, would be sufficient to corrupt absolutely.

Social and cultural diversity constitutes a basic condition of a free and secular society. For such a society, 'let a hundred flowers bloom and a hundred schools of thought contend' is not merely an attractive slogan but its very essence. Once this diversity is sought to be eliminated, the structure of a democratic polity begins to weaken and can even crumble. Of course, I entirely share Shukla's basic faith that the people are unlikely to allow a crumbling of the democratic order. But it would be worthwhile to remember that even the people can be deceived by a clever ideology.

Ideology is amenable to multiple uses in society, especially a poor society. It can be used to expose real problems and to trace their causes. Or, it can be used to deflect attention from real problems by seeking scapegoats for social evils. Shukla is absolutely right in suggesting that the defence of freedom cannot be built except in the struggle for equality and programmatic statements to that effect bear continuous repetition. But we should also remember that equality will come in the end not by periodic repetitions of programmatic slogans (for that a periodic re-reading of the Constitution should be enough), but by hard and concrete actions. Ultimately, actions alone will determine whether men and women, all of them, become persons or remain mere means.

IMTIAZ AHMAD

FROM OUR CORRESPONDENTS

NEW DELHI

Clearing the Way for Toyo

THE much publicised Action Committee on Public Sector Enterprises, which was set up with high hopes to strengthen these enterprises and improve their working, does not seem to have achieved any worthwhile results so far. On the contrary, the feeling is growing that it has reduced itself to being either a pure nuisance or, worse still, an instrument for advancing the narrow interests of ambitious individuals and groups. Its first reports on the Fertiliser Corporation of India strengthens this impression.

The concluding portion of its main report on the FCI is revealing. The Committee makes the sweeping recommendation that the performance of the FCI was not likely to improve unless its top management was changed. This

recommendation has nothing to support it in the body of the report. It can be regarded only as an attempt to make use of the Committee to pursue a personal vendetta in which some members of the Committee are involved. The Committee's report does not even define the criteria by which it judged the performance of the FCI and found it wanting, leading to the recommendation for changes in its top management.

The precise objective of the report becomes clearer from the off-hand remarks made about some of the projects of the FCI and the work of its planning and design services division. The Committee proposes a re-evaluation of the FCI's present design and technology capabilities in relation to what is offer-

ed by the "best international companies". More specifically, it asks for such a re-evaluation of the proposed coal-based fertiliser plants as well as the plants which are under commissioning. Experts, presumably foreign experts, are to be invited to undertake this re-evaluation and, pending this assessment of the FCI's abilities, no new project are to be assigned to the FCI. This really gives the game away. The objective plainly is to clear the way for the entry of Toyo of Japan in association with the Engineers India into the fertiliser field.

Simultaneously with the presentation of the Action Committee's report, there has been a spurt in the spate of charges and innuendoes against the FCI and its top management. A sustained campaign to demoralise the FCI management seems to be under way. This has had some effect. The Chairman of FCI, H N Sethna, who also heads the Atomic Energy Commission, is understood to have submitted his resignation. It is disconcerting that the new Minister of Petroleum and Chemicals, D K Barooah, has taken the line of least resistance and gone along with this campaign. He has talked of taking away marketing of fertilisers from FCI and giving it back to the Agriculture Ministry. He has also talked of undertaking a major reorganisation of the FCI. Clearly, he has had no time to examine the complicated issues involved in these major policy moves. He is reported to have explained that he knew how to handle inconvenient questions in Parliament and keep MPs happy and that at this stage he was not bothered by any other consideration.

The issue of the FCI's marketing function needs to be examined more carefully. It was as far back as in 1966 that, after a careful study of the entire problem, it was decided that the production units, both in the private and public sectors, should be given the responsibility for promoting the use of fertilisers and for their marketing. It was, therefore, decided that the fertiliser pool operated by the Agriculture Ministry should to begin with confine itself to improved fertilisers and afterwards, once imports were no longer necessary, completely divest itself of responsibility for marketing. To change this policy now, or even to announce the government's intention to do so, is most irresponsible on the part of the new Minister, considering that no thought has been given to the issues involved. Barooah evidently made his statement as part of an effort to remain on the right side of some critical MPs.

The criticism of the marketing of fertilisers by the FCI arose in connection with the decision of the FCI's Board

to refer some procedural irregularities in the recovery of dues from some defaulting dealers for investigation by the CBI. The Minister does not seem to have taken into account the fact that the FCI Board had itself taken the initiative in the matter; so there was no need to condemn the top management of the FCI for any lapse. But the Minister appeared to think that it was the FCI Board which was in the dock. To move from this to the announcement that the entire policy on marketing of fertilisers would be reversed and that the FCI set-up would be reorganised, was thoughtless.

The real problem in fertiliser marketing, with which the Minister obviously has yet to acquaint himself, is that it was largely the preserve of some of the bigger private sector companies like EID-Parry, Shaw Wallace and Jardine before the FCI established its own sales promotion and marketing network. It is inconceivable that fertiliser marketing can be handed over to the Agriculture Ministry which can at best allot quotas to the state governments and to the large private companies.

Meanwhile, the development of the

fertiliser industry remains clouded in uncertainty and indecision. The targets being talked about are still very ambitious ones, though some cold water has been thrown on the target mania by the Approach to the Fifth Plan which has assessed the requirement of fertilisers to be far less than projected by the Task Force for the industry. The work of breaking down the overall target into specific projects is still held up, probably because the government is not able to make up its mind, one way or the other, on the Toyo deal. A decision on this issue has been made more difficult by the uncertainty over the back up credits for these projects from Japan.

The growth of the fertiliser industry has been, right from the beginning, subject to pulls and pressures from many quarters, domestic and foreign. Yet the industry has come a long way, thanks to the work of a group of Indian scientists and engineers. It has now reached a stage from where it can go forward to achieve self-reliance and self-sufficiency. But the pulls and pressures have not eased.

ed in cut-throat competition with one another, in a bid to make their short-term gains, at the cost of long-term development.

While accepting the fact that a large proportion of colliery owners were unscrupulous exploiters of labour, "poor labour conditions and a mass of regulations administered through corrupt officials" have been blamed for the disinclination on the part of the private industry to expand activities. For the appalling conditions of work in the mines, the colliery owners have only themselves to blame. As early as in 1936, the Indian Coalfields Committee referred to the cruel exploitation of labour at the mines. In 1937, in his note to the Burrow's Committee, M S Krishnan had referred to the status of labour in the mines as one of the worst features of mining in India. The position was summed up again before the Estimates Committee of 1954-55:

"All that the private sector of the industry asks now is: Take away the irksome controls, allow us to increase the price of coal, don't ask us to pay the labour anything more and promise that you will not take our mines away from us; and in return we shall open mines and close them as we think best, produce coal in the manner that suits us best, and give the country coal to meet the requirements of the future".

On the question of transport, it is important not to ignore the point that, with the numerous loading points — big and small — suited to the private collieries, and the ownership pattern, it was difficult for Railways or anyone for that matter to evolve a rational and scientific pattern of movement. While this does not justify the inefficiency of Railways, it remains difficult to foresee how basic changes could be brought about in the transportation of coal without centralised control and management of production. Coal loading in the Bengal-Bihar area itself accounts for almost one-third of the total loading on the Indian Railways; and it does not require much argument to establish that co-ordinated movement would be facilitated by the setting up of a centralised authority for production and despatch of coal.

Much, however, would depend upon the manner in which the future plans are drawn up and the extent to which various operators and middlemen, who have been flourishing all these years, are eliminated. The future of the coal industry is no doubt, beset with many problems. To reorganise production in a scientific manner and to secure improvements in distribution, are matters on which further thought will have to be bestowed. Yet it is unlikely that colliery expansions, insofar as the erstwhile

private sector areas are concerned, would require an investment of Rs 500 crores. The cost of production per tonne of coal varies according to the nature of mine development — according to whether it is an open cast mine, a shallow mine or a deep mine. But the private industry used to put forward its own estimates as it suited the occasion. If it wanted a large loan from the financing institutions, it pushed up the cost estimates; if it sought to establish that it could do it, it would cut down the capital cost to a meagre sum. NCDC's cost of development is high, particularly as it has been in operation in virgin areas and has attempted a higher level of mechanisation. But it would be reasonable on balance to assume a cost of Rs 50 per tonne which implies a requirement of about Rs 100 crores for adding 20 million tonnes to the private sector's output. This order of investment, within a period of five or six years, was clearly beyond the capacity of the private mine-owners.

In any event, to allow the continuance of the present law of the jungle in the field of private coal mining would have been to acquiesce in mis-

management, corrupt practices, ruthless exploitation of labour, non-implementation of wage board awards, withholding of provident fund and other dues, slaughter mining, unethical sales practices through a host of middlemen, and accumulation of black money. A look at the luxurious living of the private colliery owners — in the guest houses or the director's bungalows at Sanctoria or Pench Valley, equipped with modern swimming pools and attached bars, in the midst of lakhs of workers living in misery and penury in dark hovels or huts and receiving not even half of their legitimate wages, or living in camps of the Coalfields Recruiting Organisation that are no different from jails or concentration camps and where they are huddled together and supervised during as well as outside working hours by 'commanders' appointed by the management — would convince anyone except the private colliery owners that there was need for government intervention. As in the case of coking coal, the take-over was delayed, mainly due to lack of a proper understanding of the problems and, more than this, due to lack of political will.

Making a Scapegoat of the Opposition

(From a Special Correspondent)

IT is all the fault of the Opposition. Following the victorious culmination of the Bangladesh war, our stock in the world had rocketed to the sky. Now all that is gone, on account of the sustained propaganda by the Opposition parties alleging corruption, poverty and suppression of civil liberties in the country. These parties are not only not aware of the 'foreign dangers' that threaten the country, but not giving a duly elected government a chance to prove its worth they are really betraying their innate non-democratic attitude.

Thus spoke the Prime Minister the other day at a public meeting at Patiala. The Prime Minister's words must be taken at their face value; which means she is genuinely feeling vulnerable. And yet, why should this be so? Pray, where is the Opposition which is not giving her government a chance? In the Lok Sabha, her party is ensconced in the assured comfort of having more than three-quarters of the seats: as against the Congress party's total roll of 373, the largest opposition group, the CPM, has only 25 members. In the Rajya Sabha too, the party's majority has just been restored after an interval of nearly forty months. Even in the states and

in the Union territories, it is the Congress all the way: leave out Tamil Nadu and the wobbly regime in Pondicherry. In each of the other states it is either a full-fledged Congress government or a coalition led and shaped by the Congress or the rule of the President, which is in some sense still better from the point of view of New Delhi. If the Prime Minister has in mind extra-Parliamentary manoeuvres by the opposition to harass her government, the charge is even more far fetched: Jan Sangh, riven by dissensions, has been on its best behaviour for months on end; the Swatantra party — aside from its presence by proxy in Orissa — has almost ceased to exist and is in any case incapable of organising any mass agitations; at the other end of the spectrum, the SSP has split in half-a-dozen different directions; the CPM, dazed and demoralised, is lying altogether low, especially in West Bengal; the Naxalites have been decimated. No Prime Minister in any parliamentary democracy could hope for a docile climate than India presents at the moment. The only complaint Indira Gandhi can have is that the opposition parties have not yet form-

ally closed shop and started singing invocations to her.

This is, therefore, particularly inept pleading. If India's image has plummeted down in the course of the past one year, neither the machinations of domestic opposition groups nor the evil doings of jealous foreign powers can be held responsible for the development. Even granting, for the sake of argument, Indira Gandhi's complaint about the potential danger from the activities of external agencies, should not one point out that she is mixing up the central factors with the peripheral ones? Foreign agents will feel flattered to hear the intimations of their invincibility straight from the Prime Minister's mouth, but in fact their ability to thrive is a severe function of internal socio-economic conditions. For two consecutive years now, the growth of per capita income in the country has been zero, or negative. The general price index has moved up by nearly 25 per cent between the last week of March 1971 and that of March 1973. Going by all the visible indicators, the magnitude of unemployment is swelling. The cumulative impact of all this, somebody should have the humility to admit, could be a certain lessening of enchantment with the ruling party, a certain hint of restlessness among groups which have been economically hit hard. Saturating talk of socialism does not always turn out to be an effective palliative to such symptoms of discontent. The conspiratorial theory of history was once upon a time the monopoly of the so-called radical Left: there is ground for concern if now it were to infect a respectable party of social democracy such as the Congress takes pride to describe itself to be.

The absence of charity, in not allowing a properly elected government a 'chance', may indeed evoke remorse; but look who is talking. The process started in the country way back in 1958, when Prime Minister Jawaharlal Nehru, on the advice of Congress President Indira Gandhi, decided to dictate the end of the duly elected Communist government in Kerala. There have been similar murky instances in the more recent past, including in West Bengal in 1967. In any case, if things have suddenly started to wobble for the Congress in the states, the opposition groups, jointly or severally, have contributed very little toward the unfolding of the mishaps. It is the internal factions of the Congress which are tearing up one another. Even in Andhra Pradesh, those clamouring the hoarsest for bifurcation of the state are as much flesh of the flesh of the ruling

COAL INDUSTRY

Laissez-Faire for Neglect?

(From a Special Correspondent)

IN 'The Wrong Reasons' (February 24, 1973, p 424), Magnus has covered wide ground and — to borrow his own phrase — 'aired his misgivings' on the past, present and future of the coal industry. It is not possible for even the most ardent supporter of governmental action to deny that the take-over of the coking coal mines in October 1971 had made the rest of the coal industry fear that their days too were numbered. However, the incapacity and unwillingness of the private colliery owners to invest in expansion and modernisation of the collieries was not something of a recent phenomenon. A study of the history of capital formation in even the more well-organised private coal companies would show that, over the last decade, they had raised hardly a few crores of rupees either from their internal resources or by public subscription. Indeed, as long ago as in 1954-55, the Estimates Committee of the Lok Sabha had given the finding that there was "little fresh capital that flowed into the industry" and that there was very little progress towards modernisation. The fact that the private collieries had withheld provident fund dues, royalties, etc, of about Rs 30 crores — by no measure, a small

sum —, apart from not paying even the legitimate wages in accordance with the Wage Board recommendations, would suffice to indicate the sort of disease that had set in in this industry. To take the view, in the circumstances, that the Minister concerned had systematically undermined the industry's confidence in its own future in order to acquire a handle to take over the industry, would be to ignore the long ignominious history of the private coal industry.

True, the industry suffered for some time in the past owing to the unreliability of demand projections in respect of coal as well as the deficiency of demand. To an extent, demand estimates for a commodity such as coal are subject to infirmities resulting from the demand being a derived demand contingent on the expectations in the other sectors of development. Yet what should cause concern is not just inability to reach the targets but the real decline in production — particularly in the Bengal-Bihar area — and the absence of any long-term planning on the part of the private sector collieries. This is the inevitable result of a large number of small companies being engaged

party as, for example, are Narasimha Rao or Raghuramaiah; moreover, at least one of the opposition groups that Indira Gandhi has accused of foul conspiracy — the CPM — is more loyal to the cause of integration than are some of her seemingly devout followers.

Economic mismanagement apart, what perhaps most adversely affects a nation's external image is the credibility of its leaders. If, in 1971, India could command the grudging admiration of the international community, it was almost

entirely because of the poise and cool which the Prime Minister displayed in the face of crisis. Her recent pronouncements, in contrast, appear to be particularly lacking in a sense of proportion. On the messy affair of Maruti Limited, it is embarrassing to carry on the debate beyond a certain stage. Indira Gandhi claims herself to be a daughter of politics. Is it not the case that there is an opportunity cost involved in the choice of a responsible political career?

Is the Rajasthan Desert Spreading?

(From a Special Correspondent)

THE Secretary General of the United Nations while addressing the UN Committee on Natural Resources, which met in New Delhi last month, did not share the pessimistic conclusions about the future expressed in the 'Club of Rome-MIT' publication, "The Limits of Growth". However, he acknowledged the danger posed by the spread of deserts, which cover nearly 40 per cent of the land surface of the world. The spread of deserts has long been a subject of controversy among geographers, climatologists and other scientists. The hypothesis of increasing aridity, indicated by the long-term changes in the climatic data, has not yet been fully established. However, the diminishing carrying capacity of desert areas (in terms of sustaining human and animal populations) has been indicated in several parts of the world, including India.

In India, scientists at one time believed that the Rajasthan desert was marching towards UP and Delhi. Even the rate of the desert's march was claimed to have been precisely measured at half a mile every year. The preparation of a comprehensive scheme of massive shelter belts on our western desert border was one of the consequences of these findings. (The scheme was later implemented on an experimental basis on the Suratgarh Mechanised Farm.) A Desert Afforestation Station was established at Jodhpur which, with the help of the UNESCO, was later developed into the Central Arid Zone Research Institute (CAZRI).

The CAZRI's scientists revealed about three years back that the 'marching desert' theory was a myth. If this is indeed the case, it is not known how the myth was spread and why its exposure

was delayed so long. It is difficult to evaluate the CAZRI's findings in the absence of the necessary details. In any case, the supposed march of the desert in terms of movement of shifting sand dunes to long distances, which the CAZRI scientists have contradicted, is only one indicator, and a rather inadequate one, of the aggravation of the desert problem. The accentuation of desert conditions within the recognised coverage of the desert area is a much more serious problem. This phenomenon may be illustrated with the help of several studies, including those by the CAZRI, and a number of historical records. Depletion of soil, vegetation and water resources in the region through misuse of the delicate resource base of the desert has been quantified for a number of areas. Declining productivity of land, in terms of both crop and forage yields, is the ultimate and economically more relevant indicator of increasing scarcity of natural resources in the desert areas. Reversal of this trend is the real challenge to scientists and planners.

The spreading of plant cover over the denuded arid lands is accepted as the first step to help restore nature's ecological equilibrium. It is on this basis that the development of a pasture-based livestock economy in the Rajasthan desert region is advanced as a technically and economically sound proposition. In this context it is interesting to refer to the views of R A Bryson, who recently conducted a Wisconsin University research project on measurement of the effect of dust on the radiative cooling of air over the Rajputana desert. The thesis, which may be termed as the 'Dust Theory of Desertisation', is briefly as follows. The Rajputana desert, according to Bryson, is not a true climatic de-

sert, but a man-made desert. If all the moisture in the air over Jodhpur in the desert region were to be precipitated out, it would make a layer of water about four centimetres deep. In the truly climatic deserts of the world (like south-western United States) it would be about one-half to one centimetre deep. In the wettest places in the world (e.g. tropical areas like Congo, Brazil, Ceylon) the total precipitable water would be about 5 centimetres. The apparent paradox of low annual rainfall in Jodhpur in spite of having sufficiently large total precipitable water over the region is explained in terms of the heavy dust-laden atmosphere of the region. According to measurements taken in the spring of 1966, every square mile of the region had about five and a half tons of fine dust suspended above it. This amount of dust, according to Bryson, is greater than that over the smokiest, haziest, foggiest city on earth. This dust increases the sinking rate of the air by 50 per cent. As the air sinks, it moves to the level of higher pressure and gets compressed. When air is compressed, its capacity to hold moisture increases. But since no moisture is added, the relative humidity of the air decreases. In other words, the air becomes drier and drier.

If the air is cleared of the dust, it would lessen the turbidity of the air; the air would sink less and there would be more chances of showers. It is difficult to filter the dust out of air, but the same purpose would be served by stopping dust from getting into the air in the first place by putting land under grass and other plant cover.

Experience shows that raising plants in most parts of desert areas really does not need expensive and ceremonial *cana mahotsavas*. Nor does it need sophisticated silvicultural techniques and import of undependable exotic species. Native plants — perennial grasses, bushes and trees — grow on their own even in the driest parts of Jaisalmer and Barmer. This can be seen both in the CAZRI's experimental enclosures spread in many parts of the arid region and in farmers' fields in the Bisnoi villages where lopping and cutting of trees is prohibited. Thus what is required is protection and regulated use of native vegetation to permit it to perform its conservation function. It is to be hoped that these basic considerations will be borne in mind by the "drought proofing" schemes for desert areas which are being currently prepared and which are likely to be financed by the World Bank.

Through the Budgetary Glass

THE 1973-74 budgets of Punjab and Haryana, presented within a week of each other have some striking similarities. But they also highlight the contrasts between the financial positions of the two states. Both budgets make further attempts at resource mobilisation to cover part of the deficit, and both leave a substantial gap uncovered (Rs 11.60 crores in Punjab, Rs 10 crores in Haryana.) There are the usual expectations of larger Central assistance, of improved collections from existing levies, of further market borrowings, and of economy in expenditure. Both also have the cushion provided by 'underestimation'. The Plan and potential resources'. The Plan performance of both states has been commendable, the expenditure substantially exceeding original estimates. In the current year alone, Punjab has raised its Plan expenditure from Rs 96.25 crores to Rs 123.33 crores, without a matching grant from the Centre. Similarly, Haryana's total Fourth Plan outlay is expected to be Rs 330 crores, against the original estimates of Rs 225 crores. However, while Punjab has registered continued buoyancy in its revenue receipts, Haryana has lately been suffering from financial stringency. Punjab does not resort to overdrafts; Haryana has relied excessively on them till last year. Yet the most outstanding fact of all is that both states — which are among the richest in the country — have stopped growing. Their per capita income has remained static since 1969-70; the economic growth has barely met the needs of the increasing population.

Punjab's overall deficit has been estimated at Rs 37.21 crores, of which Rs 25.61 crores would be contributed by additional taxation, disposal of securities, loans from the banks and from the open market, and better yields from the traditional sources. The state, in fact, has the highest per capita tax in the country. The stress, therefore, is now on non-tax revenue. The new taxes, expected to yield barely Rs 4.61 crores, have been claimed to be so devised as to affect those with a greater capacity to pay. This may be true of the enhanced stamp duty on mortgage deeds (from 2.25 to 5 per cent) and on gifts (from 3 to 5 per cent), as also of the higher sales tax on foam and fur products, but the 'development cess' (at 50 per cent of the market fee on foodgrains) which is expected to yield Rs one crore will

affect all growers, regardless of status. Likely opposition from them has been shored up against by the announcement that proceeds from the cess would be earmarked for village and link roads; a material and early return on their contributions to the exchequer is thus assured.

The decision to continue the Bangla levies, yielding Rs two crores, under cover of an 'education cess' has employed the same rationale, though in this instance the contributors who comprise all categories of people will not all necessarily be direct beneficiaries. The non-tax measures include economy in non-Plan expenditure, which is often politically-motivated (Rs five crores); sale of government securities (Rs four crores); mobilisation of resources from the banks for implementing Plan schemes (Rs eight crores); and tighter control on tax collection (Rs two crores). With the proposed borrowings, the state's debt liability would mount from Rs 278.38 crores on April 1, 1972, to Rs 313.37 crores on March 31, 1973. Some minor humanitarian gestures have been made to pensioners, destitute widows, old men and women, and political sufferers. These concessions are fully warranted by the state's sound fiscal set-up.

The new taxes in Haryana are expected to net a slightly larger amount — Rs five crores, against Punjab's Rs 4.61 crores. The tax net has been spread wider, to improve the state's unsatisfactory finances since 1971, but the deficit is smaller (Rs 15 crores) in a Rs 304-crore budget. The impact of the tax package will be not only on the well-to-do but also on other sections — both rural and urban. The comprehensive and consolidated land levy, advance notice of which had been given by the Governor in his address to the Assembly on March 5, will raise the agriculturists' contribution to the public exchequer by Rs three crores. This implies a doubling of taxes on the farms. And Haryana is thus among the first states in the country to impose a higher tax burden on agricultural land. Another levy on the rural rich comes in the shape of a token tax of Rs 150 on each tractor. The additional levies on goods and passenger transport will affect all sections of people. The only relief to the taxpayer comes from the abolition of the Bangla levies; the Finance Minister made the disclosure at a press con-

ference, not in the budget speech.

While the Haryana budget indicates that the state is fast emerging from financial stringency, it also suggests that some of the tall claims about Haryana's growing prosperity are no longer tenable. It is now clear that, after increasing steadily at the rate of 9 per cent for four years, the per capita income, at constant prices, stood stationary at Rs 430 in 1969-70; it has not risen since then. Yet the Chief Minister has been frequently claiming spectacular economic progress, unique achievements and many 'firsts'. Some of the much-heralded canals — the 'pride of Haryana' — are without water, and hundreds of tubewells remain without power for long periods, rendering the massive investment largely infructuous. What is more, prospects of early relief are dim. There is scant provision in the Plan for irrigation and for thermal projects. In fact, there is a drastic cut in capital expenditure, from Rs 50.43 crores shown in the last budget to Rs 40.29 crores in the revised estimates and further to Rs 24.4 crores in the 1973-74 budget. True, the state's per capita income, recently claimed to be second only to Punjab's, increased from Rs 319 in 1965-66 to Rs 427 in 1969-70, and then rose (though by only 2 per cent) to nearly Rs 437, but in the following year it declined by Rs 2. The current year's assessments indicate that the position has worsened since. It is by sharp cuts — especially in road-building programmes (Rs 15 crores) and other Plan programmes (from Rs 85 crores to about Rs 58 crores) — that the state has been able to arrest the adverse trends. Near-bankruptcy had led it to rely on overdrafts amounting to Rs 30 crores last year. A warning from the Centre had precipitated economy by shedding of the frills. Even so, debt repayments will take away a large slice of the budget — not a heartening proposition for anyone looking to development. The budget proposals, moreover, reflect an increasing tendency to imitate Himachal's marked reliance on Central aid and loans.

Although the budget session of Himachal Pradesh will commence on March 21, the political battle between Chief Minister Y S Parmar and the dissidents has been revived already. Having failed to persuade the Centre to give him a free hand in reshuffling the ministry and dropping the two dissident ministers, Parmar has adopted another device to cause them discomfiture. On March 9 he reshuffled the ministerial portfolios without consulting the rival group. This was the third reshuffle of

portfolios in Himachal in a year; the first was effected when the Ministry was just a week old, and the second last September. Mahajan's election as the Pradesh Congress's new chief is also aimed at creating a rift among Parmar's opponents. Neither side has gained in strength during the last three months despite the many pulls. But the dissidents are in no mood to accept as final the AICC General Secretary's

KATHMANDU

Buffer Apprehensions

M R

INDIRA GANDHI's visit to Nepal early in February might be remembered in New Delhi for her *suo moto* clarification backtracking on her belated denunciation of the Vietnam war at the One Asia Assembly. But in Kathmandu, awaiting Chou En-lai's visit anytime, Indira Gandhi's sojourn is remembered for other things. It raised more questions than it answered. For instance, a joint communique had been planned but was not issued. This led to speculation that India and Nepal might shortly sign a treaty on the lines of the Indo-Soviet pact and that a breakthrough in this direction had been achieved as a result of Indira Gandhi's visit, undertaken almost as an afterthought after having cancelled it once in December last.

Indira Gandhi's vague and non-committal answers to questions about the proposed treaty left correspondents wondering if the treaty was the main subject discussed by the visiting Prime Minister. One of them even inferred that it was going to be a defence pact and his somewhat sensationalised report upset the Nepalese and caused apprehensions among the Chinese. Nevertheless, it is widely believed in Kathmandu that some progress has been made with the treaty India had proposed. The 1950 India-Nepal treaty is still alive, albeit technically, and it is possible that India would like to streamline it to bring into a pattern.

Such a treaty has far-reaching implications for Nepal, which had fancied itself a strategic buffer between India and China and thought it had a big role to play. India has similar treaties with Soviet Union and Bangladesh. If Nepal enters a similar treaty, it would be becoming part of a compact. The Chinese view is that Soviet Union is trying to realise the Brezhnev plan for collective security through individual pacts because it could not achieve it collecti-

categorical statement that the High Command did not contemplate any change in the state's leadership. The 'pilgrimages' to New Delhi have recently become very frequent, in the hope that the sustained pressure on the High Command may help remove Parmar from power. And permission is again being sought to move a no-confidence motion against him within the Congress legislature party.

vely. Nepal has to reckon with the Chinese reaction to such an arrangement with India. Pushing the treaty hard (if it has been mooted, that is), would prove counter-productive for India because Nepal would rather opt for a stance of equidistance between China and India. There are signs of a shift towards such equidistance.

In Kathmandu, one does not find the flood of the 'Red Book' and other Chinese literature anymore. The end of the Cultural Revolution does not wholly explain this disappearance. The fact that Peking felt compelled to start a Nepali broadcast service earlier this year, obviously to counter Indian and Bangladesh broadcasts which are listened to by the Nepalese, suggests a conscious effort to maintain the Chinese presence in the Himalayan Kingdom, amidst growing India-Nepal relations since August 1971 when the trade and transit agreement was signed after an unhappy deadlock.

Nepal no doubt stands to gain through such a balancing act. By tilting towards India, it would qualify for more aid from China as well as from India. A small country always has the balance of advantage in relation to two big countries. India is Nepal's biggest aid giver but it is far too conscious of its position as such and this irritates the Nepalese. The Indian Co-operation Mission in Kathmandu has a huge staff, but the benefits from the India-aided projects are diffused and rather intangible unlike, say, the Chinese-built roads which are most tangible. Chinese consumer goods, superior in quality to and lower priced than Indian-made goods, channelled through/state trading agency floods the market. The proceeds are used for Chinese-aided projects. The Chinese are making their presence felt in many ways, though they are in Nepal only as aid givers while Indians are there in many roles, as traders,

businessmen, teachers, experts, — and smugglers and exploiters. There are numerous irritants in India-Nepal relations. Indian traders and businessmen are behind the massive smuggling operations even after the 1971 trade and transit agreement.

Ironically, the world's only Hindu kingdom, ordained by geography to look to India for everything, has the friendliest of relations with Pakistan. The two Pakistani POWs who escaped into Nepal and were on the Kodari highway were detained by the Nepalese and repatriated to Pakistan and India had to protest about it. When the United States arms embargo on Pakistan was lifted, the government-controlled newspaper in Nepal welcomed the step. A few days later it became known that 200 Bihari Muslims who had escaped to Nepal are to be repatriated to Pakistan overflying Indian territory. The PLA still maintains an office in Kathmandu though there is no air service between Pakistan and Nepal. Bangkok is still the half-way house.

India-Nepal relations are far better now than they were, say, two years ago. But a treaty on the lines of the Indo-Soviet pact is sure to lead to serious misapprehensions in Nepal and in other countries. What Nepal is seeking for itself is a strategic role. Recently, it even made a futile bid to become a China-United States contact point. However, neither of the two powers perhaps saw any special plus points in favour of Kathmandu especially when Warsaw and the UN Headquarters provide better contact spots. Nepal also thought it could play a role in normalising Sino-Indian relations. Kathmandu no doubt provides the barometer to measure the warmth or lack of it in Sino-Indian state-level relations. But some observers have been tempted to link Indira Gandhi's Kathmandu visit with an impending initiative for better relations with China. Nepal can play only a very limited role in this direction because Cairo, Beirut and Warsaw are among the capitals where Sino-Indian contacts have been taking place for over two years now. Kathmandu is not the contact point even for Sino-Bangladesh relations. K M Kaiser, Pakistan's ambassador to China during the Bangladesh crisis, is now Bangladesh's ambassador in Rangoon. Rangoon, rather than Kathmandu might turn out to be the contact for some South-east Asian countries (including Thailand) with China.

What Nepal is seeking is a role as a buffer state and a formal treaty with India would compromise this buffer role. Imperviousness to this reality on India's part would only compound Nepal's apprehensions about its big neighbour.

ECONOMIC AND POLITICAL WEEKLY

GUINEA-BISSAU

End of a Revolutionary

Africanist

THE assassination of Amilcar Cabral, leader of the Partido Africano da Independencia da Guinee e Cabo Verde (PAIGC), may have been masterminded by Portuguese. But to understand the background to this assassination several factors have to be taken into account, including the contradictions within Sekou Toure's Guinea PAIGC and within the PAIGC itself. It was from Conakry in Guinea that Cabral launched the PAIGC and the struggle in Portuguese-occupied Guinea-Bissau with valuable support from Sekou Toure's government. It is well known that Toure was a close confidant of Cabral. Kwami Nkrumah also played an intimate role in the relationship between the PAIGC and Guinea. Thus, the Portuguese and other Western powers, like France, recognised that Guinea under Toure was the centre of resistance to Western domination of West Africa. The Portuguese and other powers had every reason to believe that if the moral and material support that the PAIGC was receiving from Guinea were stopped, the PAIGC's position in Guinea-Bissau would be considerably weakened. Towards this end the Portuguese instigated an insurrection-cum-invasion of Guinea in 1971 which was easily crushed by Toure's forces.

TOURE FALTERS

In retrospect, however, the Portuguese-inspired attempt at overthrowing Toure was unnecessary, as he was already beginning to falter in the face of US inroads. US monopoly investment was already moving into Guinea, primarily for the purpose of 'assisting' Guinea to exploit its vast bauxite resources and processing them into aluminium. Between 1960 and 1967, Toure remained wary of Western economic overtures, although even then he did accept US-AID grants and loans for importing badly needed food and other commodities.

But it was in 1968 that Toure signed the first big agreement with Western investors. The United States and the World Bank loaned Guinea \$85.5 million for the development of its bauxite deposits. This loan followed from an agreement between HALCO — a consortium of seven leading US companies

— and USAID, the World Bank and Guinea. The total investment for the entire venture of exploiting the bauxite deposits at Boke amounted to \$190 million providing \$85 million (all of it borrowed from the US and the World Bank).

Though Toure was actually conscious of the totally neo-colonial nature of the regimes of Houphouet-Boigny in the Ivory Coast and Leopold Senghor in Senegal, his own regime was beginning to be influenced by massive injections of international finance capital. In 1969 Houphouet-Boigny was said to have been involved in a plot to assassinate Toure, but in 1972 he paid a surprise visit to Guinea and was welcomed by Toure with the declaration that "from now on, only unity, fraternity, sincerity and solidarity" would exist between their two countries. And in the same year, Toure re-established relations with Senegal. What all this amounts to is that Guinea is fast becoming a state that can hardly be distinguished from its neo-colonial neighbours. But Toure's constant cry remains that he is building African socialism (whatever that is) through using imperialist finance — an incompatible proposition, almost as good or bad as attempting modern surgery with the help of a voodoo witchdoctor!

Due to the contradictory policies that Toure has been following, Guinea has become a hotbed of subversion and intrigue. Since the PAIGC has been working in such close collaboration with Guinea, it would be surprising if schisms had not also developed within the PAIGC.

Initially, the contradictions within the PAIGC were muted, since its single-minded aim was to gain independence from the Portuguese oppressor. But its ideology, as expressed by Cabral, was always confused. For instance, Cabral denied that the peasantry in Guinea-Bissau was "... in any way the primary revolutionary element". Yet, at the same time, the peasantry was organised by him and his party as the primary base of the revolutionary movement in Guinea-Bissau.

During the decade from 1960 to 1970 the Party was a unified fighting machine with Cabral at the helm. To quote Cabral himself: "I want to emphasise that the leadership of the strug-

March 31, 1973

gle is the leadership of the Party. Inside the Political Bureau there is a War Council over which I preside as Secretary-General of the Party. There is no important military action in our land that does not pass through my hands. When there were fronts, sectors, and units, they had autonomy for normal, daily actions within certain bounds, but from then on any extensive modification, any new action, passed and still passes through the hands of the War Council and, specifically, through my hands".

This was as it should be and there could be no criticism levelled at Cabral's concentrating so much power in his hands — as long as the Party was assured that Cabral was proceeding in the right direction. But the crux of the matter was that the PAIGC had to be sure that Cabral was on the correct path, as any doubts would serve to weaken the unity and solidarity of the Party.

INCORRECT LINES

By 1971 it became apparent that Cabral was indeed proceeding along distinctly incorrect lines. The incorrectness of Cabral's stand became clear when he, firstly, wanted the liberated zones of Guinea-Bissau to be declared as an independent area, and secondly, when he wanted to negotiate a peace with Portugal.

Cabral's plans to declare the liberated areas as an independent Guinea-Bissau were formulated as early as 1970 when the PAIGC decided to hold elections for the First Popular National Assembly. In 1970, each administrative sector had elected members to the councils of the 15 large administrative regions. By 1972, the electoral registers of each sector were completed and direct and secret elections were held at the village level. What remained to be formed was the National Assembly. The 15 regional councils were to select one-third of their members to sit in the National Assembly. This one-third of the regional councils would constitute two-thirds of the Assembly — the other one-third were to be nominated from among PAIGC's full-time workers. The National Assembly that would come into existence would adopt a constitution and proclaim independence.

This proclamation of independence would exclude the Cape Verde islands since the PAIGC had not managed to penetrate them. The capital city of Bissau would also be excluded from the independence scheme. Cabral himself made this clear when he stated that

Take-Over without Tears?

RECENT Ministerial pronouncements on food policy give further confirmation of how limited a role government seeks to play in the whole business of feeding the population, the so-called 'take-over' of wholesale trade in foodgrains notwithstanding. Thanks to the unloading of foodgrains from public stocks to private traders and the failure to achieve even one-half of the kharif procurement target, the government's stocks reduced to 2.7 mn tonnes at the beginning of this month. These are proposed to be replenished by procurement of 7-8 mn tonnes from the rabi crop. Since the wheat crop is currently estimated at nearly 30 mn tonnes, the projected order of procurement may be achieved. Last year, when the wheat crop was 26 mn tonnes, procurement had been 6 mn tonnes. This year, with the so-called take-over of wholesale trade, an additional couple of million tonnes for the public stocks are the least that should be expected.

But will stocks of this order be enough for feeding the population? The government evidently thinks so. It actually expects to have a 'buffer stock' at the beginning of July. But even with what the Minister has himself described as an 'inequitable and deficient' distribution system, about 9 lakh tonnes per month are on an average demanded from the public distribution system. Drawals from the public stocks have increased to over twice as much in recent months. Clearly, the government's idea of having enough stocks to feed the population is simply to have just enough to keep the wholly inadequate public distribution system from total collapse.

More cynical perhaps than its assessment of what is adequate foodgrains production, procurement, or stock, is the government's tendency in recent months to project an anthropomorphic view of the public distribution system. The Ministers concerned have dubbed this system defective time and again and have held it responsible for everything ranging from the "price rise of foodgrains" to the "widespread distress" in certain regions. Yet, apart from asking the states to increase the number of fair price shops and allowing the Food Corporation to foolishly unload its stocks to traders in the open market with a view to bringing down prices, what has been done to strengthen the system? A clue about how the government views its own role in food distribution is to be had from the decision to club Delhi with Haryana when, from April 1, individual states are to become separate wheat zones to facilitate procurement. In other words, the government will largely rely on private trade to meet the food-grain requirements of the capital city. Similarly, both the government and the Congress Working Committee have been at pains to underscore that the take-over of wholesale trade did not imply statutory rationing, even in the bigger cities. What sense does State monopoly of wholesale trade make without adequate controlled sales outlets? True, the number of fair price shops have increased from 1.22 lakhs in 1970 to 1.66 lakhs in 1973, but their spread among the various states is very uneven and a large number of them are operated by private traders who can at will divert the stocks from public to private account.

What frightens the government about statutory rationing is, of course, the fact that it makes explicit the real demand for foodgrains and with it the actual gap in supplies. The obfuscations of the 'take-over' of wholesale trade — monopoly procurement of marketed (not marketable) surplus, delicensing of wholesale traders but permitting sales by licensed retailers and growers, allowing an open market with prices stipulated at around 'fair prices' — make sense in this context. The marketed surplus so rounded up will be about the same as what finds its way into government stocks after a good rabi crop; the responsibility for anything more than this is, in political and administrative terms, too much for the government. Even so, the attempt to create alibis to explain away possible failures has already begun. The government has been hinting at the threat of a possible 'sabotage from within' by the bureaucracy. Grain traders of course know better, despite the public breast-beating of last week's *hartal*. Thus while wheat prices are said to be declining in the wheat *mandis* of the North they have been maintained or are even rising, in the retail markets.

A Charter for the Land

B B Vohra

The habit of considering land as incidental to narrowly conceived departmental schemes instead of as a single indivisible resource which needs attention in its own right lies at the back of many of our troubles and must be rooted out. Today, the irrigation engineer looks at land as something either to water or to drain (but rarely both), the agricultural soil conservation engineer as something to terrace and bund, the forester as something to grow trees on, and the planner as something which can create large-scale employment opportunities — whether for the skilled or the unskilled, whether for landless or the small farmer, whether in wet or dry conditions and whether on a crash or a continuing basis.

We thus have a multiplicity of agencies each of which is necessarily interested only in implementing its own schemes without reference to the others and none of which can see the picture as a whole. This is a situation which can be corrected only by creating organisations that can take a synoptic and a sympathetic view of the needs of the land so that these may be catered to in a direct, deliberate and efficient manner.

The management of land and soil resources is indissolubly linked with the management of water resources and cannot therefore be attempted without subjecting the latter to some discipline. It is because such discipline has been absent in the past that so little attention has been paid by our irrigation projects to the problems of sedimentation, water-logging and proper water utilisation. It will be necessary to ensure in the future that while on the one hand no new projects are taken up which do not give enough attention to these aspects, energetic steps are also taken on the other hand to remedy such deficiencies in the case of existing and on-going projects. Such a policy will not result in any shrinkage of employment opportunities for engineers, as feared by some, but rather in their expansion.

A sound land policy will therefore automatically lead to a sound water policy which lays more emphasis on the development of ground water resources and insists on much more care with regard to surface water schemes. There is little doubt that such a policy will bring about a close working relationship at various levels between the proposed land authorities and the organisations which deal with the development of water resources, both ground and surface. In the fullness of time, the remorseless logic of circumstances will complete this process by demanding the creation of a Department of Land and Water in the Ministry of Agriculture at the Centre and of similar arrangements in the states. In due course, responsibility for various other neglected aspects of the ecological environment will also inevitably get drawn to such departments. Let us, however, take only one small step at a time.

I

The Setting

IT is passing strange that 25 years after Independence we should still be without a policy for the management of our land and soil resources, let alone the organisations needed to give effect to it. Yet the soil constitutes the very basis of all agricultural, animal and forestry production and is without doubt the most important natural resource that we possess.

The neglect of the soil has led in the past to the disappearance of once-flourishing civilisations. In our own country extensive soil erosion and water-logging, together with their attendant ills, have already contributed very significantly, though insidiously, to the impoverishment of the land and its people. However, there is as yet little awareness of the existence and seriousness of these threats and consequently, little sense of urgency to meet them. This explains why even at the national level there is as yet not even a broad perspective plan for the

care of the land, no exact information regarding the extent and location of lands which require protective and ameliorative treatment and no agency charged specifically with responsibility for the assessment and management of our irreplaceable resources of land and soil. Things at the state level are no better.

It is not as if nothing whatsoever is being done in this field. But whatever little is being done is being done in a fragmentary, piecemeal and inefficient manner and without the sense of direction and priorities which can emerge only from a comprehensive view of the total situation. Thus, soil surveys are being carried out in limited areas by various states and agencies but on a scale which is entirely insignificant and in a manner which is not related to any overall framework of reference and action at the national level. As far as management aspects are concerned, our biggest activity consists of "soil conservation" programmes on which we have spent around Rs 300 crores since the begin-

ning of the planning era 20 years ago and on which great hopes are being pinned in the context of our need to create massive rural employment opportunities of a productive nature. However, the bulk of this programme as we shall presently see, is being implemented in a financially wasteful, technically defective and administratively unco-ordinated manner by two different agencies — the State Forest and Agriculture Departments — which are, so to say, not even on speaking terms with each other. The only other sizeable programme which has been undertaken and on which also about Rs 300 crores have been spent so far relates to the construction by State Irrigation Departments of spurs, embankments and other engineering works in the lower reaches of certain rivers as a protection against floods. However, this programme suffers from the very serious drawback that it is being executed without any recognition of the fact that it can at best offer only temporary relief and that a long-term solution to floods must be found in

reduction of the sediment carried by rivers, which can be achieved only by effective soil conservation measures in their upper reaches.

Many other examples can be given of the near-chaotic state of affairs which exists today in the field of land and soil management. Thus, very large areas of good agricultural lands have gone out of use on account of water-logging and salinisation brought about mainly by seepage from unlined canals and distributaries. State Irrigation Departments, however, feel little or no responsibility for this state of affairs. Even the threat which sedimentation, caused by soil erosion in the catchments of reservoirs, poses to the life of our projects, does not bother Irrigation Departments unduly — it is the responsibility of the State Forest and Agriculture Departments to meet this threat as best as they can, although they have no direct interest in doing so. Again, construction engineers in their anxiety to reduce the cost of their projects, fail to provide adequate cross-drainage works while laying out roadways, railways and canals, with the result that much avoidable flooding and water-logging of good agricultural lands occurs. But till today there is no way of ensuring that such outrages on the land do not take place.

It is clear that such a confused state of affairs — in which responsibility for the welfare of the land cannot be pinpointed on any specific agency of the Government and this most basic of resources has no known custodian of its interests — cannot be allowed to persist. The continued degradation of our land and soil resources must — if we are at all serious about 'Garibi Hatao' — not only be arrested but also reversed with all the energy that we can bring to bear on this task. There is absolutely no room for complacency in this matter. For though the Green Revolution has helped us to achieve a measure of self-sufficiency in foodgrains, we are still seriously short — even at our present pitifully low levels of nutrition and consumption — of oilseeds, pulses, animal proteins, natural fibres, timber, fuel wood and a host of other commodities which owe their origin to the soil. These gaps will widen with increases in population and with rising expectations of a better life. Our only hope of bridging these gaps at some future point of time and of achieving for our citizens a standard of living which will no longer be among the lowest even

among the "developing" countries in the world, lies in ensuring that the soil is kept in good health, that wherever necessary it is restored to good health and that each piece of land is managed in such a manner that it yields the best that it is capable of, whether this be in the form of crops or trees or grasses.

However, all this is easier said than done. The task ahead is going to be exceedingly difficult, not only because of its sheer size, but also because of its extreme complexity. Yet the challenge must be accepted. Before we consider what would be the best way of meeting it, it would be necessary to examine, in some detail, the major problems which cry for solution.

II

Problems of Land and Soil Management

EDUCATION AND INVOLVEMENT OF THE PEOPLE

The foremost problem and, in many ways, the most intractable of all is the education of the people in matters relating to the soil so that they may become convinced that it is something which it is in their own interests — and of the interests of their children and of their children's children — to care for. Once the barriers of ignorance on this subject are struck down, unconcern for the land will automatically disappear. But so long as these barriers remain, nothing else will avail very much. For the care of the land is not something which can be achieved like the construction of a dam or a bridge — in a one-shot operation but requires the intelligent involvement and willing co-operation, on a continuing basis, of large sections of the population.

An effective public relations campaign aimed at the creation of a general awareness of our need for the soil and in turn, of the needs of the soil, is therefore an obvious necessity. However, side by side with such a campaign must also be undertaken specialised programmes for the edification and orientation of those classes of the population which occupy positions of particular importance in this field. One such class consists of the children and the young people who are the custodians of the country's future and who must, under no circumstances, be allowed to grow up in ignorance of the land and its problems such as the present generation suffers from and which more than anything else is responsible

for the current neglect of the soil.

However, the section of the population which will need the greatest attention consists of those farmers and graziers of marginal lands whose activities contribute the most towards the erosion of the soil and who are therefore the most likely to be affected by programmes of protection and amelioration. For it is the improvident cultivation of lands which were not designed by nature for agriculture at all, the over-grazing of pastures and the over-felling of trees which renders the land defenceless against the fury of wind and rain and causes the dislodgement of the fertile top soil. So long as these activities are not effectively curbed, expenditure on soil conservation works is obviously a waste of time as well as of money. But in the last analysis, these activities cannot be curbed unless the people concerned are taught better ways of earning their living and are convinced that the conservation of the fertile top soil is in their own long-term interests. Mere controls and regulatory measures will not do.

Public co-operation in the protection of forest lands and other Government or community-owned lands is particularly important because nobody has a personal stake in caring for such lands. Experience has shown that afforestation and soil conservation works carried out at great expense on such lands have failed to produce any worthwhile results because it has not been possible to ensure their protection against continued depredations by local populations. Fences and guards have failed in their purpose because fences can always be got past and guards can be almost always bribed or bullied. Expenditure on fences and guards is in any case a luxury which we cannot afford if work has to be taken up on any significant scale. Fences and guards also create another problem — they generate in the authorities a psychology of distrust of the people and a contempt for their understanding which is likely to be reciprocated and makes it impossible for mutual trust and confidence to be established between the authorities and the people.

It is time to realise that the present system has been tried out over a long enough period, that has failed to deliver the goods and that it therefore needs to be replaced by an altogether different approach. This approach will lie in a sympathetic understanding of the ignorance and genuine difficulties

of the local people and in the inculcation of the faith on the part of conservation staff that the people can be made to co-operate with the authorities once they are convinced that restrictions on their present activities are ultimately to their own advantage. Experiments show that lands which are closed to indiscriminate grazing and allowed to develop a good cover of grass can thereafter support many times the number of cattle as in their denuded condition. Similarly trees, if allowed to grow to maturity, can be harvested with much greater profit than if they are cut down before they have had a chance to reach their optimum height and size. All these things must be patiently explained to the people and demonstrations must also be laid out to let them see for themselves that measures aimed at the conservation of the soil are worth the effort as well as the temporary inconvenience involved.

This will however require a complete departure from the traditional attitudes from which the average forester suffers. Instead of looking upon himself as the custodian of forest resources against the depredations of an incurably hostile populace, he must learn to trust them and to convert them to a conservationist approach to the land. Once the grazier and the farmer realise that protection will yield desirable results, they will not be slow to respond and to extend their willing co-operation to the authorities. Some fencing will perhaps still be necessary to keep cattle out, but guards should ultimately not be needed — there will come a time when the people will look after plantations and closures in their own interests.

RESOURCE ASSESSMENT

The second major problem in the field of land and soil management concerns our present lack of knowledge about these resources. Not only has no proper nationwide survey been carried out so far to obtain an accurate idea of our soil resources and to locate and identify the areas which need priority attention because they are afflicted with erosion, floods, water-logging or salinity but such a survey has not been even planned as yet. A strong Central Soil Survey Organisation charged with the responsibility of carrying out such a survey on a time-bound basis is clearly a matter of the highest priority. A significant step towards the creation of such an organisation has been taken very recently

by the decision to re-unify the infant soil survey organisation in the Union Department of Agriculture which was bifurcated some years ago. Further steps will include the incorporation into this unified organisation of the small soil survey groups which exist in the Central Water and Power Commission and the Department of Rehabilitation and its expansion thereafter in accordance with the tasks placed before it.

The major tasks of the Central Soil Survey Organisation — besides, of course, carrying out a basic soil survey of the country within a period of not more than ten years or so — will be to promote the creation of adequate soil survey organisations in each of the states. State Soil Survey Organisations will be expected to carry out the detailed surveys which are required to be executed in support of ameliorative and development programmes of various kinds and which will also ultimately be needed to serve as the basis of a scientific land use policy.

The Central Organisation will also have to ensure that the State Soil Survey Organisations follow a unified methodology and a standard system of classification and terminology, both of which are conspicuous by their absence today. The apex body will also provide technical leadership in the field of aerial photo-interpretation and other remote sensing techniques which can save the country a great deal of money as well as time and which must, on account of their high cost, be used in a co-operative manner by the Central and State Organisations.

The relevance of detailed soil surveys to all programmes of land management needs to be explained. Approximately 50 per cent of our total land surface is today suffering from either erosion or water-logging and will sooner or later require appropriate treatment to restore the soil to health. Now, the determination of appropriate engineering treatments for eroded soils and of correct drainage designs for water-logged soils requires information such as the nature and depth of the soil, its slope and its permeability and erodability characteristics. In the absence of such information, which can be provided only by detailed soil surveys, the adoption of correct specifications is obviously not possible. In fact, what is happening today and is resulting in a great deal of infructuous expenditure, is the adoption of over-cautious specifications based on a rule-of-thumb approach.

Detailed soil surveys are also required to be carried out in areas where irrigation facilities are available and their optimum utilisation is desired. For it is the amount of water which the soil can hold that determines the quantity of water that needs to be applied to it for meeting crop requirements, as well as the frequency and the manner of irrigation and the drainage requirements of the land.

However even the remaining areas of the country, i.e. those which neither require ameliorative treatment nor are cut out for intensive agricultural development, will also sooner or later have to be covered by detailed soil surveys. This is so because it is necessary to have an exact knowledge of the productive capacity of all parts of the country if we are to achieve our ultimate objective of scientific land use planning. It is in fact the almost complete absence today of the concept that land is best used only for the purpose for which it is fitted by virtue of its soil and available water resources that has given rise to popular misconceptions about the availability of land for agriculture. Thus, the well-intentioned suggestions which are made every now and then that "forest lands" and "waste lands" should be distributed among the landless in the interests of increased production, are based on a crass ignorance of the basic fact that most such lands cannot be easily put to agricultural use. Most forest lands are so vulnerable to erosion once their natural cover is destroyed and the soil is opened up for cultivation that they would soon turn into waste lands. As for waste lands they deserve protection by their very definition and have probably become what they are today only because they have been over-exploited in the past. The possibility of reclaiming waste lands for agricultural purposes is therefore an illusion in almost all cases except where degradation has been caused by water-logging and salinisation of the soil and is capable of being reversed by drainage and other treatment. In the case of eroded lands — whether the erosion has been caused by wind or water — the best use to which the land can be immediately put is not agriculture but the growing of pastures and trees. Large areas all over the country in fact need to be rescued from improvident agriculture and over-grazing and diverted to forestry and controlled grazing — but not the other way round.

It has been estimated that a reconnaissance type survey for the whole country can be completed in about 10 years and at a cost of around Rs 20 crores. Detailed surveys will cost many times this amount but will obviously have to be phased out over a much longer period of time in accordance with the needs of actual ameliorative and development programmes.

EROSION BY WATER

Although, in the absence of complete information about our soil resources, exact figures are not available, it is estimated that erosion by water has affected around 90 million ha out of a total geographical area of around 320 million ha. Erosion by water constitutes the most serious menace to the land resources of the country not only because it denudes the soil directly but also because it leads to the siltation of reservoirs and tanks, to the occurrence of floods and to the loss to the sea of a great deal of sweet water.

The genesis of erosion lies in the destruction of the natural vegetative cover of the soil by over-felling and over-grazing. Once this cover has disappeared, the fertile top soil — an inch of which it takes nature 500 to 1,000 years to build — gets dislodged and carried away by fast flowing waters which then act as agents of erosion in their own right in areas which they pass through. It has been estimated that the total annual loss of soil nutrients which takes place in this manner is of the order of 5.37 million tons of NPK and of the value of around Rs 700 crores. The amount of soil displaced is of the order of 60,000 million tons, a part of which finds its way into the sea but a good deal of which finds a new habitat for itself in irrigation tanks, reservoirs and river beds. Evidence of the damage caused by water erosion is offered by the bare hillsides and slopes which one comes across in all parts of the country and by the deep ravines of the type made famous by the Chambal dacoits. However, the damage caused by erosion is also reflected, though in a less perceptible manner, by the steadily decreasing productivity of the affected areas.

The premature siltation of tanks and reservoirs is a particularly alarming consequence of water erosion. Observations show that the average rate of sedimentation in reservoirs is at least four times as high as the rate which was assumed at the time they were

designed and built — the life of these projects will therefore be reduced correspondingly. However, in many cases there are no alternative sites for reservoirs once these have been rendered useless. This means that even if we have the money to build fresh projects — and this is by no means certain — we shall not have the physical opportunities for doing so. The hydro-electric and flood control capability of multipurpose projects is also affected by sedimentation in the same way as their irrigation capacity.

While sedimentation naturally takes time to show up in the case of big projects it affects small tanks much more dramatically. In fact the rate at which the new irrigation potential is being created by minor surface irrigation schemes at a cost of around Rs 50 crores annually is today almost off-set by the rate at which existing capacity is being lost by siltation. Considering that minor surface irrigation schemes account for nearly 30 per cent of our total irrigation potential, the time seems to have come when we should seriously consider the diversion of available funds for such schemes to soil conservation works in the catchments of existing tanks which are about 5 lakhs in number. Such a consideration will also ultimately have to prevail in the case of major and medium projects.

Seasonal floods — which during the last four years are estimated to have caused an annual loss of over Rs 300 crores by way of damage to crops, animals, habitations and public works — are also in large part caused by the sediment which gets deposited in river beds. As river beds rise, the carrying capacity of the channels is reduced and water over-spills its banks in times of peak flows. A permanent solution to the menace of floods therefore does not lie in the construction of embankments and spurs along the lower reaches of rivers, as is commonly assumed in engineering circles, but in the control of soil erosion in their upper reaches. Embankments are at best palliatives and experience has shown that, to be effective, they have to be raised year after year to keep pace with the constant rise in the level of river beds.

Finally, the conservation of the soil is also necessary for the conservation of a great deal of water which otherwise goes waste. Since denuded surfaces offer little resistance to the flow of rain water, it gets so much less time to percolate into the soil and

thereafter into ground water aquifers. This is why the denudation of the slopes is always accompanied by a lowering of water tables in the valleys below and in the drying up of natural springs and artesian wells. Since groundwater is one of our most important natural resources and constitutes our best defence against droughts, its maximum replenishment through programmes of soil conservation deserves to be made one of the cornerstones of any national water policy.

A programme for controlling water erosion on all the 90 million odd ha which have been affected by it would not cost less than Rs 5,400 crores even if we assume an average cost of no more than Rs 600 per ha to carry out the necessary protective, vegetative and engineering measures. Such a programme will naturally have to be phased out over several plan periods and carried out in accordance with carefully thought-out priorities. The protection of multipurpose projects and irrigation tanks would naturally deserve high priority; so would the treatment of eroded areas which contribute significantly to the occurrence of floods. In arid and drought-prone areas the conservation of the soil and, along with it, of whatever precipitation that these areas enjoy must obviously form the hard core of any "dry farming" and other development plans that may be drawn up for them.

Large sums of money are likely to become available for all these purposes in the Fifth Plan. The constraints in the way of effectively carrying out a vastly expanded programme for the control of water erosion will however lie mainly in the organisational field. Past experience shows that very little has been achieved by the investment of Rs 300 odd crores which has been made in this sector during the last 20 years. This unpleasant fact must be identified so that remedial steps may be taken in the future. These reasons are briefly as follows:

First, as has been noted already, there has been little effective protection and maintenance of forestry and engineering works carried out on public lands. There has also been very little maintenance of engineering works such as contour bunds carried out on private agricultural lands. Second, although a great deal of lip service has been paid to the ideal of the complete small water-shed as a unit for the planning and execution of soil conservation measures, it has not

A new symbol of dynamism, diversity and quality.

Now when the country is facing its toughest challenge on the economic front, Shriram Chemicals is well prepared to meet its responsibilities in the crucial field of chemicals.

With the increase in production of fertilisers, Shriram Chemicals is not only helping the farmer but is also keeping the imports to the minimum. In addition, it is contributing towards the development of the country's plastic industry by manufacturing PVC resins/compounds.

Quality products from Shriram Chemicals:

- Urea • Superphosphate
- PVC resins/compounds
- Caustic Soda • Sulphuric acid • Chlorine.

SHRIRAM CHEMICALS

fulfil their promise of plenty...
through chemicals.

ATARS-SC 94/72

been translated into actual practice almost anywhere. The two departments which are mainly concerned with soil conservation work — Forest Departments in public lands and Agriculture Departments in private lands — have, in almost no state, cared to co-ordinate their activities with the result that a great deal of the work done by either department has proved to be infructuous. In future, plans for each small water-shed must be drawn up by a single authority and executed in an integrated manner by each of the Departments so that the highest reaches are treated first and the lowest reaches are treated last regardless of whether the lands are public or private. *Third*, a great deal of engineering work has been done in the absence of adequate data with regard to soil characteristics as well as of local hydrological and sedimentation conditions and has therefore been technically below standard and financially wasteful. *Fourth*, "contour bunds" on agricultural lands have not followed the contour lines strictly wherever these have cut across ownership boundaries. The redrawing of ownership boundaries requires the involvement and co-operation of the land owners as well as of the revenue authorities but this has not been attempted anywhere. *Fifth*, states have shown insufficient interest in the implementation of soil conservation programmes aimed at the reduction of sedimentation in reservoirs situated outside their boundaries even though money for this purpose has been made available to them under a Centrally-sponsored scheme.

Suggestions aimed at the enlistment of public co-operation for the protection of soil conservation works have been made already. The need for improving our soil survey arrangements has also been dealt with above. Suggestions for the creation of new organisational arrangements which will cut across departmental and territorial boundaries and ensure that complete water-sheds are observed as units for planning and execution, will be made in a later portion of this paper.

EROSION BY WIND

The erosion of the soil by wind affects approximately 50 million ha of land in the country, the greater part of which is situated in the Rajasthan desert. As in the case of water erosion, wind erosion too is triggered off in the first instance by the destruction of the natural vegetative cover of the land by over-felling and over-grazing.

Once the top soil is laid bare to the fury of strong winds in conditions of aridity, it gets blown off in the form of dust storms and sand storms. In the process not only does the land get denuded but great damage is caused — through the formation of dunes and the smothering of vegetation — to the areas where the dust and sand settle down.

The control of wind erosion lies primarily in curbing indiscriminate grazing by nomadic herds — so that natural vegetation may get a chance to re-assert itself — and in the creation of wind breaks and shelter belts which reduce the velocity of strong winds and thereby their erosive and desiccating effects. Experiments in Rajasthan have shown that excellent pastures can be developed in closed areas with native as well as exotic grasses and that, under conditions of controlled grazing, these pastures can support as many as four times the number of animals which can otherwise be carried by the same land. The planting of wind breaks and shelter belts — under protected conditions, of course — not only helps to develop such pastures but also to provide timber and fuel in an area which is practically treeless today. These are also the methods by which sand-dunes — which occupy nearly half the total area of the Rajasthan desert — can be stabilised and prevented from contributing to the leeward "creep" of the desert.

It is visualised that the "reclamation" of the desert by such methods would, by enabling it to carry a much larger number of animals, than at present, ultimately make it unattractive and uneconomical for any portion of it to be used for agriculture. This would be a most welcome development indeed because cultivation involves the disturbance of the top soil, which is not at all good for the health of the land in desert conditions. If better land management could, through richer pastures, support a high level of animal husbandry in these areas the farmers would find it more economical to obtain their requirements of food-grains and cereals from other areas which are better equipped by nature to grow them. A deliberate policy of diverting land from agriculture to animal husbandry based on rotational grazing of pastures by improved strains of sheep, goat and cattle therefore needs to be followed in the desert areas in the interests of the soil as well as of the people. Fodder banks

based on the harvesting of grasses would also need to be set up to guard against occasional droughts. Since drinking water for animals and humans can now be made available in many parts of the desert by tapping ground water resources, we should be able, at some future time, to put an end to the migrations of cattle which take place every now and then from these areas and result in the loss of so much animal wealth.

The control of wind erosion also carries with it the hope of ending the aridity of the desert and therefore of finding a permanent solution to its problems. Studies indicate that one of the possible reasons why moisture-laden clouds pass over western Rajasthan without precipitating their burden on it is the fine dust suspended in the air over the desert — dust which is the direct result of wind erosion.

The menace of wind erosion is however not confined only to the desert but also, though to a much smaller extent, affects the rich alluvial plains of the Indogangetic valley. The common practice of ploughing up the land after the winter crop and leaving it exposed to the sun and wind during the hottest and the most arid part of the year is no doubt good for ridding the land of weeds but it also results in the displacement of a good deal of the fine top soil under the action of strong winds which encounter no physical barrier over vast distances. Good land management in these areas would involve the protection of the soil against wind erosion — among other things by trees grown along field boundaries and wind breaks and shelter belts planted on public and community lands. Such plantations would incidentally also add to local fuel and timber resources and permit cow dung to be applied to the land instead of being used as fuel.

Very little effective work has been done so far in combating wind erosion, mainly because of our inability to deal with nomadic herds and to give adequate protection to plantations. It is estimated that a programme for the control of wind erosion over about 50 million ha would cost around Rs 3,000 crores even if we assume an average cost of no more than Rs 600 per ha to carry out the necessary afforestation, grassing and protective measures. Here again, money is not likely to be a real constraint. The main difficulty will lie in ensuring protection for areas which

are sought to be reclaimed and in enlisting the support of local populations for programmes of rotational and controlled grazing.

EROSION BY THE SEA

Sea erosion is a problem which affects many parts of our long coast-line but has so far drawn attention to itself only in the densely populated areas of Kerala, where the loss of land is of the order of 2 to 5 meters per annum. An expenditure of nearly Rs 10 crores has been incurred so far on combating sea erosion along parts of the Kerala coast line and it has been estimated that another Rs 40 crores will be required for the protection of the entire coast line in the state. However coastal areas in many parts of the country will also need protection against erosion by the sea as the pressure of the population on the land increases. It would be desirable to institute special studies for this neglected problem so that preventive action may be taken in time.

FLOODS

It has been estimated that about 20 million ha of good agricultural lands are subject to seasonal floods — the average area inundated annually being about 7 million ha. It is true that, in the short run, protection against floods in the lower reaches of rivers can be provided only by engineering works such as embankments and spurs. A total expenditure of about Rs 300 crores has been incurred on such works so far and what is described as "reasonable protection" has been afforded to 6 million ha of land — at an average cost of Rs 500 per ha. However the cost of providing such protection is rising year by year because increasing amounts of money have to be spent on maintaining existing embankments and on raising their level to keep pace with the rise in the level of river beds on account of sedimentation. The cost of giving protection to new areas during the Fourth Plan has risen to around Rs 1,500 per ha. At this rate the 14 million odd ha which still need to be provided "reasonable protection" by engineering works would require an outlay of around Rs 2,000 crores at current prices. While an expenditure of this order appears to be unavoidable on short-term considerations, it must be kept in mind that it would prove to be infructuous in the long run unless adequate attention is paid without delay to the control of ero-

sion in the upper reaches of rivers. In this context, the so-called Flood Control Commissions which have been set up in certain basins with memberships composed wholly of "Irrigation Engineers" make little sense indeed.

WATER-LOGGING AND SALINITY

Water-logging and the salinisation of the land which often accompanies it, occur when the sub-soil water table invades the root zone of the soil and comes up to within 5 feet of the surface. As a result, the soil — which needs adequate aeration for its health — begins to lose its fertility and ultimately becomes totally unproductive. It has been estimated that approximately 12 million ha have been affected by water-logging and salinity so far. About 50 per cent of this area is situated in coastal regions and is subject to periodical inundations by sea water. The remaining 6 million odd ha are situated inland and represent a more serious loss as they were productive till, so to say, the other day and owe their present position to purely man-made circumstances.

Although interference with natural drainage gives rise to local situations of water-logging, the major cause of water-logging in inland areas is the seepage which occurs from unlined canals and distributaries in flat lands which have not been provided with adequate drainage facilities. It is this seepage which explains why the bulk of the afflicted areas are situated in the commands of old irrigation projects and why additional areas are going out of production year after year even in the commands of new projects such as the Chambal and Gandak. It is a particularly distressing thought that lands which are sought to be benefited by being provided with irrigation at great public cost should run the risk of losing their productivity as a result of this very facility — merely because enough attention is not paid to the drainage requirements of the land when the distribution systems are being laid.

The remedy for water-logging consists basically in providing the land with adequate drainage (salinity may need additional treatment by way of leaching and soil amendments). Unfortunately it is not a remedy which the farmer can adopt with his own unaided efforts but necessarily requires Government action in a big way. This is so because field drains — which the farmer may be expected to provide at his own cost — can function only if they can

ECONOMIC AND POLITICAL WEEKLY

empty into intermediate drains which in turn require to be connected to major drains which will take excess waters into a river or other natural outfall. Drainage must therefore be provided in a planned basis for a whole drainage area — or not at all. This rules out individual and even group action and places the major responsibility for reclamation on the Government.

State governments have however generally done very little in this direction so far. Although recent research findings have shown that water-logged lands can be restored to health at a cost of around Rs 3,500 per ha, these findings have yet to be tested under field conditions. However the economics of reclamation are not in doubt because the cost of good agricultural lands with access to irrigation is nowhere less than about Rs 15,000 per ha. The reclamation of 6 million odd ha at a total cost of around Rs 2,000 crores would therefore be a bankable proposition and present no financial difficulties. Such a programme would however require to be backed up by an investment of perhaps Rs 1,000 crores by government on major and intermediate drains. Although not enough is known about the problems of the reclamation of areas rendered water-logged or saline by the sea, a somewhat similar investment on such lands may also be justified in due course — this work will obviously merit a lower priority.

Any strategy for tackling the problems of water-logging will have to take note of the fact that it will avail very little if new areas continue to become water-logged while large sums of money are being spent on reclaiming existing water-logged areas. Our first concern must therefore be to stop new areas being lost to water-logging. This can be done only by ensuring, in the first place, that all new roads, railways and canals are provided with adequate cross drainage works. Although the cost of construction will go up as a result of such a policy, the additional outlay will be more than justified. In the second place, no new canals, distributaries and water-courses should be allowed to be built unless these are lined. Here again cost will go up but will be more than justified on the consideration that productive lands will be saved from damage. However justification for such a policy can also be provided on two additional counts. Seepage losses, which amount to around 40 per cent of all the water which is released from a reservoir, will be saved if lining is undertaken. Again, since

ECONOMIC AND POLITICAL WEEKLY

lined canals, distributaries and channels can be made deeper and narrower in section, they occupy far less land than is required by unlined systems.

As far as existing water-logged areas are concerned, their reclamation would also make sense only if steps could be taken more or less simultaneously to put an end to the seepage which has been responsible for their present condition. Although the lining of existing distribution systems is, for operational reasons, a much more complicated and difficult task than the lining of new systems, it must be attempted sooner or later. Here again, the cost of the work would be justified by the savings which would accrue by the prevention of seepage losses and the additional land which will become available for cultivation on account of canals and distributaries occupying lesser space. In this connection it is relevant to mention that the additional water resources which would become available through a programme of lining existing canal systems have been estimated to be equivalent to an irrigation potential of 6 million ha. Since the creation of additional irrigation potential of the order of 6 million ha would cost around Rs 2,000 crores, an expenditure of this order on a programme of lining the existing canals and distributaries would seem to be justified even if the cost of the land saved is not taken into account.

It will be seen from the above that at a very rough estimate an outlay of around Rs 5,000 crores would be required for the reclamation of inland water-logged and saline areas and for the lining of existing canals and distributaries. An outlay of another Rs 3,000 crores could perhaps be justified, in due course, for the reclamation of lands water-logged or rendered saline by the sea. Financial constraints in the way of carrying out such reclamation and anti-water logging programmes are however not likely to be important because the expenditure will be productive from every point of view. The organisational constraints should also not be particularly significant because very well-organised and equipped engineering organisations exist in almost all states in the shape of Irrigation Departments, which can, if necessary, be easily expanded to take up large-scale drainage works and in the process provide meaningful employment to large numbers of unemployed engineers and technicians.

INTENSIVE USE OF IRRIGATED AREAS

Approximately 40 million ha of land

have access to irrigation facilities as of today. Of this, approximately 16 million ha are served by ground water and perhaps an equal area by Government canals, the remaining 8 odd million ha being irrigated by small tanks and diversion schemes, etc. At a very conservative estimate these irrigation facilities represent an investment, from private and public sources, of around Rs 8,000 crores on the basis of an average of Rs 2,000 per ha.

Quite naturally a great deal of our hopes for self-sufficiency in food are centred on our irrigated lands because it is only in these lands that there can be any assurance of growing more than one crop a year. However, the fact is that the utilisation of the valuable resource which these lands represent has so far been far from satisfactory. The overall intensity of agriculture in our irrigated areas is still no more than 125 per cent which means that we are still far from obtaining even two crops a year from them, let alone achieving higher levels of "multiple cropping", of which there is so much loose talk these days. This is largely due to the fact that the quality of the irrigation which these lands receive varies widely from place to place. The most reliable source of irrigation is the well or the tubewell which the farmer owns and runs himself and which, since it is situated on the farmer's own field, is easy to manage and presents none of the difficulties associated with the conveyance of water over long distances. Government canal systems are much more difficult to operate to the satisfaction of the farmer, particularly in the context of the rather exacting requirements of new high-yielding varieties. Not only are the timings of irrigation uncertain but satisfactory arrangements do not yet exist for the delivery of water to each farmer in accordance with his requirements, and for the carrying away of the surplus so that his land is not damaged by water-logging. As far as small tanks and diversion schemes, etc. are concerned, arrangements for maintaining them in good order are far from satisfactory in most cases. Such schemes are generally not the responsibility of State Irrigation Departments but of district level and even block level engineers. Here again the efficiency of irrigation is much lower than in the case of ground water.

It has been estimated that the productivity of the water which is being presently applied to the land by irrigation can be increased by at least 100 per cent, if irrigation systems and

methods could be modernised and brought into line with soil and crop requirements and if wastages by seepage and by over-application of water could be avoided. It would be worthwhile to make such an effort because in the ultimate analysis, the intolerable pressures to which large areas of our marginal and sub-marginal lands are being subjected by being placed under agriculture can be relieved only if we are able to significantly increase the productivity of our better-placed irrigated lands. A little calculation will show that even if an average production of no more than 3 tons per ha of food-grains could be achieved on all our "irrigated" lands, these alone would be able to produce all the food that the country needs today, and therefore release large portions of the remaining 100 million ha or so which are under unirrigated agriculture for being put to more rational and profitable uses. Among these uses would be a vastly better animal husbandry based on richer pastures and improved strains of cattle, sheep and goats, very much more forestry and very much more horticulture — all of which would be consistent not only with the objective of getting the most out of the land for our impoverished and growing population but also of conserving and improving the soil.

A programme for the better utilisation of our irrigated lands must therefore be taken up as a matter of the highest priority. Such a programme would, in turn, have to give priority to the commands of big irrigation projects because it is in these areas that there is the greatest scope for improvement. The first ingredient of such a programme would be the improvement of water delivery arrangements beyond the "outlet" in the distributary. This is so because the responsibility of Irrigation Departments ceases at the outlet and it is the farmer who is supposed to make arrangements, in concert with other farmers in the block — which may range from about 50 ha to 200 ha in size — served by the outlet to construct and maintain water courses. Experience has shown that such arrangements vary a great deal from place to place. Over vast areas, aggregating to something like 2 million ha, water courses have yet to be built by farmers although the main distribution systems have been completed by Irrigation Departments who have since departed from the scene. In such areas there is no irrigation at all, in spite of water being available.

India's biggest undertaking in the field of Fertilizer Industry, the Fertilizer Corporation of India Limited, is one of the largest producers of plant nutrients in the world.

HOW BIG IS FCI? FCI's five functioning units at Sindri (Bihar), Nangal (Punjab), Trombay (Maharashtra) Gorakhpur (U.P.) and Namrup (Assam) have the installed capacity of half a million tonnes of plant nutrients. This will rise to over two million tonnes when additional six plants under construction go on stream.

CATALYST KNOW-HOW — FCI is one of the few organisations in the world to develop and produce a complete range of fertilizer catalysts, so vital to the industry.

TOTAL FERTILIZER TECHNOLOGY — Backed by its intensive Research & Development efforts, FCI has now developed its own know-hows, design and engineering capability and can execute six to eight modern fertilizer plants at a time from the blue-print to the final commissioning stage.

MARKETING SET-UP — With a vast network of sales outlets and promotional activities, FCI now serves about 80 per cent of the country.

THE FERTILIZER CORPORATION OF INDIA LIMITED

In many other areas, where paddy is the only crop, irrigation is carried out by the "flood" or field-to-field method without the use of any water-courses at all — the resulting waste of water can be easily imagined. In the remaining areas there are *katchha* water courses which are wasteful of land as well as of water, are difficult to keep in good order and do not lend themselves to controlled irrigation. If efficient irrigation is to be achieved, properly aligned and lined water courses which are equipped with *pucca* structures capable of delivering water to each field in the command of the outlet are an inescapable necessity. However this would be a near-impossibility so long as the number of fields remains unduly large on account of fragmentation of holdings. The consolidation of holdings at least within the command of each outlet is therefore a prerequisite for efficient and economic irrigation. Such a process of consolidation will however require close co-ordination between the Irrigation and the Revenue authorities as well as, of course, the co-operation of the people.

Another ingredient of the programme is the levelling and shaping of each field so that it may be possible to apply water to it in a uniform manner and without waste. A fourth ingredient is the provision of drainage facilities wherever these are necessary to prevent water-logging and salinity. However, as has been already explained, drainage facilities must be provided in a comprehensive manner over fairly large areas so that the planning and execution of the major and medium drains may keep pace with the construction of field drains.

It has been estimated that a programme of this nature would cost around Rs 3,200 crores to carry out over 16 million ha assuming an average cost of no more than Rs 2,000 per ha. Expenditure of this order would however be justified on purely economic considerations. In the first place it would enable larger areas to be brought under irrigation — and, what is more important, under irrigation of a kind which will be vastly superior to what can be practised by the farmer at present. This should enable Irrigation Departments to collect betterment levies and higher water charges and thereby to make irrigation projects more viable — today they are losing around Rs 100 crores a year for a variety of reasons, one of which certainly is that farmers are

not sufficiently appreciative of the rather indifferent service which is being provided to them. In the second place, since the productivity of the land would be significantly increased through better water management, farmers would be able and willing to pay, over a period of time, for the improvements in the delivery systems as well as for land levelling and field drainage. (The medium and major drains would have to remain the responsibility of the Government.)

As far as the remaining irrigated areas — approximately 24 million ha — are concerned, these too would require attention but on a much smaller scale than the commands of major and medium projects. It is envisaged that these areas would require little or no land levelling and drainage facilities. However, improved water delivery systems would be required even in these areas. In the case of on-farm ground water projects, *pucca* water courses or underground delivery systems have proved to be extremely useful in improving the quality of irrigation. At a very rough estimate, we would perhaps require Rs 1,200 crores for these 24 million ha assuming an average outlay of no more than Rs 500 per ha. The total cost for achieving a higher level of water utilisation and therefore a higher level of agriculture in our irrigated areas would thus work out to nearly Rs 4,400 crores. Such an outlay will however require to be phased out over several plan periods and since it will be of a productive nature, should present no particular difficulties in financing.

The main constraints in the way of executing such a programme will however be of an organisational and technical nature because it will require a great deal of co-ordinated work among a number of disciplines. Thus, soil scientists and agronomists will be required to determine the water requirements of optimum cropping patterns, civil engineers to design and build the delivery systems to meet these water requirements, the revenue authorities to consolidate holdings so as to keep the length of the lined water courses to the minimum, and civil engineers and soil scientists to determine how best the land should be levelled and drainage facilities provided.

In view of the complicated nature of the work and the fact that we are very short of trained soil scientists, work on the improvement of irriga-

tion in our command areas will necessarily have to be slow. However, there is no dearth in State Irrigation Departments of civil engineers who can easily master the jobs of constructing water courses and drains and of levelling the land. Responsibility for these works will therefore have to be placed on State Irrigation Departments which can, if necessary, be suitably expanded for this purpose. It would not be wise for State Agriculture Departments, which are today responsible for improved water management programmes, to set up their own engineering organisations for implementing them. Such a step would mean unnecessary duplication and waste of effort and also smack of narrow departmentalism.

MAINTENANCE OF SOIL FERTILITY

Contrary to popular belief, the soil is not an inert substance but almost a living organism of unrivalled complexity. Fertile soil teems with life and a teaspoonful of it may contain billions of living organisms — the micro-fauna and micro-flora which are responsible for the fixation of atmospheric nitrogen and the breaking down of organic as well as inorganic materials into forms suitable for assimilation by plants. These minute organisms also perform the indescribably complex functions which are carried on simultaneously in the soil at various levels physical, chemical, geological and biological — so that life may continue to be sustained on this planet.

One of the major dangers to which soils are exposed is their depletion under conditions of intensive cultivation. Modern high-yielding varieties make very heavy demands on soils not only for the commonly known NPK but also for micro-nutrients such as zinc, manganese and boron. For maintaining the fertility of soils it is therefore necessary to replenish the nutrients which are taken away from them. A very considerable extension of soil testing facilities as well as of the findings of research with regard to the application of relevant nutrients in the most economical and effective manner will therefore have to be given high priority in respect of irrigated lands. Care will also have to be taken to ensure, by frequent monitoring, that the use of fertilisers and pesticides on such lands does not produce any toxic result. Such a precaution is particularly necessary because the pollution of the soil also involves

the pollution of the waters flowing over or through it.

It is not possible at this stage to give an estimate of the cost of providing such a service. However, this cost is likely to be high.

DEMANDS OF URBANISATION

Another danger to which good agricultural lands are exposed and about which very little is being done at present is their diversion into non-agricultural uses as a result of the growing urbanisation of the country. Adequate Town and Country Planning Organisations armed with regulatory authority which reaches down to the last village, will have to be created in all the states in the interests of planned urban growth. Such organisations must be made responsible for ensuring, in consultation with soil survey organisations, that good agricultural lands are not used for urban and industrial purposes as far as this is possible. Further urban expansion must take place either on inferior lands or in a vertical direction — rich soils must, in no circumstances, be placed under new townships, houses, factories and airports.

III

Some Organisational Imperatives

The ten-point programme outlined above would cost around Rs 23,000 crores to implement. However, since the implementation of such a colossal programme will take a good deal of time — perhaps no less than 30 years with the best will in the world — and since the degradation of the soil will proceed apace during this period, the final bill will be much larger than Rs 23,000 crores. It may well reach a level of around Rs 35,000 crores at current price levels.

Our present level of investment in land and soil management schemes stands at well below Rs 100 crores a year including outlays on major drainage, engineering works for flood control, and the "soil conservation" components of such special recent Central Sector schemes as the DPAP, CSRE, MFAL and SFDA. To reach an investment level of around Rs 1,000 crores a year in even 15 years from now — which is the minimum we must aim at — is therefore going to demand a tremendous effort. This is particularly so because we shall simultaneously have to improve the quality of our performance and ensure that

money is spent productively — any failure on this account will involve the release of further inflationary pressures and grave damage to the economy. It is in this background that we have to consider what kind of policy decisions and administrative arrangements need to be made to ensure the efficient implementation of an ambitious programme of land and soil management.

THE CENTRE'S ROLE

The very first point to be decided is the extent to which the Centre should at all involve itself with the care of the nation's land resources. The Constitution has placed this subject on the State List and, strictly speaking, the Centre has no obligation to do anything about it — the role of the Centre has in fact been of a minimal nature all these years. Thus, almost the entire outlay of around Rs 600 crores which has taken place during the last 20 years on soil conservation works and major engineering schemes for flood control has been in the State sector. The Centre has traditionally done little more than to support some research and demonstration activities, some soil survey work and some soil conservation projects in the inter-state catchments of a few big reservoirs — at a total cost of perhaps no more than Rs 60 crores.

Unknown to itself, however, the Centre is being latterly forced by the logic of circumstances to play a growing role in the field of land and soil management. Thus, it is being asked, year after year, to foot a major portion of the national bill for the relief of distress caused by droughts and floods, both of which are, to a large extent, opposite sides of the same coin of the mismanagement of the country's land and water resources. The Centre is also under increasing pressure to formulate and directly finance employment-oriented schemes for massive rural works, of which by far the most important component consists of "soil conservation" works — very large sums of money have been allocated for this purpose in the last two or three years and still larger allocations are likely to be made in the Fifth Plan. Again, the inter-State aspects of programmes for the protection of reservoirs, major drainage schemes and of flood control works are beginning to receive increasing attention with the realisation that all such works have necessarily to be planned and executed for entire river basins — and this is something which can today be attempt-

ed only by the Centre. But above all, it is the Centre which, in the last resort, has to face the consequences of low production levels in agriculture, animal husbandry and forestry and must therefore interest itself in the health of the soil.

It would be prudent for the Centre to take cognisance of these facts of life and to assume — and deliberately so — a much larger responsibility in this field than it has cared to exercise in the past. For these pressures are not likely to lessen but to grow with time and the sooner they are contained within a conscious policy for the land, the better it will be for everybody. Such a policy must be based, in the last analysis, on an adequate statutory foundation, for which it will be necessary to amend the Constitution so as to place the subject of Land in the Concurrent List. This should, however, present no great difficulty. In the meantime, the Centre has no option but to obtain a commanding position for itself in the field of land and soil management through financial and administrative means.

THE CENTRAL LAND AUTHORITY

This object can be achieved by placing land management programmes increasingly in the Central Sector — a trend which has set in already, though unwittingly — and by creating, at the national level, a focal point of authority for all matters relating to the assessment and management of our lands resources. Such an authority — which may well be called the Central Land Authority (CLA) — will naturally have to be vested with responsibility for the efficient planning and execution of the ten-point programme outlined earlier and therefore with the authority to cut across the various inter-state, inter-departmental and inter-agency boundaries which today come in the way of an integrated approach to what is basically a resource management problem. By the very nature of things the CLA shall have to combine in itself the triple functions of a planning and policy making body at the national level, an executive agency responsible for the proper implementation of various programmes in the Central Sector and a technical agency which can act as an apex organisation in respect of the various disciplines concerned with the assessment and management of our land and soil resources.

In view of the inter-disciplinary nature of the work involved, the CLA

shall necessarily have to be organised in the form of a Board capable of providing representation to the many interests concerned. On the assessment side, the Board should contain representatives of organisations such as the Survey of India, the Central Soil Survey Organisation, the Institute of Photo-Interpretation, and the Indian Space Research Organisation; while on the management side it will have to include representatives of the various technical wings in the Department of Agriculture responsible for disciplines such as forestry, agrostology, agronomy, soil conservation engineering, irrigation water management, and minor surface irrigation. The Board should also be representative of the research and training wing of the Indian Council of Agricultural Research in the field of soil and water management, the drainage and flood control wing of the Central Water and Power Commission and of the Central Town and Country Planning Organisation. The Board shall of course have to develop its own public relations wing and, in view of the large outlays envisaged, a strong wing for economic studies, analysis and evaluation. Needless to say such an authority shall have to be presided over by a whole-time Chairman of the highest possible calibre and administrative experience and serviced by a strong and efficient secretariat.

The secretariat of the CLA shall have to be organised with particular care if the Authority is not to be bogged down in unnecessary detail. It should be a small and compact body and should consciously guard against the temptation to build up a big organisation at the Centre. Nothing in fact should be attempted to be done from Delhi which can be done at levels closer to the ground. Strong regional agencies should therefore be set up by the CLA to formulate concrete programmes and to ensure their implementation through appropriate State agencies, as well as to fill the technical vacuum which characterises the field of land and soil management today. Such agencies will naturally have to be organised in accordance with the boundaries of the major river basins which are the natural units for land and soil management. The maximum possible delegation of powers and authority must thereafter be made by the CLA to these bodies which may be called River Basin Land Authorities (RBLA). Only if some such method is followed will it be possible for the

CLA to properly discharge its most important function, namely, the formulation and monitoring of national plans and policies in the entire field of land and soil management.

The alternative of stationing armies of chair- and air-borne inspectors and specialists in New Delhi and expecting them to control and supervise large-scale field operations in all parts of the country is too frightening to be even entertained. Experience shows that one of the major reasons why the Centre is not as effective as it might be expected to be in certain fields, is that it has burdened itself with too many direct executive and technical responsibilities and that these prevent it from paying adequate attention to its real work of planning, supervision, and co-ordination — such a mistake must not be repeated while taking up colossal new responsibilities in the field of land and soil management.

THE RIVER BASIN LAND AUTHORITY

A land authority will therefore have to be established for each of the major river basins of the country within which it will act as an agent of the CLA for almost all purposes. While some of the smaller river basins which are contiguous to each other — for example the Tapti and the Narmada — can be clubbed together for purposes of convenience, it will be necessary to divide the Ganga basin which is too big to be handled as a unit, into separate basins such as the Chambal, the Yamuna and the Upper Ganga so as to form units which are roughly equal in area and comparable in respect of the scope and size of management problems they pose. On this basis, about a dozen River Basin Land Authorities will be needed to cover between them all parts of the country.

It will largely fall upon the RBLA to make good the administrative and technical deficiencies which characterise our land management programmes at present and to ensure that the big programmes which we plan for the future are carried out with the maximum degree of efficiency and economy. The RBLA will be expected to make, as quickly as possible, an overall assessment of the different kinds of land and soil management problems within the basin, to identify the areas which qualify for priority action, and to initiate the same through state agencies in as efficient a manner as possible. It is envisaged that the allotment of Central Sector funds for various

programmes within each basin will be made by the CLA on the recommendations of the RBLA which will take into account the administrative and technical competence of the state concerned to carry them out. An evaluation of the work done by different states within each basin will also have to be carried out more or less continuously by the RBLA in order to ensure that certain minimum technical and administrative standards are maintained.

It is to be remembered that such work will be of an entirely novel nature and has never been attempted before in the country. In order to make it possible that it is carried out efficiently, it will be necessary for each RBLA to equip itself with specialists and technical experts in a variety of disciplines. Since such people are not really available today — because there has been no demand for them — it will be part of the RBLA's responsibility to create the necessary cadres for itself. Such an attempt must be made cautiously so that we do not pull out from the states too large a proportion of the limited numbers who are actually working on land and soil management projects today. For this reason, it will be desirable to recruit, as far as possible, fresh graduates and to train them up in actual field conditions. This in turn can be done only if the RBLA directly undertakes the operation of a large number of site-specific land and soil management projects which should aim at serving as models of their kind for state governments to follow.

There are today no more than two dozen such projects on the ground of which about half are oriented towards soil conservation and the other half towards the better use of irrigation waters in command areas; the former are controlled by the ICAR while the latter are run by the Department of Agriculture. Projects aimed at the demonstration of measures against wind erosion, sea erosion, water-logging and salinity are conspicuous by their absence. It is obvious that a very large expansion in the number of demonstration projects will have to be undertaken by each RBLA in the light of its own local needs.

Although research in soil and water management problems is being carried out at a number of stations, their findings lack credibility to the extent that they have not been tried out under field conditions. The proposed demonstration projects will provide an ex-

& Implements**
manufactured at their Kandivli & Nagpur
plants in Maharashtra.

cellent opportunity for adaptive research under actual field conditions and thereby bring research closer to training, demonstration and extension. The properly trained and technically confident workers produced by these Centres will, it is hoped, carry much greater conviction with the states than it is possible for advisers of the traditional type to do — advisers who have sometimes not had anything to do with actual project work for perhaps the last 20 years! These site- and problem-specific Centres will also be capable of functioning as Centres for refresher courses for the more senior technicians in due course.

For all these reasons the establishment and successful operation of a large number of demonstration projects will necessarily form the cornerstone of the activities of the RBLA for many years to come. The cost of such projects will naturally have to be borne by the Centre except to the extent that improvements carried out on private lands will as far as possible be financed out of institutional loans by the beneficiaries themselves. If the demonstration projects are carefully sited, it would be reasonable to expect that they will have a powerful "ripple" effect on neighbouring lands. These projects will thus become focal points of growth in their particular fields and will begin to play an increasingly important role in our programmes.

Experience shows that in spite of good intentions, many of our schemes fail because sufficient attention is not being paid to matters which appear at first sight to be matters of mere detail. One of these matters concerns the living conditions of workers in outlying areas where even the basic amenities are lacking. Since hundreds of demonstration projects which will ultimately have to be established will by definition have to be situated in out of the way places and in the deep interior, it is necessary that we should make them attractive for people who are expected to work and live there. Suitable allowances depending in each case on the unattractiveness or hardship level of the area, will have to be given to attract suitable people to such projects and to tempt them to stay there for long periods.

Only after the RBLA has established all the projects which are required by it and only after these projects have begun to find solutions to concrete problems which are both financially and technically viable and to turn out

trained workers, will the state be reached when we can confidently take up large-scale programmes of development. During the preliminary period when solutions are being patiently found and cadres are being built up progress will necessarily be slow. But then the land yields only to patient and solid work and there is no magic wand by which we can improve it overnight.

The RBLA also shall have to be organised in the form of a Board more or less on the lines of the CLA. This Board will contain whole-time representatives of the various disciplines concerned but technical representatives of the states situated wholly or partly in the basin may also be provided representation on an *ex-officio* basis. In addition, the RBLA will incorporate in itself the local Flood Control Commission if any, and thus correct the imbalance which characterises flood control work at present. The Chairman of the RBLA shall, again like the CLA, have to be a man of the highest possible administrative ability and leadership. Success or failure in this vital field will depend to a large extent on the imagination, energy and resourcefulness with which the Chairmen of the various RBLAs approach their tasks. It will therefore be well to make these posts as prestigious and attractive as possible so that they may attract the very best talent.

THE STATE LAND AUTHORITY

The third link in the proposed chain of administrative arrangements for proper land and soil management will be the State Land Authority (SLA) which will be cast in the image of the CLA and will have the same kind of responsibility within the state as the CLA will have at the national level. The SLA will, in the discharge of its functions, have the authority to cut across all departmental and administrative boundaries within the state. The SLA will work in close co-operation with the RBLAs with which the state is concerned and will, in order to qualify for financial assistance for various programmes, have to effectively implement the inter-state plans which are drawn up by the RBLA on basin-wide considerations.

THE WATER-SHED LAND AUTHORITY

Within the state, all soil conservation and drainage programmes will be planned and undertaken only on the complete water-shed or sub-water-shed basis, regardless of where the owner-

ship of land lies. All the departments concerned will be involved in the implementation of plans in accordance with their specialisation and capacity. For this purpose it may be necessary for the SLAs to appoint, as their agents and operational limbs, water-shed land authorities and sub-water-shed land authorities which can ensure the integrated planning and execution of works. Needless to say, these authorities will work in accordance with the technical standards which are set for them by the RBLAs. They will also, it is envisaged, depend heavily on the RBLAs for the trained men that they need.

THE COMMAND AREA LAND AUTHORITY

In view of the special importance of utilising to the maximum possible extent the potential of our irrigated areas, it would be appropriate to appoint for the command of each major and medium project within the state a suitably constituted authority charged with responsibility of putting available waters to the best use. Such an authority which may be called the Command Area Land Authority (CALA) will undertake such works as properly designed water courses, the consolidation or holdings within each outlet of the command, the levelling and shaping of fields, and the provision of field drains wherever necessary. Such an authority will also undertake the lining of canals and distributaries on a progressive scale and the execution of other works designed to modernise existing flow systems.

The improvement of the efficiency of irrigation in the commands of state tubewells, private tubewells and small surface irrigation works will also need attention. This may be provided by a suitable organisation for water management within the SLA which will have the necessary extension agency in each district.

IV

Some Financial Aspects

Although the total outlay of around Rs 23,000 crores required for the implementation of the ten-point programme is of staggering proportions, it need not frighten us unduly. This is so because less than 40 per cent of this outlay will have to be met by the government directly — the remainder represents investment of a productive nature and can therefore be financed from institutional sources both internal and external. According to the

TABLE

Job	Total Outlay	Government Outlay (in crore rupees)	Institutional Outlay
(1) Education and public relations	10	10	Nil
(2) Soil surveys	100	100	Nil
(3) Control of water erosion	5400	2000	2400
(4) Control of wind erosion	3000	2000	1000
(5) Control of sea erosion	100	100	Nil
(6) Engg works for flood control	2000	2000	Nil
(7) Major drainage and control of water-logging	8000	2000	6000
(8) Optimum use of irrigated areas	4400	Nil	4400
(9) Soil testing and maintenance of fertility levels	20	20	Nil
(10) Administrative expenses including prevention of diversion of good lands	20	20	Nil
Total	23050	8250	14800

best judgment that it is possible to make today, the size of the total programme will be somewhat as shown in the Table.

It will be seen that jobs Nos 1, 2, 5, 6, 9 and 10 have been debited entirely to the government account because they either represent services of an infra-structural nature or works which the government has been financing directly all these years. Job No 8 has been placed in the institutional sector because it represents works which will benefit the farmer directly and which, experience shows, he can pay for over a period of time. As regards Jobs Nos 3 and 4, it is felt that these will cover both public and private lands and that although the works will be of a productive nature, recoveries will be possible only in respect of the latter and even then not to the extent of 100 per cent in all cases. Expenditure on these jobs has therefore been divided between the government and institutional sectors on the basis of the best available judgment. As regards Job No 7, the Rs 2,000 crores which are proposed to be spent on providing major and intermediate drains has been shown in the government sector and the remainder, which is envisaged to be spent on the reclamation of privately-owned water-logged lands has been included in the institutional sector.

It is felt that it should be possible to undertake a total programme of around Rs 1,000 crores in the Fifth Plan and of approximately double this amount in the Sixth Plan. If an increase of around Rs 1,000 crores can be maintained in each subsequent Plan period, it should be possible to achieve a total outlay of around Rs 23,000 crores over a period of 30 years.

V

A Summing Up

With 75 per cent of our people still dependent on the land for their livelihood, the care of this resource must obviously rank high in our priorities. The cost of looking after our soil, however high it might be, is still less than the price we are paying for neglecting it. However, time is running out and the creation of the administrative, technical, financial and legal arrangements necessary to ensure the care of the soil is a task which admits of no further delay. The political will needed to make such an effort possible is also likely to be forthcoming — the country is in a mood, in the 26th year of its independence, to demonstrate that it is capable of taking and implementing hard decisions.

The habit of considering the land as incidental to narrowly conceived departmental schemes instead of as a single indivisible resource which needs attention in its own right lies at the back of a lot of our troubles and must be rooted out. Today, the irrigation engineer looks at the land as something to either water or drain (but rarely both), the agricultural soil conservation engineer as something to terrace and bund, the forester as something to grow trees on, and the planner as something which can create large-scale employment opportunities — whether for the skilled or the unskilled, whether for the landless or the small farmer, whether in wet or dry conditions and whether on a crash or a continuing basis. We thus have a multiplicity of agencies each of which is necessarily interested only in implementing its own schemes without reference to the others and

none of which can see the picture as a whole. This is a situation reminiscent of the seven blind men and the elephant in the story — a situation which can be corrected only by creating organisations which can take a synoptic and a sympathetic view of the needs of the land so that these may be catered to in a direct, deliberate and efficient manner.

The management of land and soil resources is indissolubly linked with the management of water resources and cannot therefore be attempted without subjecting the latter to some discipline. For irrigation is not an end in itself but only a means to greater production from the land. It is because such discipline has been absent in the past that so little attention has been paid by our irrigation projects to the problems of sedimentation, water-logging and proper water utilisation. It will be necessary to ensure, in the future, that while on the one hand no new projects are taken up which do not give enough attention to these aspects, energetic steps are also taken on the other hand to remedy such deficiencies in the case of existing and ongoing projects. Such a policy will not result in any shrinkage of employment opportunities for engineers, as feared by some, but rather in their expansion.

A sound land policy will therefore automatically lead to a sound water policy — one which lays more emphasis on the development of ground water resources and insists on much more care with regard to surface water schemes. There is little doubt that such a policy will bring about a close working relationship at various levels between the proposed land authorities and the organisations which deal with the development of water resources, both ground and surface. In the fullness of time, the remorseless logic of circumstances will complete this process by demanding the creation of a Department of Land and Water in the Ministry of Agriculture at the Centre and of similar arrangements in the states. In due course, responsibility for various other neglected aspects of the ecological environment will also inevitably get drawn to such departments. Let us however, take only one small step at a time and not hasten the future unduly, dream of it though we must.

[The views expressed in this paper are those of the author and do not necessarily reflect those of the organisations to which he belongs.]

Calculation of Efficiency Indices of Farmers

A Numerical Exercise

Ashok Kumar Hati
Ashok Rudra

This paper presents the results of an exercise that was carried out with respect to a sample of farmers with a view to evaluating for each individual farm:

(a) an index of "technique efficiency" in relation to the production possibility set to which the sample observations are supposed to belong;

(b) indices of "allocative efficiency" in relation to some of the input items that a farmer may be assumed to be free to allocate; and

(c) marginal productivity of each of these variable input items.

In an earlier paper (Ashok Rudra, "Allocative Efficiency of Indian Farmers: Some Methodological Doubts", January 20, 1973) the theoretical basis for the currently popularised idea that Indian farmers are rational allocators of resources was subjected to some serious criticisms. In another paper (Amal Krishna Dey and Ashok Rudra, "A Test of Hypothesis of Rational Allocation under Cobb-Douglas Technology" March 24, 1973) results of certain tests were presented which rejected the hypothesis of allocative efficiency. In the course of the present paper we present the results of an exercise that was carried out with respect to a sample of farmers with a view to evaluating for each individual farm:

(a) an index of "Technique Efficiency" in relation to the Production Possibility Set to which the sample observations are supposed to belong;

(b) indices of "allocative efficiency" in relation to some of the input items that a farmer may be assumed to be free to allocate;

and (c) marginal productivity of each of these variable input items.

We shall first of all explain the different concepts of efficiency used. A Production Possibility Set is a set X in the $n+1$ dimensional vector space such that each point $x_1, x_2, \dots, x_{n+1}$ in that set represents a possible combination of inputs $x_1, x_2, \dots, x_n$ and the resultant output x_{n+1} , given a certain state of technological knowledge. Consider the subset X^* of X such that the typical point x^* belonging to X^* is a combination of inputs $x_1, x_2, \dots, x_n$ and the maximal output x_{n+1}^* possible by the transformation of the inputs $x_1, x_2, \dots, x_n$. The subset X^* is defined as the Production Function. All points belonging to X that do not belong to X^* represent "inefficient" combinations of input and output — an output less than the maximum possible by transforming the same combination of inputs used, given the state of techno-

logical knowledge. It is a strange fact that while this definition of a Production Function is universally accepted in the literature of production economics, it is practically never followed in the empirical literature of statistical production functions. An important exception is the work of M J Farrell who suggested a method for estimating the facets of a convex polyhedral enclosing a set of observed points. There are two serious limitations in Farrell's approach for our purpose. One is that he uses a non-probabilistic method of estimation which gives highly unstable results in that the estimates are liable to be changed drastically by the addition of a single observation. The second is that he uses activity analysis assumptions which makes the approach unsuitable for agriculture. The methods commonly used for fitting production functions — the Least Squares Method, the Method of Maximum Likelihood, etc., — are such that the underlying model obviously is

$$x_{n+1} = f(x_1, x_2, \dots, x_n) + g \quad (1)$$

or, more commonly

$$x_{n+1} = f(x_1, x_2, \dots, x_n)h \quad (2)$$

where g is an additive error term and h a multiplicative one. In other words the production function $f(x_1, x_2, \dots, x_n)$ is conceived of as the Expected Value of output, given the inputs $x_1, x_2, \dots, x_n$ and not the maximal value. We have however proceeded according to the theoretically correct definition of the Production Function and have defined the different indices of efficiency in the following manner.

(1) Index of Technique Efficiency is given implicitly by the relation

$$x_{n+1} = x_{n+1}^* E_1 = x_{n+1}^* E_h \quad (3)$$

where x_{n+1} is output actually obtained by a particular farm from a combination of inputs $x_1, x_2, \dots, x_n$; x_{n+1}^* is the maximal output possi-

ble from the same combination of inputs, given the same technological knowledge; h an error term, to take care of various chance factors, with mathematical expectation equal to 1; and E a factor measuring the inefficiency of the farm concerned in the matter of transforming inputs into output. It is however not possible to isolate E and h . At the best, estimates can be made of E_1 , the product of the chance factor and the efficiency factor. We shall call this E_1 the Index of Technique Efficiency. E should be always less than 1, but E_1 can indeed take value greater than 1, thanks to the contribution of h .

(2) Indices of Allocative Efficiency Let F be a function that maps the set of inputs $x_1, x_2, \dots, x_n$ on to the set of maximal outputs x_{n+1}^* . Then

$$x_{n+1}^* = F(x_1, x_2, \dots, x_n) \quad (4)$$

represents the production function. Consider now variations in F for variations in the input variables. We shall assume that a certain number s of the inputs $x_1, x_2, \dots, x_n$ are fixed for each farmer, whereas he is free to choose the remaining inputs,

$$x_{s+1}, x_{s+2}, \dots, x_n \text{ Let } x_{s+1}^*, x_{s+2}^*, \dots, x_n^* \quad (5)$$

represent the optimal input combination for a particular farm subject to the condition of the inputs $x_1, x_2, \dots, x_s$ remaining fixed and let the technologically maximal output corresponding to this combination of inputs be x_{n+1}^{**} :

$$x_{n+1}^{**} = F(x_1, x_2, \dots, x_s, x_{s+1}^*, x_{s+2}^*, \dots, x_n^*) \quad (5)$$

Then we shall define as the Allocative Efficiency Index for output the following:

$$E_2 = \frac{x_{n+1}^*}{x_{n+1}^{**}} \quad (6)$$

Also we shall define as Allocative Effi-

ciency Index for the r th input the following

$$q_r = \frac{X_r}{X_r^*} \quad (7)$$

For numerical evaluation of these indices we have used data pertaining to 149 farms drawn at random (with probability proportional to farm size) from the Hooghly district of West Bengal. The variables we have considered are:

- A cultivable area in acres
- P quantity of output (per acre)
 π price index of output (which may vary from farm to farm)
- M quantity of material inputs (measured in value units per acre)
- L quantity of human labour input in hours (per acre)
- r percentage of cultivable area irrigated

The production function that has been fitted can be written as

$$P\pi = \max P\pi = a M^{\alpha_1} L^{\alpha_2} e^{\alpha_3 r} A^{\alpha_4}$$

So that the Index of Technique efficiency would be

$$E_1 = \frac{P\pi}{\hat{P} a M^{\alpha_1} L^{\alpha_2} e^{\alpha_3 r} A^{\alpha_4}}$$

It may be seen that the functional form used is the Cobb Douglas with a certain modification. The modification consists in putting one of the variables, namely r , percentage of area irrigated, as an exponential term rather than a product term. This is done to take care of the problem that would arise when r takes the value 0. Many cross-section production functions encountered in the literature treat r as just another variable in a straight-forward Cobb Douglas form. This has the absurd implication that production would be nil whenever land is not at all irrigated. It also makes computation in logarithms impossible. The same difficulty would arise (and the same remedy should apply) when considering such variables as fertilisers and machinery. Surely production can

take place and does take place with zero irrigation, zero fertiliser input and without the aid of any machinery. The statistical procedure followed in fitting the function F would be discussed in a later section. We would rather proceed now to present the quantitative results.

TECHNIQUE EFFICIENCY

Let A_i , P_i , π_i , M_i , L_i and r_i be the observed variable values for the i -th farm ($i = 1, 2, \dots, 149$). Then the formula for the calculation of the index for the i -th farm is

$$E_i = \frac{P_i \pi_i}{(10.958) M_i^{0.2408} L_i^{0.5530} e^{0.3856r_i} A_i^{0.1122}} \quad (10)$$

This formula has been used to calculate the Technique Efficiency Index for each of the 149 farms. The results are presented in the form of a frequency distribution in Table 1. It may be seen that about 60 per cent of the farms have efficiency lower than 40 per cent; that is, about 60 per cent of the farm are such that they produce less than 40 per cent of what the most efficient farms among them can produce given the same inputs. It may also be noticed that Y farms have index value exceeding 1. That indicates the effect of the chance variable h acting in a highly efficient farm.

ALLOCATION EFFICIENCY: UNCONSTRAINED MAXIMISATION

If farmers could freely vary all the inputs considered, namely, land, labour, irrigation and material inputs, and if they were allocating resources in what is called a rational manner, then they would of course all end up having identical input combinations. That they are not doing so, that all the farms are not identical like so many Siamese twins, is sufficient proof that allocative efficiency in that sense does not prevail among them. This point is flagrantly ignored by those who compare the marginal producti-

TABLE 1: FREQUENCY DISTRIBUTION OF INDICES OF "TECHNIQUES EFFICIENCY"

Range for Index e_1	Number of Farms	Percentages
0-0.20	25	17
0.20-0.40	63	42
0.40-0.60	31	21
0.60-0.80	18	12
0.80-1.00	5	3
1.00 and above	7	5
	149	100

Note: The index e_1 is the ratio of P_i the observed values of farm output and $\hat{P}$ the maximal value of output technologically possible for the same combination of inputs.

TABLE 2: FREQUENCY DISTRIBUTION OF THE RATIO OF MARGINAL PRODUCTIVITY OF MATERIAL INPUTS TO THEIR MARKET PRICES

Rates of Marginal Productivity to Market Price	Number of Farms	Percentages
0-0.50	24	16
0.50-1.00	43	29
1.00-1.50	29	19
1.50-2.00	18	12
2.00 and above	35	24
	149	100

TABLE 3: FREQUENCY DISTRIBUTION OF THE MARGINAL PRODUCTIVITY OF LABOUR

Marginal Productivity of Labour in Rupees Per Day of 8 hours	Number of Farms	Percentages
0-1	14	9
1-3	18	12
3-5	19	13
5-8	58	39
8 and above	40	27
	149	100

Note: The market wage rate may be taken to be Rs 3 per day of 8 hours

ties of all inputs (including land) with their market prices as a means of testing for their allocative efficiency!

To be more realistic, we shall assume that for each farm i the amount of land A_i and the share r_i of it irrigated are fixed for all practical pur-

poses; so that if the farmer is to allocate his resources rationally, the input items on which he can operate are the material inputs M_i and the human labour input L_i . If indeed he is choosing M_i and L_i so as to maximise his profit, given by

$$P_i \pi_i - M_i - L_i W \quad (11)$$

where W is the wage rate, he would be equating his marginal productivity of material inputs to 1 (given that M_i is measured in rupee units) and that of labour to W . That farmers are not using inputs in such optimal proportions is made clear by Tables 2 and 3 which present the marginal productivities of material inputs and labour for individual farmers in the form of frequency distributions; the marginal productivities have been calculated by using the following formulae:

$$\begin{aligned} \frac{\partial P}{\partial M} &= \frac{\partial \hat{P} E_i}{\partial M} = \alpha_1 \frac{\hat{P} E_i}{M} \\ &= \alpha_1 \frac{P}{M} \quad (12) \end{aligned}$$

marginal productivity of labour =

$$\frac{\partial P}{\partial L} = \frac{\partial \hat{P} E_i}{\partial L} = \alpha_2 \frac{\hat{P} E_i}{L} = \alpha_2 \frac{P}{L} \quad (13)$$

Hence, the marginal productivities of the i -th farmer may be written as

$$\alpha_1 \frac{P_i}{M_i} \text{ and } \alpha_2 \frac{P_i}{L_i}$$

As can be seen from Table 2, more than one-third of the farms are operating in such a way as to have marginal productivity of material inputs 50 per cent or more above the level that would satisfy the criterion of rational allocation of resources and one-sixth of them have marginal productivity below 50 per cent of that level. Table 3 presents the frequency distribution of marginal productivities of labour for 8-hour days in rupees. If one wants to compare these marginal productivities with the "market wage rate", one may take for the latter the figure of Rs 3 per 8-hour day or Rs 0.375 per hour. (Given the operationwise and seasonwise variations of wage rate in agriculture, as well as the different rates for different categories of hired labour, it is difficult to say what single number could be regarded as the "marginal wage rate"; but if a single number has to be taken, a reasonable model average would be Rs 3 per day.) It is seen from Table 3

that 27 per cent of the farmers are using human labour in such a fashion as to produce a marginal productivity of labour per day of Rs 8 or more; and another 10 per cent are operating with a marginal productivity of less than Re 1 per day! So much for the Rational Allocation of Resources thesis getting established by the observed correspondence of market prices and marginal productivities!

The matter may be looked at in a more direct fashion. If indeed an efficient farm, subject to the production function F given by (8) and given the fixed resources A_i and r_i , is maximising output by optimally choosing M_i and L_i , then it can be shown that the optimal inputs M_i^0 and L_i^0 and the resultant optimal output P_i^0 would be given by

$$\begin{aligned} 1 - \alpha_1 - \alpha_2 &= (\pi_i P_i^0)^{\alpha_1 + \alpha_2} \\ &= a e^{\alpha_3 r_i} A_i^{\alpha_4} \left(\frac{\alpha_2}{w} \right)^{\alpha_2} \quad (14) \end{aligned}$$

$$M_i = \alpha_1 P_i \pi_i \quad (15)$$

$$L_i = \frac{\alpha_2 P_i \pi_i}{w} \quad (16)$$

Numerical calculations show that these optimal inputs and outputs would be more than the observed inputs and outputs by factors that may be of the order of 100 or 200 or more. Table 4 shows some such calculations for three selected cases.

ALLOCATIVE EFFICIENCY: CONSTRAINED MAXIMISATION

We can now add one further constraint on the i -th farmer. We shall say that he is free to choose M_i and L_i only in such a fashion as to satisfy the budget constraint.

$$M_i + L_i W = Z \quad (17)$$

(M being measured in value units does not require to be multiplied by price). It can be shown that with this constraint the optimal combination of labour input and material inputs would be given by

$$M^* = \frac{\alpha_1}{\alpha_1 + \alpha_2} Z \quad (18)$$

$$L^* = \frac{\alpha_2}{\alpha_1 + \alpha_2} \frac{Z}{W} \quad (19)$$

We can assume for the i -th farmer that his budget Z_i is exhausted by

the actual inputs he is observed to make; that is, Z_i may be calculated by the formula:

$$Z_i = M_i + L_i W \quad (20)$$

This permits the calculation of M_i^* and L_i^* for him by the use of the formulae (18) and (19). We can treat the ratios

$$\frac{M_i}{M_i^*} \text{ and } \frac{L_i}{L_i^*} \quad (21)$$

as the Allocation Efficiency Indices for material input and labour input, respectively. Tables 5 and 6 present these indices in the form of frequency distributions. It is seen from Table 5 that about 40 per cent of the farms use material inputs 50 per cent or more above or below the optimal level. The divergence from the optimal labour input is less marked. Thus, as many as 65 per cent of the farms have their labour inputs within ± 25 per cent of their respective optimal labour input levels. The question may be asked: could this extent of divergence from the optimal levels taken jointly be explained away as arising out of chance factors alone? This would require a test and such a test was carried out (with the same body of data) and the results presented in the earlier paper. It was found that the test rejected the hypothesis of farms departing from the optimal levels only by chance factors.

It is, however, interesting to notice that even though the combinations of labour input and material input are significantly different from the (constrained) optimal combinations, the (constrained) optimal point

$$F(A_i, r_i, M_i^*, L_i^*)$$

on the maximal production surface corresponding to the farm having land A_i and irrigation percentage r_i does not differ a great deal from the maximal point $F(A_i, r_i, M_i, L_i)$ corresponding to the observed combination

$$E_2 = \frac{F(A_i, r_i, M_i, L_i)}{F(A_i, r_i, M_i^*, L_i^*)} \quad (22)$$

is in most cases very large. Out of the 149 cases only in 6 is the ratio less than 0.95 (see Table 7). This means that the technologically maximal output varies only slightly when A_i , r_i as well as Z_i are kept fixed.

STATISTICAL METHODS

The statistical procedure that has been used to estimate the function F

0.90-0.95	38	26
0.95-1.00	83	56
	149	100

is as follows. We have to begin with a straightforward fit of the function to our data in the usual way — that is, by the Method of Least Squares applied to the logarithms. We expressed all the variables in per-acre terms to ensure homoeostaticity. The estimates yielded were

$$\alpha_0 = 0.53972$$

$$\alpha_1 = 0.24084 \text{ (0.09810)}$$

$$\alpha_2 = 0.55302 \text{ (0.1417)} \quad R^2 = 0.4985$$

$$\alpha_3 = 0.38562 \text{ (0.09292)}$$

$$\alpha_4 = 0.11219 \text{ (0.05805)}$$

(The figures in brackets are the res-

pective standard errors). α_3 , it may be noted, is the estimate of the constant term in the linear regression equation. The next step was to calculate for each observed combination of values of inputs M_i , L_i , r_i and A_i the expected value of $\log P_i$ by using the formula:

$$E(\log P_i) = \alpha_0 + \alpha_1 \log M_i + \alpha_2 \log L_i + \alpha_3 r_i + \alpha_4 \log A_i \quad (23)$$

We then took the deviations

$$\log P_i - E(\log P_i) = d_i \quad (24)$$

and studied its frequency distribution. With the help of this empirical distribution we estimated the upper 95 per cent point of the population distribution of d_i which may be designated by $\log d$. Then the estimate of the parameter a in the formula (8) has been made by using the following formula

$$a = \alpha_0 d \quad (25)$$

The interpretation we put on the estimate a thus arrived at is as follows.

In repeated sampling it may be expected that an observed output P_i would exceed the estimated maximal

values P_i roughly in 5 per cent of the cases. The fact that the estimated P_i does not pretend to be an absolute maximum but a probabilistic limit subject to a 5 per cent chance of being exceeded is precisely the singular virtue claimed by us for this method. It also follows that if the estimates in the first instance are based on a reasonably large sample size, the upper limit thus arrived at will change only slightly on recalculation after incorporation of fresh data.

The R^2 value is rather small. However, given the interpretation we are giving to the fitted function, R^2 is not to be interpreted only as a measure of "goodness of fit". It is to be interpreted also as a measure of dispersion of the Technique Efficiency

Indices (which, it may be recalled, reflects variations due to efficiency differences as well as due to chance factors). A small R^2 means a large dispersion.

It may be mentioned that while the addition of the irrigation term significantly improves the fit, that of A does

not. That is, the co-efficient α_4 is found to be non-significant. It may be asked why, in that case, the variable A has been retained at all. Our answer is that the inclusion of the A term with a positive co-efficient would imply increasing returns to scale, whereas its omission would mean constant returns to scale. (This is so as the variables M , L and r are each proportions of A). We would insist

on retaining the co-efficient value $\alpha_4 = 0.11219$, as representing a moderate increasing returns to scale tendency. It is non-significant only *vis-a-vis* the null hypothesis of constant returns to scale. We know of no prior scientific reasoning to subscribe to the view that constant returns to scale prevail among the farms studied. And as such it is quite incorrect to set up, quite arbitrarily, a null hypothesis that α_4 is actually zero in the population. In such a situation, the best course of action is to fall back upon the best point estimate, which is, in this case, 0.11219.

Fibreglass Pilkington

FIBREGLASS PILKINGTON has undertaken a substantial expansion programme at its Thana factory for manufacture of continuous glass filaments; for that purpose it will require to raise additional funds. The board proposes to obtain a rupee loan of Rs 54 lakhs and a foreign currency loan of £ 136,235 (equivalent of about Rs 26 lakhs) from ICICI. The foreign currency loan is to be obtained out of the UK line of credit as stipulated by the Government of India. As one of the conditions for grant of the loans, ICICI has stipulated that it would have an option to convert part of the loans into 90,000 equity shares of Rs 10 each at a premium of Rs 2.50 per share during the period April 1975 to March 1977. The shares issued to ICICI will rank *pari passu* with the existing shares, provided that they will be entitled to a proportionate dividend from the date of allotment in respect of the financial year in which they are so allotted.

The economic performance of the agricultural sector in most countries has been largely determined by the organised research and extension activity in those countries. An increasing number of studies have established an association between productivity growth (as conventionally measured) and the level of such activities.¹ The term 'non-conventional' factors has crept into the related literature to describe these activities.

At present, a complete compilation of the level of investment in agricultural research is not available either for all-India or for the major states in India. This paper develops such a compilation, in the form of time series data on research investment in each major state from 1950 to 1968.

The primary purpose in developing these data is to provide a basis for studies of productivity gains in Indian agriculture. The authors realise that the enterprise is fraught with difficulties, as witness the notes to the tables. It has been possible, however, to obtain a reasonably complete reconciliation between two independent data sources — which has been the basis for reporting them here. The authors present this report in the hope that it will induce further studies which will provide more accurate data on these activities in the future.

Brief Organisation History²

THE agricultural research system in India is a large and complex one. Furthermore, it has changed greatly in organisational form and in research emphasis in the post-1950 period.

The earliest institutions for research in agriculture were founded in the last quarter of the nineteenth century. During the pre-Independence period, research activities focused mainly on commercial crops such as sugarcane, coffee, cotton, tea, jute and to a lesser extent on rice. Organisationally, there were various central research institutes under the Ministry of Food and Agriculture and central commodity committees on sugarcane, tobacco, oilseeds, jute, coconut, lac and arecanut. There was little central co-ordination of these activities, however, though, in addition, each state operated its own, usually small, research stations. The research of that period was, however, of considerable significance in the cash crops — in particular, in sugarcane.³

The period after Independence has brought successive changes in the agricultural research system of the country. That the government has been very conscious of the need for these changes is seen in the fact that four high-powered committees have recommended changes in 1955, 1959, 1962 and 1963. The main thrust of the reorganisation has been twofold:

- (1) The Indian Council of Agricultural Research was revamped in 1964, bringing under its aegis (though not as subordinate institutions) the various research institutions operated by the commodity committees and all the central research institutes.

- (2) Since the late fifties, an agricultural university has been established in almost every state — the earliest being the UP Agricultural University at Pantnagar, the Punjab Agricultural University at Ludhiana, the Orissa University of Agriculture and Technology, and the University of Udaipur in Rajasthan. Most of these Universities have now taken over a large portion of the state research systems from their respective Departments of Agriculture.

It is this reorganisation that has made

possible the All India Co-ordinated Schemes in maize, wheat, rice and agronomy, among others. The research system is still, of course, in a state of flux and we expect that many more changes will accompany its inevitable expansion.

ALL-INDIA ESTIMATES

Table 1 summarises our efforts. It presents our best estimates of expenditures (in constant 1968 rupees) of research devoted to ordinary crop pro-

TABLE 1: INDIAN AGRICULTURAL RESEARCH EXPENDITURES, 1950-1968

68	13.56	3.00	1.15	17.71	0.17

Notes: *Includes coconuts, tea, arecanut, lac and jute. Other crops included in crop research.

**Approximated from Indian Agriculture in Brief.

duction, to livestock production, and to specialty crop production. This series is compiled from our state estimates which are detailed in the Appendix to the paper. As the notes to the Appendix Tables indicate, certain adjustments — many of them 'judgemental' — had to be made in the course of the compilation. We feel that the adjustments are reasonable and that the resultant series reported in Table 1 is not subject to great error.⁴

Table 1 clarifies the major trends in research investment. Perhaps the most striking feature is the substantial real increase in investment in crop research, from Rs 3.5 crores to Rs 13.5 crores over the period. In absolute terms, the largest part of the increase has occurred in the second half of the 1950-68 period. Taking Robert Herdt's [6] estimate of roughly Rs 4.3 crores as the spending of the Central Government in the early 1960s, we have an indication that the states spent roughly one-half of the total. This figure has probably increased to roughly two-thirds by 1968.

It is also quite apparent that the relative weight of both livestock and specialty crop research has declined over the period — from 32 per cent in 1950 to 23 per cent in 1968. Research on foodgrains has increased most rapidly over the period. The percentage of agricultural product value invested in research activities rose substantially over the period, but continues to be low by international standards. Most developed countries invest approximately one per cent in agricultural research.

In Table 2 we present our estimates of the research expenditures which were directly related to specific crop commodities in 1968. These estimates are partially based on the data in Table 4.⁵ The Table shows that the commercial crops — cotton, jute, and sugarcane — continue to receive heaviest

TABLE 2: COMMODITY ORIENTATION OF INDIAN AGRICULTURAL RESEARCH EXPENDITURES, 1968

	Rice	Wheat	Maize	Millets	Sugar	Cotton	Jute
Estimated expenditures (Rs crores)	.74	.56	.16	.24	.51	.47	.12
Per cent of commodity value	0.035	0.082	0.080	0.042	0.10	0.22	0.15

emphasis, but to an extent far less than would have prevailed in 1950 (or in 1930 when commercial crop research dominated the programme). Actually, we do not have detailed data on commodity values for lac, tea, coconuts, arecanut, or spices, but these commodities appear to have higher research expenditures per rupee worth of product than those in Table 2.⁶

RESEARCH OUTPUT: PUBLICATIONS

Tables 3 and 4 present data based on two completely independent sources. They are, in fact, not measures of research investment, but of research output. Table 3 is a tabulation of publications abstracted in three international abstracting journals; *Plant Breeding Abstracts* [10], *Dairy Science Abstracts* [2], and *Biological Abstracts* [1].⁷ Table 4 is based on a tabulation of publications from *Indian Science Abstracts* [7]. Both Tables provide an important check on the expenditure data.

Table 3 provides a check on the change in research investment over time. Our expenditure data indicated that investment in the 1962-68 period was three times as great as in the 1948-54 period. Table 3 indicates that crop research publications increased by a factor of only 2.3 over the same period.

This does not seem unreasonable, since the real costs of doing research have tended to increase in almost all countries over this period. The publications data suggest a higher share for livestock-oriented research than is suggested by our expenditure data, but this is partially due to a relatively high publications-to-scientist ratio in dairy-related work.

The publications data also show a relatively high concentration of research on cotton and sugar. They indicate that the research concentration is becoming more equitable between commodities over time, as research per unit production of rice, wheat and millets — the major foodgrains — has increased substantially over time. We do not have good data on research on pulses and oilseeds, but our scanty information indicates that very little research on pulses has been undertaken.⁸

Tables 4 and 5 present data on a state basis. The two sets of data are reasonably consistent with each other. Table 4 allows a crude assessment of the statewide allocation of commodity research. Overall, there is a reasonable correlation between the location of research and the location of production. The five leading rice producing states — West Bengal, Bihar, Andhra Pradesh,

TABLE 4: COMMODITY ORIENTED PUBLICATIONS BY MAJOR INDIAN STATE: ABSTRACTED FROM INDIAN SCIENCE ABSTRACTS 1965-1970

State	Rice	Wheat	Maize	Millets	Sugar	Cotton	Total	Publications per Community Development Block

Delhi	48	106	26	39	15	27	870	—
All India	468	285	115	258	298	260	6687	—

desh, Orissa, and Tamil Nadu — produce 60 per cent of India's rice and carry out 70 per cent of the rice research in India.

Uttar Pradesh, Punjab and Haryana produce 65 per cent of the nation's wheat, and undertake 32 per cent of the research. When the research done in Delhi is included, however, this region accounts for 69 per cent of the wheat research. The states of Uttar Pradesh, Bihar, Punjab, and Rajasthan, produce 63 per cent of the maize and perform 65 per cent of the maize research.

Research on millets is less concentrated in the leading producing states. Maharashtra, Mysore, Madhya Pradesh, and Andhra Pradesh, produce over two-thirds of the millets, but account for only 25 per cent of the research. Uttar Pradesh, the leading sugarcane producing state, conducts almost half of the sugarcane research in the country. The

other significant research states, Tamil Nadu, Punjab-Haryana, and Bihar produce less than 20 per cent of the nation's sugar. Gujarat, Maharashtra, and Punjab-Haryana, produce about 75 per cent of the cotton in India and perform only 20 per cent of the cotton research (30 per cent if Delhi is included).

These comparisons have obvious limitations, but it should be noted that the publications data in Table 4 are quite consistent with those in Table 3, even though independent sources were used. The publications data are less consistent, on a commodity basis, with the expenditure data in Table 2. We would not, however, expect a high degree of consistency here, since we know that there are systematic differences in publishing standards in different fields: It is simply easier to publish in some fields than others.

Our final set of data are in Table 5.

There we present, for selected years, annual research expenditures on crop production only (excluding specialty crops), by states. These data may be compared with those in Table 4 to obtain a crude consistency check. The Table shows that Uttar Pradesh is the leading research state by a wide margin. It is, of course, also the largest state, geographically and economically. We need some basis for comparison if we are to say anything about research intensities. The proper 'deflators' would be related to the extent and nature of the problems to be solved. We know that the problems facing agricultural researchers are related to climate factors which differ greatly over India. They are also partly related to the economic organisation of production. In Table 5 (and in the right hand column of Table 4), we have deflated research by the number of delineated community development blocks in each state.⁹

TABLE 5: CROP RELATED EXPENDITURES BY STATES, 1953-1968

State	Total Expenditures				Expenditures per Community Development Block			
	1953	1958	1963	1968	1953	1958	1963	1968
Andhra Pradesh	.353	.440	.569	.929	.79	.90	1.28	2.09
Assam	.119	.122	.122	.128	.74	.76	.76	.80
Bihar	.300	.450	.548	.548	.52	.78	.95	.95
Gujarat	.180	.320	.475	.900	.80	1.43	2.11	4.01
Haryana	.120	.188	.349	.496	1.46	2.29	4.25	6.05
Kerala	.050	.073	.128	.180	.35	.51	.90	1.26
Madhya Pradesh	.161	.171	.390	.595	.39	.41	9.3	1.43
Maharashtra	.176	.426	.593	1.390	.42	1.00	1.30	3.27
Mysore	.328	.437	.450	.720	1.22	1.63	1.68	2.68
Orissa	.245	.245	.548	.583	.80	.80	1.78	1.90
Punjab	.204	.320	.594	.845	1.76	2.76	5.12	7.28
Rajasthan	.113	.166	.735	.740	.49	.72	3.16	3.19
Tamil Nadu	.562	.700	.907	.919	1.50	1.87	2.42	2.61
Uttar Pradesh	.444	.591	1.452	1.712	.49	6.6	1.62	1.91
West Bengal	.100	.231	.364	.364	.29	.68	1.07	1.07
Delhi	.580	.890	1.290	2.451	—	—	—	—

Alternative deflators, such as the value of agricultural output, or harvested acreage would not alter the pattern in Table 5 greatly.

As the Table indicates, Punjab and Haryana have been investing clearly the most in research over the entire period (the separation prior to 1964 is in proportion to the number of blocks). In 1953 and 1958, Tamil Nadu ranked next, followed by Mysore. By 1968, Gujarat, Rajasthan and Maharashtra moved ahead of both of them. In 1968, the five states with the lowest research investment per community development block were: Assam, Bihar, West Bengal, Kerala and Madhya Pradesh. The latter three states ranked among the lowest five throughout the period, while Assam and Bihar ranked somewhat higher in 1953. Uttar Pradesh, Rajasthan and Maharashtra showed the greatest relative improvement over time.

The total publications data in Table 4 include speciality crop publications, and so are not strictly comparable to the expenditure data in Table 5. For example, West Bengal and Kerala rank higher when the speciality crop research is included. Other than these two states and Gujarat, however, the publications data and the expenditure data (for 1963) are well correlated.

In this paper, we will not attempt to relate the research programme to the economic performance by states. We will only note the obvious. By any standards, the leading states in economic performance during the 1956-71 period have been Punjab-Haryana and more recently Gujarat. The states with the poorest economic performance in the decade are also those lowest in the research ranking.

The Appendix provides state expenditure time series and notes on the calculations. We should again note that this is in no sense an 'official' data series. It contains numerous judgments on our part. We developed it because an official series does not exist and will not be produced for the time period in question. Even today, no official agency of the Indian Government is systematically collecting annual data on this activity. It is our hope that this set of data will be improved through criticism by others and through provision of further information.

Appendix

TABLE AND NOTES

The Appendix Table provides state-wise time series data on annual crop research expenditures. The basic data

source is *The Directory of Scientific Research Institutions in India* [11]. This directory lists data for some 285 research institutions working on agricultural research. It does not include all existing research institutions. Some rather obvious omissions were several of the new Agricultural Universities. We have estimated the budgets of these Universities by comparing them with Universities for which data do exist. Most of the Universities are now administering the state research systems, which were expanded substantially between 1950 and the middle-1960s. The directory did not always provide separate data for each of the state stations, an it was not clear in some cases whether the University data included the state station data.

The 285 institutions, for which data were provided, really included more than 285 research units. That is, sub-stations were not usually treated as separate units. The total number of separate research or research-type units may exceed 500 and the directory may well have missed 100 or so. By and large, the omission of the smaller stations is not too serious. From the data on small stations that we do have, we can get a pretty good idea of their budget and staffing patterns. They would typically have budgets of Rs 25,000-50,000 and research staffs of two to five or so. Even 100 such stations would only account for 2 per cent of the total research budget.

The budgets reported in the directory need not reflect real research, of course. Most Universities, Institutes, and Colleges, reported budgets which included some teaching and extension work. On the basis of data from ICAR — which indicated that, of the total budget of IARI, only 75 per cent was actually spent on research — we made the following adjustments:

- (1) The budgets reported by all Research Institutes and Agricultural Universities (not research stations however) were multiplied by 0.75 to estimate the research component.
- (2) The budgets of agricultural colleges were multiplied by 0.5 to obtain the research component. This was arbitrary and based on the relatively larger teaching activity in colleges. In fact, our impression is that these colleges conduct very little research.

With these modifications, including the estimation of the budgets for universities which did not provide data, we obtained the 1968 figures. The next step was to construct a time series for each state. This was done in two alternative ways, from two independent

sources and represents the major check on our data.

We construct one series from the directory data, as follows:

- (1) Universities and Institutes established after 1950 were assumed to have had a budget one-half of the 1968 level at establishment, rising to the 1968 level over a period of five years.
- (2) Large Universities and Colleges and Institutes established prior to 1950 were assumed to have had a 1950 budget 1/2 the 1968 budget, rising to the 1968 level by 1960.
- (3) All small stations and Institutes with budgets less than Rs 10 lakhs were assumed to have maintained their 1968 budget levels from the data of establishment. (For example, state stations and PIRCOM stations).

A second time series was constructed by examining the budgets of each state in detail. These budgets have important elements of inconsistency, and early work with aggregate budget categories convinced us that the expenditures under the general headings were of little value. All states have two such headings: (1) *Experimental Farms* and (2) *Agricultural Experiments and Research*. On examination of the detailed budgets, it becomes quite clear that much non-research activity is included in these budgets. In fact, they overstated the research expenditures by approximately a factor of 2. Furthermore this overstatement was not consistent across states.

We thus had no alternative, but to go through the detailed budgets for each state for several years and select the obvious research expenditures by the state governments. We also identified payments to the states by the central government through ICAR and the payments made by the various Central Commodity Committees. This involved some judgments, but most non-research activity, such as fertiliser schemes or extension activity, was obvious.

We examined the two alternative series for major inconsistencies. Most inconsistencies were obvious, such as missing University budget data. When these were checked we found a surprisingly good correlation between the two series. For the early 1960s, the two series were within 10 per cent of each other for all states.

A final modification was made on the grounds that for the late 1960s the Directory data were most reliable, and that for the early 1950s the state budget data were most reliable. The Directory series was modified for several states for the early 1950s to bring it in line with the budget data, and this is the final series on which the paper is based.

Appendix Table

ANNUAL AGRICULTURAL RESEARCH EXPENDITURES BY STATE (ADJUSTED)

	Andhra	Assam	Bihar	Gujarat	Kerala	MP	Maharashtra	Mysore	Orissa	Rajasthan	Tamil Nadu	UP	West Bengal	Haryana	Punjab	Delhi
1950	3,530	1,187	3,000	1,796	392	1,429	1,555	3,115	2,451	1,112	5,984	3,731	797	1,069	1,821	5,000

68	9,292	1,284	5,479	9,000	1,800	5,946	13,928	7,197	5,829	7,393	9,778	17,123	3,636	4,961	8,448	24,513

Notes: Specific Adjustments

- (1) Adjustments made to college and university data.
- (2) The 1950 to 1960 Directory series was scaled downward by Rs 850,000 to make it consistent with State Budget data.
- (1) The Tea Research expenditures are not included in the series (they are included in the speciality crops series Table 1).
- (2) Assam Agricultural University is not included in the series. No estimate of the contribution was attempted.
- (1) 1950-1955 expenditures based on budget data. 1955-60 interpolated between budget and Directory figures.
- (1) Budget Adjustment for 1950-1955 — Interpolations to Directory figures 1955-60.
- (1) Expenditures for rubber, coconut and arecanut included in speciality crops series.
- (1) Series consistent — standard adjustments.
- (1) Estimates of expenditures for Poona and Nagpur Agr Colleges made, 1950 (Rs 750,000), 1960 (1500), 1968 (11,000) interpolation in the intervening years. [These are probably a little high.]
- (1) Arecanut and coffee research included in speciality crops.
- (1) Budget data on State research stations added to Directory series. (Rs 5,77,000 in 1968, Rs 2,22,000 prior to 1964).
- (1) University adjustment is 50 per cent instead of 75 per cent since it is not an Agricultural University.
- (1) 50 per cent of Faculty of Agricultural Anamalai University, S Arcot estimated to be research expenditure.
- (1) Estimated research expenditures on APAU, Pantnagar of Rs 7,500,000 based on PAU, Ludhiana budget.
- (1) Birla Agricultural College budget estimated to be the same as Bihar Agricultural College.
- (1) The composite series prior to 1965 was divided by the ratio of Community Development Blocks in the two States.

On the Essence and Manifestation of Capitalism in Indian Agriculture

Ranjit Sau

The question of the degree and trend of capitalist development arises in the context of defining the strategy and tactics of class struggle. The basic question, then, is twofold: (a) whether and to what extent capitalism has already penetrated and is penetrating Indian agriculture and industry; and (b) whether capitalism can develop in India, and if it develops what its character would be.

The nature, extent and trend of the development of capitalism in agriculture as much as in industry in any country in all historical periods are necessarily and fully manifested in the existing class relations and the dynamics thereof, which in turn dialectically interacts with the pace of capitalist development.

To have a look at the data of wage-labour and/or of the capital stock, without any analysis of the underlying class relations, and to pronounce on its basis on the extent and trend of the development of capitalism is to betray ignorance about the essence of capitalism in the sense of Marx.

IN a review article on Gunder Frank's remarkable book, "Capitalism and Underdevelopment in Latin America", I have raised certain questions about his concept of the essence and manifestation of capitalism.¹ His latest note in this journal has further clarified his concept.² But thereby it has only confirmed any interpretation of his contention as well as my comments thereon. However, my earlier remarks call for an elaboration in the light of Gunder Frank's note.

Meanwhile, in the pages of this journal a debate is going on with regard to the nature and extent of capitalism in Indian agriculture. The exchanges have been occasionally reduced to personal carjature and a parade of 'eight-legged essays'. At any rate, the basic issues yet remain very much open. Besides, it seems to me that in the maze of the polemics, the fundamental perspective has been lost sight of. As Marx says, "the very formulation of the problem carries its own solution".³ In this case also the problem yet remains to be formulated in the correct perspective.

I

Marx gives the *differentia specifica* of the capitalist mode of production as follows: "Labour-power is sold today, not with a view to satisfying, by its service, or by its product, the personal needs of the buyer. His aim is augmentation of his capital, production of commodities containing more labour than he pays for, containing therefore a portion of value that costs him nothing, and that is nevertheless realised when the commodities are sold. Production of surplus-value is the absolute law of his mode of production."⁴ This is not a mere isolated quotation torn out of context; indeed, it sums up the core of Marx's view on capitalism as a mode of production.

It is important that the above quotation is fully and clearly understood. In order to facilitate the subsequent discussion let us spell out its meaning in the form of the following three propositions which are not mutually exclusive.

Proposition A: The very fact that labour-power is sold does not *per se* imply capitalist mode of production, unless other conditions are satisfied.

Proposition B: it is certainly not capitalism if labour-power is purchased with a view to satisfying, by its service or by its product, the personal needs of the buyer of labour-power.

Proposition C: The fundamental aim of the buyer of labour-power in the capitalist mode of production is augmentation of his capital, that is, accumulation. In other words, the objective of the capitalist for the production of surplus value is accumulation.

A definition is a phrase signifying a thing's essence. To Aristotle, the 'essence' of a thing in turn consists of a set of fundamental attributes which are the necessary and sufficient conditions for any concrete thing to be what it is.⁵ By the 'essence' Lenin, however, means "one of the 'essentials', one of the principal, if not the principal, characteristics or features" of the definiendum. This is precisely how Hegel, too, puts the matter, while Aristotle in his *Metaphysics* continually grapples with it and combats Heraclitus and Heraclitean ideas.⁷ In any case, to Lenin 'the essence' and 'the necessary and sufficient conditions' are clearly not equivalent in the sense of one-to-one correspondence. When Lenin defines capitalism as "that stage where labour-power itself is a commodity"⁸ he gives the 'essence' of capitalism, not 'the necessary and sufficient conditions' thereof. In order to appreciate the following discussion it

is worthwhile to bear in mind the distinction between the *essence* on the one hand, and the *necessary and sufficient conditions* on the other. In the 'essence' of a thing Lenin locates one of the major necessary conditions of its being rather than the full set of its necessary and sufficient conditions.

Furthermore, the essence as such is one thing, and the *manifestation* of the essence is another. 'Manifestations' are "only the results of their [the 'essential features'] action on our sense-organs." When, for instance, one measures the degree of capitalist development in a country what one measures is not the essence as such but the extent of the 'manifestations' of the essence of capitalism. The essence — "where labour-power itself is a commodity" — is manifested in the employment of wage labour. "The employment of hired labour" is "the principal manifestation of... capitalism", according to Lenin.¹⁰

Which particular manifestation of the essence would be measured and how it would be measured in order to understand the degree of development of capitalism in a given case depends very much upon the nature and availability of data. In the course of his attempt to find the relative incidence of the capitalist system and the corvée system in Russian agriculture, Lenin observes, "first of all, no precise statistics are available on the matter, and it is not likely that they could be collected: that would require a registration not only of all estates, but of all economic operations performed on all the estates. Only approximate data are available, in the shape of general descriptions of individual localities as to the predominance of one or another system."¹¹ On another occasion he observes that "railway statistics provide remarkably

[The authors have relied heavily on two main sources in the compilation of research expenditures by state. They are: (1) *Directory of Scientific Research Institutions in India, 1969*, T S Rajagopalan and R Satyanarayana, Indian National Scientific Documentation Center, Delhi. (2) The Annual Budget reports of each State.

In addition, they have utilised three other sources for supplementary data:

- (i) The Annual Reports of the Indian Council of Agricultural Research.
- (ii) An unpublished paper by Robert Herdt, "Agricultural Research Expenditures in India", University of Illinois, mimeo, 1970.
- (iii) *Agricultural Research in India*, M S Randhawa, ICAR, 2nd edition 1969.

These latter sources do not provide information on the research supported by and performed by state government organisations. They are, however, valuable references to the work sponsored by the Central government.

The authors are indebted to V S Vyas for helpful comments.]

Notes

- 1 See Fishel [4], for a summary of several studies. Also Hayami and Ruttan [5].
- 2 See Albert H Moseman, editor, [9] for a discussion of research systems in India and other Asian countries.
- 3 See Evenson, Houck and Ruttan [3] for a discussion of the contribution of Indian Sugarcane Research.
- 4 The closest agreement between the two data sources occurred in the early 1960s. We would judge that the plausible error from omissions is unlikely to exceed 10 per cent for this period and perhaps 20 per cent for the earlier period.
- 5 See page 9.
- 6 Our estimates are that between Rs 50 and 6 million rupees were spent on tea research in 1968, 1.3 on lac; 1.9 on coconut, and 1.0 on arecanut.
- 7 See Evenson and Kislev [8] for complete details and a comparison with other countries.
- 8 R Herdt [6] provides evidence that the Central Government does little research on pulses.

ECONOMIST

Required by a Bank in Calcutta to head its Economic Research Department.

Job Description :

1. To organise the bank's economic and operational research activities.
2. To undertake field studies of potentialities for banking development, evaluation of activities in various fields like agriculture, small business, etc.
3. To assist formulation of corporate business plans at various levels.
4. To organise the statistical services of the bank.

Qualification :

1. A doctorate or a first class post-graduate degree in Economics and other related disciplines from an Indian or Foreign University with consistently good academic record.
2. About five years' experience in conducting and organising research activities in a supervisory capacity in a research institution or a business organisation.

Please write giving full particulars and stating remuneration expected, to Box

No. 150. Economic and Political Weekly, "Skylark", 284 Frere Road, Bombay 400 001.

Biggest by many standards

Indianoil—a small company in public sector in the early sixties—has now grown to be a giant oil organisation meeting 55 per cent of the nation's petroleum requirements. Emerging as the biggest corporate enterprise in public

and private sectors, Indianoil has achieved a record turnover of Rs. 2.5 crores a day (Rs. 862 crores in 1971-72). The largest profit-yielding company in the country — Rs. 37 crores for 1971-72 — Indianoil's total profits

have reached Rs. 105 crores. Biggest by several other standards, Indianoil is looking forward to a brighter future, ensuring the nation a total self-sufficiency in petroleum and its by-products.

exact data on the different rates of growth of capitalism and finance capital in world economy".¹² Of course, by no means is the growth of railway route-kilometres the essence of growth of capitalism and finance capital, but only its manifestation in one specific historical context.

No matter how its growth has been actually measured with statistical data, Marx's concept of the capitalist mode of production implies at the same time three things, namely, (a) the purchase of labour-power, (b) in order to produce surplus value, (c) with a view to augmenting the capital of the buyer of the labour-power.¹³ It should be noted that "the ultimate aim" of Marx's "Capital" is "to lay bare the economic law of motion" of the capitalist society in general,¹⁴ whereas Lenin has tried to apply Marx's law of capitalism in the particular historical setting of Russia, where the purchase and employment of wage-labour in the main implied production of surplus value as well as its reinvestment. But whether the employment of wage-labour is intrinsically linked up with the production of surplus value and the accumulation in a given historical stage in India is a question which has to be answered with concrete data for India; it cannot be answered *a priori* by invoking the fact that Lenin thought so with regard to Russia, or the United States, or Germany or some other European countries at a certain period.

Further, to argue that the employment of hired labour invariably and everywhere implies the production of commodity is simply fallacious. Labour-power may be purchased "with a view to satisfying, by its service or by its product, the personal needs of the buyer". Hence, the employment of hired labour does not necessarily result in the production of commodity and of surplus value. Moreover, the production of surplus value itself need not always lead to the augmentation of capital in all historical situations.

II

Marx's law of capitalist production holds as much in agriculture as in industry, although in agriculture the process of development of capitalism is immeasurably more complex and assumes incomparably more diverse forms.

As revealed by the Farm Management Studies in India, even the farmer with a tiny plot of land, less than one acre, employs hired labour. Evidently he also sells a substantial

part of the output in the market, presumably in order to meet the personal needs. If employment of wage labour is the sole criterion then this has to be classified as capitalist production, and he a 'capitalist farmer'. But certainly it goes against the Marxian concepts of capitalist production and capitalist farmer. For, according to Marx, a capitalist farmer is one "who makes his own capital breed by employing wage-labourers."¹⁵ "The prerequisites for the capitalist mode of production [in agriculture] ... are the following: The actual tillers of the soil are wage-labourers employed by a capitalist".¹⁶ And who is the capitalist? The capitalist is "the capitalist farmer who is engaged in agriculture merely as a particular field of exploitation for capital, as investment for his capital in a particular sphere of production".¹⁷

Evidently there is no basic difference between a capitalist in general and a capitalist farmer in particular. A capitalist farmer is a capitalist who "makes his own capital breed by employing wage-labourers" in agriculture as "a particular sphere of production". And Marx has defined a 'capitalist' in amply clear terms.¹⁸

In dialectic materialism, practice is the criterion of truth. In the specific historical situation of Russia at the turn of the century, and with the limitation of the availability of appropriate data, Lenin considered the employment of wage-labour as the principal manifestation of agricultural capitalism in Russia. But then he himself mentions in one place that it led to "an over-estimation of the degree of capitalist development in Russian agriculture". To quote at length: "While we correctly defined the trend of development, we did not correctly define the moment of that development. We assumed that the elements of capitalist agriculture has already taken full shape in Russia, both in landlord farming ... and in peasant farming, which seemed to have given rise to a strong peasant bourgeoisie and therefore to be incapable of bringing about a "peasant agrarian revolution". The erroneous programme was not the result of "fear" of the peasant agrarian revolution, but of an over-estimation of the degree of capitalist development in Russian agriculture. The survivals of serfdom appeared to us then to be a minor detail, whereas capitalist agriculture on the peasant allotments and on the landlords' estate seemed to be quite mature and well-established. The revolution [of 1905] has exposed that mis-

take; it has confirmed the trend of development as we have defined it" [but not the moment of that development].¹⁹

Marx's theory of capitalism has been confirmed by history. While armed with Marx's theory, Lenin to discern and measure the growth of capitalism in Russia. In his own words, he had to work with the data as they were available to him at that time and his findings were not always fully borne out by history particularly in the Revolution of 1905-1907. On India today there are much better data in terms of variety, richness and reliability. Also meanwhile nearly three quarters of a century with events of profound significance have passed by. Today, to mechanically copy Lenin's formula of measuring the degree of capitalist development in India, without having regard to the advancement of knowledge in the meantime is tantamount to a denial of the dialectical theory of knowledge; it is indeed non-Marxist, non-Leninist.

III

If the employment of wage-labour does not necessarily imply the capitalist mode of production, the re-investment of the surplus product also is not the sufficient condition for this mode. Loot, plunder and other forcible expropriation of the surplus product in India was one of the sources of primitive accumulation for the development of capitalism in England. But the primitive accumulation as such is not the result of the capitalist mode of production but only its starting point.²⁰ In the subsequent period, the surplus expropriated from the colony of India was accumulated in England. But then to claim that therefore the mode of production in India in the colonial period was capitalist to that extent is to commit the error of the other extreme, as compared to the 'thesis' that the employment of wage-labour always and in all historical situations implies capitalism.

Agricultural capitalism without the capitalist farmer is as much nonsense as capitalism without the capitalist. And there is no basic difference between the capitalist in general and the capitalist farmer in particular. Was the British colonialist who expropriated surplus from the zamindar a capitalist farmer in India in the Marxian sense of the term? Certainly not. Was the zamindar in British India a capitalist farmer in the Marxian sense of the term? Certainly not. The extent of capitalism in Indian agriculture during

the colonial days therefore cannot be inferred from the mere fact that the colonial expropriator re-invested the surplus in Britain.

True, the capitalist farmer need not reinvest the surplus value in the same farm or even in agriculture as such; the accumulation also need not take place within the geographical boundary of India. The point however is that agricultural capitalism is impossible without the capitalist farmer, and that neither the zamindar in India nor the British colonialist who expropriated surplus from India and accumulated it in Britain was a capitalist farmer in India so long as they did not produce agricultural commodity with wage-labour in India.

Wage-labour is possible without the capitalist to the extent that labour-power is purchased for satisfying personal needs of the buyer, by its service or by its product. But the capitalist is inconceivable without the wage-labourer. The capitalist farmer is the chief sign and surest indication of capitalism in agriculture.

IV

At the outset we have emphasised that the problem must be correctly formulated keeping in view the fundamental perspective. The question of the degree and trend of capitalist development arises in the context of defining the strategy and tactics of class struggle. If so, the basic question is twofold: (a) whether and to what extent capitalism has already penetrated and is penetrating Indian agriculture and industry; and (b) whether capitalism can develop in India, and if it develops what its character would be.

It is interesting to note that even though according to the Second Havana Declaration²¹ and Debray²² the Latin American economy, particularly its agriculture, is essentially feudal in nature, and whereas according to Gunder Frank²³ no part of the Latin American economy is feudal but it is already fully capitalist, they are nonetheless unanimous that the road to the fullest economic development of Latin America does not lie through further development of capitalism. Similarly, recognising that the then Chinese economy was semi-feudal and semi-colonial, Mao Tse-tung²⁴ in 1940 observed that Chinese capitalism could not develop in China in view of the national and international class alignments.

The nature, extent, and trend of the development of capitalism in agri-

culture as much as in industry in any and every country in all historical periods are necessarily and fully manifested in the existing class relations and the dynamics thereof, which in turn dialectically interacts with the moment and pace of the capitalist development. This is the basic lesson Lenin draws from the revolutions in Russia; this is also in line with the fundamental conclusion of Mao Tse-tung.

To have a look at the data of wage-labour and/or of the capital stock, without any analysis of the underlying class relations, and to pronounce on its basis on the extent and trend of the development of capitalism is to betray ignorance about the essence of capitalism in the sense of Marx.

Philips India

PHILIPS India's sales for the year ended December 31, 1972, were Rs 49 crores — an increase of 5.5 per cent over 1971 (Rs 46.56 crores). Profit before tax for the year after charging Rs 1.48 crores for depreciation (Rs 1.28 crores) amounted to Rs 10.06 crores, as against Rs 11.57 crores for the previous year; the lower profit of the year reflects the inflationary pressure on costs. Profit after tax is Rs 3.4 crores (Rs 3.87 crores). Provision for tax is Rs 6.66 crores (Rs 7.7 crores). From the profit after tax Rs 15 lakhs (Rs 1.8 lakhs) has been provided for Development Rebate Reserve and Rs 10 lakhs (Rs 10 lakhs) for Debenture Redemption Reserve. Rs 6 lakhs (Rs 6 lakhs) has been released

from Development Rebate Reserve and Rs 39 lakhs excess provision for tax for previous years has been written back. An interim dividend, absorbing Rs 65 lakhs was paid in November 1972, leaving a balance of Rs 2.9 crores, which has been transferred to General Reserve (Rs 3.21 crores). For the year ended December 31, 1972, the Directors have proposed a final dividend of Rs 1.20 per share, subject to tax. The proposed final dividend together with the interim dividend of Rs 1.20 per share, less tax, will bring the total distribution to the shareholders for 1972 to Rs 2.40 per share. The proposed final dividend, if approved, will be paid out of the General Reserve.

Elite Farmer Strategy and Regional Disparities in the Agricultural Development of Pakistan

Hamza Alavi

Because the overall rate of growth of agricultural production in Pakistan had outstripped the rate of growth of population; by a simplistic arithmetic of averages, there was a tendency to assume only too easily that the result was a general prosperity for all classes of farmers and for all sections of the rural population.

In fact, the impact of the so-called 'green revolution' on the different strata of the rural population has been quite uneven. Because it was mainly those who cultivate large landholdings who have benefited most from the new developments and those who cultivate small holdings have benefited less, one consequence of the green revolution has been to widen disparities in income and wealth among the different strata of the rural population. It has also had the effect of widening the disparities among the regions. A further consequence of the green revolution, which follows from the secondary effects of changes in patterns of rural incomes and expenditures, is that in the case of those farmers whose physical farm output has not gone up, their real incomes have deteriorated absolutely, as result of the inflationary pressures and the greatly increased demand for manufactured consumer goods.

If such complex secondary effects of the green revolution are taken into account, it is not so surprising that it was in 1968—the year in which the biggest harvests ever had been reaped — that the entire country and the countryside erupted with popular discontent on an unprecedented scale. It is only in the aftermath of that political upheaval, that the 'achievements' in the agricultural sector have begun to be reviewed afresh and some of its contradictions and paradoxes have been recognised.

NEW developments in the agrarian economy of Pakistan, which began in the mid-fifties and gathered momentum in the sixties, culminated by the end of the sixties in unprecedented rates of growth of agricultural production. In West Pakistan, the rate of growth of agricultural production was only 1.4 per cent per annum in the First Five Year Plan (1955-60) and 3.8 per cent per annum in the Second Five Year Plan (1960-65). However, for the first four years of the Third Five Year Plan a rate of growth of agricultural production of 6 per cent per annum¹ was claimed. This was a considerable achievement. And, because this overall rate of growth of agricultural production had outstripped the rate of growth of population, by a simplistic arithmetic of averages, there was a tendency to assume only too easily that the result was a general prosperity for all classes of farmers and for all sections of the rural population. In fact, however, the impact of the so-called green revolution on the different strata of the rural population has been quite uneven. Because it was mainly those who cultivate large landholdings who have benefited most from the new developments and those who cultivate small holdings have benefited less, one consequence of the green revolution has been to widen disparities in income and wealth among the different strata of the rural population. As we shall show in the following analysis, it has also had the effect of widening the disparities among the regions. A further consequ-

ence of the green revolution, which follows from secondary effects of changes in patterns of rural incomes and expenditures, is that in the case of those farmers whose physical farm output has not gone up, their real incomes have deteriorated absolutely, as result of the inflationary pressures and the greatly increased demand for manufactured consumer goods. If such complex secondary effects of the green revolution are taken into account, it is not so surprising that it was in 1968 — the year in which the biggest harvests ever had been reaped — that the entire country and the countryside erupted with popular discontent on an unprecedented scale. It is only in the aftermath of that political upheaval, that the 'achievements' in the agricultural sector have begun to be reviewed afresh and some of its contradictions and paradoxes have been recognised.

Policies directed towards agricultural development — based on the recommended priorities of the 'Five Firsts' which were put forward by the Food and Agriculture Commission of 1960 — have consisted of providing heavily subsidised inputs, embodying modern technology, such as tractors, tubewells, fertilisers, pesticides, and new seeds. To facilitate access to these inputs, generous credit facilities were provided through newly created public institutions. Policies affecting procurement and prices of agricultural commodities were also revised in order to raise the prices. In theory, these benefits were

available for all farmers. But, in practice, the benefits have flowed largely to those with large landholdings. There is some evidence that those with very small holdings, who are no longer able to supplement the income from their tiny holdings by sharecropping, and who are being forced into debt because of inflation that has further eroded their diminished incomes, are compelled by their circumstances to sell their land. Sharecroppers are being evicted from their holdings, notwithstanding their legal 'security of tenure'; in many cases, instead of being evicted altogether they are being dispossessed of a substantial part of the land which they previously rented for sharecropping. Because of evictions and the growing shortage of land available for sharecropping, the terms of sharecropping have been altered to the detriment of the sharecropper. In general, then, the lowest strata of the rural population have benefited little from the green revolution and the position of many has actually deteriorated.

It is sometimes argued that, parallel with the erosion in the land holdings of the lowest strata of farmers, there is also a similar movement at the other end. The landholdings of the biggest landlords, too, it is said, are being reduced by sale because a new class of 'capitalist farmers' are buying up their land. It is, further, maintained that this new 'rural middle class' is quite distinct from the 'old landed aristocracy' whose land they are buying up. The landed aristocracy, it is argued, is losing both

economic and political power, which is being concentrated in the hands of the new rural middle class — the capitalist farmers. Such a picture is misleading and is not supported by facts. There are some landowners, especially a few who have ventured into commerce and industry, who are taking advantage of the inflated prices of land to sell

some of their underutilised land. But such landlords are few and far between. Most landowners, on the other hand, and especially the biggest among them, are investing their untaxed and inflated incomes in buying more land, for they see no other way of utilising their money. The bigger landowners are easily able to outbid all others in

In the context of West Pakistan, it would be quite misleading to make a sharp distinction between so-called 'feudal landlords' and 'capitalist farmers', for they do not constitute separate and distinguishable classes. Sharecropping and mechanised capitalist farming are two, often complementary, methods of exploitation of land. Moreover, those who give their land for sharecropping are not necessarily great 'absentee' landlords. Until mechanised farming was introduced, all landowners who owned, say, more than 20 or 25 acres, i.e. more land than could be cultivated by the family labour and a pair (or at most two pairs) of bullocks, would employ sharecroppers. Conventionally, 12.5 acres (half a 'square') of land is taken to be the maximum area which can be cultivated by one pair of bullocks. A large family of owner cultivators might employ two pairs of bullocks, but rarely more. The method of exploitation of land (and of sharecroppers) was identical in the case of very big as well as very small landowners. In this sense both belonged to the same class. There is generally little difference even in their respective styles of life. The large differences in wealth and economic power between them are generally reflected in differences in political power and dominance.² Therefore, big and small landowners may be looked upon as being located at opposite ends of a single continuum, indicating their different degrees of wealth and power, but without any structural criterion dividing them into separate and distinct classes.

The effect of farm mechanisation has not been to alter this basic grouping of landowners in a single category; it has not brought into being a new class of middle class capitalist farmers. It is the big landowners who have made the greatest progress in the direction of farm mechanisation. The difference between big and small farmers, is still that of the scale of resources that they employ in agriculture. According to the Survey of Farm Mechanisation in 1968, the biggest landowners — owners of more than 500 acres — held no less than 52.3 per cent of the land ('area owned') in the mechanised farm sector. They accounted for 43 per cent of the 'area operated' on all mechanised farms. Corresponding figures for those who owned between 200 and 500 acres were 25.4 per cent and 26 per cent, respectively, and for those who owned between 100 and 200 acres, 11.9 per cent and 14.5 per cent, respectively. Therefore, all owners of mechanised farms with holdings of more than 100 acres accounted for the bulk of the land in

the mechanised farm sector namely 89.6 per cent of the 'area owned' and 83.5 per cent of the 'area operated'. Far from being distinct from the capitalist farmer, the big landowner is thus himself the capitalist farmer. The full significance of these data can be grasped if we also consider the fact that, according to the 1960 Census of Agriculture, farms between 50 and 150 acres numbered only 2 per cent of all farms and those of above 150 acres were no more than one-sixth of that number, whereas farms between 25 and 50 acres were 6 per cent of the total number — or three times as many. But the latter accounted for only 6.9 per cent of the 'area owned' in the mechanised farm sector and 9.9 per cent of the 'area operated' in that sector.³ These figures indicate a much greater concentration of mechanised farming in the bigger holdings and do not support the view that it is in the medium-sized farms that 'capitalist farming' is concentrated.

The only structural difference between farm mechanisation on large holdings and that on medium-sized holdings is that, in the case of the latter, the owners have evicted sharecroppers in order to resume land sufficient for cultivation by tractors. In the case of the former, however, the practice has been not to evict sharecroppers altogether but to take over from sharecroppers, a portion of the land as required for mechanised cultivation, and to retain sharecroppers with diminished holdings as tied sources of labour needed by the big landowners to cope with the seasonal harvest operations. This difference in itself may be only transient, if present policies — which cater to the demands of the big landowners regardless of the consequences for sharecroppers — are continued. Introduction of mechanical harvesting and threshing will eliminate the need for the big landowners to retain sharecroppers as a tied source of seasonal labour. Then they will have every incentive to push the mechanisation of cultivation of their land further by introducing more tractors and harvesting and threshing equipment. Only then will they evict all their sharecroppers. At the present time, therefore, a distinction may be made between medium-sized landowners who have adopted mechanised farming techniques and for whom the constraint (apart from capital) is land rather than labour so that they evict their sharecroppers, and big landowners for whom the constraint is labour rather than land and who therefore tend to retain their sharecroppers on diminished holdings. But this does not differentiate their economic roles or interests in a fundamental way,

Multan District	3,076	2,639	86

classification as 'capitalist farmers' and 'feudal landlords', respectively. They have both adopted capitalist modes of production. The transitional dependence on sharecropping in the case of big landowners is complementary to capitalist farming. There is no conflict of class interest between the two groups. The same set of policies relating to the agricultural sector would suit them both and they stand united in the political arena — under the leadership of the big landlords.

The widening of inequalities in income and wealth between the different strata of agriculturists, as a consequence of the elite farmer strategy of the green revolution, has been the subject of a considerable amount of comment recently, especially in the context of parallel developments in India which have been subjected to more critical examination. But there is another aspect, no less significant, which also calls for comment. It is the effect of the green revolution and the elite farmer strategy on inter-regional disparities. This is an aspect which is highly relevant today; but it has received less attention than it seems to deserve. The importance of some of the problems which arise in this context was given official recognition for the first time in Pakistan, at the highest level, when, in the sum-

Study Group in the Planning Commission to report on problems of *barani* (rainfed) agriculture in West Pakistan. But research on problems which arise in this area has only just begun.

There are inter-regional differences in the structure of the agrarian economy of Pakistan, which originate from ecological differences and consequent differences in the patterns of historical development. However, in past discussions, inter-regional comparisons have focused almost wholly on natural differences and have therefore tended to obscure the underlying differences in economic and social structure. The Food and Agriculture Commission (1960), for example, distinguishes between the following regions of West Pakistan:

- Canal Irrigated Plains
- Submontane Regions
- Range Lands
- Hill Catchment Area

This is a simple ecological classification. The Commission does not offer any argument as to why some other (additional) criteria might not be relevant for a further elaboration of the regional pattern, in order to identify issues of public policy. Because such an approach emphasises 'given' natural conditions, the problems of each region appear to be specific to itself and we have no framework in which the problems of the different regions could be inter-related.

TABLE 6: DISTRIBUTION OF LAND IN THE MECHANISED FARMING SECTOR IN WEST PAKISTAN

Size of Holdings (acres)	'Area Owned'		'Area Operated'		'Average Area Operated' per Tractor (acres)
	Percentage of Total (per cent)	Average Holding (acres)	Percentage of Total (per cent)	Average Holding (acres)

Elahi, was perhaps among the first to pursue the question of regional differences in agricultural productivity systematically, in two articles which appeared in the *Pakistan Geographical Review*.⁴ As a geographer, Maryam Elahi focuses her analysis largely on physical factors, although at the outset she does recognise that "efficiency of agriculture reflects the influence of varied physical, economic, social and historical factors". The second of her two articles is a sophisticated attempt to rank different regions of Pakistan according to their relative efficiency in agricultural production, taking into account the yield of each crop and the cropping pattern. The weakness in her analysis seems to lie in the fact that she allocates an equal weight for every crop in ranking productive efficiency and, therefore, does not take account of the relative weights of particular crops in the national economy or in the economy of a particular region. But her study does focus on disparities among regions and relates them mainly to physical differences among the regions.

Another recent study on the subject is by Carl Gotsch of Harvard. Gotsch has computed differences in the rates of growth for the various districts of the Punjab.⁵ He provides valuable insights into various 'sources of growth' which

he breaks down into 'acreage effects', 'yield effects', and 'cropping pattern effects', and he examines the extent to which one or the other effect has been prominent in the growth of agricultural production in the different regions of the Punjab. He then examines the factors which have contributed to the predominance of one or the other effect in the growth of agricultural production in those regions. The critical variable in his analysis is provision of water.

An important additional variable, which might be considered in this context, is farm size; for, the structure of the agrarian economy of each region, as determined by distribution of land among different sized farms, vitally affects the prospects and problems of development.⁶ In West Pakistan, the structure of the agrarian economy — looked at from the point of view of distribution of farm size — can, moreover, be said to have derived from the historical development of each region, conditioned by the respective environments. One could thus distinguish, for example, between, four regions of the Punjab, which have quite distinct characteristics. These are:

- the Poor Old Settled Districts of the *barani* region
- the Rich Old Settled Districts which have good irrigation as

- well a good rainfall
- (iii) the Canal Colony Districts
- (iv) the arid and relatively sparsely populated Western Districts of Mianwali, Muzaffargarh and Dera Ghazi Khan.

Recent irrigation projects are changing the characteristics of the last group of districts. I have therefore not treated them as a separate category. In the discussion which follows, I have defined the Canal Colony Region as inclusive of Sargodha, Multan, and Bahawalpur Divisions, with the exclusion only of Mianwali District, which I have classified together with the Rawalpindi Division as constituting the region of the Poor Old Settled Districts. The districts of Lahore Division constitute the region of the Rich Old Settled Districts. I have chosen these somewhat awkward labels for the respective regions, mainly to emphasise the historical conditions of their development which have determined their present state.

The demarcation of the regions owes much to the natural conditions of the regions. To begin with, a primary distinction is established by the alignment of the iso-precipitation lines which differentiate the Northern region of the Punjab, consisting of the Rawalpindi and Lahore Divisions, that receives sufficient rainfall to permit *barani* (rainfed) cultivation. South of that region, until the advent of canal irrigation, the land was, by and large, an empty waste peopled mainly in the riveraines by semi-nomadic tribes who practised a rather perfunctory agriculture on strips of land irrigated by the annual riveraine floods. In some parts of this arid region, there were also a few scattered agricultural settlements around wells.

In the *barani* area, viz, Rawalpindi and Lahore Divisions, sufficiency of rainfall fostered a settled agricultural population from very early times. Therefore, I have referred to these regions as the Old Settled Districts. The long history of a settled agriculture in these districts is relevant because, as a consequence, land in these populous districts, has been subdivided from generation to generation, and the average size of farms in these two regions is now very small as compared, for example, with the Canal Colony Districts.

The *barani* region (or the Old Settled Districts) can itself be subdivided into two distinct agrarian regions, viz, (i) the Rich Old Settled Districts of Lahore Division and (ii) the Poor Old Settled Districts of Rawalpindi Division. The former region not only has good rainfall but there is additional water available to it from canal or well irrigation. The southern half of that

region (viz, Lahore and Sheikhupura Districts as well as much of Gujranwala District) has the benefit of canal irrigation. On the other hand, in the northern half of it (viz, Sialkot District and parts of Gujranwala District) where topography does not favour the extension of canal irrigation, ground-water supplies have been easily accessible and agriculture has been supplemented traditionally by wells operated by Persian wheels and now by tubewells. As a result, the region is highly productive. Rawalpindi Division, on the other hand, with the exception only of a part of Gujarat District, is almost wholly dependent upon rainfall for agriculture. There, groundwater is not easily accessible and canal irrigation is limited because of the region's topography. With the population crowded into small uneconomic farms, it is a very poor region.

In the dry zone to the south of the Old Settled Districts, before the advent of canal irrigation, large tracts of land, which had little value, were appropriated by big landowners. Introduction of canal irrigation, beginning from the turn of the century, transformed the agrarian economy of a large part of the dry zone. Colonists were brought in from all parts of the Punjab and sizeable allotments of land were made on a variety of bases including auctions. The average size of farms in this region is, therefore, relatively large. Not enough generations have passed to fragment these large holdings into the extremely small sized holdings which are typically found in the Old Settled Districts.

However, one factor has served to introduce a substantial number of small landholders and landless people into the Canal Colonies. Before 1947, a large proportion — although a minority — of the population of the Canal Colony Districts in West Pakistan consisted of Hindus and Sikhs who, at the time of 'the Partition' (of India) were driven out of the country. The evacuee land which they left behind was initially allotted, provisionally, to families of incoming refugees who were driven out from India, on the basis of one acre for every member of a refugee family. But later, after 1953, the evacuee land was re-allotted among the refugees on the basis of claimed holdings in India. This was land reform in reverse; those who could establish large claims acquired large landholdings, whereas others who could not do so lost what they already had. This great upheaval in landholdings, and the eviction of those who could not establish sufficient claim, has been, curiously, ignored by

those who have written about agriculture in Pakistan. But that measure has had a far-reaching effect on the agrarian economy of the Canal Colony Districts. One of its consequences was a large increase in the proportion of the agricultural population who had to look to sharecropping or labouring as a principal means of livelihood, because their landholdings had been diminished or taken away altogether.

Table 1 illustrates the pattern of landholding in the three principal agrarian regions of the Punjab which I have described above. I have chosen one district for each region for purposes of illustration.

The different regions have not shared agricultural prosperity equally; the region with a preponderance of small farms having progressed least. An index of the uneven distribution of agricultural wealth among the different regions of Pakistan is provided by statistics of crop production. The production of the principal crops of West Pakistan was distributed as shown in Table 2.

The data in Table 2, indicate wide disparities in the agricultural prosperity (or poverty) of the various regions of Pakistan; which can be judged by comparing their share in the production of the principal crops with the proportion of the rural population in each region. The prosperity of the Punjab is in marked contrast to the poverty of Baluchistan and NWFP. The Indus Plain (Punjab and Sind) where Bhutto scored his electoral victories, accounts for no less than 92 per cent of the wheat production, the entire cotton production, and over 98 per cent of the rice production of the country, with only 76 per cent of the total rural population. In the poorer region, more of the coarse cereals are produced relatively to wheat and cash crops such as cotton and rice. But the very large share, for example, of the NWFP in the production of maize must be viewed in the light of the fact that the total acreage under maize in the whole of West Pakistan was only 3 per cent of the cropped area as compared with 33 per cent of the cropped area under wheat. But in the Punjab itself, there are marked differences among regions. The production of wheat per capita in the Poor Old Settled Districts was about the same as that in the Rich Old Settled Districts in 1964-65. On the other hand, the latter had substantial lead in the production of other commodities, especially rice. The Canal Colonies had a dominating lead over the other regions in the production of wheat and cotton, as well as in other crops.

The above figures testify to the fact that, in 1964-65, there were already very marked differences in agricultural wealth of the different regions of West Pakistan. However, as a consequence of the pattern of subsequent development, these differences have been accentuated. For example, the above figures show clearly that the relative position of the Poor Old Settled Districts has worsened between 1964-65 and 1967-68. The relative positions of Baluchistan and NWFP have also deteriorated. The position of Sind improved marginally in the production of wheat; there was also a change in its cropping pattern, for it gained in its share of cotton production but lost ground in rice which is a major crop for that province.

II

The very substantial increase in crop production in Pakistan — the green revolution — followed the introduction, on a large scale, of new improved seed of dwarf varieties of wheat and rice, accompanied by a substantial increase in fertiliser use. But it could be argued that the key factor which made this development possible was the greatly increased (and more timely) availability of water through tubewell installation. An estimate of the contribution of various factors that contributed to an increase in agricultural production between 1960 and 1965, was quoted in the Third Five Year Plan. There was an overall increase in crop production of 26 per cent, which was attributed to the various factors as follows:

Increased output during Second Five Year Plan Period (1960-65) due to:	
	(per cent)
(1) Groundwater Development	9
(2) Additional Surface Water	4
(3) Fertiliser	5
(4) Plant Protection	4
(5) New Seed	3
(6) Other Factors	1
Total increase in output:	26

This estimate is based on limited data and it may not claim precision. Nevertheless, it plausibly indicates the relative importance of the various factors. Increased availability of water, either through tubewells or through canals, is rated highly and is said to account for half the total increase in output. Indeed, it might be argued that the increased availability of water was the crucial precondition for the increase in other inputs also — because adequate and timely watering is needed for increased application of fertiliser and these two, in turn, are necessary conditions for profitable cultivation of the high-yielding varieties of seed which in addition calls for (and benefits most

from) plant protection measures. One might, therefore, go so far as to say that tubewell development was the most important single factor which contributed to the green revolution. This is best seen by a comparison of the conditions of the Poor Old Settled Districts of Rawalpindi Division with the other regions. For in the Poor Old Settled Districts of Rawalpindi Division tubewell development has not gone very far and canal irrigation is absent. It is only the most Northern Districts of the Barani area — e.g., Mardan and Hazara — which receive relatively greater and more dependable rainfall, that have made some progress in introduction of new seed and greater use of fertilisers.

The relative contribution of tubewells to the increased supply of water can be estimated from the data in Table 3. In the quinquennium covered by the data in Table 3, tubewells accounted for no less than 63 per cent of the increase in water supply. But the pace of installation in the subsequent quinquennium was very much higher. According to data contained in The Report on Farm Mechanisation Survey, the number of tubewells installed in West Pakistan increased, from 31,600 in 1965 to 75,700 in 1968, or two and a half times. And its relative importance as a source of irrigation water is increasing progressively.

Tubewell development in Pakistan, however, is highly concentrated regionally, i.e., mainly in the Rich Old Settled Districts and the Canal Colony Districts of the Punjab. According to the 1968 Farm Mechanisation Survey, 91.2 per cent of the 75,700 tubewells in West Pakistan were located in the Punjab of which only 3 per cent were in the Old Settled Districts of Rawalpindi Division (which had, however, 10.9 per cent of the public tubewells installed in West Pakistan). It is sometimes argued that the shortage of private tubewells is due to the absence of adequate groundwater supplies in the region. But there is evidence that there is, in fact, considerable scope for tubewell development in many parts of this region, although the relative costs would be greater than in other areas as the water table is lower and the groundwater is more difficult and expensive to mine. The major obstacle in the way of a more rapid expansion of private tubewell development in the region, it would appear, is the preponderance of small farms in this area and the relatively higher costs. The backwardness of the Poor Old Settled Districts cannot, therefore, be

attributed wholly to natural factors, as is generally done. It is rooted essentially in the fragmented structure of its agrarian economy. A public tubewell development programme can achieve a great deal here. But lack of political influence, that could be brought to bear in the allocation of resources for this purpose, is an obstacle in the way of development of this region. For example, in 1967-68, the Basic Democracy Institute at Lala Musa had worked out a viable scheme for tubewell development in Kharian Tehsil which was vetted and approved by experts and given formal approval at the district level. But, ultimately the scheme never got off the ground because those who were committed to implementation of the scheme lacked the necessary 'political resources' to bring an adequate amount of influence to bear on the powers that be. It is vital for the development of the Barani Region that the potentialities for identifying such possibilities be explored in every part of the region and then pursued with determination.

Outside Punjab, there is very little tubewell development. It is limited to Peshawar Division which had 2.7 per cent of private tubewells and Khairpur Division which had 1.7 per cent. The prospects of tubewell development in NWFP and Sind are rather limited by the lack of accessible supplies of groundwater (although even the available supplies are not tapped adequately there) and the high degree of salinity of groundwater in Sind. An estimate of the regional availability and the quality of the groundwater supplies was given in the 1966 IBRD Survey Report as shown in Table 4.

The new importance which has been assumed by groundwater supplies as a source of water for irrigation raises new questions about the basis of regional allocation of surface water. The regional or provincial shares of surface water were determined when the development of canal irrigation was begun in the Indus Basin; at a time when supply of water from tubewells did not feature in the calculations of water resources. The situation now is radically different; and the matter is one of paramount importance to Sind, NWFP, and Baluchistan. The groundwater in Sind, for example, is highly saline as shown in Table 4. Most of it is unfit for agricultural use, and some of the water which is of marginal quality must be mixed with canal water to be useable for agriculture. In the circumstances, the inter-regional allocation of water resources justifies a fresh review which

has now been taken in hand.

The pattern of concentration of tubewell ownership has not only a inter-regional aspect but, within each region, it has also a stratification aspect. There is a high degree of concentration of tubewells on large farms. For example, a PIDE Survey of installation of tubewells between 1963 and 1965 shows the concentration of tubewells on large farms as shown in Table 5.

The concentration of tubewells by region and by size of farm, is paralleled by a concentration in tractor ownership. Of the total of 16,600 tractors in West Pakistan in 1968, 13,800 were in the Punjab; and of these, 9,900 were in the Canal Colony Districts and 3,300 in the Rich Old Settled Districts (Lahore Division). Of the tractors 94 per cent were on large farms of over 25 acres. According to the Farm Mechanisation Survey, from which these data are taken, the distribution of tractors by size of holdings of the tractor owner was as shown in Table 6.

In the case of large holdings, on which the 'area operated' averaged between 145 and 714 acres per tractor the 'operated area' is too large to be cultivated by a single tractor; the bulk of the tractors used being of 35 to 55 hp. On such large holdings, only a part of the land was under mechanised cultivation, the other part being cultivated with the help of bullocks, by sharecroppers. It is only in the case of smaller holdings that owners evicted sharecroppers altogether, to resume sufficient land for mechanised self-cultivation. On the larger holdings, sharecroppers have been retained, as mentioned earlier, with diminished holdings to provide a tied source of labour for seasonal harvest operations.

Land ownership is also highly concentrated. The degree of concentration cannot be determined precisely from the available published data. The Report of the West Pakistan Land Reform Commission (1959) contains some data which are admittedly inaccurate and is also quite out of date. The only source on which, for the moment, we might base some reasonable judgments is the Pakistan Census of Agriculture, 1960. The Census shows the distribution of land in West Pakistan according to farm size as shown in Table 7. These data on farms as operational units, under estimate the degree of concentration of land ownership, because almost half of the total farm area was sharecropped and much of the area of smaller farms belonged to larger landowners. The

distribution of land by tenure was as shown in Table 8. If it is assumed that large landholders owned, in addition to the land comprising large owner-cultivated farms (19.4 per cent of the total farm area), also the whole of the area under tenant farms and a part of the area under owner-cum-tenant farms, then it may be estimated that they owned nearly 70 per cent or more of the total farm area.

So far, I have emphasised the skewed distribution of resources in the agrarian economy, both regionally and among different strata of farmers. This raises a number of questions about the structure of the agrarian economy, viewed with reference to farm size, both in respect of the stratified relationships as well as the regional patterns which are the consequences of ecological and historical adaptations.

Two parameters are of special interest when considering the implications of farm size. One is that of technology, which determines the upper limits of the farm area which can be cultivated with a pair of bullocks and, say, two men. Conventionally, 12.5 acres (or half a 'square') is taken by farmers and landowners in canal colony districts, to be the maximum which can be cultivated by one pair of bullocks and their complement of human labour. Some place it at 10 acres. But the actual figure will, of course, vary according to the quality of soil, the conditions of agriculture (irrigated or otherwise), the quality of the animals, and so on. The conventional maximum of 12.5 acres is of significance as a yardstick, on which the farmers themselves base their judgments after making allowances for various factors. No landlord gives more than so much land to a tenant with only one pair of bullocks. Where a large tenant family has two pairs of bullocks, he may give them double that area of land, and so on. Similarly, with regard to self-cultivation, it is rare to find an owner-cultivated farm, which relies on bullock power, of above 25 acres. Owners of larger holdings have traditionally given them out for sharecropping. Tractors, on the other hand, call for much larger farms and one of the inevitable consequences of their introduction has been the eviction of sharecroppers by landowners, in order to resume sufficient land for tractor cultivation. One tractor is estimated to displace a dozen (or more) of bullock drawn ploughs. The amount of land available for sharecropping depends, therefore, on the degree of concentration of landownership and the method of cul-

tivation employed, i.e., whether by bullocks or tractors. In both respects, conditions vary among regions, and we can identify different patterns. In the Old Settled Districts, the amount of land available for sharecropping is limited because farms are small. But the same factor inhibits the spread of mechanisation. In the Canal Colony Districts there has been much land available for sharecropping. But the large holdings encourage mechanisation, which is rapidly diminishing the amount of land available for sharecropping.

The second parameter which is relevant to the set of problems we are examining, is that of the size of farms in relation to its capacity for generating a 'surplus' over subsistence needs, which would provide resources for investment and development as well as for raising consumption above the minimum. Empirically, there are obvious difficulties in determining the level of subsistence which can be considered to be a 'necessary' or a 'tolerable' minimum level. Even if a minimum per capita requirement for subsistence is established (arbitrarily) it would nevertheless be impossible to express it in terms of a definite size of farm required for subsistence — because that would vary with the number of the members in the family which it must sustain as well as differences in farm productivity. Even so, a crude 'average' figure for an 'average' family is not without practical value in dealing with the problem. An IBRD Survey (1966) estimated such an average minimum size of farms necessary to provide a minimum subsistence for an average family in a Canal Colony District to be five acres. With all the qualifications which we may attach to that figure when making use of it in our analysis, it is still a useful yardstick which provides a point of reference. We do thereby have some idea, however vague, of the order of magnitude of the farm size, so that a farm substantially below the estimated figure is likely to show a deficit and one which is substantially above it would be likely to yield a surplus.

Those whose farm holdings are too small for subsistence must look for alternative or supplementary means of livelihood. In the Canal Colony Districts, until recently, because the large holdings could not be cultivated directly by the big landowners themselves (with the help of bullocks), a substantial amount of land was given out for sharecropping. The farm economy in the Canal Colony Districts could absorb the available manpower because the

number of small holders and landless persons in those districts was comparatively small. In the Old Settled Districts, on the other hand, there was a very large number of persons with diminutive holdings, and the number of those with large landholdings was relatively smaller. The surplus manpower in these districts had, therefore, to be absorbed in employment outside the farm economy. Consequently we find two quite different patterns of employment in the two regions. In the Old Settled Districts of Rawalpindi Division, with numerous small farms and landless persons, there has been a considerable incentive for emigration to towns (or into the army) for employment. Those who found work outside the villages, have generally remitted money to dependents left in the village. The deficit farm economy has, therefore, depended heavily upon funds remitted from outside. In the Canal Colonies, on the other hand, such a symbiotic relationship with outside employment, does not exist on a significant scale.

These differences in the respective configurations of the self-sufficient farm economy of the Canal Colony Districts and the deficit economy of the Old Settled Districts, stem from ecological differences and the historical pattern of their respective development. But these differences are reflected also in the social and cultural patterns of behaviour in the two regions. A most significant difference has been that in attitudes towards education and in the actual progress of education in the two regions. If we examine the statistics of education, we discover the rather striking fact that the progress of education is actually much greater in the Poor Old Settled Districts of Rawalpindi Division than in the richer regions. The Census data probably even underestimate the greater progress of education in the Old Settled Districts, because the educated persons from those Districts emigrate from the village for outside employment and get counted as residents of other Districts where they happen to be in employment at the time of the Census. But their links with their village home usually remain close, and economically they play an important role in sustaining the economy of the village as they remit money home.

Finally, there is one further aspect of the regional pattern of the green revolution which merits attention, for it poses some central issues of policy. That aspect is the indirect consequences which follow from the changes in rural incomes. The Gross Provincial Product

from Agriculture in West Pakistan has almost doubled in the decade of the sixties. But the unequal distribution of the income from agriculture has brought about a manifold increase in the incomes of a small group of rich farmers and landlords in the Canal Colony Districts and the Rich Old Settled Districts of the Punjab. On the other hand, the incomes of small farmers in these districts and, especially, of farmers in other poorer regions have failed to improve, or have not improved in the same measure. The indirect consequences of the green revolution for the latter follow from the impact of the additional purchasing power in the hands of the former on the demand for and the prices of manufactured consumers goods. The main thrust of inflationary pressure derives primarily from the greatly increased incomes of this class of rich farmers, since the weight of agricultural incomes in the total national income accounts is very large. In 1967-68, it was 42 per cent of the GPP in West Pakistan, as compared with income from manufacturing which was only 16 per cent of the total.

The great increase in the incomes, and consequently in the expenditures, of the rich farmers has tended to draw heavily on the available flow of domestic

manufactured goods and imports. Economists who emphasise adverse changes in terms of trade for agriculture in relation to industry to demonstrate a worsening in the relative position of farmers, focus narrowly on price effects and do not take into account the income effects in the economy and the implications of changes in income distribution for the different sections of the national community. Despite the adverse changes in the terms of trade, rich farmers, whose inflated incomes are the primary cause of price inflation, nevertheless enjoy considerably enhanced real incomes, as indeed do the urban entrepreneurs whose profits multiply as a consequence. But other sections of the community both urban and rural have suffered as a consequence of the price effects of the changed income distribution. This applies not only to urban salaried middle classes and wage earners, whose real incomes have deteriorated, but also to other strata of farmers (and farmers in other regions) who have not profited directly from the green revolution and have lost by virtue of its indirect consequences.

The additional income which has passed into the hands of the rich farmers has not only increased the total of consumption expenditure; it has also been accompanied by a structural

change in the pattern of the consumption expenditure. The demand for manufactured consumer goods has expanded at a relatively faster rate and, because of the multiplication of the incomes of those who were already well-to-do, the overall increase in consumption expenditure has been accompanied by a relatively greater expansion in the demand for luxury goods — particularly those which are imported or which have a high import content. This "Engel's Effect" which is familiar to economic theory, can be readily observed in West Pakistan villages, and is testified to by traders who have prospered in this boom. I have not, however, come across any studies designed to examine and assess these changes. Yet this change appears to have contributed not only to the inflation of the prices of consumers goods in general but also, in particular, to the pressure on foreign exchange because of the higher import content of the additional consumption expenditure. Even in the case of investment in the farms, the preference for mechanisation too has added to greater pressure on foreign exchange resources. A consequence of the green revolution, therefore, has been the generation of large inflationary pressures and the deterioration in the real incomes of those who have not directly benefited

from it and also an increased pressure on foreign exchange resources.

The system of agricultural taxation and subsidies has served to accentuate disparities among different strata of farmers and different regions. This is because Land Revenue is levied on the basis of a flat rate per acre and is borne equally by all classes of farmers in a district, whereas the benefits from agricultural subsidies are distributed in proportion to the use of the subsidised inputs, so that the rich farmers who prospered most have also had the lion's share of the subsidies. Land Revenue rates do vary from district to district. But that variation does not reflect any rational basis for the differentiation; it is only the accidental result of history. The rates were originally established — in theory, at any rate — on the basis of productivity of the land in the respective areas. But many decades have passed since they were thus determined; and the assessments were, moreover, made at different times in different districts. There is no uniformity, therefore, in the basis of assessment. Land Revenue rates were to be raised slightly in 1962 on an *ad hoc* basis, and some token changes were made in a few districts. Intended changes in some other districts were not implemented. This has hardly helped to remove the irrationalities in the existing structure of land revenue rates, which in any case are nominal in their incidence on those with larger holdings. They vary from Rs 9.13 per acre in Lyallpur District to Rs 1.04 per acre in Hazara District, inclusive of 'cesses' on Land Revenue. The overall incidence of Land Revenue on agricultural incomes has been negligible, amounting in 1968-69 to no more than Rs 182 million as compared with the Gross Provincial Product from Agriculture in West Pakistan of Rs 14,797 million — i.e., about 1.2 per cent. A review of taxation of rural incomes as well as of subsidies, has long been overdue. The consequences of the green revolution in accentuating the inequality in rural income distribution — both regionally as well as among the different strata of the farming community, — makes it more urgent.

As I have indicated at the outset, the data on which my analysis is based are somewhat limited. The object of my paper is not so much to present firm and final conclusions on questions which arise in an inadequately researched problem area, but to outline themes to indicate some new directions in which research efforts might be fruitfully directed. It is only on the basis of a comprehensive set of studies, dealing not only with natural conditions

but also the structure of the agrarian economy and society of West Pakistan, that we can arrive at more confident judgments. On the other hand, certain broad features of regional differences in West Pakistan do stand out quite unmistakably, and the problems involved are too pressing to allow their solution to await the results of detailed and painstaking research which might satisfy the purist.

[This paper is part of a study of rural social structure and economic development in West Pakistan undertaken by the author at the Institute of Development Studies at the University of Sussex, under a grant from the United Kingdom SSRC.]

Britain's International Investment

A NEW assessment of Britain's external assets and liabilities published by the Bank of England shows that by the end of 1971 Britain's total external assets of £ 39,880 million exceeded its aggregate external liabilities of £ 35,645 million by some £ 4,200 million. An inventory of this nature assembles a wide variety of financial claims and obligations which differ both in degree of liquidity and method of valuation. But taking into account these limitations, Britain's private investment overseas, including portfolio investment of £ 5,500 million, totalled £ 14,910 million at the end of 1971. During that year the book value of its direct investment, excluding oil, increased by £ 470 million and included a number of major acquisitions abroad by British companies. This investment was mainly financed either by retained earnings or by foreign currency borrowing. The increase in 1971 of £ 100 million in oil companies' investment, however, is net of their borrowing abroad which was substantial in that year.

The valuation of British banks' and insurance companies' direct investment in the United States remained at £ 475 million and the market value of aggregate United Kingdom portfolio investment overseas has continued its gradual

decline in recent years, from £ 6,150 million at the end of 1968 to £ 5,500 million at the end of 1971. Some £ 3,000 million of the latter sum represents the value of investment in securities of countries outside the sterling area and the balance of £ 2,500 million the value of investment in overseas sterling securities.

The book value of net assets attributable to total inward direct investment in Britain was £ 5,235 million at the end of 1971. The growth during the year of some £ 250 million in the net assets of overseas oil companies at work in Britain included the further development of their North Sea oil and gas ventures. About one-half of the £ 300 million increase in inward direct investment in 1971 (excluding oil) represented retained profits, the balance including major acquisitions of loan and share capital. The increase in overseas portfolio investment in Britain of £ 650 million reflected both the strong recovery that took place in Britain share prices in 1971, and the provision from overseas source of £ 220 million of foreign currency to British companies, including £ 90 million by subscription to issues on the international bond markets.

they would proclaim independence "...even while a small part of our country and our capital are still in enemy hands".

His ambivalence concerning the independence of the Cape Verde islands first became evident in 1969. In that year, in an interview in the Cuban journal, *Tricontinental*, he made a totally confusing statement regarding the place of the Cape Verde islands, in the liberation struggle: "Something very important in this context is that the Portuguese have no problems in the Cape Verde islands. When we begin the action there the struggle in Guinea will be practically over. It is not an indispensable condition for the termination of the struggle; it can end without this prerequisite. But the day that the action is extended to Cape Verde, the struggle will be practically ended" (Cabral's emphasis). This ambivalent attitude towards the independence of the Cape Verde islands is very likely to have alienated those members of the PAIGC who were from the islands.

Similarly, Cabral's call for a dialogue with Lisbon surprised many within the PAIGC, as well as Lisbon itself. In November, 1971, he stated: "We do not want to bring the Portuguese to

their knees, but to reach a political solution". Yet, a few months earlier he had stated: "We have the elements of a state — our fight is to achieve liberation of our country".

In November, 1972, Cabral, on receiving no response to his dialogue call, declared that the liberated areas of Guinea-Bissau were to be declared an independent state early in 1973. But before this could be done he was assassinated in Guinea. Although he had been showing signs of turning counter-revolutionary, his role in the struggle for the liberation of his home land shows that during the larger part of the liberation struggle in Guinea-Bissau he had proved to be a great revolutionary.

It is a fitting epitaph to him that the movement which he helped to launch and organise is the most successful among all the liberation movements in Africa. The position of the Portuguese in Guinea-Bissau is grim. They are confined to the main towns and a few forts in the interior which can only be supplied by air-drops. Their days in Guinea-Bissau are numbered and partly due to the success of the PAIGC there are indications of growing disenchantment within Portugal about Portuguese colonialism in Africa.

REVIEW

The Missing Dimension

H S Verma

Air Pollution and the Social Sciences: Formulating and Implementing Control Programmes, Paul B Downing (Editor), New York, Praeger, 1971; pp xv+270; \$7.00.

THIS book forms part of a series of special studies in US economic and social development published by Praeger. It attempts to review the literature in the social sciences on air quality and related environmental quality issues. The air pollution problem is popularly viewed as the main concern of industrial biologists, engineers, and politicians. But it is far from so. It is as much of concern to, and draws as much upon, other disciplines as on industrial biology. The book under review considers the various facets of the air pollution problem as seen by the sociologist, psychologist, political scientist, lawyer, and economist.

The book contains a chapter each considering the problem from the point of view of these disciplines. In the process, gaps in the existing literature

on the subject become evident and areas for future research get identified. The editor himself has contributed two chapters — one as the introduction trying to define the central issues of interest to the social sciences and the second as the concluding chapter which presents a model for combating air pollution.

Downing, in the introductory chapter, states that society has been demanding better air quality, and for this it is willing to allocate more resources to the production of cleaner air than the market is currently allocating for the purpose. According to him, the problem of air pollution has persisted because of: (1) lack of effective polluter action; (2) lack of effective public action; and (3) lack of effective government control. However, in recent years,

public interest in improving environmental conditions has grown rapidly, becoming in some societies a leading political issue. There are four aspects to its solution which Downing discusses: (1) the desired level of control; (2) the technology and cost of control; (3) the attainment of resource reallocation; and (4) distribution of financial burden.

Molotch and Follett provide a sociological perspective on the problem of air pollution, drawing upon the general framework and basic concepts of their discipline. They review the few studies that comprise beginnings of sociological data on the subject of air pollution, and then venture to identify the areas for future sociological research. Awareness about air pollution (levels, forms and dangers inherent) among people, socio-economic characteristics of people who complain against air pollution, working of organisations engaged in fighting pollution, interests of various groups in environmental policies, community action, decision making on environment, policy planning, pollution standards in different societies, agencies administer standards and their working, are some major areas in which Molotch and Follett would like sociologists to contribute through their research.

Psychological and behavioural effects of air pollution are examined by Reynolds, utilising whatever research has been done in the United States and the Soviet Union. Reynolds notes that standards in the United States have been based primarily on levels of pollutants which induce pathological conditions, specially in the pulmonary system. The Soviets, on the other hand, have emphasised levels of pollution that induce changes in behaviour and electro-physiological responses in the central nervous system. Reynolds recommends three basic tasks for the psychologist: first, the effects of long-term exposures of monkeys to the principal air pollutants (ozone, nitrogenoxides and carbon monoxide), on reaction time, delayed match to sample, and visual discrimination. Second, on the addition of different levels of ambient temperature as a variable. And, finally, short-term studies might use data derived from these two tasks on the effects of pollutants and temperature on human performance.

Loveridge, then, examines the relationship of political science and air pollution. According to him, control of air pollution requires government intervention so that problems of air cleanliness become a political issue. He rightly avers that clear air depends more upon political decisions determined by

money and power than on development in science and technology. He notes that there is increasing interest shown by political scientists in policy analysis dealing with the problem. Dealing with the past research on the subject, he concludes that the political scientists have focused their research efforts on the policy processes and not on policy problems. Loveridge suggests review of policy process in terms of three stages: formulation, legitimization and implementation. This classification scheme adopts a quasi-systems model of the policy process. Formulation refers to inputs, legitimization to informal decision-making, and implementation as to what happens to decision outputs. Finally, he poses two research questions: what do we know? And what can we do? According to him, four kinds of projects merit attention: (a) responses, support, and demands of the public; (b) effectiveness of administrative control agencies; (c) analysis and evaluation of policy strategy and future control alternatives; and (d) the general study of the politics of air pollution across the nation.

LEGAL VIEWPOINT ON AIR POLLUTION

Krier presents the legal viewpoint on air pollution. Before controlling air pollution, the problem itself needs a proper definition. Drawing largely from the cases on the problem in the US, he brings out some of the shortcomings of the litigation, of the court as an institution for effective pollution control, and some desirable directions for investigation and change. He follows it up by a more systematic critique of these shortcomings and of the sort of palliatives that exist to contribute to a more effective institution. For purposes of discussion, he identifies two classes of problems: (a) problems of proof, and (b) problems inherent in the judicial process. He covers pollution control legislation and its administration in the United States. Government there has generally tried to attack pollution in essentially three ways: (a) by regulation, i.e. proscriptions and prescriptions backed up by punitive measures; (b) by subsidies or awards and (d) by charges, effluent fees. Krier emphasises the need to involve international institutions for controlling air pollution, backed by environmental quality studies and advisory councils. He also feels that there should be continuing work with regard to property rights as the interface between law and economics and into the bearings of recent insights on judicial and legislative schemes.

The economics of air pollution is

examined by Anderson Jr and Crocker. According to them, as development progresses, forces are typically unleashed that cause demands for a pleasing environment to be intensified, while, at the same time, environmental quality is unrelentingly degraded. It is the confluence of rising demand with increasing unavailability that seems to be the source of today's anti-pollution fervour. Allocation systems have not evolved in a manner permitting reconciliation of these tendencies. They then, go on examining the theoretical and empirical studies of (a) the emitter; (b) receptor; (c) general equilibrium models and (d) studies of institutional instruments of control. They review empirical work of emitter control cost functions through engineering and survey studies, and examine political, interview, response, and market behaviour studies. Aggregated systems and control instruments are also examined, assessing relative costs.

POLICY TRADE-OFF/ANALYSIS MODEL

In the final chapter, Downing summarises the material included in the five chapters representing five disciplines, placing emphasis on their policy implications. It uses this material and also information from other sources to develop a framework for the analysis of alternative policies available to decision-makers. He describes what he calls a 'policy trade-off/analysis model' in which he attempts, in a very tentative way, to interrelate the physical, economic, social, administrative and institutional aspects of problems that affect and are affected by any control

policy. While one may be sceptical about the implementation of such a model and doubt the comprehensiveness of the model and the directions indicated therein, one must also concede that the model is not bad as a beginning on which refinements could be attempted later.

PRACTICAL UTILITY LIKELY TO BE LIMITED

Wading through the material provided in the book and the collation done by the editor, one is left wondering whether research on the problem of air pollution should be conducted in such separate disciplinary compartments. Even a cursory look at the areas identified by each of the contributors would lead one to doubt the wisdom of undertaking this kind of exercise. For instance, the sociologist recommends analysis of the awareness of the problem, working of the organisations interested in fighting the problems, and decision-making on air pollution. Precisely these are also the areas in which research is recommended by the political scientist and even the economist. The reviewer would be more inclined to appreciate the outcome of a joint interdisciplinary research effort, in which each discipline would contribute to the realisation of the goal rather than look to further intradisciplinary work suggested in the volume. By far the most important fact is that decisions pertaining to control of air pollution, as Loveridge has rightly noted, are largely politically motivated and, as such, the practical utility of such studies in any society is likely to be very limited.

Special Programmes for the Rural Poor The Constraining Framework

N S Jodha

The Small Farmers' Development Agencies (SFDA) and the Agencies for Marginal Farmers and Agricultural Labourers (MFAL), though regarded as institutional innovations to help the rural poor, represent an extremely modest approach insofar as they do not contemplate removal of the basic causes which have stood in the way of the small man's participation in the development process in the past.

The Special Schemes are to work within the given framework and will be totally dependent on the existing institutions for their effective functioning. They do not pretend to change the production strategy which implicitly recognises only the well-endowed farmer as a source of growth. They also do not contemplate any radical changes in the procedures and policies of rural institutions which again because of their bias for the better-off sections have neglected the small man.

In the circumstances, their direct support to the rural poor through widening their production base would be conditioned largely by the absence of worthwhile and viable side-activities in keeping with the small man's farm-level infrastructure. Their indirect help to the rural poor through area specific schemes through strengthening the infrastructure would have a built-in tendency to encourage leakages to the better-off.

The Agencies meant for the poor would thus not be serving the exclusive interests of the poor.

I

Focus on Rural Poor

PHILOSOPHICAL concern for the poor has been part of our heritage. Frequent reference has been made to the poor in the political and economic documents governing the course of the country. However, the poor have remained condemned to poverty. The reasons for this range from undiminished sway of the karma theory on the large masses to the precious little done in concrete terms to help the poor. However, in recent years, the problem has acquired added urgency. The alarming conclusion of the now oft-quoted studies on poverty that the extent of poverty has increased during the planned period and the slightly changed political alignments in the country, seem to have caused renewed concern for the poor. The concrete result has been the introduction of a number of special programmes for the weaker sections of the community. These programmes, meant for different sections, range from the Small Farmers Development Agencies to the provision of mid-day meals for pre-school children in slum areas. The important special programmes for the rural poor (which broadly include agricultural labour, small and marginal farmers, farmers in chronically drought-prone areas, and rural artisans, etc) are: Small Farmers Development Agency (SFDA), Agency for Marginal Farmers and Agricultural

Labour (MFAL), Drought Prone Area Programme (DPAP), and Crash Scheme for Rural Employment (CSRE).

The above schemes were started in selected areas on an *ad hoc* basis during 1969-70 and 1970-71, and as per official thinking, they are to continue during the Fifth Plan period. It would be too early to attempt any meaningful evaluation of their impact on the economy of the rural poor. Yet their effectiveness, as instruments for improving the conditions of the rural poor, can be judged *ex-ante* through a critical examination of their mode of working *vis-a-vis* the basic problems of the rural poor as well as the factors which were responsible for their relative neglect in past development efforts. This has been attempted with reference to the SFDA and MFAL agencies, which at times have been described as institutional innovations³ to help the rural poor (henceforth the term would stand for small and marginal farmers and agricultural labourers).

II

Special Programmes: SFDA/MFAL

The SFDA and MFAL projects represent an organised attempt to find institutional solutions to the problems of the rural poor who have remained largely neglected under our development programmes in the past. These programmes stem from one of the

principal recommendations of the All India Rural Credit Review Committee. The Committee, after examining the results of large-scale surveys as well as specific studies of the small farmers in different states sponsored by the Planning Commission and the RBI, came to the conclusion that co-operatives, extension agencies, as well as other government agencies, have failed to pay specific attention to the problems of small farmers. The committee therefore felt a need for some institutional set-up such as the SFDA to help these sections of the farm community. A complete scheme, with proper guidelines etc, was suggested. Government accepted it. However, it was realised that SFDA would cover only the potentially viable small farmers and that the vast majority of the rural poor were marginal farmers and agricultural labourers who would remain uncovered. Hence a new scheme for these sections (MFAL) was added. The rationale in the case of the latter was also same, but the programme content was somewhat different, putting greater emphasis on mixed farming and wage as source of income. Subsequently, some of the SFDA were asked to cover the marginal farmers and agricultural labourers along with the small farmer.

At present there are 46 SFDA and 41 MFAL projects in the country. The area of the former is generally a district and it is expected to benefit 50,000 small farmers. An MFAL

agency covers a smaller area and is expected to cover 20,000 marginal farmers and agricultural labourers over a period of five years. The land holding limit for a farmer to be eligible for SFDA assistance is 1 to 3 acres. The land holding limits adopted are *ad hoc*, and are not based on detailed income studies.⁵ The marginal farmers are those who own land below one hectare. Agricultural labourers have been defined as those having a homestead and deriving more than 50 per cent of their income from agricultural wages.

The SFDA/MFAL Agencies are autonomous bodies, registered under the Registration of Societies Act. They include district-level functionaries (including representatives of Zilla Parishads and District Co-operative Banks) and nominees of the Central Government. They are schemes of the Central sector, in the sense that they get their finances directly from the Centre and are not accountable to any state or district level authority. They are provided with a skeleton staff at the head-quarters of the project, consisting of a project officer and a few assistants. For actual operations and implementation of the programmes, the agencies depend entirely on the existing extension staff in the block and other development departments.

FUNCTIONS AND FUNDS

The principal functions of the Agencies are:

to identify the eligible participants for the programme, identify their problems and potential, and prepare a scheme for helping them;

to locate the institutional help and induce the institutions (through subsidy etc) to aid the identified activities; and

to create infrastructural facilities which may prove conducive for better performance in the activities followed by the participants.

The Fourth Five-Year Plan provides Rs 106 crores for these agencies — approximately at the rate of Rs 1.5 crores per SFDA and Rs 1.0 crore per MFAL project.⁷ Apart from the administrative expenditure on the Agencies, which is subject to 5 per cent of its total allotment,⁸ the funds of the Agencies are to be utilised for giving grants or subsidies to individual participants and to institutions which support the Agency programmes (e.g. co-operatives, agro-service centres, etc).

The financial help from the Agen-

cies is available to institutions like co-operatives, agro-service centres and others as an inducement, so that they would help the participants in the special programmes. For instance, these subsidies are available to credit co-operatives for recruiting additional staff and for building up their risk fund. Co-operatives and other agencies get subsidy if they set up supporting facilities for processing, marketing and storage (e.g. godown, transport vehicle, chilling plant, etc). Agencies providing other custom services also get help. Besides, the Agencies are to spend their fund on creating the required infrastructural facilities in the area. Rural works are also carried out in the MFAL areas. Individual participants also get subsidy for the current farm inputs (so that co-operatives would find them creditworthy) and capital investment (including purchase of milch cattle and birds for poultry farming) — the subsidy being high where group projects are taken up by them.

From their inception to end of May 1972, 15.80 lakh and 7.56 lakh participants have been identified by the SFDA and the MFAL, respectively. No data about their progress are readily available in sufficient detail to facilitate a worthwhile analysis. Yet, it has been reported that the two Agencies, taken together, have assisted 2.95 lakh participants; they have helped in the construction of over 28,000 wells/tube-wells and in the installation of over 9,000 pumpsets; they have distributed over 14,000 milch cattle and over 4,000 poultry birds; they have helped the disbursement of (short-medium- and long-term) credit exceeding Rs 32 crores. More than 13,000 persons have been assisted through rural works programme.⁹

III

Neglect of Rural Poor in the Past

For a proper understanding of the suitability or efficacy of the SFDA and the MFAL, as programmes to help the rural poor, it would be worthwhile to briefly consider the factors responsible for the relative neglect in the development efforts of the past.

To begin with, despite our professed policy of simultaneous pursuit of the twin goals of growth and social justice, the former has always received ascendancy over the latter in development programmes — including the development programmes in the farm sector. In agriculture, the central objective of all efforts — starting

from the grow more food campaign to the HYV and multiple-cropping programmes — has been increase in farm produce. This objective was sought to be achieved through improving and adjusting the factor supplies (including services and inputs) to the land factor. Thus all development efforts in agriculture got effectively concentrated on those who were well-endowed in terms of land (and other associated assets). By implication, the 'big farmer' was recognised as the 'source of growth', and the resource allocation within the farm sector got distorted in his favour.¹⁰ Consequently, extent of participation in the development process and share in the development gains became a direct function of one's pre-determined resource position. The small and marginal farmers owing to low and deficient farm-level infrastructures, obviously had limited capacity to benefit from the development strategy with its bias for the land factor.

In such circumstances, two ways were still open to help the rural poor. (1) To remove his disabilities by helping improve his farm-level infrastructure which was restricting his participation in the development process. (2) To evolve a development strategy in keeping with the features of his resource endowment (e.g. surplus labour and small or no land); this would have meant an emphasis on labour-intensive activities.

In the past, the first alternative was emphasised.¹¹ Attempts to help the poor were made through the State sponsored/patronised institutions, such as the co-operatives and the community development programmes. The co-operatives were expected to strengthen the position of the rural poor by providing liberal credit for production and investment. The CD Programme was much more ambitious and was introduced to effect a transformation of rural India, by creating infrastructure, providing extension services, and undertaking activities for the benefit of the whole village community including the weaker sections.

However, in course of time, it was discovered that these agencies have failed to help the disadvantaged groups. Instead, they have further strengthened the position of the already better-off sections of the farm community.

The fourth Evaluation Report of the PEO in 1957, observed that "... There is wide disparity in the distribution of achievements and therefore of be-

nefit of the programme... within a village it exists as between cultivators and non-cultivators and within cultivating classes it exists as between cultivators of bigger holdings and larger financial resources and those of small holdings and less financial resources".¹² The subsequent PEO reports also did not see any improvement in the situation.

The All India Rural Credit Review Committee in 1969 observed: "It is now generally agreed that the small farmers have not benefited in proportion either to their numbers or their needs from the various programmes of rural development which have been under implementation during the three Plans. Our review of record of the co-operative agency... confirms that this is also broadly true in regard to availability of institutional credit for agriculture."¹³

The failure of rural institutions to help the weaker sections may be attributed broadly to two factors. First, already discussed, is the emphasis on production (*via* the big farmer). The second relates to the superimposition of democratic institution on a non-egalitarian (and, therefore, undemocratic) social structure which prevented percolation of benefits to the lower strata of the rural community.

The emphasis on the first factor in the CD programme became quite apparent when during the Second Plan its whole approach was modified from a multi-dimensional to a rather single dimensional one. Expansion of agricultural output became the central objective and the principal test of the programme's success.¹⁴ This change was in response to the unanimous view of three study teams¹⁵ that, unless production performance of agriculture is improved, the CD programme would find it difficult to sustain itself. Hence "more energy and resources should be devoted to expanding agricultural output and less to other activities". The result was a selective approach to agricultural development, which reinforced the tendency of "growth through better endowed farmers", as discussed above.

In the case of the co-operatives (which are supposed to be the strength of the weaker), the tendency to discriminate against the small man was more apparent. This was inherent in their land-based credit policies,¹⁶ with creditworthiness of the potential borrower being judged in terms of his ownership of land (and related assets); consequently, the rural poor

had little chance to benefit from them.

As a result of the recommendations of the All India Rural Credit Survey Committee (1954), an attempt was made to improve the situation. The Crop Loan System — which attempted to make co-operative credit production-oriented rather than security oriented — was introduced. In 1969, the All India Rural Credit Review Committee found, however, that the new system was not adopted extensively. What is more, wherever it was adopted, the crop loan system itself tended to "stimulate a larger flow of credit to big cultivators insofar as they accounted for larger production."¹⁷

As regards the second factor, *viz.*, the implications of fostering democratic rural institutions on an undemocratic social structure, the following developments may be noted.

The Indian policy-makers had been partly impressed by the Gandhian view of 'harmonious village community' and partly guided by their own unrealistic hope that with proper State help and direction a decentralised democratic superstructure (both through co-operatives and the CD programme) could be created to ensure development and welfare of a composite rural community at each block level. However, this approach completely disregarded, or at least under-rated, the informal yet effective grip of the traditional caste and land-based power structure on the village community.¹⁸ The inadequacies of land reforms left the traditional power structure almost unchanged, and the same power structure in the villages, which had never been favourable to the weaker sections, derived new strength after the new democratic institutions were created at the village, block, and district levels.¹⁹

A few factors which proved instrumental in the process described above were: (1) the target-oriented programme of co-operatives and the CD, which required inviting everybody having influence on the masses to take the leadership of the new organisations;²⁰ (2) excessive State patronage to these programmes part of which degenerated into spoils of office or prizes for actual operators of the programmes;²¹ and (3) *de facto* recognition of 'the big farmer as source of growth' (necessitating a resource allocation favourable to him) which helped in legitimising the gains of the programmes cornered by the 'power operators' who were big farmers themselves.

Thus, in the ultimate analysis, rural institutions degenerated into instruments in the hands of the power groups, and all the hopes, that the rural poor neglected by production strategy would be looked after by the institutions, were belied. Consequently, even after completion of the three Plans, nothing had changed for the rural poor and, as Dandekar put it, "they must wait for the promised bread which will come at the end of the nth Five-Year Plan of overall economic development, where n is the eternal unknown."²²

IV

Potential of the Special Programmes

Having considered the factors basically responsible for the relative neglect of the rural poor in past development efforts, we may now examine the extent to which special programmes would prove effective in helping the rural poor.

The new Agencies for small and marginal farmers and agricultural labourers have no pretensions to changing the basic production strategy which implicitly considers the 'well-endowed farmer as a source of growth'. Nor do they intend to restructure the distribution of productive resources. Also, they do not contemplate radical changes in the structure and operational aspects of the existing rural institutions (which have neglected the small man). In other words, the special Agencies accept the *status quo* and want to help the poor by operating within the existing framework²³ with its built-in indifference (if not open hostility) to the small, resourceless man. Thus, to the extent that the poverty of the rural poor is the result of the factors discussed in the preceding section, it will probably persist, notwithstanding the special agencies. Considered in this way, the approach of the Special Agencies is too modest compared to the magnitude and basic causes of the poverty of their participants.

The Agencies propose to do their job: (i) by identifying and promoting the activities which the small man (with abundant labour and with small or no land) can follow with advantage, and (ii) by inducing or persuading other institutions to extend their help and services to the weaker sections. Hence the success of the Special Agencies would depend ultimately on how effectively these two functions are performed. In the absence of any past

record to guide us, the contemplated pattern of their working could perhaps throw some light on the potential effectiveness of the new programmes in solving the problems of the rural poor. This has been discussed below.

INSTITUTIONAL SUPPORT

Let us take the problem of institutional support first. The SFDA and MFAL Agencies are expected to make use of the existing institutions and agencies such as the co-operatives, community development panchayat institutions, and government departments. To activate these agencies (particularly the co-operatives and the extension agencies) *vis-a-vis* the rural poor, a two-pronged approach has been envisaged. On the one hand, direct help in terms of subsidies etc is being provided to the existing institutions to compensate them for the expenditure required for engaging additional staff, creating or strengthening the infrastructural facilities (including agricultural processing and custom-hire services), and for meeting the risk involved in helping the participants in the special programmes. On the other hand, the existing institutions are to be induced to help the participants by the Agencies presenting the latter's activities or enterprises before the former as economically viable propositions.

There is a merit in the above proposition in that it intends to present the small man too as a 'source of growth' and may thus remove one of the causes of institutional indifference to him. (Of course finding really viable activities particularly in the case of MFAL will be a difficult problem by itself.) But one may find it difficult to wholly agree with the another aspect of the proposition, which, by implication, assumes that lack of resources with the institutions or risk involved in the small farm enterprise were so largely responsible for the neglect of the small man in the past.

On the contrary, studies have shown that, despite certain inherent limitations of the small farmers, their performance in terms of repayment of co-operative credit etc has not been poorer than that of the big farmers. In fact, the extent of default was found to be more in the case of big farmers.²⁴ Reasons for this may range from initial overfinancing to the big farmers to their deliberate choice to default.²⁵ Similarly, efforts made in the past to induce the co-operatives

(through additional provision for risk funds etc) to help the weaker sections more liberally have failed to bring about very satisfactory results.²⁶

Finally, the biggest limitations of the above schemes *vis-a-vis* existing institutions is that they completely ignore the rigidities of the institutions emanating from the now widely admitted fact of their class- or caste-orientation.

If this phenomenon operated against the weaker sections in the past, there is no reason to expect its complete inactivity in the future — as long as the Special Agencies also operate through the existing institutions. The potential for such a possibility does exist at several stages of the operations of the Agencies — from selection of area and schemes to identification of the eligible participants.²⁷ Hence, if particular sections dominate the existing institutions, it would not be very difficult for them to influence the priorities and the flow of benefits from the Special Agencies to non-eligible sections and individuals. This gives rise to the problem of leakages in the special programmes for the rural poor. Some aspects of this are discussed below.

VIABLE ACTIVITIES

Apart from locating and activating the institutional support for the participants, another difficult task for the new Agencies is identifying the potential and economically viable activities which directly or indirectly help the poor. The contemplated activities are broadly of two types: (i) those relating to the individual farm/household, (ii) those relating to the area. The former are expected to broaden the production base of the weaker sections, either through intensive use of land surface (by ensuring supply of complementary inputs and services) or through adding new types of enterprises to the farm — such as dairying, poultry-farming, etc. The latter category of activities are largely of infrastructural nature (to be undertaken by existing or newly formed institutions and supported by the special Agencies) and would be conducive to a proper functioning of the activities under category (i); they would include measures ranging from provision of custom hire services to marketing and processing facilities to help the small man.

An important problem relating to the first category of activities is that, insofar as they are meant for indivi-

dual farms/households, at the time of providing new enterprises there is a strong possibility of ignoring the inherent limitation of the small man's resource base *vis-a-vis* the minimum degree of technical/economic specificities of activities suggested. The most talked about 'dairy to small man' is one case in point; factor proportions involved in a viable dairy farming enterprise being ignored while recommending it for a man with limited or no land.²⁸ Unless a minimum farm-level infrastructure, in terms of land base, organisational ability, risk bearing capacity, etc, is ensured, no additional enterprise of worthwhile size may prove a viable source of regular income. The Special Agencies, as it appears, intend to solve these problems through creating or arranging supportive services for their participants with the help of the co-operatives, agro-service centres, and other processing and marketing agencies etc. Hence the problems emanating from deficiencies of farm-level infrastructure are attempted to be solved by strengthening the area-level infrastructure. However, till the former remain weak the latter may not prove a great help. The consequence would be ineffective, or underutilisation of, supportive services and other facilities arranged for the small enterprises (and larger flow of benefits from infrastructural facilities to the better-off sections having the capacity to make use of them). One possible solution in such circumstances could be found through 'pooling' of the resource base and the enterprises of the participants in the programme.²⁹ But this is one of those very steps which have constantly been evaded in the past. What is different is that its necessity is being increasingly realised in the context of the working of the Special Agencies, as reflected in the discussions at the National Seminar on SFDA/MFAL Programmes, held in Delhi during April 1972.

AREA SPECIFIC ACTIVITIES

Regarding the second set of activities, *viz.*, those directed towards creation or strengthening of infrastructural facilities, there is an inherent problem of leakages. As these measures are area-specific, rather than class-specific, their advantages cannot be restricted to a particular section of the community. In all probability, a larger proportion of the benefits from these facilities (e.g. milk processing plants, godowns, market yards, trans-

port vehicles, agro-service centres, staff- and fund-wise strengthened co-operative institutions etc) would flow to those who are already better-off and well-equipped to make maximum use of the facilities.

In a way, these benefits to the not-so-poor may be regarded as leakages in the programmes meant for the poor. Their extent would vary according to the choice of activities, which in turn may be influenced by the well-off sections involved in operating these schemes as mentioned earlier. Thus, ultimately, one may be dismayed to discover that schemes designed to help the poor have helped those who were already better-off.

In fact, this is a dilemma inherent in the situation. It originates from the fact that there are not many 'class specific' and still viable programmes (like some activities requiring use of only manual labour) which can automatically prevent the benefits from flowing to non-eligible sections of the community. Secondly, no programme for the poor can sustain itself if it is delinked from the other activities operating in the area which are technically linked with the programmes suggested for the poor. In other words, the spatial dimensions of the 'class specific' programmes cannot be ignored.

Thus, the logic of the situation suggests that the Special Agencies, though meant for helping the weaker sections, would not in fact be serving the exclusive interests of the poor.

Moreover, in view of the ever-increasing demands on the Special Agencies to support or associate themselves with basic programmes — like exploration/exploitation of groundwater, land reforms (particularly consolidation), creation of infrastructure including setting up of processing facilities, provision for supply of cross-bred animals etc — and to co-ordinate and dovetail their programmes with the on-going development programmes in their respective areas,³¹ it seems likely that Special Agencies for the poor may be converted into area development agencies.³² This thinking is further strengthened by the limited experience of the Agencies that, in the backward areas with poor infrastructure, it is still difficult to help the poor. There is need for developing the infrastructure first. If the Special Agencies virtually convert themselves into area development agencies, the following implications would have to be reckoned with.

Taking the negative side (from the standpoint of the rural poor), their exclusive interest would be served to a still reduced extent. If the Agencies further concentrate on those growth-promoting activities in which the rural poor have little to contribute, the history of the neglect of the poor by the CD programme may repeat itself.

Taking the positive side, the rural poor may not stand to lose by virtual conversion of the Special Agencies into area development agencies as, in most cases, there is a convergence between poor areas and the poor classes.³³ Taking a more optimistic view, one may think of greater advantages for the poor if the area development programmes prepared by the Agencies are based on broadly defined factor-endowments of the region (of which the rural poor are a part). Here, one can expect higher priority to the programmes in which the rural poor may have a comparative advantage. But all these are big 'ifs'.

Concluding Remarks

To sum up, the SFDA and MFAL schemes, though regarded as institutional innovations to help the rural poor, represent an extremely modest approach insofar as they do not contemplate removal of the basic causes which have stood in the way of the small man's participation in the development process in the past. Nor do they pretend to change the production strategy which implicitly recognises only the well-endowed farmer as a source of growth. They do not even contemplate any radical changes in the procedures and policies of rural institutions which (again because of their bias for the better-off sections) have neglected the small man. In other words, the special schemes are to work within the given framework, and will be totally dependent on the existing institutions for their effective working. Their direct support to the rural poor (i.e. through widening his production base) would be conditioned largely by the absence of worthwhile and viable side activities in keeping with the small man's farm-level infrastructure. Further, their indirect help to the rural poor, through area-specific schemes (e.g. through strengthening the infrastructure), would have a built-in tendency to encourage leakages. In the net situation, the Agencies meant for the poor would not be serving the exclusive interests of the poor. Of course, one

can justify the special schemes serving the area, in the belief that poverty, in terms of area and class, converges.

[The author is thankful to V S Vyas, for his valuable suggestions while preparing this paper.]

Notes

- 1 Drought Prone Area Programme (DPAP) covering 54 districts was started with the basic objective of providing employment to the rural people in the dry areas with low resource endowment and at the same time creating productive assets which will mitigate the effects of droughts. Present thinking is towards directing and running these programmes with a well-thought-out strategy of development which can harness the potential of dry areas through schemes relating to resource conservation and animal husbandry.
- 2 Crash Scheme for Rural Employment was initiated to help agricultural labourer and small farmers who offer themselves for wage employment on public works. The scheme hoped to benefit about 1000 persons in each district on works which would create durable assets in the rural areas. In order to study the impact and problems of above programme a new scheme called Pilot Intensive Rural Employment Project (PIREP) was undertaken in selected 15 blocks under the CSRE in October 1971.

- 4 For details see, Report of the All India Rural Credit Review Committee, RBI, 1969, Chapter 18.
- 5 In the initial stage, the RBI insisted on income criteria for identification of small farmers. However, the land holding criterion, more easy to operate, was accepted. Of course, depending upon the local circumstances, some additional consideration (e.g. source of off-farm income in the family etc) is taken into account. The possibility of farmers who are genuinely not eligible but still getting membership of the agency is always there. If all depends upon the interest taken by the personnel of the extension agencies who help in identification process.

- 7 See "Special Projects for Small Farmers, Marginal Farmers and Agricultural Labourers", A Note from Ministry of Agriculture, New Delhi, for the Seminar on Rural Development for Weaker Sections, October 1972, sponsored by the Indian Society of Agricultural Economics and held at IIM, Ahmedabad (Mimeo).

- 8 *Ibid.*
- 9 Minhas, B S. "Rural Development for Weaker Sections: Experience and Lessons", Seminar on Rural Development for Weaker Sections, October 1972, Ahmedabad (Mimeo).
- 10 Thomas Balogh, "while commenting on Third Five-Year Plan, observed as follows: 'The Government can either fully back the successful owners of viable type and hope for a 'bourgeois-entrepreneurial type of revolution on the land or it can energetically push the risk of new co-operative rural organisation, through determined leadership... The oscillation between the two policies... is likely to continue to hampering economic growth', ('Economic Strategy for the Third Plan', *Economic Weekly*, Special Number, February 4, 1961). From hindsight, it appears that by recognising the big farmer as a source of growth, the Government silently made a choice for the first alternative. In view of the above it would not be wholly correct to blame the official functionaries of the CD for their extra attention to big farmers. Their job, too, was to fulfil the production targets. The small farmers obviously were of not much use for them for meeting the production targets.
- 11 One hardly comes across any programme which had given central importance to labour. The most publicised rural works programmes always proved poor starters and became the first casualty whenever the resource constraints developed for the plans. For inherent inadequacies of these programmes see, Ranjit Gupta, 'Rural Works Programme: Where It Has Gone Astray', *Economic and Political Weekly*, Volume VI (20), May 15, 1971.
- Further, whenever labour-intensive projects became a necessity, the same were operated through contractor system the disadvantages of which for the labour are well known. Use of contractor system has been observed even in the case of 'Crash Schemes for Rural Employment' in some areas like Banaskantha in Gujarat.
- The labour-intensive activities under the CD programme have a yet different story to convey. In the name of people's participation, the poor contributed their labour and got employment at very low or little wages. Once the approach of the CD programmes got modified during Second Five-Year Plan to concentrate on raising agricultural production, the rural construction works practically ceased to be part of the CD activities. Thus precious little was done to sustain the gainful employment of the rural poor. Practically similar is the case regarding rural crafts and other occupations, from which the 'rural poor' could benefit.

- 14 The following passages from the Third Five-Year Plan quoted by the Report of the Study Group on the Welfare of Weaker Sections in the Village Community *op cit*, pp 16, 35-36, would illustrate this approach.
- "... whatever little improvement (in agriculture) is possible, does in the very nature of things benefit the biggest land owners far more than the petty holders" ... (hence) "Much greater attention should be given in all activities to the needs of the less privileged sections". But at another place the document observes "... the growth of agricultural production is of such critical importance that... the principal test to be met by the community development must be its practical effectiveness as an agricultural extension agency."

- 17 *Op cit*, p 563.
- 18 One gets this impression from at least two crucial developments in the past. First, the All India Rural Credit Survey Committee considered the existing landlord-money lender dominated rural structure as one of the 'reputed causes' of the failure of the co-operatives. They also found the stronghold of the same sections on the co-operative movement. (For details see General Report, Volume II Chapters 21, 22 and also 4 and 5). Yet their recommendations did not contain any measures to counter the aforementioned tendencies. Hence all the measures

suggested for strengthening the co-operatives in effect strengthened the position of those who constituted one of the 'reputed causes' of co-operative failures.

Secondly, regarding the CD programme the Fourth PEO Report for the first time indicated in April 1957 that the programme was developing as a class- or caste-oriented programme. According to the PEO, this was a matter of concern for the future of the movement. But within a period of seven months, i.e. in November-December 1957, the Balwantray Mehta Committee recommended, that through democratic decentralisation more powers should be given to the people. The consequence was Panchayat Raj System which further accentuated the process of the movement towards a class- or caste-oriented movement.

- 19 The consequence, as Daniel Thorner observed long back, was that the "traditional structure of village power has imposed and will continue to impose, its own pattern on the co-operatives". See 'Context for Co-operatives in Rural India' *Economic Weekly* Annual Number, February 1962.

Thorner talked of co-operatives but same is true for the CD and Panchayat Raj institutions. See Michael Lipton, 'Strategy for Agriculture: Urban Bias and Rural Planning' (in "The Crisis of Indian Planning", editor P Streeter and M Lipton Oxford University Press, 1968) Section on Village Power, Attitudes and Institutions pp 135-141.

- 26 Report of the Rural Credit Review Committee, *op cit*, pp 563-66.
- Even during the short period of the working of the Agencies it has been found in several areas that existing agencies do not readily co-operate in the programmes of the SFDA and the MFAL. (See Proceedings of National Seminar on SFDA/MFAL program-

mes held at Delhi, April, 1972, (Mimeo).

- 27 Even the Rural Credit Review Committee itself, which recommended the creation of SFDA, apprehended that big farmers in the guise of small farmer may attempt to seek advantage from the scheme. This needs to be guarded against. See Report, *op cit*, p 589.
- However, to the extent that representatives of existing institutions, like district co-operative banks, Zilla Parishads, etc, are also included in the membership of the Agencies, their role in influencing the priorities (favourable to certain sections), within the framework of special schemes, cannot be completely ruled out. In the name of creating infrastructure, they may decide for facilities, which may not be of immediate use to the small man, but serve the better-off sections well.

- 28 The National Commission on Agriculture is the latest authority to recommend providing dairy farming as a supplementary occupation to the people with small or no landbase, in their, Interim Report on Milk Production Through Small and Marginal Farmers and Agricultural Labourers (December 1971).

But it is seldom realised that to run a profitable dairy farming is even difficult for the farmers with substantial land, whose out-of-pocket cost of dairying is considerably reduced, because of the home produced fodder (and to some extent feed too). Further, if whole cost of dairying (including expenditure on dry and wet animals) rather than the cost of milk production alone (i.e. expenditure on milking animals) is considered, there would be hardly very few farmers getting net returns from dairying. Further, they cannot reduce the cost by doing away with the dry animals (as the dairymen in towns do), because their keeping is essential to maintain steady flow of milk production. The problems of marginal farmers and agricultural labourers is still serious. They cannot afford intensive stall feeding as well as keeping more animals with different calving cycles. They maintain their animals largely at 'social cost' (e.g. through village pasture, etc) and remain without milk production for most part of the year. These and other similar facets of dairying have been clearly shown by an ongoing study of Economic Relationship between Crop Production and Dairying in South Gujarat, by AERC, V Vidyanagar. The centre's studies in other parts of Gujarat and Rajasthan also confirm these facts.

According to one study, by the AERC, Vallabh Vidyanagar, the milk yield per buffalo per

year was only 660 litres in the case of marginal farmers compared to 2,980 and 3,902 litres in the case of medium and big farmers, respectively. See, "Economic Profile of Marginal Farmers and Labourers": Research Study Number 24, 1972, (mimeo) p 70.

The National Commission on Agriculture further recommends for supply of cross-bred milch cattle to the rural poor. But, as the field observations in parts of Haryana indicate, even resourceful farmers find it difficult to maintain these delicate breeds. Hence the rural poor would find them still more difficult to productively maintain them. In terms of expenses, even their insurance charges would probably exceed the amount which a labour family spends on itself during a lean year.

- 29 The Special Agencies encourage pooling through greater subsidy to 'group projects'. But past experience of the Gujarat Land Development Bank shows that except in some areas like Mehsana, small farmers did not take any advantage of 'group loan' schemes. For other details, see "Some Aspects of Long Term Co-operative Agricultural Finance", *op cit*, chapter V.

- 30 For an interesting point of view, that spread effects of capitalisation of regions (through infrastructure in backward regions as emphasised by the Planning Commission)

may not result in improvement in the living conditions of the poor, see, P R Brahmananda, "A Very Skeptical Note on the Fifth Plan Approach To Solution of Economic Backwardness As Defined by the Planners" in Seminar on Regional Economic Planning Sardar Patel Institute of Economic and Social Research, Ahmedabad, March 1973, (mimeo).

- 31 Seminar on SFDA/MFAL Programmes, *op cit*.

- 32 Of course the National Commission on Agriculture in their Interim Report on Credit for Small and Marginal Farmers and Agricultural Labourers, (December 1971), has recommended setting up of Farmers Service Societies to look after the credit and other service needs of the participants in the special programmes. They have also visualised the possibility of the SFDA and MFAL Project Boards which will virtually develop into Agricultural Planning Boards for the said societies. However, this idea of creating Societies for rural poor paralysed to present co-operative structure was understandably not appreciated by the members from co-operative agencies who participated in Delhi Seminar on SFDA/MFAL projects, *op cit*.

- 33 For instance See M D Desai, "Problems of Low Income Sections in Rural Areas", in Seminar on Rural Development for Weaker Sections, *op cit*, (mimeo.)

Usha Alloys and Steels

USHA Alloys and Steels is entering the market next month with an issue of 7,39,900 equity shares of Rs 10 each and 30,000 9.5 per cent redeemable cumulative preference shares of Rs 100 each. Usha Alloys has been promoted by Usha Martin Black (Wire Ropes) and out of the present issue of shares, 1,99,900 equity shares have been reserved for allotment to Usha Martin Black for cash at par. With the 50,000 equity shares already allotted to the company, Usha Martin Black will hold about 27.8 per cent of the issued equity capital of Usha Alloys. Out of the present issue, equity shares have also been reserved for LIC (50,000), ICICI (24,500) and Unit Trust (24,500). The remaining 4,41,000 equity shares are being offered to the public along with the entire issue of 30,000 redeemable cumulative preference shares. The entire issue of preference shares and 3,92,000 of the 4,41,000 equity shares offered to the public have

been underwritten by ICICI, LIC, IDBI, IFCI and UTI.

Usha Alloys proposes to set up a plant for the manufacture of high/low carbon alloy steel billets with an annual licensed capacity of 50,000 tonnes for which it has been granted an industrial licence. In the first phase the company proposes to manufacture between 28,500 and 35,000 tonnes of billets. The company expects to commence commercial production by the middle of 1974. A major portion of the company's production will be taken by Usha Martin Black. In any case, the company will not have any marketing problem since the country's requirement of high carbon alloy steel billets is far in excess of the present production. The company's plant will be located at Adityapur near Jamshedpur.

The subscription list will open on April 23.

Social Welfare Policy and Services

Some Issues

S N Dubey

This paper seeks to examine some issues relating to the need for a well defined social welfare policy and the nature, content and administration of such a policy.

In the formulation of a social welfare policy, political parties and organised groups have to play a crucial role. However, political parties at the national and state levels have given very little attention to issues relating to social welfare policy. Not surprisingly, therefore, there is no clear-cut policy on the place of social welfare in the social and economic development of the country.

THE purpose of this paper is to discuss some issues relating to the need for a well defined social welfare policy, its nature, contents, and administration in the country.

The first issue refers to whether there is a need for a statement of policy regarding social welfare services in the country. It seems that a policy statement is important because it provides a frame of reference to a specified area of activity; specifies the relationship between goal/s and the appropriate means to achieve them; and provides guidelines for devising indicators to measure the effectiveness of the strategies in achieving the goals [Indian Council of Social Welfare, 1971: 56]. Kulkarni points out: "A policy statement is like major threads of warp and woof on which, by filling details, a mantle is woven.... It is a macro-frame in which micro-actions are meaningfully held. There is, therefore, a need for a policy for every area of activity if the action is to be directed to predetermined goals, if results of an activity in an area were to be measured in terms of being satisfactory or unsatisfactory" [1971: 2].

Social welfare policy is defined as the strategy of action indicating the means and methods adopted to implement the social welfare services [Kulkarni, 1964]. Social Welfare Services include programmes which are intended to cater to the needs of persons and groups who, by reason of some handicaps — social, economic, physical — are unable to avail of or are traditionally denied the amenities and services provided by the community. In other words, the term social welfare service refers to the field which offers services for those who need special care [Dubey, 1971: 20].

Among the social welfare services which form a part of the Five-Year Plans in the country, the welfare of Backward Classes and the social welfare services for the vulnerable and handicapped sections of the population are very prominent. These two subjects have been grouped along with labour welfare in the Five-Year Plans under

the heading Social Service Sector. A question arises: What is our policy in regard to Backward Classes' welfare and the welfare of such other vulnerable sections of the society as children, youth, women, slum dwellers, handicapped, women under moral danger, juvenile offenders, beggars, prisoners, etc?

WELFARE OF BACKWARD CLASSES

In the Five-Year Plans, Backward Classes include Scheduled Castes, Scheduled Tribes, Denotified Tribes, Nomadic Tribes, and some miscellaneous groups referred to as "Other Backward Classes". The total population of the Backward Classes forms approximately 25 per cent of the total population of India. They also represent the most disadvantaged segment of Indian society [Dubey, 1971: 21-25]. Though, social, economic and educational backwardness are the common characteristics of all the Backward Classes, each category has a distinct problem of its own. The problem which distinguishes the Scheduled Castes from the rest of the Backward Classes arises from the practice of untouchability. The socio-economic conditions of the Scheduled Tribes are largely traceable to the isolation of the tribals from the mainstream of national life. The stigma of a anti-social heritage characterises the problems of Denotified Tribes; and the Nomadic Tribes suffer from the problems arising out of a wandering life [Kulkarni, 1965].

The Constitution of India contains Directive Principles of State Policy, laid down in Article 46 which provides that "the State shall promote with special care the educational and economic interests of the weaker sections of the people, and, in particular, of the Scheduled Castes and Scheduled Tribes and shall protect them from social injustice and all forms of exploitations", so that these groups can be brought to the level of the rest of the population in the country and thus can enjoy the fruits of a developing economy and socio-political democracy. In order to fulfil the promise of the Directive Prin-

ciple, specific provisions have been made in several articles of the Constitution. These articles provide for the reservation of seats for Scheduled Castes and Scheduled Tribes in the legislative assemblies of the states of the Union and in the Parliament. Further seats have also been reserved for these groups in all-India as well as state services and in public corporations. Article 17 of the Constitution declares that "untouchability is abolished and its practice in any form is forbidden. The enforcement of any disability arising out of untouchability shall be an offence punishable in accordance with law". In pursuance of the provision of the Article 275 of the Constitution, funds have been provided in the Five-Year Plans for the welfare of Backward Classes. During the first three Five-Year Plans, Rs 102 crores were spent on welfare programmes for these groups. During 1966 to 1969, a sum of Rs 69 crores was spent for the welfare programmes of the Backward Classes. In the Fourth Five-Year Plan, Rs 135 crores have been allocated to backward classes' welfare, in addition to a sum of Rs 30 crores committed to the non-plan budget.

In the light of these provisions, an important question arises whether the original objective — to bring the Backward Classes on par with the rest of the population — has been achieved. It has been pointed out by several studies [Commissioner for Scheduled Castes and Scheduled Tribes, 1969; Dhebar Commission, 1960] that, in spite of the advance made, particularly in terms of education and employment, the overall progress is not only not commensurate with the expenditure, but the objective of reaching parity also is still far from being in sight. Further, the relatively less backward groups among the Backward Classes have taken greater advantages of the special facilities and the more backward groups have essentially remained where they were 25 years ago. Thus, the existing policy of providing services to Backward Classes, on the basis of constitutional provisions, is not satisfactory. An important question,

ECONOMIC AND POLITICAL WEEKLY

therefore, is: What should be the basis of providing special facilities to these groups? The Pre-Conference Working Party of the Indian Council of Social Welfare (1971) recommended a scientific approach based on realistic and reliable statistics and a well defined and substantiated priority system in the planning and implementation of services to weaker sections. The approach should also take into account cultural variations within the sections. The Working Party, therefore, felt that eligibility criteria, based on means test, for services to the weaker sections should be devised. Further, it recommended that there is a need to bring about a change in the existing organisational set-up for the implementation of social welfare policy in order to achieve integration and co-ordination among various social welfare services for the weaker sections. Lack of a proper organisational set-up can defeat the most brilliantly framed policies [Indian Council of Social Welfare, 1971: 58].

Though, the contents of "social welfare services" have not been clearly defined, and thus lack consensus, over the period of three Five-Year Plans, certain subjects have, more or less, come to be identified as concerns of social welfare. In the division of subjects among the Union, State, and Concurrent Lists, contents of social welfare services have not been clearly defined. Some of the subjects (such as reformatories, borstal schools, relief to the disabled and vagrancy, labour and social security) have been included in the State list. "The Working Group for the Third Five-Year Plan, which for the first time drew up a comprehensive framework for planning social welfare services, covered within its compass subjects such as child welfare, women's welfare, welfare of the handicapped, social defence, youth welfare, welfare of slum dwellers and also training, research and administration. The Fourth Plan Working Group made only a slight modification... and included the aged and the infirm along with the handicapped" [Kulkarni, 1965: 27].

However, there is no clear-cut policy in regard to these services, except, perhaps, social defence, which generally includes the services for the prevention and treatment of juvenile delinquency, suppression of immoral traffic among women and girls, prevention and treatment of beggary, probation and after-care services, and the rehabilitation of released prisoners.

CORRECTIONAL SERVICES

A provision of nearly Rs 4 crores was made for social defence programmes

during the Second Plan. In the Third Plan, a total provision of Rs 2.04 crores was made under the Ministry of Home Affairs mainly for offering assistance to centrally sponsored schemes of social defence. In the Fourth Plan, a provision of Rs 5 crores has been made for probation services, prevention of juvenile delinquency, welfare work for beggars, social and moral hygiene programmes, and institutions for correctional training.

The prevention and treatment of juvenile delinquency are the most important aspects of social defence. The responsibility for the organisation and administration of these services rests with the state governments. The policy regarding these services has been spelled out in various state and central legislations. During the Second Plan, the programmes for combating juvenile delinquency received a great deal of attention. The two central acts, namely, the Central Children Act, 1960 (for Union Territories), and the Women's and Children's Institutions (Licensing) Act, 1956 were passed. Subsequently, the Licensing Act of 1956 has been repealed by the Orphanages and Other Charitable Homes (Supervision and Control) Act, 1960. [Refer Chapter V, Section 31 of the Act.]

The purposes of the Children Acts (state as well as central) in general are custody, protection, care, education, training and rehabilitation of the children. There is, however, no uniform notion as to who is a child. The term has been used to refer to persons of different age-groups. Besides, the provisions of these acts are related only to the socially handicapped — delinquent and non-delinquent children —, and do not cover other categories of children.

The suppression of immoral traffic among women and girls forms one of the important services in the field of social defence. As a signatory to the International Convention on the Suppression of Immoral Traffic in women and children in Geneva in 1921, the Government of India had undertaken the responsibility to prevent immoral traffic in women and girls. A number of states passed acts for the suppression of immoral traffic, and made soliciting, pimping, brothel-keeping and living on the earnings of prostitution as severely punishable offences. However, it was in the Second Plan that the moral and social hygiene programmes received impetus. The Central Act for the Suppression of Immoral Traffic in Women and Girls was passed in 1956. It replaced all the state acts and provided

for services and institutions for the rehabilitation and treatment of the rescued women. The Act declares the following activities as offences: (a) the keeping of a brothel or allowing premises to be used as a brothel; (b) living on the earnings of prostitution (however, this does not apply to the children of the prostitute if they are under 18 years of age); (c) procuring or inducing women and girls for the sake of prostitution; (d) detaining a woman or a girl in the premises where prostitution is carried on; (e) carrying on prostitution in the vicinity of public places; and (f) seducing or soliciting for purposes of prostitution.

One of the important issues in the implementation of the SIT Act is that there is a lack of uniform understanding among the state governments regarding the nature of the problem of immoral traffic among women and girls. Thus, in Bihar the problem of immoral traffic tends to be viewed as a public health problem. Consequently, the implementation of the Act has been entrusted to the health agency. In Rajasthan, Mysore, Kerala and Punjab, it seems to be viewed as a problem of the degradation of public morality and conduct. Consequently, the implementation of the Act has been entrusted to the Home Department. A question can be raised: What is the nature of the problem of immoral traffic among women and girls? Is it basically a public health problem or a law and order problem or a social problem the victims of which need protection, rehabilitation and restoration? Obviously, it is basically a social problem. Consequently, it should be entrusted to a department which has experience in preventive and rehabilitative social programmes, and which has developed a relatively more humane approach towards socially disapproved and condemned behaviour.

The prevention and treatment of begging is another important correctional service. The earliest attempts to check the practice of begging in public places were found in the City Police Acts of Calcutta, Madras, and Bombay. Some state governments have also passed their own anti-beggary legislations. For example, anti-beggary Acts exist in Hyderabad (1949), Bengal (1943), Mysore (1944), Madras (1945), Bihar (1952), Bombay (1959), Jammu and Kashmir (1960), and Assam (1964). Some special acts such as the Leprosy Act (III of 1898), Lunacy Act (1912), the Indian Railway Act, the Indian Penal Code also deal with the problem of beggars. As a result of those legislations, such institutions as Receiving

Centres, Certified Institutions, Work Homes, Special Homes, Sick Homes, Beggary Homes, Relief Centres, etc, have been opened in various states.

One of the issues regarding the beggar Acts is a lack of uniformity in the objectives and in the definition of a beggar. The objectives of the Acts differ from state to state. For example, the objectives of the Bombay and Assam Acts are to make uniform and better provisions for prevention of begging; and for the custody, trial and punishment of beggar offenders. The Kashmir Act stresses the making of good citizens out of beggars. The Mysore Act aims at prohibiting persons from resorting to begging as a means of livelihood. Thus, there is a need for a clear-cut policy regarding the prevention and treatment of begging. Perhaps a central legislation which provides a common definition of a beggar, a procedure to apprehend him and a uniform administrative machinery to implement the legislation seems necessary to solve these problems.

The Central Probation of Offenders Act, 1958, provides the statutory basis for the probation services in the country. The main features of the Act are: (1) if the offender is guilty of an offence, punishable with imprisonment of any length, except for life, irrespective of number of previous convictions, can be released on probation with or without supervision; (2) previous convictions, nature of the offences, age, etc, will not disqualify the offender for release on probation; (3) all magistrates are empowered to take up cases in which probation might be considered; (4) it is obligatory for the magistrate to call for presentence report of the probation officer in cases where offenders are under 21 years of age; (5) in case of violation of probation, the terms of sentence will automatically be put into force where it is already pronounced and the offender will not be tried again for the original offence; and (6) the probation officer may appeal against the order of the magistrate refusing to release the offender on probation.

There are a number of issues relating to the implementation of probation policy. One of these refers to whether probation service should be under the control of the administrative departments or under the judiciary? Further, what should be the role of voluntary organisations? A second issue refers to the dual system of control exercised on the probation officer. The probation officer is appointed by the Directorate of Social Welfare or by voluntary agencies. But he is required to work with the judiciary. Consequently, he is required

to work under a dual system of control, the Director of Social Welfare on the one hand, on whose cadre he is borne, and the judiciary on the other hand, under whose supervision he works. This creates a considerable amount of strain in his job performance. The magistrate, who supervises and evaluates the probation officers' performance, often does not share the same orientation.

For adult prisoners, a few services are organised as a part of the Five-Year Plans. They include appointment of welfare officers, assistance to families of prisoners, creches for children of women prisoners and assistance in cash and kind to discharged prisoners to enable them to establish themselves in life with some source of livelihood.

FAMILY AND CHILD WELFARE

A number of programmes for child and family welfare have been formulated and implemented since Independence but an explicit national policy for child welfare has not so far been evolved. Consequently, though among the general social welfare programmes, in terms of priorities, emphasis has been placed on child and family welfare services in the Five-Year Plans, the content, the clientele and the organisation of the programmes have changed considerably since the time of the First Plan. The preoccupation with handicapped children, which was displayed at the beginning of the First Plan, has been replaced by concern and preference for the welfare of socio-economically deprived children. Further, the emphasis has also been shifted from rehabilitative to positive and promotive services. The latest emphasis is on an integrated approach in providing services to families and children. Thus, currently, Family and Child Welfare Projects are the largest single national programme directed towards welfare of women and children, specially in rural areas.

The Family and Child Welfare Projects were initiated on November 14, 1967 to reorganise, improve, and expand the welfare services for women and children provided by the Co-ordinated Welfare Extension Projects, and the Demonstration Projects for Integrated Child Welfare Services. Since the Family and Child Welfare Projects have been organised on a pilot basis, they have been included in the Central Sector in the Fourth Plan with an outlay of Rs 6 crores. In addition, an amount of Rs 6 crores has been allocated for nutrition, health, education; and Rs 2.3 crores for the welfare of the physically handicapped. The project normally caters to the age group of 0-16 years.

However, greater attention has been given to children in the age-group 0-6 years. The next priority is given to children between 6 and 11 years. While services dealing with health, nutrition, education, recreation and welfare are implemented in a co-ordinated manner, the combination of services and the emphasis differ for different age-groups depending upon their physical need.

The Family and Child Welfare Project consists of one main centre at the Block Headquarters and 5 sub-centres in key villages. In addition, the Central Social Welfare Board provides modest financial aid and project staff to villages where local mahila samitis and panchayats, etc, are keen to initiate, with their voluntary effort, limited welfare programmes. The main centre consists of Balvikas Kendra and a Griha Kalyan Kendra. The services provided in the Balvikas Kendra include a creche or day care centre for about 10 infants whose mothers are busy on farm or in the home. The Griha Kalyan Kendra serves as a demonstration-cum-training unit for about 15 young mothers and leading village women. The main activities in the Kendra include education in personal hygiene, health and sanitation, home craft and home management, mother craft and child development, family nutrition and feeding, family relationship, domestic budgeting, preparation of family clothing, family planning and citizen education, etc.

From the above description, it may be stated that the social welfare policy regarding family and child welfare services has been *ad hoc* and vague. There is a need for a clear statement of policy regarding family and child welfare. What are our goals in the area of family and child welfare? How do we plan to achieve these goals? Is the goal for family and child welfare to strengthen the basic institution of family? Which aspect of the child's life should be given priority? Which group of children should be given priority in the immediate future, and which groups in the distant future? In other words, there is a strong need to clarify the value premises, operational objectives, and types of children to be served by the family and child welfare programmes. The statement should also indicate the nature of the organisational and administrative set-up.

ORGANISATION AND ADMINISTRATION

The responsibility for the implementation of social welfare policy rests with (1) voluntary organisations and (2) the public welfare bureaucracy. The responsibility of fulfilling the statutory

obligations under various central and state legislations, especially those dealing with the welfare of children, women and scheduled castes and scheduled tribes, rests with central and state governments. The voluntary social welfare organisations deal mainly with non-statutory services of general social welfare for children, women, handicapped, and other vulnerable groups. Thus, the voluntary social welfare organisations share a major responsibility in the implementation of social welfare policy. Perhaps, the main reason for the allotment to voluntary organisations of a crucial role in the implementation of social welfare policy are (1) the pioneering experience of voluntary organisations in the field of social welfare; (2) the humane approach of voluntary agencies in providing services; and (3) the limited amount of resources available for social welfare services at present.

The state, however, has to provide aid to voluntary organisations to maintain and develop welfare services. A special body, called the Central Social Welfare Board, was set up by the Government of India for promoting voluntary action in the field of social welfare. The idea behind the creation of CSWB was to introduce the system of grants-in-aid to improve existing services, and to develop new services under the auspices of non-official bodies. In order to accomplish this goal a large amount of money was allocated to the Board. The Central Social Welfare Board created a network of organisations at the state, district, and block levels through which aid was channelled and the programmes were sponsored. At the state level, State Social Welfare Advisory Boards have been established; at the block level, the Project Implementation Committee, recently replaced, at some places, by the Functional Committees for Family and Child Welfare, were organised. These bodies consisted of official and non-official social workers. The CSWB, so far, has given grants to 6,000 voluntary organisations, and has sponsored Welfare Extension Projects in rural and urban areas, after-care services and educational programmes for women, etc. It should be noted that Welfare Extension Projects have been replaced by the Integrated Family and Child Welfare Projects in 1967. Judging from the work the Board has done, its record has been impressive. However, from the point of view of policy, two crucial questions can be raised in relation to the goals of voluntary organisations in the field of social welfare: (1) How far the co-

luntary organisations would be helpful in the development of social welfare in a welfare state? It is being increasingly recognised that in a welfare state the measures of social security, maternity and health services, assistance to the dependents and the handicapped, employment services, services to the aged, etc, will have to be provided universally. Ultimately, therefore, the state will have to assume responsibility for providing these services. The services of voluntary organisations will continue to be required, but they will have to be supplementary to the measures of social security provided by the government. (2) What would be the role of the Central Social Welfare Board and its representative bodies at the state, district and block levels in developing voluntary action in the fields of social welfare, in view of the creation of panchayati raj institutions in most states? It seems that the panchayati raj institutions, which are the representative bodies of the people, can more effectively generate voluntary actions than the CSWB. This is precisely the purpose for which the panchayati raj institutions have been created. In other words, the role of the CSWB in the generation and the promotion of voluntary action in the field of social welfare will have to be supplementary to the efforts of the panchayati raj institutions.

Some other issues relating to the implementation of social welfare policy by the voluntary organisations, which need to be examined critically, are their ability to raise funds from the community, maintain freedom of action, personnel practices, and programme innovation. In view of the policy adopted by the national and state governments, it is reasonable to assume that the sources and amount of contribution from the community for social welfare are extremely limited. It is, perhaps, due to this factor that most of the voluntary organisations receive about 40 per cent of their resources from the government. Therefore, in the circumstances, it is doubtful if the voluntary organisations can develop an independent base of resources and maintain their autonomy as community supported institutions.

In terms of personnel policy, the voluntary organisations are manned by untrained staff, particularly at the top and the middle levels. It should be noted that the executive secretary of the Central Social Welfare Board is a "generalist" and does not have any specialised training in social welfare administration. Most of the inspectorate staff of the Board are also not trained. Similarly, the State Social Welfare Advisory

Boards are managed by non-professional staff. Most of the Executive Secretaries of the State Social Welfare Advisory Boards are not trained social workers. Most of the voluntary agencies also do not have a personnel policy to employ trained social workers. The untrained staff employed by them tend to follow administrative practices unsuitable for the management of social welfare organisations. It is, therefore, not surprising that the experimental projects run by these organisations are sub-standard, unimaginative and sterile. The CSWB, SSWAB and voluntary organisations have not realised that the quality of personnel significantly determines the success of the programmes. Even the most brilliantly thought of programme falls flat on its face when run by untrained, unimaginative and substandard staff. It is, therefore, imperative that the CSWB, the SSWAB, and the voluntary welfare agencies revise their personnel policy in favour of trained social workers. Further, the currently untrained staff working in these organisations should also be sent for training. They should depute one or two supervisory personnel for training in one of the good schools of social work in the country which offer programmes in social welfare administration. The investment in training will pay a high dividend in terms of improved quality of service, administrative efficiency, and innovation in the development of social welfare programmes.

In the governmental organisation, the social welfare subjects are distributed among various executive departments in the state. In some states, they are affiliated to 12 or more departments. This contributes to the fragmented and unco-ordinated approach currently prevailing in the planning and implementation of social welfare programmes. The main departments at the state level responsible for the implementation of social welfare programme are the Directorate of Social Welfare, Backward Classes Welfare and Tribal Welfare. These departments are generally headed by generalist administrators who do not have any specialised training in social welfare. Their approach to social welfare administration is based primarily on the classical theory of administration which places heavy emphasis on standardisation of procedure, formalism, centralisation of authority, job oriented (authoritarian) leadership, inflexibility, neglect of individual situations, etc, which may be appropriate for managing organisations engaged in "habit forming" tasks and not for organisations engaged in problem solving and "so-

cialisation" tasks which are the goals of social welfare organisations [Bennis, 1967: 36-78]. A more suitable approach to social welfare administration seems to be one which emphasises what Drucker calls "management by objective", flexibility, expressive supervision, decentralisation of authority, participation in decision-making, cohesive work groups, etc, conducive to the generation of capacity and forces in the organisation necessary for socialisation and problem solving tasks. It is, therefore, important to entrust the task of social welfare administration to a specialist, trained in social work and in modern techniques of management. Since such a functionary does not exist, the existing personnel in the field will have to be trained. Besides, a special field of training in social welfare administration will have to be developed by schools of social work in the country. The Tata Institute of Social Sciences has recently introduced such a programme of training.

The panchayati raj institutions are important units in the implementation of the social welfare services at the district level. A large number of social welfare services have been transferred to panchayati raj institutions for implementation. The main programmes transferred to panchayati raj institutions for implementation are related to Backward Classes' Welfare and Family and Child Welfare. It is, therefore, important to examine critically the scope, potential and limitations of implementation of social welfare services under the panchayati raj institutions. One of the issues in regard to social welfare under panchayati raj is that in some of the states social welfare is not treated as a technical subject unlike agriculture, education, animal husbandry, etc. The District Social Welfare Officer is also not treated on par with officers of the other departments who work as heads of the departments. Consequently, he is not able to handle his responsibility as effectively as other officers. Some states (Maharashtra, for example) have begun to realise the difficulties in this arrangement and are considering seriously making social welfare a separate department and giving it a technical status. Another issue refers to safeguarding the interests of Backward Classes under the panchayati raj set-up. It has been reported that very little, if any at all, of the zilla parishad's budget is allocated for the welfare of Backward Classes. Further, funds for schemes meant for Backward Classes are also diverted to other schemes. Besides, proportional representation of Backward Classes in

panchayati raj institutions has not been provided for in the panchayati raj Acts of the states. The hope that the Backward Classes would be represented in these institutions through the electoral process has not materialised. Those who get elected to the panchayati raj institutions tend to be the people above the average in wealth. Even in villages predominantly inhabited by the Scheduled Castes or Scheduled Tribes money lenders or caste Hindus manage to get elected as Sarpanches. Co-optation as a mode of representing the Backward Classes, provided for in the most panchayati raj Acts, has brought into panchayati raj institutions the middle class or better off members of the group who lack a realistic perspective on the appropriateness and the purposes of the programmes. They also lack commitment to and interest in the welfare of the Backward Classes. It will, therefore, be desirable to amend the panchayati raj Acts to provide for the allocation of funds by the panchayati raj institutions from their own resources for the welfare of Backward Classes; to recognise social welfare as a technical department, and to treat the officer in charge of this programme as head of a department like other technical officers; and to provide for proportional representation for Backward Classes in panchayati raj institutions.

One of the critical issues in social welfare policy is the recognition of the place of social welfare services in the socio-economic development of the country. The national leadership has occasionally asserted that the purpose of economic development is to enhance the well-being of the individual, the group and the community. In this sense social and economic development tend to complement each other. However, social welfare services which directly contribute to the well-being of the people (a necessary element in economic development) have not been given sufficient attention in the national plans. Though the absolute amounts of resources allocated to social welfare in the Five-Year Plans have shown an increase, their percentage to the total Plan outlay has remained static if it has not actually decreased. Thus, there is no clear-cut policy on the place of social welfare in the social and economic development of the nation. The formulation of social welfare policy can be viewed as a process of choice among various alternatives available for the social and economic transformation of the country. Consequently, in the formulation of social welfare policy, political parties and organised groups play a

crucial role. However, the political parties at the national and state levels have given very little attention to the issues relating to social welfare policy, except for empty slogans. Thus the masses will have to be educated about the nature and operation of the political process so that they can press for their demands on the politicians. The development of public opinion for social welfare is necessary for effective formulation and implementation of social welfare policy in the country.

Toshiba Anand

TOSHIBA Anand Batteries commenced commercial production on January 1, 1972 and produced during the year ended September last 34.66 million numbers of dry cell batteries against the installed capacity of 60 million numbers per annum. The company earned a gross profit of Rs 24 lakhs on sales of Rs 289 lakhs. After making provisions for depreciation and development rebate, there was a surplus of Rs two lakhs. Demand for the company's products, which have earned reputation for quality, has been encouraging. Export markets are now being explored.

India and the International Copyright Conventions

Jaman H Shah

It is clear by now that India's membership of the international copyright conventions has yielded it less benefit than it has taken away. What the conventions safeguard is not so much the author's right to reward and protection of intellectual property, but the commercial interests of the foreign copyright owners and publishers. What they amount to is the Western countries claiming an unrestricted right to exploit our markets, retarding in the process the development of indigenous book manufacturing activities.

Past experience has shown that the advanced countries will brook no change in the provisions of the conventions which may limit their right in this respect. India and other similarly placed countries should, therefore, seriously consider withdrawing themselves from these conventions.

THE time has arrived for India to reconsider the impact of its continued adherence to international copyright conventions — both the Berne Convention and the Universal Copyright Convention (UCC). These conventions have neither benefited us directly nor fostered the growth of the indigenous book industry. The latest Paris Revision of the Berne Convention, ratification of which is currently under government consideration, may in fact work against our interests. The Revision seemingly gives developing countries, such as India, the limited right under certain conditions to grant compulsory licensing; but what it actually concedes is so meagre compared to what it denies that no useful purpose would be served by our ratifying it. Countries like India, therefore, should either try to persuade the other powerful signatories to the Conventions to grant liberal translation, reprinting, and reproduction facilities — and, in their absence, the right of compulsory licensing, of course, bearing in mind the right of author to protection/royalty — or withdraw from both Conventions. Past experience and years of frustrating negotiations give little hope of the first alternative fructifying; we are, therefore, left with the second.

Foreign copyright owners today claim almost absolute rights — which we, as signatories to the Convention, may not restrict ostensibly on grounds of our own interest. What the Conventions protect is not so much the author's right to reward and protection of his intellectual property, but the commercial interests of the foreign copyright owners and publishers. India had subscribed to the Conventions in the hope that they would facilitate free flow of knowledge into the country and in the belief that it is necessary to protect the interests of the authors. The first argument has been belied by experience, while the second has been overwhelmed by the attitude of foreign publishers who have refused reprinting rights to indigenous

publishers.

If India opts for compulsory licensing or withdraws from both Conventions, several benefits would accrue to it:

(1) It could reprint books and the price of books reprinted in India would probably be only a-third of the price of imported books — which might widen the readership base.

(2) Part of the approximately Rs 6 crores in foreign exchange which India spend every year on the import of books would be saved; a portion, corresponding to the import of books which have a very limited market, would of course continue to be spent on them, but books which are now imported in bulk could be reproduced within the country with substantial foreign exchange savings (estimated at about Rs 3 crores). Our liability would then be limited to royalties payable to original authors, after deduction of tax at source; even this liability on account of royalties results because we, on our initiative, resort to compulsory licensing on ethical grounds, and is not payable if we simply withdraw from the Conventions.

(3) The right of reproduction would lead to rapid growth of the Indian book industry, generating new business and employment all along the line — from publisher to paper mills to printing presses to booksellers.

(4) At present, government earns no tax-revenue from the import of books, but if books are reprinted in India, it would earn substantial revenues — from the tax on royalty remittances, as well as from excise duty, sales tax, and other levies on the increased consumption of paper, printing services, etc.

These and related issues were, in fact, referred to as far back as in 1963 by M C Chagla, then Education Minister, while inaugurating a joint meeting of the executive bodies of the Berne Convention and the Universal Copyright Convention at New Delhi. At that gathering, Chagla put forward a specific proposal — "a provision similar to

what you find in the Universal Convention about the rights of translation". Since India has been party to both conventions, it is restricted by both. Thus it cannot give compulsory permit with regard to translations because it would offend the provisions of the Berne Convention — though if it were party to only the International Convention it could do so. But Chagla had argued that "something much more than translation is necessary. There should be a provision that if a book is not published in this country within a certain time, the government should have the right to give a compulsory permit after giving due notice to the author and after safeguarding his rights. Because if an author wants the publication of his books, if he wants a particular country to read his books to benefit by the ideas contained in that book, there is no reason why he should not publish his books in that country. Today, you will find a large number of books coming from England and the United States mostly, some from other countries, which we have to import and pay for; they are not published here. Now, if a book is sufficiently important, there is no reason why there should not be a wide circulation of that book here. I am prepared to safeguard the rights of the author. He can have it published here and he will get his royalties perfectly safeguarded here. But suppose he does not do it. Just as in the case of a translation, when an author does not bring out a translation of his book, under the Universal Convention a compulsory licence can be issued, similarly, in the case of the publication of the original book, if it is not done in the country, say, within two or three years, or in a fixed time limit, then, the government of the State should have a right to issue a compulsory permit. Now, this suggestion that I am making to you, does not, in any way, offend against the principle I laid down to start with. It protects the author because he will get his royalties;

it does not in any way prevent the spread of knowledge. On the contrary, it helps the spread of knowledge; more books will be published, there will be more circulation of books, more people will read. Therefore, my appeal to you is to consider seriously this question of extending the rights of compulsory permits given to the States."

Thus while the author would be assured protection not only in his own country but also abroad, whenever a book is required in large quantities in any country other than the country where the work is first published, the author would have to authorise a local edition of the book — failing which, the State could intervene and grant a compulsory licence after giving the author reasonable notice and after ensuring just compensation to him. It is anticipated that the measure would benefit the reader as well as the author, in addition to encouraging the local book producing and related activities.

It may be argued that the production of local editions will hurt the interests of the original publisher. True, in some cases, his profits may be reduced; but the author's interest would not be harmed. If we look back into the history of copyright, moreover, it is clear that copyright was made a statutory right exclusively for the benefit of the author (see the opening words of the first Copyright Act, the 8 Anne), on the argument that this would encourage creativity.

As things have turned out however, it is not the authors, but the original publishers who exploit the provisions of copyright. A paper received from Sidney Kramer, a leading American publisher, at the international symposium at Delhi in March 1972, "Books for the Millions", underscores this fact. Kramer said: "In practice, it is not the laws that govern, but rather custom — really a matter of contract, not of copyright law. Let me explain. Usually the British paperback publisher buys his rights from a hardcover British publisher, or a British author, and he buys and contracts for an exclusive right to publish the book in the United Kingdom and the rest of the present former British Empire and Commonwealth. The British Publishing Association has put forth a list of territories where its members insist on having exclusive rights. India is certainly on the exclusive list to be serviced by British publishers only as to any title published in Britain... A similar and parallel operation takes place in the United States where the exclusive territory extends beyond the United States, to the

Philippines and the US trust territories. Canada is also usually added to the exclusive United States rights if the author is American. If the author is British, Canada very often lands on the British side. All the rest of the world is defined as 'open market' where the British and American editions compete. There are variations and exceptions of all kinds... These territorial delineations serve the respective US and British publishers quite well, but I don't know if India's needs are best served by that system or not. I would guess it could be improved."

While a publisher may be allowed monopoly of his domestic market — as otherwise no publisher would ever come forward to publish a book since the different editions which the author is free to negotiate would cut into one another and make publishing impossible — allowing the publisher to claim a monopoly of the market outside his country effectively reduces the output of books.

A brief account of the background of the Berne Convention and the International Copyright Convention would be relevant for an appreciation of their implications for us and the rational choice that we should make.

Berne Convention:

The Berne Convention was evolved in 1886 at Berne by the Continental (European) countries to secure for their respective authors copyright protection in other signatory countries, on a reciprocal basis, without recourse to cumbersome bilateral treaties as were then in vogue. Since these countries had diverse interests, approaches, and legal systems, agreement was secured by compromise. The Berne Convention has been revised on five occasions — once in Berlin in 1908, then in Rome in 1928, in Brussels in 1948, in Stockholm in 1967, and more lately in Paris in 1971. India adheres to the Brussels version of the Convention. Members are not obliged to ratify the latest Act, so there has been no uniformity of rules among the members of the Berne Union.

India has been a member of the Berne Convention right from its inception, because the Berne Convention was extended to the then Crown colonies by a simple declaration of the protecting States as was provided in the convention. In other words, India had not freely chosen to be a member; though it is true that, after Independence, it could have chosen to withdraw from the Union. Our choosing to stay in seems to have been part of our predi-

lection for working for reform from within international bodies.

The International Copyright Convention:

While the US was developing, the American book publishers developed rapidly by helping themselves freely to the literary outlets of England and other Continental countries. It is interesting that the growth of American book publishing was helped by the fact that, right from the day the US became independent, it disregarded the 'intellectual property rights' of other countries for over two centuries. Several American Presidents proudly possessed pirated editions of the "Encyclopaedia Britannica" which was then a British publication. Even the American courts condoned such 'piracies'. In a judgment involving the piracy of the "Encyclopaedia Britannica", Justice Arthur Butler declared: "To reproduce a foreign publication is not wrong. There may be a difference of opinion about the morality of reproducing a work here that is copyrighted abroad, but the public policy of this country as respects the subject, is in favour of such re-publication. It is supposed to have an influence upon the advance of learning and intelligence."

The US copyright laws encouraged the development of not only indigenous book publishing but also other related book-producing industries. The interests of the indigenous book manufacturing industries have been fully and forthrightly protected, ever since 1891, by the manufacturing clause of the US Copyright Act which stipulates that no work in the English language is protected — unless wholly manufactured in the US. Though the American Registrar of Copyright — under pressure from book publishers and authors — had recommended its repeal, when the US Copyright Act was taken up for revision a little over a decade ago, the US Congress submitted instead to pressure from book manufacturers and retained the clause. (Since US ratification of the Universal Copyright Convention in 1955, the clause does not apply to UCC countries.)

When the Berne Convention was drafted, the US refrained from acceding to it, as it did not suit US needs. However, as the US book industry made rapid progress in the thirties and the forties, and took a leading role in the world of books, American publishers began to urge the US government to accede to the Berne Union — but without success. In order to provide a bridge between the Berne Union and the US, UNESCO evolved the Universal Copy-

right Convention in Geneva in 1952. This convention came into force in 1954 when 12 countries ratified it.

Thus as things stand, the Berne Union is a fortress that guards the interests of the UK and the Continental countries, while the UCC guards the US interests.

It is of course ironical that, though the US publishers helped themselves freely to the output of other countries for generations, they strongly condemned Taiwan when American works were freely reproduced there. Indeed, the US government brought pressure upon Taiwan and urged it to join the UCC; but Taiwan has refused to do so. The only concession it has made is to undertake not to allow the export of the editions published in Taiwan — though, in practice, even this undertaking has not been too faithfully kept. The important fact to note here is that the US became a champion of the international copyright law only after its publishers had developed their book exports in the post-World War II world.

Intellectual property comprises two main categories: (a) copyright in literary and artistic works and (b) industrial property (patents, trade marks, etc). Britain did not extend to India — then a Crown colony — the provisions relating to international protection of industrial property, viz, the Paris Conventions and the separate agreements thereunder. In fact, India continues to be out of the Paris Union.

As the Berne Convention was scheduled to be revised for the fourth time in Stockholm in 1967, and as countries like India were going to the Stockholm conference as 'independent' States for the first time, they took the opportunity to demand provisions appropriate to their specific needs. The Indian Copyright Office issued a detailed questionnaire to publishers, educationists, authors, etc, early in 1965, to obtain their views. The investigation revealed that rights and permissions were being refused not only to publishers in the private and public sectors but also to universities and scholars, on pecuniary grounds by foreign copyright owners. This finding convinced the Indian Government that it was necessary to regulate the rights enjoyed by the foreign copyright owners. In August 1963, at the African Study Meeting at Brazzaville, sponsored by UNESCO and BIRPI, the African States too came forward with suggestions for certain amendments to the Berne Convention to suit their specific needs. The Berne Union is administered by the United International Bureaux for the Protection

of Intellectual Property, better known as BIRPI.

In response to these demands and in accordance with the provisions of the Berne Convention, a special study group, called the Swedish BIRPI Study Group, was set up to prepare the programme for the Stockholm Revision Conference. In its 1964 report, the Study Group recognised that special provisions for the benefit of the developing countries had been demanded on several occasions, and it incorporated such provisions in the Draft Protocol Regarding Developing Countries for inclusion in the Convention, as a new Article. The Protocol provided that developing countries be allowed to make certain reservations for a short period of time. The reservations comprised, among other things, the terms of protection and the right to grant compulsory licence for translation and reproduction.

There was nothing extraordinary about the demands made by the Afro-Asian countries — particularly the demand put forward by India for compulsory licensing. The proposals could well have been incorporated in the Revision as regular clauses of the appropriate Articles, and this would have ensured the continued membership of these countries. It was not necessary to bundle these disconnected proposals together, as temporary reservations allowed to the developing countries only, under the label 'Draft Protocol Regarding Developing Countries'. By stipulating that these proposals be restricted to developing countries, the Western countries succeeded in dividing the Berne Union into two groups — the developed and the developing — and so introduced an element of horsetrading. Further, by restricting the right to grant compulsory licences to works required for science and education only, the Union further extended the scope for bargaining. Unfortunately, failing to see that no substantive concession was being made, the developing countries fell prey to Western manoeuvres.

India and the other countries should have focused on an unconditional recognition of this principle. The division of the Union into two unequal groups is now in the open, so is its operation to the disadvantage of the developing countries. By restricting the so-called concessions to the developing countries, however, even a developed country like Canada — which is in a position similar to that of developing countries in that its import of books are heavy — was excluded from the new provision; it might have otherwise actively supported

countries like India in obtaining a better deal. Canada had, under Sections 14-15 of the Canadian Copyright Law, provisions enabling issue of compulsory licences for reproduction in Canada of certain foreign works under certain conditions. American publishers were thereby compelled to print separate editions in Canada for the Canadian market. India could have made it clear that unless such a fair measure was unconditionally accepted, it would have to opt out of the Berne Union. Instead, it showed weakness. And what the developed countries, particularly the UK, got away with, through obfuscation, was most succinctly described in a detailed report on the Stockholm conference in *The Sunday Times* (London) in July 1967. The report, 'Books Row by Insight', said:

"The Stockholm conference emerges as a minor classic in the annals of the British civil service. Britain's role at Stockholm was to wreck the new proposals without incurring the odium of actually voting against them. It proved to be a task uniquely suited to the talents of Whitehall. The negotiations themselves were a patient rearguard action strategically derived from years of careful committee work. And the agreement which has emerged is so complicated that it could only have been drafted by the British civil service bent on destruction." (italics added).

Triguna Sen, then Union Education Minister, did repeatedly assure Parliament that, unless the UK accepted the Stockholm Protocol within six months, India would opt out of the copyright conventions. At the same time, the UK government was assuring British publishers and authors that the UK would not sign on the dotted line. In the event, India failed to carry out her threats, although the UK firmly refused to accept the Stockholm Protocol.

Since the Stockholm Protocol is mandatory for all those who ratify it and since the UK wanted to ratify the Stockholm Act without the Protocol, negotiations were stretched further to resolve the deadlock. It was suggested, as a compromise, that the Stockholm Protocol be delinked from the Stockholm Act and that similar provisions be incorporated instead in the Universal Copyright Convention, for the benefit of the developing countries.

Several study meetings were held in Washington and Paris to prepare the programme for simultaneous revisions of the two conventions (Berne and UCC). In Paris, the *le package deal*, so labelled by the British, was worked out. The deal practically destroyed the substance of the Stockholm Protocol.

It was this, *le package deal*, that went before the Diplomatic Revision Conference of the two conventions which were in session in Paris simultaneously from July 5 to 24, 1971. Again, contrary to promises made at home earlier, India allowed delinking of the Stockholm Protocol from the Stockholm Act, even though similar provisions did not go into the UCC.

While at Stockholm the principle of compulsory licensing extended to the two fields of education and culture, at Paris the cultural field was altogether dropped. Moreover, the word 'educational', which could be liberally interpreted, was replaced by a more restrictive phrase; 'systematic instructional activities'. This was further reinforced by adding the proviso: author failing to make available copies of his works at prices reasonably related to those normally charged in the country for comparable works.

What the present situation thus amounts to is that, by claiming absolute rights under the name of international copyright, the Western countries are claiming an unrestricted right to exploit our markets. Many countries, not all of them developing, are still outside the Union. When countries take to the Union they may do so on the basis of its economic aspects. The inclusion in the Union of countries who import more than they export is of greater importance to the developed countries than it is to the adhering developing countries themselves. The UK's book exports, for instance, are about three times its imports, while India's imports are about seven times its exports. If India were not already a member, would it accede to either or both of these conventions today? Since the ostensible principle of these conventions is reciprocity, a country needs to accede to the conventions only if it serves its needs. Only half of the countries of the world adhere to these conventions. The two book-producing giants, the US and the Soviet Union, are out of the Berne Union. Two other countries, Cuba and the Philippines, have already opted out of the conventions. In the circumstances, India too should give serious thought to withdrawing from both the Berne Union and the UCC—especially since its reasonable and specific demand regarding the right to compulsory licensing is unlikely to get the concurrence of the Conventions.

In any case, Indian authors enjoying an international market can readily secure protection in the Berne Union

and the UCC, by simply first publishing their works in any Union country—say the UK—or, if the book is published in India, airfreighting a few copies of their work to the UK within one month of Indian publication. Those who profess the author's moral right to compensation, must necessarily extend the national copyright act to all authors. If BIRPI or UNESCO were to conduct a survey, this author feels that it would

be discovered that most countries would probably like to respect the international copyright and protect all authors—not merely their national authors—in accordance with their laws. But for this the exploitative character of the two Conventions must first stand exposed—even if this means resigning the two Conventions and unilaterally extending the provisions of the Indian Copyright Act to all authors of the world.

ADMINISTRATIVE STAFF COLLEGE OF INDIA

INVITES

Applications for Faculty positions and Research Associates
in Economics

Administrative Staff College of India have developed a Programme of research and training in ECONOMICS with special reference to PLANNING AND DEVELOPMENT. The faculty member is expected to conduct and organise research in these areas and the Research Associates will generally assist their colleagues.

QUALIFICATIONS:

FACULTY:

The applicants for the Faculty position should have a Doctoral degree or equivalent research experience in Economics preferably with a good background in quantitative methods and interest in allied social sciences.

Research Associate:

The applicants for the Research Associates should have a first or a good second class degree in (i) Economics with Statistics and Mathematics as optional or (ii) Mathematics or Statistics with a good knowledge of Economics. Research experience is desirable.

REMUNERATION:

The positions offer good prospects in research, training and consultancy. Starting salary will be commensurate with qualifications and experience of the individual. Gross emoluments can be upto Rs 20,000 per annum for a faculty member and Rs 12,000 per annum for a Research Associate.

GENERAL:

Applications with detailed bio-data, details about present job and names of three referees (five referees in case of candidates applying from abroad), should be sent to the Registrar, Administrative Staff College of India, Bella Vista, Hyderabad-500004, so as to reach him within 20 days from the date of this advertisement. After preliminary screening, selection interviews will be arranged in the month of May/June 1973. All applications will be treated as strictly confidential.

A move towards the better—

Could G.E.C. help?
With technology
and resources.

The march forward points to a single all-round benefit—the well-being of every man, woman and child in India. And the march forward is heading towards development and self-sufficiency in industry, power and agriculture. The country is loaded with untapped resources yet to be exploited—for instance, millions of tonnes of steel are still to be produced, megawatts of power yet to be generated, a countrywide growth plan for small-scale industries is in blue-print and thousands of acres of waste land have yet to be irrigated.

But how can G.E.C. help here?

Quite simple really. Because G.E.C. has not only an enviable past record of vital involvement in many of the nation's development projects, but it also has on tap international G.E.C. know-how, the expertise, the latest equipment and vast resources.

In other words, G.E.C. is ready now with its technology and resources to take the load of India's march towards a better tomorrow. Today.

GEC geared to take
the load.

Pay Commission's Pot Pourri

GIVEN the context, and the somewhat surcharged atmosphere in which crucial economic decisions are taken in this country, the Pay Commission has perhaps done about as well as one could have expected. There is, howsoever faint, a glimmer of recognition in its report that the technical content of government is nearly as important as its administrative content, and thus of the need to narrow the wage differentials currently existing between the two sets of personnel. Slashing down drastically the number of grades and hierarchies was an obvious first task toward the elimination of the claustrophobic anomalies; it would be petty-mindedness to complain that the Commission did not do more than what it has in the matter. The Commission is on somewhat more specious grounds when it claims to have advanced the cause of egalitarianism by narrowing the gap between the highest and the lowest wages in the government sector. What perhaps is more directly relevant is the spread of the duly weighted median income at the two terminal zones. But certainly it was not for the Commission to come up with an exhaustive blueprint for social revolution: that onus clearly belongs elsewhere. Meanwhile, the fact that the Commission has fortuitously drawn the government's attention to the futility of compartmentalised income policies should be regarded as a bold enough departure: a body of such grey eminences could have, after all, taken an altogether juridical view of the terms of reference set for it.

If one therefore still feels inclined to join issue with the Commission, it is because of certain *obiter dicta* generously strewn across the Report. The Commission, having worked out its own criteria for determining the money equivalence of a need-based wage, nonetheless decides to shelve the concept. The majority of the Commission has contented itself by offering entrants to public employment in the junior-most categories a pay packet of Rs 185 per month as against what would have followed from an application of their own concept, namely, Rs 196. According to the majority view, since the government is as yet unable to offer any corresponding sustenance to the much worse-off agricultural workers and the mass of the unemployed, it would be a "misdirection of resources" to underwrite a need-based minimum wage for the government employees.

This is the substantive argument, although the Commission does its utmost to spoil whatever case it may have by tagging on a somewhat spurious, subsidiary plea as well. An entrant to government employment, it argues, is likely to be yet unmarried and, therefore by implication, without any dependents, whereas the estimate of minimum need-based wage of Rs 196 per month is on the assumption of three dependents per individual; on the average; at the end of five years, by which time he could be expected to have acquired some dependents, the employee would in any case obtain Rs 196 per month. This is the fallacy of averages at work with a vengeance. Unless the underlying assumptions are stated explicitly, in actuarial terms it would be difficult to prove the probability of a new entrant having a lesser burden of domestic responsibility than an employee with a certain period of service behind him. Even if perchance any actuarial law to support the argument could be developed, one would still be left to deal with any number of specific instances where, the average tendency notwithstanding, the number of dependents of a relatively fresh entrant to service is substantially larger than in the case of an employee whose career is well advanced.

To return however to the principal theme, namely, the government's prior responsibility to the mass of the unemployed and low-earning agricultural workers. It is a pity that this plea was not invoked when salaries in the range of, let us say, between Rs 1,000 and Rs 2,000 per month was recommended by the Commission for upward adjustment. The invocation of social conscience is a convenient instrument to deploy, but only provided it is not deployed selectively. There is almost a touch of vulgarity in the fact that, as a consequence of the Commission's recommendations, government employees currently enjoying gross monthly emoluments of as much as around Rs 2,000 would in the overall come to gain anywhere between 5 and 10 per cent.

The Commission, it is true, would justify these concessions on grounds of rationalisation, so that for jobs whose social significance is adjudged to be more or less the same, the emoluments also become comparable. However, the objective of rationalisation can be furthered along two alternative directions. One can adjust upwards the scale of emoluments of those who had been till now discriminated against. But the same result can be brought about in case the emoluments of those who had been discriminated for in the past are scaled down. It is not at all certain that the alleged legal difficulties in

There is the other, congenitally bureaucratic argument that by being rigorously stingy at the relatively higher levels of salary scales, you save very little resources, while an extra dose of liberalism at the bottom of the totem pole causes the loss of a huge outlay. It is to the credit of the Commission that it has steered clear of this blatant piece of anti-egalitarianism. This has not, however, made much of a qualitative difference to its conclusions. What must have, imperceptibly or otherwise, worked at the back of the Commission's mind is the notion that as a category Class IV employees contribute only marginally to the social dividend, and therefore one should not expend much sympathy in case they are denied the equivalence of the minimum need-based wage. The anxiety expressed by two members of the Commission, N R Ray and A K Dasgupta, that Class IV office employees be encouraged to improve their skills and, in the process, improve their mobility, is welcome, but in a way this also reflects the latently held view that these groups of employees are by and large worth being dispensed with.

If low-paid employees in government offices are currently contributing only meagrely to the material expansion of the economy, the fault does not lie with them. It is the neo-feudal, neo-colonial administrative apparatus nurtured over the past 25 years which has made them comparatively useless, undecorative appendages of the ruling bureaucracy. And if retrospective retribution is to visit any section of the community for this cumulative idiocy, it ought to be the decision-making politicians and the top bureaucrats responsible for sustaining the system. But apparently they are free; it is only the poor employees at the lowest level who have to abide the question.

The other irony lies in the near certainty that the Pay Commission's admonitions would not put an end to the 'misdirection of resources' alluded to. What resources would be saved by denying the low-paid public employees their demand for need-based minimum wages would now be expended on respectable-sounding boondoggles such as liberal doses of cash incentives for export promotion or encouragement of luxury consumer industries under the alibi of development of backward regions or of the small-scale sector. The overwhelming majority of the unemployed and the underemployed, for whose sake the stern majority of the Commission has

shaved off the princely sum of Rs 11 per month from the pay packet of Class IV employees, will continue to have only these poorest paid category of the employed to fall back upon for survival: for, the government's various schemes for employment creation will merely scratch the surface of the problem, and straightforward unemployment assistance will continue to be regarded as being one of the original deadly sins.

Import Policy

Native's Return to the Fund?

THERE are fewer dramatic pronouncements in the import policy for 1973-74 announced by the new Minister of Commerce than was the custom in the days of his more flamboyant predecessor. The mandatory 'expansion' of the role of public sector agencies in import-export business and additions to the list of 'canalised' items are there, but mercifully we have been spared exaggerated figures of the proportion of total imports routed through public sector agencies. Last year's import policy announcement, for instance, had claimed that imports through these agencies would go up to 75 per cent. In the absence of the relevant statistics (which were released with much fanfare last year), it is difficult to say what the actual achievement in this regard has been. But if the past is any guide, the share of public sector agencies in total imports may be expected to continue around 60-62 per cent in the current year also.

The compulsory export obligation is being extended to a number of non-priority industries manufacturing such products as radio receivers, cosmetics and toilet articles, vacuum flasks and spectacle frames. If units in these industries fail to export at least 5 per cent of their production, they are threatened with a cut in their import allocations. This, it may be claimed, is the first move towards the diversion of the output of luxury goods for export, promised by the Approach to the Fifth Plan. But the government itself appears to have doubts about the exportability of the products of many of these industries. Thus we have the cautious declaration of intent that "more industries will be added to the list based on a proper assessment of export potentials". The cost structure of most of these industries is such that their export potential would appear to

be negligible, unless they are heavily subsidised.

Clearly, the export obligation idea, within the framework of import policy, needs rethinking. Most of the industries subjected to export obligations at present belong to two major industrial categories, viz, engineering and pharmaceuticals. If units in the industries export less than 5 per cent of their production, their import entitlements are liable to be cut, though only in the event of inadequate availability of foreign exchange. However, in the last few years situations in which the government has had to cut import allocations to these industries because of inadequacy of foreign exchange have not arisen. Also, it is well known that administrative laxity in implementing the export obligation scheme enables most of the units to escape the rigours of this so-called 'carrot and stick' policy. The government needs to have a fresh look at the list of industries covered by the export obligation policy and to include many more industries in the list. It must be made clear to units in these industries that they will be denied foreign exchange if they fail to meet their export obligation, irrespective whether foreign exchange is available or not. Second, the imposition of export obligation should be related not to the type of goods — i.e., whether they are non-essential items or essential ones — but to the competitiveness of the industry.

The new import policy has added 11 more industries to the list of 59 priority industries. It is difficult to understand the logic of putting industries producing such items as synthetic detergents, polyethylene, PVC resins and polystyrene on par with industries like fertilisers, drugs and pharmaceuticals and machine tools as priority industries for allocation of foreign exchange. But the dilution of priorities involved in the steady lengthening of the priority lists afflicts wider areas than merely import policy.

The government's policy in respect of registered exporters should also undergo a basic change if it is to make any economic sense. Though the government claims that import replenishment licences are meant to meet only actual import-input requirements, the replenishment licences are in effect no different from the import entitlement licences that used to be issued prior to the June 1966 devaluation. Like import entitlement, import replenishment

enables exporters to get imported inputs far in excess of their requirements and they are able to earn large premiums by disposing of the surplus import licences or imported goods. This year's import policy makes liberal provision for import of even machinery and equipment against replenishment licences.

It is equally disturbing that the government has still not bothered to bring about any co-ordination between the import replenishment and the cash subsidy schemes. A rational export promotion policy would require that the level of cash subsidy should be linked to the foreign exchange earned, net of import replenishment. But in the absence of proper co-ordination between the two schemes, the effective rate of subsidy paid per unit of net foreign exchange earned from export of different items varies a great deal, rendering the export promotion policies highly irrational.

An interesting sidelight on the import policy is that it does not in any way reflect the developing gravity of the foreign exchange situation. Excluding gold and SDRs, foreign exchange reserves have declined from Rs 508 crores in December 1971 to Rs 435 crores in December 1972. The actual decline is much larger if we remember that the non-sterling component of foreign currency holdings is now valued at the current market rate of the rupee which has depreciated by about 10 per cent during this period. The foreign exchange reserves position should be expected to worsen further once the large payments for import of wheat, edible oils, etc, take place.

Since the import policy for the year is generally announced after some foreign exchange budget forecasts have been made internally by the government, the fact that the import policy does not reflect any concern over a likely worsening of the foreign exchange position would suggest that the government has some plans for augmenting its reserves position. It was suggested in these columns some time ago (December 16, 1972, p 2435) that the government would soon need to approach the IMF for a standby arrangement of \$ 400-500 million. The recent defreezing of \$ 87 million of US aid has changed the picture to some extent, but one should not be surprised if the government has already made up its mind to approach the IMF for a substantial standby facility.

West Bengal

Impressing with Weight

LAST month, Sidhartha Sankar Ray's Congress ministry completed its first year of office in West Bengal. If the statistical information dished out by the government is to be taken as an indication of its performance, it might appear that the ruling Congress has made an all-out effort to lift the state's stagnant economy by its bootstraps. Take, for example, the impressive annual figures of additional area irrigated or number of pumpsets distributed or tubewells drilled. If these are to be believed, the present government's performance in every respect has been a multiple success compared to what was achieved by the two preceding united front governments — or for that matter by P C Sen's Congress regime earlier. The amount spent on agriculture constitutes a tale by itself. During a single year the government claims to have spent Rs 47.72 crores. Even this fades in significance when compared with the improvement that is claimed to have been made in West Bengal's complex and difficult labour situation. The number of work stoppages, closures, and ghettos, has markedly declined. The official advertisement also presents some other figures of progress. What it does not care to depict — and understandably so — is the number of new factories opened or the number of old or sick units rehabilitated.

Unfortunately for the government's publicity effort, another official source is also available which gives out very different and unpalatable information. The "Annual Review of West Bengal" says that there were about 708 strikes and lockouts in 1972; and more than 150 units had to close shop because of financial stringency, throwing about 11,000 persons out of jobs. A few units — 22 to be precise — have been reopened: but these are surviving on spoon-feeding. Although the Annual Review has avoided looking too closely at production trends in the state last year, it does come out that none of the major industries fared well. The government might say that those setbacks were due to the intransigence of the workers and their irresponsible union leadership. Yet it cannot deny what has been officially accepted, viz, that the state's economic malaise stems more from the investor's apathy and from official bungling than from labour indiscipline.

It needs to be appreciated, however, that preparation for the present level of achievement was being made even during President's Rule which preceded the present regime. While Left activists were being 'tackled', politically and physically, plans worth crores of rupees were being mooted and promises of even juicier schemes to follow were being dangled before a harassed people. Despite this all-out support operation, the state's economy has not been resuscitated. Even the 17,000 jobs promised in the state secretariat have not materialised. Agricultural prospects have not improved; industrial production remains uncertain. That the government stands on shaky ground is evident from its inability to come out with a prompt reply to the Marxist leaders' challenge regarding the credibility of the government's claims. In any case, even if it fails to substantiate its claims, the ruling Congress party is unlikely to be bothered very much; the government has other ways of proving its credentials. The CRP is ever-present. The publicity claims merely give the Left something to crib about.

Indo-Bangladesh Relations

Protective Measure

THE Government of India's approach to the question of normalisation of relations among the countries of the Indian subcontinent appeared to be fairly clear till the other day. Our view, repeated over and over by the Prime Minister and the Foreign Minister, was that it was upto Pakistan to make the next move by recognising Bangladesh, upon which the ground would be cleared for the repatriation of the Pakistani prisoners of war as well as the settlement of other problems among the three countries. But now the position seems to have undergone some change. P N Haksar, former Secretary to the Prime Minister, is currently in Dacca carrying a special message from Indira Gandhi to Sheikh Mujib. And it has been suggested that after completing his talks in the Bangladesh capital he may go on to Islamabad.

One notable aspect of Haksar's visit to Dacca has been the publicity given to it. There has even been, what clearly appears to be, an inspired leak about the contents of the Prime Minister's letter to Mujib. In her letter the Indian Prime Minister is said to have emphasised the need for a fresh initiative to solve the post-war problems facing the subcontinent. It has also been mention-

ed that the repatriation of Pakistani prisoners of war has figured prominently in Haksar's talks with the Bangladesh leaders, including Mujib.

Does this suggest a shift in our earlier position that the ball was in Pakistan's court or could the explanation be somewhat different? Last month's elections in Bangladesh swept the ruling Awami League back into power and recognition by Pakistan is perhaps no longer the sensitive political issue for Bangladesh that it used to be. At the same time, Sheikh Mujib has every interest in trying to remove whatever reservations aid-givers to Bangladesh may have on the score of the country's relations with Pakistan, especially on the question of the return of the Pakistani prisoners of war. The United States, which has been and will remain Bangladesh's Santa Claus number one, may particularly be expected to press upon the Bangladesh government the view that no purpose is served by hanging on to the Pakistani prisoners of war. For his part, through some of the changes he has made in his cabinet after the elections, especially the transfer of the Foreign Affairs portfolio from Abdus Samad to Kamal Hussain, Sheikh Mujib has served notice that should the need arise, his government would not allow an excess of gratitude to India or the Soviet Union to stand in the way of independent initiatives in foreign policy.

What do these various pointers add up to? Can it be that the Haksar visit to Dacca is the Government of India's response to the realisation that Bangladesh has begun to move in the direction of normalisation of relations with Pakistan without any more standing on the formality of prior recognition by Pakistan and also without being too finicky about prior consultations with India. Apart from the damage to the Government of India's *amour propre* arising out of this development, it also holds the possibility of our suddenly appearing as the bad boys dragging their feet over improvement of relations between Pakistan and Bangladesh. As it is, we have had to carry the can for the unjustifiably long delay in the release of the Pakistani prisoners. After all, the prisoners are physically held captive in this country and the joint command of Indian and Bangladesh forces to which the Pakistani army is supposed to have surrendered was to a large extent only a protocol entity. The danger of being left out in the cold is thus not inconsiderable. And to protect against this danger may be the purpose of the Prime Minister's letter to Mujib and Haksar's trip to Dacca. India, it must be made to appear, is nudging Bangladesh in the direction of "a fresh initia-

tive to overcome the post-war problems afflicting the subcontinent".

Left Politics

In Conventional Groove

A Correspondent writes:

NEITHER its worst enemies nor its closest friends would allege that the CPI has ever been lacking in financial capability. It would not have involved undue strain on its resources to import a hundred thousand or thereabouts of men and women into New Delhi to demonstrate against high prices and against the alleged slide-back of the Union Government from the implementation of 'progressive policies'. A friendly Railway Minister may have offered some marginal assistance, but, even without such assistance, the CPI would have been able to organise the demonstration. One or two minor debating points were scored by the MPs belonging to the Swatantra Party, Jana Sangh and Congress (O) when they tried to raise Cain in Parliament over the episode of ticketless travel by some supporters of the CPI; these were mostly at the frivolous line. To be as clean as the hound's tooth is a concept which does not readily belong to the politico-moral sociology popularised in the country in the past quarter century.

There could be other questions though. A rally of the-kind the CPI organised, there is no doubt, can be a substantial morale-lifting exercise for the rank and file of the party. Besides, in view of the by-now firmly implanted style of political operations, if one wants to make a point, the point needs to be made in New Delhi itself. But will the shape of realities be changed even marginally by such demonstrations of mass support? Will the Government be persuaded to take, as a consequence of the CPI rally, one additional step to restrain the heady spiralling of prices, or to stop making the kind of compromises it has been systematically

making in recent months with what the CPI describes as 'the forces of Right reaction'? The roster of suggestions the party has made for controlling prices consists almost entirely of the old faithfuls, namely, more and more of nationalisation, the taking over of this and that sector of commodity production and distribution. It is as if the eternal verities were revealed, in their full glory, once and for all, in some theses which the party had approved of in some distant past, and time has come to a stop since then. In none of the CPI's prescriptions can one discern any effort to analyse the morphology of production and distribution of individual commodities. The kind of take-overs-made-easy which the government has been recently specialising in have not hurt any of the vested interests; despite the bark unleashed, this would be true even of the take-over of the wholesale trade in grains. If pressed hard, the government may be quite willing to have some more segments of the economy formally nationalised. Since the objective conditions will however remain what they are, there is going to be little impact of such measures on prices, or for that matter on the degree of monopoly enjoyed by the 'vested interests'.

Not that there is any greater order of clarity in any of the other political parties belonging to the Left. Over the entire spectrum their activities are marked by a tenacious reverence for cliches. Doctrines learned by rote twenty or thirty years ago still form the base of their mental frame; even techniques of demonstration are shop-worn prototypes from the past. A handful who, a few years ago, tried to think and act dangerously differently, have been snuffed out, and Left politics in back to its conventional groove. In a sense, there are no greater preachers of the *status quo* than these so-called revolutionary parties, for they refuse to learn a-new, be it a theorem or a corpus of tactics.

Calcutta Diary

A M

THE time has come, the Walrus said. Those, who ought to be in prison, are out; those who ought to be out, are in: would this not about sum up the situation around those parts even as summer, along with the lean season for foodgrains, ensues? Tucked away in remote corners of newspapers, you will find stories of murders, mayhems, assaults, raids by armed gangs. If it were two or three years ago, our conscientious, truth-serving newspapers would have provided those items with shrieking headlines: civilisation has reached the end of its tether: Joyti Basu, assassin, to the gallows; enough is enough, we demand the restoration of the regime of law and order, productive economic activities have come to a halt in West Bengal: the polity must be saved from the marauding Left; the Centre must act and put an end to the gory events.

Today, the scenario is different only in the sense that it is intended to appear different. Murders are minor episodes, newspapers cannot afford on the average more than one-and-a-half column-lines per murder. These murders belong to the inconvenient category: one alleged supporter of the Congress knifing to death, or shooting down point-blank, another supporter of the party does not constitute the stuff out of which hair-raising fiction should be built interminably. In Durgapur, it is not the intransigence of the Left-leaning unions which is choking production: it is the fact of one Congress faction battling it out with another one, with no holds barred, certainly the deployment of sten guns or light machine guns not excluded. Bustling areas in Calcutta may suddenly experience a midday eclipse: traffic will wither away, the local police station will be cordoned off by vicious-looking characters, shops will put up their shutters, factories will stop work, schools and colleges will empty — all the outcome of one Congress group flexing its experimental muscle, and in response to what a competing Congress group had dared to do, maybe the previous day.

Consider certain other facts. An individual who, two years ago, was the Mayor of this city, the largest one in the country on the authority of the 1971 Census, has been living away from his own house for more than a year; he belongs to the wrong party, and the police can offer no assurance that, in case he returns, he would not be

summarily executed by the local toughs, who know of no other goddess than the Prime Minister. According to one count, there are at least twenty thousand such political workers who have been turned into political refugees since last year. Some who had ventured to go back have paid with their lives; these, one presumes, have been deemed as patriotic killings by the police — the files have therefore been closed.

Every dog will have his day; every ruffian is having his. The Congress party, as it is currently constituted in this neighbourhood, provides an interesting sociological study. Take the seediest amongst West Bengal's lot of professional politicians, place them next to elements from the underworld, add a few barristers and other affluent elements, top up by borrowing some intellectuals from the CPI, now stir: the resulting cocktail would represent the character of any typical conglomeration within the party. But the Gresham's Law has taken charge, and the rogues and ragamuffins have pushed the others aside; a deliberate debasing of the political coin has taken place. Ideology has been supplanted by cliches; uncouth bullying has emerged as the dominant style of party politics. The process, we would be told, was already set in motion in the late 1960s, when elements belonging to the Left came to the fore. True, in any period of flux, habitual criminals converge toward, and seek protection from, those who are tending to emerge as politically the most powerful. In the resulting confusion, it often becomes difficult to separate the true from the false, the wholesome from the filthy. The temptation to relax the criteria for accepting new recruits to the fold grows. Many of the Left parties, there is no question, were victims of such weakness during the halcyon days of the United Front.

During the fading days of the Naxalite movements, it would be pointed out, a working alliance was struck between groups of anti-socials and one or two factions among the revolutionary radicals too. Since, for some ideologues, the collapse of law and order, never mind through what means this was brought about, was to be objectively preferred to any other situation, they had no qualms in coming to an understanding with the habitual knife-wielders and wagon-breakers. There were some among them for whom the main

enemy was not the Congress, but the CPM; alliance were therefore formed with avidity with Congress toughs with the single-minded objective of physical liquidation of CPM cadres. But perhaps *agents provocateurs* had also been been simultaneously at work. Certainly the various allegations that the police in West Bengal had, selectively, planted their own men amongst the Naxalites have not been denied.

The inability to see beyond one's nose is a ubiquitous malady. The Left is now being called upon to pay the wages of folly. It is the same flotsam which had tried to be chummy with the Left parties barely a few years ago that now constitutes the infrastructure of Congress strength. There is a difference though. In the past, the criminal elements were always on the fringe of the political movement and would not dare to strut about in the open. A metamorphosis has occurred. You can hop from one area of Calcutta to the next one; the wellknown toughs of each locality need no longer be ashamed of their avocation. The ruling party has welcomed them with open arms, feted and financed them and has offered them *carte-blanche* protection against possible onslaughts upon them by the forces of law and order. The police, on their own, had tried and failed to subdue the Left in this state; it is the toughs and bully-boys who really did the job, and the latter thus think it to be within their rights to lay claim to a share of the Congress gravy.

In recent months, one has often heard of the Left parties being accused of excessive demoralisation at the turn of events. Their workers, it has been said, had no business to run away; they should have stuck to their own areas and organised resistance. There is however the other point of view. In earlier times, the police did not ever come out openly on the side of ordinary criminals; in contrast, those who live by murder are now being deliberately encouraged by the administration. In such circumstances, the traitorous lessons in resistance learned in relatively tranquil times are of no avail.

Meanwhile, nobody knows for sure how many political prisoners are crammed in the different jails in West Bengal. There is a semantic revolution here. The political prisoners are no longer described as such; they are simply hauled into prison under various criminal charges listed in the penal code. The prayer for bail is opposed by the police and generally turned down; in case the examining magistrate does grant bail, the moment the prisoner steps out of

the court room, the Maintenance of the Internal Security Act is used to recapture him and keep him indefinitely behind bars. There is the case of one particular trade union leader who, in the course of a bare fortnight, was charged under one criminal offence within the jurisdiction of one police station, released on bail, charged under another offence by another police station, again released on bail by a second magistrate, arrested by a third police station for allegedly committing yet another offence within its jurisdiction released once more by a third magistrate; at which stage the MISA was invoked and the agony ended.

If you read the local newspapers, political prisoners do not even exist. Peace has returned to West Bengal. Economic activities are humming. Games and musical soirees and advertisements for lush consumer goods hog the space. If some stray murders take place, let them. The state, after all, has been made safe from the depredations of the Left; what are a few murders set against the gain of such a tremendous order? How does it matter if, in order

to usher in the peace which is the beloved of the plutocrats, the social scum have to be kept in good cheer? There is no peril greater than the peril of ideology. The social scum can be bribed and kept on your side. The idealists cannot however be purchased. Let us therefore honour the former, and let the latter rot in prison.

But can this season last for long? Habitual criminals are habitual criminals. You may try to humour them along, but, beyond a point, their criminality will be out. Once there are no more cadres of the Left left to be beaten up, the criminals will seek psychological release by beginning to fight among themselves: ragamuffin A will be out to seek the blood of ragamuffin B, and it is entirely incidental that, while indulging in the game of mutual liquidation, both swear by the Prime Minister's name. The process has already started. The catalysis of physical tyranny and dishonest public relations it will be soon discovered, cannot provide any satisfactory long-run answer to the challenge of ideology. One must reluctantly, look for other chemistries.

CAPITAL VIEW

Who Rules the Ruling Party?

Romesh Thapar

INDIRA GANDHI will have to move with a certain vigour, even ferocity, if she is to stamp out the disruption that the so-called "forum" activity is causing within the Congress party. In the Capital, during the last week, we have witnessed an open confrontation between Congress MPs belonging to the "Forum for Socialist Action" (largely a get-together of former CPI activists) and the "Nehru Forum" (a combination of traditional Congressmen and anti-communists). This trial of strength in the parliamentary party, weighted heavily in favour of the Nehru Forum, is only bringing the leadership of Indira Gandhi into question.

Take the recent incident. The so-called Socialist Action Forum calls a special seminar whose theme is identical to that of the massive CPI march in the Capital — the threat of Right reaction. An impression is created that the CPI has ordered the seminar, for not only are the sponsors former members of the CPI (includ-

ing Cabinet Ministers!) but CPI leaders are asked to take part in a Congress Party discussion. Read together with reports of the Communist march, heralded by ticketless travel from all corners of the subcontinent, the story begins to circulate that Indira Gandhi is handing the Congress over to the Communists.

The solid support extended to the protests of the Nehru Forum reflects deep fears within the ruling party — and these fears, let it be known, are not confined to those who are disturbed by the progressive thrust of the PM's programme for change. Firm supporters of the Prime Minister, who consciously back her policies, are questioning the wisdom of allowing "forums" to function as lobbies and factions for this or that interest. The urgency behind the demand for discipline is emphasised because loose-tongued colleagues of the PM have been talking of "vice" unable to co-exist with "virtue", of "purges" and "purifications".

Indira Gandhi is not unaware that the party is being infiltrated by all manner of Rightists and Leftists who do not have any respect for Congress aims and methods. The expulsion of such elements cannot for long be delayed. The Socialist Action Forum, the Nehru Forum, the Farmers Forum, the Backward Classes Forum, etc, etc, have certainly helped to expose this aspect of the chaotic organisational state of the ruling party. These forums are building all-India networks and considerable funds have suddenly become available to them. They represent a dangerous threat to the normal disciplines within which a party leadership functions.

So far, all the self-appointed saviours of the party tom-tom their loyalty to the Congress and "to the leaders". However, the knowledgeable know that this kind of practice can change overnight. Congress President Sharma, who has allowed himself to be misused in many ways, should be the first to be disciplined. He needs to be educated about the dangers of infiltration from Right and Left when the ruling party is without the kind of clarity required to resist subversion. Sharma, in other words, shuns his main task — to give the Congress party the intellectual and ideological ballast to cope with the pressures from Right and Left. It is a task which cannot be performed by factional forums. A thinking, sensitive, alive party centre needs organising. Interestingly enough, no one talks about it.

The party of Gandhi and Nehru was designed to respond to the complex realities of a continental federal policy. It was not a party built in imitation of another. Nor did it dance to alien tunes. But the very amorphous nature of the continental party exposed its flanks to penetration. The penetration ceased when there was action to match theory, when the continental consensus carried within it a forward thrust. The penetration increased in a period of confusion. Whether we admit it or not, we are in such a phase of indecision. A great mass ferment has been sparked. We are still groping for the programme which will make an impact on the life and work of the poorest of our people. Until this programme is sketched, there will be intense debate and confrontation, but there is no justification for disruptive forums in the Congress, which turn one party member against another.

The story, pushed by various inter-

ested quarters, that Indira Gandhi is handing over the country to the communists under pressure from the USSR, on whom we are alleged to have become terribly dependent, is a lot of poppycock. Even the communists, hunting for a secure perch on the Congress bandwagon, don't really believe it. They know that when the chips are down, the Congress party

will not play the politics of polarisation. Continental pressures warn against such politics. However, the public has every reason to wonder at some of the statements that Indira Gandhi's colleagues make every now and then. And inevitably, the question forms: who rules the ruling party?

In the coming difficult months,

Indira Gandhi will have to answer this question in no uncertain terms. She understands mass communication. She cannot allow the people to be confused. For a start, her Council of Ministers could be put under discipline. This might also help performance in their respective ministries — performance, that sadly neglected task. April 2.

COMPANIES

Building on Wider Base

Hansavivek

UNION CARBIDE INDIA has been issued a 'letter of intent' for manufacture of 5,000 tonnes of MIC-based pesticides in which it expects to use the maximum amount of indigenous know-how and equipment. The company's application for a licence to be able to import four additional trawlers is still under government consideration. It has also planned shore-based processing facilities so that it can undertake some

consumer packing of shrimp for export. Last year, modernisation of battery-manufacturing facilities continued, and the zinc rolling facilities were completed towards the end of the year. The company incurred capital expenditure of Rs 450 lakhs on various units, mainly for equipment to improve products or to prepare for expansion. The proposed additional expansion for batteries too is still under government consideration. An

industrial licence for manufacture of midget electrodes has been received, but the project has not been yet undertaken as government has imposed export conditions which have rendered the project non-profitable.

Last year, the company spent Rs 37 lakhs on research and development. The Chemicals and Plastics division improved and developed recycling processes of waste streams, carried out catalyst development, and process improvement. Process improvement programmes and development of manganese ore beneficiation were continued

in the electrolytic manganese dioxide plant; additional development work was undertaken on carbon electrodes; and import substitution was pursued of raw materials for cinema arc carbons. The Consumer Products division continued developmental work in various battery systems. The Agricultural Products division increased its formulation development efforts, with quality improvement and import substitution programmes. Extensive research was carried out in biological screening of carbonate molecules and in process development of dichloro-benzyl alcohol, iso propyl-phenol, and i-naphthol. Significant achievements in 1972 included: development of the process technology for producing electrolytic manganese dioxide of international quality standards; development of an indigenous method of producing alpha-naphthol; encapsulation of toxic granular pesticides with indigenous equipment; and decontamination of organic waste chemicals in process water by oxidation and biodegradation.

During 1972, the market for UCI's products in general continued to grow but chemicals remained generally depressed, mainly due to excessive imports of plasticisers and plasticiser alcohols. The company envisages continued shortage of polyethylene in the country for several years; it says that government has been importing polyethylene on an *ad hoc* basis and that its application for

expansion of existing facilities, submitted in 1970, is still awaiting government approval. The company's net sales advanced by about 21 per cent to Rs 61.55 crores and, with margins widened, gross profit rose by about 22.5 per cent to Rs 13.02 crores. With the tax liability draining away substantially more than in the last year, net profit was a shade lower at Rs 3.96 crores. Even so, dividend stepped up 2.5 per cent to 20 per cent, was well-covered.

ELECTROSTEEL CASTINGS, Rajgangpur, is setting up a steel melting shop at Ghaziabad with two numbers of 10-12 tonnes electric steel melting furnaces, a twin-strand continuous casting machine and a high-speed steel rolling mill to roll billets into carbon steel wire rods in coils. The installed capacity of this composite unit is proposed at 40,000 tonnes of steel wire rods, for which the company has an industrial licence. The first furnace was commissioned in June and the second in September 1972. Production of steel ingots was initially hampered by shortage of graphite electrodes and later by a power-cut. The position of graphite electrodes remains uncertain, and supply of electric power too may further deteriorate in the coming months. An order for the import of essential components of the continuous casting machine has been placed with Concast of Zurich. ICICI has sanctioned a loan

of Rs 21 lakhs in foreign exchange on the condition that it will have the option to convert part of the loan into 42,300 equity shares of Rs 10 each in the company at Rs 15 per share during 1974-75. For the setting up of the wire-rod rolling mill, the company has appointed a firm of consulting engineers to design the mill and supervise the manufacture as well as to install and commission it. The continuous casting plant is expected to be commissioned by May 1974 and the wire-rod mill by December 1974. Owing to its improved financial position during 1971-72, the company has withdrawn its application for a term loan of Rs 40 lakhs submitted to IFCI. In spite of frequent interruptions in operations, owing to scarcity of power supply, the Khardah unit in West Bengal showed much better results last year. Production of spun pipes improved and sufficient orders were secured at DGS & D rates. Production of steel ingots also showed an upward trend and output of steel castings was restricted to items in which the company has specialised knowledge. Net sales were substantially higher and, although profit-margins contracted, gross profit rose from Rs 53 lakhs to Rs 101 lakhs. The ratio of inventory/sales declined sharply. Dividend, stepped up 2.5 points to 12.5 per cent, was covered twofold. Punjab State Industrial Development Corporation, promoter of 'Punjab Con-Cast Steels' had entered into an agreement

ECONOMIC AND POLITICAL WEEKLY

April 7, 1973

with the company for technical and financial collaboration for the setting up of a project at Ludhiana for manufacture of 50,000 tonnes of steel billets per annum. The company was later informed by PSIDC about the 'onerous' conditions, imposed by IDBI for granting loans to PCCS, which were 'in serious conflict' with the main terms of the agreement entered into by the company with PSIDC. PSIDC has unilaterally terminated the agreement with the company and it has taken up the matter with PSID. Meanwhile, from October last, the commission payable to the company's sole selling agents has been reduced, from 3 per cent on all the products of Khardah works to 1 per cent on the sale of steel ingot castings and 2 per cent on other products.

VULCAN-LAVAL is seeking government permission to undertake manufacture of tobacco machinery. Meanwhile, the task force set up by government has agreed to fuller utilisation of the company's installed capacity for manufacture of dairy machinery, auxiliary equipment for chemical and dairy industries, separators, vegetable oil plants, etc, on the basis of certain export commitments. As at the end of February last, the company had on hand orders worth Rs 485 lakhs, as compared to Rs 315 lakhs a year ago. Of these, orders for dairy machinery were lower, but those for mining accessories and other industrial equipment increased considerably. The additional duty on stainless steel, proposed in the Budget for 1973-74, is likely to have further adverse effect on

future orders for dairy machinery and equipment. Last year, too, the company experienced keener competition in the field of dairy machinery and had to accept orders on the basis of lower margins of profit. It was, however, able to produce good results by undertaking the manufacture of new products, diversifying the existing range of products, and improving industrial engineering methods. Gross profit increased by over a third to Rs 68 lakhs, following rise in net sales from Rs 393 lakhs to Rs 518 lakhs. Net profit advanced from Rs 15 lakhs to Rs 22 lakhs, and dividend was stepped up 5 points to 15 per cent. In view of the increase in the manufacturing activities of the company, the power of the Board to borrow moneys is sought to be increased to Rs 5 crores.

FROM OUR CORRESPONDENTS

Cover for Wage Curbs?

(From a Special Correspondent)

ONE of the economic shibboleths of the government is that labour in organised industry constitutes a privileged class. And now, it seems, the millennium is at hand for this segment of society. A high-powered Wage Policy Committee, with one of the members of the Planning Commission as Chairman, has just singled out wage and salary earners in organised industry for being subjected to a national wage policy which, according to newspaper summaries of the Committee's report, will ensure to them (i) a minimum wage; (ii) allowance for skill differentials, including compensation for occupations characterised by exceptional hazards or disadvantages; (iii) a 'growth dividend'; (iv) dearness allowance sensitive to price changes; and (v) a share in profits.

On the face of it, this is an impressive list of benefits sought to be conferred on industrial labour. However, the inspiration for the setting up of the Committee and its own approach to the problem leave little doubt that the whole exercise was intended to provide a respectable cover for imposing restraints on wage increases in organised industry. That such an exercise should have been undertaken should come as a surprise to no one. After all, government spokesmen, including the Prime Minister, have seldom missed an opportunity to suggest by

innuendo that if so many people in the country are without work, at least a part of the reason for this is that workers in organised industry are getting away with a disproportionate share of the cake.

As at the end of March 1972, the country had an estimated 185 million "workers". Of these, about 74 million (i.e., about 40 per cent) were wage (and salary) earners. Of these, again, agricultural labourers numbered about 49 million. Of the 25 million wage-earners in non-farm activities, about 17 million were in the organised sector of whom the Committee's report is supposed to relate to some 10.70 million, leaving out government employees covered by the Third Pay Commission. The Committee has suggested the creation of a national wage commission. It will be the responsibility of the board to ensure that wage fixation in the different sectors is in harmony with the national wage policy. The national wage policy, as envisaged by the Committee, is expected to achieve the general objectives enumerated in the first paragraph above. While these appear to add up to a formidable list of benefits for labour in organised industry, a more careful examination shows how false this impression is.

First, the minimum wage suggested by the Committee is based on the mi-

nimum consumption requirement of Rs 40 per capita per month in October 1972 prices — i.e., the 'poverty line' consumption as defined in the Approach to the Fifth Plan. This is the national average and the Committee has suggested that wages should be worked out taking into account variations in cost of living in different centres and regions. This poverty line wage is to be paid by the entire organised sector by 1978-79. But doesn't the Approach to the Fifth Plan promise poverty line consumption (Rs 40 per capita per month in October 1972 prices or Rs 37 in 1971-72 prices) to everyone by 1978-79? So there is nothing in this for labour in organised industry to be enthusiastic about.

Second, the Committee's recommendations about the need for the wage structure to adequately reflect skill differentials, etc, appear to be half-hearted and not based on a study of the problem in depth. It is the Committee's view that "excessive differentials have to be avoided and the need to bring down disparities progressively should be kept in view". The Study Group on Wage Policy appointed by the National Commission on Labour, which had made a thorough study of the subject of skill differentials, had come to the opposite conclusion that the existing "differentials are not adequate for the purpose of encouraging the requisite skill formation. It is extremely essential for a developing economy that these differentials are widened" (Report, p 59). The Wage Policy Committee, it ap-

ECONOMIST

Required by a Bank in Calcutta to head its Economic Research Department.

Job Description:

1. To organise the bank's economic and operational research activities.
2. To undertake field studies of potentialities for banking development, evaluation of activities in various fields like agriculture, small business, etc.
3. To assist formulation of corporate business plans at various levels.
4. To organise the statistical services of the bank.

Qualification:

1. A doctorate or a first class post-graduate degree in Economics and other related disciplines from an Indian or Foreign University with consistently good academic record.
2. About five years' experience in conducting and organising research activities in a supervisory capacity in a research institution or a business organisation.

Please write giving full particulars and stating remuneration expected, to Box

No. 150. Economic and Political Weekly, "Skylark", 284 Frere Road, Bombay 400 001.

pears, has fallen prey to facile egalitarianism without realising the implications thereof.

Thirdly, as a measure of innovation, the Committee has propounded the idea of a 'growth dividend' based on the projected Fifth Plan growth rate of 5.5 per cent in gross domestic product, "to enable the workers to function enthusiastically". However, the actual increase in national consumption expenditure per capita per annum in the Fifth Plan period may not exceed 2 per cent and if the growth is given by a sliding scale of 60 per cent to 20 per cent, the benefit can hardly be attractive to labour. A person drawing a salary of Rs 200 per month or Rs 2,400 per year will get Rs 24.48 for a full year. Even this is subject to a significant qualification: "This extra amount should not be allowed to be spent in consumption but be deposited in a savings account."

Fourthly, the Committee has recommended that dearness allowance, fixed as a percentage of the basic wage, be linked to the regional cost of living indices. After 10 years dearness allowance would be merged with basic wage. It is by now well established that the system of wage fixation in our country has reduced the real wages of workers over a period of years. An important reason for this is the lack of a mechanism for adjusting the total wage to changes in cost of living. As the Government of India's Labour Bureau has pointed out: "in most of the foreign countries such adjustments are made by upward or downward revisions, as the case may be, of wages themselves, but in India a somewhat peculiar system of making a separate payment known as Dearness Allowance has come in vogue." The National Commission on Labour had also emphasised that the existing system of neutralisation of rise in cost of living either through the DA or through periodic wage adjustments cannot fully protect the worker against a fall in his real wages. Firstly, there is a time lag and, secondly, the neutralisation is seldom cent per cent. The Wage Policy Committee has not thought it necessary to even refer to the consequences of the existing system under which neutralisation of increases in cost of living is linked to a small part of total wages and is content to perpetuate the gross inequity in this regard.

As for giving workers a share in profits, the Committee has avoided

detailed discussion of the subject on the convenient plea that the Bonus Review Committee is already seized of the matter.

LABOUR'S SACRIFICE IN VAIN

The government's preoccupation with wage restraint, for which the Committee's report is intended to provide the rationalisation, might have had some justification, firstly, if wage cost had risen so much that it was a significant factor in the persistent inflationary situation obtaining in the economy; secondly, if this labour in organised industry had in the past appropriated a disproportionately large share of the net output they had helped to produce; and, thirdly, if despite decline in real wages and despite inflation being nurtured by factors other than rise in wage costs, there is assurance that the sacrifice imposed on the working class will benefit the unemployed and the poor in terms of greater employment and better incomes.

On the first two of the above points, the National Commission of Labour had made detailed studies and come to categorical conclusions. According to the Commission, "the increases in the money wages of industrial workers since Independence have not been associated with the rise in real wages nor have real wage increases been commensurate with the improvement in productivity" (p 225). Further, "the net effect of the operations of the industrial dispute machinery on wages of factory workers has been that in 1965 the industrial workers at the

lower levels were earning hardly a real wage corresponding to that in 1952" (p 223). And the situation has decidedly worsened after 1965 on account of the sharp increase in the cost of living index. Between 1965-66 and 1972-73 (April-January), the index number of industrial workers rose by over 45 per cent. Yet the share of wages in value added by manufacture has sharply dwindled in the last few years (see table).

As for the impact of wages on commodity prices, the National Commission on Labour again came to the conclusion that "wage costs as a proportion of total costs of manufactures have registered a decline" (p 225). More recent data from the Reserve Bank's studies of company finance confirm this findings. Wage cost in value of output (net of basic duty) has declined from 15.4 per cent in 1965-66 to 14.8 per cent in 1969-70 in respect of the 1,501 large and medium companies (Reserve Bank Bulletin, July 1972). In both cases, there have been larger increases in raw material costs as well as in entrepreneurial profits. Excise duty has also been a major factor in raising the costs of production. The cost of wages, salaries and bonus in respect of 1,501 companies studied by the Reserve Bank (which account for 80 per cent of all public limited companies) amounted to Rs 952 crores, against this excise duty amounted to Rs 707 crores. Of course, there may be some improvement in wage levels because of the strength of the workers' organisations.

SHARE OF WAGES IN VALUE ADDED BY MANUFACTURE

(Per Cent)				
Year	Wages	Salaries	Money Value of Benefits	Total (2+3+4)
(1)	(2)	(3)	(4)	(5)
1949	53.3	10.6	1.1	65.0
1952	51.6	10.7	1.3	63.6
1955	41.8	10.6	2.7	55.1
1958	39.8	11.6	3.3	54.7

1968	38.4*		21.4	59.8

* For 1967 and 1968, excluding bonus and hence not comparable with the earlier years.
Source: Upto 1964, Report of the National Commission on Labour (1969). pp 224-25; thereafter Annual Survey of Industries.

That none of these sacrifices made by labour in organised industry has benefited the poor masses is evident from the state of the economy. The level of investment continues to be at a level much below that which had been reached in 1965-66. It is also clear that the Fifth Plan investment projections will hardly take the economy forward in terms of investment or employment ("Polishing the Vessel", Annual Number, February 1973). During the last six years, 1965-66 to 1971-72, employment in organised industry has risen by 10 per cent, i.e., at a compound rate of about 1.5 per cent per annum. Further, organised industry has been able to substitute capital for labour in even traditional industries where the case for such substitution in social cost-benefit terms is weak or non-existent. The increase in the share of 'salaries' in value added by manufacture as against that of 'wages' is evidence of such substitution (see table). The increasing capital intensity has also been induced by the cheap rate at which capital funds are made available to entrepreneurs. There is thus little evidence to show that restraints imposed on labour have yielded any increase in the rate of investment or in employment creation. On the contrary, what has been thus squeezed out has been appropriated by industrialists in terms of larger profits, rich farmers in terms of high and assured procurement prices, and professionals and merchants in terms of tax evasion and avoidance. Apparently, the incomes of none of these latter categories of persons are to be curbed for they are all deemed to be vital to the growth process!

It passes comprehension how a national wage policy can be based on such a biased view of economic processes. Should not those who seek to advise restraint on the claims of labour in the name of growth and employment show some recognition of the need for more efficient and honest collection of taxes, for reduction in non-development expenditure, for curbing investment in a whole host of non-essential and luxury industries, for better management of public sector units, for better utilisation of industrial capacity, for larger procurement of foodgrains and greater production of wage goods so as to contain the rise in the prices of the necessities of life, for some effort at taxation of farmers with large holdings and incomes, and, above all, for

a push to investment and employment? As things are, the demand for restraints on the earnings of labour appears virtually as a substitute for action in any of these other directions. It is thus no accident that it is after

POONA

Industrial Workers Organise Themselves

(From a Special Correspondent)

ONLY 12 years ago, Poona was still a city famous for its educational institutions, its historical monuments, its ammunition factory, and its printing business. Now it has acquired a new face with its modern industrial estates and its complex of industries alongside its old institutions and forts.

Out of 140,000 workers in the Poona-Chinchwad-Pimpri industrial belt, nearly 10,000 workers have been on strike for the past one month. On March 2, following a rally under the banner of 'Seva Shramik Sangha' — from which the INTUC abstained —, a strike started among the workers of the printing industry, one of the oldest industries of Poona. Poona has a high concentration of the state's printing industry and orders are placed with Poona printers from all over Maharashtra. Work in the industry has almost stopped, with 800 workers from 12 big printing presses being on strike. The strike is over the workers' demand that there should be immediate implementation of the 'Abhyankar Award'. Nearly four years ago, a dispute regarding wages and service conditions of printing workers was referred to a Labour Tribunal. At the end of 1972, the Tribunal finally gave an award favourable to the workers; this is popularly known as the 'Abhyankar Award'. The press owners were, however, known to have decided to go to the High Court on the ground that the industry could not bear the cost of the revised pay scales and other benefits. The owners' petition against the Abhyankar Award was filed in the High Court on March 26. Resort to dilatory legal processes is a well-known way of by-passing workers' demands. The workers, therefore, reacted by striking work.

The Aryabhushan Press, where most of the Maharashtra SSC Board question papers are printed, was the scene of disturbance on March 15 and 16. The owners were eager to print the profitable orders of the SSC Board at any cost. As their own workers were on strike, they attempted to get the papers

1965-66, as economic growth has slumped and the government's economic management has lost all sense of direction, that the doctrine of wage restraint has been advanced most insistently.

printed with the help of 'outsiders'. The workers resisted. The State machinery immediately came to the aid of the owners. A D Bhosle, of the Lal Nishan Party and leader of the printing workers union, was arrested along with 22 others. On the following day, 400 workers went out in a morcha to the police station and from there to the printing press. The arrested leaders and workers were finally released on bail.

Another major factory in the grip of a strike is Swastik Rubber Products. Workers started the strike on March 2 because two workers were dismissed for alleged intimidation of a supervisor. Whether or not the story of intimidation is true, the two dismissed workers were known to be active members of the unrecognised union. What is interesting is that, when the dismissal took place at the Chinchwad unit where 1,200 workers are employed, the Khadki unit employing 2,100 workers and Shree Products (an allied company of Swastik Rubber) employing 600 workers also stopped work. The Chinchwad unit started a sit-in, followed by a procession to the others units. R M Chatterjee, leader of the unrecognised union, held meetings and charged the management with refusing to settle the disputes before the Labour Commissioner. The demands of the union were: reinstatement of the two dismissed workers and appropriate dearness allowance to all workers including the large numbers of 'temporary' workers. The management refused to consider these on the ground that the union was an unrecognised one. On March 5, the Swastik management declared the strike illegal and subsequently announced a lock-out. The police made a lathi-charge at a strikers' demonstration on April 2. The same day, R M Chatterjee and some other workers were arrested.

Rajabhadur Textile Mill is one of the biggest mills in Poona; it employs 2,500 workers and its daily production

is about 1.6 lakh bales. Last year, a Labour Court decision did away with weekly holidays and sanctioned the management's scheme for 355 working days. On March 3, rallying behind the call of the Action Committee led by A D Bhosle, the workers took the day off as it was Mahashivratri. The 'recognised' INTUC union did not support the action; the management rushed to the court which ruled that the absence of the workers on that day be treated as a strike. The management went a step further to declare a seven-day week — the holiday wage rate to be paid was to be 25 per cent of the normal wage. As the INTUC union was indifferent to the workers' grievances, an Action Committee was formed under the leadership of Bhosle and demands were made, including a six-day week with a weekly paid holiday, DA according to the Poona Index and not according to the Sholapur Index that was being used by the management, better facilities for workers, sick leave, a holiday wage rate at twice the normal rate as payment for overtime. As the previous strike had been declared illegal, a sit-in was started on March 8 on the mill premises which workers of all three shifts joined. The management, the INTUC union, and the police, all took a tough attitude; but the workers refused to leave the factory premises; the Action Committee and the families of the workers brought food for the workers sitting in at the factory. The Labour Court again ruled that the strike was illegal. A lock-out was declared on March 28 and the strike is in full swing.

On March 21, workers of Mahendra Owen started 'non-co-operation' with management: the food supplied by the subsidised canteen was stated to be of inferior quality and the management was intransigent. On March 29, workers gheraoed an officer for eight hours. R M Chatterjee, leader of the unrecognised union, intervened, and the gherao was lifted. The workers achieved some success regarding their demand.

The strike of the Maswi Company workers started on March 2, under the leadership of the Bharatiya Mazdoor Sangh, for 8.33 per cent bonus. It ended successfully on March 20. Another strike began at the Anti-Friction Bearings Corporation, Lonawala, for reinstatement of refrenched workers, against de-gradation of skilled workers, and against the generally tough attitude of the management. Nycrome Metal workers started an indefinite strike on March 23 for renewal of the old seven-

year settlement which had expired in December 1971 and which the management was unwilling to renew.

Thus the general demands of the Poona workers range from payment of bonus according to law, wage increase, and DA according to the Poona Index, to the oppressive conditions of work. The major strikes are led by unrecognised unions forming action committees; the workers rally behind the unrecognised union while the recognised unions take up attitudes suited to the managements. Evident here, too, is the management's tendency to take shelter behind the dilatory legal machinery. Government, so far, has been apathetic. But this may well be the beginning of more action. Most of the Poona workers are from the local population — unlike in Bombay city, where a large proportion is immigrant. Poona's workers also belong to the post-Independence generation. They appear to be generally free from the social propaganda of the non-progressive local

newspapers. And they have shown, in the recent wave of unrest, an organised strength and discipline which is remarkable. In the Poona strikes one may again find a vindication of the fact that struggle for higher wages does not preclude the possibility of fundamental worker consciousness emerging. When increases in wages are wiped out by inflation, struggles for better wages and better treatment could lead to a more organised working class movement. What is evident again is that, as the recognised unions led by Congress and CPI do not want to take up issues (such as oppressive working conditions and social division of labour) that affect industrial workers but are content to look to bureaucratic solutions, the workers have started to form their own action committees. As a result, wild-cat strikes have occurred. It may be that the leaders of the unrecognised trade unions and action committees are out to get support among the working class. But this may yet be a beginning.

INDUSTRIAL LICENSING

Still Tied in Knots

(From a Special Correspondent)

THE Union Government continues to tie itself up in knots in the matter of industrial licensing policy. Last year, ostensibly for encouraging higher production in important industries, it was decided to accord approval to certain industries for installing additional capacity, without the formality of industrial licences, provided the expansion was brought about without any import of capital goods. This dispensation, which covered 65 lines of manufacturing, did not automatically apply to units belonging to the larger industrial houses and foreign majority companies. A special Task Force was set up to go into the request for expansion coming from the latter group of firms. According to the "Economic Survey", till the end of December, 86 such applications were approved, and included such items as machinery and machine tools, process control instruments, textile instruments, electronic instruments, ball and roller-bearing, switch-gear, paints and enamels, various chemicals and pharmaceuticals, automobile components and ancillaries, optical and laboratory glass, etc.

The spectrum of industries covered was indeed impressive, and could not but lend body to the suspicion that the Task Force was merely a smoke-screen, a token homage to the conventional

grammar. The modified industrial licensing policy issued in February, incorporating a 'consolidated' list of 'basic, critical and strategic' industries which are to be open for the participation of larger industrial houses and branches and subsidiaries of foreign companies, further clarified the government's not-yet-quite-dared-to-be-explicitly-spelled-out intentions. The list is supposed to encompass core industries of importance to the national economy in the future, other industries sharing direct linkages with such core ones, and industries with a long-term export potential. Since practically any and every industry can, with some mild semantic effort, be covered by these descriptions, let some time pass, the government would not perhaps find it at all difficult to convince itself that the nineteen industries specifically listed in the statement were for purposes of illustration only, and that there could be other, equally legitimate candidates.

The expression 'core' was much too rigid; the terms 'basic, critical and strategic', on the other hand, have a certain plasticity about them. And this definitional liberation can save the government from other kinds of jam that may be in the making. For example, if

it is decided to freeze the capacity of foreign majority companies producing so-called non-essential items, a subsidiary decision has to be taken as to the disposal of their profits. In case dividends are not to be permitted to soar beyond a point in order to prevent the drain on foreign exchange, the companies might legitimately seek to spread out laterally. Certain tax privileges, after all, accrue to a foreign company if, instead of declaring dividends, it ploughs back profits into new investment. Where such plough-backs are discouraged within the industry itself, the foreign majority companies would naturally demand permission to enter other spheres of activity. The government can now welcome them in 'basic, critical and strategic' industries. However, since the companies will be choosy, and will prefer industries with prospects for high and quick returns, an impasse is bound to be reached unless a definitional flexibility is built into the new-look industrial policy.

This flexibility is now very much on, as illustrated by the phenomenon of the India Tobacco Company succeeding to cajole the government to allow it entry into hotel-building or fisheries. Investment in hotels, under some variant of project analysis, may indeed be shown to yield a sufficiently high rate of return and therefore to belong to the category described as 'of importance to the national economy in the future'; given the prospects of invisible earnings, such investment may also be passed off as having 'a long-term export

potential'. But, with altered assumptions, it may also be possible to reach a different conclusion: given the government's stated anxiety to prevent the expansion of the luxury consumption sector, it is — one can argue — odd to allow private foreign capital to go into the development of hotels.

As the econometricians would say, the licensing system is clearly in danger of being over-determined: there are too many objectives being loaded on a single instrument of policy. Could it be that one way out of the impasse is to arrange that all funds deemed surplus with foreign majority companies be compulsorily deposited in a public investment trust against the payment of a minimum rate of interest? Such a step, it may be maintained, would dry up the flow of private foreign capital into the country. But, in any case, if the government's pronouncements are to be taken at their face value, foreign capital is not supposed to be encouraged in non-essential lines of production; as far as the more vital industries are concerned, the injection of fresh funds from abroad are these days almost invariably subject to bilateral negotiations between the Government of India and the government of the country from which the funds are expected to come. It would be altogether strange if, in case the socio-political objectives set for the domestic sector of the economy clashes with the keenness of one's desire to have a larger inflow of private foreign capital, the former is abdicated in favour of the latter.

NORTH

Akalis on Warpath

PERHAPS the most disconcerting development in Punjab during the past few weeks has been the Akalis' drift towards extremism and the adoption, by their legislature wing, of anti-national postures. They have renewed their demand for a Sikh homeland ("where the Sikhs' aspirations are fully expressed") on the ground that justice is not being done to the community under the present dispensation. The draft of a policy statement, to be issued later this month, enunciates the Akali Dal's political objective and expresses its decision to launch a struggle for a separate independent entity — the Khalsa Panth, which was the late Master Tara Singh's slogan for a Punjabi Suba. Thus the old theme of state autonomy, vehemently voiced by the DMK and echoed by the former Akali

ministry, has been revived. The Akalis' attitude towards the Centre comes through in the party's demand in the state Assembly for an early repatriation of all Pakistani POWs not wanted for war crimes trials and without waiting for Pakistan's recognition of Bangladesh; the Akalis contend that the stalemate on this question is of India's making. P S Badal, former Chief Minister and the new leader of the Akali Assembly party, has gone so far as to say that India would be responsible for any 'confrontation' with Pakistan or any other country. He has also attacked India's foreign policy in general. The Akalis insist that India's relations with neighbouring countries, particularly those where Sikhs live or where they have their religious places, should be friendly and warm. Signifi-

cantly, Radio Pakistan goes out of its way to please the Sikhs and daily conducts a half-hour programme ('Punjabi Darbar') for the community.

Undeterred by Akali manoeuvres, Communist 'morchas', and other agitations on prices and ceilings, the Punjab Government is going ahead with its manner of business. The "Approach to the Fifth Plan, Punjab State", presented to the Assembly on March 27, talks of the government's intention to make massive efforts to step up the present growth rate of 7.2 per cent to 8.2 per cent through a bold programme of industrialisation and development of the infrastructure for farm and factory. To achieve this growth target, an investment of between Rs 1,600 crores and Rs 2,150 crores in the public and private sectors would be needed during the Plan period. Besides the problem of finding such huge resources (since Central public sector programmes rarely favour Punjab), the apparently endless power famine may prove a major hindrance to rapid development. The only way to ease the power constraint, it is felt, would be by construction of a 1,000 MW nuclear power station in the state.

The Approach Paper outlines the government's five main objectives: (i) reduction of poverty through institutional changes, employment-intensive programmes, etc; (ii) rapid increase in the state's income; (iii) removal of regional disparities through speedy development of backward areas; (iv) provision of essential consumer goods at reasonable prices to the vulnerable sections of the community through a public distribution system; and (v) effective steps to solve the problem of unemployment among the educated. The document warns that, in agriculture, it might not be possible to maintain the growth rate of 7 per cent achieved between 1966-67 and 1970-71, because of the flattening out of the gains of the 'green revolution'. A growth rate of about 6 per cent in the farm sector may be possible, however, by diversification of crops and optimum use of land and water resources with a view to ensuring higher intensity of cultivation.

HIMACHAL'S ECONOMY

In line with the current syndrome, Himachal Pradesh has left uncovered a gaping Rs 9.98-crore deficit in a Rs 115.50-crore budget. But while most other states hope to square up accounts through larger loans and economies, Himachal Pradesh relies on its traditional source — the Central Government. The state's deficit has been mounting

faster than its domestic receipts — from barely Rs 30 lakhs in 1971-72 to Rs 6.10 crores in 1972-73, and a further 50 per cent increase is estimated for 1973-74. Despite all the talk of 'a viable economy' befitting a full-fledged state, Himachal continues to bank on excessive Central props. The lopsided fiscal structure is evident from the fact that, while the state's domestic receipts for 1973-74 are put at Rs 35.94 crores, Central loans will amount to Rs 37.76 crores and grants to Rs 31.81 crores — together constituting over 66 per cent of the total revenue. Another striking feature of HP's economy is that its expenditures on establishment constitute about 101 per cent of its domestic receipts; there is no sign yet of this disproportionate allocation coming down. Much is made by the government of the 64 per cent increase in domestic receipts between 1968-69 and 1972-73, but the fact is that most of this increase has resulted from the natural buoyancy of revenues.

Tax-free budgets have by now become a tradition in this hilly state, even though there is scope for supplementing the revenues — by tapping the apple and potato kings, for instance; but the

apple and potato kings pull all the political strings. There are no signs either of a streamlined administration. That there are loopholes in the tax-collecting machinery is clear from the recent disclosure that sales tax arrears have been increasing even faster than sales tax revenue. In 1971-72, these arrears rose to Rs 5.54 lakhs. No claims have been made about lowering this outstanding amount. On the contrary, the state has decided to withdraw Bangla levies as in Haryana — a decision which has naturally been welcomed by the people. There is also considerable support for the government's submission to the Sixth Finance Commission that the devolution of funds be readjusted so as to "break the vicious circle of backwardness breeding backwardness". True, the state has a narrow resource base; even so, the government could, with some courage, make the people who have the capacity contribute a more equitable share to the exchequer. Enhanced internal revenue would surely help avoid repetition of the strange spectacle of the government seeking a Central loan to cover the Assembly Speaker's travelling expenses during a foreign trip!

KERALA

United Front and Panchayat Elections

THE cloud that had gathered over the United Front government has disappeared with a drizzle. The national PSP, with two members in the Assembly, has broken away from the Front. This has reduced the strength of the Front to 68 in a House of 134. However, when the vacant Kondotti seat, a safe one for the Muslim League, is filled up later this month, the Front may expect to increase its strength to 69. Though E M S Namboodiripad is threatening to confront the government with more intensive struggles, it is not clear what weapons he has left in his armoury for immediate use. The real difficulty for the Front may, however, arise when the panchayat elections take place in May. The Tirur municipal elections, just over, have given an indication of the direction in which the wind is blowing.

Tirur is a small town which became a municipality recently. It is in Malappuram, a new district formed during the Namboodiripad ministry to oblige the Muslim League. The League considers the district as its homeland. The Tirur municipality has 24 seats. The United Front could not agree on contesting the elections jointly. As a result,

the League fielded 20 candidates and supported one RSP nominee and three Independents. No other party, except the Jan Sangh, put up party candidates officially. But members of the other major parties came together and contested as Independents under the label "Pouramunnani" (People's Front). The Pouramunnani contested all the 24 seats. The Muslim League won 15 seats, and the Pouramunnani 8, of which Congress got 3, CPI(M) 2, CPI (Rebel) 1 and Independents 2. The remaining seat went to a Jan Sangh member who had contested as an Independent. A striking aspect of the Tirur elections was the coming together of the Congress and CPI(M) in the Pouramunnani. How this happened has not been explained clearly by either of the two parties or anyone else. Of course, Tirur may not be repeated.

The panchayat elections due in May are of crucial importance. There are 960 panchayats and they cover the entire state. Would the United Front be able to contest the panchayat elections jointly? It is to be expected that each constituent of the Front will claim more seats than warranted by its actual

strength. Ordinarily such disputes are not beyond settlement through political bargaining. But there is a peculiar difficulty here. The Muslim League, one of the constituents of the Front, is not a political party in the ordinary sense. It is a communal body and, to ensure its position in the community, it requires the recognition of the other ruling parties that it is the sole representative of the Muslim community. And so, as happened in Tirur, it will press for all the panchayats in the Malappuram district to be allotted to it exclusively and for weightage disproportionate to its actual strength in the other panchayats. At the same time, however, the Muslim League would be the last to wreck the present government and go into political wilderness. The RSP is likely to go all out to support the League. The Congress holds the trump cards. Will the Congress and its ally, the CPI, be able to play their cards cleverly and to outmanoeuvre the League and the RSP. It would be difficult to avoid a rift in the Congress ranks if the League is given too much weightage. Also, the Congress may not be able to ignore the consequences of such a move at the all-India level.

There was a sign of relief in ministerial circles and the opposition camp was visibly lacking in enthusiasm when the latest round of strikes and agitations came to an end without any apparent success. It may be some time before the political gains and losses are known. It was against this background that the budget session of the state Assembly started on March 9. There was nothing new in either the Governor's address or the budget presented by the Finance Minister. However, during the discussions a lot of criticism was directed by the opposition benches against the government's police policy and its attitude to the deepening economic crisis.

In his address the Governor had complimented the police for its efficiency and tact in handling the waves of agitations and strikes in the last few months. And the Home Minister made it clear in the Assembly that the role of the police was to maintain law and order and that it could not be looked upon as an instrument for social change. Against this statement, it was easy to understand the opposition parties' contention that the government's police policy was directed against people's movements.

In regard to the economic situation, the budget speaks for itself. By March 1974, the liabilities of the state would increase to Rs 608 crores against assets of Rs 506 crores, leaving a gap of Rs

102 crores, an increase of 16 per cent over the previous year. Besides, the year would end with a deficit of Rs 44.18 crores on revenue account. No fresh taxes have been proposed. The Finance Minister is pinning his faith on the Finance Commission to solve the problems of the state. And upto a point, the Finance Minister was prepared to agree with the opposition that the rising prices, growing unemployment and widening inequalities were the result of the wrong policies of the Central government. But his approach to the Centre to get the policies changed is similar to that of the moderates during the British days. Those who watched the performance of the Finance Minister could not fail to appreciate the Governor's sense of humour or cynicism (depending on how one looks at it) when he finished his address with a prayer to God to bless the state.

★

The District Court at Tellicherry celebrated its centenary last week. The occasion attracted many legal luminaries and interesting discussions took place on various aspects of law, including the law's delays. Justice Beg of the Supreme Court presented a learned paper on Muslim personal law reform, a subject which has been agitating the minds of progressive Muslims for quite some time. Justice Khalid and his colleague, Justice Moidu, of the Kerala High Court had also papers on the subject.

Justice Khalid rightly pointed out that the law applicable to Muslims in India is Anglo-Mohammedan law and not the Shariat law. All the three judges were critical of the abuses of Shariat law by its wrong application in India to marriages and divorce and of the hardship caused to women as a result. They emphasised that polygamy was a rare exception and divorce was not easy and simple in Shariat. They also pointed out that most Muslim countries had made reforms to alleviate the sufferings of Muslim women. Justice Beg went to the extent of suggesting a common civil code applicable to all or at least giving the option to those who wanted such a code in preference to the present uncoded Muslim personal law. Justice Khalid wanted only a codification of Muslim personal law according to true Shariat law.

From the discussions, it was difficult to avoid the conclusion that Muslim personal law required codification. Who is standing in the way then? Why is the Muslim League not taking a lead in the matter?

★

With the death of K M Cheriyan,

Kerala has lost an eminent public man and journalist. He was the managing editor of *Malayala Manorama*, the leading daily in Kerala. The paper was founded by his grandfather more than 75 years ago. Cheriyan took it over from his father, Mammen Mappilai, in 1954. The circulation of the paper was then 54,000. Today, it is being published from Kottayam and Calicut simultaneously and the circulation is nearing 3 lakhs. Cheriyan made *Malayala Manorama* into an all-Kerala paper by keeping it above caste, community or re-

ligion. Though financial control was firmly with him and his brothers, the first person singular was not in his vocabulary. The paper could be highly critical of policies — it has not yet reconciled itself to the socialist policies of the government — without being offensive.

Tailpiece: Thanks to the Muslim League, Arabic has an important place in the school curriculum of Kerala. Arabs apparently pronounce Kerala as 'Khair-allah, meaning the land blessed by Allah!

BANARAS UNIVERSITY

Students Can Be Pawns

N K Singh

THE Banaras Hindu University, India's largest campus, is once again in turmoil. And once again it is tension masterminded by a handful of student politicians. Although, at the time of writing, it seems unlikely that the University will witness any more violent eruptions during the current academic session, sporadic disturbances cannot be ruled out.

The trouble at BHU has distinct political overtones (see 'Part of a Larger Plan', March 10, 1973, pp 504-506). The confrontation is no longer between the university authorities and the student community. It is now effectively between the Congress and CPI on the one hand and the united opposition front comprising CPM, Congress(O), Jan Sangh, SSP, SP, BKD, and Swatantra on the other. The agitation is being conducted on a highly sophisticated political level.

The campaign, led by RSS, JS, the Vidyarthi Parishad and the Bharatiya Yuva Sangh, and supported by the Youth Wings of the other parties opposed to the Congress, is directed against the Congress party as such — and only indirectly against Vice-Chancellor L K Shrivastava, though he is of course the immediate target. Thus the agitating students have been demanding his resignation with slogans such as: "A double agent of the Congress and the CPI". Wrote the JS daily, *Motherland*: "So long as this political puppet plays his nefarious game in BHU, it is not clear how peace and scholarship can return to the university".

An idea of the political edge may be had from the debate on March 25 in the Varanasi Municipal Corporation. The Jan Sangh which had formerly rejected a motion seeking to discuss the

situation at the BHU because "the house had no jurisdiction over it", now supported a similar motion when it was brought to the House. The earlier VC, Amarchand Joshi, was after all an RSS man and progressive students were fighting against him; now the VC is a Congressman and the RSS is heading the agitation. Similarly, BHU may be suffering from the "corruption and nepotism" practised by the university authorities, as has been alleged by the agitating student leaders, but the RSS-led movement itself has little to do with students' problems or with contradictions that plague academic life. The movement seems to be motivated more by the 1974 elections to the UP Vidhan Sabha. It is with an eye on the elections to the Vidhan Sabha, that parties of 'extreme Left' and 'extreme Right' seem to have decided to take extra interest in BHU and put up a joint front with a view to fomenting disorder on the campus and frustrating the efforts of the VC to ensure the functioning of the university. The opposition parties' hope seems to be that, if they can successfully provoke clashes between the students and the provincial armed constabulary and police force, the latter's resort to lathi charge or firing might alienate university's 14,000 students and the other local population from the ruling party.

So the youth wings of the opposition parties, guided by their all-India leaders, have been systematically disturbing the peace at Banaras ever since mid-November. The RSS-led agitators have been resorting to violence and coercion to create situations in which the authorities are compelled to take a tough stand or to concede demands; it is 'heads I win, tails you lose'. The main

demand now is removal of the VC, "if the university was to be saved". The University had to be closed *sine die* on December 2, 1972, after some 20 days of violence, arson, looting and assault on students and teachers alike. The RSS-led Student Action Committee, which was mainly responsible for the closure, then launched a campaign for the university's reopening. Yet, when the university started to function again from February 28, the Committee launched another agitation re-creating anarchy.

The pretext for this renewed agitation was provided by the expulsion of six students — among whom was the RSS Vice-President of the BHU Students Union — by the VC, following the report of a three-member Enquiry Committee headed by a former judge of the Allahabad High Court, Gyanendra Kumar. The Committee had been appointed to inquire into the charges of indiscipline and misconduct against 32 students — a majority of them belonging to the RSS and Rajnarain Socialist's Samajbadi Yuvajan Sabha — and it had upheld "one or more" charges against the six students out of 16 cases into which it had inquired. The Students Action Committee organised a relay fast from March 1. On March 10, the Save BHU Citizens Committee, comprising representatives of all the opposition parties, staged a demonstration and held a meeting at the campus gate. It announced that the audience would "march into the university, take possession of the Registrar's office, the proctor's office and the Central Office". The rally was addressed by Rajnarain (SSP), Gauri Shankar Rai (Congress-O), Satyanarain Singh (CPM), Pitambar Dass and M P Tripathi (Jan Sangh), who delivered fiery speeches and attempted to lead the way into the University through the main gate. Hardly 200 people responded to the call. In any case, police barred their way. (An earlier call for 'Banaras Bundh' given by the same organisation had proved an utter failure.) The next two days witnessed further incidents of violence and arson.

What the opposition parties fail to realise is that, while the RSS-JS combine tries to make out that their campaign represents a broad consensus of different opinions, it is in fact exploiting the opposition parties' informal association with the movement. Excepting Raj Narain Socialists, none of the other political parties whose leaders were associated with the March 10 raid on the University have any following at all within the campus. Moreover, the movement has an unmistakable communal

character: of all the Departments, it was the Department of Urdu and Persian which was selected to be put aflame during the recent disturbances.

In such circumstances, the BHU students' allegations, contained in their memorandum to the President, charging the VC of complicity in irregular admissions, disbursement of aid meant for poor students, and even favouritism in examination and appointment of teachers, and blaming him fully for the four unscheduled closures aggregating eight months during his tenure, lack sufficient credibility. The argument that "the students behave the way they do because of the lawlessness that permeates the university administration" is simplistic and does not wash the large-scale violence on the campus. At the same time, the university authorities' view of the situation, as a basically law and order problem, is unimaginative and unhelpful. The trouble may be immediately political, but it also has deeper social roots. Like all campuses in the country, the BHU is prone to corruption, nepotism, and undemocratic operation. While immediately the situation may be brought under control by recognising the share of political party interests in it, it cannot stay under control unless the future of 14,000 students is safeguarded by more fundamental reform of the university's method of operation.

An epilogue may be found in the fact that while the BHU Teachers Association has once again appealed to all political parties and their leaders to refrain from interfering with the academic life of the university — the Association had made a similar appeal in November — 'RSS Bhawan' continues to be housed on the campus and the 'Swyamsewaks' continue to brandish their lathis.

Tibet and the Musketeers

G P Deshpande

A SECTION of the Indian elite has always been keenly interested in Tibet and its future. This group of the elite can be broadly divided into two categories. The first category consists of those whose attention was drawn to 'the Tibetan problem' mainly because China which claimed Tibet as part of its territory happened to be ruled by the communists. If it was Chiang Kai-shek who had sought to consolidate Chinese claims on Tibet, they would probably have completely ignored the matter. In other words, these people got interested in Tibet because of the cold war and their rather feverish anti-communism. The people belonging to the second category, no less anti-communist themselves, were mainly interested in Tibet for historical and cultural reasons. These people sincerely felt that Tibet historically and culturally had never been a part of China. Some of them also saw Tibet's cultural relations with India being as important as those with China, justifying thereby the separate historical identity of Tibet.

Both these groups have by now borrowed so much from each other's arguments that it is probably not possible to say with any certainty who belongs to which group. But it is important to see the difference between the two lines of argument. The first line is easily taken care of, as the cold war is practically over now. The second line of argument is still relevant. These were times, particularly during the fifties, that those

who followed the second line were themselves as anti-communist as the others. It would appear that if Sino-Soviet differences continue unabated, there may also turn out to be some decent socialists who may begin to see Tibet as an independent cultural and historical entity. If this were to happen, Tibet would once again become a centre of yet another cold war — a cold war between the two communist giants.

Admittedly, this is no more than a possibility at the present moment. If Sino-Soviet tensions do get diffused, then this may not happen. But that such a possibility exists, once again draws out attention to the inevitable 'international' character of this problem. It is interesting how history repeats itself. When for the first time Britain pursued a policy of making Tibet a buffer state, it did so to check the expansion of Tsarist Russia. As Britain saw it at that time, Russia had clear designs on Tibet. In other words, Russian interests in the Central Asian periphery of China were an important factor in the late nineteenth and early twentieth century politics of this region. Now it is the Chinese who are giving vent to their fears of Russian interests and machinations in this area. Tibet and Sinkiang have once again become very sensitive spots.

It is not my purpose here to go into the relative merits of the Russian and Chinese arguments against each other. Nor is it necessary. There are, how-

ever, two important differences in the situation which have to be taken into account: For one thing, China was rather a passive actor in the nineteenth century developments. It had little option but to watch helplessly the various moves and counter-moves in and about Tibet. All that China succeeded in doing was that Britain did not recognise Tibet as an independent sovereign state. The British did concede Chinese suzerainty over Tibet. One does not know whether this typical Anglo-Saxon exercise of distinguishing between sovereignty and suzerainty made any sense to the Chinese. The Chinese, in any case, seemed to have ignored it and continued claiming full sovereignty over Tibet. Secondly, the two powers between which Tibet was a buffer were great imperial powers, Russia and Britain. China, on the other hand, was a weak power. The imperial dynasty of China was already in its death throes. The picture would have been radically different if a strong central authority had existed in China.

These two factors made the political game in the Central Asian region a very different one from what it is today. The argument, 'Tibet a buffer state then and Tibet a buffer state now', is plain nonsense as it ignores some very fundamental considerations. It was then easy for Britannia to maintain that buffer state with the hapless, defeated Chinese just looking on. It is simple unreason to hold that a similar feat is possible for a weak India *vis-a-vis* a nuclear China today. For India to think so would be a clear symptom of megalomania.

It can be argued that while the feat of liberation of Tibet is not possible for a weak India, this may be possible for a super power like the Soviet Union with Indian sympathy and aid thrown in. But it would appear that the crux of the Tibet problem is this: whether the Soviets are interested in such a project and if so whether they could really succeed in accomplishing it. I do not know whether the Soviets are or are not interested in the dismemberment of China. It is futile to go on speculating about that. What may be more useful and relevant is to see what chances there are of the Soviet Union being successful in such an undertaking. In other words, it may be fruitful to see whether there exist some factors which the Soviet Union will have to reckon with before it could pursue any policy regarding Tibet.

To begin with, it is worthwhile noting that Britain being a non-regional power had no minority or integration problems

involved in its dealings with Tibet. In the case of the Soviet Union, the situation is quite different. A strong, organised China can give the Soviet Union considerable trouble in this sphere. There is no reason to believe that the Soviet Union's problem of Asian minorities is already taken care of and that while disturbing the Chinese nest in Sinkiang or Tibet it would not be asking for trouble. The chances are that it certainly would. The likelihood, therefore, of Tibet and Sinkiang being the Soviet Union's propaganda ploys against China is higher than of any serious Soviet involvement in these areas.

The time has come also to ask yet another question. Is it really possible in today's world to carve out an independent state from an already existing larger one, even by military means? Bangladesh and the war that went with

it would probably find many Indians answering that question in the gleeful affirmative. Was not Bangladesh more the exception than the rule? Have we paused to think whether the geographic absurdity of Pakistan did not play its role in the drama last year? If Bangladesh had been geographically contiguous to the rest of Pakistan, would the outcome have not been different? Would, in that case, the Bengalis in East Pakistan not have met with a similar fate as the Ibos in Nigeria did? Would not the war in Pakistan then been too long and arduous, thus bringing many a skeleton in the Indian cupboard to life? I do not think that these questions have even been asked in this country, let alone answered. Had it been otherwise, so many musketeers would not have come forward to champion 'the cause of Tibet'.

VIETNAM JOURNAL

Development of Agriculture

Harish Chandola

IN North Vietnam's history, the problem of food, which was mainly that of rice, had remained insoluble until recently. Food shortages, of a periodic character occurred yearly, with famines causing thousands, sometimes millions (as in 1944-45), of deaths. In one of the best pre-War years, 1939, the total output of food crops reached 2,728,300 tons, including 2,467,500 tons of paddy for a population of 12 million. Each inhabitant got 227.7 kilograms of food that year, including 205.6 kg of paddy (a kilogram of paddy yields 0.65 kg of rice on the average). After land rent, debts, taxes and other extra charges had been paid, there remained for most peasants only about three months' supplies of rice in the whole year. On the other hand, the rich squandered the rice and had it exported to meet their luxury expenses.

Agriculture, the fundamental economic branch, was poor, unbalanced and backward. In those conditions of fragmentary and small production, the Vietnamese peasants did not have the material means to fight against natural calamities, improve techniques and farm-tools, increase yields, carry out extended production. Rice remained the prevailing crop. Animal husbandry, a mainly family occupation, was not able to supply either the necessary number of draught animals or the manure necessary to get higher yields. Crop production, marking time during centuries and confined

within the limits of an overcrowded delta, could only provide a meagre ration to a constantly growing population. The land, fertile as it was, did not nourish man. Man, industrious and intelligent as he was, was powerless in the face of the blind forces of nature and could not take out the necessary products from the land; toiling and moiling all the year round, he never ate his fill.

"To solve the question of food basically" was the immediate task set forth by the North Vietnamese leadership after the restoration of peace in 1954. Land reform was effected from 1954 to 1956, which thoroughly swept away the class of landlords and gave land to the tiller. But owing to the shortage of cultivable land, each peasant received only a small plot: 810,000 hectares were shared between two million peasant households. However the peasant, now owner of his land, freed from the feudal and colonial yoke, encouraged and assisted by the state, set to work enthusiastically. The land reform brought a sharp increase in production. The total output value of agriculture, on the basis of 1956 prices, went up as follows — 1955: 100; 1956: 117.8; 1957: 121; 1958: 140.7; 1959: 152.4.

However, the good effect of land reform had its limits. The results of 1959 soon appeared to be the maximum one could get with tiny individual holdings, which could neither promote the

application of new techniques nor ensure a stable living standard for the peasant. The small farmer remained powerless in the face of natural calamities and could not invest in important works; the exhausted land could not give bigger yields. A bad harvest or an illness would be enough to compel the small peasant to sell all or part of his possessions and the rich peasants had already begun to profit from usurious loans.

The free development of small mercantile production, paving the way for the spontaneous development of capitalism, would have entailed a rapid pauperisation of all the masses of poor peasants and a return to the past. The merchants had resorted to speculative methods, disorganising the market at the expense of the labouring people. In the years 1956-58, a differentiation began to appear among the various strata of peasants.

In the years following the land reform, a question was clearly posed: which way was to be adopted, that of capitalism or of socialism? The Vietnam Workers' Party debated this and then its Central Committee at its Sixteenth Plenum in April 1959, passed a resolution, which said: "In these circumstances, agriculture co-operation is necessary not only for the development of agriculture and the steady improvement of the peasants' living conditions, but also for the consolidation of the worker-peasant alliance on a new basis."

Co-operation among peasants in farming tasks was not a new thing. After the land reform and redistribution of land, peasants had formed mutual aid teams to do farming work collectively. By the end of 1955, there were 153,000 mutual aid teams, which included 40.5 per cent of peasant households. In that year, however, there were only eight farming co-operatives.

The peasant had remained a small owner, strongly attached to his plot of land, and afraid of his holding disappearing in the midst of a collective holding, of which the village co-operative was to be the new owner. Entry into a co-operative gave rise in each individual, in each family, to a conflict between two aspirations, the one as deep as the other, between the certitude of having something well in hand and a vision of the future proposed by the Party in which everyone had absolute confidence. After all, it was the Party, which had freed them from the feudal and colonial yoke and given them their personal plot of land. Many hundreds of thousands of peasants had become members of the Party during the strug-

gle against the French and the Party had instilled in them clear ideas about socialism.

The conflict within the peasant about joining a co-operative and giving his plot of land to it, however, remained. It was settled on the basis of a triple principle: voluntariness, mutual benefit, democracy. No one was forced to join a co-operative. And even after joining, a farmer was free to leave it at any time. In fact several farmers did actually leave the co-operatives they had joined when those were badly managed. But over the whole country, the number of requests to leave at the most difficult moments only amounted to 1.6 per cent of the total number of peasant households.

To encourage peasants to join co-operatives, the Party began educating them actively, inculcating in them socialist ideology, and it also carried out experiments from which lessons were drawn. In all villages, innumerable sessions of study and discussion were held, at which the question was posed again: which road should one choose, that of capitalist development or that of socialist development? It turned out, contrary to common belief, that the attachment to individual farming was not stronger than the aspiration for socialism, as in some regions the party had to advise the people against or even prevent them from making premature attempts at co-operation while conditions were still not ripe.

The formation of a co-operative had to be supported by three main conditions: that there existed as a nucleus a mutual aid team which had been working well; that good ideological education had been conducted among the peasants so that they themselves demanded the creation of a co-operative; that good leading cadres were available. When one of these conditions was lacking, the setting up of a co-operative could be easily done, but its working would meet with difficulties which would discourage its members.

And, in fact, the working of co-operatives, especially in the beginning, met with many difficulties and the superiority of collective farming did not show itself immediately. It is during this period of 'running in' that the stand of each member or cadre was put to utmost trial. If a co-operative got important aid from the State, it also had definite obligations towards the State; the leadership of the co-operative also had to take a correct stand concerning each member's family economy.

To face difficulties, to keep one's confidence in bad times, to have a correct

attitude in relations with the socialist State and each family's economy, are not technical, but political, ideological problems. These were fundamental problems that had to be solved correctly, if the co-operatives were to go on living and developing. Who then would be best able to carry out this policy?

The April 1959 resolution of the Workers' Party Central Committee specified that one must:

"Rely resolutely on the poor and lower middle peasants; Unite closely with the middle peasants; Manage to limit, then put an end to exploitation by the rich peasants; Prevent the landlords from raising their heads. Go on encouraging those among them who work to re-educate themselves so as to become new men; Lead the whole peasantry resolutely along the road of co-operation towards socialism."

The first two points were the most important. The poor and lower middle peasants constituted the larger part of the working peasantry. They followed the revolution with more firmness and made up the main forces of agriculture co-operation. The middle peasants had certainly more experience in technique or management, but they easily leaned towards the family economy and tended to profit from the benefits granted by the State to the co-operatives without wanting to fulfil their obligations in return.

The Party also said that if one relied on poor and lower middle peasants, one must above all take care of their interests and aspirations and help them by all means to overcome their difficulties in production and daily life. When a co-operative was created, the active elements among the poor and lower middle peasants were organised at first as a nucleus, then those middle peasants who wished to join it were admitted.

In the managing and audit committees of the co-operative, at least two-thirds of the members had to be poor and lower middle peasants. The main posts, such as those of manager, chief auditor, chief accountant, leaders of production teams, were in the main reserved for active elements among the poor and lower middle peasants. It was decided that if one wished to rely on poor and lower middle peasants, one must have confidence in them and the conviction that they have the required ability to become the leading cadres of the movement.

The upper middle peasants who on the whole had adopted an attitude of hesitation, of 'wait and see', were regarded as working people. But it was decided to educate them, to persuade them, so that they would join of their

own free will. While they were reflecting, weighing the pros and cons, it was decided to have patience, to wait for them and convince them by means of the concrete results of co-operative farming, such as higher yields, higher returns. When they joined the co-operative, care was taken of their legitimate interests and a just, appropriate solution of problems arising from the lands, cattle and farm-tools they had brought in was worked out.

The rich peasants were admitted only when co-operation had been completed in the main in the region where they lived; former landowners who had changed their attitude after the years of re-education were allowed to join the co-operatives; their children were judged according to their personal attitude and not their birth.

Great attention was paid to the family economy. On joining a co-operative, the farmer was permitted to retain five per cent of his land for his family economy, for growing vegetables, raising poultry, pigs, etc. While the co-operative economy supplied the staple food and farm produce for urban areas and exports, the family plots supplied a good deal of necessary foodstuffs, like vegetables, pork, poultry, eggs, etc. The farmer was free to sell the produce of his family plot, from which he drew much of his cash income. Both the co-operative economy and the family economy were allowed to develop harmoniously.

Co-operative farmers felt themselves the real masters of their co-operatives. Without this feeling and without the people having full confidence in their government, no agronomist or economist, even if he be a genius, can promote the agriculture of an underdeveloped country. The prime reason of the success of the movement to start co-operatives and cultivate lands collectively, was the very high degree of political consciousness of the Vietnamese peasant. Of course the movement's success was also due to the progress the first few co-operatives made, which substantially improved the living standards of their members. The result was that by 1966, 85 per cent of peasant households had joined co-operatives. The size of co-operatives became bigger. There were some with over 110 households in them, cultivating more than 200 hectares.

For thousands of years, the Vietnamese peasant had been living on the brink of famine and misery. Except for a minority of rich peasants and landowners (whose income depended essentially on land rents and usury), the poor peasants who constituted the great majority could hardly secure their daily

rice. 'To eat one's fill' was an age-old dream which never came true. The standard of living of a peasant family before the agrarian reform consisted of — Food: for three to six months, a diet of rice mixed with tubers; otherwise, a few potatoes or some vegetable soup each day. Salt: bought daily, in small quantities. Meat: twice a year, on the first two days of the year. Fish: small fish, crabs, shrimps from streams and ponds. Sugar: none. Clothes: most often, only rags handed down from father to son or discarded by better off relations. When the harvests were good, the children might get a new pair of trousers or a new shirt (of light, not durable, cloth) on the occasion of the New Year's celebrations. Quilts, mosquito-nets: none. Other items (soap, medicine, books, newspapers, etc): none.

Let us now look at the family of a co-operative member in Tan Khang village in Thanh Hoa province. It is made up of seven members, two of whom are sturdy workers. The family has a private plot of 200 square metres, and raises three pigs and a score of poultry. It gets yearly — Paddy: 2,200 kilograms allocated to it by the co-operative, each member of the family receiving 314 kg of paddy or 204 kg of rice. The vital needs are thus met. Sales of vegetables and sugarcane from the private plot (apart from family consumption) earn 97 dong (one dong is a little more than two rupees). Sale of pigs to the State Agency and manure to co-operative earns 106 dong and sale of poultry and eggs, 64 dong. Income from fishing by two young children and from basket weaving by the old folks amounts to 188 dong.

From the co-operative the family receives chiefly foodstuffs — mostly paddy — which constitute the fundamental part of its needs; the rest of the family's needs are met with money obtained from outside the co-operative — crops: 21.3 per cent animal breeding; 37.3 per cent, fishing and side occupations: 41.3 per cent. This situation is common to most peasant families in North Vietnam.

It can be seen that the peasants' income derives from two distinct but complementary sources: co-operative work, which provides the staple food, this being the most important thing. Family work, which brings in most of the cash income as well as some farm products to improve the diet. Once the daily rice is assured, the peasants meet their other needs with the cash income they obtain. Now you can see in all peasant houses, mosquito nets, blankets,

decent clothing, furniture, tableware and kitchen utensils. And with good harvests, many buy a bicycle, a radio set, a wrist watch, or even a house. Gradually the dreams come true. There are now other expenses also, on medicines, books, newspapers and magazines, schooling of children, etc. These are expenses that no one dared think of 20 years ago.

Each hamlet now has a primary school (the first level of general education up to the fourth standard) and generally two villages share a second level school (up to the seventh standard). All children go to school. Adults attend spare-time classes in the evening. Every village now has a dispensary and a maternity ward. In North Vietnam there are now over 50,000 auxiliary physicians, nurses and midwives. At this stage of development, the peasants buy books and other school things for their children, build and maintain the schools and pay the teachers.

Now North Vietnam grows four rice crops a year, instead of two, which were the winter crop with sowing in October-November and harvest in May-June, and the autumn crop with sowing in May-June and harvest in October-November. The additional crops, of new varieties of rice, are the spring crop sown in February-March and harvested in June, and the summer crop, sown in April-May and harvested in July-August. Almost in all parts of North Vietnam, paddy production has risen to five tons per hectare. The target now is seven tons per hectare, which many co-operatives have already achieved.

Because the size of the co-operatives is growing, some cultivating over 200 hectares, mechanisation is being introduced, in the shape of mechanical rice-threshers and husking machines, and improved tools. Greater investments are being made in agriculture in the form of more manure and fertiliser and better seeds. As the area of cultivation increases, managerial skills are being improved. Almost all new members of co-operatives are persons who have passed the seventh standard. They work on experimental plots where they try out new techniques before disseminating them. They are charged with delicate tasks, such as, culture of azolla (green manure), the determination of the fertility of the soil, the selection and multiplication of seeds, the tracking of plant diseases and insects and the collective raising of animals for both farm-work and meat. Most co-operatives have their own technical scientific groups and their own experimental fields.

**Pledged to serve people
engaged in all vital sectors
of the economy**

DENA BANK
**gives high priority to helping
small industries
progress and prosper**

DENA BANK is an active partner in the development of the vital sector of Small-scale Industries. Through its large network of branches DENA BANK is giving financial assistance to a large number of enterprising entrepreneurs, thereby helping them to produce more goods to employ more people and to accelerate the pace of our country's all-round progress.

Please visit the nearest DENA BANK Branch and enquire how DENA BANK's Small-scale Industries Finance Scheme can help you also.

Cries of Crystal Gazers

Ranjit Sau

The Prediction of Communist Economic Performance (ed) P J D Wiles; Cambridge University Press, 1971; pp x + 390; £ 4.

THIS book is a collection of exercises on predicting economic performance of the following nine countries: Albania, Bulgaria, China, Czechoslovakia, the German Democratic Republic, Hungary, Poland, Rumania and the Soviet Union, by nine experts on the so-called communist economics. The base year is 1967 and the year for prediction is 1970. "A hasty reader might complain of the inclusion of apparently obsolete pieces", concedes the editor. "This is 1970, yet here are pieces, written in 1967, incorrectly predicting 1970. Could they not have been updated, nay scrapped?" The editor himself then gives this solemn answer: "This volume is essentially methodological, and all other information is a mere by-product." This keynote should be kept in view while going through this book and this review.

I

The book opens with two useful chapters on an inter-country, comparative analysis of the process of planning in industry and in agriculture. Peter Wiles, writing in the year 1969 on industry concludes that there are three general tendencies in this respect: conservative, radical and Chinese. He identifies radicalism essentially with the free play of the market mechanism, and conservatism with centralised planning. The most conservative country, according to Wiles, is Rumania which has hardly moved from the Stalinist system; the next most conservative are the USSR, Poland and the GDR. The remaining four countries, Albania, Bulgaria, Czechoslovakia, and Hungary are radical of various shades. And China, of course, is a class by itself. This classification is based upon the answers given by respective experts to a standard questionnaire.

It was not possible, we are told, to get a China expert to answer the questionnaire. But lo and behold! It did not stop Wiles from drawing conclusions. He pulled the rabbit from his hat and proclaimed: "After all China is more or less a market economy". No wonder, he continues, "Chinese resource allocation must be held as surprisingly rational! For so many

prices are market determined, and so much capital is borrowed from the bank. The practical effects of the market cancel, presumably, the anti-national theory".

Everett Jacobs presents another questionnaire-type study to provide easy-to-use material for the assessment of the agricultural sectors of the Soviet and East European economies. The first part of the questionnaire deals with the ownership (in the loose sense) of land and the means of production. In addition, it includes data on agricultural production, the size of agricultural labour force, recent trends in the structure of farms, and the organisation of farm work. The extent of the diversity in agricultural organisation and ownership in the Soviet Union and Eastern Europe becomes readily apparent. Interestingly, an almost exact correlation is found among these countries between the rank in terms of fertiliser consumption per hectare and the rank in terms of wheat yield.

The other part of the questionnaire of Jacobs deals with planning in agriculture; it is descriptive rather than statistical. In the descending order of the degree of decentralisation in various aspects of agricultural planning Hungary tops the list, followed by a group composed of Bulgaria, Czechoslovakia, the Soviet Union, and Yugoslavia. Centralisation is strongest in East Germany, Poland and Rumania. Albania has been excluded from the list for lack of information.

Now comes the core of the book, the methodology of prediction.

II

A difficulty that constantly dogs all these crystal ball gazers is the lack of adequate reliable data. But in the heat of enthusiasm their zeal for transcending this barrier is matched only by their zest for the superficial.

To begin with, Michael Kaser reviews the performance of the Albanian economy during the third five-year plan, 1961-1966. This was a period of sharp changes in Albania's external relations. Moscow broke off diplomatic relations with Tirana in December 1961. Soviet aid, both technical and

financial, ceased; and trade between the two countries was eliminated by the following year. Nonetheless, Albania did remarkably well by mobilising local resources, by building small-scale plants closely related to the exploitation of natural resources. A notable beneficiary of this concentration on domestic-based projects was education.

Albania in 1967-1970 has some of the elements of a quasi-Chinese 'great leap forward', according to Kaser. As for the projection for 1970, he offers none. In his own words, "the projections for 1970... are not projections in the sense of representing the author's best guess of activity in 1970, but his estimate of what is feasible on the working hypothesis that the Albanian government will do what it seems to be undertaking." Even then, about his methodology of estimating what is feasible in 1970, the less said, the better.

Two years later, in 1969, Kaser had an occasion for after-thoughts, which add very little to his original thoughts as of 1967.

The author on Bulgaria is Alexej Wynnyczuk whose paper is dated 1968. Bulgaria is the poorest (after Mongolia) and probably the fastest developing member of the Comecon countries. It is also the only country in Eastern Europe which shows a parallel to the Chinese Great Leap in 1959-60.

The Bulgarian national income had grown at the annual rate of 8.5 per cent between 1948 and 1965, with cyclical fluctuations around the trend line. Hence the author summarily comes to the conclusion that the same growth rate would be maintained right up to 1970; and thereafter for few years the rate may slow down a bit in deference to the trade cycle. His projections for industrial production and agriculture use essentially the same methodology of trend extrapolation qualified by a few casual remarks.

W Klatt has written on China. After a brief run down of performance of the Chinese economy upto 1966, he comes to the forecast for 1967 and then for 1970. Oh yes, the methodology? Here is a specimen: "If the *status quo ante* as it existed prior to the cultural revolution could be restored speedily, an increase of gross industrial production by 50 per cent during the current Five-Year Plan might still be possible. This would imply an annual industrial growth rate of 8½ per cent". How will this growth rate be possible? What happens if the *status quo ante* is not restored?

Klatt does not care to elaborate on such questions. Two years later, in 1969, he returned to the topic, and repeated his earlier performance. "If the *status quo ante* the cultural revolution can now be restored speedily, an increase of gross industrial production by some 30 per cent during the period of the current Five-Year Plan (1966-70) may still be possible", he concluded.

Then Boris Pesek has two papers written in 1967 and 1968 respectively, and a postscript dated September 1970 only to tell us that in the then prevailing conditions of Czechoslovakia it was not possible for him to make any prediction.

Next in line is East Germany. Horst Seidler, writing in 1967, found that during 1964, 1965 and 1966 the annual growth rate of real net material product was between 4 and 5 per cent. He was a little more optimistic about the year 1967, and put the growth for that year at 5.5 per cent. He estimated the growth rate of industrial production at 7 per cent; of consumer goods industries at about 5 per cent; and so on. As for 1971, total employment remaining constant at the level of 1967 by assumption, and the annual growth of gross investment being estimated at 8 per cent, the annual rise of real national income of 5 per cent between 1968 and 1971 should be feasible. Gert Leptin adds a note in support of Seidler's exercise.

Alan Brown presents quite an elaborate exercise about Hungary which merits careful study. But then R D Portes, writing one year later in 1968, showed why one of Brown's forecasts was erroneous, and also how what one did know and could infer might have been used to predict events of 1967.

The main contributor on Poland is Michael Gamarnikow. One of his major findings is the dilemma the Polish planners are facing in the course of tackling the unemployment problem. The regime's own weekly wrote in 1966: "One thing is certain and we must all realise that. The population must choose: either additional significant growth of employment, or limited employment and better growth of real wages". It underlines the conflict between the objectives of more employment and better wages. Writing one year later in 1968, Bogdan Mieczkowski contended that unemployment in Poland was not 300,000 as reported by Gamarnikow, but substantially more, namely, two million, including underemployment.

Michael Kaser has written two more pieces, one in 1967 and the other in

1969, and both of them are on Rumania. These pieces could hardly boast of their methodological contents.

Soviet Union gets the lion's share of attention, with six papers written by four experts, covering some ninety pages. Two of these papers break new ground compared to playing the game of trend extrapolation or simply fancy 'informed judgment'. These two papers are taken up in the next section; the authors are Haruki Niwa and Peter Wiles.

In fact, if you take out the arithmetic of compound growth rate and trend extrapolation, three-fourth of this book would go out with it. For the remaining part, the book is certainly overpriced.

III

Haruki Niwa has an econometric model for Soviet economic growth. It consists of twelve simple regression equations (with one independent variable in each equation), and seven definitional relations. The dependent, endogenous variables are, for example, demand for intermediate producer goods; industrial fixed capital formation; agricultural fixed capital formation; residential capital formation; industrial production; agricultural production; and so on. The exogenous variables are, for example, employment in non-agricultural sector; flow of capital goods to final demand sector; the relative shares of agricultural investment, housing investment, and industrial investment, in total investment; population and so on. There are no demand equations and, no monetary equations.

The model has been estimated with the method of least-squares using the data of the period 1934-1963. Correlation co-efficients are uniformly high. What does it mean? Did the Soviet economy behave in the same elemental way, in spite of, or because of, Stalin, Bulganin and Khrushchev? Will it continue to follow the same path regardless of Kosygin and his successors? In fact, such a model has very little predictive or even explanatory power. One need not be surprised if someone else comes up with a different econometric model for the same period of the Soviet economy with equally high correlation co-efficients.

Niwa's observation that all the 'predicted figures' for the endogenous variables estimated by earlier versions of the model agreed marvellously well with the actual figures for the period 1935-1960 contains practically no additional information. If you estimate an equation with the data of a given pe-

riod, the predicted value of the endogenous variable for the same period will be close to its actual value so long as the correlation co-efficient is high. In fact, that is the meaning of a high correlation co-efficient. The predictive power of a model has to be tested against the data of a period different from the one in which it is estimated.

Finally, we come to the most glittering gem of this volume, a piece where Peter Wiles uses the Cobb-Douglas production function to examine the feasibility of the Soviet agricultural plan, 1966-1970. We are warned well in advance: "the uninitiated should not be dazzled by the technical sophistication", says Wiles.

The Soviet agricultural plan, 1966-1970, envisages a 5 per cent annual growth in output, whereas it provides for a mere 2 per cent annual rise in agricultural inputs. Is the target feasible? Wiles, armed as he is with a borrowed Cobb-Douglas production function, addresses himself to this all-important question.

B I Iskakov elsewhere has estimated the following production function for the Soviet economy, 1951-1960:

$$Q = 1.03 K^{0.9} L^{0.1}$$

where Q is national income, K capital and L labour. Taking Q as the industrial production another Russian author, A Tolkachev, has got a very similar result with the data of 1950-1964:

$$Q = 1186 K^{0.845} L^{0.155}$$

Encouraged by this confirmation, Wiles accepts Iskakov's estimate, and without batting an eyelid applies it to Russian agriculture. "I shall not here attempt to fit a production function to our agricultural data", says Wiles, "for they are too few and inaccurate". "Moreover, Stalin's production function must have been entirely different from Khrushchev's. Instead I simply transfer the exponents found for industry or national income by the two Soviet statisticians." That is to say, he takes the exponent for labour as 0.1 and that for capital as 0.9, in Soviet agriculture. Furthermore, this 0.9 is divided arbitrarily between 'capital' and 'current industrial inputs' as follows: 0.49 and 0.41 respectively.

Although total agricultural inputs would grow at the overall rate of 2.18 per cent per annum during 1966-1970, labour would actually decline at the rate of 0.6 per cent, capital would rise at the rate of 13.7 per cent and current industrial inputs at 8.5 per cent. If the production function is Cobb-Douglas then the growth rate of output

is given by the sum of the growth rates of inputs times their respective production elasticities. In this case it works out as follows:

$$(13.7 \times 0.49) + (8.5 \times 0.41) - (0.06 \times 0.10) = 10.19 \text{ per cent}$$

Thus the inputs by themselves would contribute a 10 per cent growth rate in

the Soviet agriculture. But the agricultural plan itself envisages a growth rate of 5 per cent only. Therefore, should the plan be realised, it would mean that the rate of 'technical progress' in Soviet agriculture is actually negative; precisely it is - 5 per cent per year. Wiles has this final word: "A gloomy prophecy that sounds realis-

tic enough to be fulfilled". My own comment on this exercise of Wiles is simply this: it is hardly worth the paper on which it is printed.

If this volume, as the editor claims, is essentially methodological and all other information is a mere by-product, those who have not yet read it have not missed much.

SPECIAL ARTICLES

A Research Programme for Urban Housing

Shirish B Patel

This paper outlines a research proposal for a series of investigations into aspects of urban housing which it seems important to understand before formulating an enlarged public housing programme. Studies in the areas outlined here are either scanty or non-existent.

The studies therefore proposed here should be concerned essentially with the following broad questions:

- Whether a diversion of investment to housing would not in fact benefit the economy from the point of view of raising the rate of savings and levels of employment.*
- What kinds of accommodation (for essential amenities only) should be provided, how should loans be administered, and what special legislation if any is necessary to ensure continuing success.*
- Would the 'incremental' housing programmes suggested here succeed in the face of quite possibly lower priorities being attached by families—especially poorer families—to housing compared to other necessities of urban life; will the fact of provision of improved housing lead to increased migration to these areas.*
- What values of density, and what design parameters besides density should be adopted as guidelines in the broad layout and planning of residential districts.*

I

THE view has long been current that from the national point of view housing is a 'dead' investment, locking up resources which would be far better invested in industry or used in some other 'productive' manner. The view is held to be valid regardless of the end product of the industry involved. The recent setting up of the Housing and Urban Development Corporation (HUDCO) and the allocation of substantial funds for the provision of public housing has been made because the need was felt to undertake more substantial programmes of social welfare, while tacitly assenting to the view that investment in housing is from the point of view of economic development decidedly less desirable than investment in industry. But how far is this view correct? It rests on the assumption that domestic savings are relatively inelastic, or if elastic are not related in any way to the availability of opportunities for investment in housing. Is it possible that if opportunities were offered to individuals to hire-purchase a house, this might result in a substantial increase in the rate of domestic savings? Would such pay-

ments towards the house encroach on other forms of savings, and if so how seriously? Or would there be a curtailment of consumer expenditure, and a diversion of the savings so effected into housing? Since we are particularly concerned with the low income groups, it would be important to try to establish our findings especially in regard to these groups. How this can be done, forms part of the investigation. It seems difficult to do because, until now, opportunities for savings towards a house have been practically non-existent for such groups. For somewhat higher income groups, however, it may be possible to carry out both time-series and cross-sectional studies to test our hypothesis. The first may be possible with certain Housing Board occupants, if we compare their pattern of savings before they were allotted a house with the pattern of savings after they were given possession of a house and started hire-purchase payments. Cross-sectional studies may be possible in companies or other organisations which offer loans or other facilities for the purchase of housing, by comparing the pattern of saving of those employees who have availed

themselves of such opportunities with the pattern of those employees in a corresponding income bracket who have not taken such loans. It may also be useful to take a look at information available from other countries, although this may not be strictly relevant unless such countries are at a corresponding level of economic development with India.

II

What is the labour content of the rupee spent on housing compared with the labour content of the rupee spent on other consumer products? The labour content will mean not only the on-site labour content of housing, but the labour content of each of the inputs, such as sand, bricks, stone, steel, cement, and so on. For each of the manufactured items such as steel, cement, flooring tiles, etc, there is a further labour content, in addition to that contained in the value added by manufacture, and this is the labour content of the intermediate input materials, continuing backwards until we reach the stage of production of raw materials. It

may be said that, if we take into account all the backward linkages, the entire rupee will be labour only. This may be true if we extend backward linkages through all previous time, and assume that labour is the only scarce primary factor, but in the immediate context we may suppose that the rupee will finally break up into several components including (a) labour, (b) taxes, (c) the cost of capital, including profits, (d) wholesalers' and retailers' margins, which include some component of labour, which we may assess separately. There is also the rather special case of machinery. The production of machinery involves a labour component, and if we add up the contributions of each of the backward linkages, we can arrive at the final labour content of the machinery used in producing any particular consumer product. As far as the labour content of the particular consumer product is concerned, machinery constitutes an intermediate input like any other, and we must take as contributing to the consumer product the amount that the machinery depreciates over the production of a particular volume of consumer product and the labour content of this amount of depreciation.

It would be important to express the labour content of the rupee spent as described above not only in money terms of the component spent on wages, salaries, and other benefits, but also in man-hours of employment. The wage paid per man-hour varies considerably from industry to industry.³ In a situation where we are trying to maximise employment in terms of numbers employed as well as in the amount that is paid to labour, the man-hour figure for the rupee spent will be of some significance.⁴

We can derive the direct plus indirect labour contents of final products as follows:⁵

Let [A] be the usual input-output inter-industry co-efficient matrix, at market prices, corrected to include machinery depreciation, a typical element being A_{ij} , for n industries

[L] be the vector of total labour content of final products and of inputs, per unit of output for each industry.

[I] be the vector of labour content in the value added by the industry (excluding the labour content of inputs)

[X] be the vector of gross outputs of industry, then

$$L_j X_j = \sum_{i=1}^n A_{ij} L_i X_i + I_j X_j$$

which becomes

$$(L) = [A]' (L) + (I),$$

where [A]' is [A] transposed

$$\text{so } (L) = (I - [A]')^{-1} (I),$$

where I is the unit or identity matrix, which can also be expressed as

$$(L) - ([I - A]^{-1}) (I)$$

$[I - A]^{-1}$ is the usual inverse matrix used in input-output computations, and

(L) and (I) can be expressed in either rupee or man-hour values per rupee of output.

III

What is the tax component in the cost to the consumer of various building materials? It may be that certain materials, but for the tax component, would be cheaper to use than others which are conventionally employed.⁶

What is the total tax component in a finished house, as compared with the tax content of various other consumer items? As with the labour content, this involves not only the tax on the last stage of production, but on all the intermediate inputs, extending the backward linkages up to the stage of production of raw materials.

IV

Assuming that we find it desirable to encourage consumer spending on housing in preference to consumer spending on other items, what should be the rates of interest applicable to loans towards purchase of housing? The encouragement of investment in housing should be reflected in a longer repayment period and lowered rates of interest. On the other hand, a rapid repayment of capital is desirable so that it is quickly recouped and made available again for recycling. Would it be possible to have differential rates of interest with lower rates for a quick repayment of the loan and higher rates if the repayment of the loan is delayed?

How should loans for housing be administered, bearing in mind the need to reach as wide a market as possible, and particularly to reach the low income groups? It would seem that the best agency to perform the role of reaching the individual customer would be banks, rather than any centralised agency. The central agency may be responsible for refinancing and insurance against bad debts. What steps

would need to be taken in order to make it possible for banks to make available loans for housing over longer periods than the conventional 5 or 10 years that banks normally allow? Would it be possible to link such bank loans for housing with deposit schemes or other forms of regular saving?⁷

Particularly for the low-income groups, is it possible to have schemes by which payment towards housing is in kind rather than in cash? Perhaps certain jobs could be linked with the provision of a house, and wages paid partly in the form of coupons or a credit entry towards payment for the house. If such a scheme were developed, it should be made possible for a private employer also to avail of it for his employees. Alternatively, payment towards housing might be in the form of an acceptable kind of piece-work.

Whatever the schemes, if they are to work they will need to be supported by effective means for repossession of the house in case of defaults in payment. Would special legislation be necessary to enable repossession? This is not an aspect of the problem that can be lightly regarded. Unless loan repayment can be reasonably assured, we are unlikely in our economic circumstances to be able to sustain and progressively expand any major public housing programme.

V

Can we introduce an element of cross-subsidy in the provision of housing, so that the lowest income groups pay less than actual costs for their housing, and the higher income groups pay more? Various formulas for cross-subsidy can be devised, all more or less arbitrary, but some conditions which such a formula should satisfy are: first that the total amount recovered by way of surcharges on the higher income group's houses approximately equal the total amount of subsidy offered to the lower income groups; second that the amount of surcharge on any higher income group house should not be so much that the final price exceeds the competitive market price. It seems equitable that the percentage subsidy or surcharge follow a gradual scale, those with the smallest accommodation qualifying for the largest percentage-on-cost subsidy, and those with the largest accommodation paying the highest percentage surcharge. One danger to be guarded against with subsidies is that accommodation is made available below cost price, and consequently presumably below market value. This implies some

restriction on transfer of ownership of the subsidised accommodation, at least for a period of time, or some guarantee that the same low-income family is not able to claim a fresh house allotment after selling off an earlier one.

How would one ensure a sufficient volume of surcharges to cover the subsidies desired? One way would be for public housing agencies, which are engaged in constructing low-income housing, to actively and simultaneously enter the middle and high income housing markets.⁸ This is an obvious way of turning what would otherwise be private developers' profits into earnings which can subsidise lower-income housing.

However, it may be politically unacceptable for public housing agencies to be seen constructing flats for the well-to-do. The alternative, of imposing a graduated surcharge varying with size of accommodation on privately built housing, may be possible; this possibility should be examined, but one's first impression is that the difficulties of applying such a surcharge would be formidable. Another possibility, less satisfactory because it leaves the really expensive housing untouched, may be to vary housing loan interest rates, charging higher rates for larger loan amounts against a single house as collateral.

VI

There is considerable uncertainty about the 'rent paying capacity' of various income groups in urban areas. Various attempts have been made to determine this figure by interviewing households, but it is by no means clear that the interviewing technique yields any reliable information on this point. There seems to be some evidence to indicate that the capacity to pay towards eventual ownership of accommodation is higher than the so-called 'rent paying capacity', even of the lowest income groups.⁹

So far, surveys and investigations seem to have been confined to obtaining answers to hypothetical questions such as "What kind of accommodation would you like?" and "How much would you be able to afford to pay for such accommodation?". It is almost always true that the costs of the desired accommodation, though the needs expressed are fairly modest, far exceed the individual's capacity to pay. This irreconcilable difference is left unresolved. Would it be possible instead to offer, first hypothetically and then in a real life situation, accommodation over a range of sizes and amenities, at an

economic price which ensures a reasonable return on capital, and observes individual preferences? This implies construction of accommodation, or the provision of amenities only, at levels well below those currently provided in public programmes.

VII

Until quite recently, much of our approach to housing has been based on the assumption of a 'minimum standard' of two rooms, independent bath, independent WC, and kitchen, in an area not less than 230 sq ft, and using building materials which ensure a permanent type of construction with a life of something like 80 years. This has not only been beyond the means of the low-income population to which it is supposedly addressed, but has also led to a level of investment which it is not possible to sustain; in consequence, the provision of housing has been a fraction of the demand. It has meant a steadily mounting backlog and no significant impact on the housing situation.

If we are to make any such significant impact it is clear that we must develop schemes which are within the means of the households to which they are addressed. What we provide within these means may seem hopelessly inadequate, and we must consequently make it possible for whatever is provided to be upgraded gradually to better and better standards as the economy develops and as people are able to invest more in their houses. This would mean developing the following:

(a) Designs which make it possible to have a minimum level of investment to begin with, with gradual improvements over a period of time, so that the initial housing is steadily improved to a larger as well as a more permanent construction. This is a design problem which has not yet been solved. It seems simple enough to design a dwelling with the cheapest building materials such as bamboo matting or palm leaves, and to design another low cost dwelling with a timber framework and asbestos sheets, another with brick walls and mud plaster and a temporary roof, and so on, up to a permanent type of construction with brick walls and a concrete slab. But the real difficulty is to start with the cheapest form of construction and incrementally upgrade it to the next better level, without destroying entirely the initial construction and starting over again, and without damaging seriously the livability of the house while construction is in hand. There is obviously bound to be a certain amount

of wastage involved in replacing one material with another, and the design problem is to keep this wastage to a minimum.

(b) The materials and labour required for these incremental improvements should be available on a domestic scale. In other words, the individual homeowner should be able to go to a retail shop, invest a small amount of money at any point in time and obtain a visible improvement in his accommodation, which encourages him to repeat this kind of investment and gradually go on improving his dwelling.

(c) Ownership of the plot or a share in the plot, so that the householder has sufficient security of tenure to want to invest further and want to improve his house. Transfer rights in such ownership, however, may need to be restricted in some way to protect the owners against *dadas*, and to ensure that the essential purpose of such individual ownership is realised.

(d) Sites which are attractive for the prospective occupants. This means primarily convenience of access, or access to a transportation system sufficiently moderately priced to be within the financial means of the occupants.

VIII

Is any programme of housing where we expect the householder to invest and make continuous improvements unlikely to succeed because individuals do not attach a high value to good housing? What are the family's attitudes to housing in different income groups? To what extent, in different income groups, do individuals regard their house as a place to sleep and keep their belongings, or as an object of pride and a measure of social status, or as an investment and security against the future?

IX

Is it possible that the provision of improved housing in urban areas will lead to an increase in migration to these areas? To what extent is the lack of availability of reasonable accommodation in an urban area a disincentive to migration? It may be possible to infer an answer to the first question by an investigation of the second.¹⁰

If return migration is a significant phenomenon, would it be possible to encourage this by making the surrender of accommodation in an urban area the basis for the provision of similarly priced accommodation (which would be ampler in area and size of plot provided) in a less developed area?

X

The standards of density (families per acre)¹¹ which are adopted for most Indian cities in their current plans for development are derived from Western norms. According to these for new developments densities of about 20 to 60 families per gross residential acre are recommended as being near the optimum.¹² At the other extreme, we have the example of Hong Kong, where new developments are being undertaken at planned densities of approximately 400 families per acre.¹³ What standards should we adopt for New Bombay? It seems clear that infrastructure costs, such as the costs of water distribution, sewage collection, street lighting, power, telephones and so on, vary inversely with the density of development. More correctly, the more compact a development for a given level of population, the lower the development costs. Apart from densities, this implies that the land uses which are high consumers of land — such as playgrounds, maidans, open areas, schools and hospitals — are most economically located on the periphery of any development, whereas the core which requires services is kept as compact as possible.

One proposal for the New Bombay area is that it will be developed as a series of compact nuclei, each varying in population size from 50,000 to 150,000 or more, with the nuclei being linked by a mass transportation system. Each nucleus will contain jobs, adequate local facilities for shopping, schooling, medical attention and so on, and residential accommodation for all income groups. The nuclei will be discrete and distinct from each other, with open spaces between. What are the desirable densities to be adopted for each nucleus, considering costs and in particular transportation costs, and considering also the effects of density on the quality of the environment and the quality of social life?

Ground-level or ground-plus-one living is considered by many to be more human, more Indian, and in some sense anti big-city. In practice, the lower densities that it implies may lead to a vast sprawl similar to what has happened in the case of New Delhi. Costs increase, particularly transport costs (using the word 'costs' in its broadest sense to include social costs as well as money costs). Does the lowered density result in a better quality of life than exists in some of the more densely packed areas of Old Delhi? Or is the optimum somewhere in between? This investigation will be particularly difficult, because in com-

paring two different areas with different densities there will be further differences in the qualities of amenities available in each area, differences in whether the area is newly settled or older with more well-established social relationships, differences in the mix of income groups occupying each area, and so on. It may also be that densities of development which are satisfactory or desirable for one particular income group are not so for another. It is likely that with rising income, and a readier economic access to means of transport, there is a drop in the desired density level. Is this true for all income groups, or only the most affluent? Or are there cultural differences also for different parts of the country? We know that people in one part of the country prefer to huddle their houses together in a village even where there is otherwise plenty of room around and no danger from wild animals, whereas in another part of the country they prefer to keep their houses spaced apart. Does this difference extend to towns?

Are there any lessons to learn from the densities, number of storeys, and layout patterns of the older pre-British Raj parts of Indian cities? How should such findings be used to develop guidelines for new work, given the fact that norms have changed — in such respects as for instance hygiene and fire hazards —, that aspirations are rising, that we have access to a different construction technology, and that with rising population the entire scale of the city has changed dramatically and inevitably?

XI

To what extent is density a meaningful criterion for measuring the quality of an urban development? It has the advantage of being easily measured, easily prescribed and easily controlled, at least in terms of the allowable extent of construction in an area, although the numbers of people occupying that construction are not so easily regulated. It also answers the need for a simplified global kind of index, whose single prescription would ensure the desired quality of urban development. The specifying of land-use — whether an area shall be residential or industrial or commercial or for transportation — and the stipulation of density of development, are taken to be the two basic manipulable independent variables in the hands of the city planner. The correct mapping of the first, and the correct specification of the second for different areas of the map, are generally taken to be sufficient to ensure a satisfactory urban development.

There can be no doubt that the extent of construction per unit of ground area is a good rough index of the openness or extent of crowding of buildings in an urban area. For instance, Central London probably has 61,700 sq ft of construction per gross acre, Central Manhattan 302,000. Greater Bombay has 175,000 in Bhuleshwar, 150,000 in Fort (North), 76,200 in Fort (South), 42,500 in Bandra Hill.¹⁴

For those who believe that the nature of the physical environment is a fundamental factor in determining the quality of city life, there can be no doubt that the regulation of density, and architectural design, are vital elements in establishing that quality. By and large, the view is that the lower the density the happier the community although there is a point of view, particularly forcefully expressed by Jane Jacobs, which pleads for higher density levels;¹⁵ and a still more extreme view, not frequently encountered, which holds that a degree of crowding and tension in living is desirable to create the peculiar 'urban' quality in the environment which yields the creativeness and dynamism needed for progress.

How far are these views correct? First, assuming the view is valid that physical arrangements are of fundamental importance in establishing the quality of city life, what, besides density, are the elements that matter? the heights of buildings? trees? noise levels? traffic-free areas? privacy? the opening of dwellings on community spaces? ground floor living? variety in the physical environment? variety in the range of activities being carried out in the neighbourhood? the possibility of escape to open areas? convenient access to shopping and schools? Second, to the citizen living in an area, is it indeed the shape of the physical environment that is the most important factor in determining the quality of his life? where in the scale of relative importance would one find the costs of transport? and consequent ease of access to a variety of other areas? the quality of municipal services? the quality of health or educational facilities? opportunities for recreation? opportunities for participation in community activities?

This will be a particularly complex and difficult investigation. Responses will vary for different income groups. But what is especially difficult is that respondents are probably unable to visualise correctly the possible alternatives, and unable to assess what their responses might be in the alternative situation. The effect of physical arrangements in particular may also be subtle

and indirect, and not immediately appreciated by the lay respondent. It is this very difficulty which makes it especially easy for the planner, particularly one with an architectural background, to assume responsibility for knowing best and to give weightage to matters of physical disposition, whereas to best satisfy citizens' needs it may well be more important to concentrate resources on other aspects of development.

XII

Each of the investigations outlined above could be carried out in two phases. The first phase would be a desk study, involving a search for information which is of relevance to the particular investigation in hand, and an analysis of the available data. It would conclude with tentative findings and formulation of a field programme, if it becomes clear that such a field investigation is necessary. The second phase could be field work and further analysis.¹⁶

Notes

- 1 HUDCO is understood to have so far committed Rs 50 crores to various schemes for housing a population of 350,000. Loans are for five to seven years, sometimes 10 years, at rates of interest varying from 6.5 to 8 per cent. HUDCO's revolving fund is expected to rise to Rs 200 crores.
- 2 A close examination of the industries that have developed in India over the last two decades may reveal many to be manufacturing items whose consumption we may consider socially less desirable than the consumption of housing. For example, the annual value of output in the art silk and man-made fibres industries in 1965 was Rs 178 crores (ASI data). As against this, spending on housing during the Third Plan averaged Rs 60 crores per year on public sector housing and Rs 280 crores per year in the private sector (Fourth Five-Year Plan document). How much of the private sector housing was for the lower income groups is not clear. However, the argument about the social desirability of encouraging consumer spending in one area rather than another is not one that I will pursue further here, as it is irrelevant to the purpose of the present paper.
- 3 Wages vary from Rs 0.26 per man-hour in cashew-nut processing to Rs 5.65 in manufacture of electronic equipment. The mean for all industries in the ASI list is Rs 1.27, with a standard deviation of Rs 0.65 (extracted from ASI 1965).
- 4 Remembering, of course, that a man-hour of skilled labour implies some man-hours spent in imparting and in learning these skills, which
- 5 should be divided over the total working man-hours expected in the life of the worker to arrive at the 'indirect' man-hours of effort to be added to the 'direct' man-hours of skilled employment in industry. This is a correction we may ignore as an unnecessary refinement.
- 6 I am indebted to Kirit S Parikh for advice in this formulation, and also for his comments on the rest of this paper. I am also indebted to K Srinivasan and others for assistance in extracting some of the information used in this paper.
- 7 For example on 6 mm thick Asbestos Cement sheets the components of import duty on the raw material and excise duty on the finished product account for 25 per cent of the final ex-factory price; on 24 gauge aluminium sheets excise duty alone is 54.5 per cent of the final price. Net of these taxes, 6 mm asbestos and 24 gauge aluminium sheets would cost the same; with taxes aluminium sheets are 34 per cent costlier per sq foot of area.
- 8 The Syndicate Bank has a scheme which allows depositors a loan for purchase of a house up to five times their average Savings Account balance over the preceding 24 months, subject to a maximum of Rs 10,000, or 50 per cent of the value of the house, whichever is lower, with the house as collateral. Interest rates are 3.5 per cent over the Bank rate, but not less than 10 per cent.
- 9 The LIC has already entered the field of middle-income group housing with its Jeevan Bima Nagar township at Borivli. 1,300 flats have been constructed (500 more are in hand) and are offered for sale at prices ranging from Rs 14,850 to Rs 35,800. It is understood that the price includes some surplus over costs to LIC. It has not yet been made clear whether or not this surplus will be used in subsidising lower income group schemes.
- 10 P Ramchandran "Housing Situation in Greater Bombay", Tata Institute of Social Sciences, 1972.
- 11 An interesting question is whether there is any relationship between the amount of physical investment in an area and the extent of migration to that area. For physical investment it may be possible to use some crude index, such as the amount of cement consumed in that area.
- 12 Density can be variously expressed, as gross residential density (meaning the residential population per unit of total area, including roads and public spaces), net residential density (the residential population per unit of plot area, excluding areas for arterial roads and public spaces) and so on. Commonly about 60-65 per cent of a residential area consists of plots, the remaining 35-40 per cent being roads, shops, open spaces, etc. Net residential densities are therefore about 1.6 times gross densities.

In planning work, after a desired density figure has been determined it is usually translated into dwellings per unit area, on the basis of assumed family size, and finally into plots per unit area with an appropriate Floor Space Index (FSI), also called Floor Area Ratio (FAR) or by another name, meaning in each case the built-up floor area divided by the plot area. The regulation of FSI is deemed to be an adequate, indirect means of controlling density.

- 12 The following figures are presumably for gross residential densities although this is not always made perfectly clear in the relevant source. Writing about the British New Towns, Emrys Jones "Towns and Cities", 1966 says: "Planners and architects are slowly reintroducing urban densities into the new towns. Later additions depart very considerably from the standard 10-12 houses per acre. Fifteen per acre is not considered outrageous, and in one case 20 houses per acre has been accepted". The Master Plan for Delhi (1961) recommended densities varying from 25 persons to 150 persons per acre, most areas being within the range of 75 to 100 persons (15 to 20 families in Indian conditions) per acre. The Greater Bombay Municipal Master Plan (1964) is not very clear on the subject of densities but recommends population levels of 32.5 lakhs in the city and 47.5 lakhs in the suburbs, the areas available for residential development being 17.8 and 68 sq miles respectively. Densities calculated from these figures work out to 285 and 109 persons (57 and 22 families) per acre respectively. The Calcutta Development Plan (1966) recommends net densities from 100 to 700 persons (20 to 140 families) per acre. Gross residential densities (see 11 above) would be 12 to 88 families per acre. For smaller towns in India densities range from 33 to 129 persons (6 to 26 families) per acre (B B Garg, 'Formulation of Densities in Physical Planning', CBRI, 1970).
- 13 In the Castle Peak new town development, it is expected to accommodate 1,000,000 people in an area of 500 acres, a density of 2,000 persons (about 400 families) per acre (from D J Dwyer, Hong Kong, 1971). In many other smaller estates including Choi Hung, Wah Fu, and Ping Shek, densities exceed these figures (Hong Kong Housing Authority, 1970-71).
- 14 Calculated from Greater London Development Plan (1966 figures), Urban Design Manhattan, Regional Plan Association, and from Survey Maps of Greater Bombay, City and Suburban offices.
- 15 Ranging from 100 to 200 dwellings to the net acre, (or about 62 to 125 families per gross acre), Jane Jacobs "The Death and Life of Great American Cities", Chapter 11, 'The Need for Concentration'.
- 16 While the programme outlined here

has been drawn up keeping in mind the specific needs of the New Bombay project, for which the City and Industrial Development Corporation of Maharashtra (CIDCO) is the agency responsible for planning and development, it is hoped that scholars and investigators concerned with other areas

will communicate with CIDCO if they feel that the scope of the present investigations could be modified or enlarged so as to make the results relevant and useful for areas other than New Bombay, or if they are aware of work being done elsewhere which is pertinent to the present programme. While CIDCO is pre-

pared to co-ordinate the research programme, and provide some financial support wherever necessary, it is expected that the actual investigative work will be carried out by other agencies and consultants outside CIDCO, and it is they who will take responsibility and credit for the work that they are doing.

On Comparing Levels of Living in Different Regions

N Sreenivasa Iyengar

Lila Ram Jain

A rational concept of equivalence for comparing standards of living in two regions may not be difficult when a single consumption basket is equally representative of the goods and services purchased by households in the two regions which are to be compared. Definition of equivalence becomes more difficult, however, when the goods and services available and the household consumption patterns are quite different in the two regions.

Determination of comparable groups, through an analysis of consumption at different income levels has been attempted before. Expenditure differentials between two regions have been derived through statistical analysis of Engel curves fitted to data on household expenditures on specific commodities and total outlay in the two regions.

In this paper, is proposed a simple method of obtaining such expenditure differentials between two or more regions, especially when the joint distributions of the expenditures on specific items of consumption and total consumption expenditure in those regions are known.

MEASUREMENT and comparison of the levels of living of communities with diverse economic, cultural and demographic characteristics involves many technical problems. Consequently, very few empirical comparisons of this kind have been made, though there is a real need for such studies. Every comparison of living standards or costs depends upon some concept of equivalence. A rational concept of equivalence may not be difficult to find when a single consumption basket is equally representative of the goods and services purchased by households in the two regions which are to be compared. Definition of equivalence becomes more complex, however, when the goods and services available and the household consumption patterns are quite different in the two regions. Groups of households of the same size and composition may perhaps be regarded as belonging to the same economic level if their incomes are utilised to the same extent for supplying their basic needs. By this definition, households in one region allocating, say, 60 per cent of their total outlay to necessities are in the same economic circumstances as households in another region which also allocate 60 per cent of their total outlay to necessities. This

ratio of the outlays between the two regions provides a measure of the difference in costs or standards of living of the groups in the first region as compared to in the second.

The determination of comparable groups, through an analysis of consumption at different income levels, has been attempted by Roy (1943), Synder (1956), and others. Expenditure differentials between the two regions have been derived through statistical analysis of the Engel curves fitted to data on household expenditures on specific commodities and total outlay in the two regions. In this paper, we propose a simple method of obtaining such expenditure differentials between two or more regions, especially when the joint distributions of expenditures on specific items of consumption and total consumption expenditure in those regions are known. The method involves comparison of mean outlays of households spending a given variable proportion of their total expenditures on cereals in different regions, in the absence of a workable definition of necessities.¹ Graphical representation of these means show not only differences in average standards of living between the two regions being compared, but also bring out disparities of an intrinsic nature within

each region. This representation is somewhat different from the fractile graphical representation used by Mahalanobis (1960).

Our present study provides some evidence for the view that a rise in the average standard of living is necessarily accompanied by a widening of consumption disparities.

DATA USED

This study is based on household expenditure data, collected in the 17th round of the National Sample Survey (NSS). In this survey, which covered the period between September 1961 and July 1962, a stratified two-stage pps sampling design was adopted. In the urban sector of a state (region), the first-stage units were the urban blocks, whereas in the rural sector the village formed the first-stage unit. In both sectors, the households constituted the ultimate units of investigation.² The sample was obtained in the form of three independent interpenetrating subsamples. However, because of limitations of time as well as non-availability of disaggregated data in the required form, this investigation was confined to one subsample of households spread over two distinct regions

of India. The regions covered were Uttar Pradesh (the northern region of India) and Madras (now called Tamil Nadu, representing the southern region).

The total sample consisted of 884 households, of which 502 lived in rural areas during the survey period. The Uttar Pradesh sample was considerably larger than the sample from Madras, as indicated below:

NUMBER OF HOUSEHOLDS IN THE SAMPLE	
Region	Number
Rural Uttar Pradesh	316
Urban Uttar Pradesh	192
Rural Madras	186
Urban Madras	170
Total	884

METHOD OF ANALYSIS

The present analysis was further restricted to only two important household variables, viz, monthly expenditure on all household items of consumption including cereals (x); and monthly expenditure on cereals (y); both these variables are expressed in constant rupees of 1961-62. The derived household characteristic, viz, the proportion (w) of total outlay allocated to cereals is of considerable interest.

By definition, the three variables x , y and w , are interrelated; since $w = y/x$,

$w \leq 1$. Each sampled household h provided a pair of observations (x_h, y_h). Such points were plotted and scatter diagrams were obtained. These diagrams provide an empirical basis for formulating explicit relationships for $x = f(w)$ between w and x . This relationship differs in some respects from the Engel curve, since the latter regards x as the argument and y , and hence w , as the dependent variable.

According to Engel's Law, at successive economic levels, the expenditure for necessities increases in amount but decreases in proportion to total expenditure for all goods and services. Since expenditure on cereals is a necessity,³ Engel's ratio (w) for cereals would be lower for households with comparatively high levels of living. On the other hand, an increasing value of w may be taken to mean increasing poverty, and in this sense, the distribution of w could be expected to reflect the distribution of poverty.⁴

MAIN RESULTS

Table 1 gives the distribution of households according to levels of living or poverty levels. This Table is further

TABLE 1 : DISTRIBUTION OF SAMPLE HOUSEHOLDS ACCORDING TO THEIR LIVING STANDARD
(Uttar Pradesh and Madras, 1961-62)

Living Standard	Uttar Pradesh				Madras			
	Rural		Urban		Rural		Urban

TABLE 2 : DISTRIBUTION OF SAMPLE HOUSEHOLDS ACCORDING TO THEIR LIVING STANDARD
(Uttar Pradesh and Madras, 1961-62)

Living Standard	Uttar Pradesh		Madras	
	Rural (Per Cent)	Urban (Per Cent)	Rural (Per Cent)	Urban (Per Cent)
$W \leq 0.30$	22.9	50.0	16.6	40.0
$0.30 \leq W \leq 0.60$	60.4	43.7	64.5	50.5
$W > 0.60$	16.7	6.3	18.9	9.5
Total	100.0	100.0	100.0	100.0

condensed in Table 2, by merging successive poverty intervals into three main

segments, viz, $w \leq 30$ per cent, 30 per cent $< w \leq 60$ per cent and $w > 60$ per cent, which may be regarded as the rich, the middle, and the poor classes, respectively. Table 2⁵ reflects the inter-regional and inter-class differences in the distribution of levels of living.

An interesting question arises regarding the shape of the distribution of w . Some Indian scholars working on NSS consumer expenditure data have found that the distribution of x is approximately lognormal. For certain items of consumption, Iyengar (1967) assumed that the joint distribution of (x, y) is bivariate normal in logarithmic scale, implying that the marginal distributions of x and y are also logarithmically normal. Further, the regressions between x and y are linear in logarithms. This has the further implication that the distribution of w is also lognormal. The present analysis indicates, however, that the assumption of lognormality for the distribution of w for cereals is not

realistic. This at once leads to the conclusion that the relationship between x and y is different from doublelog.

There is still another way of presenting the same data by drawing the specific concentration curves for the conditional distribution of x classified according to levels of w . For this, it is necessary to compute the mean values of the x 's for each of the w -classes. These group means are shown in Table 3.

The specific concentration curves vary from one region to another, and also between the rural and the urban areas within the same region. These curves lie above the line of equal distribution, showing that there is an 'inverse' relationship between x and w . This, indeed, is in accordance with Engel's Law. These curves indicate that consumption levels in urban areas are more unequal than in the rural sector. They also reveal that the rural-urban differentials in levels of living are much greater in Tamil Nadu as compared to in Uttar Pradesh.

Table 3 shows that an average house-

hold in Tamil Nadu spends nearly 13 per cent more than its counterpart in Uttar Pradesh. Rural households in these regions do not, however, exhibit wide differentials in their consumption standards. Perhaps, a more direct comparison of the average levels of living or poverty between the two regions could be made by simply computing the regional or sectoral relatives for each stratum of households. Those calculations are shown in Table 4.

CONCLUDING REMARKS

This study, confined as it is to only one item of necessity, is essentially of an exploratory nature; it could be extended to other items of necessity, covering other regions of India as well. Our calculations are based on data from only one subsample in both rural and urban sectors of the two regions. Use of two independent subsamples would have provided an idea of the margins of error in our conclusions.

There could be several questions pertaining to the use of the Engel ratio for establishing equivalence between levels of living. For instance, this ratio may not be a good indicator when the prices of cereals and other items of consumption in different regions have moved disproportionately. The comparison between the regions would be more meaningful when the size and composition of households being compared were the same.

Nevertheless, the exercise provides a realistic instance of a specific concentration curve lying above the line of equal distribution; this curve has some similarities with the class of concentration curves proposed by Bentzel (1970). It further shows that the relationship between expenditure on necessities and total expenditure differs from the linear doublelog relationship often assumed in the estimation of Engel elasticities (Iyengar, 1960). There is also a suggestion that a rise in the general standard of living is accompanied by a widening of consumption disparities. This tendency is discernible in most of the developing countries in the early stages of their economic development.

Notes

- 1 The concept of 'necessities' is a truly dynamic concept. Adam Smith, in his "Wealth of Nations," wrote: "By necessities I understand not only the commodities which are indispensably necessary for the support of life, but whatever the custom of the country renders it indecent for creditable people, even of the lowest order, to be without."
- 2 For definition of the concepts used, see National Sample Survey, 1961.
- 3 As already pointed out, a satisfactory definition of necessities is difficult to establish, as the concept of income adequacy is itself a dynamic one. In some of the Indian studies, however, cereals has been used as proxy. See, Mahalanobis (1962).
- 4 More recently, interesting definitions of poverty, based on nutritional standards, have been attempted by Dandekar and Rath (1971), Bardhan (1971) and others, using the distribution of x.
- 5 This classification is no doubt arbitrary. Alternatively, one might use fractile classification, following Mahalanobis (1960).

Mode of Production in Indian Agriculture

A Comment

Jairus Banaji

THIS article attempts to take up some of the points raised by Pares Chatterpadhyay in his reply to Utsa Patnaik (Review of Agriculture, December 1972). Chatterpadhyay's apparent preoccupation with clear definitions and his abundance of textual marxism conceal a real atrophy of theory. His thought, as Trotsky said of the historian Pokrovsky, is "gripped in the vice of rigid social categories which he puts in place of live historical forces".

INTRODUCTORY CONCEPTUAL POINTS

Firstly, it is difficult to see why Chatterpadhyay, having conceded that in relatively exceptional historical circumstances production relations and relations of property might bear a relation of 'non-equivalence', should want to continue to deny precisely this historical possibility in the imperialist transformation of juridical forms in India in the eighteenth century. To say, "what the colonialists introduced in India was private property and not bourgeois property..." does not help, for the whole question precisely revolves around the class character of the juridical relations through which big property of the colonial world which witnessed similar evolutions — French Indochina, Mexico under Spanish imperialism and so on. 'Private property' as such has characterised several historical epochs and modes of production. On the other hand, if Chatterpadhyay merely wishes to define property relations as production relations and then build his case on a series of tautologies ["there could be no question of bourgeois property in land in the absence of free wage labour..."] he is quite free to do so. It is interesting, nevertheless, that Bettelheim, whose authority Chatterpadhyay invokes, emphatically supports the position of Pierre-Philippe Rey that at no point in *Capital* can one find an identification of production relations and relations of property¹ [la tradition marxiste, constituée depuis la mort de Marx... a identifié, sans aucune raison, sans qu'on puisse trouver l'origine de cette identification en aucun point du Capital, rapports de production et rapports de propriété]. As juridical relations, relations of property belong to the superstructure, as Rey correctly maintains, and though they are determined

in the last instance by the relations of production, this determination is never a simple one. It is perfectly possible to maintain that in most parts of the colonial world which experienced the installation and expansion of big landed property, the instance determining these property relations was not the relations of production within the colonial social formations but those which prevailed between these formations and imperialist capitalism, that is, the international relations of production. Unlike the scattered precapitalist national modes of production which prevailed till the sixteenth century, the colonial modes of production were subordinate elements of a complex international structure.

Secondly, and less importantly, capitalism is not in the first instance an 'economic social formation', as Chatterpadhyay maintains, but a mode of production. A social formation is a historically unique object, an expression of the historical determination, in the widest possible sense, of one or a series of modes of production. As Poulantzas states, "a social formation, which is a real-concrete object, always original because unique (*singulier*), presents, as Lenin showed in *Development of Capitalism in Russia*, a particular combination or a specific interlocking of several 'pure' modes of production".² Thus Bismarckian Germany, Stalinist Russia, T'ang China — these are social formations. Capitalism is a mode of production.

Thirdly, as marxists our main interest is not the purely formal, abstract and sterile exercise of establishing the 'basic identity' of this or that capitalist social formation, but precisely the much more difficult and politically more important task of determining the *historical differences* between them. For, as Trotsky never tired of maintaining, history does not repeat itself. Again, if Chatterpadhyay prefers the relative security of conceptual tautologies ["capitalism is everywhere the same insofar as it has the same basic or essential features."] to the task of concrete historical analysis, let it be so.

CAPITALISM AND REVOLUTION IN RUSSIA

The disregard for concrete historical analysis which lurks behind an apparent concern for theoretical clarity is carried

ed so far, however, that we read with astonishment the following statement: "It is doubtful whether the leaders of the October Revolution would accept U Patnaik's unqualified statement 'Russia was no colony', for in their official account they clearly pointed out that, on the eve of the First World War, Russia was converted into 'a tributary semi-colony' of Britain and France". Firstly, it is doubtful that Patnaik ever made such an unqualified statement. Secondly, it is by no means certain that a history of the CPSU published in Moscow in 1948 has anything to do with the 'leaders of the October Revolution'. But both these points are minor ones. The important point is the bland way in which Chatterpadhyay passes from 'colony' to 'semi-colony', as if the modification of the concept were of no significance. The 'slip' is symptomatic of a decisive absence in Chatterpadhyay's work, namely, the absence of a *theory of colonialism*. Lacking such a theory, he is forced to stumble blindly and pragmatically from one 'characteristic' of the colonial period to another, without any sort of articulation emerging. Thus we are told that "the British accelerated as well as retarded the development of capitalism in India", that they "obstructed" the growth of capitalism in India by "preserving pre-capitalist relations" but also that "by its very nature imperialism contributed towards the development of capitalism in India". This unification of opposites would seem to make Chatterpadhyay's position impregnable, but in fact it reveals its theoretical vacuum, for at no point is there the slightest indication as to why this contradictory relationship existed. A real theoretical ambiguity comes into play at this point, for we are not sure whether to Chatterpadhyay it is the *blocking* of the productive forces in the colonial and semi-colonial world or their *emancipation* through accelerated capitalist development which is the dominant 'essential' feature of imperialism in its colonial phase.

This ambiguity is fully revealed by the fact that he goes on to quote a famous passage from Lenin's *imperialism* — "the export of capital influences and greatly accelerates the development of capitalism in those countries to which it is exported". Despite the hindsight of over 50 years which he has, Chatterpadhyay makes no attempt to *evaluate* this statement. It is simply presented as 'obvious'. But theory scorns the obviousness of 'elementary marxism'. A correct evaluation of Lenin's state-

ment presupposes a certain theoretical conception of the relationship between the advanced capitalist imperialisms and the countries which were subjected to one or other of several forms of imperialist domination. These relationships varied significantly according to the particular historical form of imperialist domination. Now, a few lines before making the statement in question, Lenin in fact reproduced a table showing the distribution of foreign capital circa 1910. The interesting point in this table is the fact that for each of the three major capital-exporting nations — Britain, France and Germany — the bulk of the investment was not in those sectors of the world which were directly colonised, i.e. subjected to a colonial mode of production, but in Europe and America (including the S American countries of Argentina and Brazil). Lenin could even point out that for German capital colonies were of no significance whatever.³ Figures from recent sources⁴ show that between them Europe, the United States and Canada accounted for 51.2 per cent and, including L America, for 70.5 per cent of foreign capital circa 1913, as against Asia and Africa's combined 24.3 per cent. Between them Canada, the USA, Australia, New Zealand, S Africa and Argentina absorbed 63.1 per cent of British investments at that period, as against a total of 14.4 per cent for India, Ceylon, W Africa, Egypt and the Far East (excluding Japan). This unevenness was even more pronounced in the case of French investments, the bulk of which was in Europe, especially in Russia, and of German investments which were divided between Europe and America. Cairncross writes that "even if we include L America it is unlikely that the less advanced countries as a group obtained more than about \$500 million a year in foreign capital in the decade before 1914 when the international flow of capital was at its tide".⁵

Thus capital was exported predominantly to those countries which stood in various intermediate forms of dependence vis-a-vis imperialism and to the USA which was itself moving into the role of an investor-imperialism to semi-colonies and neo-colonies lying predominantly in the temperate zones — with one major and significant exception — Russia.

Chattopadhyay's whole section on capitalist development in Russia misses this central fact, namely that Russia was the one major country with 'semi-Asiatic' characteristics, i.e. a large impoverished peasantry, which from the

inception experienced an advanced [because purely economic] rather than a backward form of imperialist domination. The failure to pose the question in these terms springs directly from his wholly one-sided grasp of dialectics. In other words, he understands the uneven character of historical development, even though in a purely formal way, but not, simultaneously, its combined character. For it was from the co-presence of both characteristics of the historical process that Trotsky was able, long before Lenin, to put socialist revolution in the foreground of the workers' movement in Russia. Chattopadhyay's presentation of the issue is not only dishonest, insofar as it deliberately ignores Trotsky, but intellectually bankrupt for it makes no attempt to explain the transition of 1917 in terms of the entire historical development of the preceding decades. Lacking this explanation he is forced to invent his own peculiar scenario for the Russian Revolution. We are told that it was due to the bourgeoisie's assumption of state power in February that Lenin decided on the transition to socialist revolution. In fact, of course, the whole point was that the bourgeoisie had not completely seized power and was overtaken in the course of attempting to do so, as Trotsky pointed out to Pokrovsky.⁶

But how could it be overtaken so rapidly? This question immediately takes one back to the whole character of Russia's economic development. Russia was in fact dominated as a neo-colony of French and Belgian capital, not as a 'semi-colony' as the apparent leaders of the October Revolution, writing in 1948, imagined. In her case this advanced type of imperialist domination — standing in sharp contrast to the colonial mode of production in India and Indochina — took two forms which co-existed. Not only was the Russian peasantry enslaved to the European Stock Exchange through the intermediary of the Tsarist state and its foreign debt, but foreign capital exploited the Russian working class through direct investment as industrial capital. As Trotsky wrote before the first decade of the century was complete in one of the most intelligent early appreciations of neo-colonialism:

"Deprived of the possibility of dumping its products on Russia, European capital crossed the Eastern frontier in its most invulnerable and attractive hypostasy: in the form of money. Any animation on the Russian financial market was always determined by the contracting of new loans from abroad. Parallel with this, the European entrepreneurs took direct possession

of the most important branches of Russian industry. Europe's finance capital, by assimilating the lion's share of the Russian state budget, returned in part to Russian territory in the form of industrial capital. This enabled it, through the intermediary of the Tsarist fiscal system, not only to exhaust the productive forces of the Russian muzhik, but also to exploit directly the working energy of the Russian proletariat. During the final decade of the nineteenth century alone, and especially after the introduction of gold currency in 1897, not less than 1.5 billion roubles of foreign industrial capital flowed into Russia..."⁷

But this was not all. The industrial capital invested directly in Russia took the form, predominantly, of large scale factory production, 42 per cent of the Russian working class laboured, at the turn of the century, in enterprises employing over 1,000 workers; another 15 per cent in enterprises with 500-1,000 workers. The concentration of industrial production in Russia in this sense was greater even than in Germany. What is important, however, is the specific social combination which this form of imperialist penetration determined. As Trotsky wrote in "Results and Prospects", "the proletariat immediately found itself concentrated in tremendous masses, while between these masses and the autocracy there stood a capitalist bourgeoisie, very small in numbers, isolated from the people, half-foreign, without historical traditions...".⁸ Furthermore, this was a bourgeoisie mainly resident in the parliaments of France and Belgium and one which had no desire to associate itself with the bourgeois opposition in Russia. As long as Russian absolutism conformed to the role delineated for it by the financial bourgeoisie of Europe, there was no basis for the potential contradiction between these two forces to emerge. "The European Stock Exchange was even directly interested in the maintenance of absolutism, for no other government could guarantee such usurious interest".⁹ In short, the transition to socialist revolution in 1917 was not the product of Lenin's political genius, but, fundamentally, of the whole historical experience of Russia's capitalist development, summed up in the relationship between a weak national bourgeoisie and a strong concentrated raw proletariat. [The relationship between the subjective and objective planes can be stated more rigorously by saying that the latter played the determining role, and the former the decisive one]. This relationship, however, not only made the transition pos-

sible but historically necessary as well.

The transition was a historic necessity due to the backwardness of the 'national' bourgeoisie in the face of the acute agrarian crisis which Russia was experiencing. It was not merely Russia's 'European' or 'American' industry or, on the other hand, her semi-Asiatic backwardness which in abstract isolation determined the possibilities of a transition to October. It was the combination of these characteristics or 'stages' of development. The Revolution was the product of combined and uneven development.

But to Chattopadhyay's purely one-sided understanding of historical development is added insufficient knowledge of economic conditions in nineteenth century Russia. Thus he quotes Gerschenkron to make the point that agricultural capitalism was relatively backward in Russia. But the question cannot be posed in these terms, for Russia was divided quite sharply into distinct agricultural-economic regions with their own special characteristics and levels of development. Again Trotsky's analysis makes the point quite clearly when it divides the fifty provinces of European Russia into (a) northern old-industrial region characterised by factories (especially textiles), cottage industries, flax cultivation and commercial agriculture, a grain-deficit zone, (b) Russia's America in the southeast, with practically no serfdom and with "wheat factories" using modern agricultural machinery and exporting grain; "in this area differentiation within the peasant community goes extremely deep, the peasant farmer standing at one end of the scale and the agricultural proletariat... at the other", and finally (c) Russia's India between the old industrial north and the new industrial south, densely populated, dominated by a landlord economy and experiencing considerable out-migration of the peasantry. "Here" Trotsky writes, "the capitalist farmer cannot compete with the pauper tenant-farmer, and the steam plough is defeated in the struggle with the physiological resilience of the muzhik, who, having paid as rent not only the entire profit on his 'capital' but also a large part of his wages, exists on a diet of flour mixed with wood shavings or ground tree-bark...".¹⁰ Of this the central black-earth region, Trotsky remarks, "compared with the north and south, the stratification of the peasantry is highly superficial...". The passage concludes as follows, with a specificity which is totally absent in Chattopadhyay's blank statements: "During the 1890s the semi-serfdom relations in agriculture which were dominant in

the twelve provinces of the central black-earth area prevailed also in five provinces outside the black-earth strip. On the other hand, capitalist agricultural relations predominated in nine black-earth provinces as well as in ten non-black-earth provinces; and lastly, in seven provinces the two systems were roughly equivalent".¹¹

It is not surprising, then, that Lenin should have referred to the survival of landlord economy shortly before 1917, for agricultural capitalism nowhere develops in an even fashion, least of all in terms of a 'natural-agricultural' space. Thus as far as today is concerned, one has only to look at the north of Iran with its mechanised cotton production, or Mexico's North Pacific region, or the southern states of Brazil, or coastal Peru or Colombia's Valle del Cauca, and contrast these regions with the impoverished zones surrounding them.

COLONIAL CAPITALISM AND WORLD CRISIS

It was precisely due to the form of imperialist domination which Russia experienced that such disparities in the level of economic development in agriculture could emerge. This form of domination did not entail the direct political subjugation of the nation and far from blocking the productive forces led to a relative development of industry and the home market. India, on the other hand, experienced a quite different type of domination by imperialism, where the export of capital was not only of secondary significance [thus in India's case commercial exploitation was far more important, cf. Bagchi] but also had a quite different impact on the economy as a whole, for when not sunk into railways and public utilities it was loaned to the government or invested in the extractive and plantation sectors with a low organic composition of capital. It makes little sense, in Marxist terms, to subsume the two radically distinct forms of capital flow involved in an accelerated neo-colonial development on the one hand (as in Canada, Australia, etc. at the turn of the century, where foreign capital amounted to between 30 and 50 per cent of gross domestic capital formation; or as in so many countries today) and 'traditional' colonial investments on the other (as in Indian tea) under the single term 'export of capital'. In a trite sense it is, of course, true that in both instances capital crossed geographical boundaries and engaged directly in production or in expanding infrastructure. But the effects of capital-exports were quite different in the two instances, due

chiefly to their volume and distribution; and hence the speed of capitalist development which they determined varied significantly as between the two sectors. Lenin's statement, while correct of countries like Canada and Australia, has to be interpreted differently for countries dominated by the colonial mode of production.

One could say, then, that because he wrote *Imperialism* at the historic juncture of neo-colonial and colonial domination, Lenin tended to confuse the two types of export of capital characterising these forms of domination (neo-colonial and 'traditional' colonial). The objective historical basis for this confusion was again the combined and uneven character of imperialist expansion, in which the final stage of colonial subjugation — in Africa and S E Asia — coincided with the growth of capitalist monopolies and the transition to the dominance of finance capital. While both these agents of neo-colonialism (finance capital and monopoly) participated in the exploitation of countries dominated by the colonial mode of production — a good case is Dutch finance capital and Indonesian sugar — the fact remains that European capital industrialised Russia and the white colonies at a rapid speed, whereas in the colonial and semi-colonial countries it tended to retard the development of capitalism. The two distinct modes of reproduction of capitalism — through neo-colonial loans and direct investment and through the colonial modes of production — were defined by (1) different speeds of capitalist development, (2) by different tendencies. Under the first the main tendency was the predominance of the capitalist mode of production (this was the essence of Lenin's controversy with the Narodniks) and under the second, due to blocking of the productive forces, disadvantageous international specialisation, external presence of centres of capital accumulation and direct political domination — i.e. all the basic characteristics of the colonial modes of production — the main tendency was what Bettelheim has called the "conservation-dissolution of non-capitalist modes of production"¹² or what an Egyptian Marxist M Hussein¹³ has described as an "abortive transition to capitalism" (*transition bloquée*) in which the mass of the Egyptian peasantry were "proletarianised" without becoming a proletariat, i.e. without stable reintegration into the process of enlarged reproduction of capital. Thus as late as 1915, after more than a century of colonial rule in India, over half a century of semi-colonial domination of Egypt and almost half a

century of colonial plunder of Indochina, Lenin could write: "In the colonies, however, capitalism is only beginning to develop".¹⁴

In fact, the new speed with which capitalism did begin to develop in the strictly colonial sector at the time of the First World War was not due chiefly to the penetration of foreign capital, but to an investment of national capital made possible by the crisis which hit international production relations. The case of semi-colonial China illustrates this point against Chattopadhyay who seems to think that it was primarily foreign capital which 'accelerated' capitalist development in that country. In fact, the first phase of imperialist semi-colonial domination of China merely transformed sections of the old Manchu ruling class into brokers for foreign capital (compradors); this situation "kept the country's productive forces in a political straitjacket" as Trotsky wrote around 1939. During the First World War, however, Chinese industry, like the industry of India, received a great stimulus. "It was during this period that the so-called 'national' bourgeoisie, seeking to establish its own economic base in competition with the imperialists, began to emerge..." Bipan Chandra has likewise shown, in an excellent article, how the major phases of industrialisation in India coincided with periods of crisis of capitalist imperialism, i.e., precisely those periods when the export of capital experienced decline.¹⁵ Bagchi's detailed research confirms this picture: "the grip of European businessmen on the economy of India was loosened by the impact of the First World War... the cotton mill industry under Indian control was stimulated by the growth of demand; many Indian concerns sprang up in engineering and other trades supplying the army and the navy... In other fields also, such as iron and steel, paper and cement India began to supply more and more of her own requirements". "Indian entrepreneurs advanced by taking advantage of the limited opportunities for import substitution... However, no decisive and irreversible advance was made until the coming of the depression", precisely when crisis hit world capitalism with special intensity. Egypt showed the same pattern. Here the number of industrial workers employed in big industry stood at 20,000 on the eve of the First World War and, after the depression, on the eve of the Second War, at 92,000.¹⁶ In all these instances — though with qualifications in the case of Egypt — it was a purely national capitalism which managed to advance.

Nothing is more misleading, then, than quoting Stalin's banal division of the colonies into 'more' and 'less' capitalistically advanced countries, and implying, as Chattopadhyay does, that the colonies were 'becoming capitalist' due primarily to the export of capital, i.e., foreign investment. As we have said, the flow of foreign capital had a quite different significance according to the particular form of imperialist domination, and when capitalism did begin to advance relatively fast during the First World War and the Depression in countries subjected to colonial or semi-colonial domination, the chief determinant was not the export of capital but the shift in the balance of forces between foreign and national capital brought about by crisis.

INDICES OF CAPITALIST AGRICULTURE?

In order not to have to concede the whole argument after admitting that agricultural capitalism was quite insignificant in India — though with two arguments which do not actually show this at all¹⁷ — Chattopadhyay is forced to decipher 'capitalism as a trend' in Indian agriculture. For this purpose he isolates what we are supposed to accept as indices of this 'capitalist trend' — firstly, the growing proportion of produce sold 'on the basis of the profit calculus'; secondly, the rate of growth of non-foodgrains; thirdly, differentiation among the peasantry according to the distribution of land and capital expenditure; fourthly, a 'non-negligible' force of free wage labourers; fifthly, a slow, "even very slow" rate of capital accumulation; and finally, expansion of irrigated area, diffusion of improved seed varieties and improvement of traditional technology. None of this, however, establishes 'capitalism as a trend', for in practically all countries dominated directly by colonialism these phenomena were present in varying degrees. What they reflected was not a developing landlord or peasant capitalism but the intensity of colonial exploitation, which, within the pregiven technological framework, forced the peasantry, firstly to produce for an unknown market, secondly, to exploit the soil and themselves more intensively; and which, in the second place, attempted to stimulate the production of the crops which were the main exports — cotton in Egypt, sugar in Indonesia, rice in Burma and Indochina — partly by paying more attention to technical characteristics in those sectors. One has only to read Owen's detailed study of Egyptian cotton production,¹⁸ or Cheng's less detailed study of Burmese rice production,¹⁹ or

Geertz's account of sugar production in Java²⁰ to be convinced of the fact that increasing commercialisation of production and the accompanying technical shifts in irrigated acreage and so on had very little to do with an internal development of capitalist agriculture. The forms of exploitation which made increases in the production of cotton, sugar or rice possible were far from 'capitalist'. In fact, to take one example, Egypt's integration into the world market as a cotton producer led, at the turn of the century, to a sharp upward movement in rents (from £E 4 per feddan to £E 8-10) which in turn intensified the trend toward exploitation through ground rent; and the substitution of *fermage* (where land was contracted on a short term basis for a fixed sum) for *metayage* as the dominant mode of ground-rent exploitation only left the peasant in a situation where all the benefits of a rise in agricultural prices were immediately swallowed up by rent increase.²¹

Again, differentiation of the peasantry was primarily a reflection of the growing pauperisation of the lower strata of the rural population under the pressures of colonial exploitation, and simultaneously of the (slow or fast) expansion of big landed property. The polarisation of rural property was the combined effect of a series of historical determinants such as an increase in the rate of population growth, rural bankruptcies resulting from excessive fiscal pressure or commercial slump, specific modes of transmission of rural property, an investment of commercial and other forms of capital in the purchase of land (for leasing), the formation of big estates through the action of the state, and so on. Rural semi-proletarianisation was emphatically not the product of an expanding agricultural capitalism but, in the last instance, of the specific mode of domination experienced by the colonial and semi-colonial countries, as Utsa Patnaik has argued elsewhere.²²

On the other hand, capitalist agriculture was making advances in areas of the world like the south of Brazil, the coastal region of Peru and parts of Mexico. In each case this was due to specific and exceptional historical circumstances not in the least characteristic of the colonial and semi-colonial world as a whole, e.g., in Mexico due to a radical bourgeois revolution which directly assaulted the semi-feudal properties established under Spanish colonial rule; or on the Peruvian coast due to the penetration of British and American monopolies which dominated sugar and cotton production directly and

not, as in Burma under the British or Java under the Dutch, through the peasant economy. In Peru and Brazil the growers of sugar, coffee and cotton had to import their proletariat from the impoverished zones, whereas in Burma, Java, Egypt, Indochina, and parts of India and semi-colonial China foreign capital exploited the peasantry within the framework of its own process of production. The technical shifts which occurred in the latter countries were in no sense a reflection of an internal transition to capitalism, i.e., of a spontaneous investment by landlords, rich peasants or merchant capitalists.

Finally, the existence of a free wage labour force in the sense of a labour force torn from the means of production and driven by economic necessity to sell its labour power, only indicates the presence of capitalist development under particular conditions. Such a labour force can exist without the co-presence of any of those conditions. Thus the transition from the *encomienda*, established in Mexico in the 1520s, to the *hacienda*, already dominant in the early seventeenth century, was accompanied by a progressive diminution of the Indian population, due chiefly to epidemics. This shrinkage increased the pressure of competition for labour supplies between the semi-bureaucratic fiscal agents of the Crown called *encomenderos* and the nascent *hacendados* or semi-feudal proprietors with the result that for a short historical period towards the end of the sixteenth century and start of the seventeenth, it was directly in the interests of the latter to accelerate the decay of the forced labour drafts (*repartimientos*) which were the basis of the *encomienda*. The transitional mechanism which played the temporary role of diverting labour from the *encomienda* was precisely free wage labour. Already by the 1580s free wage labourers (*gananes*) were being employed on the wheat farms of the Valley of Mexico. By the close of the sixteenth century this class had become quite numerous around Mexico City and Puebla, though progressively in the course of time, as the *hacienda* established its predominance, this free labour force became tied to the soil through various devices, chiefly the accumulation of debts. By the close of the seventeenth century the free proletariat of the previous century had become a semi-servile proletariat, for the *gananes* were now considered estate property. Yet the *hacendados* who in the late sixteenth century favoured the emancipation of Indian labour and, with the assistance of objective pressure such

as growing landlessness, induced it into their own economy with wages, were far from being capitalists, as Gibson's book and the work of Chevalier prove.²³

If we have seemed too 'polemical' in parts of this paper, we apologise, for this has not been part of our intention. We hope that the debate about the 'mode of production' started by Chattopadhyay's earlier contribution — with which we find more points of agreement — and by U Patnaik's articles will continue with new interventions.

Rajasthan Spinning and Weaving

RAJASTHAN SPINNING AND WEAVING proposes to invest Rs 45 lakhs in the share capital of a new company, 'Hindustan Electro-Graphites', promoted in association with the French industrial complex, Pechiney Ugine Kulmann, for manufacture of graphite electrodes and related products. The foreign collaborator will participate in the equity capital of the new company and also supply technical knowhow for erection and start-up of production. An agreement to this effect is being finalised. Meanwhile, in order to enable the new company to defray the obligatory expenditure with regard to its incorporation etc, a loan of Rs 5 lakhs is proposed to be granted to it, which will be repaid when it receives funds by issue of its shares. Graphite electrodes and anodes, which are essential for making electric steel and are also used in electrochemical industries, are largely imported from other countries. Rajasthan Spinning's

directors envisage "attractive prospects" for a good return on investment in the new company. Rajasthan Spinning is also setting up another textile spinning mill, which is expected to go into production in early 1974. The present spindleage, distributed among the cotton, viscose, acetate, acrylic, grey polyester, and dyed polyester blends sections, is considered 'extremely uneconomic'. It is stated that the cost of production per spindle per year has gone up, from Rs 218 in 1968 to Rs 432 in 1972. Commercial processing in the new dye-house plant commenced from April 1972. The company spent last year about Rs 26 lakhs on capital assets, including Rs 16 lakhs on the dye-house. It had encouraged the setting up of a silk mill at Bhilwara, which, in the absence of a process house in the vicinity, suffered a handicap in the production of synthetic fabrics out of the yarn supplied by the company.

Credit to Priority Sectors on Basis of Bankable Propositions

Lending Policy Clarified: No Detriment to Financial Discipline

Shri R K Talwar, Chairman of the State Bank of India, has stated that credit to the priority sectors can be made available only after formulating specific schemes that take into account the economic and organisational infra-structure.

"We are chary of hasty and adventurous measures that seem glamorous at first sight but are difficult in execution and could be disastrous in results", he said.

Referring to last year's competition for advances among banks, he said that as far as the State Bank was concerned, there was no lowering of lending standards whatsoever.

IN his speech at the 18th Annual Meeting of the shareholders, held in Bombay on Friday, the 30th March, 1973, Shri Talwar said:

"I am happy to welcome you all to the eighteenth annual general meeting of the State Bank of India. You will recall that last year's meeting was held in Calcutta. I said then that it was the intention of your Board of Directors to hold these meetings in different cities as often as practicable. I must, however, clarify again that there would be no point in holding this meeting in a city, in or around which the number of shareholders is too small to assure reasonable attendance. In any case, our choice thus being limited, these meetings can be held outside Bombay at best once in two years.

WORKING RESULTS

The annual report, including the balance sheet as on the 31st December 1972 and the profit and loss account for the year ended that day, is already in your hands. In spite of higher operational costs and lower credit-deposit ratio, to which a reference has been made in the annual report, you will be happy to notice that the profit for 1972 was higher than for 1971.

SURPLUS LIQUIDITY

Last year I had reported, with a sense of satisfaction, an improvement in the Bank's liquidity during 1971 in keeping with that in the banking industry. This had been the outcome of a faster rate of deposit growth and slower rate of credit expansion. This development, in the wake of a prolonged period of resource stringency in relation to credit demand, was, of course, wholly welcome. The

continuation, more vigorously, of this trend in 1972, however, caused some problems in the banking system.

Banks continued their thrust in the area of deposit mobilisation, as was incumbent on them to do, through branch expansion in rural areas as well as in metropolitan cities. Novel schemes were introduced, as witness our own premium prize deposit certificates and gift cheques. The success of these schemes was heightened by fortuitous factors coming into play, notably the heavy

Shri R K Talwar

injection of deficit financing as revealed in the Government of India's Economic Survey. Concomitant with this upswing in deposit accretion was a slow-down in the demand for credit, not only for food procurement operations but also for industrial production in general. In the event, the banking system was confronted by a steep fall in the credit-deposit ratio at 66 per cent in 1972 as against 73 per cent in 1971 and 78 per cent in 1970. From the stage of comfortable liquidity, we proceeded to the stage of a somewhat burdensome liquidity for the first time in more than a decade.

COMPETITION FOR ADVANCES

Two consequences of this development are noteworthy. One was that, to drop up their sagging credit-deposit ratio, banks began competing for advances. This was not exactly an unknown phenomenon. Prior to nationalisation and also thereafter, borrowers have transferred their accounts, either for better facilities or for greater flexibility in operations. The transfers of accounts that we saw in the latter half of 1972, however, could be construed as having in some instances gone beyond the boundaries of healthy competition. I had constantly voiced the opinion on various occasions during this period and at different forums that such unhealthy competition was not conducive to the growth of banking in this country. Although we were drawn into an unhappy situation, which we neither started nor perpetuated, I would like to assure you that, in so far as the State Bank is concerned, there was no lowering of lending standards whatsoever, nor was there a single instance where we could be held to have taken over any account from another bank to the detriment of any financial discipline sought to be imposed by the other bank.

In such circumstances, the intervention of the Reserve Bank of India was necessary and I welcome their guidelines which have put a stop to the unhealthy competition of the recent past. In my view, the new guidelines should really herald an era of greater co-ordination among banks in the lending field. The major banks being in the public sector, it will be to our mutual advantage to strive for a convergence of ideas, not merely in the matter of credit appraisal but in follow-up and supervision as well. Once we make adequate progress in this direction, it would not be unrealistic, perhaps, to express a hope that the monetary author-

ities could, in the foreseeable future, be influenced to relax, rather than tighten further, credit authorisation measures.

FINANCING PRIORITY SECTORS

A second consequence of the surplus liquidity was the spate of criticism, against not only the State Bank Group but against all banks, that they had failed to avail themselves of the opportunity to increase the flow of funds to the priority sectors. With all respect to those advancing this view, I wish to say that it is hardly necessary to emphasise our abiding interest in the priority sectors. We are, however, chary of hasty and adventurous measures that seem glamorous at first sight but are difficult in execution and could be disastrous in results. After all, if our resources were to be frittered away on wasteful projects, the advocates of instant aid to priority sectors would be ever more vociferous in condemning bank managements. The two premises on which such criticism is based are the need for funds by neglected and weaker sectors and the availability of these with the banking system. These premises are indisputable but, I am afraid, it is only up to this point that I can agree with the critics. To my mind, it is a rather simplistic notion if one were to believe that funds should have been injected into these sectors just because they were needed and were available. This is somewhat like saying that a patient who is in need of strength should be given all available food. After all, the patient's capacity to digest the food and convert it into energy must be reckoned with.

Let me restate our objective in this important field of bank lending. I believe that what is sought in such financing is not an outlet for the banks' resources, but that such credit should serve as a powerful tool for raising the level of production in these sectors and thereby improve the standard of living of the people connected with these activities. As I have indicated on past occasions, credit can be made available to these sectors only after formulating specific schemes that take into account not only the need for funds, but also the availability and development of the economic and organisational infrastructure.

LEAD BANK APPROACH

The banking system has adopted the Lead Bank approach to enable the commercial banks to play their due role in the process of economic development.

I believe that any strategy that we would like to adopt for purveying credit to the priority sectors should be given special emphasis in the framework of the Lead Bank scheme. The merit in this approach is that, at least geographically, our area of responsibility is clearly defined and this would enable us to set priorities for the deployment of human, physical and financial resources.

Under this scheme, the districts that have been allotted to the State Bank Group are all backward. A difficult and challenging task, therefore, lies before us in terms of ameliorating the economy of these areas. Our operations in the Lead Districts, as elsewhere, are essentially on the basis of an integrated area approach. It is agriculture that commands our major attention in our Lead Districts, in which we have already located 33 of our Agricultural Development Branches; many more will follow.

There is clearly a time-lag from the point at which an area is selected for intensive development up to the point when actual operations commence in the shape of loan accounts, and some more time is involved before results start flowing in terms of our stated objective. I feel prompted to indicate how this activity is conducted, and I shall give you brief details of the strategy that we are implementing.

The initial quick economic surveys of the Lead Districts have helped us to identify the centres where bank branches need to be established, but little more. As the next logical step, we have found it necessary to select pre-determined, manageable units of area for studies in depth — for the time being we regard such a unit as a 'development block'. Some studies have been completed and many more are in various stages of progress. A representative study reveals the credit gaps, in specific terms, in each economic activity, the scope and potential for investment for viable economic growth, as also the infrastructure gaps that need to be filled. Plans of action, both short-term and long-term, emerge from a study of the various factors and subsequently get crystallised into 'bankable' propositions.

FINANCIAL DISCIPLINE

The success or failure of any action plan depends on the individual borrowers who have to make efficient and productive use of the credit provided. At one of our Agricultural Development Branches, advances had been granted to a large number of villages under various schemes for growing high-yield-

ing paddy, new strains of groundnut, and other wet and dry crops. In one of these villages a group of borrowers belonging to the scheduled caste, a section deserving and receiving our special attention, turned recalcitrant and refused to repay the loans taken by them, despite good returns from their farming operations. We are not sure whether this was their own decision or they were instigated to this action by some other agencies, our evidence however, points to the latter. All our efforts at persuading and educating the borrowers in the matter of financial discipline having failed, we have invoked the help of the official machinery and instituted legal proceedings for recovery of our loans. This experience has not merely stalled progress in that village but the frustration and disappointment of our field staff has affected morale and our work in the adjoining villages as well.

In quite another area, at a village where the people were at or below subsistence level, 50 families, initiated into poultry farming, not only repaid their loans within 18 months but also doubled the size of their operations. The scheme was extended to cover all the 100 families in the village, and I am not exaggerating in stating that the living standard in that village today is one of near affluence, by local yardsticks. This experience has been successfully carried to another village on a larger scale and, what is more, the demonstration of this possibility has led to the State authorities initiating a similar scheme on a district-wide basis, and seeking our participation. Needless to add, ours has been a matching response.

In another instance, in a cluster of villages covering hardly 2,800 hectares of cultivable land in a dry belt, a group of enterprising small farmers were enabled, with substantial credit facilities, to plan and implement a scheme for lifting water from a nearby canal in a major irrigation system to wet their lands which are on a higher level. Within a few years farming operations have been mechanised, modern cultural practices have been adopted, extensive additional employment has been generated and per capita incomes have soared. Goaded by success, the farmers are now seeking to enlarge their incomes further by going in for dairy farming and, at one more remove, through processing of their own agricultural produce. One tangible effect of this success is the State Government's initiative in preparing similar projects for development of many more

villages in the same area.

A crucial factor, therefore, for success in this activity is the integrity, enterprise and motivation of the borrowers. From the experience gained, we feel that what we can do is to start with a group of borrowers who are endowed with these attributes, help them to make efficient use of the credit and ensure that they derive the benefits intended. The success experienced can then be transplanted into a larger group and the area of operations gradually expanded. The purpose of my elaborating on this theme is to focus attention on the very considerable time and effort involved in this activity. In-depth studies, formulation of schemes and bankable proposition, initial experimentation and gradual extension are time-consuming; but I believe this is the process that will produce tangible and permanent results.

GOVERNMENT'S ROLE

I would like to mention here one element which is of paramount importance to the development effort, namely, the co-operation, assistance, and, indeed, positive contribution of the State Governments and their agencies at the grass-roots level. Action plans or schemes formulated by us cannot but be within the framework of the concerned State Governments' development plans for the area. Problems arise when a State Government feels that we are there only to function as providers of funds, and, even that, in a manner decided upon by the Government; they feel unhappy when we raise questions about 'bankability' of the propositions and schemes. There has been, happily, welcome and positive response in some areas but one may say without complaining that there are many more areas where things are different. To quote an instance, the Government readily agreed, in one small area, to authorise the recording of particulars of share-croppers in the land records, enabling the Bank, thereby, to launch upon a special experimental scheme for financing these share-cropper agriculturists. The scheme was implemented with enthusiasm by the Bank, and the results in terms of increased production as also prompt payment of bank loans have been quite satisfying. In an adjoining area, in the same State, where the Government, for reasons of its own, decreed remission of all Government dues, the borrowers adopted the attitude of refusing the repayment of our loans also. I would plead that what is needed is an appreciation by the State

Governments that our objectives are no different from their own, even though our approach may not be the same as theirs.

INTERNATIONAL BANKING

In the field of international banking, the Bank's policy has been to assist the development of the country's export trade by providing the necessary advisory, promotional and financial services. We are well equipped to meet the diversification taking place in the country's exports and the projects we handled in 1972 covered a wide range, including export of steel rails, cement plants, textile mills, railway wagons, electricity generating equipment, diesel engines and heavy-duty transport vehicles. The goods went to a number of countries such as Iran, Iraq, Kuwait, Egypt, South Korea, Syria, Malaysia and the Philippines and also East European countries like Hungary and Poland. Our assistance went beyond the mere mechanics of providing finance and included advising exporters on drafting of the contracts and finalising documentation and other formalities which are of a highly technical character.

Apart from assisting the development of the country's export trade, international banking offers good scope for increasing our earnings, so necessary for carrying out our developmental activities at home. You may be happy to know that we are seriously considering the possibilities of expanding our international banking operations. The working of our foreign branches at New York, London and Colombo, and the Representative Offices at Frankfurt and Beirut, has been very encouraging during the year. Our expansion has, however, to be in terms of a well defined policy which will take into account the growth prospects of trade in different territories and the type of business that we wish to take on.

REORGANISATION

The plan of reorganisation of the administrative structure and customer operations was extended to all offices of the Bank in 1972. Our efforts are now directed at stabilising the new system, so as to derive the substantial advantages that the new design is capable of producing. An important element of the new system is the introduction of performance budgeting to provide a better sense of direction for the operating units and appropriate feedback to policy-making levels. Simultaneously, attempts are also being made to rationalise the information

structure in order that the system may provide data for purposes of operational control as well as for statistical analysis.

STAFF RELATIONS

My thanks are due to the vast majority of our staff for the sense of loyalty and dedication they bring to bear on their duties, despite the numerous distractions of which they are reluctant victims.

The concept of employee participation was given concrete shape last year in the banking industry with the nomination of employee representatives on the Boards of Directors of the nationalised banks. Similar changes are to be effected in the State Bank Act also to provide for such representation on our Board. I feel, however, that, employee participation does not end with the induction of employee representatives in the Boards of Management means that at every branch employees must share responsibility for formulating the branch objectives and strategies as also their successful execution. This problem bristles with difficulties but must be tackled in earnest by the unions and management.

Last year I mentioned the need for changing the tasks in keeping with the employees' creativity needs. Job enrichment can be effected, perhaps, in several ways. Our experience in the last one year has shown us that an effort at changing individual jobs in a large organisation has its limitations. What is feasible, perhaps, is first to locate the employee groups in a branch, in which each member is performing a job complementary to the jobs performed by other members of the group. Thereafter, an attempt can be made to improve the content of the group task, so that a more direct relationship is established between the work being done and the branch objectives. Experimentation with this approach has started and the results strengthen our desire to launch a more purposive effort in the coming year.

LOCAL BOARDS

Shri P Brahmayya, President of the Madras Local Board and Director of the Central Board, and Shri J B Dadachanji, Vice-President of the New Delhi Local Board, relinquished office during the year. As at the beginning of this year, Shri Vijay M Merchant, Member, Bombay Local Board, also relinquished office. I thank all the three for their able guidance and direction".

**IOL spent many man hours
and money making this Electrode -
then rejected it**

**That's IOL building in
"Quality-Plus"**

The leadership that IOL electrodes have had and always will have is the result of many hours of specialised hard work. Hard work in choosing very carefully at the raw materials stage. Hard work at every manufacturing stage, where IOL puts added emphasis on quality. And hard work at the checking stage where the electrodes are given hours of attention by specialised IOL

technologists who are far ahead of their times. All this, coupled with the world-wide expertise and latest know-how and processes, build into each IOL electrode the well-known IOL "Quality-Plus". A coupling of the finest materials built into the finest products with the help of the most advanced welding technology which others can't beat.

KNOW ASHOK LEYLAND BETTER—2

Ashok Leyland hauls in foreign exchange too!

Several countries have been importing Ashok Leyland vehicles and spare parts worth crores of rupees. And more export markets are being captured.

Thus, Ashok Leyland earns a lot of foreign exchange through exports and also saves it through indigenisation to the extent of 97% in COMETs.

But earning and saving foreign exchange is only a part of Ashok Leyland's service to the Nation.

Ashok Leyland's contributions also include India's widest, mightiest range of vehicles for on- or off-the-highway applications, and Power-Plus 370 and 680 Diesel Engines — which serve the developing economy on so many fronts.

Balancing Act

EVENTS of the last three weeks in Sikkim have exposed the constraints on change in a small country which is a protectorate of a big neighbour. For years on end, the Chogyal, sometimes with the benign support of the government of India and sometimes by holding out indirect threats of inviting the Americans into his little kingdom in case New Delhi should demur, had gone on enforcing an authoritarian rule on his people. Even when, a few years ago, he condescended to accept a facade of democratic arrangements for electing a Durbar to advise him, it was the imperial model of divide-and-rule which was the guiding impulse. The principle of one-man-one-vote was brushed aside. In lieu, what was adopted was the stratagem of 'communal' representation; the Nepalis, constituting nearly three-quarters of the population, could elect only the same number of members as the remaining one-quarter consisting of the Lepchas and the Bhutias. The Chogyal, in addition, directly nominated nearly another one-third of the membership of the Durbar.

For a while, the Chogyal tried to exploit the animosities between the leaders of the Janata Congress and the National Congress, but the joint Council of Action formed by the two groups put paid to any ambition which he might have cherished along these lines. He then fell back on a much more dangerous, but somewhat obvious, strategy, namely, to arm some of the Tibetan refugees and deploy them for beating up the activists of the two Congress parties. The Chogyal did not quite stop here. He was not averse to selling the story that the two Congresses were surreptitiously trying to attract China's favour. The fact that the Tibetan refugees were aligned with him and not with the opposition groups was used by him as a bait to tempt the government of India with.

The bait apparently had worked in the initial phase. The alacrity with which Swaran Singh, on his way to Burma, had stated that it was the government of India's duty and obligation to respond to the Chogyal's request for troops took one's breath away. Indian army personnel were moved within a few hours of the Chogyal's prayer being communicated to New Delhi. It was almost as if Sikkim was just another disturbed state within the Union of India, the problem was simply one of restoration of law and order, and New Delhi was despatching, in the ordinary course, a few additional contingents of the CRP to put down the mischief-makers bent on embarrassing the local administration.

Fortunately, there would appear to have been an attack of belated wisdom. By the time Indian troops took up position in Gangtok and other places, large sections of the population, including fair numbers of even Bhutias and Lepchas, were in revolt. In the changed circumstances, the Chogyal can survive only if protected by New Delhi. He too realises this, and has hurriedly handed over the reins of government to India's representatives. New Delhi has gone on record that, after restoring law and order, it would hand over the reins of administration to the civil authorities. This may be pure formalism, but who will henceforth constitute the 'civil authorities' is the core of the matter.

Inevitably, the charge has been made, and not by the Chinese alone, that the government of India may have had a hand in the agitation against the Chogyal. It is known that the government has not been very happy with the pseudo-nationalistic noises the Chogyal has been making and the newly appointed Indian Administrator, B S Das, did hint before leaving for Gangtok that it was possible that the Chogyal may be reduced to the position of a titular constitutional head. Be that as it may, what appears most likely is that the government of India will seek to bring about a compromise between the Chogyal and the Joint Action Committee which will leave both parties dependent on it. In the short-run, the government's ability to enforce some such solution need not be doubted. But will it resolve any of the basic issues? Inside Sikkim the problems between the Chogyal and those outside his charmed circle and between the Nepalis and the Lepchas and the Bhutias must raise their heads again soon enough. Equally, it would be naive to think that with the Chogyal's wings clipped, the strain on relations between Sikkim and India will ease.

Maharashtra

High-Powered Promotion

THE Maharashtra government has declared that 50 per cent of the water stored in the dams which serve the cotton growing districts will be reserved for pre-monsoon cultivation of H-4. This year in western Maharashtra there is no water available in the dams other than that committed to what little sugarcane is still surviving. Does the government intend to starve this sugarcane of water? The only justification for such a radical step would be if the water was diverted to foodgrain or fodder cultivation in this year of drought. To starve the sugarcane of water and give the water to H-4 cotton would be a pointless cruelty.

The second step the government has taken to promote H-4 is pressuring the nationalised banks not only to disburse loans for the growing of H-4 cotton, but also to take up schemes and do extension work to promote the variety. The government has even gone so far as to help recover loans given for H-4 through the monopoly cotton procurement machinery. This is especially significant in the light of the uncompromising statement made last year by the Minister for Co-operation that no dues other than those of the co-operatives would be recovered under the monopoly procurement scheme. In fact in several towns the agents of nationalised banks seeking to collect dues from farmers were prevented from entering the premises of the cotton market yards. The chairman of one of the banks had taken up the matter with the finance ministry with no results. Large amounts of loans given for cotton crops by the banks still remain uncollected. They could be collected from the 20 per cent payment the marketing federation still has to make. The federation has, however, refused to co-operate in this respect. It is strange, in the circumstances, that the chairmen of the banks have agreed to the arrangement about H-4 cotton without a protest.

It is fairly obvious that the government must have a very good reason to go to such ridiculous lengths to promote H-4 cotton. The suitability of a crop for a particular region and a very high yield potential could be the justification of such a high-powered promotion campaign. But we find that although H-4 cotton has done well in Vidarbha, in western Maharashtra trials over the past three years at the government experiment stations at Malinagar (Sholapur) and Kopergaon (Ahmednagar) have

shown that this long-duration cotton gets caught in the September rains, resulting in uneconomically low yield levels. Also, because it is a long-duration crop, it makes a second crop, usually wheat or jowar, impossible.

One has therefore to look elsewhere for the reason for the promotion campaign. In an article in the *Economic Times* of March 20 a contributor attempts an educated guess. He writes: "Individual impulses and self-interest, rather than deep economic studies, operate as the motive force for the formulation of major policies. Thus, a few big-wigs in authority may themselves be producers of quality seed. They may encourage special programmes to produce hybrid jowar seed or H-4 cotton seed or soyabean seed and their procurement through co-operative institutions under government guarantees, with the result that the anticipated demand may just not be forthcoming and the procurement agency may be forced to carry large seed stocks, involving huge losses. As examples, we can cite the reported losses of Rs 10 crores on the hybrid jowar seed and Rs 1 crore on H-4 cotton seed, which is commented upon by the Public Accounts Committee."

The fact which the author of the above article has failed to point out is that despite holding large carry-over stocks of H-4 seed, the Maharashtra State Co-operative Marketing Federation is procuring a further Rs 2 crores worth of H-4 seed this year. It would be interesting to compile a list of growers who produced H-4 seed on substantially larger areas than the ¼ acre which the government allows a single farmer. Such a list would surely give an indication why the government of Maharashtra is using all the means — fair and other — at its disposal to push H-4 in an area where there is no agronomic or economic justification for doing so, and consequently blocking the introduction of more improved varieties developed by Gujarat and the Indian Council of Agricultural Research.

Exports

Enough of Fun and Games?

THE Commerce Ministry has decided to move back to the old system of compilation of export data using finally passed shipping bills (FPSB) instead of provisionally passed shipping bills (PPSB). The decision, we are told, follows the recommendations of the Committee headed by B S Minhas, a Member of the Planning Commission. It is

a minor mystery why the Committee required over 14 months to come to the simple conclusion that the old system of compiling data on the basis of FPSB gave a more accurate picture of exports. Or is it that the change in the method of recording export data had to await a change of the Minister of Commerce?

The change to the now discredited PPSB based system had been made following the recommendations of a working group headed by P L Tandon. The objective of the change was to expedite compilation of export data and to reduce the time-lag with which they were made available to policy-makers. But in fact under the PPSB system the time-lag in release of export data was not only not reduced but, in fact increased considerably. In any case, the expected reduction of time-lag in compilation of export data with the FPSB system was not more than three weeks. In the event, the change created all-round confusion with the then Minister for Foreign Trade trying to claim credit for a fictitious export growth of 8.6 per cent in 1970-71 until the Reserve Bank came out with its own figures in February 1972. The credibility of the Ministry's export statistics further suffered on account of double counting of figures of short and shut-out shipments and taking credit for massive relief material sent to Bangladesh and for commodities sold within the country against projects financed by international developmental agencies.

Due to the change in the method of recording export data in November 1970 we do not have a comparable continuous time-series of export data after 1965-66. Comparability of time-series export data could be maintained by ascertaining the extent of statistical inflation of the export figures for 1970-71. It had been suggested in these columns (March 18, 1972, p 607) that the Minhas Committee could usefully undertake a sample survey of finally passed shipping bills for a representative group of commodities at the more important ports. This would indicate the length of the time-lag between the date of provisional passing of a bill and the final shipping of commodities against that bill. It would be possible on that basis to estimate the statistical inflation of export data for 1970-71. It is a pity that the Committee has apparently not gone into this aspect of the problem.

The shift back to the FPSB system now is likely to create further confusion if the DGCIS apparatus does not understand the implications of the change

correctly. In view of the time-lag between the provisional passing of a shipping bill and the actual shipment of goods against it, some of the exports taking place after April 1, 1973, would have been included in the figures for the earlier period when export data were being compiled on the basis of the FPSB system. It is not known whether the statistical lead built into the export series during the period from November 1, 1970 to March 31, 1973 is at all going to be corrected. Unless the exercise mentioned above is carried out, the DGCIS is likely to blunder once again in its data compilation. It needs to be impressed upon the DGCIS sufficiently in advance that it must not make a downward adjustment of export data for the current financial year on account of short and shut-out shipments relating to the provisionally passed shipping bills used for compiling data upto March 31, 1973.

Consultants

Too Many Doing Too Little

A Correspondent writes:

THE lack of direction in planning for development of indigenous technology has been well brought out by your Delhi Correspondent ("Cover for Import of Technology", March 24). It is indeed unfortunate that while on the one hand an impression is given that the Central Engineering and Design Bureau (CEDB) is overloaded with work, so that the feasibility study for the Tata Steel expansion had to be entrusted to Japanese consultants, CEDB itself has been engaging in tasks unconnected with steel technology, the development of which should be its basic concern. The statement that the CEDB carries a heavy load of work is thus disputable. With a virtual stalemate as regards the proposed new steel plants as well as the expansion of the existing plants, CEDB seems to have hardly enough work for its team of more than 1,000 engineers.

It is obviously detrimental to the development of indigenous technology that public sector consultancy firms, such as CEDB, NIDC and Engineers India should try to edge out one another rather than specialise in well defined fields of operation. The Toyo affair lends credence to the apprehension that there are too many people doing too few things.

The more important, and perhaps less noticed, aspect is that the CEDB has done little to develop design capacity in the country. Though its name

suggests that it is a design bureau, all these years it has almost exclusively concerned itself with only project engineering. Development of design capabilities seems to be nobody's concern. It may be news to many that the Heavy Engineering Corporation, which is the sole public sector agency for manufacture of steel plant equipment in the country, also maintains a design organisation with more than 400 engineers. But neither CEDB nor HEC has done any tangible work so far for developing basic designs. For instance, there is no organisation today that can prepare the basic designs for essential steel plant equipment, such as blast furnaces or converters. To add to the multiplicity of agencies, Bokaro has its own design bureau. Since all these organisations — CEDB, HEC and Bokaro — are Soviet aided, what actually happens is that Soviet designs are borrowed and copied meticulously in three different stages by three public sector agencies! Need one look any further for the reasons for our perpetual dependence on foreign steel technology?

Our consultancy firms have indeed become sub-agents of foreign firms. It is time someone thought of building up a truly indigenous organisation for filling up the gap — almost a vacuum — in technology. For the development of ferrous technology an organisation could be easily developed around the CEDB and Dasturs. In respect of non-ferrous metals, the responsibility should be fully that of NIDC. For coal, an R and D organisation should be set up under the newly-formed Coal Mines Authority and Bharat Coking Coal, abolishing the Coal Board whose *raison d'être* consisted of the subsidies amounting to crores of rupees it used to disburse to private collieries. In the field of fertilisers, FCI and FACT can certainly be trusted with the job. Finally, Engineers India would do well to refrain from poking its nose in everyone else's affair and confine itself to the field of oil. The country should learn to respect ideas and not persons.

CRP

A Fact of Life

IT is apparently the strength of the presence of the Central Reserve Police which separates the good guys from the bad guys among our states and union territories. The three brief paragraphs on the CRP in the Home Ministry's annual report for 1972-73 say nothing about its deployment. However, some bare figures of the distri-

bution of the CRP's 360 companies as on February 1, 1972, have been published in the press recently. It does not come as a surprise that, on that date, 60 of the 360 companies were stationed in two states, West Bengal and Kerala. It is, of course, no coincidence that these happen to be the two states where there is a credible communist alternative to the Congress reign. That Andhra Pradesh should just now have 65 companies of the CRP is similarly not unexpected in view of the agitation for bifurcation of the state. The presence of 31 CRP companies in Jammu and Kashmir should also cause no surprise. This, after all, is only one of the many manifestations of the 'special status' of that state.

What does, however, come as something of an eyebrow-raiser is the concentration of the CRP in the country's north-eastern region comprising the states of Assam, Manipur, Nagaland and Tripura and the union territories of Arunachal Pradesh and Mizoram. Together, these states and union territories accounted for less than 19 million of the country's total population of 548 million in 1971. Yet, they had 153 of the 360 companies of the CRP at hand to keep watch over them. And unlike in the case of, say, Andhra Pradesh, the CRP and the paraphernalia that goes with a para-military force of this kind are a constant presence in this region. In fact, the strength of the CRP there just now is very likely rather below its normal complement because of the need to divert temporarily a certain number of companies to Andhra Pradesh.

Even such acute concentration of the CRP is not, however, considered sufficient to adequately discharge the function of "maintaining law and order" in the region. For, there is the Assam Rifles which is exclusively deployed in that part of the country. The Home Ministry's Annual Report for 1972-73 contains this brief paragraph on the Assam Rifles: "The Assam Rifles is a para-military force under the Ministry of Home Affairs. The Ministry exercises control through the Governor of Assam, Nagaland, Meghalaya, Manipur and Tripura. The Force is headed by the Inspector General of Assam Rifles with headquarters at Shillong. The present strength of the Force is 21 battalions and they are assisting in the maintenance of law and order in the north-eastern region."

Manipur, Meghalaya, Nagaland and Tripura and Arunachal Pradesh and Mizoram are on paper states of the union and union territories, just like all the rest. With one vital difference,

however: the people of the rest of the country are expected to behave themselves with the help of only the local police in normal times, whereas the people of these areas are assumed to require the constant presence of large paramilitary forces, deployed and directly controlled by New Delhi to keep them on the straight and narrow path. It takes a rare newspaper report to make the people of the rest of the country aware of this. But for the Mizos and the Nagas and the rest of the people concerned, it is a fact of life they have lived with always.

Joint Sector

In Lieu of Public Sector?

Our Delhi Correspondent writes:

THE joint sector idea appears to have been at least approved by the Union Cabinet at last. However, while endorsing the idea and giving the Industrial Development Ministry the green signal to go ahead with its promotion, the Cabinet appears to have very sharply restricted the scope of the joint sector. Established private sector enterprises, including those belonging to the large business houses, have been specifically excluded from the ambit of the joint sector. Only new enterprises in certain specified fields are to be brought within the joint sector. The industries in view for the joint sector appear to be cement, paper, soda ash, caustic soda and a few others in which shortages have developed and in which sizeable investments are called for.

This seems to suggest by implication that it is no longer proposed to rely on the public sector for expansion of investment and output in these vital areas. Cement is a case in point. Plans of expanding cement production substantially via the public sector Cement Corporation of India appear to have been quietly dropped. Instead, the expansion is now proposed to be achieved through the joint sector.

The justification for the joint sector, as propounded by the Industrial Development Minister, is that the government, directly or through the public financial institutions, has already widespread financial participation in the private sector. The joint sector arrangement would enable the government to acquire participation in management of these enterprises commensurate with its investment in them and, to that extent, erode the wholly private character of these enterprises. According to Subramaniam, these units are anyhow not

run by the owners themselves but by managers hired by the owners. The joint sector will ensure that these managers do not serve only the interests of the private owners, as is the case at present, but also wider economic and social interests.

Taken against this argument, how can the exclusion of existing private sector enterprises from the scope of the joint sector make sense? Subramaniam's explanation is that the government does not want to tinker with the managements of running businesses since it does not have enough administrative and managerial resources to do so. But this argument runs counter to the very justification for promoting the joint sector. If the professional managements now running the private sector companies with large public sector investments are neutral and if, as has been claimed, the owners are no longer performing the management function in these enterprises, the extension of the joint sector to existing private sector units will involve nothing more than making the existing professional managements in these units responsible to the government, in addition to the private owners.

Confronted with this argument, Subramaniam had to plead that it was just that the government was willing to go only upto a point with the implementation of the joint sector scheme. The problem of the larger houses and the conglomerates would have to be dealt with separately and it would be sometime before anything could be done about this problem.

All this supports the criticism that, contrary to its public postures, it was never the government's intention to use joint sector to extend public sector control to areas currently completely under the control of the private sector, including the large business houses. Instead, the major function of the joint sector will be to secure the participation of the private sector in enterprises and activities which the public sector should have promoted on its own.

Yarn Distribution

Ineffective Control

THE government has decided to control yarn distribution, ostensibly to protect powerloom and handloom weavers from the depredations of traders and speculators. However, there are enough indications already that achievement in this regard is likely to fall far short of ex-

pectations. So far neither has the rise in yarn price been arrested nor have handloom and powerloom weavers got the promised yarn. Speculators continue to go scotfree and about 79 lakh weavers in the so-called 'decentralised' sector of the textile industry are threatened with imminent closure of looms.

The government's objective is redressal of short-term difficulties caused by the sharp fall in yarn production due to the extensive power cut particularly to the southern mills, rather than solution to the fundamental problem which is that the handloom and powerloom weavers are at the mercy of the mill-owners and yarn traders. The mechanism by which the government is seeking to achieve its limited objective is differential pricing of yarn of different counts and the fixing of a production pattern to suit the needs of weavers. For yarn of 59 counts and below the price taken is that of December 1972. However, between January and December last year, yarn producers had already managed to push up prices considerably even though cotton prices — particularly prices of indigenous varieties like Kalyan which go into the production of low count yarn — had declined quite sharply. By fixing the price of yarn of 60 counts at the August 1972 level, again, the government has similarly closed its eyes to the almost 35 per cent increase in prices which had already been effected by yarn producers and traders.

These blemishes of the scheme of control apart, the machinery for enforcing the scheme and for controlling the production and distribution of yarn is distinctly rusty. To prevent the mills from cornering available supplies of yarn, the government has stipulated that yarn producers must produce at least 60 per cent of yarn in hanks for use by handlooms. There is no mention of yarn in beams for use by the powerlooms. Nothing, again, is said about what the government proposes to do if the yarn mills fail to comply with the stipulated production scheme. In this connection, doubts have been cast even on the official estimates of production on which the entire scheme is based. There are undoubtedly very strong incentives to understate production and the opportunities for doing so are also considerable, especially where producers have been able to boost production through installation of captive generators. On the whole, therefore, the control scheme notwithstanding, there appears to be enough yarn left with the traders for carrying on brisk and highly profitable speculation.

RMMS

Part of Larger Scheme

Our Maharashtra Correspondent writes:

CLOSE on the heels of the debacle in the Bombay Municipal Corporation elections a second blow has been struck at Rajni Patel's leadership of the Bombay Pradesh Congress Committee. The Rashtriya Mill Mazdoor Sangh, the recognised trade union of Bombay's cotton textile workers, split in two last week and one of the factions has formed a rival union called the Bombay Mill Mazdoor Sangh. It will be recalled that Rajni Patel had wrested control of the RMMS last year from Vasantrao Dada Patil, prominent Maharashtra Pradesh Congress leader and Minister for Irrigation and Power in the V P Naik Cabinet, who had been president of the organisation for four years.

Trouble had been brewing in the RMMS ever since Vasantrao Patil's displacement. Patil had threatened to resign from the state cabinet in protest against his ouster, but had been persuaded by Chief Minister Naik and other MPCC leaders not to make a public issue of the matter. In January a no-confidence motion had been brought against the general-secretary of the RMMS, V R Hoshing, a nominee of Rajni Patel. The move was made by D S Salvi and other close associates of Vasantrao Patil. The no-confidence motion was, however, defeated in the 1,000-member general body of the RMMS by about 140 votes.

The BPCC's disastrous performance in the Corporation elections and the simmering dissatisfaction in the party with Rajni Patel's leadership evidently emboldened the Vasantrao faction in the RMMS to come out into the open. It is, of course, well known that the Maharashtra government and MPCC leadership were far from unhappy with the Corporation election results to which they contributed in some measure, directly and indirectly. Significantly, the Bombay Pradesh Congress's performance was particularly poor in Girangaon, the mill labour locality in Central Bombay, where it lost a number of seats to Shiv Sena. In the elections to the Maharashtra Assembly in March 1972, the same area had returned a number of Congress labour leaders, including the RMMS general-secretary, Hoshing, and Bhai Phosale, another prominent leader of the Rajni Patel faction in the RMMS. The results of the Corporation elections thus seriously damaged the Rajni Patel group's claim to leadership of the city's industrial labour.

That Vasantrao Patil is behind the

split in the RMMS and the formation of the rival BMMS is evident enough. The president of the BMMS is Vasantrao Phalke, Congressman from Satara district and a brother-in-law of Vasantrao Patil. The formal ceremony marking the formation of the BMMS was held in the premises of Indira Co-operative Bank (named after the Prime Minister) which is controlled by Shalini Patil, Vasantrao's wife. D S Salvi has claimed that the BMMS will get the support of at least 30,000 workers in 30 textile mills in Greater Bombay.

While immediately it may be expected to launch a few wild-cat strikes to draw attention to itself, it is not clear yet what the BMMS's strategy for gaining support among workers will be. It may be taken for granted that the BMMS will have the tacit backing of the state government. In this context it is significant that the Shiv Sena has come out in support of the BMMS and has asked workers owing loyalty to it to join the new organisation. And knowing where the sympathies of the state government lie, industrialists and millowners who have all along supported the RMMS

against the communist-controlled Girmi Kamgar Union, are likely to take particular care not to fall foul of the BMMS. Once they are convinced about Rajni Patel's political decline, they will not hesitate to openly switch support from the RMMS to BMMS.

The split in the RMMS is thus very much a part of larger political developments. The straightforward objective is to rid the BPCC of Rajni Patel and his group. A somewhat less direct objective may be to bring home to the Prime Minister that the attempt to impose a leadership on the BPCC unacceptable to the MPCC will not work. Some significance must surely be attached to the willingness of a prominent MPCC leader like Vasantrao Patil to openly oppose someone hand-picked by the Prime Minister like Rajni Patel. The temptation is also strong to see all this in the context of the incipient trends in Congress politics in other parts of the country. In quite a few states leaders known to enjoy the personal confidence of the Prime Minister have been eliminated or seriously weakened. Events in Bombay city seem to be moving in the same direction.

Calcutta Diary

A M

TO each his own Pablo Picasso. For some, the excruciatingly enchanting Blue Period; for some others, perhaps the innumerable Cubist scaffoldings. There are many others for whom meaningfulness will be represented by the days when Picasso was still a Fauve. Or would you rather vote for the slightly eccentric, enormously rich Pablo, installed in France's Cote d'Or, the restless dilettante with the twinkle in his eye, shuffling about from pottery to sketches to sculptures?

For yet others, Picasso was *Guernica*. *Guernica* was Picasso: the artist who knew that there was no art without life, that art was a transcription of one's experience, that art was war, and that the artist was the activist. *Guernica* was, and remains, primal emotion, the ringing protest against the depredations of men against other human beings; but it was, and is, also the assertion of life; it was, and remains, a magnificent blend of indignation and empathy, despair and hope, hatred and love.

Resistance collapsed in Spain, the combatants — those amongst them not left behind, dead and often unburied, in the battlefield — dispersed. But the passion lingered. Spain could not be saved, but there were other causes. Fascism had to be fought in other

lands, in Europe as much as elsewhere. Inevitably, despite Spain, death came to fascism almost in every other country. The Soviet Union came through. Picasso was furiously at work. Even as the Second World War ended, there was however a re-gathering of reaction. Winston Churchill did not wait for long to deliver his Fulton speech, Bertolt Brecht was hounded out of Hollywood, the House Anti-American Activities strode on the scene, and could Joe McCarthy be far behind? The Rosenberg couple went to their heroic death, there was the unleashing of General McArthur in Korea, the Ho Chi Minh trail came alive. Soon, Dien Bien Phu was round the corner. Pablo Picasso was still engaged, the doves of peace began to flutter all over, in the motifs of your dreams, even in the handkerchief of your betrothed: the days continued to be the days of faith, dedication, enchantment.

Very few were aware that it was already late. The Twentieth Congress was a great saboteur; idealism never quite recovered from the shock administered by it. Even were one to bypass the urge to analyse what caused it all, the consequences of Nikita Khrushchev are there for all to see. *Guernica*,

the doves of peace, Picasso, each was a symbol of the international brotherhood of toiling peoples, of a *camaraderie* of fighting idealists. The Twentieth Congress liquidated that *camaraderie*. It was the death-knell of great universal causes. From then on, John Osborne's hero could only look back in anger.

Old age brings oblivion because of natural reasons. But the fact that there was so little occasion in recent years to return to the theme of *Guernica*, or to mention its creator, is part of a greater malaise. In a world given to sectarian self-seeking, idealists are an embarrassment. Picasso became an embarrassment to a large number of his past patrons. Art was being supplanted by craft: the erstwhile idealists were being taught, assiduously, the blessings of deviation. The Red Flag and the *Internationale* were reduced to rituals: Pablo Picasso became an irrelevance. A man with a tremendous reservoir of Gallic wit, he tucked himself in. Of late, one used to hear so little about him.

Yet, did this withdrawal from the limelight really matter? A destitute Calcutta slum-boy, or a rack-rented Adivasi farmer in a remote Purulia village, never heard of Picasso. Nor was Picasso ever conceivably aware of the specific conditions of their living. But he was a shrewd operator: exploitation, he had no difficulty in recognising, has a quality of ubiquitousness: you run across time and space, the form of exploitation changes, its content hardly ever. It may seem altogether far-fetched to suggest that the problems and sufferings of a black American in a New Orleans ghetto, of a Mexican cotton picker in the vast open tracts next to Ciudad Obregon, of a political activist languishing in a West Bengal prison, or of a Vietnamese child whose human form the American napalm has despoiled beyond recognition, are bound by a common thread of narration. It is however largely a question of faith — and empathy. An international movement is born the moment several distantly-flung people come to claim a common heritage, and to declare a community of goals. Faith, after all, is the end-product of ascription. We ascribe, therefore we create.

This is precisely what Pablo Picasso the activist did. By a single piece of *Guernica*, by his exuberant scattering of the doves of peace, he created, on his own, a common fury, a common idealism, a common fire of indignation, a common tension. He did not conform, he refused to define himself in terms of pre-ordained formulae. This fact

notwithstanding, none could ignore the fierce activism of his art. Since the grammarians could not lick him, they joined him; perhaps that was their strategy to make him join them. He did join, but only in his kind of way. Picasso could not, for example, ever be persuaded to sign a testament running down Mao Tse-tung.

What the quaint little man has left behind will continue to be the subject of wild disputations. The many women in his life will fight over the earthly spoils; MGM will, for all one knows, soon launch on a full-length cinematographic biography; almost for certain, the Communist Party of France will air its proprietary rights over him, and the battle will no doubt be taken up by the far-out radicals; Jean-Paul Sartre and Simone de Beauvoir will feel impelled to join in the fray; mountainloads of polemics will pile up along the Left Bank. The unemployed artisan in Howrah, and the destitute day labourer in Bankura, will have never heard of him: they will be no part of his direct legacy, the quality of their daily travails will remain what it has been. Irrespective of whether the Union Government takes over the collieries given to slaughter-mining, the miners, crammed in hellish hovels, will continue to live, and die, like expendable beasts. At the dead of night, the landlord's men, in the company of the constabulary lent by the officer-in-charge of the local police station, will swoop on the decrepit hut of the share-cropper and take away the grain by force. The assassin's knife will

suddenly herald the end of the throbbing idealism of a young college teacher, who, in his folly, considered it to be a part of his birthright to read, and in turn let others read, the literature of the Revolution. Organised trade union activity will remain the subject of venomous attack on the part of those in authority; every now and then, confrontations will continue to take place between the struggling workers and the forces of law and order, who, it can be taken for granted, would invariably respond to the whims of the capitalist owners. Prices will soar, the profiteers will make their pile, but in case you want to raise your voice in protest, you will be put out of harm's way.

This is a world altogether remote from the tranquil fishing village where Picasso had ensconced himself for the past two and a half decades: there were few occasions for him to return, overtly, to the theme of international *camaraderie*; rich American dowagers would drop in; fat commissions for sculptures would arrive from here and there. But the heritage of *Guernica* is the heritage of *Guernica*. It cannot be disowned. Even if it be in one's subconsciousness, the doves of peace will keep fluttering. Whether he is at all aware of it or not, the Calcutta student, who chucks a bright academic career to disappear behind the bars in order that the country's 'security' may remain unimpaired, is thus carrying in himself a bit of Picasso. The flame of *Guernica* will burn. We are all *Guernica's* children.

LETTER TO EDITOR

Nationalisation of Sugar Industry

B D DHAWAN's reply (March 3) to our letter on his article "Nationalisation of the Sugar Industry: Economic Perspective" has provided us yet another opportunity to clarify some of his misgivings.

We are glad that Dhawan has conceded that a nationalised set-up would not make any difference to the operation of a buffer stock policy. Similar is the case with regard to development of bagasse based paper industry in India. Dhawan has agreed that he did not intend to apportion the blame for lack of progress in this behalf to the sugar industry. It is, therefore, not necessary for us to labour further on these aspects.

However, with regard to cane development work, Dhawan continues to labour under a serious misunderstanding. We had explained that the cane development work in the north Indian states was already in the nationalised sector. Unfortunately, this simple fact has been misconstrued by Dhawan to mean that the industry was opposed to the allocation of cane purchase tax collections to the government agencies for cane development work. In other words, our aforesaid reference has been interpreted by Dhawan in a very narrow and restricted sense as referring to only disbursement of purchase tax collections to government agencies. But that was not what we had endeavoured to ex-

plain. On the contrary, our reference covers the cane development work in its entirety including its physical handling. So long as the government agencies continue with this work, it is natural that the disbursement of funds has to be through those agencies and industry can have no objection to it. Our objection is to their very handling of cane development work. The industry's offer to take over the responsibility of cane development work refers to such physical handling of cane development work and not to mere disbursement of purchase tax collections as seems to be Dhawan's understanding.

In all the north India sugar producing states, cane development work has been entrusted to the agencies created by the state governments or their own Departments. Sugar factories do not have any effective say in the matter. Under the State Cane Laws, factories are required to draw supplies of cane through the agencies of the Cane Co-operative Societies and thus do not have a direct relationship with the growers. Furthermore, under the State Cane laws, factories are unable to advance money to the cane growers for promotion of cane cultivation. Also, with an intermediary agency they are not in a position to realise such loans under the State Cane laws which prohibit any deductions, from cane price dues to the growers. Here it will also be pertinent to quote rule 47 of the UP Sugarcane (Regulation of Supply and Purchase) Rules 1954:

"The occupier of a factory or a purchasing agent shall not make any deduction from the amount due for cane sold to him by a cane grower or Cane growers' Co-operative Society.

"Provided that recovery of the dues of a Cane growers' Co-operative Society may be made by deduction from the price payable for cane."

Under such conditions it will be appreciated, there is really precious little that the sugar factories can do in the matter of cane development in the north Indian states. We hope the foregoing would further clarify the position.

We had also pointed out that the state governments who collect substantial amounts by way of purchase tax on cane actually spend very little for cane development work. This again has been misconstrued by Dhawan to suggest that the industry only wanted to take charge of the purchase tax collections for directing cane development work. This is not true and only reflects lack of proper understanding of the situation. The facts are otherwise. Factories, if given the opportunity and responsibility of cane development work,

would be able to organise the flow of inputs on a massive scale as is being done by their counterparts in the south and in Maharashtra. It is common knowledge that an average size factory in the south and in Maharashtra where they directly participate in cane development work, is able to import inputs annually to the tune of Rs 60 to 70 lakhs against the insignificant amounts spent by the government agencies in the factory areas of the north. Therefore, the industry's offer to take the responsibility of cane development work should not in any way be misconstrued as representing a desire to take charge of the cane purchase tax collections. It reflects their sincere desire to saturate the factory areas with required inputs by import of inputs on their credit. It is our belief that unless this is done, the cane development work in the north would continue to suffer.

In this context, Dhawan has reiterated that there exists a conflict of interest between the sugar industry and the cane growers in that while the former would be interested in improving the sucrose content in cane, the latter in higher yields per acre. Dhawan observes that "sugar mill owners would not strive to expand the resources in order to raise cane yields in their factory command areas", but has conveniently ignored the facts given in our earlier comment.

As we had clarified, sugar factories do not retain with themselves the advantage of lower cane costs following higher sugar recoveries which is passed on entirely to the cane growers under the New Pricing Formula for sugarcane. The savings effected in the manufacturing cost are passed on to the consumers as the controlled price is determined taking into account the sugar recovery percentages and the duration of the season. While this is so, many sugar factories particularly in the northern region had in recent years to rest content with considerably shorter working seasons due to paucity of cane. Obviously, to improve their working, factories are anxious to ensure larger and concentrated supplies of sugarcane from within their command areas which may be possible only by improvement in per acre yields.

Since sugarcane is a highly perishable commodity and cannot be transported over long distances, when we say adequate cane supplies, we hope it is clear that such supplies have to be obtained from within economic distances and limited areas where factories operate. Obviously, the only way to achieve this would be to increase the per acre yields, which, besides ensuring

adequate supplies, would also result in supply of fresh cane due to shorter haulage time and consequently minimum incidence of diage. That being so, we are indeed surprised at Dhawan's conclusion that sugar factories have no interest in raising the per acre yield in their areas.

The cane development work in the north Indian states is not directed by the factories but in the southern part and in Maharashtra where the factories are able to effectively associate themselves in the matter, their endeavour has been to improve both quality of cane as well as per acre yield. For, good quality cane as well as adequate supplies thereof are equally important for sugar factories; one cannot replace another. Therefore, it is also incorrect for Dhawan to say that in the southern part, factories have only encouraged cultivators to grow such cane varieties as would prolong their duration of crushing and have refrained from taking measures to enhance per acre yields. While it is true that appropriate varieties do play a very important role in extending the crushing season of the factories, the importance of raising per acre yield cannot also be overlooked, especially when factories have to obtain supplies from limited areas where they operate. It would therefore be incorrect and unjust to say that this aspect of development has been neglected by sugar factories in the south.

Dhawan has also referred to the trends of development in Maharashtra and in south being slow. There are reasons for that. Since 1964-65 sugar factory farms have been taken over by the state governments and are being run now under the management of the Maharashtra State Farming Corporation. Since the take-over of these farms, the yields and the quality of cane have been deteriorating and this is bound to get reflected in the trend. In the south also with the licensing of a large number of new units year after year newer areas are being brought under cane cultivation and their results tend to dilute the achievements in the older factories areas. Thus based on the trend of development it will not be possible to form any accurate assessment of the work that is being done by the sugar factories on cane development in these states. It will not be also out of place to mention here that nationalisation of sugar factory farms in Maharashtra has also given us some lessons to learn.

We hope the foregoing will clarify all the points mentioned by Dhawan.

J S MEHTA

Indian Sugar Mills Association,
New Delhi

Detentism to the Fore

Romesh Thapar

OUR attention has been hopping from Dacca to Gangtok and from Gangtok to Dacca. In between, we have been taking hurried peeps at Rawalpindi where the air is thick with talk of coups and conspiracies. It doesn't need emphasising that all these many facets of a developing situation around us are actually part of a single situation — the slow and complex *detente* on a sprawling sub-continent.

If Dacca has to take another look at the whole question of the future of the prisoners-of-war, and the trial of leading elements for war crimes, Rawalpindi cannot continue to play double-cross on the recognition of Bangladesh without damaging its own interests and political future. As for Gangtok, long a playground for all manner of adventures, it becomes, in a sense, one of the septic foci of a sub-continent. What fascinates is the way in which events on the sub-continent occur as if part of a single scenario.

We have all been dragging our feet on the question of a *detente* on the sub-continent. The tendency to put the blame for the stalemate on this or that issue or person is to refuse to face facts. Traumatic collisions, deep suspicions, complex internal and external manipulations cannot be overcome by occasional meetings of officials or leaders. Continuous dialogues have to be attempted if a genuine *detente* is to become an integral part of the strategy of development in the sub-continent. A prejudice removed, a movement of thought here, a long-overdue correction there, a thrust forward at a point, rigidity elsewhere — of such a mix is a *detentist* policy made.

Maybe the lesson has gone home, or is beginning to make an impact. A tight-lipped Haksar is the best of emissaries. What a relief from the talkative ones! Quiet work is also on in Sikkim where the naive Chogyal imagined that the people would support, or let pass, all his strange doings. Events in Sikkim will prepare the way for many corrections and have a salutary effect on the Himalayan Kingdoms. One of the impressive sidelights to the situation is the efficiency with which the emergency in Sikkim has been tackled. We are certainly growing up.

If the complexities of the Pakistani

situation are dealt with in the spirit of a continuous dialogue — and major break-throughs are certainly possible on the issue of Bangladesh and the POWs — we will then be in a better mood to conduct our normalising diplomacy with China, now silent along the frontier and making sweet noises elsewhere.

Why the obsession with a *detente* in the sub-continent? Because there cannot be any creative unfolding of our role in international affairs so long as crises and alarms at home detract us and give opportunity to our enemies to embarrass us. We have yet to formulate a meaningful role for ourselves in South Asia and the Indian Ocean; indeed, the countries of the region are disturbed that we have remained distant and aloof. We have also to begin the business of formulating relevant tasks for the non-aligned in the new international situation; to repeat the old *mantrams* is to make ourselves ineffective and to expose our friends to the dangers of all kinds of demoralisation and defection.

LAZY FOREIGN OFFICE

Our Foreign Office is lazy, indeed very much like similar establishments elsewhere. There is a reluctance to research new situations for fear that carefully built-up sinecures will be threatened. There is a passion, typical of under-development, to unearth diplomatic plots and conspiracies to preserve the myth of grassroots work. There is determination to somehow divorce the problems of diplomacy from the urgent battles conducted by other ministerial teams in hundreds of different international areas. And, there is an overwhelming conviction that all policy is settled in the Capital, that the reports of men in the field are of little consequence. Add to all this the rather special history of our Foreign Office, and how it was never called upon to do co-ordinated perspective thinking, and then you know the truth we have to live with.

To get this Foreign Office into concerted action without a drastic reorganisation is to expect what is tantamount to the impossible. We can only rely so far on pressures from political leadership and from opinion formers within the Establishment and outside to push our diplomacy in the direction of a

detentist policy. Fortunately, the Foreign Minister has sense and works broadly in the same direction. But as the *detente* crystallises, it will need very professional handling from the Foreign Office system itself. Here, there is weakness, serious weakness of all kinds. Now is the time to re-fashion the service — as qualitatively different challenges present themselves and we move to meet them.

This needs saying, because the handling of our interests in other parts of the world leaves, to use the old cliché, much to be desired. For example, our relations with the super powers have to be conducted at a very much more hard-headed level, without the intrusion of sentiment and emotion. So far we have allowed ourselves to be carried by newspaper headlines; this is worthy of an island in the sea, not a continental power. Similarly, our handling of the Iran-Iraq equations are simplistic, to say the least — and, what's more, dictated by a rather superficial analysis of present-day alignments, if they can be so-called. As for our postures on the Arab and African world, the less said the better. We seem to be repeating ourselves *ad nauseum*; indeed, to such an extent, that now nobody bothers to record the reactions of the Government of India.

When will we realise that it is possible to take significant initiatives without abandoning "time-bound" (*sic*!) positions? Perhaps, if we want to make friends and influence people, we will first have to shake-up the Foreign Office — with a tiny cultural revolution!

The climate at this moment of writing is certainly *detentist* wherever one turns. The forums within the Congress Party are dying the kind of death that Indira Gandhi decrees with great skill. The Aligarh University events have proved once again that Muslim obscurantism needs to be handled with much keener subtlety than the Education Ministry was able to muster, and apparently the last word has not been spoken. Uttar Pradesh Congressmen, with an eye on the coming elections, are looking for leadership, and this may spark many reorganisations — even within the Council of Ministers at the Centre.

But, in between such speculation, the power hierarchy follows with close attention the progress of the takeover of the grain trade. Much hangs on this step.

April 8

Free Depreciation as a Replacement of Development Rebate

A Note

Sudhir J Mulji

BROADLY SPEAKING investment through the corporate private sector will take place in the economy if two states of affairs exist. First there need to be a sufficient number of profitable investment opportunities and, secondly, firms should have access to or be able to generate enough resources in order to undertake fresh investment. Development rebate assisted in creating both states of affairs; it improved the opportunities for investment by reducing the capital cost on plant and machinery and thereby raised the rate of return on capital, and it ensured that the necessary resources were generated in the early years when they were most needed, namely, at the time of undertaking the investment.

Although the Finance Minister was not unaware of its advantages he has decided to withdraw this incentive to investment as it had proved too expensive to government revenues; the cost to the exchequer arose by virtue of the fact that for every Rs 100 of investment the company was allowed to depreciate upto Rs 120, or in the case of certain types of assets, upto Rs 140 with a consequent loss to the government on the additional tax allow-

ance over and above Rs 100. In suggesting any new fiscal concession replacing development rebate one has therefore to keep two points in view, (a) the tax benefit should act as a stimulant to investment, and (b) its effect in the long run at least should not be such as to deplete government revenues.

On this basis one useful investment concession could be an acceleration in the depreciation schedule; quite simply an acceleration of depreciation implies that you are allowed to write off for tax purposes at a rate faster than the economic life of the asset would justify. Thus, for example, suppose a plant has a life of ten years and would in the normal course be written off at 10 per cent per annum, under an accelerated schedule the company would be allowed to write it off in say five or even less number of years. The ultimate concession in this direction is free depreciation; this amounts to permitting any company to depreciate as much of their assets (upto a maximum of 100 per cent) in any year it chooses to, including the very first year if profits are sufficient to justify claiming such an allowance.

The main advantage of permitting free depreciation to companies is that it

enables them to generate internal resources for investment; essentially the liability to tax gets deferred until the company has recouped enough to cover the cost of initial investment. In turn this enables companies to retain funds which they can either use for further reinvestment or alternatively if such reinvestment possibilities are not available or profitable, they can lend sums in the market to finance the investment of other companies. Accelerated depreciation has been described as amounting to an interest free loan from the exchequer to the firm for a period from the time when the depreciation is written off to the time when it would have been written off in the normal course.

The merit of the scheme is however that although it is an interest free credit from the government to the firm, it leads to no loss of revenue to the government. On the contrary if a reasonable view of the matter is taken it can be shown to lead to a substantial improvement in government revenues over a period of time. This point has been illustrated by a simple numerical example in the Table.

In the Table it is assumed that machinery is of the value of Rs 1 lakh and that it earns a gross revenue before tax and depreciation of Rs 50,000; two situations are contrasted; first the effect on tax revenue is calculated on normal depreciation basis over five years (the life of the machine) and then the calculation is done on free depreciation basis. It is further assumed that all accumulated depreciation is loaned out by the firm to the market where it will

TABLE

Schedule on the Basis of Normal Depreciation						
	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Machinery value Rs 100,000; Accumulated depreciation	—	20000	40000	60000	80000	100000
Income from accumulated depreciation at 10 per cent	—	2000	4000	6000	8000	
Profits before depreciation	50000	52000	54000	56000	58000	
Depreciation	—20000	—20000	—20000	—20000	—20000	
Profits after depreciation	30000	32000	34000	36000	38000	
Tax at 50 per cent	15000	16000	17000	18000	19000	85000
Discounted at 10 per cent present value of tax	15000	14545	14050	13524	12977	70096

Schedule on the Basis of Free Depreciation				
	Year 1	Year 2	Year 3	Year 4
Machinery value Rs 100,000; Accumulated depreciation	—	50000	100000	100000
Income from accumulated depreciation at 10 per cent	—	5000	10000	10000
Profits before depreciation	50000	53000	60000	60000
Depreciation	—50000	—50000	nil	nil
Profits after depreciation	nil	5000	60000	60000
Tax at 50 per cent	nil	2500	30000	30000
Discounted at 10 per cent present value of tax	nil	2273	24794	22539

earn a rate of interest of 10 per cent per annum. On these assumptions if the normal depreciation schedule is applied the total government tax revenue in a period of five years is Rs 85,000 (provided the tax rate is 50 per cent) and the discounted value of the sum comes to Rs 70,096. On the basis of free depreciation although the government collects no tax revenue in the first year and very little tax revenue in the second year the total revenue it collects over the life of the machine is Rs 92,500 and discounted at 10 per cent it collects exactly the same amount as under the first schedule.

The implication of using the same rate of discount on government revenue as market rate on loans is that provided the government can borrow at the rate of interest that the depreciation fund can earn in the market it incurs no loss of revenue over the life of the machine. If on the other hand the firm can earn on its depreciation funds a higher rate of return than the government's borrowing rate (and this is indeed very likely) the exchequer will actually gain quite substantially depending on the marginal rate of its borrowings and the marginal rate of investment in the economy. In this note I have presented the figures in the simplest possible case but in fact the general argument will carry through even if the case is complicated quite considerably.

It will be of some interest to note the reasons why this result occurs; the essential feature of the free depreciation scheme is that in order to make full use of it, the entrepreneur of the firm has to sacrifice present consumption for the sake of savings; the higher the depreciation he claims the more he has to forgo by way of dividend. This in turn generates additional income in the future years which raises both government revenue in future years plus the amounts available for distribution and consumption. Since the approach paper to the Fifth Plan envisages a similar strategy for development (namely, the curbing of current consumption for future consumption) the granting of free depreciation should meet with government approval without too much difficulty.

Free depreciation is likely to provide a stimulus to profitable investment: in the example that has been given, it would clearly pay the firm to reinvest its depreciation fund in more machines, since its rate of return from the machine is 30 per cent whilst the market rate is only 10 per cent. In its reinvestment it will be partly financed by a further deferment of tax and this pro-

cess can logically go on until the rate of return on investment falls below the market rate. At that point reinvestment no longer pays and the company will start paying both taxes and dividends. In other words free depreciation should assist in improving the quality of investment, as the maximum gain will be to those companies with the most profitable asset base.

Another advantage of the scheme is that it is easily reversible; suppose for example the government announced, to start with, that all fresh investment would be entitled to free depreciation for the next three years; this would stimulate investment now without deferring government revenues for too long a period. (Meanwhile, the government would have to finance its programmes by internal borrowing.) If at the end of three years the government wanted to extend the scheme it could continue to do so, otherwise it could revert back to normal depreciation and start collecting a larger share of the revenue.

Finally the scheme of free depreciation or accelerated depreciation is

particularly useful to small entrepreneurs with highly profitable industries; these entrepreneurs normally are not able to finance rapid expansion owing to the imperfections of the capital market and their incapacity to borrow from institutions like banks and industrial finance corporations. On the other hand, small companies have to pay a substantial portion of their profits to the government by way of taxes at the formative stages of their development which prevents them from achieving any kind of take-off. However, under the scheme of free depreciation they would be able to generate substantial internal resources the utility of which is far higher to a smaller unit than to a larger one. Once again the Table illustrates the point; assume that the man is entirely dependent on his internal resources, and assume that he retains all his post-tax profits in his business in the normal depreciation case, he will still not be able to buy a second machine till the start of the fourth year; on the other hand in the free depreciation case he will be able to do it a year earlier, namely in the third year.

COMPANIES

Changing Structure — and Dividend

Hansavivek

ATLAS COPCO (INDIA), which brought Indian participation in its equity capital to 40 per cent by issuing, through a Prospectus, 3,21,340 equity shares of Rs 10 each at a premium of Rs 7.50 per share in May last, has slashed dividend from 30 per cent to 17.5 per cent, despite higher earnings in 1972. The first call on the public issue was Rs 5 per share on capital account and Rs 4 on premium account. The new shares allotted to the Indian public are entitled to dividend on a *pro rata* basis on the paid up amount from the date of allotment. Total distribution is thus only Rs 9 lakhs, against Rs 14 lakhs last year. The company's actual production last year was 310 numbers air compressors, 1,857 numbers rock drills, and 2,058 numbers other pneumatic equipments. The installed capacity is 720, 3,600 and 2,940 numbers, while the licensed capacity is 450, 720 and 300 numbers, respectively. The company has applied to government to issue a licence for 720 numbers air compressors to regularise present capacity. It has received manufacturing

licences for 3,600 numbers rock drills and 780 numbers pusher legs, subject to terms which are being discussed with government. For other items, the company's application for a regularised licence is pending with government. The number of employees with total emoluments of Rs 2,000 or more per month increased from 17 to 30 over the year.

KAMANI ENGINEERING has commenced work on three turnkey projects in Libya, Iran and Thailand, and is also actively negotiating for other large export orders. Last year, the company's export turnover was Rs 739 lakhs, against Rs 617 lakhs in the preceding year. At home, the company has recently completed the railway electrification project from Ahmedabad to Baroda — spanning a distance of 300 km. Erection of the rolling mill has also been completed and initial production commenced. Output of road rollers is being stepped up to meet the growing demand. As at the end of February last, the company had on hand orders worth

about Rs 20 crores. The order book position is expected to further improve in view of the priority accorded to power development in the current financial year and the forthcoming five-year Plan. The company has obtained the consent of the Controller of Capital Issues for issue of additional share capital and debentures. In December 1972, KEC made a rights issue of equity shares of the value of Rs 41 lakhs. Steps are being taken to issue preference shares of about Rs 9 lakhs and debentures of Rs 75 lakhs to UTI, IDBI and ICICI. The company has produced good results for 1971-72, with higher sales and earnings. Dividend is stepped up two points to 12 per cent.

SYLVANIA AND LAXMAN, which was established in 1962 and now ranks among the leading producers of fluorescent tubes, GLS and other lamps and lighting products, has undertaken a large expansion programme. The company is installing additional manufacturing facilities for all types of lamps (including GLS, special auto, railway, operation theatre and projection lamps), glass shells and lamp components. Estimated to cost Rs 344 lakhs, the programme is proposed to be financed by issue of additional share capital (Rs 140 lakhs), foreign currency loan (Rs 102 lakhs), rupee loans (Rs 91 lakhs), and internal cash generation (Rs 10 lakhs). A rights issue of equity capital of Rs 40 lakhs has been already made, a public issue of Rs 40 lakhs in equity and Rs 20 lakhs in preference is being made now under a Prospectus, and further equity capital of Rs 40 lakhs will be raised later by way of a rights issue. The company expects to commence production of most of the licensed items before the year is out. According to the chairman and managing director, Laxman S Agarwal, on full implementation of the project, S and L's turnover should increase from Rs 3 crores in the year ended September 1972 to around Rs 9 crores by 1975-76. He also envisages substantial improvement in profits which should enable the company to step up dividend to 10 per cent for 1973-74 and to 15 per cent and 18 per cent for the subsequent two years. For 1971-72, the company paid at 8 per cent. The subscription list for the public issue will open on April 25 and close on May 7 or earlier, but not earlier than April 27.

PIRAMAL STEELS, engaged in the setting up of a steel ingot casting plant at Tarapur, about 100 km from Bombay, with an annual installed capacity

of 21,000 tonnes, is offering to the public for subscription at par 1,68,000 equity shares of Rs 10 each and 7,000 9.5 per cent redeemable cumulative preference shares of Rs 100 each. Besides, 1,12,000 equity shares have been reserved for allotment to promoters, directors and their friends. Total capital outlay for the project is estimated at Rs 102 lakhs. The balance of the finance is proposed to be raised by way of term loans from a nationalised bank (Rs 25 lakhs) and from SICOM (Rs 15 lakhs), and deferred payments under IDBI's scheme (Rs 25 lakhs). The company has placed an order for an electric arc furnace with a capacity of 10/12 tonnes per day and has engaged W S Atkins for complete consultancy and detailed engineering services for the project. The factory is expected to go into commercial production by September or October next. According to the chairman, the company should be in a position to pay a maiden dividend of 10 per cent at the end of the first year of commercial production. It is intended to step up capacity to 50,000 tonnes per annum and also to diversify

production. When permitted by government, the programme would be financed by internal each generation. The subscription list for the public issue will open on April 26 and close on May 5 or earlier, but not earlier than April 30.

SICA BREWERIES is setting up a modern brewery with a capacity of 65,000 hecto litres of beer per annum in the union territory of Pondicherry. The estimated capital outlay of Rs 140 lakhs is intended to be financed by share capital of Rs 65 lakhs (of which Rs 26 lakhs will be subscribed by promoters and their friends and Rs 39 lakhs will be offered to public) and long-term loans of Rs 75 lakhs from nationalised banks. A contract is being entered into with Vulcan-Laval for supply of plant and machinery and process knowhow. The company expects to introduce its products on the market by mid-1974. The public issue of capital is intended to be made in early July next. K R Srivatsa is chairman of the new company.

FROM OUR CORRESPONDENTS

TAMIL NADU

The Politics of Power

WHEN the Tamil Nadu Electricity Board announced a 25 per cent power cut in October last, there was only a faint murmur of protest from the air-conditioned office rooms of First-line Beach — reflecting the nuisance of having to ring up or call on old contacts in the Secretariat, of having to manipulate at the local level the quotas and the metering. There was as yet no realisation of the coming catastrophe. The complacency of officialdom and industry was so great that soon the old boy network efficiently nullified the cut and energy consumption was back to the pre-cut level. A slightly precarious living for six months, industry thought, then with the break of the monsoon it will all be over. Which speaks volumes for the manner in which the Electricity Board and the government have handled the worst ever power crisis in Tamil Nadu that was staring them in the face as early as in July last year.

The 25 per cent cut became 40 per cent in December and then, calamity, 75 per cent in February. The cut applies to industrial consumers. Shops have to close by 7-30 p.m., domestic consumption is limited to 150 units per month and agricultural pumpsets are supplied power for five hours a day. The cuts, enforced strictly, have brought down the state's daily consumption from 22 million units (MUs) to 15 MUs. Even so, the total hydel resources in the state at the beginning of April were less than 100 MUs, or roughly 6 days' supply, not counting the thermal stations. The thermal units which should be able to supply more than the required 15 MUs by themselves if they worked to full capacity, now manage to meet only three-quarters of this demand, daily depleting the hydel resources to precarious levels, long before the expected rains. If the thermal plants do not increase their contribution, a more severe cut leading to the closure of several factories will become unavoidable. As against the normal demand of 1,300 MW, the Tamil Nadu grid is able to feed only 700 MW, out of an installed capacity of 2,144 MW, of which 1,244 MW is hydro-based.

How did the state get into this situation? Is the monsoon that failed in 1972, the only villain, as made out by government spokesmen? Even if it were, what can explain the criminal

inaction of the government from July to December, when the water resources were squandered away without restraint? Some observers claim that the government had turned down the Electricity Board's suggestion of an earlier and larger cut. Whatever be the truth, the Tamil Nadu government has much to answer for.

The failure of rains is only half the story; the other half is to be traced to the galloping increase in the connected load without regard to installed capacity and to the failure to utilise installed capacity to the maximum. While the central government issues industrial licences without proper co-ordination with power development, the State Electricity Board extends agricultural supply on its own, with only paper plans for power generation, over which in any case it has no control. The net result has been a steady increase in the load, outstripping the increase in generation capacity, with both the state and central governments fully aware of the facts, but frozen in their bureaucratic ways to even attempt a reversal of the tide.

In the short run, delayed execution of schemes, poor maintenance of equipment and the Neyveli muddle have been the major factors responsible for the power crisis. If only the Neyveli and Ennore thermal units had worked to capacity last year, a large part of the hydel resources could have been conserved. Of the three thermal stations in the state, Ennore has for long been supplying less than 50 per cent of its 230 MW capacity, mainly due to problems of obtaining enough sea water through tidal movements for the cooling system. Some project decisions taken on false notions of economy seem to be at the root of this problem. Now power generation at Ennore has temporarily improved to 200 MW, but it can be stabilised at this level only after the receipt of a dredger expected next month and after the problem of insufficient water has been solved permanently with an investment of Rs 1.5 crores in a sea water pumping system.

The Basin Bridge power station has an installed alternator capacity of 117.5 MW; the boilers, however, have a capacity of only 90 MW and the cooling system of only 70 MW. So much so, the benefit to the grid from

this power station has been of the order of only 50-60 MW at any time.

Ennore and Basin Bridge have both been affected also by shortage of coal. As against the 82,000 tonnes of coal promised to the state every month, January saw the delivery of only 25,000 tonnes and February of 41,000 tonnes. The stocks are at their lowest now; in fact, Ennore is currently living on a ration of 2,200 tonnes/day against the full requirement of 3,000 tonnes/day.

But the problems of these power stations really pale before the colossal Neyveli muddle. When this central corporation started mining operations in 1956, a power plant of 250 MW capacity, a fertiliser plant of 1,50,000 tonnes urea capacity and a briquetting plant of 3,27,000 tonnes capacity were built on site to make use of the total lignite output of 35 lakh tonnes per annum. The power plant capacity was increased to 400 MW in the third plan and 600 MW in the Fourth Plan. Consequently upon this, lignite raisings were supposed to go up to 45 lakh tonnes and 63 lakh tonnes, respectively, for the two stages. But this 'integrated' project was so unintegrated that though the full power plant capacity was established in 1970, lignite production is still limping at less than 40 lakh tonnes, thanks mainly to the appalling state of repair of the mining machinery.

The Neyveli Lignite Corporation had asked for an additional Rs 18 crores worth of excavating equipment to reach the 63 lakh tonnes target, but given its record of past maintenance management neither the Planning Commission nor the Finance Ministry took the NLC seriously. Sanction of this investment was held up while the Subramaniam Committee, appointed by the Finance Ministry, called for a full project report and techno-economic viability report for the 63 lakh tonnes projection target — all after the power plant capacity had already been installed. Now the view is that the investment of Rs 18 crores will only help to stabilise output at 45 lakh tonnes — enough for the generation of 400 MW of power.

In this merry-go-round between the Finance Ministry, the Planning Commission, the Ministry of Steel and Mines and the NLC, nobody seems to have really cared that a project employing 18,000 people, producing vitally needed fuel, fertiliser and power has been steadily going downhill with mounting losses and power generation down to one-quarter of the installed capacity. Last year power generation

stopped altogether for two months due to flooding of the mines. Flooding of the mines has now become an annual feature, thanks to the dubious decision taken to reduce groundwater evacuation from 50,000 gpm to 15,000 gpm. As a result of all this, Neyveli supplied to the Tamil Nadu grid 400 MUs less energy in 1972 compared to 1971. Neyveli's generation has now improved to 350 MW from the earlier 100 to 150 MW, but at the cost of crippling the output of briquets and fertiliser.

The hopeless state of maintenance of equipment and the poor technical decisions taken are said to be the result of lack of co-ordination between the top technical and administrative personnel of NLC. Anyone visiting Neyveli is struck by the low morale of its operating engineers. However, the central ministries must also bear a very heavy responsibility for the ills of Neyveli. A belated decision has been taken to seriously study the economics of a second mine cut, but it will take more than paper decisions to get Neyveli moving again.

Apart from the thermal units, the Kalpakkam Nuclear Project (400 MW) was scheduled to start operation in 1971-72. But due to delays in the execution of civil works, the completion date has been now put off to 1976-77. Kundah 5th stage (110 MW hydro), a spillover from the Third Plan, may not be completed even in the Fourth Plan. Ennore's 5th Unit (110 MW thermal) is running seriously behind schedule. Kodayar (100 MW Hydro) has commissioned, but has produced hardly any power due to defective civil works.

The enumeration of these major and minor lapses of omission and commission can go on, but the resulting chaos, loss of production, shortages and price rise have been anything but small. Large industrial undertakings have laid off 50 per cent of their labour force. Some units work only one or two days in a week. A total of 3,50,000 workers in the organised sector and lakhs of other workers have been badly hit. Thousands of workmen, unable to support their families on half wages, are leaving the cities for the villages in the hope that their relatives might shelter them for a while. Many have been made desperate enough to 'voluntarily' surrender their permanent jobs so as to get the compensation amount that would take them back to the faraway villages. It is difficult to estimate the loss of production, but the effect in some industries, like cement, has already begun to be felt.

Turning to agriculture, the 6 lakh

connected pumpsets are supposed to be supplied power 5 hours a day, but they are lucky if they get 2 to 3 hours. Added to this, the Electricity Board is not in a position to keep to any fixed schedule of power supply; so millions of farmers are forced to camp near their wells day and night — praying for, and cursing, the power that comes so fitfully. In some areas standing crops have been lost. Agricultural workers have been the worst hit, caught in the vice-grip of unemployment and soaring prices. Lakhs of small and medium farmers face certain ruin.

Shortages of gigantic proportions stalk the land. Diesel and kerosene have virtually disappeared. The demand for diesel is estimated to have shot up 60 to 100 per cent as a consequence of activation of diesel generation sets by industry. Diesel engines are now bargain buys at four times the normal price. Once again, in regard to a problem that could have been foreseen months ago, action is being taken only now. Despite assurances of adequate supply, one sees lorries queuing by the hundreds at petrol stations, leading to minor riots. The Madras and Cochin refineries have increased their diesel output, but this can only be done at the cost of kerosene — already in short supply.

In several villages kerosene is not available even at thrice the normal price. Kerosene lamps have doubled in price. Prices of rice, wheat, pulses, coarse grains and meat have gone up; edible oil has shot up by more than 25 per cent. Grain hulling and grinding charges have registered a 300 to 400 per cent rise. Cotton yarn, the very life blood of the handloom industry, has gone underground, throwing hundreds of thousands of weaving families on the streets. Where it is available,

INDO-BANGLADESH RELATIONS

Where Gratitude Stops

IT is going to be a long night's journey into the day. The fact that P N Haksar had to extend his stay in Dacca beyond the time stipulated earlier would indicate that the going there was hard. The discussions with the Bangladesh government are now supposed to be resumed soon in New Delhi. This too would imply that the battle has only been joined; the Bangladesh authorities, according to all accounts, would drive quite a bargain before agreeing to India's unilateral right to hand back the overwhelming majority of the Pakistani prisoners of war to President Bhutto. Even as it is, the plot was already sufficiently complicated. For domestic political rea-

sons, Zulfikar Ali Bhutto is currently in no position to recognise Bangladesh; and this is a confession which must have been duly conveyed to New Delhi. The strategy to let the Pakistani President to stew in his own juice is also unlikely to pay any dividends, since not even the Soviet Union would favour the prospect of a further splintering of Pakistan. Afghanistan's past enthusiasm toward the cause of Pakhtoonistan too has cooled off in recent years. If fishing in troubled waters is to be ruled out, Bhutto remains India's best bet, and he will be unable to defuse the for-the-present verbal confrontation with India unless he gets the prisoners of war back.

The gravity of the crisis has at last sunk in among the people. Industry is preparing itself to face a long spell of power cut, perhaps at a reduced level — and at the cost of labour as usual — even after July. It has laid off workmen out of proportion to the reduction in production. Many concessions, big and small, won by labour after many struggles have been taken away by the mere threat of closure. Captive power generation, using imported diesel generator sets, is being planned by several units, but with one apprehensive eye on uncertain availability of diesel. Agriculturists are trying to switch to diesel sets. Responsible trade unions are mobilising to fight for workers' right to a full wage.

It is the politicians of Tamil Nadu who have yet to rise to the occasion and view the problem in its total perspective. With the exception of CPI(M), the other opposition parties have seen the power cut only as a handy weapon to bring the Karunanidhi government to its knees. That the power cut symbolises the total bankruptcy of planning as practised by the central government; that K L Rao amuses more than he informs when he demands a doubling of the present generation capacity within six years; that the power famine has come to stay in all but two states of the Union are all uncomfortable truths, best hidden from the public gaze, for the political convenience of the Congress, the CPI, the ADMK and the Congress(O).

Moreover, if he does not get them back, the American administration would have reason to continue to be grumpy towards India. A grumpy United States administration, let it be admitted, is a phenomenon the Government of India is no longer in a position to cope with. Even were recourse taken to drawing down our quotas with the International Monetary Fund, we might be in need of even more foreign funds in the latter part of the season, in case for example the monsoon behaves erratically for a second successive year. The Finance Minister must have brought back some fairly pithy messages from Washington.

RITUALISTIC REASONS

In international relations, gratitude as a coin is hardly ever permanent legal tender. For ritualistic reasons, Sheikh Mujibur Rahman, would, for some more months, continue to mention, with gallons of feeling, the assistance, relief and succour accorded by this country to Bangladesh. But, just as Christ stopped at Eboli, gratitude too would, quite legitimately, stop short of any major concessions involving national interests. Bangladesh cannot therefore be blamed if it demands a price from both India and Pakistan for turning a Nelson eye to India deciding to release the prisoners of war. Formal recognition by Pakistan of the reality of Bangladesh may not *per se*, be worth much, but if it comes about, China would perhaps desist from wielding the veto in the United Nations whenever the question of admitting Bangladesh comes up again in that forum. There is also the problem of settling, once and for all, the liability

for the international loans contracted in the past by Pakistan ostensibly for projects located in erstwhile East Pakistan.

PACKAGE OF SETTLEMENTS

What P N Haksar was doing in Dacca was obviously to ascertain the feasibility constraints of a package of settlements, and the nature of the related mutual pay-offs. Such a package, once agreed to, would then have to be hawked to Islamabad. A single round would hardly do for sorting the different issues out; more cross-continental travels are therefore very much on the anvil.

What seems ironical is the emergence of a situation where the burden of responsibility for arriving at a settlement equally acceptable to all the parties concerned has suddenly devolved almost entirely on India. In the process, the world might lose track of the fact that the responsibility for starting the holocaust, which is at the root of it all, was Pakistan's. Of equal relevance is the conjecture that if Bangladesh, had not been insisting on the acceptance of certain minimum terms by Pakistan, India on her own would perhaps have been able to reach a deal with Islamabad at the time of the Simla Agreement itself. It can thus be forgiven in case, in not-so-quiet moments, groups of Indians genuinely start to work out a calculus of net gains accruing to the nation from its involvement in the affairs of Bangladesh beginning with April 1971. It is an ill wind which only brings runaway inflation and uncompensated international headache.

PAY COMMISSION

Disappointment for Most

THE Pay Commission's long-awaited report has already provoked sharp controversy. No group of government employees seems to be satisfied by the Commission's recommendations, with the exception perhaps of the IAS bureaucracy. The Commission has recommended significant improvements in the emoluments of certain sections of government employees, among them professional and technical personnel. But these improvements are firmly contained within the frame of overall supremacy of the IAS in the government secretarial set-up. The men of the IAS are satisfied that the Commission has been 'realistic' enough not to disturb the basic structure of

government administration. The secretary, in other words, remains the boss.

The fact that apart from a special cell in the Finance Ministry, the Secretary to the Prime Minister, P N Dhar, has also been asked to make a parallel study of the Commission's bulky report gives some idea of the complex problems it has raised for the government. First of all, of course, there is the question of the financial liability. According to the calculations of the Commission, there will be an additional liability of Rs 140 crores per year. This is considered manageable and the Finance Minister had indicated at the time of presenting the budget that this ex-

penditure would be met by resort to additional deficit financing. But the first reaction, in the Finance Ministry and in the other concerned ministries, particularly the railways, is that the Commission has underestimated the liability. In addition, the implementation of the Commission's recommendations will raise the question of corresponding relief for state government, local body and other employees and the total liability on this account will turn out to be much larger. The erosion of the assumed resources for the Fifth Plan will turn out to be far larger than the figure of Rs 140 crores would indicate.

BITTEREST PROTEST

While the financial liability arising from the recommendations of the Pay Commission is a matter of concern for the government, for the overwhelming majority of government employees the Commission's dispensation must inevitably seem disappointing. The bitterest protest has been over the rejection of the concept of a need-based minimum wage. The minimum wage of Rs 184 per month recommended is lower than the minimum in organised industry, both public and private sectors. The need-based minimum norm adopted by the Fifteenth Indian Labour Conference, on which the staff organisations had based their case, would come to as much as Rs 314 per month. But even the Pay Commission's own more spartan calculations still put the minimum at Rs 196. The minimum wage recommended by the Commission is, however, only Rs 184.

To justify the minimum wage recommended by it, the Commission has used the currently fashionable argument about the need to commit resources for upliftment of the poorest sections of society, including the unemployed. But, besides this stock argument which the employees' organisations refute by referring to the generous treatment meted out by the Commission to those in the middle and upper salary brackets, the Commission has also relied on another spurious argument. This is that the lowest paid employee when he enters government service does not generally have a family to support and that the minimum income norm, which is based on a family of four, should not therefore apply to them. This is a highly questionable assumption in our social and economic conditions. Even if many of the entrants into government service are not married at the start of their

careers, these employed have to take care of other members of the families, including the unemployed ones in the working age group. The Commission has also shown poor appreciation of the case of the employees by its total disregard of the fact that a large proportion of government employees are not secretarial workers but are engaged in jobs with responsibility similar to those in industrial and commercial enterprises in the public and private sectors. The case of employees in the railways, the post and telegraph department, defence production and other such sectors for treatment comparable to that received by employees in public sector industrial and commercial enterprises is unexceptionable.

Another weakness of the Pay Commission's recommendations relates to its DA formula. Though its DA neutralisation scheme does away with the anomalous slab system suggested by the Second Pay Commission, the essential weakness of the system remains. The scheme still

rests on the premise that the question of DA relief should arise only when a certain level of increase in the cost of living index has been recorded over a 12-month period — 8 points according to the Third Pay Commission compared to 10 points suggested by the Second Pay Commission. The DA relief will, therefore, become available, as in the past, after the employees have lived through a period of steep and persistent rise in the cost of living for several months. The assumption, of course, is that DA will also not be withdrawn abruptly if prices begin to fall, but experience clearly shows that prices move steadily upward and that the premise about up and down fluctuations in prices, on which the DA formula is based, is completely unrealistic. One possible step in these circumstances might be to reduce the time span for purpose of revision of DA for rise in the cost of living index to, say, three months. An equally strong objection to the whole scheme is that the neutralisation granted is still not full but only partial.

SOUTH

Kerala Experiments

Mohit Sen

IT has not been Kerala's fortune, for as long as one cares to remember, to have had a government in office for three continuous years. This is feat enough for the ministry headed by Achuta Menon; but it is very far from being the only feat. The importance of Kerala lies in its experiments, both positive and negative.

The positive first. Those who were in the van of the positive experiments certainly had no illusions as to the possibilities of the present system. The experiment was, therefore, not only to investigate these possibilities concretely but, even more, to see how these possibilities used — as it were, to the end of their tether — could secure vantage points for radical changes in the system and win for further radical changes a larger and broader grouping. For those concerned with the development of the Indian revolution, this was certainly venturing upon unexplored paths.

The crucial criteria to apply to the record of the Achuta Menon Ministry, therefore, are: has social change prospered under it; have more people of differing political and other faiths been won for the cause of the democratic re-

volution. Certainly, in any critical examination, other related criteria have also to be employed — corruption, bureaucracy, employment, industrial growth, and the like. But the first two are crucial.

One revealing comment, by a Congress member of the Working Group on Land Reforms of the National Commission on Agriculture, may be cited here. When the team concluded its visit of the state, he asked whether he had been visiting a part of India or a part of another country or was it a time-journey! The social change, the difference in the position of the working peasant as well as of the rural rich, as compared to any other part of the country, is so tangible and so refreshing that only the purblind and prejudiced can fail to perceive it. The social emancipation of the downtrodden has gone a considerable distance in this southernmost state.

It may be said that this is not due to the Achuta Menon Ministry being in office. And this would be true. The gains in the sphere of social emancipation are the result of decades of struggle, in which the Communist party

played the most outstanding role. They are lasting testimonies to the vitality and indispensability of the pioneering, vanguard role of this party. The veterans and stalwarts of this party, now present both in the CPI and CPM, are the biggest national figures of the state — the late Krishna Pillai, Namboodiripad, A K Gopalan, Achuta Menon, M N Govindan Nair, T V Thomas. In recent decades, the history of Kerala's advance has been very largely the making of this movement. It is no coincidence, and the social historians of modern India should note it, that the process of social emancipation and the strength of the communist movement are directly correlated, at least in this state. One is far from claiming all the credit for the Achuta Menon Ministry.

But if the analysis of the CPM is correct, then three years of this Ministry should have seen the reversal of this process — or at least no advance of it. One is familiar from the experience of West Bengal with what happened when the United Front Ministry fell and the jotedars felt their day had returned. Regression apart, what about the abolition of tenancy, the building of houses where the Harijans would live amidst other members of the community, the takeover of the lands of the recalcitrant Kuttanad landlord, the co-operatives for engineers and medical practitioners, the minimum wages and sliding scale for the agricultural labourers, etc? All this and more explains why the worker and the toiler in Kerala holds his head higher than his class brothers in other parts of this vast country. This is achievement enough for any Ministry, and its significance is all the greater since no other Ministry in any other state of India can show anything comparable.

The only comparable achievement is that this process of social emancipation has brought closer together the political articulations of the working class, the petty bourgeoisie, and the intermediate strata. In 1957-59, very few would have agreed with the forecast that the Communists and broad sections of the Congress would be able to come together on a platform of radical institutional changes. But this is precisely what has happened. There was a time when the Congress in Kerala used to officially organise demonstrations against the commemoration of the heroic events associated with Punappra-Vayalar solely due to bitter anti-Communism. And now one can find Congressmen openly associating with the celebrations; and there is, of course, no question of any organised demonstration against it. Any

competent observer of the political scene in Kerala would notice that there is absolutely no resistance from the Congress; on the other hand, there is active co-operation from it in the implementation of the radical reforms outlined in the programme of the coalition ministry — a programme which is essentially the same as that adopted by the United Front of 1969, in which the CPM was the dominant and domineering partner. This coming together of forward-looking forces in Kerala for the implementation of deep structural changes is more than a pointer for the rest of the country; it is a pathfinder.

A negative experiment is also on in the state. The CPM's Central Committee has announced that it cannot formally join the Biju Patnaik-sponsored 'federal united front'. In the meantime, 'informal' and not so informal alliances are being forged, above all in Kerala. Under the name of Civil Rights Protection Association, the CPM is openly associating with the Kerala Congress, the Syndicate, the Swatantra, the Jan Sangh, etc. This Civil Rights body does not confine its activities to abstract liberties and their protection. It actively intervenes in the politics of the state, as was seen in the recently concluded strike of a section of the NGOs. This joint activity was carried forward when, at the beginning of the Assembly session, Namboodiripad sat together in a so-called *dharna* with all the known leaders of Right reaction in the state. Indeed, the CPM theoretician makes no bones about this joint activity. Issue-to-issue united front is how he terms it. He does not, of course, explain why this approach is confined only to the parties of Right reaction. Where is the issue-to-issue united front that he has tried with the CPI or the Congress in the state? He then pushes forward the thesis that to unite with the devil is not sinful when it is to oppose still more monstrous demons. This amounts to saying that, in Kerala, the main enemy of the progressive forces is the Congress-CPI-RSP-Muslim League coalition. Where is the perspicacious Marxist theoretician's class approach? Can he make out a case that the ousted and remaining landlords, the plantation owners, and the rest, regard this coalition as their political representative and that, therefore, these vested interests cannot be fought without concentrating the main fire on the Achuta Menon ministry? Can he overlook the fact that Kerala is a part of India and that Right reaction is on the offensive even against the partial reforms announced by the Central government? Whose company does he

seek and whose interests is he espousing?

It cannot be denied that this 'grander alliance' does have considerable voting strength in the state. Its capacity for mischief and the financial resources it can mobilise should not be underestimated. Nor can it be overlooked that the 'grander alliance' has all-India tentacles. At the same time, one noteworthy feature has to be pointed out. The CPM's mass base is a radicalised, Left

The Elusive Link

NOW that the Committee of 20 on international monetary reform has agreed on the basic principles which would inform the reform of the present international monetary system, hopes have been raised that the reformed system would be framed and its acceptance secured before the end of the year. The Indian Finance Minister has indicated that the chances of the outline of the new system being presented to the Nairobi Annual Meeting of IMF are very bright.

Let us see what is the sort of reformed international monetary system that is in the offing. The basic principles agreed upon by the Committee of 20 are four, namely, that (i) the new par value system should be "stable though adjustable"; (ii) the role of "principal reserve asset" should be assigned to Special Drawing Rights (SDRs) rather than to gold or national currencies; (iii) speculative capital movements need to be controlled; and (iv) in order to promote economic development, the flow of real resources from developed to developing countries should be encouraged.

It is clear that unlike in the case of the system it would be supplanting, the linchpin of the reformed international monetary system would be the mechanism by which par values can be easily adjusted. Fixed par values are the centrepiece of the present monetary system; that of the new monetary arrangement would be a "stable though adjustable" par value system. There is thus a clear recognition that the burden of correcting balance of payments imbalances have to be borne by the par value system itself. This is a major departure from the old regime under which par values once established become almost sacrosanct.

It is strange but true that those who put up a last-ditch fight for the fixed par value system were not the developed countries, or even those members of the Group of 20 which have benefited

mass base. It has its loyalties, but it also has principles and instincts. It, therefore, refuses to get drawn into the campaigns and actions of the CPM, when the latter is acting in concert with the worst anti-communists and reactionaries in the state. This failure to respond is the beginning of the gradual erosion of the mass base of the CPM. And when this assumes significant proportions, Kerala's experiment would enter a qualitatively new phase.

the most from the system that was set up at Bretton Woods, but the developing countries including India. In his latest statement to Lok Sabha, Y B Chavan, bewails the passing away of the fixed par value system, though he is realistic enough to see that the developing countries would have to learn to live with the consequences of more frequent changes in exchange rates. But how have the developing countries as a Group, and India in particular, come to the conclusion that the balance of advantage for them lies in fixed rather than flexible par values? Certainly, India has not stood to lose under the floating exchange rate system that it has maintained since the dollar was first devalued.

While under the new international monetary system the SDRs will play an important reserve currency role, it is not certain that agreement will be reached easily on reducing, not to speak of eliminating, the monetary reserve role of gold. The reason simply is that it will be hard to persuade the major holders of monetary gold to exchange their gold holdings for SDRs, though they have agreed on an exchange of their dollar (and sterling) balances for SDRs. So long as gold continues to be held in monetary reserves in such large proportions as at present, not only will the SDRs remain a less-than-perfect monetary reserve but the supremacy of gold will actually get increasingly reinforced.

As for the problem of putting some brakes on the movement of speculative capital across national frontiers, the point really is not whether or not it would be necessary to curb large-scale movements of such capital for the effective working of the reformed system. The point really is whether under a reformed system, where adjustment, especially adjustment downwards, of par values is not looked down upon but is accepted willingly as part of the balance of payments equilibrating pro-

cess, speculative movements of capital will at all take on the proportions that they did over the past two decades, particularly over the past two years.

WASTE OF EFFORT

It is in the above context that the question of the 'link' — between SDR creation and the flow of real resources to the developing world — has to be reviewed. The Finance Minister appears to have come away from Washington with the impression that the developed countries are not kindly disposed to the establishment of the 'link'. But let the developing countries try to realistically answer the question: why is it that the developed countries are not particularly well disposed to the 'link'?

Among the developed countries there are two clearly identifiable groups — the surplus countries and the deficit ones. The surplus countries hold not only large quantities of monetary gold but also large quantities of dollars. They want to be rid of the latter but not of the former. The deficit countries, particularly the USA, recognising that the accumulation of large quantities of their IOUs in the hands of the surplus countries makes their par values highly vulnerable and that short of altogether repudiating these IOUs some alternative has to be devised whereby they can avoid being called upon to honour the IOUs, at any rate in the immediate future, have welcomed the idea of converting the outstanding dollar and sterling balances into SDRs. Once this conversion takes place, the rest of the problems become, in the minds of the developed countries, manageable. No large-scale creation of additional SDRs is envisaged from year to year. Imbalances in the balance of payments will be taken care of by the new mechanism of the "stable but adjustable" par value system.

If any additional liquidity is to be created to meet the genuine needs generated by the expansion of international trade, this would be met by the limited creation of reserve currencies. But to make sure that no one country enjoys the benefits of being a reserve currency, the new system would have to be so devised as to ensure the participation of virtually all the developed countries. If in the past the US was the principal beneficiary, followed by Britain as a poor second, now everybody will have to benefit from the arrangement. The problem, however, is that only a country running a deficit can make a contribution to world currency reserves. But is Bonn prepared to run a deficit? Or is Tokyo?

The real snag, therefore, is that in the contemporary world where more than 80 per cent of international trade takes place among the developed countries, at any time only some can be net beneficiaries of the creation of reserve currencies. In the end, this benefit might once again go largely, if not exclusively, to the USA. Not only that, in time to come, a repeat performance of the present scene might well be enacted. It is this realisation that throws the developed countries back to the SDRs once again.

However, in this whole scheme of things the question of directing the flow of real resources to the developing world does not arise — unless it is made a deliberate purpose of world monetary policy that reserve creation in the form of SDRs should be channelled through the developing world. The pattern al-

Radicalisation of Western Science

A P Balachandran

THE Jason division of the Institute for Defence Analyses (IDA) employs about 40 leading American scientists and functions in an advisory capacity on national security matters to the US Department of Defence. The Pentagon Papers suggest that it was the primary inspiration for the initial formulation of the electronic battlefield concept [1]. The latter has since been used for the indiscriminate slaughter of the Vietnamese people. According to a recent report [2], past Jason research papers include titles like "Explosively Produced Flechettes" [3], while an IDA seminar is entitled "Insurgency Patterns in India Today".

The issues of *Le Monde* of June 15 and 16, 1972 carried items about a Nobel Laureate American physicist, Murray Gell-Mann, who had to leave College de France without completing his seminars. He was to lecture on elementary particles, but a part of the audience was more interested in his work for the Jason project. He stated that he was not free to answer questions on Jason [2]. The response to his position was hostile and on the second day of his lectures, he had to be escorted out of the lecture hall to the safety of the streets.

The issue of *Le Monde* of September 30, 1972 contained a report about an international symposium on physics held at Trieste. There were demonstrations against the five Jason members who were participants in the symposium.

ready set for SDR creation, on the Fund quota basis, apart from being inefficient from the point of view of genuine liquidity creation, pays virtually no heed to the requirements of the developing world. What is there in the context of the contemplated reform to compel the developed world to pay such heed? It is a matter of international morality and conscience rather than of the mechanics of the monetary system. Whether SDR creation under the reformed international monetary system would go beyond the formal homage paid in the basic principles outlined by the Committee of 20 is a matter of speculation, but it will be a mistake to lay too much stress by empty phrases. The 'link' might well elude us altogether. But some of us would have wasted a lot of breath, energy and time in the process.

Wigner, Nobel Laureate and a Jason, responded to denouncements of the Jasons as war criminals by holding up a sign which read, "I am flattered by your accusations. They are compliments for me" [4].

This surge of militancy and self-criticism among scientists is only a few years old. In the past, the ideological characterisation of science as value free and international had provided a rather effective insulation from an awareness of its social roots. There was a tiny breach in this insulation due to the development of the atomic bomb. At the first test of this bomb, Oppenheimer is known to have remarked that "scientists have known sin" [5]. Nonetheless, the consciousness that knowledge partakes of both good and evil dimmed among the scientists after the war. Big science in the US and Europe became more and more involved with the state and industry and came increasingly to participate in social contradictions. The scientific community did not develop a significant political consciousness despite its increasing and manifest involvement in national and international affairs.

Science and the pursuit of knowledge are the activities of social beings and are, therefore, necessarily affected by the nature of the society. The phraseology of Darwin like "the survival of the fittest" has a clear resonance with capitalist norms. In our times, subjects like psychology which study

human beings have a tendency to treat them as objects fit for manipulation. Skinner is a prominent American behavioural psychologist. He has proposed a society planned and controlled carefully, by behavioural psychologists as the solution for the present ills [6]. In the world of business administration, extensive research in psychology is in progress to influence the individual to buy toothpastes and contraceptives. In a society where humanity is in a state of deep alienation and human lives tend to be regarded as objects in the service of the market economy, it is not astonishing that the study of human beings takes on the characteristics of the study of things, and methods of their manipulation become an academic pursuit. The recent influence of society on the physical sciences in the west has been direct and rooted in economics. Thus much of the expensive American and European physics is financed by the governments while many American universities maintain subsidiary institutions which do war-related research with help from the academic profession.

THE ANTITHESIS

Characteristically, implicit in a scene such as this is its own antithesis. With the realisation that the American war machine was engaged in an atrocious war in Indochina and that their own professions were collaborators in these efforts at subjugating a people, there arose among the American scientists a spirit of self-criticism and movements for self-purification and an appropriate political response. Unsuccessful attempts were made to persuade the American Physical Society (APS) to assume an official stance on political matters. Papers began to be read at APS meetings on colonialism and oppression [7]. At MIT and Cornell, faculty-student coalitions launched struggles to force the universities to divest themselves of war research. These struggles were partially successful and continue to persist at other American universities. Organisations like SESPA (Scientists and Engineers for Social and Political Action) were formed and radical journals like "Science for the People" were launched [2, 8]. The academic left in Europe also felt involved and formed groups such as the Collectif Intersyndicale Universitaire d'Orsay Vietnam-Laos-Cambodge.

The confrontations with the Jason members are an outcome of these trends. They have occurred at Paris,

Rome, Varenna, Trieste and Geneva [2, 9]. The SESPA group has published a tract on Jason [2]. Interestingly, the Varenna statement against the scientists who help in the American war effort in Indochina was signed by almost all (about 60) of the participants in the Varenna summer school. The same statement was circulated at a large physics conference at Batavia in the US. Only 21 out of the 700 participants signed the document and most of the signatories were European [2]. This is a good indication of the weakness of the radical impulse in the US.

As the war in Indochina becomes less important in the western view, the scientist in the US, who felt guilt about the involvement of his profession in the brutalities of his state, is inclined to be less interested in matters of this sort. Typically, an American university professor who a short while ago was troubled by self-doubt and was inclined to a mild militancy now feels less spirited about preparing a petition. He is likely to regard his duty done by working for the Democratic party during the national elections. The American academic left has had a short life which is beginning to fade out. Still, for a few, the significance of these past years will endure. For them, these were years which radi-

calised their vision of the world and of themselves permanently.

SIKKIM

Troubled Protectorate

HARDLY a week after the abrupt end to the Sino-Indian loudspeaker warfare across the strategic mountain passes of Nathula, Jelepala and Chola — where the Indian and Chinese troops face each other in a state of constant alert throughout the year — while Gangtok, the world's smallest capital, was being prepared to celebrate the fiftieth birthday of Chogyal Palden Thondup Namgyal on April 4, events in Sikkim suddenly took a tense turn. On the morning of April 4, instead of extending birthday greetings to their ruler, the palace guards rushed to inform him and his Gyalmo Hope Namgyal that the Gangtok police had fired on the volunteers of Sikkim National Congress and Janata Congress while they were making their way towards the palace in defiance of the prohibitory orders. The situation had turned grave enough for the royal birthday functions arranged for April 4 and 5 to be cancelled.

The law and order situation had in fact deteriorated in recent weeks following charges of official rigging of elections to the 24-member Sikkim Council. There was growing discontent about the Chogyal's handling of the political situation. The discontent assumed organised proportions on March 27, when Krishna Chandra Pradhan, President of the Sikkim Janata Congress, was arrested on the charge of making provocative and seditious speeches from the platform of his party's newly formed joint front with the National Congress. The Sikkim National (or Rashtriya) Congress and the Sikkim Janata Congress — the two representative political organisations of the kingdom — organised mass protest rallies and demonstrations all over Sikkim, and 86 volunteers went on an indefinite fast in front of the Tsuklakhang, the palace monastery where the present Chogyal had been consecrated as the twelfth ruler of

Sikkim on April 4, 1965.

Last month's situation was brought temporarily under control by G. S. Bajpayee, the Indian Political Officer in Gangtok. The first few days of April were comparatively peaceful. The fasting volunteers were persuaded to break their fast, and the warring politicians were brought to the negotiating table. What seems to have queered the pitch of the talks, however, was the presence and influence of Sonam Tsering who was leading the government team. Sonam Tsering was also president of the Chogyal's Birthday Celebration Committee. As Vice-President of the Sikkim National Congress till recently, Tsering had been considered enemy number one of the Chogyal in the entire kingdom. However, last year, after he was decorated with 'Pema Dorji' — the highest honour awarded in the kingdom — Tsering, according to the present front leaders, turned into a staunch supporter of the Chogyal. In fact, Sonam Tsering is said to have betrayed his party and colleagues once before too. In 1948, he was one of the three secretaries appointed by the late Tashi Namgyal; he violated the Sikkim State Congress mandate instructing him to resign the post, while the other two secretaries carried out the party directives and resigned. In the recent talks, his attitudes seem to have become obstacles to arriving at an understanding.

FIRST INCIDENTS

As the negotiations seemed to flounder, on the evening of April 3, hundreds of people gathered on the outskirts of Gangtok in response to the Joint Front's call. By the evening, thousands of people were thronging the camps set up by the constituent parties in Lal Bazaar and the nearby parking place. Reports received from other areas of the kingdom spoke of wild demonstrations at several places, including Gayzing, Namchi, Singtam, Rangpo, Ranipool, and Rhenok. Last minute efforts were made at Gangtok to give a fillip to the sagging negotiations. The talks at the palace lasted for about five hours, and were attended by six representatives of the government, six of the joint front of the two parties, and one of the National Party. In the dead of the night, it became apparent that the talks had failed. The volunteers waiting in the fog and darkness at the camps were given the green signal by the front leaders to proceed to the palace. In the confrontation that followed, there were police firings and several arrests.

The little kingdom had witnessed a similar upheaval soon after British withdrawal from the Indian subcontinent, when over 10,000 satyagrahis from all over the kingdom had gathered in Gangtok, gheraoed the palace for over 48 hours, and forced the formed head of State, Maharaja Tashi Namgyal, to constitute a popular ministry under the chief ministership of the Sikkim State Congress leader Tashi Tsering. The ministry, however, lasted for only 29 days and was dissolved — at the instance of New Delhi.

This time, too, tension mounted in Gangtok, as the people, ill-clothed and bare-footed, started to arrive from all over the kingdom. Section 144 was promulgated in anticipation of trouble. Security measures were tightened on all approach roads to the Tashiling, the secretariat, and the palace. The first incident occurred in the early hours of April 4, when the Kanchenjunga peak, overlooking the capital, was still enveloped in the Himalayan fog, the front gave the signal to the volunteers to move to the palace. The police claim they had to open fire as a large number of demonstrators attempted to defy the prohibitory orders; on the other hand, Kazi Lhendup Dorji, leader of the joint front, has asserted that the firing was unprovoked and that the demonstrators had not violated any ban. The road to the palace had been barricaded and steel-helmeted armed police were on guard. The main road in the area was afterwards found strewn with teargas shells.

In the afternoon, the demonstrators regrouped themselves and were again stopped by the police near the palace gate. When the agitators refused to disperse, the police again burst teargas shells and opened fire. In the evening, about 1,000 satyagrahis marched to the Ranipool police station, 12 km from Gangtok, where, too, they were fired upon by the police.

By the evening of April 5, however, the tables were turned on the government. Police outposts in many places were taken over by volunteers of the joint front. The Sikkim Durbar administration collapsed throughout the State — except in the deserted palace and in the Gangtok Bazaar area. In the outlying districts, police outposts and administrative offices were either abandoned or were taken over by the demonstrators. In most district towns, demonstrators gheraoed public offices and heckled senior government officials. A contingent of the Sikkim Guards, usually on guard at the palace, was

deployed to take over police outposts in some nearby towns; but they retreated to the capital after they were faced by huge numbers of demonstrators. The Chogyal sought assistance from India at this stage.

While it now seems certain that law and order may thus be restored, the deeper causes of discontent will yet require attention. Although the Nepalese constitute nearly 65 per cent of the population in Sikkim, the present electoral system allows them only as many seats in the Sikkim Council as are available to the minority communities of the Lepchas and Bhutias. The Chogyal selects the Executive Council (Cabinet) from among the 'elected' members of all the three communities. The joint front has now confronted the Chogyal with the demand for 'one man one vote'.

HISTORY TO LIVE DOWN

This is the first time in the history of Sikkim that politics have taken such a violent turn. Apprehending loss of control of the situation in this strategic area, New Delhi hurriedly sent to Gangtok Avtar Singh, a senior secretary in its External Affairs Ministry. Avtar Singh, a former Indian Political Officer for Sikkim and Bhutan, has been known to be well-disposed towards the popular political leaders in the kingdom; so expectations in Gangtok are that the conclusion may not be entirely favourable to the royalists. Under the Indo-Sikkim treaty of 1950, India is responsible for the defence and territorial integrity of Sikkim and has the right to take such measures as it considers necessary for the defence of Sikkim or the security of India. However, India has much past history to live down. The democrats, too, have not forgotten the visit of another Indian official in similar circumstances some 23 years ago. Instead of directly meeting the political leaders in troubled Gangtok, the then Deputy Minister of the External Affairs had several meetings with the royalists and officials of Government of India. After his return to Delhi, he recommended dissolution of the popular ministry. Will such retrograde recommendations be made again? Over the last 23 years, the political parties in Sikkim have gained in experience. They may no longer passively accept Delhi's verdict and may insist on democratic institutions. New Delhi should not fail to take note of this change of consciousness. It needs to see that the choice is really between a friendly Sikkim with a democratically constituted government and a feudal protectorate.

Persons interested in full details may obtain copies of Prospectus and Application Forms from the Underwriters, Brokers and Bankers to the Issue or any of the Offices of the Bankers to the Issue mentioned below and also from the Registered Office of the Company.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 23RD APRIL, 1973 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 5TH MAY, 1973 OR EARLIER AT THE DISCRETION OF THE BOARD OF DIRECTORS OF THE COMPANY BUT NOT EARLIER THAN THE CLOSE OF BANKING HOURS ON 26TH APRIL, 1973

USHA ALLOYS & STEELS LIMITED

(Incorporated under the Companies Act, 1956)
Registered Office: 14 Prince Street, Calcutta 700013

HISTORY AND OBJECTS OF THE COMPANY:

The Company promoted by Usha Martin Black (Wire Ropes) Limited was incorporated on the 1st December, 1971 in the State of West Bengal under the Companies Act, 1956 and obtained the certificate of entitlement to commence business from the Registrar of Companies, West Bengal, on the 14th December, 1971. The main objects of the Company are inter alia to manufacture, export, import and deal in alloy steels, special and stainless steels, billets and ingots and to carry on business as steel makers, electric and blast furnace proprietors and manufacturers, repairers, importers and exporters of and dealers in ferrous and non-ferrous castings of all kinds and in particular continuous casting, special alloy castings and foundry work of all kinds.

The Company proposes to set up a plant for the manufacture of high/low carbon alloy steel billets with an annual licensed capacity of 50,000 tonnes. In this respect the Government of India has granted an Industrial Licence to the Company being Licence No. L/1A(1)/N-61/72-L.C. dated 11th October, 1972 as amended by letter No.1(18)/70-L.C. dated 16th November, 1972. In the first phase the Company proposes to manufacture between 28,500 and 35,000 tonnes and barring unforeseen circumstances the Company expects to commence commercial production by the middle of 1974. The current annual requirement for high carbon steel billets of the Promoters of the Company, Usha Martin Black (Wire Ropes) Ltd. is estimated at 25,000 tonnes. Further, Usha Martin Black (Wire Ropes) Ltd. have substantial expansion programme in hand and by the time the Company comes into full production, there is every likelihood that a major portion of the Company's production may be taken by them. It is estimated that the country's current annual requirements for high carbon alloy steel billets is far in excess of the country's present production and it is therefore considered that the Company will have an assured market for its products.

LOCATION OF THE INDUSTRY:

The Company's plant for the manufacture of high/low carbon alloy steel billets will be set up at Adityapur which is approximately 6 km. from Jamshedpur in the State of Bihar and is well connected by road and rail with important industrial centres such as Ranchi, Bokaro, Bhilai, Calcutta, Dhanbad, Durgapur and Rourkela.

APPLICATION TO THE STOCK EXCHANGE:

Applications have been made to the Calcutta Stock Exchange and Bombay Stock Exchange for permission to deal in and for quotation for the Equity Shares and Preference Shares of the Company.

	Rs.	29,89,000

Now offered to the Public for subscription for cash at par:

4,41,000 Equity Shares of Rs. 10/- each	Rs.	44,10,000
30,000 9.5% (free of Company's tax but subject to deduction of tax at source at the prescribed rates) Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs.	30,00,000
	Rs.	74,10,000

*A sum of Rs. 19.99 lakhs has been deposited by Usha Martin Black (Wire Ropes) Limited with the Company. Usha Martin Black (Wire Ropes) Limited has given an undertaking to the underwriters hereinafter named that they will not withdraw the said sum of Rs. 19.99 lakhs or any part thereof from the Company and that will not do any act or thing forbidding the Company from allotting the said 1,99,000 Equity Shares to them. The Company has also given an undertaking to the Underwriters that the said amount shall be applied for allotment of said Shares and that under no circumstances the said amount be refunded nor any interest be paid on the said amount to Usha Martin Black (Wire Ropes) Limited.

APPLICATION AND TERMS OF PAYMENT

Application for shares must be made only by residents in India and must be for a minimum of 50 Shares or multiples thereof in the case of Equity Shares and for a minimum of 5 shares or multiples thereof in the case of Preference Shares and the amounts payable on the respective shares shall be as follows:

	Equity Shares	Preference Shares
On application	Rs. 2.50 per share	Rs. 25/- per share
On allotment	Rs. 2.50 per share	Rs. 25/- per share

The balance of Rs. 5/- per Equity Share and Rs. 50/- per Preference Share shall be payable in such call or calls as may be determined by the Board of Directors of the Company but

so that no call shall be made earlier than two months after the date of allotment of the shares. Calls shall be made proportionately and simultaneously for both Equity Shares and Preference Shares.

UNDERWRITING ARRANGEMENTS

Out of the Shares offered to the public for subscription hereunder 3,92,000 Equity Shares and 30,000 Preference Shares have been underwritten as follows:-

Name and Address of Underwriters	Nominal value of Equity Shares underwritten	Nominal value of Preference underwritten
	Rs. (in lakhs)	Rs. (in lakhs)
THE INDUSTRIAL CREDIT & INVESTMENT CORPORATION OF INDIA LIMITED 163 Backbay Reclamation, Bombay 400020	10.00	10.00

VIETNAM

Unworkable Agreement

Lajpat Rai

ON reading the text of the "Agreement on Ending the War and Restoring Peace in Vietnam", one cannot help concluding that this is a compromise document meant to accommodate all the signatories and that it accords closely with the battlefield results in the last phase of the Vietnamese war. In this Agreement the United States was compelled to make two concessions to Hanoi: the US forces will be withdrawn from Vietnam within a specified time while the North Vietnamese forces will remain in South Vietnam for an indefinite period. The fact that the US was forced to yield on these points represents a significant achievement for the Vietnamese people as well as for the world-wide anti-war movement. But Hanoi too was forced to make concessions. The long-standing Vietnamese demand that the cessation of military hostilities be accompanied by a political solution to the civil war in the South was dropped. Hanoi and the NLF abandoned their demand that the Thieu regime be eliminated and their insistence on the formation of a three-segment coalition government comprising elements of the present Saigon administration, the Provisional Revolutionary Government (PRG) and the 'neutralist forces'. Under the agreement Hanoi was made to accede to the existence of the Thieu regime and thus to the continued existence of the American foothold in South Vietnam. The *New York Times*, a long-time critic of Nixon's Vietnam policy, wrote in its editorial dated December 27, 1972: "Long-overdue concessions on both sides have produced a document that realistically recognises a military stalemate and transfers the struggle for power in South Vietnam to the political arena where it has always belonged."

The *Wall Street Journal*, (November 27, 1972) a mouth-piece of American big business, called the terms of the proposed agreement as "quite favourable ones" and noted that they reflected "a will to settle on the part of the North Vietnamese Communists." The reactionary, jingoistic, pro-Nixon *New York Daily News* called the proposed agreement "a victory for Nixon" and commented that "in essence Hanoi accepted the proposal Nixon made last May 8, when he ordered intensive bombing of North Vietnam and mining of its northern harbours." The cause of jubila-

tion on the part of the reactionary American press lay not so much in the nature and the terms of the peace agreement that was signed, but in the fact that the negotiations in Paris came to a successful conclusion. Any pact, irrespective of its contents lends an aura of legitimacy to the US aggression in Vietnam, giving the false impression that the United States had a justified reason for intervening. A section of the American press as well as of the ruling clique in Washington had reluctantly come to the conclusion that the United States will be forced to quit Vietnam unconditionally and in disgrace with no cover whatsoever for its crimes. The agreement provided a face-saving device for the US aggressors and also a tacit recognition of the premise that the United States did in fact have something to negotiate in Indochina. In this sense, the agreement made a major contribution to the victory of Nixon in the US presidential election.

The North Vietnamese leaders themselves, while attempting to portray the agreement as a victory for the liberation struggle recognised that they had made important concessions. The *New York Times* of October 30, 1972 carried an article by Professor Richard Barnot, the Co-ordinator of the Institute for Policy Studies and an outspoken critic of the Nixon administration, who was invited along with some others "to hear a clarification of North Vietnamese views on the proposed agreement". According to Barnot, Nguyen Minh Vy, the Deputy Premier of North Vietnam and the PRG Foreign Minister, Nguyen Thi Binh, "recognise that a standstill cease-fire involves risks, particularly since they have relaxed their previous demand that President Thieu's administration and his 'repressive apparatus' be dismantled before fighting stops." That the Vietnamese have made major concessions, dropping their demand even for a dubious coalition government, is indisputable. The forces which exerted pressures for these concessions to be made are located not only in Washington, but also in Moscow and Peking. Washington's pressures were two-pronged: its savage bombing of North and South Vietnam and its mining of North Vietnamese harbours which restricted greatly the movement of war materials and other supplies; the other pressures were indirect via Mos-

cow and Peking.

As against the unprecedented concentration of explosive power dropped by the US on a small country, what help did Moscow and Peking give to a member of the 'socialist family' in military terms? The military aid given to Vietnam by the Russians did not come up even to the level of aid they doled out liberally to some friendly bourgeoisie regimes such as that of Egypt. When the Egyptian regime was threatened by further Israeli expansionism, Moscow sent weaponry of an advanced type that was never delivered to the revolutionary government of South Vietnam or to the socialist state of North Vietnam. Egypt was provided with anti-ship missiles to deter the Israeli Navy. The Vietnamese who could have used the same equipment against the Seventh Fleet, had to rely only on conventional gunnery. The Egyptian regime received MiG-23s, jet fighters that are superior to the US F-4 Phantoms, even though operation of them was restricted to Soviet pilots. The North Vietnamese had to make do with obsolescent earlier generation aircraft. Further, the most advanced surface-to-air missiles were delivered to Cairo, but not to Hanoi.

The Peking regime, no doubt, could not have provided military aid on the level Moscow could have. Yet, in the spring of 1972, the Chinese government while claiming to give "all possible assistance to the heroic Vietnamese" came up with \$ 300 million worth of military aid to prop up the undemocratic regime of Zulfikar Ali Bhutto. But the Moscow-Peking let down of Vietnam was not only military, it was also political. Both the communist capitals, especially Moscow, commanded the allegiance of millions in the international workers' movement, millions who could be mobilised into a massive worldwide campaign to force the United States to quit Indochina. But instead they followed policies aimed at splitting and dividing the world anti-war movement and tailoring it to their own diplomatic objectives. The course of events in 1972 showed the crucial role played by Moscow and Peking in forcing the Vietnamese to accept the so-called "Agreement on Ending the War and Restoring Peace in Vietnam". The drastic re-escalation of the US bombing of North Vietnam was timed to coincide with Nixon's trip to Peking and Moscow. The very visit of Nixon to the socialist capitals was a blow to the Vietnamese efforts to achieve victory. In Indochina the CIA dropped millions of leaflets showing pictures of

Mao and Nixon and Brezhnev and Nixon shaking hands. On February 14, 1972, *US News and World Report* commented: "The American authorities hope that the 'understanding in principle' reached in Peking may, in time, result in a softening of Hanoi's rigid stance, on the battlefields and at the Paris talks". The comment, of the *New York Times* of February 17, 1972, was: "Peking's attitude has undergone a subtle change. On Vietnam, instead of exhorting Hanoi to fight to the finish as in 1970, Peking now urges a negotiated settlement, even if ostensibly on Hanoi's terms." The *Washington Post's* correspondent, Stanley Karnov, noted: "The Soviet Union and China played a significant behind-the-scenes role in persuading the North Vietnamese leaders to work towards the compromise settlement of the war that now appears to be emerging". In Karnov's opinion Nixon's Peking and Moscow trips were "designed, in part at least, to urge the People's Republic of China and the Soviet Union to exert pressure on North Vietnam to agree to a compromise end to the war." The sop given to the Chinese, according to the US analyst, was that "peace in Vietnam would result in the withdrawal of US forces from the island of Taiwan."

The assessment that Moscow and Peking had pressurised Hanoi into signing the present agreement was nearly universal in the US Press. On October 30, the *Wall Street Journal's* Robert Keatly wrote gloatingly: "Premier Chou En-lai helped push a balky North Vietnamese leadership into seeking largely made-in-America terms to end the war. But Chou En-lai did not push alone. Soviet Communist Party General Secretary Leonid Brezhnev, too, has let it be made clear that Moscow also wants peace more than it desires a prolonged Vietnam war; for Russia, also, proletarian solidarity has its limits in practice, if not in theory." Keatly also reported that during Nixon's Moscow trip the Russian correspondents travelling with US reporters "privately berated Hanoi for trying to sabotage co-operation between the super powers. They also accused the Vietnamese leaders of trying to undermine the Moscow-Washington summit with their offensive in South Vietnam. As intended, such talks got into print." The same conclusion was drawn by the two well known syndicated columnists Robert Novack and Rowland Evans who wrote (*New York Times*, October 28) the

following: "Accordingly, Nixon's political judgment seems vindicated that Hanoi under pressure from Peking, Moscow and the brutally effective American bombing and blockade, would agree to a genuine compromise now, rather than dealing with a re-elected and unfettered President Nixon." But despite the intentions of Moscow and Peking, it is apparent to anyone following the developments in Vietnam, that the current agreement cannot produce peace in Vietnam; at most it can result in a temporary halt in the fighting.

The agreement recognises two administrations and more importantly, two armies in South Vietnam: Thieu's puppet outfit and the North Vietnamese army along with the guerilla units of the NLF. The 'neutralist', democratic elements, the third segment of the National Council of Reconciliation and Concord, are mostly confined to Thieu's jails. It is thus a situation of dual power in South Vietnam strongly weighted towards the side of the Saigon regime and US imperialism. The fact is that the proposed accord does not dismantle the repressive apparatus of Thieu's administration and gives the latter a free hand to suppress all opposition with a firm hand. A PTI despatch from Saigon (*Times of India*, October 30) said that the Thieu government had made the "possession of the NLF flag punishable by death." It also stated that "each person will be required to produce a government flag along with an identification card when asked by the police." PRG Foreign Minister Madame Binh charged (*Le Monde*, October 29) that Thieu had unleashed an extermination campaign against South Vietnam's more than 200,000 political prisoners, "Women and children are being tortured in jail" she said. She also added, "The US is equally responsible, for Thieu is incapable of carrying out such a policy alone." The release of civilian political prisoners according to the Agreement is a matter of negotiation between Thieu and the PRG. Even before the ceasefire went into effect, the US government rushed massive military aid to Saigon. The *New York Times* (October 27) reported that the "Defence Department was accelerating shipments of jet fighters, tanks and artillery previously scheduled for delivery to Saigon" to ensure that the equipment reached there "before any cease-fire closes off reinforcements". As a result, Thieu today has one of the greatest military arsenals in the world. His air force strength is only less than that of the US, the Soviet

Union and China. Assured of this massive US support, the Thieu regime has given ample indication of how it expects to implement the "national reconciliation and concord" called for in the agreement. In a recent interview with Associated Press (Hanoi, March 18, 1973, *Times of India*, March 19), Ha Van Lau, head of the North Vietnam's Commission for Implementation of the Peace Agreement, charged that "the US has given the green light to the Thieu regime to attack the liberated areas with all its 13 divisions". He also complained about the US troop withdrawals from South Vietnam and pointed out that the withdrawing US and South Korean troops had left their arms in South Vietnam against the provisions of the agreement. He added that "blood continues to flow and the guns are not silent yet."

From the news pouring out from South Vietnam it is clear that a blood-bath is now under way, with Thieu and his American mentors wielding the axe. Jail tortures have reached a new high and cold blooded killings of patriots are a daily occurrence. Political prisoners are being kept in tiger cages "till they forget how to use their legs". Some with withered legs were recently shown in TV newsreels. The notion that the Saigon regime will allow itself to be ousted through a gradual process of peaceful politicking is preposterous. A cease-fire cannot end the class struggle because it cannot solve any of the fundamental problems facing the Vietnamese people. Full-scale resumption of the civil war is only a short step from the Saigon repression which is already under way. Thieu can no more permit the indefinite posting of a hostile army in South Vietnam than he can allow a peaceful political process to take place in Saigon itself. The regime of hated militarists, landlords and puppets cannot peacefully co-exist for any length of time with the revolutionary armies representing the interests of workers and peasants. The Hanoi-Washington accord recognises two governments and two armies in South Vietnam and instructs them to settle their differences peacefully through an election. Only a heavenly miracle can achieve such a feat in reality. Article 9(b) of the Agreement stipulates: "The South Vietnamese people shall decide themselves the political future of South Vietnam through genuinely free and democratic general elections under international supervision." But neither elections nor international supervision can bring about any change in the existing balance of power. The 1954 Geneva

accords promised elections within two years. But the decisive delay of two years allowed Washington to build up the Diem regime, arm and finance its campaign of repression and then cancel the elections when the time came. Of course this does not take Vietnam back to the point at which it stood after the Geneva accords of 1954. The balance of forces, both national and international is in favour of the Vietnamese liberation movement. Yet, it would be disastrous not to learn from past experience and to have faith in imperialism whose recent record is as black as it was two decades ago. In this connection, one cannot ignore Nixon's threat to North Vietnam that the US would be "forced to take action" if the North Vietnamese penetration in the South continues.

But even in the immediate sense, the Agreement is likely to be unworkable. Significant areas of South Vietnam are under Saigon's control during the day and the PRG's control at night. In such a situation it is not simply a stretch of territory over which control will be disputed, but a village-by village struggle for power. There is no doubt that if peaceable processes as stipulated in the Agreement are allowed to proceed, such areas will come under the jurisdiction of the liberation forces. But Thieu will never permit such processes to unfold. The repression unleashed in the areas under Saigon's firm control is likely to snowball, spreading geographically, first to contested areas and then to areas recognised in the Agreement as North Vietnamese sanctuaries. In fact this latter process has already commenced as Ha Van Lau's protest mentioned above indicates.

What will Hanoi's response be to this repression? Will it come to the aid of the NLF guerillas when Thieu breaks the cease-fire? There is hardly any doubt about it, unless pressure from Moscow and Peking limits its actions only to the extent of defending its own base areas. Here, one aspect of the Agreement becomes perfectly clear. The most massive destructive force ever assembled — the US Seventh Fleet and the air force units in Thailand — will remain poised to attack the liberation forces. The Agreement says nothing about the deployment of American forces in Thailand and about the Seventh Fleet. The Pentagon admits that there are over 50,000 US personnel attached to the Fleet and 65,000 stationed at various bases in Thailand. The four aircraft carriers in the Fleet carry 240 fighter-bombers. The Thailand-based

air armada contains over 500 combat planes, 50 B-52s among them. Should Nixon decide (mark his threats) that the Vietnamese people have "broken the cease-fire" by resisting Thieu's bloody aggression, the planes and troops are ready. The removal of troops from Vietnam, even from Indochina, will itself in no way restrict the US ability to resume bombing at a moment's notice. If the past history of Indochina and the perfidious role of American imperialism are any indication, then should the civil war break out again and should US puppet forces again get the worst of it, US imperialism will not hesitate to resume where it left off. Since Moscow and Peking have demonstrated their unwillingness to act in the face of such an eventuality, there is no international force capable of staying the hand of the American imperialists. They were able to carry out the most vicious and brutal attacks on a people in world history because neither

Moscow nor Peking came to the aid of the Vietnamese in a meaningful way. Nor is it expected that they will do so in future.

And the Vietnamese know this. They know that they were forced to pay the price for the unprincipled *detente* — dictated by narrow nationalist interests — between Moscow, Peking and US imperialism. A *Nhan Dan* editorial (August 17, 1972) commented: "The imperialists pursue a policy of *detente* with some big countries [USSR and China] in order to have a free hand to consolidate their forces, oppose the revolutionary movement in the world ... bully the small countries and stamp out the national liberation movements ...". The same article states that the *detente* is tantamount to "throwing a lifebuoy to a drowning pirate" and accuses both Moscow and Peking, without naming them, of following their "immediate and narrow interests while shirking [their] internationalist duties."

REVIEW

Defence Strategies

S Krishnappa

Contemporary Military Strategy by Morton H Halperin, Faber and Faber, London, 1972; pp 149; £ 1.95.

THE new edition of this book was revised and published in 1972. As such it seeks to present up-to-date position papers on American, Soviet and Chinese strategies as seen by an American. Halperin has worked in the US Defence Department and later, on the staff of the National Security Council.

The author has, as is suggested by the title of the book, done well to restrict himself to looking at the power balance and strategic picture as they have developed since 1945. He has, therefore, been able to avoid a considerable amount of cluttering which invariably finds its way into other books on the subject. He regards 1945 as a watershed year. The development of nuclear technology was accompanied by a bipolar distribution of power between the United States and the Soviet Union. But by 1970 this bipolarity had broken down to some degree, the nuclear capability of the two super powers proving less relevant to the situation than such factors as the conflict between the

Soviet Union and China, the growing economic and political power of West Germany and Japan and persistent nationalism in the newly independent countries. Within the framework of the nuclear stalemate, limited local wars, including guerilla wars, have become an instrument of international political change and the United States and the Soviet Union will not intervene directly unless it affects their vital interests. Thus, general nuclear war is not worth fighting for. According to the author this paradox provides the challenge and setting for consideration of the role of military strategy in the nuclear age. Here 'general war' is defined as a war involving attacks by the United States and the Soviet Union on each other's homelands. A 'local war' is seen as one in which, though the United States and Soviet Union are in opposite camps, there is no attack on the homelands of the two super powers.

The nuclear environment has impelled new thinking and techniques, particularly quantitative ones, for dealing with these problems. The

book has a useful chapter on quantitative and qualitative analysis. However, the author holds the view that in the final analysis — as in the case of Cuba — quantitative calculations, though important, are secondary to qualitative political judgment which still shapes the crucial policy discussions in a nuclear world.

The portrayal of development in military thinking, doctrine and strategy in the United States goes around familiar landmarks. But writing on the USSR, Halperin makes an important observation in underlining the fact that the Soviet government, party and the bureaucracy do not have a single view on defence matters. Granting this, the author thereafter is on unfamiliar ground, arriving at the bold if somewhat uncorroborated conclusion that "Soviet statements and actions suggest that Soviet thinking about strategic questions closely parallels Western thought".

The survey of Chinese military strategy is of particular interest. The fundamental principle of Maoist military doctrine is the notion of going from a weak position to a strong position so as to achieve selected objectives. The Chinese Communist Party used this strategy to gain power and is now following it in its international relations. Mao has also said that an enemy may be strategically despised but must be tactically respected. This means that in the long run the enemy, however strong, can be defeated, but in the short run his strength must be recognised. It is in this light that such statements as the United States is a paper tiger are made — meaning that in the long run the US can be defeated by proper strategy.

This does not mean that nuclear weapons cannot destroy China. There is a widespread view that the Chinese do not understand nuclear war, do not fear nuclear war, in fact, even desire nuclear war, and that they lack an understanding of the realities of the nuclear age. Actually, while the Chinese recognise the importance of nuclear weapons because these weapons form the basis of increased power, they also recognise that nuclear weapons are of marginal value in achieving Chinese political objective in Asia. Likewise, an examination of the role of conventional forces as an instrument of Chinese foreign policy indicates a strong desire to avoid a major conventional war, primarily for two reasons — the economic costs in preparing for such a war and the

economic and political costs of such a venture. This has not precluded the Chinese, however, from using military forces for specific purposes as on the Sino-Indian border. The author has only touched the major trends in the Chinese military strategy and dismissed them in nine pages. He has left out many important facts about their military thinking, organisation and practice that would have interested Indian and other readers. For example, the Chinese have created an ingenious organisation for fighting the enemy even after a full-scale nuclear attack on themselves. China's improvised and cheap bomb shelters spread over the entire length and breadth of China are an achievement not only in civil defence but in keeping ready an organisation for resistance on an unprecedented scale. The standby logistic and communication systems have been similarly devised. The determination to defend their country at the level of every citizen, village and over the entire length and breadth of the countryside forms the fundamental basis of their strategic thinking and doctrine. This is an entirely unique concept — as far as conventional military thought is concerned — because it is a novel blend of the social, political and military ethos of a nation.

The Nixon doctrine, the situation in Asia, SALT (Strategic Arms Limitation Talks) and the NPT (Nuclear Non-Proliferation Treaty) have been dealt with neatly and in a 'scholarly' manner in this book. Halperin makes a very pertinent observation regarding the NPT. He says "both sides will be free to pursue improvements and changes in the areas not covered by the agreement. Each side thus needs to ask itself the question whether the likely action of the other side in the areas not covered by the agreement will produce a situation of greater or lesser strategic stability than that which would occur without an agreement".

An American carrying the burden of the 'free world' cannot, however, understand the compulsions of the situation as they exist in the have-not world. Vietnam symbolises these compulsions and there could be perhaps a dozen Vietnams waiting to be born out of injustice. Contemporary military strategy has, therefore, to devote much more attention to the field of crises and responses arising from such a situation. This, the author himself all but acknowledges at the very outset when he accepts it as a

basic premise that general nuclear war involving the homelands of the super powers has been mutually vetoed and it is the limited wars that must be kept limited.

Limited wars, of course, have an important place in the Nixon-Kissinger doctrine for maintenance of the status quo. A quotation from Henry Kissinger's book, "Nuclear Weapons and Foreign Policy", would be appropriate. (There is so much talk in the book about the opportunities presented by limited war that Kissinger's strategy seems to include initiating such a war.) Kissinger writes: "the existence of a Communist regime in some areas is a threat to our security, however the regime is established. Do we resist Communist domination of an area only when it is illegal or because the domination of Eurasia by Communism would upset the strategic balance against us?"

The Nixon-Kissinger doctrine, as expressed in the US President's 1971 "State of the World" message emphasises a limited war strategy, with an important role for nuclear weapons: "To deter conventional aggression, we and our allies together, must be capable of posing unacceptable risks to potential enemies. We must not be in a position of being able to employ only strategic weapons to meet challenges to our interests. On the other hand, having a full range of options does not mean that we will necessarily limit our response to the level or intensity chosen by an enemy. Potential enemies must know that we will respond to whatever degree is required to protect our interests." (Emphasis added.) This emphasises the search for a third option — a combination of tactical nuclear and electronically guided war.

Morton Halperin himself, after resigning from the National Security Council, wrote in the *New York Times* of November 7, 1970: "President Nixon's Vietnamisation policy, far from getting us out of Vietnam, will at best lead to an indefinite presence in Vietnam of thousands of American troops. It could well drive the President to massive escalation, the mining of Haiphong Harbour and saturation bombing of North Vietnam." The message, therefore, is clear despite the present show of US withdrawal from Vietnam. The Americans will not give up their control of the 'poor world' from where so much of their raw materials come, from where so much of their profits and prosperity are derived.

Non-Impact of Soviet Writing on Indian Thinking and Policy

Stephen Clarkson

The object of this study was simply to determine what influence Soviet writing about India had on the country's intellectuals and policy-makers. Given the exacerbation of India's relations with the US and the excellence of recent Indo-Soviet relations; given the generally satisfactory aid relationship through which Russian credits had made it possible for India to establish a large number of State sector enterprises; and given the coincidence of views between Soviet marxism-leninism and the bulk of Indian intellectuals concerning the importance of national economic independence, the imperialism of American foreign policy, and the need for State control of the private sector; the expectation behind this research was that Soviet intellectual and policy influence in India would be seen to be considerable. In fact, the research revealed that neither in theory nor in practice have the Soviets had any noticeable impact on the Indian elite's ways of thinking or acting in governmental affairs.

The low impact of Soviet writings and policy on Indian thinkers and policy-makers may, however, work to the advantage of the Soviet government, which is more concerned about stability and influence in the subcontinent than ideological converts or policy disciples. While not flattering to Soviet ideologists, India's cool reaction to marxist-leninist ideas may be the best condition for continuing healthy long-term relationship of this country with the Soviet Union.

The evidence appears conclusive that, if the influence of marxist-leninist thought is to grow in India, it will be less because of external stimulation, whether from Moscow or any other communist capital, than from the indigenous flowering of a local communist practice and experience of the type seen in Kerala or West Bengal.

IN the struggle that has been waged by the super powers for the 'hearts and minds' of the third world, it has been assumed that the ideological combat was not just a rationalisation of the great power conflict but also a direct appeal to the uncommitted nations for them to adopt socialist or capitalist models for their own development. Politicians justified aid programmes as the means to buttress recipient countries from the subversive dangers of capitalism or communism and academics devoted monographs to assess whether countries, X, Y or Z were being drawn into the orbit of the imperialist bloc or socialist camp, respectively. As this was the era of social science model-building in the Western academies and of nation-building by the mostly intellectual new leaderships in the third world, it was not unreasonable to assume that ideas would have a formative impact on the political, economic and even social systems of these 'emerging' societies. Indeed, the events that captured the headlines and dominated the book catalogues on Third World problems concerned radical changes in these new states — whether it be the erection of Castro's marxism-leninism or the downfall of Nkrumah's socialism. By inference, the leaderships — including the elites in the civil ser-

vice, the economy, the press and the universities — could be shifted from one development path to another as if they were sitting on some huge teeter-totter, just needing an ideological impulse to push them up or down one way or the other.

Recent political science research has not addressed itself to assessing what impact super power theories and models have actually had. To take as an example India which has been the most thoroughly studied of third world countries; we have studies on Indian public opinion concerning the US and the USSR,¹ comparative research on Soviet and American aid to India,² studies on the Soviet ideological line for Indian communism,³ sensitive analysis of the internal dynamics of Indian communism,⁴ and anti-communist descriptions of the extent of Soviet propaganda distribution in India.⁵ No work has been done on the influence of either the USSR or the US on the thinking or policy-making of Indians.

Since it was felt that an analysis of Soviet development theory would be incomplete without an assessment of its impact, a hundred-interview field trip was undertaken by this author to investigate the influence of Soviet thinking on the third world elite of a specific country. Since there is no 'typical'

developing country and since it was hypothesised that evidence of Soviet influence would be difficult to identify, India was chosen as the site for the field work: the interviews were carried out during March and April 1972, just after the liberation of Bangladesh by the Indian army under the umbrella of the 1971 Indo-Soviet treaty and immediately following the March state elections in which Indira Gandhi's Congress Party had elicited a second sweeping mandate of public confidence. It was in fact a period of national confidence *vis-a-vis* the outside world and, as far as the Soviet Union was concerned, a period when feelings towards the USSR were as friendly and unapprehensive as they have ever been. If the time for the research was biased towards favourable responses concerning the Soviet Union, so too was the selection of interviewees weighted in favour of knowledge of Soviet thinking and its possible impact on the policy process within the Indian government. As the objective was to ascertain what influence Soviet political, and economic thinking had on Indian thought and policy-making, the interviews were of: 9 journalists, 17 economists, 10 international relations experts, 10 other political scientists, 6 historians, 15 senior civil servants at the secretary, joint secretary or ad-

viser level, 4 in the government circle, 2 ministers and 2 ex-ministers, and 4 other politicians, 20 entrepreneurs, 14 from the private sector and 6 general managers of public sector corporations.⁶

The object of the study was simply to determine what influence Soviet writing about India had on the country's intellectuals and policy-makers. Given the exacerbation of India's relations with the US and the excellence of recent Indo-Soviet relations; given the generally satisfactory aid relationship through which Russian credits had made it possible for India to establish a large number of State sector enterprises; and given the coincidence of views between Soviet marxism-leninism and the bulk of Indian intellectuals concerning the importance of national economic independence, the imperialism of American foreign policy, and the need for State control of the private sector; the expectation behind this research was that the Soviet intellectual and policy influence in India would turn out to be considerable. In fact, the research revealed that neither in theory nor in practice have the Soviets had any noticeable impact on Indian elite's ways of thinking or acting in governmental affairs.

I

Low Impact of Soviet Scholarship on Indian Intellectuals

However huge India may be as the second most populous nation on earth, its elites are small. The English-speaking elites that actually make government decisions and formulate educated opinion are concentrated in the capital of New Delhi, the commercial centres of Bombay and Calcutta, and a handful of better university departments. Whatever truth there may be in the view that the 'real' India is beyond the grasp of the English-speaking elite, it can be taken for granted that whatever influence foreign thought, in this case Soviet, does have would be first discernible in these English-speaking national elites.

(A) Journalists:

Because the intellectual world is effectively so small, the role of the journalist as intellectual pace-setter is greatly increased. In what is a largely conformist intellectual milieu, ideas circulate rapidly. When attempting to feel the pulse of Indian thinking one is immediately referred by local intellectuals to the senior columnists and editorial writers of New Delhi's major newspapers. Interviews with these journalists revealed a set of attitudes that turned out to be widely held by all the academic

interviewees: a blend of national self-confidence and remoteness from foreign thought.

The first indication of what turned out to be a general theme running through interviewees' minds on the irrelevance of foreign thinking was expressed directly by one senior journalist as a general disinterest in all foreign writings about India, on the grounds that no outsiders could possibly comprehend the complexity of Indian social reality. Asked why his paper has never reprinted a Soviet article on its editorial page, an editor at the *Times of India* responded that, if they were to reprint foreign material it would come from the *London Times*, not the *Moscow New Times*. It was not out of animosity towards the Soviet Union that the interviewed journalists expressed low interest in Soviet writing. On the contrary; during the course of interviews it became clear that this reluctance concerning Soviet thought had nothing to do with attitudes towards the Soviet Union, which were warm when they were not enthusiastic. That the Russians have proven themselves India's best friends in action, was a point repeatedly made by these editorial writers who clearly had no fear of the Soviets nor any concern that dependence would lead to improve behaviour by the USSR. While this self-confidence contrasted markedly with the anxieties expressed by journalists such as Kuldip Nayar only a year or two before,⁷ it is even more striking that such politically pro-Soviet attitudes could co-exist with ideologically anti-marxist-leninist views. Explaining why the Indian press carries virtually no Soviet material, most journalists evinced a great distrust for the political bias of Soviet scholars and what they consider the resulting low quality of their publications. One editor's explanation for not publishing Soviet material was that India has a democratic political system; by inference, the Soviet Union's undemocratic thought was not welcome. Just as friendliness towards the Soviet Union did not prevent apprehension concerning Soviet writings, so too a distrust of marxist-leninist ideology did not prevent a much greater interest in Soviet national interests than in Soviet ideological formulations. The final straw breaking the credibility of Soviet writings for one Indian journalist was what he saw as a contradiction between the socialist agrarian theory they are preaching abroad (collectivisation and co-operatives) and the actual capitalism they are practising at home (increased size of private plots and de-collectivisation). If the Soviets are coming to the Indians for help in plant genetics, it

is understandable that this Indian writer specialising in agrarian problems could not take Soviet ideological thinking seriously. It is not very surprising that Indian journalists generally agree in their self-confident perception of the Indo-Soviet relationship and their disregard of Soviet writing. The ideological distance between the *Patriot* on the Centre Left and the *Times of India* on the Central Right is not very great: conformism and considerable defence towards the governmental line is a common characteristic of the partially controlled daily press in India. What is far more surprising is the consensus concerning Soviet writings that was revealed by interviews of Indian academics from the moderate Centre to the far Left of the ideological spectrum. While the amount of knowledge of, and the level of interest in, Soviet writings vary among different academics depending on their area of specialisation, the attitudes of those Indian intellectuals who could *a priori* be expected to be most familiar with Soviet thinking can be best presented in three dimensions: little information, low credibility, and poor personal contact.

(B) Non-Marxist Intellectuals:

Little Information: The most striking aspect of the intellectual relationship between India and the Soviet Union is the extremely low level of information among Indian academics concerning Soviet development theory. When the author presented papers on the Soviet development model in university centres the general reaction was one of great interest in information which the listeners had never heard before. At Jaipur University, speaking to a refresher course for political science professors from across north India he was thanked for telling them something about which they all "knew very little". Even at such a respected establishment as the graduate School of International Studies, Jawaharlal Nehru University in New Delhi, which is specialised in foreign affairs and area studies, the level of knowledge about the Soviet Union in general and Soviet thinking in particular was also low. Only one professor gives courses on Soviet politics. While there is some interest in communist political theory, this is restricted to a knowledge of Marx learned through western, anti-marxist texts. In fact, notwithstanding the School's interest in area studies, the Soviet Union, Central Asia, and East Europe included, the official curriculum for all courses given there included only nine Soviet books. Even adding two works by Trotsky, the Soviet-authored listings made up only

7 per cent of the recommended readings.⁸ The lack of knowledge about Soviet writings on India did not reflect disinterest in Soviet relations with India. On the contrary discussion of the Indo-Soviet Treaty, and of the new power balance in Asia resulting from the liberation of Bangladesh, all indicated a lively interest in Soviet performance and intentions. Economists are interested in the efficiency of Soviet aid projects as compared to western project performance. Liberal political scientists are interested in what kind of relations the Indian communist parties, particularly the reputedly pro-Soviet CPI, have with Moscow. But the question whether the Soviet academic researchers have anything to say of relevance about India is a non-starter to Indian intellectuals.

Low Credibility: This ignorance of Soviet writing on India is not a product of disinterest in Indian problems: on the contrary, Indian social science is characterised by an almost total pre-occupation with Indian issues. Nor is it a question of language, though it is true that facility with the Russian language is an extremely rare professional quality among Indian academics. Much is translated from Russian into English in other areas of knowledge. Soviet writings on India could be translated if the interest were there. The crux of the problem, however, was reiterated in interview after interview: Soviet scholarship suffers from an extraordinary credibility gap among Indians. What material Indian scholars have read is called by them 'turgid', 'monotonous' 'unreadable'. Worse than the style is the perceived poor quality of the writing which is dismissed time after time as 'only propaganda', 'jargon', or 'rhetoric'. The Soviet intellectual is considered not to be free to write what he considers the truth, undertaking research only to refute accusations made by the Chinese or 'bourgeois ideologists'. Where they are not being defensive, the Soviets are considered to be 'political' academics, so constrained by party directives that they could only present the official view on any particular topic. Underlying all these stereotypes of Soviet writing, is the feeling that there is a double contradiction in Soviet social science work on developing countries. One contradiction is between the Soviet writings on the third world — which are revolutionary in tone or conclusions — and Soviet foreign policy towards third world countries — which is accommodating if not supporting reactionary regimes. The other contradiction, between marxist-leninist theory which is hostile

to bourgeois capitalist systems and actual Soviet analysis of India which is presented as a progressive country, further discredits the Soviet school among the more radical thinkers.

Poor Personal Contact: It might be thought that this set of unambiguously scornful attitudes is bred by ignorance and could be corrected through better personal contact between Indian scholars and their Soviet colleagues. This is not the case. Contempt for Soviet writings may not be bred on familiarity, but it is certainly nourished by contact with the Soviet academic establishment. This contact takes two forms: meeting Soviet scholars visiting India and dealing with the Soviet Ministry of Education about research matters. When questioned about Soviet academics visiting India, Indian intellectuals have a number of responses — none favourable. The general view, as summarised by one political scientist, is that they "come as academics but talk like diplomats". Even those political economists whose better quality books are translated into English have disappointed their Indian interlocutors. Gordon-Polonskaya, author of an important study on Pakistan, gave a seminar at the School of International Studies and appeared 'doctrinaire', unwilling to discuss questions in the seminar. More recently, in March 1972, when Grigory Kotovsky was in New Delhi it was noticed that he diplomatically declined to answer a journalist's questions concerning current Indian problems on the grounds that this was 'politics' and he was a scholar. This inhibition against frank and open discussions is compared with the more free-wheeling, self-confident behaviour of western professors who, while their bias is equally identifiable, are found more stimulating because of their readiness to engage in intellectual battle.

A more specific, professional complaint comes from those Indians who have tried with little success to get facilities for research in the Soviet Union or who are frustrated by having the research projects of doctoral students wanting to do field work in the Soviet Union rejected by Soviet authorities.

Thus, whether the Soviet writings are dismissed for being determined more by ideology or foreign policy than by scientific considerations, whether the attitudes are based on direct knowledge of working conditions in the Soviet Union, or whether the scepticism is based on a knowledge of more of Soviet English-language propaganda than the best Soviet scholarship, the views of

liberal intellectuals in India are strikingly similar to those of their western colleagues, despite the unusually good relations of India with the Soviet Union and the pro-Soviet attitudes of the Indian elite.

(C) The Left Academics:

Little Information: It might be argued that these very anti-marxist-leninist attitudes are only to be expected from liberal academics brought up in the shadow of Oxford or Harvard. Their standards of scholarship are western and the better of them identify themselves as part of the international social science community. It comes as a surprise, therefore, that the large number of Left-wing political scientists, historians, and economists in India, harbour identical views towards the Soviet school of analysis though for somewhat different reasons.

One encounters as little informed knowledge about Soviet writings among radical as among moderate scholars. Whether formally members of one of the communist parties, ex-communists, or independent marxists, these intellectuals are less fellow travellers than parallel travellers: they are working with similar hypotheses, using similar concepts but not particularly interested in what their Soviet counterparts have produced. Take the case of Aurobindo Ghose a doctoral student at the Delhi School of Economics: a radical, he is working on Indian monopoly capital.⁹ When apprised of the Soviet work that has been going on for 15 years on the same subject in India, he was interested enough to want bibliographical references to any relevant English translations but was not excited to the point of wanting to go to Moscow to find out what has been achieved by Soviet scholars. A more senior colleague Krishna Bharadwaj is working on a political economy theory of development relating different modes of production in a global analysis without any direct knowledge of the large Soviet literature on this subject.¹⁰ Even a well known young radical economist like Nirmal Chandra, working on the definition of rural classes in East Pakistan, and who does refer in his writing to a Soviet book on this subject by Gankovsky and Gordon-Polonskaya, has had no intellectual contact of any kind with these authors apart from reading and citing their book.¹¹

Whether it is Paresh Chattopadhyay writing on State capitalism,¹² or Ranjit Sau trying to formulate the laws of development of the Indian economy,¹³ whether it is Ashwani Saith working on

the peasant economy,¹⁴ or Stephen Ganguli analysing Indian capitalism,¹⁵ the academics of the radical Left appear intellectually impervious to Soviet writings.

An examination of the references in the radical literature confirms this low degree of intellectual communication with Soviet sources. In a symposium edited by Mathew Kurian, "Alternate Policies for the Fourth Five Year Plan", in which a large number of marxist writers offered a critique of Congress planning, only two of the book's 257 footnotes referred to Soviet works.¹⁶

Low Credibility: Among Indian marxist scholars, this absence of Soviet intellectual output is less a result of ignorance than a series of individual rejections of Soviet work which has been seen at first-hand to be inadequate. While liberal intellectuals ignore Soviet writing out of disinterest, Indian marxists reject Soviet 'hacks' with emotion. Whereas the younger academics at the doctoral level are completely ignorant of Soviet work, their more senior colleagues, who have passed through the communist party in one or other of its former incarnations, have come to a very similar though more passionate scorn of Soviet scholarship than have the liberal intellectuals. Soviet intellectuals are not searching for the truth, they say; their work is politically controlled, so it is futile to study what they write; they are dogmatic, sterilely using pre-formed analytical frameworks; their scholarship is poor using random footnotes to pretend to seriousness.

This rejection of Soviet thought is not restricted to political economists. Marxist historians assume an attitude of amused tolerance in discussing Soviet historical work on India. While they appreciate and use some of the English translations of Soviet works on the Indian national movement — since these do accept colonialism as a reality and do not try to explain it away as do western historians — they show no real interest in Soviet historiography. For instance, they did not think recent Soviet thinking on the relevance to India of the concept of 'asiatic mode of production' was useful enough to translate into English.

Poor Personal Contact: Given the strength of these attitudes, it is no wonder that personal contact by radical intellectuals with Soviet scholars simply reinforces this rejection. Observation of the Soviet delegates at the large international seminar on "Imperialism, Independence and Social Transformation in the Developing Countries", simply reinforced these attitudes. The Soviet

delegates were felt to be highly political in their participation, applauding Indira Gandhi's path of state capitalist development for simple *raison d'état*. This hostility towards all things Soviet is considerably strengthened by the radical marxists' perception of the Soviet Union's policy towards India as that of backing the Congress Party in order to annihilate the Marxist Communist Party (CPM) — the one party that has been creatively marxism in *praxis* in West Bengal and Kerala. Even those on the Left who are not politically committed to partisan activity have been unimpressed by the quality of visiting Soviet scholars. At the Indian Statistical Institute in Calcutta, for instance, Soviet agronomists Rastayannikov and Maksimov are remembered as pleasant visitors but as not to be taken as seriously as, for instance, a foreign scholar like Daniel Thorner who has spent years in the field and talks with great personal expertise and direct knowledge.

(D) *The Centre Left CPI: An Oasis of Influence:*

One would think that among the pro-Soviet communists in and around the CPI (Communist Party of India), at least there would be considerable Soviet influence. This, after all, is the wing of the communist movement that has kept open its lines of communication with Moscow. Having succeeded in gaining access to the Congress-run government by electoral alliances and informal co-option into the government, it shares the same view on State capitalism as does the official Soviet line. As the most atrophied of the three communist fractions, could it not be expected to maintain its historical record of dependence on direction from Moscow? Once again, expectations are belied by research. Interviews with CPI intellectuals indicated that Soviet scholarly influence is as weak among the faithful as it is among the unconverted and the heretics of Indian communism.

Little Information: The level of information among Indian communists about Soviet writings on India is not perceptibly higher than the little knowledge displayed by other intellectuals. None of the CPI's leading intellects reads Russian so the informational sources are as restricted for them as they are for others — and no Indian is intellectually satisfied by the crumbs that fall occasionally from the weekly *New Times* and monthly *International Affairs*. As for translations of other Soviet writings, the party's organs are unable to handle such a task. The weekly

paper *New Age* has no space for reprints because of its limited resources. In any case the low rate of literacy in English and the few intellectual resources in the party make it practically impossible to have a serious ideological and theoretical CPI publication. Even the monthly *Mainstream*, known as a CPI-inspired magazine, which can afford good design and long articles devoted only 3 per cent of its columns to re-printing Soviet articles in 1971. Even if more Soviet indology were to be available in English, it is doubtful how much impact it would have on CPI thinking. As Mohit Sen, the party's leading theoretician, put it in an interview, Indian communists have been misled too many times by the errors of judgment and analysis, made by Moscow observers such as Dyakov and Balabushevich, for Soviet writing to enjoy the authority it did in the decade 1945-55. Once analytically bitten, twice ideologically shy. What is more, he complained, Soviet indology is not relevant to the party's day-to-day concerns since it comprises academic rather than political writings. More important, according to Sen, was the desire by the CPI to be intellectually independent of Moscow. Since the concepts and the methodology of marxism-leninism are universal, they feel no need for instruction in how to use the basic intellectual tools. These should be better applied by local communists to analysing the Indian scene than by foreigners working abroad — however superior their research resources might be.

Low Credibility: The unenthusiastic CPI attitudes towards Soviet indology are further explained by the CPI's general thinking concerning Soviet writings. Hiren Mukherji spoke with sadness of the 'shoddy' scholarship which the Soviet writers still demonstrate. Even for the pro-Soviet Indian communists, Soviet indology suffers from a large credibility gap. It is characterised by analytical wish-fulfilment, oversimplification of political problems, and imposition of stereotypes on the Indian reality.

Poor Personal Contact: Nor do the pro-Soviet Indian communists get more inspiration from their personal contacts with visiting Soviet scholars than do other Indians. Lack of Soviet support — not excessive control — was their complaint. Hiren Mukherji complained of the Soviets' failure to answer the serious allegations made against the USSR by revisionist and maoist critics. The Russians do nothing to offset their embarrassing image of a non-revolutionary power. Mohit Sen complains that

letters written to Soviet scholars remain unanswered, whereas letters to western marxists like Dobb or Sweezy receive a prompt reply. These complaints have been brought to the attention of the Soviet comrades. While Sen was careful to say that he was not charging the Soviets with intellectual colonialism, he clearly felt that his Soviet comrades were not much intellectual help to the CPI.

Objective data substantiate the CPI intellectuals' own reports that the Soviet influence on CPI thinking is equally low. Even though the propaganda campaign by the *Soviet Union* is thought by anti-communists to be colossal, such events as the world book fair held in New Delhi in March 1972 indicate that the Soviets' effort is not at all directed at communicating their political economy analysis of India to the Indians. True there was a large book display by Mezhdunarodnaya Kniga in which the CPI People's Publishing House (PPH) shared the space. Of the Soviets' English translations which are available for purchase, there was only one of any substance on Indian political economy. The rest were either propaganda brochures or reprints from Marx and Lenin. Even the Russian language books on display had no indology within their rank. It was as if the Soviets wanted to give the impression that they did no serious work on India in their own Academy of Sciences. This impression is not belied by the PPH catalogues. In its 1971-72 edition, the PPH catalogue lists only 12 Soviet books out of 115; of these 12, only three are about India. In the catalogue "Soviet Books in English 1972" 21 out of 725 titles concern the third world and of these 15 are on India, while 58 others are reprints from Marx's and Lenin's writings. In a third catalogue, "New Books in English and Indian Languages from USSR", none of the 214 titles is about India and only three are concerned with third world problems.

Consistent with the lack of serious intellectual input from the Soviet Union into Indian radical thinking, is the minimal contact that CPI thinkers have with Soviet academic sources. An analysis of the footnotes of the five most important recent books authored or edited by CPI intellectuals corroborate this psychological distance. Three books have no references at all to Soviet works. Two are collections of essays, "Das Kapital Centenary Volume", a symposium edited by Mohit Sen and M B Rao (1968), and "Homage to Karl Marx", a symposium edited by

P C Joshi of CPI (1969). The third, "Evolution of Agrarian Relations in India" by Bhowani Sen (1962), is particularly remarkable since the leading CPI expert on agrarian problems wrote a 295-page book on agrarian problems in India without making one reference to the translated work of Kotovsky not to mention other Soviet writings on the subject. Gautan Chattopadhyay's "Communism and Bengal's Freedom Movement" (1970) contains the largest number of Soviet footnotes of this group, though most of them are references to English versions of Soviet controlled press like *Inprecor* and *New Times*. Four of the 242 notes in "Society and Revolution: Essays in Honour of Engels" (1970) refer to Soviet material. Of the 1077 footnotes in the five PPH books under analysis, only 18 were from Soviet sources. When CPI leaders talk of wanting to be intellectually independent the autonomy of their printed work justifies their claim to considerable intellectual isolation.

The Barriers to Communication: If intellectuals Left, Right and Centre show the same pattern of little knowledge, low credibility and poor personal contact with Soviet intellectual sources, the prospects for increasing Soviet intellectual influence in India can hardly be considered rosy. Indeed, the efforts made by the CPI to establish some intellectual autonomy beyond Soviet apron-strings represents a trend visible throughout the academic establishment to reject foreign models and standards in favour of local approaches. On India's intellectual Left, for instance, an indigenous school of marxist scholars is crystallising. Although it is weakened by ideological and political cleavages, this collection of individuals is finding a corporate identity through occasional seminars held on specific issues and through an intellectual forum in the *Economic and Political Weekly* of Bombay which keeps the Left open to non-marxists and communicates the new marxist thinking to a wide public of government and political leaders. What makes this emerging Indian marxist school congenitally unresponsive to Russian intellectual production, is the perceived conservatism of Soviet marxism-leninism. Whatever its state of intellectual disarray, radical Indian thinking is not fossilised and would greatly resent the establishment orientation of Soviet writing which, it is felt, uncritically accepts the virtues of State capitalism for India.

A second obstacle in the way of any Soviet impact, is the fundamentally western orientation of all Indian intel-

lectuals — radicals very much included. Indeed, if any new ideas are to fertilise the indigenous marxist schools, it seems that they will have to come from the west. After the New Delhi seminar on "Imperialism, Independence and Social Transformation in the Developing Countries" it was westerners such as Magdoff and Andre Gunder Frank who were invited to tour the main campuses of the country — not the Soviet delegates. Nor do other indications within the Indian university system point to any potential increase in interest in Soviet society or Soviet thinking. There are few lecturers in Soviet politics — one in Bombay and one at Nehru University — and so, few courses on the Soviet system. While the USSR is included in the undergraduate courses on comparative politics, these institutional descriptions are at such a low level of sophistication that they cannot be counted on to raise the awareness of the new student-generations passing through the colleges. Whatever the curriculum, there will have to be a vast extension of English translations of Soviet political economy output on India, for the Soviet school to make an intellectual impact upon the undergraduate level. As it is, the handful of English translations of Soviet works are put on university library shelves, not on course reading lists. Since the Indian government has some influence in setting priorities for the translations of Soviet books, the overwhelming preponderance of English language Soviet books available in India are technical and scientific texts rather than works in political economy: only 72 of the 725 Soviet titles offered in English translations by the People's Publishing House in 1972 were on political economy, while 318 were on scientific and technical topics. The declining level of students' competence in English at Indian graduate schools, makes even the availability of Soviet texts in English a doubtful instrument for achieving a Soviet intellectual breakthrough. If authoritarian learning behaviour is perpetuated, and if conformism rather than originality is encouraged among politics teachers, it would be optimistic to predict that any foreign schools of thought will become attractive by virtue of their distinctiveness. On the contrary, the fact that they do not adhere to the ritualised formulae of mediocre professors will condemn Soviet thinking to more decades in the cold.

The low degree of interest in studying foreign systems in general, and the Soviet Union in particular, reflects both the current academic climate in India

and the educational priorities expressed by senior personnel in the Education Ministry. The possibility that Soviet aid to the Indian educational system could affect curriculum development seems remote. The Indian Institute of Technology, constructed with Soviet aid in Bombay, has the same curriculum as the other IITs established with other nations' aid, and the Soviet instructors have already been withdrawn.

Books are not the only way to convey Soviet thinking. Articles can equally well be translated. Their impact might be greater if they are published in non-Soviet journals. But an examination of the Indian press does not reveal it to be an effective communication channel for Soviet thinking. For the calendar year 1971, no Soviet articles appeared in the Indian daily press. The *Economic and Political Weekly* has never carried a Soviet article in translation. It is not surprising that *People's Democracy* and *Frontier*, which express viewpoints close to the QPM, should not have reprinted any Soviet articles during this period. *New Age*, the organ of the CPI, only reprinted 800 words of Soviet texts, or 0.05 per cent of its columns for the year; whereas *Mainstream*, the major carrier of Soviet articles, only published 39,500 words of Soviet material — just under 3 per cent of its year's total material. Direct Soviet distribution of news and commentary may get more words into the hands of Indians, but not into their minds. The number of interviewees who reported they throw Soviet embassy news hand-outs unopened into their wastepaper baskets, was a reminder that the credibility of Soviet writings must first be established by dissociating it from its official and propagandistic images in the Indian mind.

Nor is foreign language training likely to make a radical change in the general situation. The number of Indians with a reading knowledge of Russian has increased to several thousand, but the professional separation of language competence from social science expertise reduces the likelihood that these language graduates will provide a channel for communicating Soviet social science to Indian thinking.

No one has assessed the political impact of students returning from Moscow's Lumumba University whose Indian recruits are chosen by such CPI-dominated organisations as the Indo-Soviet Friendship Society and Indo-Soviet Cultural Society. There is no evidence that these repatriated marxist-leninists would be even as radi-

cal as graduates returning from American or British universities, where they can frequent revolutionaries unrestrained by Soviet Victorian discipline. There is little likelihood that the increased cultural exchanges between India and the Soviet Union, as envisaged by the 1971 Indo-Soviet Treaty, will alter this generally unreceptive atmosphere. Even the prospect of increasing numbers of Indian students spending years in the Soviet Union does not imply that much intellectual cross-fertilisation will take place. Samar Sen, editor of the radical monthly *Frontier*, reported that he had no contact with Soviet indologists during the five years he spent in Moscow. Although he was a translator of Soviet works into Bengali, he felt his command of the Russian language was inadequate to engage in serious economic or political discussion. Even if these barriers of language and distribution disappear, it would take a major revolution to break the cultural interpenetration of the Indian elite with the Anglo-Saxon world and to create a sufficient integration of the Indian with the Soviet worlds to bridge the historical gap that has kept these neighbouring peoples apart over the centuries.

This is not to say that no shift of values is possible in India. A de-westernisation of the Indian academy is already taking place. Still, this process is itself largely stimulated by the intellectual contribution of western radicals whose critique of western society and its social science is finding a response among the better Indian intellectuals.¹⁷ The simple assumptions behind modernisation and development theories are being challenged, and even liberal economists brought up in western schools are becoming aware of the narrowness of their intellectual horizons. Since the Soviet school remains dedicated to growth and industrialisation, it is unlikely to appeal to the new wave of thinking which talks the language of eco-systems and zero growth rates. Thus, for reasons of history and circumstance, of ideology and prejudice, of communication and contact, the influence of the large school of Soviet indology on Indian thinking is so low as to be negligible and it shows no prospects of discernible increase.

It is one thing to influence another nation's thought patterns; it is another to have an impact on its policy processes. Having determined that the Soviet theoretical influence in India is low, one can still ask what has been the influence on India's governmental processes of this super-power neigh-

bour — which has given the country unique international support, has opened up precious new trading relations, has provided a model for economic planning, and through its large-scale aid projects to the public sector has enabled the country to establish new economic institutions. Even if India's intellectuals still revolve in an essentially western milieu, it is surely possible that Indian *praxis* better reflects the country's position as a non-aligned country at a strategic crossroad between the socialist and capitalist worlds.

II

Low Soviet Impact on the Indian Political Process

To establish whether a foreign power has had a significant impact on the political processes and policies of another country is somewhat easier than to identify what impact it has had on the country's thinking. Behaviour can be discerned, both on the part of the country under examination and of the foreign power. Movement of personnel between one country and the other can be observed and their inter-action documented. Analytical problems arise nevertheless. How can one tell, for instance, whether India would have done what it did regardless of the Soviet Union? How can one decide whether observable impact by the Soviet Union on India is normal, more, or less, than one would expect between neighbouring countries one with super-power status and the other with major political and strategic interests in the Asian continent? Whether one looks at the Soviet impact on Indian practice, in its external dimensions of foreign policy and trade relations or on the internal plane of the planning process and policy in the public sector, the Soviet impact appears to be far less than might have been expected — given the extent, intensity and duration of the close economic, diplomatic, and military links between these two contiguous powers.

THE EXTERNAL SOVIET-INDIAN RELATIONSHIP

In the simplest sense, the Soviet Union has an obvious impact on Indian foreign policy. The reversal of Soviet world policy following Stalin's death — in particular its new open-arm approach to independent third world countries — dramatically changed India's international position. Nehru's triumphal tour of the Soviet Union in 1955 and the Khrushchev-Bulganin return visit to India in the same year dramatised

the USSR's adoption of Nehru's India as a progressive leader of the non-aligned world. India's new bilateral relationship was expressed economically by the signature of successive trade agreements which doubled and re-doubled Indo-Soviet trade.

Indians appreciate their Soviet trade relationship: the windfall benefits of markets that compete very little with other, already saturated foreign markets. It gives Indian manufactured goods a sheltered trial area for development before attacking western markets. It allows imports without expending foreign currency and provides alternative sources at competitive prices for imports of both equipment and needed raw materials. On reviewing this relationship over a 20-year period, there is little evidence that it re-oriented India's foreign policy toward the rest of the world to the extent that the Soviet policy change might have led the Kremlin to expect. While it is true that Nehru's non-alignment would have been lopsided if the Soviet Union had refused to co-operate, it is also true that India had proven its independence of western control and influence before the Moscow *colle face* of 1954-1955. India had already been critical of American expansionism in Korea during the days of high Stalinism and had shown its ability to keep its distance from Britain by rejecting Dominion status in favour of becoming a republic within the Commonwealth.

Evidence that the Soviet relationship has restrained Indian behaviour in international crises, most notably over Suez (1956) and Czechoslovakia (1968), is not seriously questioned.¹⁸ The record also shows that, even if India's non-alignment has been pink, India has sided with the United States one out of every two times that it has sided with the Soviet Union against the USA on issues when the super-powers were in direct conflict at the United Nations.¹⁹ Even so dramatic a new development as the Indo-Soviet Treaty of 1971, is considered on balance by observers of the Indian scene to have had the effect more of freeing India to pursue its own external objectives — the liberation of Bangladesh under the umbrella of Soviet nuclear deterrence against China — than of inhibiting her foreign relations.

Since the Soviet Union was the first major centrally-planned economy with which India undertook large-scale economic relations, one might have expect-

ed that certain changes would be made in New Delhi's economic institutions to manage its new bilateral trade relationship. One could also have expected that the nature of trade negotiations between India and a socialist country would be different in kind from its economic relations with the private enterprises of the western capitalist economies.

Opinion differs about whether the State Trading Corporation was established in 1956 exclusively, primarily, or only partially, to adapt Indian trade to the institutional characteristics of the centrally-planned economies. No one interviewed on this question denied that the Soviet trade relationship had a causal impact on establishing the STC. As a former manager of the STC put it, the Soviets gave a 'fillip' to the direction that Indians wanted to take in any case. What is more surprising in this regard, is the absence of Soviet collaboration with Indians in setting up the institutional mechanisms for Indo-Soviet commerce. According to an academic observer closely involved with the Institute for Foreign Trade over the past decade, the Indians had to learn by experience how to adjust to the Soviets' ways of working and trading. No Indian trainees were sent to the Soviet Union. No Soviet experts came to work with Indian civil servants. In fact, it continues to be the Indian embassy in Moscow which provides the major information on Soviet trade mechanisms for the benefit of Indian foreign trade personnel in New Delhi.

Soviet negotiators are reported by Indian officials to be tough bargainers who are not out to do India any favours but operate under the slogan 'business is business'. This does not imply that the Soviet trade relationship is less valuable than has been claimed. What does undermine the hypothesis, that the Soviet trade relationship decisively changed the nature of the Indian public sector, is more recent Soviet behaviour which has turned from dealing through the Indian public sector commercial enterprises such as the State Trading Corporation to operating directly with Indian private firms. Soviet pressure brought to bear on the Indian government to prevent the nationalisation of the New Delhi distributing agency that was handling Soviet imported tractors, indicates that the Soviet relationship may now have a negative impact on the socialisation of the Indian economy. Such evidence is strengthened by the frequently voiced (though insufficiently documented) allegation, heard especially from economists and businessmen, that

Soviet traders prefer to deal with the less respectable businessmen with some reputation for illicit operations. Even if the 'ugly Soviet' image that is developing in the country bears little relation to the reality of Soviet performance in India, the reduced esteem for Soviet aid can be expected nevertheless to reduce the political impact that Indo-Soviet economic relations might otherwise have.

INTERNAL POLITICAL PROCESSES

The fact that the Indophilia of post-Stalinist Soviet policy had less impact on India's external policies and institutions than was anticipated, does not preclude the possibility that the Soviet Union has had an important influence on Indian policy-makers — both in their conceptualisation of the State's role in planning and in the construction of the Indian public sector. After all, Nehru never hid his admiration for the socialist (as opposed to the repressive) features of the Soviet system. Before coming to power, he often referred in his speeches and writings to the Soviet experience as a model for India: "So far as I am personally concerned," he said in a speech given in London on February 4, 1936, "I very largely approve of the Russian system of government and I hope some such thing will extend to India."²⁰ After almost 10 years in power, when the basic structure of the Indian political and economic system had been assembled, he told Frank Moraes that "the Soviet experiment didn't come in the way. On the contrary, it helped our thinking."²¹

Interviews with present-day planners and architects of Indian planning, indicate that Nehru's 1930-image of Soviet industrialisation and planning may have been the most important channel through which the Soviet model had its limited influence on policy formulation in independent India. Talking on the debates on the heavy industry approach taken by the famous Second Five Year Plan (1956-61), former Finance Minister C D Deshmukh recalled that there was not much Soviet input in their policy thinking in the late 1940s. The pro-Soviet thinking of Nehru was vague and ill-defined. A commitment to a major role for the public sector in infrastructure and heavy industry development had already been made by the Tata-Birla plan produced for the Indian National Congress in 1944 by the big capitalist wing of the Party. The acceleration of industrial development, through an interventionist State investment and planning activity, was thus conventional wisdom

for the new leadership of independent India.

This does not mean that Soviet experts did not participate in the background thinking for Indian planning. One Soviet economist, M I Rubinstein, was invited by P C Mahalanobis to join the group of renowned foreign economists whom he had assembled at the Indian Statistical Institute of Calcutta to provide a brains-trust for conceptualising the planning system. Reports vary about Rubinstein's effectiveness in this assemblage of world expertise. Those who were favourably impressed by his contribution, still rate it lower than that of Oscar Lange from Poland or Charles Bettelheim from France — both marxists who were stronger in intellect and more respected in their policy advice. According to C D Deshmukh, Joan Robinson was the most influential foreign economist with her Left-leaning sympathies and her theoretical rigour. The most generous assessment of Soviet policy influence came from P C Mahalanobis himself, who went to Moscow as early as 1952 to consult Soviet Planning experts. Such economists as Strumilin and Varga gave him strong advice — but in the direction of not going too far with forced industrialisation. Recalling the Soviet scissors crisis of the late 1920s they advised against too much nationalisation, against too large a steel target for the Second Five Year Plan, and even supported Mahalanobis's inclination to support small-scale cottage industry at the same time as heavy industrialisation was proceeding. Asked whether the Second Five Year Plan would have been different without this Soviet participation, Mahalanobis replied that it was helpful to have their sympathy at the top level, "like airforce cover for the army". Thus, rather than pushing the Indians into radical action, Soviet influence on the Indian planning system was first to popularise the general idea of planning among Nehru's colleagues, second to restrain Indian policy planners from over-enthusiasm, and third to provide both internal political support through their private conversations with Indian leaders and external ideological assistance through their public writings in the Soviet press.

This supportive participation in the Indian plan formulation was the high point of the Soviet's involvement in the Indian policy process. It is true that Rubinstein was followed by a number of Soviet statisticians who visited the ISI. Their contribution, however, was academic: they gave papers on Soviet

statistics, but not advice on Indian practice.²² Rubinstein thus remains the sole Soviet economist who had any personal involvement in the planning of Indian planning — a participation that must be contrasted with the Ford Foundation team of American economists who still have official status as members of the Planning Commission, despite the officially cool relations between the US and India. It is, in fact, only with some difficulty that economists can be found in the Planning Commission, who are even interested in either what the Soviets write about India or what the relevance of the Soviet industrialisation debate of the 1920s might be to India's industrialisation problems. Whether it is a feeling that Indian planners are highly sophisticated economists themselves or that modern Soviet problems are quite different from those of India, even P C Mahalanobis expressed no desire for further Soviet intellectual participation since the formulation of the Second Five Year Plan. Since the basic plan formulation was completed, he felt, the Soviets had more to contribute by capital assistance to specific public sector projects.

It is indeed obvious that the Soviet Union has had an impact on the Indian economic process through directing its aid effort primarily to large industrial projects in the public sector. The Bhilai steel mill, like the Aswan Dam, is an international symbol of Soviet aid. The question that concerns us here, is whether these public sector aid projects themselves have had an impact on the Indian policy process. By helping the Indian government develop a publicly owned oil industry which the western oil cartel refused to permit India, Soviet aid has clearly affected the shape of the Indian economy in that industry as in other industries where it has helped construct public sector enterprises. By training Indian engineers to take over management of these enterprises, it has also helped the Indian economy to sustain the operation of these projects and, in some cases, to expand their activity. These statements can, of course, also be made of aid relationships by other countries with India; but the major difference is that Soviet projects have related more to the public industrial sector than to infrastructure projects in the public sector.

Apart from this important distinction there seems no tendency for these projects, whether taken individually or as a whole, to affect the Indian policy process in the public sector. Discussions with managers of public sector enter-

prises and with senior civil servants or politicians responsible for them, indicated only a qualified enthusiasm for Soviet aid projects. Repeatedly the point was made that the Indians had gone to the Soviet Union for aid in building a particular public sector enterprise only when western countries had turned down Indian requests. The price of getting Soviet support for a particular project was accepting less sophisticated and less up-to-date technology. The resulting lower efficiency constituted an economic sacrifice generally balanced by the positive contribution the enterprise made to the economy. Many irritating examples of bad planning rattle in the Indian policy-makers minds: the surgical instruments factory that has still not sold any of its products on the Indian market; the roof design of the Bokaro steel mill built in a tropical area yet constructed to withstand six feet of snow. The ideological euphoria with which Soviet writers discuss these projects contrasts sharply with Indian views on them. A striking example is the State farm at Suratgarh which, in Soviet writings, is seen as a model farm for collective farming but, in the view of its manager, Congressman Krishna, has no ideological significance beyond its practical purpose as an experimental farm producing the seed grains needed in Indian agriculture.

This evidence makes it necessary to qualify the conclusion by Eldridge, among other scholars that, because "the forms of Soviet aid to India have proved mutually convenient the political impact of Soviet aid on India has for this reason been out of all proportion to its amount".²³ It does not follow that because there is "a general bias of opinion at the senior administrative level in favour of the Soviet Union"²⁴ friendliness towards a neighbouring state has led to a proclivity to adopt its institutions and processes. Quite on the contrary, there is no evidence at all of the policy spin-off from the excellent diplomatic and economic relations between the Soviet Union and India that will soon enter their third decade. Whether there has been a significant pay-off in terms of Soviet influence among senior Indian policy advisers, civil servants, government leaders and businessmen still remains possible and worth investigation.

THE HEARTS AND MINDS OF INDIAN POLICY-MAKERS

Outside the Ministry of External Affairs, which devotes some resources to monitoring and responding to Soviet

writings on India, there was no evidence from our interviews of Indian policy-makers of any knowledge of Soviet thinking about India and even less interest in the relevance of Soviet practices for Indian problems. Interviews at the Secretary or Joint Secretary level elicited views which were hostile to the jargon of marxism-leninism, critical of what was considered / erroneous class analysis not corresponding to Indian reality, or impatient with Soviet writings if they did not have concrete recommendations to make on specific policy issues. All civil servants and advisers interviewed were glad of the Soviet commercial and diplomatic relationship with India; none indicated any expectation that he would find any theoretical or practical help from Soviet indologists in dealing with his current policy issues.

This does not mean that there is no radical thinking in the Indian civil service. But prominent advisers, known for their radical background, have little intellectual contact with Soviet marxism-leninism. Marxist radicals with a strong commitment to achieving an egalitarian society have even less contact with Soviet thinking. One such government adviser, Arun Ghosh, has developed a coherent argument for the more effective and aggressive use of the levers of State control by an extension of welfare and liberal economic theory to achieving socialism and reducing the role of the private sector. In working out his case, he has responded pragmatically to the problem of the 1970s with no reference at all to marxism theory or Soviet writing.²⁵ Lack of interest and expectations concerning Soviet thinking is not just a linguistic problem. Wolf Ladejinsky, a well known student of Indian agrarian problems whose mother tongue is Russian and who works for an international organisation in New Delhi, had no knowledge of Soviet writings, no interest in finding out about them, and no concern with what their recommendations might be. Underlying this dismissal of Soviet thinking among senior policy-makers is the perception that ideology is far less important than *raison d'état* in determining whether the relations between the Soviet Union and India prosper. Allied to this lack of concern with Soviet writings is the sense of confidence, particularly noticeable in the Ministry of External Affairs, that, whenever problems arise between the two countries, they can be resolved by direct negotiations.

The complete divorce of government

was best expressed by Mohan Kumaramangalam, the Minister of Steel and a member of Indira Gandhi's inner cabinet circle. Although a member of the communist party from 1935 to 1956, he does not read Soviet writings or have direct knowledge of Soviet thinking about Indian economics. While grappling with the problems of increasing the efficiency and productivity of both public and private sectors in the steel industry, by creating a new holding company²⁶ that could exert complete control over the whole process of production from mine to ingot, he had no inkling of what the Soviets might be thinking of such a new venture. Still expressing a strong interest in socialist goals, he was more concerned with raising the standard of living of the mass of Indians than expanding the State sector for the sake of ideological purity.

A sense of balance between form (ideology) and content (policy) characterises Indira Gandhi's handling of the overall Indo-Soviet relationship. Interviewees including most businessmen were pro-Soviet since the USSR had just proved itself in the time of need during the Bangladesh liberation to be indeed a true friend of India. Despite real Indian gratitude for such consistent support, there was general sensitivity to the danger of dependence on the USSR. Interviewees were generally confident that Indira Gandhi was never going to accept any serious dependency and that, should the Soviets abuse their influence, the whole relationship could be broken off overnight. This co-existence of great friendliness with an underlying distrust is one part of the double contradiction on which the dynamic of India's non-alignment is based. Although attitudes towards the USSR as an international power are warm and friendly, attitudes towards the Soviet system and ideology are hostile and suspicious. The Indo-American relationship shows an equal but opposite contradiction. Attitudes towards the US are almost universally hostile: the Americans who refused to build Bokaro and whose re-arming of the Pakistani army forced India to divert scarce resources to its own military forces are seen at every step to be undermining India's position. This anti-Americanism seems as superficial as the pro-Soviet feelings. Whether it is *Time* magazine, "Future Shock" or the latest Harvard University Press publication, the reading material of Indian leaders, moderate or radical, betrays their basic westernisation that is far too ingrained to be fundamentally damaged by the blunders of American foreign policy. Whether

this double contradiction is a conscious policy or not can be debated. What seems an inescapable conclusion is the usefulness to those in power of this double dissonance. The superficial anti-Americanism, which is managed carefully by press manipulation and the government's activation of trivial issues, combined with the superficial pro-Soviet views of the public make an effective instrument for continually re-gliding the government's and the leader's progressive image; simultaneously ingrained anti-Soviet attitudes provide an insurance against any uncontrollable shift to the left on the Indian scene. At the same time, the pro-western attitudes of the Indian elite allow the leadership to maintain India in its various international economic, political, academic and scientific relationships, thus keeping India abreast of the latest developments in the world community. The low impact of Soviet writings and policy on Indian thinkers and policy-makers may also work to the advantage of the Soviet government, which is more concerned about stability and influence in the subcontinent than ideological converts or policy disciples. While not flattering to Soviet ideologists, India's cool reaction to marxist-leninist ideas may be the best condition for a continuingly healthy long-term relationship of that country with the Soviet Union.

The evidence appears conclusive that, if the influence of marxist-leninist thought is to grow in India, it will be less because of external stimulation, whether from Moscow or any other communist capital, than from the indigenous flowering of a local communist praxis of the type seen in Kerala or West Bengal.²⁷

The impact of Soviet development writings on other countries of the third world cannot, of course, be deduced from the Indian case. Experience has already shown one case in the person of Fidel Castro who was so attracted by marxism-leninism that he declared himself a communist and was admitted to the socialist camp. Others such as the UAR have practised the non-capitalist path which the Soviets preach while invoking Allah rather than Lenin as doctrinal source. Chile presents the example of a country with an autonomous marxist tradition, independent of the marxist-leninist school. In some of the younger States the elite is much narrower than India's and so possibly more amenable to foreign made analysis. In the Latin American countries which have enjoyed political, if not economic, independence

for generations, there are national intelligentsia that consider themselves best suited to work out the solutions to their own problems. In sum, while it is probable that the fortunes of marxist-leninist thought will wax and wane in different countries of the third world, it is unlikely that a critical variable will be the intellectual content of Soviet scholarly and semi-academic writings. The Soviet school of third world studies has many problems to overcome; but its path of development now seems more likely to be in the direction of flowing into international academic basins than towards the revolutionary waning trough.

- 6 Half of the interviewees received by mail in advance a copy of a paper written by this author on the Soviet Model of Development for India. The others received a summary of this paper or had read it as printed in this journal, (March 22, 1972). In addition to the 101 direct interviews the author had contact with 104 other Indian academics in groups devoted to discussing the Soviet model for India, 66 at three formal papers presented by the author (one in Jaipur and two in New Delhi) and 40 at four discussions held on the same subject (one in Allahabad and three in Delhi). These discussions were with groups who could be presumed to be among the most knowledgeable and interested in Soviet writings and the Indo-Soviet relationship. Since there is no clearly demarcated elite 'population' of which a scientific sample could be made, the research strategy was to talk with all those Indians at the upper leadership levels with a possible serious interest in the Soviet view. As the expertise of the interviewees ranged from the Planning Commission to the Ministry of External Affairs, from Indian Oil to the State Trading Corporation, from the

Delhi School of Economics to the School of International Studies, Nehru University, from the radical weekly *Frontier* to the moderate *Times of India*, no attempt was made to impose a standard interview schedule. With the general subject matter defined by the author's paper on the Soviet Model for India, the discussions ranged widely depending on the interests of the subject who was questioned on whatever aspect of the Soviet relationship that was relevant to his own professional or ideological position.

Swadeshi Polytex

SWADESHI Polytex, which recently launched its 'Jailene' polyester staple fibre, has already secured orders from several mills all over the country, including an order worth Rs 60 lakhs from the Mafatlal group. Swadeshi's Rs 15-crore 'continuous process' plant, set up at Ghaziabad in technical collaboration with Zimmers of West Germany, has started with the finer 1.5 denier — unlike other makers in India who, according to managing director S Jaipuria, had commenced production with the coarser deniers like 3 and 2.2. The company will also manufacture 1.2 denier high tenacity fibre, demand for which is at present met mostly by imports. Jaipuria claims the quality of his company's fibre is comparable with the best produced anywhere in the world. Commercial production at the plant started in mid-March last, in less than 20 months of effective working. The company is opening a depot at Ahmedabad to render prompt service to customers. A technical services division, manned by highly qualified technologists, has been set up with branches at important centres in the country to render on-the-spot advice and assistance to mill technicians for successful processing of 'Jailene' blends on mill floor. A well-equipped physical and chemical testing laboratory has been established at the plant site to ensure quality control.

Estimate of Household Sector's Savings in Fifth Plan

Elizabeth Krishna

Prasanta K Pattanaik

K Sundaram

In the Planning Commission's Approach to the Fifth Plan, a new procedure has apparently been adopted, different from the methods previously used by the Central Statistical Organisation and the Reserve Bank of India, for estimating that part of household saving (generally between 40 per cent and 50 per cent, going by recent estimates) which is invested in tangible assets within the sector. The account of this estimation procedure provided in the Approach document requires clarification.

IN the Approach to the Fifth Plan, 1974-79 [1], the Planning Commission has made one notable departure from past practice, in conducting the saving-investment exercise in terms of gross rather than net saving and investment. This is appropriate in view of the importance of depreciation provisions as a form of saving, and the arbitrariness of any attempt to measure the precise component of capital expenditures corresponding to replacement.

However, we are concerned in this note with the Planning Commission's estimate of the saving of the household sector over the Fifth Plan period. Here also a new procedure has apparently been adopted, different from the methods used previously by the Central Statistical Organisation and the Reserve Bank of India, for estimating that part of household saving (usually between 40 per cent and 50 per cent in the past, if we are to go by recent estimates [4]) which is invested in tangible assets within the sector. The account of this estimation procedure provided in the Approach document seems to require clarification.

The exercise of estimating the financial resources for the Fifth Plan, whose results are described in Chapter VII of the document, has been conducted in a flow-of-funds framework. The main sectors distinguished are: the public sector, consisting of central and state governments and non-financial public enterprises; the private sector, consisting of the non-financial private corporate sector, the non-credit co-operative sector and the household sector (including unincorporated enterprises); financial institutions (public and private); and the rest of the world. The household sector is the main 'surplus' sector, in the sense of saving in excess of its own investment in real assets, and, along with the rest of the world, it finances the 'deficits' of the government and private corporate sectors — in the case of the household

sector, mainly through the medium of financial institutions. The estimated saving of the household sector constitutes about 53 per cent of the total investible resources (domestic saving plus foreign borrowing) projected for the Fifth Plan period, while its estimated investment in real assets is about 22 per cent of the total.

For any sector, the following accounting relation can be written, based on the identity of its total incomes and outgoings on capital account:

$$S = I + FU - FS,$$

where S = gross saving of the sector, I = gross investment by the sector in tangible assets, FU = its financial uses of funds and FS = its financial sources of funds. FU may be defined as the net increase in its financial assets, with decreases in assets treated as negative uses, and FS as the net increase in its financial liabilities, with decreases in liabilities treated as negative sources; alternatively, decreases in liabilities may be treated as uses and decreases in assets as sources. Further, the flows FU and FS may be measured at various levels of netness or grossness, depending on the degree to which positive and negative elements are offset against each other in their construction — for example, lending by one sector to another against borrowing by the same sector from the other, increases in a sector's holding of some assets against decreases in its holdings of other assets, or the lending against the borrowing of different sub-sectors of the same sector, whether between themselves or with another sector. A greater degree of grossness is often desirable as conveying more information, and of course makes no difference to the figure obtained for the net flow, FU — FS, indicating net uses, or net sources (if negative), for the sector. In India, the household sector is treated as the residual sector in the estimation of financial flows, so that no intra-sector transactions can be

identified. This prevents, among other things, any examination in this framework of the activities of indigenous bankers and moneylenders (who are included in the sector) and of their role in the process whereby the positive savings of some households are absorbed in covering the dissavings of others.

A sector's net financial uses (sources if negative), FU — FS, must be equal to its 'non-financial surplus (deficit)', S — I, from the accounting relation above.

The Approach document estimates FU for the household sector (defined as the net increase in its financial assets) as Rs 19,105 crores (at 1971-72 prices) for the Plan period, and FS (defined as the net increase in its financial liabilities, or borrowing net of repayments) as Rs 4,885 crores. Hence net uses by the sector, FU — FS, are estimated at Rs 14,220 crores, and this represents the sector's non-financial surplus, and the net transfer of its savings to other sectors.

ACQUISITION OF TANGIBLE ASSETS

While data on financial flows exist which permit a reasonable estimation of the financial component, FU — FS, of household savings,¹ the same is not true of the other component, representing the sector's acquisition of tangible assets. Earlier attempts have been made to estimate this independently, using the commodity flow method or other procedures.² However, in the Approach document, and preceding that in the Fourth Plan Mid-Term Appraisal [2] the estimation seems to be attempted from data on the financial flows themselves. It is here that the Planning Commission's account of its procedure seems to be unsatisfactory.

The Approach document states (p 33):

"As regards the household sector's acquisition of physical assets, that is

its direct investment, a rough guess has been attempted from the side of availability of resources on account of lack of the requisite data. Household investment in the Fifth Plan period will be financed from four main sources: (1) net borrowing from other sectors; (2) realisation of claims on Life Insurance Corporation; (3) refunds and withdrawals from provident funds; and (4) financial saving minus the amount absorbed in accumulation of financial assets. The total amount available for financing direct investment has thus been estimated at Rs 9,850 crores. This has been assumed as the likely order of the household sector's saving in the form of physical assets."

As it stands, this is a curious statement. The estimation of investment from its sources of financing might be interpreted as a use of the previous accounting relation, which we can restate for the purpose as:

$I = S - FU + FS$, particularly as source (1) enumerated in the statement seems to be FS, and source (4) seems to be $S - FU$.³ But sources (2) and (3) are particular (negative) components of FU, so the 'amount absorbed in accumulation of financial assets' in (4) must be interpreted as FU without the deduction of these items, if these 'sources' are not to be counted twice over.

However, one relationship cannot be used to estimate two unknowns, and in the enumeration above of sources for financing investment, one source — saving — is itself the unknown which we are supposed to be estimating. Hence we seem to see the Planning Commission starting with the estimation of saving as net financial accumulation plus direct investment, and then running round the back of the problem to come out on the other side estimating investment as saving remaining after net financial accumulation. Consequently the figure of Rs 9,850 crores for investment emerges without any visible basis, along with the figure of Rs 24,070 crores for saving which follows in consequence. If the investment figure has been obtained by some independent estimation procedure (such as any of those referred to earlier), saving will of course be obtained from the accounting relation as a residual; or if saving is independently estimated, investment will be similarly obtained. Otherwise from the figures for FU and FS and the accounting relation, only the non-financial surplus $S - I$ can be derived and not either of its components separately.

However, use of the accounting relationship, since it is one which obtains

among all the elements of the capital account, requires a complete enumeration of the sources for financing investment; an identification of the 'main sources' would be meaningless in such a context. It could be meaningful in the context of a different type of procedure, which is based on relationships which often exist between certain specialised financial flows and particular types of expenditure. For example, if investment in urban housing were known to be financed almost entirely by mortgages, then data on mortgages would furnish a meaningful estimate of this type of investment. This would be so even if it were known that a given proportion of this expenditure was financed by mortgages. Logically, this is to add to the accounting relation an empirically testable relationship between certain financial flows and certain non-financial outlays in the capital account. However, this procedure can be applied meaningfully to particular categories of expenditure and to specialised financial claims; it becomes less plausible when extended to global expenditure categories like tangible investment, which have correspondingly generalised sources of finance — including savings itself to start with. Even sources (2) and (3) — matured life policies and provident fund withdrawals — while specific enough in one sense, seem curious candidates for this particular emphasis. For one thing, their magnitude does not seem to qualify them for inclusion as 'main sources'.⁴ For another, normal considerations from the theory of consumption behaviour would suggest that such receipts are primarily used for consumption expenditure, since they, or rather their annuity equivalents,⁵ are more analogous to income receipts, whose role in the life-cycle is such that the average and marginal propensities to consume from them approximate unity. Similarly, while net borrowing from other sectors may be mainly for investment purposes (since the main sources of consumption loans are within the sector), nevertheless some of these loans can be identified as extended for consumption purposes.⁶ In the 'accounting procedure' discussed above, for obtaining investment as a residual, these considerations would be irrelevant, since borrowing or asset realisation used to finance dissaving would imply equivalent netted-out positive saving by other households available to finance investment. However, for the 'specialised flows' procedure outlined in this paragraph, such sources would have to be excluded.

AMALGAM OF TWO APPROACHES

The Approach statement as it stands seems to be a confused amalgam of the two approaches, which its reference to 'main sources' but an apparently comprehensive enumeration, and its inclusion in the enumeration of some highly general categories along with certain specific ones. In any case it leaves one no clearer about how the estimates given for household saving and investment were actually arrived at.

An extension of the 'specialised flows' procedure would be to posit some proportionality or other relationship between certain specified sources of finance and the expenditure being estimated, or equivalently, some ratio between the use of these and other sources in financing the expenditure. Again, this is to add a second independent relation — institutional or behavioural — to the accounting identity already presented, so that two independent relations are available for the estimation of the two unknowns, saving and investment. This is essentially what was attempted in the Mid-Term Appraisal. Here (pp 28-29) it is stated that:

"Direct investment by households ... is made up of resources obtained by the households in cash by way of loans from government, banks, Life Insurance Corporation, co-operatives, term-lending institutions and the matching contribution made by them out of resources obtained from maturity of life policies, withdrawals from provident funds/fixed deposits, running down of cash holdings, sales of securities, bonds, shares, etc."

The additional relation posited is: $I = 2FS$, i.e., investment is financed half by net borrowing from other sectors and half from other sources. In the exemplification of other sources, matured life policies and provident fund withdrawals retain their curious prominence, but the association with them of the 'running down of cash holdings, sales of securities, bonds, shares, etc' indicates that this is a residual category. (Savings as such are not mentioned.)

While logically at least this is a defensible procedure, the particular hypothesis adopted, that investment is double net borrowing, does not seem very compelling. The Appraisal (p 25) refers to the matching contribution which the lenders require the households to make out of their own resources, but this seems likely to involve an over-generalisation. Certain other estimates of household investment ([4], [6]) do seem to show it as between two to two and a half times net borrowing in certain recent years, but it is not

clear how these investment estimates themselves were obtained. Since no satisfactory estimates of household investment have been possible in the past, any ratios involving household investment based on past 'experience' cannot claim much sanctity, and projections based on them will do little more than perpetuate ignorance.

In this context it may be noted, whatever the significance to be attached to it, that the estimate given for household investment in the Approach document, Rs 9,850 crores, is in fact approximately double the figure given for net borrowing, Rs 4,885 crores.

Recently attempts have been made ([4], [6], [7]) to put onto a more systematic basis the estimation of sectoral saving and investment in the context of financial flows. The financial transfers linking the non-financial surpluses and deficits of the various sectors over any period are presented in a financial transactions matrix, from which co-efficients can be derived showing the proportions in which sectors distributed their lending over other sectors or derived their borrowing from other sectors. Given stability of these co-efficients of financial activity, a given pattern of sectoral saving will give rise to a particular pattern of sectoral investment, or vice versa. Hence if sectoral savings are estimated independently, the investment pattern consistent with them can be determined; this requires stability (or predictability) of the lending co-efficients. Alternatively, if a certain sectoral investment pattern is proposed, the savings pattern required to generate it can be derived; this requires stability in the borrowing co-efficients. (Needless to say, both saving and investment cannot be estimated simultaneously.)

Independent estimation of household sector savings for the purpose of such an exercise would be based on projections of income and the use of average and marginal propensities to save derived from past trends. However, since existing estimates of past household saving are unreliable for the tangible investment component, these average and marginal savings ratios are subject to the deficiencies already mentioned.

Our purpose here, however, is not to comment upon these methods. It is merely to point out that the 'explanation' offered in the Approach document of its procedure for estimating household saving and investment is less than enlightening.

Notes

- 1 However see A Rudra [5] on the sizeable discrepancies which have arisen even in the area of financial flows between the estimates put forward by different agencies.
- 2 See A Rudra [5] for an account and critical evaluation of these procedures.
- 3 That is, if the term 'financial saving' is interpreted as referring to monetised saving. In that case, both 'S' and 'I' above must be interpreted as representing the monetised components of saving and investment. The non-monetised component, representing the households' contribution in kind in terms of 'own labour and material', is identically the same for both saving and investment, and so makes no difference to the accounting relationship involving the monetised components. The non-monetised component is estimated in the Mid-Term Appraisal (p 29) as 10 per cent of monetised investment, on the basis of rural survey data.

The term 'financial saving' is sometimes used to mean $FU - FS$, but that interpretation would lead

to absurd results in the present case.

- 4 In 1971-72, Rs 91.92 crores was paid as claims by the Life Insurance Corporation [8]. In 1968-69, Rs 107 crores was paid out of the Central Government/State Provident Fund and Rs 44 crores out of the 'provident fund and other funds' of the state governments [9]. In 1969-70, Rs 32.89 crores was paid from the Employees' Provident Fund [10]. Hence roughly Rs 1,500 crores might be expected from these sources over the Fifth Plan period.
- 5 Since these receipts are in lumpsum form, the argument applies strictly to their annuity equivalents. It suggests that the lumpsum receipt is likely to be reinvested in financial assets, which can be converted into an income stream through progressive realisation; this income will be used to support consumption. (The use of such terminal receipts for house purchase or construction seems less likely than the finance of such outlays by borrowing against mid-term life policies or provident funds. Such borrowing is included in FS.)
- 6 E.g., Rs 280 crores representing government loans to its employees for vehicles. Doubts also arise about 'loans on account of natural calamities' placed at Rs 520 crores for the Fifth Plan.

Haryana Electro Steel

HARYANA Electro Steel, which is setting up a mini steel plant near Sonapat with an annual capacity of 13,500 tonnes of mild steel, medium carbon and spring steel billets, expects to commence commercial production by October next. The project cost, estimated at Rs 70 lakhs, is to be financed by share capital (Rs 25 lakhs) and term loans and deferred-payment scheme of IDBI (Rs 45 lakhs). The promoters have already subscribed for equity shares of the value of Rs 10 lakhs, and the public is being offered for subscription at par equity capital of Rs 15 lakhs in shares of Rs 10 each. The Board includes a few prominent industrialists such as B R Jain (Director, Delhi Cloth and General Mills), Mohan Lal Bhatia (Managing Director, Hindustan Wires), Saroj Kumar Poddar (Managing Director, Poddar Projects), and a young entrepreneur Pradip Gupta. Gupta expects the company to start paying a dividend of 10 per cent out of the earnings of the first year of production and raise it to 15 per cent and 20 per cent, respectively, in the two subsequent years. The subscription list will open on April 18 and close on April 30 or earlier, but not before April 20.

MISA: TWO BIRDS WITH A STONE

STATISTICAL INDUSTRIAL GROWTH

SIKKIM: 1949 WITH A DIFFERENCE?

LICENSING AND CONCENTRATION

DROPLETS OF SOCIALISM

SARVODAYA: NO FOOL'S GAME

Changes in technology reflecting changes in industrial patterns. Nothing remains static behind this symbol. The thinking process goes on generating vast resources of technical know-how and manufacturing skill.

It started in 1938 when two engineers applied their minds to manufacturing dairy equipment. Today we are about 10,000 people involved in manufacturing plant and equipment for every major industry from dairy to nuclear. Much of the equipment was never manufactured in India before.

Tomorrow we'll be vastly different from what we are today. Because things are never static behind this symbol. The thinking process goes on. The pool of technical resources grows lending new dimensions to our capability of manufacturing equipment for every vital industry.

Tax Shenanigans

THE government's much-publicised campaign against tax evasion and black money, with the report of the Direct Taxes Enquiry Committee serving as a sort of combat manual, proceeds in a series of half-hearted skirmishes. The battle proper is never joined. The Committee's recommendation that the government should assume powers to acquire immovable property in cases where the sale deed did not reflect the true market value of the property was put on the statute books last year through the Taxation Laws (Amendment) Act, 1972. Now this week the cabinet is reported to have approved a more comprehensive bill incorporating some of the Committee's other suggestions.

The loopholes left in the Taxation Laws (Amendment) Act, 1972 are obvious enough. The minimum value of Rs 25,000 prescribed in the Act for a property to become liable to acquisition leaves the door open for immovable properties of market value exceeding Rs 25,000 to be parcelled out in such a manner that the value of each part is less than the minimum. Again, the time-limit for initiating acquisition proceedings of six months from the date of registration of the instrument of transfer, appears almost to be deliberately designed to facilitate evasion of the law through collusion between officials and intending tax evaders. Most serious, the Act is only an enabling legislation and the rigour with which it is implemented will depend on the policies of the government. And in this regard, the record of enforcement of laws concerning economic offences warrants no optimism at all.

The new bill now proposed to be brought forward is said to widen the income-tax authorities' powers to search premises and seize properties and to provide for enhanced punishment, in terms of penalty and imprisonment, for tax evaders. But before one is overly impressed by the seemingly draconian provisions, it might be instructive to see what use has been made of the penal provisions of existing tax laws. Consider, for instance, the facts brought to light by the 51st report of the Public Accounts Committee (Fifth Lok Sabha). The income-tax department launched prosecution for concealment of income in a mere 23 cases in 1968-69 and 40 cases in 1969-70. If these numbers seem small, consider the number of cases in which convictions were obtained: 4 in 1968-69 and 3 in 1969-70. Even that is not all; what finally takes one's breath away is the nature of punishment meted out by the courts to tax evaders. Out of the four cases in which convictions were obtained in 1968-69, two got away with nominal fines and the other two with imprisonment for six months. Of the three convictions in 1969-70, two were awarded nominal fines and a single day's simple imprisonment and the third, imprisonment for six months. The maximum punishment of two years' rigorous imprisonment provided for in the laws remains virtually a dead letter; even the minimum punishment prescribed of six months' imprisonment is seldom imposed, the courts being only too anxious to give the benefit of the First Offenders Act to convicted tax-evaders. Against this background, the futility of raising the maximum punishment for those who evade over Rs 1 lakh in taxes to seven years' rigorous imprisonment, as proposed in the legislation now under the government's consideration, is obvious enough. If tax evaders get away lightly as a matter of course, certainly the reason is not that the tax authorities lack powers or that the laws do not provide for more severe punishment. The reason must be sought in, first, the ubiquitous political and bureaucratic corruption and, second, the class bias of the tax administrators and the judges. No amount of legislative refinement will alter these basic systemic factors.

The government's unwillingness to come to grips with the problem of reform of the tax base to curb tax avoidance and evasion is to be seen in its refusal to treat the family as the unit of income taxation. This much-needed change once again finds no place in the proposed bill. If, as newspapers have reported, it is true that it is the Prime Minister who is opposed to this particular reform, the irony of the situation deserves to be noted. For, the current round of debate on treating the family as the unit of taxation had been set off by the Prime Minister's speech while presenting the Budget for 1970-71 in which she had promised to examine the question in detail and to "bring forward the necessary legislation subsequently". The argument reportedly used by the Prime Minister to go back on her own proposal is the hackneyed one that clubbing of husband's and wife's incomes might discourage women from taking up jobs. The number of families with income levels and marginal rates of tax at which this argument can have any relevance at all must constitute a minute proportion of the tax-paying population. It is typical of the *modus operandi* of the present government that such an unabashedly sectarian argument should

be used to kill a tax reform which has everything to commend itself both from the point of view of curbing of tax evasion by deliberate splitting of incomes and from that of equity — that families with the same incomes should pay roughly the same tax, irrespective of whether the income stands in the name of one or more persons.

The same kind of double-talk is to be seen also in the treatment of the report of the Committee on Taxation of Agricultural Wealth and Income. The Centre has been trying to make everyone believe that its job is done with the acceptance of the Committee's incidental recommendation of partial integration of agricultural and non-agricultural incomes and that it was now up to the states to take steps to introduce the Agricultural Holdings Tax which, after all, is what the Committee's report is about. In fact, the AHT, as envisaged by the Committee is to be introduced nationally on the basis of norms and principles uniformly applicable to all parts of the country. The onus of initiating action is, therefore, clearly on the Centre. If the government were serious about the tax, instead of passing the buck to the states, it could have set the ball rolling by appointing the All-India Committee on Agricultural Holdings Tax suggested by the Committee. But, just as it cries itself hoarse about tax evasion and black money while bending over backwards to soften the rigour of tax laws in favour of tax evaders, the government has sought to tuck away the AHT under a thick carpet even as it repeats over and over the imperative necessity to raise resources for development from the agricultural sector.

MISA

Two Birds with a Stone

THIS is a clear case of there being more than meets the eye. Stories are being carefully planted, in Calcutta as well as in New Delhi, of a resurgence of extremist activities in West Bengal. The legend of the Naxalites is being revived with a generosity not normally associated with officialdom, and despite the fact that this goes against the claim that law and order is now firmly restored in West Bengal. The motives impelling the authorities to say what they are saying therefore deserves some exploration.

One does not have to travel far in search of the clue. Even as different factions within the Congress fall out and start bashing one another's heads, the

police in the neighbourhood are overtaken by a crisis of identity. As long as the hope was cherished that the factions would be able to sort out their affairs or that the leadership at the state level would effect a patchwork of compromises among the warring elements, the police could refrain from showing their hand. The point of no return, however, would seem to have been passed. During more recent weeks, the bickerings among the different elements within the Congress have emerged above the surface; more often than not, and whether they like it or not, the forces of law and order have thus been directly involved. Persons belonging to the underworld who, in the course of the past few years, had got accustomed to receiving protection from the police by virtue of their alignment with one or other of the Congress groups, now suddenly find themselves threatened with extinction. For dear life, or, at the more mundane level, simply to save himself from the inconvenience of being served with an order of transfer, the officer-in-charge of the local police station prefers to identify himself with the cause of the dominant Congress faction in the area: the other factions, therefore, have to run for cover. True, this is not happening uniformly all over the state; it would also be difficult to prove that the alignment of the police is consistently with one particular faction. There can be little doubt, however, that some people, who till yesterday were under the benign protection of the police, are now back in the fold of the hounded. A new spirit of alienation — the outcome of intra-mural Congress feuds — is developing between the police and sections of the anti-socials. One has to give a dog a bad name before it can be hanged. Accordingly, a positive correlation should be observable in the coming months between the growing schisms within the Congress party and the rise in the quoted instances of extremist revival.

At the same time, a different kind of bird can also be killed with this single stone. Assuming the Supreme Court were to strike down the MISA when it comes round to delivering judgment on the case pending before it, the government would be in a jam. As the Attorney-General allegedly did not indicate, Parliament would then have to be moved for passing on an emergency basis an amending law empowering the authorities not to let out the thousands who are at present imprisoned under the Act. The bogey of a come-back of the extremists, it is conceivably being hoped, would put Mem-

bers of Parliament in the proper frame of mind to approve, without too detailed questioning, such a substitute piece of legislation.

Asian Reserve Bank

Without the Prince?

THE long drawn out efforts by the Economic Commission for Asia and the Far East (ECAFE), with the help of some well-known experts like Robert Triffin, to give concrete shape to plans for trade liberalisation through regional payments arrangements appear to have borne fruit in the reported agreement among some of the region's countries to start the Asian Clearing Union (ACU). However, the other, more ambitious idea viz, the Asian Reserve Bank (ARB), conceived by the ECAFE appears fated to be still-born on account of the stiff opposition to it by some prominent countries such as Japan without whose co-operation the ARB would be a hapless entity.

The inspiration behind the ACU was the desire among Asian countries to save the costs involved in clearing their mutual payments and receipts through foreign banks located in financial centres such as New York and London. The present clearing arrangements involve transfer costs and require large working balances in these financial centres. The ACU is expected to save the transfer costs and help to release the working balances held in foreign currencies for more productive purposes. While an IMF study team, entrusted by the ECAFE in 1969 with examining how far the ACU would achieve these results, threw cold water on the proposal on the grounds that the area was already well-served by an efficient banking network so that the saving in transfer costs would be marginal and the possibilities of releasing foreign currency balances limited, it did observe that "co-operation in monetary and exchange matters is important for any effective regional or subregional programme to promote trade and economic growth".

According to the proposed scheme of the ACU, each member country would open a credit line to every other member country equal to 1/6th of its annual exports to that country and in exchange receive a credit line equal to 1/12th of its imports from it. These credit lines would be subjected to annual review. The credits and debits of each member country would be entered in the books of the ACU in terms of an Asian unit (expected to be equivalent to

the SDR of the IMF), and net claims above the specified credit lines would be settled in an "acceptable currency". Obviously, countries like Japan who have a trade surplus with the region would always be offering continuous credits to other members, as only net claims over and above the credit lines are to be settled in foreign exchange.

The idea of the ARB is far more ambitious than that of the ACU and would involve even larger commitments from Japan. The ARB proposal envisages that each member country will hand over at least 10 per cent of its official reserve during any one quarter and be entitled to draw from the ARB 50 per cent of the decline in its official reserves during any one quarter and, within this limit, the full amount of its deposits with the ARB. Drawings above this limit would be subject to the approval of the managing board which, like the IMF at present, would provide the finance on the understanding that the member concerned will take necessary measures to correct the imbalance in its payments. Clearly, a country like Japan with massive and ever-expanding foreign exchange reserves would contribute large resources to the ARB without there being any chance of its drawing upon the ARB's resources.

The ARB scheme is, besides, too ambitious for the reality of the Asian region in the near future. It has been pointed out by the experts who formulated the proposal that the ARB would be left with substantial idle resources which are proposed to be invested in either the Eurodollar market or partly invested in the Asian region — directly or through the Asian Development Bank (ADB). The objection to entry by the ARB into the Eurodollar market is that, in the present unstable international monetary situation, this would be an unwise investment. Similarly, when there is already a going concern like the ADB, it is not necessary to allocate additional funds through the ARB when the members are free to allocate funds directly to the ADB, if they so choose. When the ARB scheme is not sufficiently attractive for a number of regional countries, it is somewhat quixotic to ask them to commit finances larger than are required in normal circumstances for meeting the member countries' demands on the ARB. It is more realistic to ask for the minimum necessary funds from the countries of the region until their desire for regional economic co-operation becomes strong enough. Until that stage, any unforeseen demands on the resources of the ARB on account of sudden unfavour-

able developments in the trade and payments of a large number of member countries may be met through some arrangements like the General Agreements to Borrow of the IMF.

But apart from these valid objections raised by the Japanese, the main factors responsible for their reluctance to join either the ACU or the ARB appear to be political. Though the Japanese are a part of the Asian geography, they have been associating more with the developed countries of the West — especially after 1964 when they became a member of the OECD. Their economic interests are deeply entangled with those of the Western developed countries and nearly two-thirds of their trade is with these countries. Moreover, as possibilities of trade expansion for it are essentially with these developed countries, Japan would not be interested to join an ideologically heterogeneous group of Asian countries.

West Asia

Shades of 1967?

THE Egyptian leadership is playing dangerous games again. There are shades of the 1967 crisis in the situation now developing in West Asia, with the Libya under Colonel Ghaddafi playing the role of the *agent provocateur* just as Syria in 1967 had goaded Nasser into pushing out the UN forces and placing the Egyptian army in a position of direct confrontation with the Israelis. Threatening postures have never been taken lightly by the Israelis, and if the signs of a military build-up — like the movement of Libyan Mirages and Iraqi Hunters into Egypt — continue, it is not at all improbable that the Israelis would launch yet another so-called 'pre-emptive strike' against Egyptian military formations and bases, particularly the airfields across the Suez Canal and in the Nile delta.

Among the leading factors which have allowed the present situation to arise is the inability or unwillingness of the United States to rein in the Israelis. If key military supplies were withheld, the Israelis would be forced to seek political solutions rather than purely military ones. But the US, which is the preponderant supplier of military hardware to Israel, has indicated that it will veto any UN resolution which seeks to limit arms supplies to that country.

And while the interests of the various governments — Arab, US, Israeli — get further entangled, the Palestinian guerilla movement is not only being

generally disregarded politically but is being physically liquidated by the Israelis as also by the Jordanian regime. Considering that Sadat's main aim is to remain in power and where possible to assume a militant tone over the Arab-Israeli conflict towards that purpose, it is very likely that the Egyptian regime is quietly pleased to see the guerillas being liquidated by the Israelis and the Jordanians as, more than anything else, it is the guerillas who are showing up the hollowness of nearly all the Arab regimes, including those of Sadat, Asad and Ghaddafi.

Industrial Growth

Partly Statistical

AFTER the 3 per cent growth in 1970 and in 1971, the government has, understandably, gone to town over the 7 per cent rise in industrial production in 1972. The Economic Survey as well as the Industry Ministry's Annual Report for 1972-73 have taken credit not only for the "resurgence" in output of cotton textiles, transport equipment and chemicals, but also for satisfactory growth in many other basic and capital goods industries. Textile manufactures with a weightage of 27.06 per cent in the CSO's index of industrial production rose by 9.3 per cent during January-August 1972 as against a fall of 3.4 per cent in January-August 1971. Likewise, the output of the transport equipment industries (weight 7.77 per cent), which had experienced a decline of 7.5 per cent in the first eight months of 1971, rose by 8.6 per cent. The chemicals group recorded the highest growth rate of over 21 per cent against less than 7 per cent in 1971. The combined index for basic industries (comprising mining and quarrying, heavy chemicals, cement, basic metals and such other industries) showed a rise of some 9 per cent and for capital goods industries (machinery and transport equipment) of about 7.5 per cent.

This widespread and substantial rise in industrial activity does not, curiously enough, find reflection in other corroborating indicators. For instance, improved industrial activity is generally associated with expansion of bank credit. But during the whole of 1972, bank credit remained sluggish. It is only from the beginning of 1973, by which time the widespread and severe power shortage had hit industrial activity in different parts of the country, that a pick-up in bank advances (other than for food procurement) has been noticed. Similarly, disbursements of the three

term-lending institutions (IDBI, ICICI and IFC) taken together were nominally lower in 1972 than in 1971. Such other indicators as capital raised (not counting a couple of very large debenture issues) and capital goods licences issued showed hardly any improvement. And despite a large amount of import licences issued during 1971-72 (April-March), there was a significant fall in the value of actual imports in the first eight months of 1972-73. In exports, the reported improvement is restricted to the traditional commodities like cotton and jute textiles, oil cakes, cashew and hides and skins. Among non-traditional commodities, only marine products showed a phenomenal rise of nearly 80 per cent in April-August 1972. Engineering exports rose by 4 per cent during the period, while exports of iron ore actually declined. Railway wagon loadings are another index of the level of industrial activity. These rose by hardly 1.5 per cent from 34.20 lakhs in April-August 1971 to 34.73 lakhs in April-August 1972. Earlier, in 1968-69 and 1969-70 when the index of industrial output had risen by over 6 per cent in each year, wagon loadings had risen by about 3.5 per cent per year from 82.71 lakhs in 1967-68 to 85.57 lakhs in 1968-69 and further to 88.29 lakhs in 1969-70. The behaviour of some of these indicators may be capable of being explained by certain special circumstances. But all of them put together give rise to misgivings about the reliability of the estimate of growth of industrial output of over 7 per cent in 1972.

A part of the increase, it appears, is statistical — arising from the government's decision to legalise capacity unauthorisedly installed in 54 critical industries to begin with and, subsequently, in 11 more industries. Units with illegal capacity in these industries were already producing in excess of licensed capacity but the excess output was not being reported since it was unauthorised. As the Industry Ministry's Annual Report puts it, applications for what is euphemistically called 'revision of licensed capacity', have been allowed in the ordinary course, except for applications from large industrial houses and foreign concerns which have to be scrutinised by a task force specially constituted for the purpose. By December 1972, 787 applications had been received for regularising unauthorised capacity, of which 265 were to be considered by the task force. Though industry-wise details of these applications are not available, the Ministry's Report suggests that they were mainly concentrated in

industries such as transport equipment, electrical equipment, drugs and pharmaceuticals, etc (pp 12-13). Similarly, the Economic Survey had given some details of the items to which applications referred to the task force related. Important among these were: certain items of machinery, process control instruments, electronic instruments, textile instruments, ball and roller bearings, switch-gear, paints and enamels, various chemicals and pharmaceuticals, automobile components and ancillaries, optical and laboratory glass, etc. It is significant that the output of many of these industrial groups, such as chemicals and transport equipment, recorded very impressive increases.

At the level of individual items, examples can be cited of a number of industries which have suddenly started reporting substantially higher capacity for 1972 as compared with 1971. In the industrial machinery group, for ball and roller bearings the capacity (the number of units remaining the same) went up from 172.23 lakhs in 1971 to 210 lakhs in 1972 and of industrial roller chains from Rs 145 lakhs to Rs 255 lakhs. In many light electrical industries like lamps and tubes, the expansion of capacity ranged from 40 per cent to 50 per cent. In bicycle tyres capacity went up from 243.86 lakhs to 318.26 lakhs. These industries have also reported larger output. Output of bicycles tyres, for instance, went up from 206.63 lakhs to 224 lakhs and that of GSL lamps from 110 million to 125.0 million. It is, of course, impossible to say how much of the expansion of capacity and output was fictitious — the result of the government's decision to legalise clandestinely installed capacity. But such circumstantial evidence as there is does suggest that a part of the increase in industrial output in 1972 was statistical.

Sikkim

1949, with a Difference

Our Correspondent writes:

WHAT is happening in Sikkim today has some striking resemblance to what happened there in 1949. Though Chogyal Palden Thondup Namgyal has announced, with Indian support, that constitutional and electoral reforms would be ushered in soon, reports suggest that 1949 is being repeated, with some differences. This is not the first time that thousands of people have marched to and through Gangtok to get their autocratic ruler to concede their demand for democratisation. Exactly 23 years ago, on a similar call

given by the Sikkim State Congress, the people had come from all over the kingdom to gherao the palace for over 48 hours, forcing the then head of state, Maharaja Tashi Namgyal, to form a popular ministry under the Chief Ministership of Tashi Tsering, the Sikkim State Congress leader. But as soon as the demonstrators had returned to their villages, hundreds of people were hired to stage counter-demonstrations in the capital demanding dissolution of the popular ministry and restoration of power to the palace. New Delhi had then despatched its Deputy Minister for External Affairs who recommended dissolution of the ministry and restoration of palace rule.

This time again, hardly had the demonstrators returned home to their villages after their 10-day camp at Paljor stadium when the pro-Chogyal National Party leaders brought hundreds of people on the streets shouting pro-Chogyal slogans and demanding continuance of the monarchy and the present electoral system. Seeing through the game, the Joint Front leaders lodged a formal complaint with the Indian Chief Administrator, B S Das.

There is, however, one marked difference between 1949 and today. This is the role in Sikkim politics of the Chogyal's American wife. From the day Hope Cooke took the place of Sangey Deki, the Lhasan first wife of Palden Thondup, a new power-political edge has been given to Sikkim politics. By planting her own men among Sikkimese youth and organising them under the Sikkim Youth Study Forum — whose members, incidentally, come from the handful of feudal Kazi families of Sikkim — the Gyalmo has tried to build an independent, in effect anti-Indian, spirit among Sikkim's upper class youth. The anti-Indian demonstration on August 15, 1968 in front of India House in Gangtok with placards reading "Indian dogs go home", "Down with Indian imperialism", "Down with Indian army" and "Don't drive us towards the north" was inspired by the Forum. The Gyalmo has also tried to Americanise the system of education in Sikkim, replacing Gorkhali with American English as the medium of instruction, even using textbooks from the United States. All these efforts are born out of acute awareness of the need to contain the Indian influence over Sikkim affairs. For its part, New Delhi is not unaware of this and, for that reason, it may go further than it did in 1949 in support of the two Congress parties — if not out of regard for the popular and democratic urges

they represent, at least as a counter to the Gyalmo's efforts.

Sugar

Short-Term Gains

THE current sugar season began in October with prices in the free market at Rs 385 per quintal. The industry's propaganda about 'scarcity notwithstanding, prices declined to Rs 350 by February 1973. Though prices rose once again to Rs 365 towards the close of the month on expectations of an increase in excise duty, they declined to Rs 330 in March as the budget left sugar untouched, and are now around Rs 345. Normally, during the three summer months, March-May, which coincide with the marriage season, demand for sugar increases. Pressure on government from both industry and trade is strong during this period for greater releases of sugar. But though during March-May 1970 government had released 11.93 lakh tonnes and in the same period of 1971 increased the quantity to 12.25 lakh tonnes, in 1972 it slashed the release for the summer season to 9.75 lakh tonnes and for March-May this year it has further reduced it to 8.45 lakh tonnes. Having earlier announced that it would not import the much cheaper sugar available, government was forced to cut monthly releases because production had meanwhile declined to 37 lakh tonnes in 1970-71 and again to 31 lakh tonnes in 1971-72. Regarding the current season there were apprehensions, voiced by the industry, that production would be 30 lakh tonnes only. Now, the industry has revised its estimates sizeably to 36 lakh tonnes, and by the end of March sugar production had evidently already crossed 33 lakh tonnes. Also, this season, 115 factories are working as against only 57 in the last season. Government has already announced the release for the eight months — upto the end of May — aggregating 22.9 lakh tonnes. On this basis, it appears that total requirements of the entire season for both internal and external markets will be less than 35 lakh tonnes. The season thus promises to close with a carryover stock of some one lakh tonnes — more than it began with.

However, the answer to the question, why have free market prices declined, is to be found in other directions. With the general level of prices, particularly of foodgrains, having increased sharply, consumer demand for sugar has been curtailed. Moreover, famine conditions

in various parts of the country have also indirectly contributed to keeping down the free market prices. There have been continuous reports from various parts of the country of levy sugar, meant for distribution in rural and semi-urban areas, actually flowing back into the free market. Such sugar is generally sold at about Rs 10 less per quintal. The urban and more affluent sugar consumers are thus gleaming side-benefits from the plight of those whose purchasing capacity has been drastically affected by the drought. Another major factor is, no doubt, the revised estimates of sugar production by the industry. Moreover, since cane growers have received much higher prices than the stipulated minimum for their cane, the area under sugarcane both in factory areas and elsewhere is bound to increase.

So the price situation may be expected to be favourable for the urban, affluent consumers of sugar for some time. Yet what about the much-advised long-term and rational policy for sugar, such that the grower gets a reasonable price, the sugar manufacturer a reasonable profit, the labourer a reasonable wage, and the consumer cheaper sugar? The way the industry has been controlled — 15 different levy prices fixed with a range of at least 33 per cent, with the result that profit multiplies from anything between two to ten times in a particular year for several factories even as losses accumulate for a number of others whose survival is nevertheless accommodated by the control system — government has effectively encouraged short-term gains and prevented competition in the industry for nearly four decades, though freer competition might have been one way of ensuring more and cheaper sugar in the country.

Political Leadership

Facade of Youth

A Correspondent writes:

AN aspect of the current flurry of diplomatic activities involving India, Bangladesh and Pakistan perhaps deserves special mention. Kamal Hossain, Sheikh Mujibur Rahman's Foreign Minister, is under forty: the Indian Foreign Minister, Swaran Singh, is sixty-five. On the Indian side, the brunt of the negotiations is being carried by Subimal Dutt, our High Commissioner in Dacca, a septuagenarian dragged out of hibernation, and P N Haksar, who has turned sixty and has already formally retired from government on two occasions. Enayet Karim, Foreign Sec-

retary in the Bangladesh Government too is barely forty-five, a neat dozen years younger than his Indian counterpart.

Neither is the contrast with Pakistan any less sharp. While we boast about the youthful looks of our Prime Minister, Zulfikar Ali Bhutto has more than ten years of lead-time over her. The person who was the principal under study of President Bhutto at Simla last year, Ali Raza, is only in his mid-thirties: there can be no mistaking the emphasis on youth, which one can find present in the composition of the political leadership of even such an unlikely land as Nepal.

For those in this country who equate Indira Gandhi's ascendance to power with the triumph of the younger generation cannot but be taken aback by this species of comparative analysis. Of course, the circumstances explain much of the spread between the age-groups of the respective decision-makers. In two erstwhile wings of Pakistan, the who have now come to power until yesterday cast out as the opposition: the entrenched ones had weightage in age, and their decision — through revolution or otherwise has now meant an accession to the power of the relatively young ones along the line. In India, on the other hand, Indira Gandhi's comparative youth proved to be a useful camouflage for the older generation, enabling her to cling to power: her leadership, instead of being a precursor for the youth move to the centre of the stage, has come the device by which they are kept in good humour and away from the wielding of effective power. With the Uma Shankar Dikshits finding their touch, this has become increasingly manifest during the more recent months.

There is some danger that, because of this disparity in age, the Indian team may be outpaced by their counterparts in Bangladesh and Pakistan in the ensuing triangular hassles. It is not so much a matter of the mobility of the body, although physical stamina and staying power need not be altogether crossed out from the list of relevant categories. What is of greater import, however, is the flexibility of the mind, the ability to take in one's stride hitherto untried-out formulae and proposals. The difficulty perhaps does not lie so much in accepting new ideas, but in getting out of the old ones.

We are hardly the only ones beset by this problem. China is certainly facing an even worse one: Mao Tse-tung is an agile eighty-one, and Chou

en-lai is a youthful-looking seventy-five. The Chinese Communist Party has prodded them to grow old along with it. That was noble sentiment, and, certainly, up to a point, has served the cause of the revolution truly and well. But the physical law of decay cannot be flouted however intense the chanting of the scriptures, and the old must, sooner or later, yield place to the new. If, meanwhile, the new generation has not been provided with the opportunity to prepare itself for the eventuality of succession, an interregnum of chaos is a distinct possibility.

China may hope that the country's communist party is still virile, and will in due course beget the fresh set of leaders it deserves. Since India's problem cannot be clearly answered along that direction, a purposive search has to be on. Irrespective of whether one believes in the Namierite view of the historical process, the P N Haksars cannot last forever. Surrogates must be found, and, in case necessary, away from the conventional reservoirs of talent, is it unseasonal rudeness to point this out?

Machine Tools

Haphazard Growth

THE machine tool industry has indeed grown rapidly during the last decade. Output is currently estimated at around Rs 55 crores against Rs 21 crores in 1968 and about Rs 6 crores in 1960. The range of machine tools produced has also widened and the industry is now capable of manufacturing special-purpose and transferline machines; very soon numerical control devices for machine tools will also begin to be made.

Exports of machine tools touched a crores, the industry is supposed to suffer from underutilisation of capacity. No precise estimates are yet available of the actual capacity. One estimate places it at about Rs 80 crores of which about three-fourths are accounted for by 10 units. Demand for machine tools is around Rs 70 crores, imports accounting for about Rs 15 to 20 crores.

Exports of machine tools touched a mark of Rs 3 crores two years ago and this had raised hopes that the target of Rs 7.5 crores of exports by 1973-74 would be achieved. However, exports in 1972-73 are estimated to be only about Rs 2 crores. There has also been a noticeable shift in the direction of exports from the developed countries to the developing countries.

At the recent Annual General Meeting of the Indian Machine Tool Manufacturers' Association, N P Godrej,

President of the Association, rightly pointed out that Plan targets for machine tools were in the past set very high and that it was essential to ascertain the existing installed capacity more precisely before additional capacity was allowed to be created. Godrej attributed the industry's capacity underutilisation problems to failure to identify gaps in the present production programme. This only shows that very little planning has gone into the development of the machine tool industry.

Strangely, in the same breath Godrej advocated liberal licensing and collaboration policies. If anything, the machine tool industry has already had an overdose of collaboration arrangements (some 105 in all)! Research and development are crucial for machine tools and the industry has yet to fully use the facilities of the Central Machine Tool Institute at Bangalore. Import substitution effort, sponsored under a programme of the National Committee on Science and Technology, has been initiated for 34 items and this effort needs to be pursued more vigorously.

The stagnation in exports has to be overcome perhaps on a consortium basis (as is done, for instance, in cables and heavy electrical equipment).

The draft Fourth Plan had placed machine tool output at about Rs 120 crores at the end of the Plan. This target was subsequently slashed to Rs 65 crores and further to Rs 60 crores. For the Fifth Plan, the demand estimate is now put at Rs 135 crores on the basis of a 7.5 per cent annual growth of the user industries. The Planning Commission is, however, believed to regard this growth rate inadequate. If targets are to be set for the sake of setting targets, the demand for machine tools can be put at even Rs 200 crores. But it is unlikely that the user industries will achieve the targets set in the Fifth Plan — the targets for transport equipment, for example, even though they are not very different from the Fourth Plan ones, are unlikely to be achieved — and, as has happened in the past, one may expect further pruning of demand estimates for machine tools by the time the Fifth Plan actually gets going.

Calcutta Diary

A M

THE extraordinary public brawl the members of the Pay Commission, which has just winded up its activities, are indulging in is a source of considerable amusement. A Marxist, who by definition is an incorrigible optimist, would not be averse to discovering traces of a developing contradiction within the ruling classes in this public washing of dirty linen: the *literati* have fallen out with the administrators over the spoils of exploitation; the crisis is bound to deepen; in whichever manner the current issue is resolved, it will lead to a welling of dissatisfaction in one or the other group; accordingly, either the cause of economic and technical development or that of administration will begin to suffer: one excellent thing will lead to a succession of others; the limbs of the government will tend to be increasingly paralysed; as a consequence thereof...

All this of course is so much pipe-dream. The eminent members of the Pay Commission are engaged in an intra-mural quarrel; they are interested in the *inter se* financial position of at most forty to fifty thousand people, who constitute the top layer of the administrative and technical hierarchies. Of course, on both sides, there is much talk of furthering the social purpose.

This can hardly be taken seriously. When the Planning Commission talks of reducing, in absolute terms, the monthly per capita consumption of the upper income groups, is it not insolence to claim that a corpus of recommendations, which includes a suggestion to raise the emoluments of every one of those who are currently obtaining more than Rs 1,000 per month, represents any facet of social purpose? Modesty would be more becoming. Why cannot the Pay Commission admit that 'social purpose' is all cosmetics, that, within the boundary conditions they set for themselves, they did their best to advance the cause of the sectarian interests they stand for, and that the hullabaloo is all because, very unfortunately, some of these interests clashed at the margin?

The *literati* are usually the faithful hangers-on of any established regime. The government will therefore find a way to mollify, upto a point, the scientists and the technicians. Their aggregate number is not large, and they can be humoured along. But where the scientists and technicians will go wrong is in case they nurse the illusion that, to the political authorities, they are as indispensable as the administrators. They are not, despite the emphasis which the government has allegedly

placed on the rapid scientific and economic development of the country. Those members of the Pay Commission who have taken the ruling politicians at their face value are demonstrating their own naivete. A polity has first to survive before it can flourish technologically. And even if there is absolutely no economic growth, those at the top can still assure a minimum rate of advancement for themselves by squeezing the other sections of the community. Therefore, even in the absence of technological and economic growth, the rulers will manage to do well by themselves, provided the administration does not collapse, whereas, if the latter collapses, everything else folds up, and the politicians have to run for dear life. First things first: a ruling politician has to cultivate the support of the leaders of the administration and of the army before he can even begin to think of other issues. In all seasons, the usual lip-service will be paid to liberal philosophical principles and to the social and economic uplift which science and technology would bring about; but, when the crunch comes, the differential favours will always go in the direction of those who help the rulers to maintain the country's security, internal as well as external.

This is of course no different from the model set up by the British. A handful of alien colonialists had to run the regime here. They therefore took the utmost care to hand-pick select groups of native administrators to manage the details on their behalf. Maybe because of the basic feeling of insecurity which any minority group of rulers are subject to, the illusion of godliness was deliberately fostered: the social distance between the senior administrators and the colonial subjects was assiduously widened; salaries and perquisites were differentiated with care. The British left in 1947, but the *comprador* elements, who took over from them, retained the model almost *in toto*. The structure of administration has remained about the same; the Chosen Ones remain the Chosen Ones. Socialism is a nice expression which a D P Mukerji or a Gyanchand told one about in the classroom; it therefore goes into the election manifesto. There is nonetheless a pervading fear of the people, a basic insecurity the politicians feel about democratic processes that may be at work amongst the masses. The masses do not understand the intricacies of economic growth; unscrupulous elements exploit them; an impatience is abroad. It would be fatal to give way to this impatience; the policy must be saved; the caco-

phony of public discontent must be drowned by some means or other. The chosen group of administrators step in at this juncture. They interpose between the political authorities and the howling masses. You leave the unpleasant chores to them. If some shooting has to be done, it will be done by the administrators. If some chicanery is to be perpetrated, some stealing of land for the favoured ones or some diversion of public funds for one's cousins and in-laws, again the administrators are to be the instrumentality. It is pointless to ask whether, if offered the opportunity, the scientists or the technicians could not have acquitted themselves equally well in the role of lackeys, informers, undertakers and performers of sordid jobs on behalf of the politicians. Scientists and technicians, the whole lot of them, cannot be made administrators. It is only a few amongst them, who stand out by their cleverness — and perhaps by their unscrupulousness —, who can be picked to make the transition from the particular world of skill-fetishism to the general world of skulduggery.

The joke is that the *literati* and the administrators will close their ranks the moment it becomes a question of defending their broad interests as against that of the overwhelming mass of lower grade employees. Practically all government employees belonging to the upper income echelons — be they generalists or technicians — will gain in absolute amount several times more than the lowest-paid ones, and it is no use flaunting the statistics of the proportionate increases proposed for the various ranges: there is such a concept as the diminishing marginal utility of money. The issue is not whether one member of the Commission wanted to offer Rs 196 per month to an unskilled employee beginning his career in government or whether his colleagues were adamant about not offering anything beyond Rs 185. The Commission as a whole laboured hard to set up a separate set of criteria, as against the one laid down by the Indian Council of Medical Research, in order that the real content of the need-based minimum wage could somehow be scaled down to within what it considered to be the limits of feasibility. Most of the mental gymnastics about what would or would not constitute a 'mis-direction of resources' have arisen in connection with the decision over the emoluments to be offered to these lowest-paid employees. These are the parasites, implies the Commission's Report; come down heavily on them. There is no awareness anywhere in the

Report that these parasites exist in government not as a consequence of any conscious decision on their part, but that they are there because the colonial pattern of administration has ordained their presence; or that if these, mostly unskilled, employees were not around, the *burra sahibs in the administration* would, for all one can surmise, feel peculiarly vulnerable, and the pyramid of the power structure would begin to appear as lacking in balance.

It would be difficult to come across an apter illustration of attitudinal kinks. It is not regarded as a mis-direction of resources if you top up with another Rs 250 the earnings of those who are already drawing Rs 2,000 per month; it is not considered to be a mis-direction of resources if one gives another Rs 100 to those who are already drawing Rs 1,000 per month. What can one say of the variant of social outlook which fails to perceive that if you go on adding such integers of income at these ranges, those at the very bottom of the scale would also then want to be compensated by fair sums?

There is a log-jam here. You have to offer these tit-bits of compensation to your senior civil servants because this is the only way you can retain their loyalty. It becomes necessary to offer to them something extra because the politicians themselves have added to their standard of living several times over during the past couple of decades; the industrial, trading and kulak communities too have at the same time bettered their lot. It has been a real cushy world for all of them, and which has been made possible because law and order have been maintained for them by the administrators. To alienate them is therefore out of the question.

In the given model, you cannot ask for any additional sacrifices of the politicians, of the traders, of the industrialists, of the rich farmers, of the civil servants; and since the senior civil servants are being propitiated, the senior scientists and technicians will also need to be propitiated to some extent. But when it comes to the wretched of the earth, the scale of values gets altered: they are an unproductive lot, they need not be offered even the so-called need-based minimum wage, let them offer sacrifice for the sake of the nation. The rationale of denying the poorest-paid employees some more is of course always the unemployed and the under-employed, for whom resources have to be set aside. It becomes tiresome to keep telling the politicians that it is neither they, nor the traders, nor the industrialists, nor the rich farmers, nor

the civil servants, nor the senior scientists, nor, for the matter, the members of the Pay Commission who maintain the unemployed and the under-employed; it is the poorest-paid employees who do. And if sacrifice is called for at

the margin so that national savings could be augmented, the first cut must be on the intake of the politicians, to whose tune the members of the Pay Commission have seemingly danced the role of the marionette.

situation in Chile could take a turn towards neo-colonialist and neo-fascist reverses, as happened in Brazil, though under different conditions and alignment of forces. How the non-capitalist path can lead to neo-fascism can be illustrated from political developments in Ceylon, Indonesia and Burma. Similar straws in the wind can be seen in India too. It is not surprising that the Chilean communists should be angry with Gunder Frank, an eminent Latin Americanist and non-conformist Marxist. What is surprising is that Frank should invoke "revolutionary truth" and "revolutionary solidarity" in relation to the traditional communists, for whom these phrases have lost all meaning.

Delhi

Separatist Movement in Andhra Pradesh

I FIND it difficult to follow the logic of G Parthasarathy, K V Ramana and G Dasaradha Rama Rao in their article "Separatist Movement in Andhra Pradesh" (March 17, pp 560-63). The authors have described the phenomenon in Andhra as a purely emotional outburst, caused by a small fraction of society which has managed to give the appearance of wide social interest to the sectional interest of small groups.

Surprisingly, however, the remedy they suggest does not intend to satisfy the wide social interest but the sectional interest. It does not aim at the isolation of what they call the petty bourgeois but its fuller appeasement. The authors suggest that in the national interest the loss of jobs to the petty bourgeois of Andhra due to the implementation of the Mulki rules should be taken over by the Government of India. They estimate that this would cost the Centre a sum of Rs 10 crores over five years. It is a queer concept of national interest which equates it with that of the petty bourgeois of Andhra.

Would not this experiment start a chain reaction all over the country and provide an incentive to the petty bourgeois to become champions of the aspirations of other inarticulate regions and sections? Would the government of India be able to buy over all of them? And would the neutralisation and buying over of the petty bourgeois satisfy or suppress all regional aspirations for ever? At least I do not share that contemptuous disregard for the aspirations of the common people of this country.

BALRAJ PURI

Jammu

LETTERS TO EDITOR

Imperialism and Social Transformation

I AM surprised at the defensive, even apologetic, tone of Gunder Frank's letter to *El Siglo* (not published) printed in the *Economic and Political Weekly* of March 31 (pp 621-2) — explaining his participation in and contribution to the so-called Seminar on Imperialism, Independence and Social Transformation — in response to Rodriguez Elizondo's attacks on him, published in the official Chilean Communist Party press. As an old acquaintance of Gunder Frank and as one who met him in Delhi a number of times when he, along with Harry Madgoff, strayed into this official 'anti-imperialist' jamboree, I have the following observations to make on his letter to *El Siglo*:

While in Delhi Gunder Frank insisted on not making any comment on the policies and actions of the Unidad Popular Government and refused to be involved in any discussion regarding it. We invited him along with Harry Madgoff to address a meeting of Delhi University Marxists, where despite our repeated requests he refused to speak on the current situation in Chile. He stuck to this position even in private talks he had with some of his friends in Delhi and at no time did he give the impression that he represented a 'group' or party in Chile. On the contrary, he told us he had come to participate in the Seminar in his individual capacity and had no representative position.

Frank made a significant contribution to the Seminar by raising a number of points concerning the political situation in Chile. He pointed out that the principal question in Chile was the winning of political power by the working class and the peasantry. The Unidad Popular no doubt controls the government, but political power is still in the hands of the bourgeoisie. He further pointed out that in the absence of a mass political line, the non-capitalist path leads to the possibility of neo-colonial and neo-fascist reverses and that the "fascist menace grows to the extent the left puts its trust in constitutional guaran-

tees and fails to prepare the masses to defend themselves". The recent elections in Chile are an indication of the fact that the constitutional course adopted by the Unidad Popular has reached a dead-end and a stage has been reached where if Allende does not move further to the left (which in the present context also means moving out of the constitutional shell), there is a serious danger of violence from the Right, not excluding intervention by the military. It is rather amusing to see Rodriguez Elizondo invoking Fidel Castro's authority in qualifying the Chilean political process as "revolutionary", and at the same time resenting Frank's expression of solidarity with the view that the traditional communist parties are not always to be found in the political vanguard, a view held and propagated by Castro till 1968.

I and Frank were present in the Chaplin Theatre in Havana in 1968, when in his closing speech to the Cultural Congress, Castro told his audience what he thought of Latin American communists. It would be advisable for Moscow-lining communists not to invoke Castro's authority in support of their political positions, lest it boomerang. Castro might regard the Chilean process as "revolutionary", but he is also on record for having stated: "Let no one dream we can achieve power peacefully... those who believe they are going to win against imperialist henchmen in elections are naive and those who believe they will take over power peacefully through elections are more than naive".

But Castro's own authority is now being questioned in revolutionary circles in Latin America and elsewhere, particularly since his declaration that "we have utmost faith in the foreign policy of the Soviet Union" and his entry into the conformist socialist club. Castro apart, Chilean communists would do well to heed the warning given by Frank and some others, that if mass mobilisation is not strengthened and the movement pushed to a higher stage, the

The Whip Will Have to Crack

Romesh Thapar

THE lack of discipline, so apparent at every level of national life, has again been sharply highlighted by the extraordinary behaviour of some members of the Pay Commission who have been regaling the Press with stories about their differences. This opportunist game of exposure and counter-exposure has reached such a level of pure farce that the GOI will more or less have to give its own verdict on the basis of the materials before it. During the next few weeks we can certainly expect intense lobbying by various interests to win concessions.

If the GOI were really alive to the far-reaching damage that can be done by irresponsibilities such as those of the Pay Commission members, it would take some sort of drastic corrective action. But everyone knows that this is not possible. After all, the GOI is headed by certain gentlemen who are themselves given to leaking vital news to the Press. Indeed, we have just experienced this kind of leakage on the Haksar Mission to Dacca. Delicate negotiations are jeopardised by the loose talk of the PM's senior colleagues.

Sometime, somewhere, the whip will have to crack. The return to discipline will hurt. The whole system is afflicted at every level. The other day, a senior army officer was making a humorous story out of the fact that Generals and Admirals and Air Marshals begin the day by dusting their offices and soon will be sweeping the spaces outside. This sort of situation has existed on the civil side for a long time. There's nothing wrong in setting a new pattern, if that is the intention; but then let there be retrenchment of unwanted Sepoys and Sweepers. If this goes on at the centre of power, one can well imagine life in the state capitals.

Very much more serious is the evidence piling up about open defiance of rules, regulations and orders in public enterprises. Executives are under constant threat and unable to mobilise any protection for themselves either from their own security services or from a police force which is now reluctant to act for fear of some lobby or power group. For the first time in many years, the GOI is beginning to show concern about the breakdown of minimum disciplines at its scattered project sites.

A great deal of discussion has started about the causes behind the developing

anarchy. Has political populism eroded the morale of the law and order agencies? Are the police a broken force? Have we allowed inter-union rivalries to go beyond safe limits? Could it be that the anarchy of the university campus is being transferred to public institutions and enterprises by the new entrants into the working force? Who is giving protection to bad characters and gang leaders? What are the failures of the executives and how can they be dealt with? At what point does one begin to spark the return to normality or near-normality?

Judging from the pressures on the GOI, it may be that the breakdown of law and order in a large number of Delhi's not-so-central residential colonies has brought the problem into focus. Women are becoming agitated about the treatment they receive in offices, on buses, in the parks, and in other public places. The girls of Miranda House have demonstrated. Other protests are simmering. There have been incidents in the Capital of hold-ups on roads and highways. And, of course, the activities of students have loomed large in the calculations of administrators. From such small warning signals around the corner, we may become conscious of the wider crisis.

The breakdown in national discipline is closely related to the spread of corruption. Here again, a national trend — if it may be so called — is noticeable. 'Over-and-above' earnings are a part of normal conversation among categories covered by the Pay Commission. Black money now operates on a massive scale, and it has been made respectable by the

political parties whose funds are made up of it. And this is given as the reason why no action such as demonetisation can be taken against black money. This business of political donations has more facets than one realises.

In a sense, the most symbolic area of the present crisis is the Reserve Bank. Its vaults are choked with old, damaged notes. There is no storage for fresh currency. We are now handling the dirtiest currency notes in the world. The unions hold the system to ransom insisting that the damaged notes must be 'hand-counted' six times. A punitive operation to burn the rubbish is not ordered for fear that the ruling party will be accused of absorbing into its secret funds the old, damaged notes! So the explosive *status quo* prevails. What's more, it's not possible to solve this problem with the aid of the inevitable committee.

While we protest about security acts and police 'zoolum' — a necessary and worthwhile activity if our democratic style is not to be damaged forever — we also need to view the other side of the picture. It should not be necessary to stress this; but unknowingly we have been playing too lightly with the essentials of national discipline. A developing democratic society cannot afford this luxury. In fact, no democratic society can — for, a total breakdown of disciplines will inevitably lead to autocratic alternatives.

Now that Indira Gandhi has got the measure of the so-called forums in the Congress Party, she will be compelled to turn to these and related questions. Admittedly, this is not her portfolio. But, then, the Union Home Ministry is currently obsessed with its attack on what it calls the 'parasitic educated elite'. Someone has got to tackle the real problems... April 16

COMPANIES

Higher Turnover but Lower Profit

Hansavivek

GUEST, KEEN, WILLIAMS has been refused government consent for purchase of 1,77,800 shares of Rs 10 each in Sankey. Wheels at Rs 6.88 per share from Commonwealth Development Finance of UK on the ground that it has not been shown that the proposed investment would in the public interest. The directors are considering a further representation to government. During 1972, GKW's capital expenditure amounted to Rs 159 lakhs — against Rs 84 lakhs in 1971 and Rs 46 lakhs in 1970 — mainly on modernisation and balancing equipment, with emphasis particularly on product quality and ability to tackle the advanced varieties of product within the licensed capacity range. This expenditure is now running at a rate equal to the depreciation provisions made by the company. As the leading manufacturer of electrical sheet

steel products, demand for which is immediately affected by shortfall in electricity supply and installation of new generating capacity, last year the sales value in this group of products declined from the preceding year. The overall increase of 5 per cent in sales thus resulted from increase in turnover of non-electrical products. The steelworks achieved the best yield of finished steel; the fastener units achieved new records, improvement being particularly marked in the bolt and nut unit; and general improvement in engineering and forging products included substantial support for the railway modernisation programme.

Industrial relations in GKW's factories were largely free from disturbances, but several of its important customers were subject to closure, with con-

sequent reduced demand for its ducts. Despite higher total turnover, company earned considerably less profit, as margins fell the squeeze consequent to cost inflation. The company has provided Rs 143 lakhs for statutory gratuity liability; but credit tax relief on this provision, amounting to Rs 97 lakhs, has been taken and the previous provision of Rs 22 lakhs has been written back. Total dividend is maintained at 20 per cent, which covered 1.86 times against 2.40 times last year. Exports of the company's products improved, from Rs 56 lakhs to Rs 72 lakhs, mainly due to the removal of the US import surcharge which restricted sales to that market in 1971. Efforts are being made to export to established lines and to increase both the range of products and the number of markets. The company has received consent of the Control of Capital Issues for issue of bonus shares on a one-for-two basis. The shares do not rank for dividend in respect of 1972.

AMERICAN UNIVERSAL ELECTRIC (INDIA) has been experiencing a major upsurge in the demand for its products and is poised for substantial growth and expansion. Steps are being taken to expand plant capacities, reduce costs, and improve quality. A long-range corporate plan is being evolved and the board expects the company to record a growth of 50 per cent per annum for the next three years. Meanwhile, professional management has been introduced at all levels to ensure an effective management control system. Progress on the new projects has been satisfactory. Commercial production of rotor stator sets, for use in sealed and semi-sealed compressors, started last year. With a satisfactory demand for most of its products, AUE increased its sales by 30 per cent to Rs 266 lakhs. Gross profit, however, increased by only a lakh to Rs 15 lakhs. Net profit was actually lower than last year's. Dividend is again skipped. Last year, the company raised additional share capital of Rs 35 lakhs, which has been utilised for implementation of its new projects.

PHILLIPS CARBON BLACK last year stepped up production by more than 53 per cent to 21,292 tonnes, and the plant was able to operate at near-94 per cent of installed capacity of 22,680 tonnes. Actually, during the latter half of the year, the rate of production exceeded installed capacity. Output, therefore, would have been still higher, but for the limited production during the first half due to paucity of feedstock. Selling prices for all products were kept unchanged, although there was rise in freight, raw material and manufacturing costs. Both sales and profits showed considerable increases over the year, although inventories in relation to sales recorded significant increase. Dividend was stepped up two points to 14 per cent. The 'letter of intent' for promoting a new company is still pending clearance under the MRTP Act. Meanwhile, the company has applied to government for fuller utilisation of the capacity of its Durgapur plant.

INDIAN ALUMINIUM is going ahead with its plans to expand the capacity of its Belgaum smelter from 40,000 to 60,000 tonnes per annum. This expansion will mean adding a third potline having 164 pots, a 50,000 tonnes per annum expansion to the Belgaum alumina plant, additions to the mining operations at Chandgad, and generally expanding the other facilities within the Belgaum complex. The new potline,

licensed capacity. Of the cost of when completed early next year, will add just over 25 per cent to Indal's expansion, estimated at Rs 16.10 crores, only about 7 per cent is likely to be in foreign exchange. Consequent to this expansion, the company is also seeking government permission to instal an extrusion press with an annual capacity of 3,000 tonnes, and to add 6,825 tonnes to its capacity at the Talaja sheet rolling mill and an additional capacity of 2,500 tonnes at the foil plant at Kalwa — all estimated to cost Rs 4 crores. The industrial licence covering the expansion of the Belgaum smelter stipulates an issue of new equity to be made only to resident Indians of approximately Rs 6.7 crores, inclusive of premium. Alcan Aluminium of Canada, the principal shareholder, has agreed to reduce its equity holding in Indal. During 1972, the company produced 78,581 tonnes of primary aluminium compared with 79,901 tonnes in 1971. The shortfall is attributed to power cuts and a short strike at Belgaum. The new Rs 15-crore sheet mill at Talaja came into full operation. Sales advanced by 10 per cent to a new record level of Rs 44.11 crores; but with margins lagging behind, gross profit could look up by only 4 per cent to Rs 12.75 crores. Net profit slipped to Rs 5.05 crores (Rs 6.92 crores), since both depreciation and taxation required considerably more than in the last year. But total equity distribution, demanding about one-fourth more, is still well covered by earnings. Bonus shares allotted on a one-for-two basis towards the year-end are also eligible for the 9 per cent final payment.

TAMIL NADU RUBBER, a new company in the joint sector, is setting up a project in the 'backward' area of Tirupattur in Ramanathapuram district, for manufacture of four lakh pieces each of automobile tyres and tubes per annum. A technical collaboration agreement has been entered into with General Tire International of Akron, USA, according to which an initial payment spread over a period and royalty after commencement of commercial production will be payable by the Indian company. The cost of the project is estimated at Rs 18 crores, and the factory is expected to go into production during the latter half of 1975.

HANDA ROTARY MACHINES, a new company formed in 1971, intends to enter the capital market towards the middle of this year with a public issue

of Rs 72 lakhs in equity shares of Rs 10 each, to raise part of the finance required for its Rs 433-lakh project. The project will be located at Umbergaon in Gujarat, where the factory buildings are expected to be completed within 18 months. Meanwhile, the first phase of production has been started at rented premises at Vapi industrial estate. The company has also made arrangements for procurement of many components from a number of ancillary units located in the surrounding area. The indigenous manufacturing capacity for all kinds of printing machinery is far below the country's requirements. This apart, no unit in the country is at present producing rotary printing machines, which IIRM proposes to take up. The company, therefore, looks forward to bright prospects for its venture. It also looks ahead to good export business.

BILASPUR SPINNING, the only spinning unit in Bilaspur district of MP, has undertaken an expansion programme to instal additional 12,936 spindles to make a complement of 25,000 numbers. Estimated to cost Rs 135 lakhs, the project will be financed by additional share capital (Rs 35 lakhs in equity and Rs 5 lakhs in preference), loan from IFCI and IDBI (Rs 90 lakhs), and the Central government subsidy for location of the project in a 'backward' area (Rs 5 lakhs). The present share capital of the company is Rs 35 lakhs, including Rs 26 lakhs in equity. The company earned thereon a gross profit of Rs 31 lakhs in the year ended September 1972. The prospectus holds out promise of a dividend of not less than 10 per cent for the current year and at higher rates in subsequent years. The dividend is expected to be exempt from tax for a couple of years, which is an added attraction for investors in the high-income bracket. The present market value of the existing shares is around Rs 16, while the fresh issue is being offered at par. MP is one of the few states which have surplus power. Bilaspur, therefore, should have no difficulty in getting the required additional power. The supply of raw material also does not pose a problem to the company, since satisfactory arrangements have been made with Gwalior Rayon. After the proposed expansion, the unit will consume cotton on a limited scale. Cotton, too, is available in plenty in MP. The subscription list for the public issue is opening on April 17. It will close on April 25 or earlier, but not earlier than April 21.

KERALA

Droplets of 'Socialism' and a Flood of Traditionalism

THE President, as the constitutional head of State, should be above criticism. It is for people around Varaha Venkata Giri to see that every public appearance of his enhances the prestige of the post which he occupies. This is the third or fourth time he is visiting Kerala after becoming President. There is no dearth of people and associations to arrange programmes for him at the slightest hint. When he was Governor here, he had endeared himself to the local bourgeoisie.

This time, Giri's visit lasted a week. Programmes had been arranged from one end of the state to the other. On the first day itself, Giri attended five functions and received in audience ministers, officials, and mobs of local elites — big and small. All this would have been a strain on even a younger person in the sultry weather which is usual for this part of the year. The state-wide programmes included worship in the enchanting Ayyappa temple at Sabarimalai in the ghats. The temple authorities made it a memorable occasion by carrying Giri in a decorated palanquin with all the temple paraphernalia reserved for the deity in the temple. Giri was made to look like a god incarnate, a true Ayyappa, which is what every devotee trekking the arduous route to the temple up the hill feels he is!

A state visit by the President is not an ordinary event. It requires elaborate security arrangements and traffic regulation all along the routes which cause no end of inconvenience to the public. It gives anxious moments to the officers in charge of hospitality to the President and his retinue, and dislocates normal working of their offices. And, of course, it costs the state exchequer, which is in deficit of Rs 44 crores, a pretty penny. There are no tangible benefits in return, except the satisfaction of vanity of a few. The President need not be blamed for all this. How could Giri, who has nostalgic memories of Kerala, refuse invitations when the state government supported them?

Socialism, meanwhile, is on the march. On April 2, Kerala has started a collective farm — the first of its kind in India, says the government handout. The farm is at Illithode in Ernakulam district. Two more — one in Calicut

and the other in Trivandrum — are on the way.

The Illithode farm is actually a colonisation scheme. In an area of about 2,000 acres, 250 families of landless agricultural labourers, half of them Harijans, have been settled. Every family has two adult workers — husband and wife. They own the land allotted to them, and their descendants can inherit it. But they have no right to alienate the property. The management of the farm is vested with an elected committee of farmers. A co-operative society has also been registered under the Co-operative Societies Act to look after the credit needs of the farms.

NEED FOR COLLECTIVISATION

The land will be cultivated collectively, each member of the farm performing duties assigned to him or her by the management committee. Every worker will get Rs 25 per week as advance, which will be later adjusted against wages calculated at the rates prevailing in the locality. A family of two workers will thus get Rs 50 as advance every week. The net profit at the end of the year will be divided among the members equally. There will be adequate provision for depreciation of assets, and funds will be set apart for such purposes as children's education, risks, and general reserve. It is estimated that, after making these provisions, a worker will be able to get about Rs 4,000 a year exclusive — in addition to wages at the normal rates. A two-member family may thus get Rs 8,000 to Rs 10,000. Besides, each family is permitted to have a small kitchen-garden and to keep poultry, the income from which need not be shared with the others.

There is little doubt that in Kerala, where the pressure of population on land is the heaviest in the country and where subdivision of holdings into tiny plots has reached menacing proportions, the only possibility of increasing agricultural production by using modern science and technology is through collectivisation. But it is doubtful whether the Illithode experiment, even if it shows some signs of success initially, will help to extend the idea of collectivisation to larger areas by inducing existing farmers, as against those who

are newly settled on land, to change over to it. Collective farming is a way of life. It requires a new social and cultural pattern.

For that, education and motivation of a different type are necessary. Only a true socialist state can provide that, not a semi-colonial one. These types of experiments may help to create an illusion in the beginning, but they will end in disillusionment. In the process, the very idea of collective farming may be discredited. If the government really believed in socialism, it would have converted the entire Kuttanad — the rice bowl of Kerala — into a collective farm. For, in Kuttanad, one finds the most class-conscious and hard-working agricultural workers who would have made a success of collective farming. And that would have given a new complexion to the grand Kuttanad development project, costing about Rs 30 crores, work on which was inaugurated on March 24.

Kuttanad is a word to conjure with. It lies in the two districts of Alleppey and Kottayam and covers an area of about 638 square miles. Four rivers flow to the sea through this area. During the south-west monsoon, the entire area is flooded and looks like a sea. Still, it is thickly populated and has a density of 2,668 per square mile, compared to the state average of 1,419. It has a literacy rate of 72 per cent, against the state average of 60 per cent. To understand the intensity of the land problem in Kerala, one has to appreciate the odds against which rice is cultivated in Kuttanad. Conditions there have to be seen to be believed. Nowhere are promptness and devotion to work so necessary as in the rice fields of Kuttanad.

Rice is actually cultivated in Kuttanad in lands lying two metres below sea-level. There are 50 villages and 1,129 *padasekharams* (collection of holdings) which are grouped into 439 blocks. Each block is protected by earthen bunds. The bunds are submersible as the fields have to be flooded to correct the acidity of the soil. After the monsoon, the entire water is drained out. Cultivation starts from September-October, and harvesting takes place in December-January. Floods during the monsoon and salinity from the sea during summer are a constant threat to rice cultivation in Kuttanad. It is quite common for bunds to be breached during the floods. In these conditions, the growing of even a single crop is a miracle. Now the proposal is to raise

two crops, and later even three. The Kerala Land Development Corporation, a fully state-owned company, has drawn up a scheme to raise two crops and the Agricultural Refinance Corporation has agreed to refinance it.

The project provides for construction of permanent submersible bunds of a total length of 1,966 km. This would enable the raising of a second crop of rice on 1.25 lakh acres. The bunds will be constructed with locally available materials, such as clay, sand, and rubber. The top width of the bund will be seven to ten feet. The plan is to plant a row of coconut trees on the bunds. To ensure the success of the project, certain infrastructure requirements have also been provided for. The main items of infrastructure are: (a) improvements to the leading channel to the Thottapally spillway; (b) protection works for the bunds affected by the operation of the spillway; (c) diversion of the Idikki tail-race waters from the Muvattupuzha river basin to Kuttanad rice fields; and (d) the Thanneermukham barrage and locks to prevent entry of sea water into the rice fields. The total cost of the project, including the infrastructure, is estimated at Rs 29 crores; of this bund construction may cost about Rs 20 crores.

STICKING TO TRADITION

With this investment, the Kerala Land Development Corporation (KLDC) expects to raise a second crop between January and May, which may yield 1.50 lakh tonnes of rice (paddy) valued at Rs 10 crores, besides 13.2 million coconuts valued at Rs 60 lakhs annually. One of the highlights of the programme, repeatedly stressed, is its high employment potential. In the fifth year of construction work, 18,000 workers are expected to be employed on daily wages. Doubts arise, however, as to how enthusiastic the worker will be to complete the work if he is not sure of alternative employment later. This is a problem which has plagued the Canadian-aided Idikki hydro-electric project.

The Kuttanad project is so phased out as to be completed in six years. The finance for bund construction would be provided by commercial banks and the ARC will refinance the banks upto 80 per cent. The state government will contribute Rs 8.80 crores. After getting money from the banks, the KLDC will advance loans to individual cultivators for construction of bunds at 9 per cent interest, repayable in 15 instalments with a moratorium for the first two years.

The Corporation has asked the cultivators of each *padasekharam* to send applications for loans along with a copy of the resolution passed by the cultivators of the *padasekharam* agreeing to participate in the project and providing numerous particulars of the kind that bureaucrats like to have. It is not yet clear who will be responsible for the construction work. Will it be the cultivator, under the supervision of the Corporation? Or will the Corporation undertake the responsibility and entrust the work to private contractors?

KASHMIR

Prolonging Dependence

Balraj Puri

THAT all is not well with the finances of Jammu and Kashmir state is indicated by the fact that the repayments of the Central loans to the state, due in the budget year, amount to Rs 62.75 crores. If this amount is actually paid, the state would be left with just enough to pay the salary bill of its administration — but with no money for its other administrative expenses and none for its developmental and welfare activities. Total indebtedness of the state is expected to be Rs 272 crores. Other states of the country, too, are indebted to the Centre. But while the per capita debt burden of all the states was Rs 120 in April 1971, it was Rs 467 in the case of Jammu and Kashmir. In the budget year, it would rise to Rs 589.

Obviously, the state cannot and will not pay its debt obligations, which would be deferred or even scaled down. But whatever happens to the past burden, the budget does not indicate any strategy for enabling the state government to stand on its own feet even in future.

PRECARIOUS DEPENDENCE

Practically the entire capital budget and most of the plan budget of the state would still be financed by the Centre. The state does not expect any surplus on revenue account, which is estimated to end in a deficit of Rs 2.41 crores. The non-plan revenue deficit works out to Rs 3.76 crores, exclusive of amounts due to the Centre on account of interest on the Central loans.

The budget betrays a precarious dependence of the state's finances on the Centre. Revenue receipts of the state, estimated to be Rs 106 crores in the budget year, include Rs 55 crores as grants-in-aid from the Centre, and over

Or will the construction be done departmentally?

These are vital questions, because it is not in the formulation of projects but in their implementation that the government often falters and fails. At Illithode, the government trumpets the settlement of a few families of landless agricultural workers as an advance towards socialism. But when it comes to a challenging project like the Kuttanad one, it sticks steadfastly to traditional methods. One can see from this the distance that remains to be travelled to reach the goal of socialism!

Rs 10 crores as the state's share in the divisible pool of the Central taxes. That the Central grants are really generous would be indicated by the fact that, on per capita basis, the state has been getting three times the average grant of all the states of the country.

SINGLE LARGEST SOURCE

Revenue receipts from the state's own sources come to about Rs 41 crores. A part of this amount, too, is illusory. For, it includes gross receipts of the departments from which expenses have not been deducted. Taking the case of forests — the single largest source of internal revenues — the state would spend about Rs 453 lakhs on revenue account (mostly non-productive) against an expected income of Rs 740 lakhs in the budget year. The income of Rs 576 lakhs from transport schemes must be similarly discounted by an estimated expenditure of Rs 536 lakhs. On public works, irrigation and power, revenue expenditure far exceeds receipts.

The state's total tax revenue, from its own sources, is expected to be just over Rs 16 crores. Out of this, land revenue would yield Rs 60 lakhs, while expenditure on the department and collection charges is estimated to be Rs 99 lakhs. The single largest source of tax is excise — mostly from the sale of and duty on liquor — which is expected to yield Rs 519 lakhs, i.e., about one-third of the state's internal tax revenues. Other taxes include Rs 429 lakhs from road toll and Rs 335 lakhs from sales tax.

Kashmir's tax effort would thus seem to be extremely meagre. According to the Reserve Bank Bulletin (August 1971), the tax revenue of the state was 12.7 per cent of its total revenue in

1971-72, while the average contribution of taxes in the revenues of all states of India was 42.8 per cent. Again, per capita tax revenue of Kashmir was estimated at Rs 17.4 in 1971-72, against the average per capita tax revenue of Rs 30.4 for all states.

It needs to be noted that it was against the background of such budgetary performance that the state Finance Minister and his party men nevertheless took much credit, during the discussion of the budget in the state Assembly, for not imposing any fresh tax for the budget year. Taxation, however, is not only a means for raising the much-needed extra resources but also for reducing disparities and bringing about other socio-economic changes.

PROBLEM OF DISPARITIES

The suggestions in the Assembly from the opposition, that some taxes should have been imposed on the rich, were answered by some Congress members with the retort that there were no rich in the state. Yet, it hardly needs any evidence or argument to show that the problem of disparities is far from being finally solved in the state. By sparing the rich and the poor alike, the Finance Minister has opted for a *status quo* budget, and by remaining neutral in the unfair competition between the rich and the poor has actually sided with the rich.

No reference has been made in the budget or in the Finance Minister's speech to the recovery of full or part of the arrears of Rs 15 crores of the forest lessees that are pending for the last several years. The state has given no indication that it means to implement the Raj Committee's recommendations regarding levying agricultural income-tax — though it admits with pride that fruit growers and progressive farmers have multiplied their incomes in the recent years. Again, the state proposes no tax on appreciation of urban land, unearned incomes, manufacture and sale of scarce goods yielding abnormal profits in black or white, affluent professions, and items of luxury.

The reluctance of the state government to explore avenues for augmenting its resources is matched by a rather reckless expansion in its non-productive expenditure. Just the salary bill of the state is believed to have increased by more than 20 times in as many years. At Rs 40 crores it is, after agriculture, the largest source of income of the peo-

ple of the state. But, unlike agriculture, administration is not a self-generating source of income. That the present size of the administration is a strain on the finances of the state is evident in the fact that the state spends almost all its internal revenues on maintaining its staff. The state government must realise, before the strain on this account becomes too heavy, that this source of employment-expansion and income-generation cannot be pressed too far.

The state cannot remain unmindful of the economic cost of even its social services. The pride with which it flaunts the fact that its per capita expenditure on education has increased from 80 paise in 1947-48 to Rs 28 in the budget year, must be tempered by the costs involved and the results achieved. In this case, the social costs also might soon become prohibitive. For the overcrowded colleges and universities are producing graduates in arts, science, law, medicine, and engineering, most of whom are unwanted and are only contributing to the growing unemployment, frustration, indiscipline and tension. Neither the economy nor the social system can for long stand this merely

quantitative explosion in higher education.

The achievements of the government can not be measured merely by its ability to spend money; it has to be measured also by its capacity to raise money and the quantitative and qualitative returns it obtains on the expenditures incurred. In fact, the fiscal performance of the government has to be judged in the broader perspective of the impact it has on the socio-economic life of the people.

NOT AN UNMIXED BLESSING

Unless the Central Government decides to write off its entire past loans to this state and convert future loans into grants, the state's present pattern of finances simply cannot be sustained. Even if this were done without fiscal discipline, efficient and honest administrative machinery, active redistribution measures, and a dynamic strategy of development, the inflow of Central money into the state would not be an entirely unmixed blessing; for, the rise in prices and the widening economic disparities would erode a part of the economic gains as well as add a positive social loss.

The Centre for Studies in Social Sciences,

Calcutta,

jointly sponsored by the Government of India and West Bengal for research and academic training, requires academic staff in the disciplines of Economics, Geography, History, Political Science, Social Anthropology and Sociology, Social Psychology and other subjects related to the study of the social bases of culture; in the following pay scales :-

- (i) Professors : Rs. 1100-50-1300-60-1600-100-1800
- (ii) Fellows : Rs. 400-40-800-50-1250

DA, HRA, CCA, as per Central University rules. Medical and Contributory Provident Fund benefits are also available.

Applications with detailed curriculum vitae, comprising academic qualifications, teaching experience, research work done and supervised, and list of publications, with names of three referees may be sent to the Registrar, Centre for Studies in Social Sciences, Calcutta, c/o State Planning Board, 6 Camac Street, Calcutta-17 before the 12th May, 1973.

Selection will not necessarily be limited only to applicants.

INDUSTRIAL CAPACITY

Making Confusion Worse Confounded

(From a Special Correspondent)

THE issue of the Reserve Bank's *Bulletin* carries a study of what is described as "the index of potential production" of manufacturing industries in 1971. This is the fourth in the series of such studies. The first one, published in April 1970, related to the period from 1960 to 1968 and also described the methodology used. The present study brings the data up to 1971.

The first study had claimed that the index of 'potential production' was intended to get over the limitations of the existing data on installed capacity and the consequent difficulties in making analytical use of capacity-output ratios. The government's industrial statistics, particularly those relating to installed capacity in different industries, are, of course, in a state of chaos. The industrial licensing authorities often have only the vaguest notions about the rated capacities of many units. There is, first, large-scale installation of unauthorised capacities. This is now officially admitted. Further, the concept of capacity used by the licensing authorities is far from uniform for different industries or even different units in the same industry. In some cases, it is related to annual physical output irrespective of the number of shifts worked (e.g. cables and wires), in some others it is related to physical output on the basis of the number of shifts worked (e.g. chemicals, engineering and continuous processing industries). Even in respect of the latter category of industries, the prescribed norms are not uniformly applied. An earlier study by the Reserve Bank had shown that, while official sources like the CSO's 'Monthly Statistics of the Production of Selected Industries' classified 16 chemical industries as working single-shift, they were actually found to be working on three-shift basis (RBI *Bulletin*, April 1969). Likewise, seven metal and engineering industries were found to be working on two-shift basis, while the CSO showed them to be on single-shift operation.

This is the reason why actual production in many industries exceeds their installed capacities as reported by CSO. The officially reported capacity is sometimes totally unrelated to the installed capacity. For finished steel, for example, actual capacity had reached 5.5 mn tonnes at the end of 1966-67 and 6.9 mn tonnes in 1969-70. These figures have been widely used in Plan documents. And yet the CSO persists in presenting an installed capacity fi-

gure of 3.60 mn tonnes.

There are also problems raised by (i) capacity in small-scale units which are not covered at all by CSO data; (ii) non-comparability of time series data because of changes in criteria for registration as units other than small-scale, as happened in 1969; and (iii) non-reporting by units and consequent underestimation of output/capacity. Some of these problems arise from official sloppiness; others are inherent in the concept of industrial capacity, which can be altered by adding small balancing equipment or by changing the product-mix.

But while the official statistics of industrial capacity are thus certainly suspect, the value of the solution offered by the Reserve Bank's study in question is equally doubtful. The method used in the study is simple: take the peak level of production in any month of the year or any earlier year after 1960 and relate it to a similar monthly peak production for the year 1960 and call the resultant index the "production potential index" with base 1960 = 100. The average monthly output for the year, expressed as percentage of the peak output gives the utilisation of the "production potential". With this simplified methodology and with a computer, the possibilities are immense: industries can be aggregated or classified into groups and sub-groups and for each group or sub-group it will be possible to present potential production indices, the growth rates of production potential and utilisation ratios. This method of capacity measurement has been used by the Wharton School in the US for the US and six European countries. However, what may suit the conditions of the American economy are not necessarily appropriate for this country.

In a period of rising output, the peak output index for non-seasonal industries is generally achieved in December. Even for seasonal industries like sugar and textiles, the peak output is in that month. Therefore, in all the years since 1960 the CSO's (unadjusted) index of industrial output has always experienced its monthly peak in December (see CSO's 'Monthly Statistics for 1971', p 279). Consequently, the RBI's index of 'potential production' for each year should in effect be the index for December of that year. If it is not, the reason may be found in the exclusion of mining and other industries account-

ing for a weightage of 18 points and the assumption made in respect of seasonal commodities that their annual average production index represents the potential for the respective years. Even when the peak level of output for some commodities and groups has been attained in any month other than December, or if the level relates to some month of an earlier year, such aberrations will not alter the aggregate potential index for the manufacturing sector as a whole, because it has been derived from the very CSO index numbers for individual commodities/groups which, when combined, give the peak index for December each year. In the circumstances, the trends in RBI's potential index for manufacturing industries as a group should represent generally the trends in the index numbers for December in each year. It is difficult to understand how these are analytically more useful than the original index numbers themselves.

Neither do they represent trends in industrial capacity in individual industries or groups of industries. While for multi-product groups, no single figure of capacity can be cited, it is possible to cite examples of single-commodity groups, such as cement, for which physical capacity figures can be obtained separately and compared with the index of potential production and utilisation ratios presented in the RBI study. For cement, total installed capacity has gone up from 12.58 mn tonnes in 1966 to 19.39 mn tonnes in 1971, showing a rise of about 55 per cent. During the same period, actual cement output has risen from 11.06 mn tonnes in 1966 to 14.90 mn tonnes in 1971, showing a rise of 35 per cent. As a result, the capacity utilisation ratio of the industry experienced a fall from about 87 per cent in 1966 to 77 per cent in 1971. In contrast, the potential utilisation ratio worked out by RBI is the highest (at 92.2) for 1971 for any year since 1960. Again, in 1971, a year when actual capacity utilisation by the industry declined from 80.4 in 1970 to 77 per cent, RBI's utilisation ratio showed a rise from 89.3 to 92.2. Even technically, 92.2 per cent utilisation is unrealistic for the cement industry. As against the rise of 55 per cent in installed capacity between 1966 and 1971, the RBI's potential production index shows a rise of 29 per cent.

Thus, if industrial groups are split into separate commodities, it will be clear that the series of index numbers and ratios given by RBI do not explain any aspect of the country's industrial economy — growth in installed capacity, or growth rate of output, or trends in utilisation of installed capacity.

New Position of Women

Harish Chandola

I CANNOT help finding reflections of the present-day life in my country in the not so distant past of North Vietnam. For instance, when members of the Vietnam Women's Union (VWU) tell me that, before the Vietnamese revolution, the birth of a baby-girl was received coldly by the father because she could not continue the lineage and perpetuate the family heritage. Or when people in the village tell me of the old folksong, sung as a lullaby by mothers with their baby-daughters in their arms:

"A woman is like a drop of rain.
No one knows whether it will fall
into a palace, or the mud of the
ricefields".

I am back in my country, where this is how things are today. And I have to tear myself away from those old stories and songs and look around to realise that I am in a different country, transformed by the Vietnamese revolution.

Outside, here, there are women in their combat positions, manning anti-aircraft batteries, driving ploughs, and operating complex agricultural machines — things done before by men only. In other houses, in the same village where I hear the old and new stories, I can see husbands performing household chores and taking care of children, while their wives are away at evening classes or at meetings.

Yet, it is the same Vietnam, a country where the poor peasant and his wife have worked hard and struggled together for the survival of their family. The man ploughed and the woman transplanted the seedlings. Like in my country, this is still the familiar sight in Vietnam, and a realistic example of equality of the sexes in production work. In the field, the woman is truly man's equal because of her patience and industry.

Among the common people, this common struggle for survival and the sharing of hardships has eliminated the idea of man's inborn superiority and strengthened the husband's and wife's mutual affection. "Together, they tasted the bitterness of life and experienced cold and hunger." In a folksong, a woman says to her husband:

"Even if we have to climb mountains, I will follow you,

Together we shall go our way, leaning on each other,
To feed ourselves, we shall pick wild fruit".

Among the common people, the woman was the equal of man in family life. When invaders attacked Vietnam, women assumed the responsibility of production work and household duties. The Vietnamese women have participated in struggles against invaders for a long time. In the year 40 AD, two sisters, Trung Trac and Trung Nhi, had led a successful insurrection against Chinese feudal domination. Through her victory, Trung Trac "avenged her murdered husband and paid her debt to the fatherland". Vietnamese history is full of stories of such roles played by its women in defending the country.

STORIES OF COURAGE

In 1952, during the struggle against the French, there were 840,000 women guerillas in North Vietnam and 240,000 in South Vietnam. Other women engaged in political struggle, consisting of propaganda campaigns aimed at impairing the morale of their enemy's troops. Supply to the front was mostly ensured by women. The women peasants of the Fourth Zone devoted 200,000 workdays to the transport of ammunition and food, the repair of roads, and care of the wounded for the Dien Bien Phu campaign alone.

There are glorious stories of women's courage and determination during the present phase of their struggle against aggression. They engaged in clandestine activities, joined the South Vietnam Liberation Front, and in spite of repression, succeeded in infiltrating into factories, markets, and workers' quarters to rouse the national conscience and kindle the flames of popular struggle.

One such woman was arrested during a mission. She refused to give her torturers any information. They asked: "Who are your comrades?", "Who is your husband?", "Where are your children?". But she remained scornfully silent. So they killed her. On the wall of her prison cell, she had however written the following poem with her own blood:

"A rosy-cheeked woman, here I am
fighting side by side with you, men!
On my shoulders, weighs that hatred

which is common to us.
The prison is my school, its mates my
friends,
The sword is my child, the gun my
husband."

Or there is the story of an old woman in a poor village in the Mekong delta who was caught while trying to hide a big pot full of rice. "This rice is surely reserved for the guerillas", bellowed the officer who searched the village, "where are they?". Then the soldiers struck her with rifle butts. The old woman raised her head proudly. "I am old", she said, "and cannot carry a gun. But my children, and there are thousands of them, all over the country, will kill you all. I am not afraid of dying." The soldiers killed her.

It was through their massive participation in the national struggle, first against colonialism and later against aggression that the Vietnamese women won a position of equality with men. In fact, the North Vietnamese women today enjoy a higher status in society than that enjoyed by women anywhere else. And it is now usual to address the Vietnamese women by their own names and not by the names of their husbands, which was the practice before.

It is quite common for the young men to go to the front for fighting. The task of agricultural production has therefore to be borne almost entirely by women; women constitute 90 per cent of labour in agriculture. Industrial production is dependent on women, because they constitute 50 per cent of the labour force in the factories. Women and old folks are responsible for all the production of cottage industries and handicrafts. In fact, if the women had not shouldered the tasks in the rear and, by doing so, freed the men for fighting, the Vietnamese struggle would not have achieved the victories it has done.

True to their old tradition of sending their men to fight, mothers ask their young sons to join the army. Young wives add their signatures to those of their husbands on the latter's applications to enlist in the army. On the wall of the Laiyen Agriculture Co-operative Club, in Ha Tay province, you can see a verse written by a woman, dedicated to her husband:

"Go and achieve brilliant exploits,
I'll take care of the house and the
village fields."

It was out of necessity that the Vietnamese society had to mobilise the "reserve labour force" of women in the country to take up the tasks from which men were being called away to join the army. Before the US started

escalating the war, North Vietnam had, in 1960, started its programme of socialist industrialisation, which began taking away men from their work in the fields. From 1964 onwards, more men had to be taken into the army to go to the front for national defence. All of them had to be replaced by women.

But socially it was not an easy task to make the people accept the fact that women were capable of holding responsible positions. Experiments had to be carried out and lessons drawn. For instance, in 1960, the members of the Thanh Thuy Party Committee (the district committee of the ruling Workers' Party) did not agree with one another on the capabilities and role of women. The Party Secretary Chu Van Loc, then suggested that they should go to the various communes and carry out an investigation on the work done by women. This brought to light many interesting discoveries: Women performed more workdays than men; they knew as much about the situation of the fields; they made up 70 per cent of the labour force; they were more industrious and hard-working; they had less opportunities to learn and received neither help nor support in the accomplishment of their tasks.

Following this investigation, it was decided to appoint women cadres in Thanh Thuy district. But this decision was not accepted at a general meeting of communal Party secretaries. "With the women at the helm", someone shouted, "it will be the end of everything!" Chu Van Loc then convened a meeting attended by 540 women, to discuss the role and capacities of women. All communal Party secretaries were invited to this meeting. The women talked about their aspirations and the difficulties they had been meeting with. Many criticised a number of leading cadres of the Party who had preconceived ideas about women and showed lack of responsibility in the matter. When Chu Van Loc asked the audience to nominate women of ability to run co-operatives and communes, names of a dozen candidates were put forward and people gave their opinion about their capacities and moral conduct. Later, another investigation was carried out in another commune, which definitely convinced the communal Party secretaries.

All Party cells, in the co-operatives and communes, were required to hold self-criticism meetings in which their members would acknowledge their erroneous conceptions and their lack of responsibility in promoting the women's

movement and appointing women cadres.

Thus Thanh Thuy's errors were redressed. By late 1965, women co-operative presidents and work brigade leaders accounted for 25 per cent of the total number of cadres. In 12 out of 15 communes, women were secretaries of the Party communal committees, presidents and vice-presidents of the administrative committees, and there were an even greater number who were co-operative presidents.

In 1960, the Law on Marriage and Family was promulgated. This law was based on four fundamental principles: freedom of marriage; monogamy; equality of the sexes and protection of the rights of women; protection of the rights of children. This law finally liberated women from the feudal family; it created favourable conditions for the development of the capacities of women and their still greater participation in the building of the new society.

In 1958, the three-year plan for the complete liquidation of illiteracy was completed. By then 90 per cent of women could read and write. Complementary courses were opened in factories for women workers to help them learn new skills. In villages, new agricultural techniques were taught to women co-operative cadres, presidents and members of managing committees and work brigade leaders. Refresher courses were organised for secretaries, accountants, and statisticians of co-operatives, by provincial and district administrations.

In general education, dispensations were granted to girls, especially those from worker and peasant families and from national minorities. To facilitate the access of women workers and peasants to universities, complementary education schools were opened for those who were too old to enter general education schools. Women cadres, who distinguished themselves by their work and moral conduct, were sent to attend colleges while receiving full pay.

Following several years of effort, the proportion of women in many fields of activity has become very impressive: 80 per cent in education and 75 per cent in health services. In towns and cities, the VWU has grouped housewives into handicraft teams (knitting, weaving, basketwork, etc) to help them lead an independent life and at the same time add to their families' income.

Because of the increasing participation of women in social activities, the State and the VWU is trying to free them from some of their household duties. In towns and villages, there are now nurseries and kindergartens where

working women can leave their infants and children in the care of nurses and schoolmistresses. Canteens and restaurants have been set up to cook and serve meals to women busy in production work. In the countryside, especially at harvest time, infant classes and kindergartens multiply. A movement of the "three look-afters" has been created, which asks a few specialised people to look after one's children, to cook one's rice and do one's shopping. These functions are assumed by some members of the farming co-operative itself. Thus freed from domestic duties, women peasants can devote all their efforts to the crops at key moments of transplanting rice seedlings and harvesting.

Never has any aggression been so cynical, brutal and barbarous as that by the US against the Vietnamese people. Both in North and South Vietnam, the US had brought the war to the most remote hamlets. In this war there was no 'rear', the woman in her house with her children was at the front-line.

On March 19, 1965, the Vietnam Women's Union (VWU) launched the movement of 'Three Responsibilities' to mobilise North Vietnamese women for carrying out these tasks:

- (1) Production and other tasks, in place of the men who had gone to the front.
- (2) Taking charge of family affairs in the absence of husband or son.
- (3) Giving assistance to the fighters at the front and undertaking, if necessary, combat duties.

Not only production had to be maintained, but productivity had to be increased with the use of improved technique, better tools, and means of production. Family affairs, had to be managed well, providing good education for the children, looking after old people whose children were at the front, helping the families of combatants and war wounded — particularly families of those who had sacrificed their lives for the country. Women also joined in defending the village and in maintaining order and security; they brought supplies to the combatants, found lodging for them and looked after the wounded; to take direct part in the fighting, they joined the people's militia and underwent combat training.

A young wife's letter to her husband at the front reads: "Dear, I can now take your place in ploughing and harrowing the fields. You need not worry. For the winter-spring crop I have got the highest mark in my work brigade. I wish you good health and brilliant successes. I long to hear from you".

Everywhere one finds this new breed

of women who are loving and discreet, energetic and brave, and as devoted to the interest of the collective as to their own families. A new way of life has developed among them, which is simple, healthy, and vigorous.

In the factories women workers learnt to take charge of the management. In factories and at construction sites the watchword of women workers was: "to master one trade while becoming familiar with several others", so as to be ready to replace men when they join the armed forces.

The VWU, which brought about this mobilisation of women, is a mass organisation. It has five million members and 10,000 of its cadres are engaged in propaganda to encourage women to fulfil the tasks entrusted to them. The President of the Union is Nguyen Thi Thap, who is also the Vice-Chairman of the National Assembly. She has dedicated her life to organising women. Members of the Union told me that they considered the war a great challenge to their society. In North Vietnam, they said, over 10,000 children had become orphans because their parents had been killed in the bombings since 1964. Thousands of children had been killed and thousands had been crippled. They told me the story of a Buddhist family in Nam Ha province. The grandparents were praying and the grandchildren were playing when the US planes came. The grandchildren rushed into one shelter and the grandparents into another when the bombing began. When it stopped, the grandparents went to take the grandchildren out. But they found them lying in a pool of blood, because one grandchild's arm had been blown away. The child was treated, but he remained without an arm. From time to time, he would ask: "Grandmother! can my arm grow again?" Through his experience he knew that when a person loses one arm, he loses a part of his life! There were thousands of cases like that. Rehabilitating them had become a great social preoccupation. The Union officials said one of their workers, whose husband was at the front, worked in Haiphong port. She lived in an isolated hamlet with her children and used to come to work from there daily. There was no soldier around that hamlet, no missile site, no military targets. But on April 20, 1972, the US planes dropped about 100 bombs on it and razed it to the ground. When she came back from work, she found her three children dead in the air-raid shelter she had built for them. She had made beds and

study-tables for them. All those had been blown to bits. What was left was just one sandal of her youngest child.

In Kham Thien street of Hanoi, I have seen women crying because they had lost their dear ones in the December 1972 bombing. A young woman named Mai said she had just left her 10-month-old baby after he had gone to sleep to go to a neighbour's house. She had hardly reached there when the bombers came and when she returned she found her house reduced to rubble and the body of the baby lying in the debris.

The indignation of the women was one of the reasons why the women's movement developed steadily. The VWU encouraged the women to shoulder the tasks of organising defence. The sharing of suffering and misery, and the collective indignation created a new feeling of solidarity. In various destroyed places you could see girls bringing out their only best clothes to cover the body of their friend killed in the bombing. Women gave the best clothes of their children killed in the bombing to the children of their neighbours.

Because the Vietnamese women had to assume new tasks, they had to raise their educational and cultural level to be able to carry out those tasks efficiently and successfully. North Vietnam has now 45,000 women who have graduated from universities and institutes. About 70,000 have passed from technical schools. At present there are 50,000 young girls in institutes and 70,000 in high schools who will all become technicians, engineers and experts in the future.

Women are also playing a greater role now in governing the country. Forty per cent of administrators at the village level are women. The National Assembly has 30 per cent women. Eleven women hold the rank of deputy minister in the Government.

Women have not only continued production, they have considerably increased the yield. It is common sight to see women working in the fields with rifles slung on their backs. Their motto is: "When the enemy comes, we fight. When it goes away, we carry on production." The women workers in industry have carried out production work in spite of the bombing. They know that they might get killed by the bombs while working in factories; but they continue their work calmly and bravely.

Here is a story of a woman worker in Viet Tri power station, in the north-west suburb of Hanoi, who got killed in the recent bombing. Her husband was away in the army, fighting at the front.

She was in charge of supplying coal to the power station. She continued her work when the US planes came. At home, she had a ten-year-old son. When she died, her co-workers went to see her son. They were worried that the child would be very distressed to hear of his mother's death. But the boy remained very calm. He said his mother had told him that she might get killed while working. She had also told him that he might then have to live with uncles who would come to fetch him. He then pointed to them a suitcase in which his mother had kept his clothes. He showed them where his mother kept her belongings. He then showed them a bank pass-book in which were shown the savings his mother was making for him. He said his mother had told him that if she died, he should tell his father, when he came back from the front, that she died fulfilling her task. The child is now being brought up by the workers of the power house. "We are very fond of him and very proud of his family", they say.

The leader of the Thai Nguyen Steel Factory is a woman, belonging to a national minority. She had joined the factory as an ordinary worker. She had five children then, and her husband was away in the army. Not only did she look after her children, she studied in her spare time and passed the sixth form. She also worked hard at her work and was acclaimed as a model worker. In 1968, she was awarded the President Ho Medal for her achievements. When Vietnam Radio announced the news and broadcast a commentary praising her, her husband was in a trench on the battlefield. He heard the news and was full of joy. At that time there were 10 soldiers of his group in that trench. They had just one cigarette between them. So they celebrated his wife's victory by sharing that cigarette.

Now that the Paris Agreement for ending the war in Vietnam has been signed, women are organising themselves for the task of rebuilding their country and healing its war wounds. The VWU officials told me that their task was also to see that the living and working conditions of women improve and they get more opportunities to study literature, science and technical subjects. They had also to bear the responsibility of rehabilitating the children who had lost their parents and those wounded and maimed by bombs; and they had to look after the families of those who had lost their lives in defending the country.

SOUTH AFRICA

The British Investment in Apartheid

A K Essack

THE revelation by *The Guardian* (London) of the starvation wages paid to African workers in South Africa raised a hornet's nest and many British companies got stung. For decades, British companies have encouraged and abetted the official policy of segregation and apartheid and extracted fat profits for themselves by plundering the human and other resources of South Africa. Now with *The Guardian's* revelations they cannot hide the facts any more, for it has been shown that it is they who, more than any one else, have been involved in the exploitation of the South African oppressed.

A starvation wage is defined in sociological jargon as a wage below the poverty datum line (PDL). *The Guardian* explains the PDL as "the minimum income, determined by nutritionists and social researchers needed by an African family simply to exist. It does not allow for medicines, education, savings, holidays, furniture and blankets — any luxuries at all — even the odd bus ride."

WAGE STRUCTURE

The PDL for a worker with a family of five has been calculated at about 90 US dollars per month. There are five hundred British firms operating in South Africa. *The Guardian's* investigator, Adam Raphael, analysed the wage structures of a 100 British firms and found that, with the exception of Shell, ICI and Unilever, all the firms were paying their African workers wages below subsistence level.

The alibi used by some firms was that they would be violating South Africa's apartheid laws if they paid a wage above the PDL. On this point the liberal paper of the British establishment quotes an extract from the British Department of Trade which advises potential investors. The Department flatly states: "The impression that legislation effectively prevents employers from improving the wages and conditions of service of non-white employees is mistaken. Employers retain a good deal of flexibility in these areas."

The exposure by *The Guardian* is not over the more fundamental question of abolishing completely a colour bar in wages and work or of instituting equal pay for equal work. The issue is simply one of whether on the wages paid

by the British firms, the African workers can survive as human beings and whether they can bring up their children free from diseases like kwashiorkor and pellagra — the diseases of malnutrition.

Those involved in perpetrating this inhumanity are now trying to exculpate themselves. Vorster, one of the arch-priests of apartheid, has said that there was a need to pay the African a living wage. The organisation of the Afrikaner bourgeoisie, the Afrikaans Handel Instituut, has laid the entire blame on the foreign companies for the low wage structure because they "control 80 per cent of South Africa's industrial production". Grobbelaar, Secretary of the all white South African Trade Union Council has stated that "British companies are no worse than German, American or other foreign companies operating in South Africa... the employers, whatever their origins, protested when the Wage Board recommended wage scales". But the Trade Union Council is equally guilty as it is totally against African workers joining it. It has thus prevented African workers from using the most effective machinery for improving their position.

The Guardian's correspondent who visited the companies of many of the African workers was appalled and shocked at their wretched and pitiable state. In one case he saw sores on children's backs due to plain starvation and their distraught father said: "My children are dying but I cannot buy milk".

The correspondent also noted that the worst offenders were those British firms which operated in rural areas. He listed a few like Slater Walker, Tate and Lyle (which also have interests in Zambia) and Natal Tanning Extracts. The views held by some of the company officers were no different from those of the white Nationalists. One Blimp who went by the name of Air Commodore E I Moses said: "You must remember these Bantu are mostly illiterate. And they are unproductive at first — we have to build them up. At home they just lie around and have a good time". The Chairman of Tate and Lyle rationalised: "Our policy in a particular country is to follow local practices".

The report also indicted a number of multi-national corporations which have subsidiaries in independent African states. British Leyland, whose trucks

are seen all over Africa, was one of those which came in for criticism. Its Chairman, Lord Stokes, had said at a shareholders' meeting last year that its workers were the best paid in South Africa. However, Leyland South Africa has now conceded that the wages it pays to its African workers are lower than those paid by its American rivals in South Africa, General Motors and Chrysler. Some of the other companies listed in the report are, Portland Cement, Metal Box, Courtaulds, General Electric, Reed, Rowntree Mackintosh, Chloride Electricals and British Foods. Some of these firms were much more sophisticated than the Colonel Blimp of Illovo Sugar Estate. They tried to wriggle out by saying that the wages they were paying were above the PDL. But this explanation was later found to be a deliberate lie. Another correspondent subsequently discovered that they were in fact paying wages well below the PDL because "with one exception, none of the companies which vehemently denied *The Guardian's* reports was willing to back up its claims with a detailed break-up of the wages".

FEARS ABOUT LABOUR

Just how much Britain benefits from the operations of its companies in South Africa can be seen from the fact that on an average British firms do not get less than a 12 per cent annual return on their investments, making South Africa Britain's second most profitable field of exploitation after Malaysia. It is, therefore, not very surprising that *The Guardian's* indictment was widely supported by the British press and other forums of public opinion, from the diehard Conservative to the radical. Behind this widespread support is the fear that unless some wage concessions are made to African workers, there could be serious labour troubles in South Africa. (It is significant that many of the same newspapers and other organs of opinion which have called for increased wages for the African worker are supporting Heath's wage freeze and condemning the strikes of the British worker.) This fear has been accentuated by the strikes last January-February of some African workers in South Africa.

Not since 1945, when the mine workers struck work, have African workers come out in such force. These workers have grown up in urban areas and know of no other life than that of the towns. In other words, these recent strikes were organised by an educated and sophisticated urban proletariat. In

January-February, only about 150,000 out of the two million strong industrial working class struck work. Adding the one million agricultural workers and the six hundred thousand mine workers, the African working class makes up a formidable force in South Africa.

It is the potential strength of the African workers that has caused apprehension within the white establishment, both in South Africa and Britain. In the long run the British companies may find themselves thanking *The Guardian* for these revelations. Some of them

have already granted minor wage increases to ward off serious labour troubles.

But these are mere palliatives because the African workers continue to be at the mercy of their employers as long as they do not have the right to organise themselves into trade unions. Their economic disabilities flow from their lack of political rights. Their economic problems as also those of education and social upliftment are directly connected with the basic question of who wields political power.

farming not being "viable" because of landlord-moneylender exploitation, is nowhere realised in the book. Thus, there are many logical contradictions in the authors' analysis. Their prescription for eradicating famine is essentially the technical one of increasing irrigation. If famines are primarily the result of the socio-economic order, then how could famines possibly be eradicated without a change in the socio-economic order? That to increase irrigation in a manner which would make it available to the mass of the peasants would itself require a transformation of the economic relations, the authors do not understand. At the same time, in another place, they point out that external factors, like the development of speedy means of transport, need not lead to mitigation of the effects of famine, since, as happened in India, the railways can be used to export foodgrains. Yet, that the effect of speedy means of transport depends upon the social structure within which it operates, again seems beyond the authors' understanding. Again, the authors deplore the rise of "anti-social" activity like looting of foodgrains stores, but don't see its connection with the hoarding of foodgrains by landlords, which they mention in the very next paragraph.

POLITICS OF RELIEF

To come back to the main theme, the superficial understanding of famine put together with the concept of social work based on a "professional relationship", gives us Jayaprakash Narayan saying, "Aid may have its politics but not relief", and following this with, "My appeal is also to the bigger farmers of the state who have stocks of grain". Despite what Jayaprakash Narayan may say, the politics of his kind of relief is apparent in his 'appeal' to the bigger farmers. That relief is apolitical is the doctrine put forward by the ruling classes and their political representatives. Jayaprakash Narayan supposedly renounced politics, but when the people are continuously losing faith in established political leaders, the Sarvodaya leader plays an important role in filling that void.

Reading this book one wonders if the persons involved could be as naive as they seem. Then remembering the record of Jayaprakash Narayan and the timely interventions of the Sarvodaya movement, one sees that the leaders are anything but naive. They may fool many of the people who work with them, but the leaders surely know what they are up to.

Non-Brahmans and Communists in Bombay

Gail Omvedt

This paper studies the radical working class movement which emerged in Bombay in the late 1920s and which brought together, in curious fashion, an emerging communist leadership with the leaders of the largely peasant-based non-Brahman movement. The ambiguities and outcome of these contacts and conflicts were decisive not only for the development of social radicalism but also for the direction of the nationalist movement in Maharashtra.

While the focus of the paper is on the Bombay working class, the larger issue is the relationship of the 'cultural revolutionary non-Brahman movement with nationalism and communism. The purpose is to provide some additional insight into why the nationalist movement in India consolidated itself under a conservative leadership.

Caste elitism, it is argued, was a major barrier to the spread of the Maharashtrian communist movement. Receptivity to a radical ideology existed among both urban and rural masses, but an anti-communist and conservative section of the non-Brahman elite was also there, ready to take advantage of any failure of the communists. These failures, along with the effectiveness of British repression, were decisive.

I

Introduction

IN the late 1920s a radical working class movement arose in Bombay which brought together, in curious fashion, an emerging Communist leadership with the leaders of the largely peasant-based non-Brahman movement. The ambiguities and outcome of these contacts and conflicts were decisive not only for the development of social radicalism but also for the direction of the nationalist movement in Maharashtra. This paper, therefore, will focus on the Bombay working class, but the larger issue we shall be concerned with is the relationship of the "cultural revolutionary" non-Brahman movement with nationalism and Communism, and the purpose is to provide some additional insight into the reasons the nationalist movement in India consolidated itself under conservative leadership as compared with the radical consolidation of the Chinese revolutionary movement.¹

It is important to begin with some analytical background. We can speak of three types of social movement in the colonial context: a national movement which arises as a *political revolution* directed against the alien colonial elite, and a social movement directed against the domination of the native upper classes which itself takes two forms, a movement of *cultural revolution* focusing primarily on the elite defined in "traditional" terms as a caste elite, and a movement of *economic revolution* focusing primarily on the elite defined in "modern" terms as an emerging bourgeoisie. The political revolution finds its first social basis among the native upper classes; the cultural revolu-

tion finds its base in the countryside in the antagonism of peasants to landlord power; and the economic revolution emerges with a base among the urban working classes. In terms of Marxist theory, we might describe these movements as directed against colonialism, feudalism, and capitalism.

A truly effective nationalist movement has to appeal to social revolutionary impulses in order to mobilise masses of the population; it is for this reason that Marxists have argued that a strong national movement must be led by the working class (rather, a worker-based Communist party) since the vacillating "national bourgeoisie" will compromise with imperialism out of fear of social revolution from below. Conversely, as western scholars continually point out, an effective social revolution in colonised societies has to represent the impulses of nationalism to consolidate its power. We may say that the strength of a colonised society's revolutionary forces depends upon the unification of the impulses of political, economic and cultural radicalism. However, the colonial context of a society such as India tends to separate these. Because the national movement is led at first by native elites, it cannot attain a mass basis and antagonises the leaders of the social movement. At the same time, within the social movement, cultural and economic revolutionary forces develop also in separation and sometimes conflict: a cultural revolutionary movement draws leadership from among the economic elites of a culturally disadvantaged group, and these leaders tend to underplay the economic aspects of opposition to the native elite. Con-

currently, the economically revolutionary (communist or socialist) movements draw their leadership first from native intellectuals who as caste elites are liable to downplay the role of caste and culture. Thus in spite of many pressures from below for unification of these movements, they tend to develop in opposition.

The first expression of social revolution in Maharashtra was the non-Brahman movement, which gained organised form with Jotirao Phule's Satyashodhak Samaj ("Truthseekers Society"), organised in 1873 as a cultural revolutionary movement directed against the traditional caste system and the religious and social domination of Brahmans. By the 1920s it had attained a strong base among the peasant masses in many districts of Western Maharashtra and Vidarbha, and was beginning to take on strong economic overtones. Increasingly it defined itself as the movement of the *bahujan samaj* ("masses" or "majority community") whose primary enemies were not only *bhatjis* or Brahmans, but also *shetjis*, the merchants and moneylenders who were frequently *de facto* or actual landlords as well: in fact the 1920s saw two important tenant-poor peasant agitations under Satyashodhak leadership. Again, up until 1920 the movement had firmly opposed the national movement which was overwhelmingly dominated, especially in Maharashtra, by the Brahman elite. By the early 1920s, however, many non-Brahmans were feeling nationalist impulses, and in the middle of the decade the leadership of the movement passed to a group of young radicals who mounted an increasingly

Challenge and Response: A Study of Famines in India by K D Gangrade and Siddharaj Dhadda, Delhi; Rachana Publications (1973); pp viii + 124; Rs 25.

IF the *Sarvodayas* could have their way, their leader Jayaprakash Narayan would transform India. It would only require a change in the 'consciousness' of the people. Knotty problems like the landlord-moneylender domination of the Indian countryside simply cease to exist. This naive faith has led to the writing of this book.

In the Bihar famine of 1966-67, the Sarvodaya doctrine was tried out on a large scale in famine relief work organised by the Bihar Relief Committee, of which Jayaprakash Narayan was President. This book, written by a teacher of the Delhi School of Social Work and a Sarvodaya leader, purports to be "A Study of Famines in India". The main point of the book, however, is its unabashed adoration of Jayaprakash Narayan. To make it seem respectable the adoration is mixed with pseudo-scientific chapters on social work, famines in India, and 50 pages on the organisational structure of the Bihar Relief Committee.

OUTMODERN CONCEPTS

A society in crisis requires some special arrangements. The kind of arrangements that are made would, however, vary from one social system to another. The authors lament that the concept of *dan*, which sees giving as a religious duty, is fading away. They find that the community spirit has broken down and that people have a negative attitude. The authors don't realise that such concepts are appropriate in a feudal economy, with a patriarchal relation between the feudal lord and his serfs whom

he must help through bad times and keep alive. With the development of a free labour force (free in the sense of not being attached to any particular employer) maintenance of the class of workers ceased to be the responsibility of the employers individually. In times of need, the State undertook to look after the survival of the workers. Thus, we had the varied legislation on 'social welfare'. At the same time, voluntary agencies also began to appear and play an important role in mitigating some of the most harmful effects of the system. Social work soon became a very organised activity and acquired some manner of theoretical backing in the writings of bourgeois sociologists (such as Pitirim Sorokin, to whom the authors frequently refer). The authors discuss three phases in the development of social work, refer many times to socio-economic conditions, and even say that "social work now envisages dealing with the total situation in all its dimensions" (p 10). But the book shows a complete innocence with regard to the basic social forces.

This innocence is seen particularly in their analysis of famine. While recognising that famines are primarily the result of the socio-economic order, and that "natural causes only provide the immediate starter" (p 26), the authors are unable to identify the main aspects of the socio-economic system. They do at one place point to the concentration of land in the hands of a few landlords and moneylenders (p 35), but at no other place does this re-appear. That famine is essentially due to peasant

severe attack on Brahmins but at the same time defined themselves as nationalists: they argued that the basic conflict was between the Indian masses and their British rulers, but that the Brahmin leaders of the national movement only betrayed the nationalist cause through their elitism and continuing attachment to caste orthodoxy which served to divide the Indian people.

The issue at this point was not so much whether the non-Brahmin peasant masses in Maharashtra would join the national movement, but whether they would do so in a way that allowed them decisive influence over the emerging nationalism or whether they would be simply co-opted by the upper class and upper-caste elite that continued to control the Congress party. The leaders of the young non-Brahmin radicals, Keshavrao Jedhe and Dinkarrao Javalkar, had by 1926 obtained a statewide reputation. After 1927 Jedhe began to be increasingly attracted by the National Congress as its Gandhian leadership appeared to offer a social reformist alternative that promised to undermine the old dominance of Maharashtra orthodox Brahmins. Here a crucial role was played by such local "Gandhians" as N V. Gadgil, who was able to speak in the language of and in terms of the needs of the *bahujan samaj* or non-Brahmin community, and it was in fact Jedhe's alliance with Gadgil which was given primary credit for leading non-Brahmins into the Congress in the 1930 civil disobedience movement and after.

As this alliance was forming, however Dinkarrao Javalkar was coming into contact with emerging radicalism among the Bombay cotton mill workers and with the Communist leadership which offered an alternative direction for the Indian revolutionary movement. Javalkar emerged from his experience as a Marxist who aimed at leading the non-Brahmin movement in a different and more radical direction from that represented by Jedhe, and before his early death in 1932 had made beginnings of such organisation. The existence of this more radical impulse among influential non-Brahmins and the correlated possibility of gaining a peasant basis for the Communist movement is important. Even more so was its failure and the subsequent incorporation of non-Brahmins into a Congress party which continued to be controlled at the top by a caste elite and the Indian bourgeoisie. It is this possibility and failure that will be examined here in the context of Bombay working class movements.

II

Social Organisation in Bombay City

Bombay city, the urban-industrial centre of Bombay presidency, was a typical cosmopolitan colonial port city. It was not a political centre for Marathi or Gujarati speakers in the same way that Calcutta was unambiguously a Bengali city and Madras a Tamil centre.⁸ Because of its particular social structure, "non-Brahmanism" did not exist there as a movement in the way it did in the Marathi-speaking rural districts. However, upperclass non-Brahmin politics did exist, and partly reflected the connections that non-Brahmins of all classes maintained with the rural areas. Similarly, the large majority of the lower and working classes were Maharashtrians, most drawn from the rural districts of the Konkan where as tenant peasants they came into conflict with largely Brahmin (but also high-caste Marathi) *khot* landlords. Thus the working class organisation that developed did so at least partly in the context of the non-Brahmin movement, and this was to have important consequences.

Within the Bombay presidency, the city overwhelmingly dominated what industrialism existed: by 1931 it contained 381 out of 794 factories employing more than ten persons, as compared to 162 for the other Marathi-speaking districts.⁹ The cotton textile industry, which dated its beginnings from the late 1850s, was again heavily dominant within the presidency and the city itself. By 1931, out of a total of 563,787 earners and working dependents in Bombay, 176,433 were employed in "industrial" categories and of these, 114,960 were in cotton textile factories of various types.⁴ It was these workers who were predominantly Maharashtrians, mainly immigrants from the Konkan districts, secondarily from the Deccan plateau; a few came from the United Provinces, almost none from the Gujarati districts.

While it was the second largest

Indian city of the colonial period, Bombay was probably the premier Indian industrial city. Unlike Calcutta, whose trade and industry was for a long time overwhelmingly dominated by Europeans partly by reason of general government patronage, Bombay Indians had played a much greater role as businessmen, collaborating with Europeans "on a basis of something like equality".⁶ These businessmen, including the mill owners and managers, were overwhelmingly Gujarati-speakers, including Parsis, Gujarati *vanis* (merchant castes) and Muslim business minority communities such as the Bohras, Khojas and Memons.⁷

In contrast, the educated and professional classes of Bombay city had from early days been dominated by Marathi-speakers, but these had found it difficult to establish their leadership *vis-a-vis* the business communities.⁸ And Brahmin dominance among them was not nearly so absolute as in the rest of Maharashtra. For example, while Poona delegates at the first session of the Indian National Congress in 1883 had all been Brahmins, the Bombay delegates included seven Parsis, five Brahmins, three Banias, two Muslims and one CKP.⁹ One result of this was that caste orthodoxy was less strong; Brahmin moderates like Gokhale could find a greater basis in the more cosmopolitan centre of Bombay, and Bombay and Poona presented markedly different political styles.

Finally, Muslims existed in greater proportion in Bombay as compared to the rest of Maharashtra, with the result that Hindu-Muslim tensions had a greater impact on the life of the city: they were 18 per cent as compared to 68 per cent in Bombay in 1931, contrasted with 8 per cent and 90 per cent in the Deccan districts at that time.¹⁰

For these reasons, the non-Brahmin question did not arise in Bombay city with the same intensity it did in the rest of Maharashtra. Although as an

TABLE 1: PLACE OF ORIGIN OF MILL WORKERS⁵

District of Origin	Per Cent of Total Mill Hands		
	1911	1921	1931

United Provinces	3.05	9.42	11.82

urban centre Bombay produced one of the earliest Satyashodhak branches and the newspaper of the organisation, *Din Bandhu*, the movement itself was weak there. Broad-based non-Brahmin social reform found an expression instead in the more religiously moderate Maratha Aikyeccu Sabha which was active from the 1890s through 1910. The term "Maratha" in its title was interpreted not in the caste sense, but to include all Marathi-speaking non-Brahmin castes except untouchables (though many of its leaders actively supported untouchable leaders), and its leaders included men such as Krishnarao Arjunrao Keluskar, the Maratha writer; Narayanrao Lokhande, the Mali Satyashodhak worker and labour leader, and S K Bole, the Bhandari political leader of the non-Brahmin Party. Indeed, Bole's career illustrates much of the particular nature of Bombay non-Brahmanism. Born in 1869, he took an early lead in caste reform activities, founding an organisation of his own subcaste in 1889 and becoming the first president of the Bhandari Education Conference in 1913. He took a leading role in organising tenant agitation against *khot* landlords in the Konkan, was the most important non-Brahmin leader of working class welfare organisations after 1900, and became one of the leaders of the non-Brahmin party in the Legislative Council in the 1920s. But he was never a member of the Satyashodhak Samaj, and later joined the Hindu Mahasabha, one of the very few non-Brahmin leaders to go in that direction.¹¹

It would be useful to examine more closely the class and caste relationship of non-Brahmins in Bombay. With no representation among the highlevel business community and very little among the intelligentsia and professional classes, the non-Brahmin section nevertheless did include some well-to-do men; mostly merchants and contractors. (Typical of this perhaps was the fact that Telugu Malis and associated groups of contractors had provided most of the early support for Phule in Bombay city.) In spite of the efforts of such organisations as the Maratha Aikyeccu Sabha, it seems that caste remained a significant factor of social intercourse, splitting the non-Brahmin groups.¹² Even among Marathas, distinctions between aristocrats and "kumbhis" as well as distinction between Marathas from the Konkan and Marathas from the Deccan, continued to be important well into the 1920s. Thus the earliest Maratha caste organisations

represented separately the "Deshastha" and "Konkanastha" Marathas; these had managed to unite in 1912 in the "Ksatriya Maratha Dnyatisamaj", but this remained an organisation dominated by aristocrats, with its office in the wealthy area of Girgaum and with activities including preparation of lists and biographies of "Ksatriya Marathas".¹³ In contrast, a "Maratha Samaj" founded in 1891 included reformist leaders like R S Asavale, Bapurao Avte, Laxmanrao Thosar and Vasudevrao Birze; this organisation considered *Din Bandu* and *Barodavatsal* as affiliated newspapers and aimed at unity, education and social reform but evidently did not survive for long.¹⁴ Instead, localised organisations, including organisations of Marathas from one district, continued to predominate.

For less aristocratic Marathas, the centre of much activity was Crawford Market and Koliwada Hall in nearby Mandvi was said to be the "headquarters for all Marathas".¹⁵ It was here that Phule had been honoured in 1888,¹⁶ and it was the site for numerous community meetings including one in 1930 attended by Jedhe and Gadgil with the aim of bringing the Maratha community into Congress. The Maratha merchant community of this area was not an educated one, but did have extensive connections. Many of its leading men had come to Bombay seeking their fortunes from the villages, and they maintained their connections with the rural areas. They took part in welfare associations, some oriented to caste activities,¹⁷ some to labour welfare activities, some to education and social reform; through these they maintained relationships with and influence over the wider group of lower-class Bombay non-Brahmins. Among these merchants were men such as Mansingrao Jagtap, a grass merchant from Satara who was loosely involved in politics both in his home taluka of Wai and in Bombay and patronised wrestling, tamashas and a wide number of social organisations; or Dhondji Patil-Bhosle who had come to Bombay from Satara as a labourer making boxes and then organised his own business and was also a philanthropist, a patron of wrestling and an important funder of the Rayat Shikshan Sanstha of Satara.¹⁸

Perhaps the most important of such businessmen-politicians and a crucial behind-the-scenes patron of Bombay non-Brahmanism was Govindrao "Bhau-saheb" Shinde. Born in 1879 in Nasik, he had come to Bombay with his widowed mother in 1890, opened a small shop in 1902 and eventually

established an ayurvedic medicine shop at Delisle Road which became one of the most important purveyors of medicine for workers in that area. His home at Delisle Road became a centre for non-Brahmin activities in Bombay that was said to be an equivalent of the "Jedhe mansion" in Poona; indeed the 1927 special meeting of the Non-Brahmin Party which was called to decide whether non-Brahmins should enter Congress, was held in his compound. He too was involved in caste activities (he founded in 1916 a Maratha Vidyarthi Sahayyakari Mandal to provide scholarship help to students) and in labour organisations such as the Social Service League of N M Joshi.¹⁹

Men such as Shinde and Jagtap — and through them the political non-Brahmin leaders of Bombay — maintained a connection with working class non-Brahmins through such welfare activities and through sponsorship of gymnasiums and wrestling societies which were important in working class social life. More significantly, perhaps, they evidently had close relationships with a number of the "jobbers" who were so crucial in the organisation of the Bombay labour force.²⁰

Jobbers overwhelmingly dominated the social organisation of the mill areas at this time and were a crucial linking group in relationships of the workers. They were responsible for the recruitment and management of labour, and their influence extended from the villages where they recruited to the mills and the working class tenements as well. The "jobber's gang" was in fact a social unit that often followed him from one mill to another. Jobbers made contacts for labourers to borrow money and frequently loaned it themselves. All this gave them tremendous social power and an income derived in large part from taking a cut of the income of the workers known as *dasturi* (fee, bribe, commission). Their caste composition was almost exactly equivalent to that of the workers and occasionally they themselves had risen from the ranks.²¹ They have been described as a city equivalent of the village patil (headman), and although their position was not hereditary, this is probably apt, for they represented a conservative, patron-client form of social organisation.

Bombay non-Brahmin society, then, though heavily stratified by class and caste, was in many ways a fluid one, and these relationships that linked workers, jobbers, businessmen, and political leaders formed the social basis for the early labour organisations of Bom-

bay. They help to make understandable a part of Bombay labour history — but not all of it. For, as Morris David Morris has noted,

the Bombay industry has a long and bitter tradition of industrial conflict. There have been more labour disputes in the Bombay cotton textile industry and they have been of greater intensity than in any other place or industry in the country. The trade unions which have emerged have had a complicated, tumultuous and unstable career.²¹

The main characteristics of this instability have been incredible tenacity in strikes coupled with the continued potential of becoming a revolutionary political force on the one hand, and on the other an inability to maintain a strong and militant union.²² Organisationally, radical (Communist or socialist) unions have upto the present been successful in calling masses of workers out on strike while in normal times reformist unions, supported by the government, have succeeded in maintaining their positions as representative unions. Two types of unionism, then, have existed among the Bombay mill workers, one based to a large degree upon the social structure outlined above, the other upon spontaneous worker radicalism (itself in part connected with non-Brahman anti-elitist themes) and militant leadership. It is the relationship between these that will be discussed in the following two sections.

III

Early Non-Brahman Labour Organisations

To a very considerable extent, early labour welfare organisation grew out of non-Brahman activity. It is a Satyashodhak leader, Narayan Meghaji Lokhande, who is credited with being India's first labour leader.²³ Born in 1848 in a Mali family of Thana, he had been educated upto high school and began life in Bombay under the patronage of a Khoja merchant and eventually became a head clerk in a cotton mill. Though little in detail is known about his early life, Satyashodhak sources tend to stress that "unlike the *panderpesha* lawyers, barristers and solicitors who lead today's unions", Lokhande had been a "worker" himself and had lived in the tenements of Parel and Byculla.²⁴ Though this was an exaggeration since he was a clerk and not a manual labourer, there is little doubt that he was closer socially to the workers than upper-caste leaders such as N M Joshi. He learned of the Satyashodhak movement early enough

to become a member in its second year in 1874, and began activities on its behalf in Bombay. In 1880 he was given the editorship of its paper *Din Bandhu*, which began to call itself the "Journal in the Interests of the Working Classes", and with this opportunity he left his service for social work and founded the Millhands Association.

Lokhande differed little in style from other early upper-class labour leaders in that his role was primarily in representing the workers' grievances before the British and in attempting to ameliorate conditions that caused unrest rather than in organising the workers to press their demands directly. However in 1884 he was responsible for organising meetings of textile workers out of which 5,000 signed a petition of demands to the Factories Commission,²⁵ and the Millhands Association did have an organisational basis among jobbers.²⁶ The Association itself was weak and shortlived, but it evidently remained as a tradition among the workers; during the 1920 general strike an organisation under that name appeared and distributed a leaflet of demands.²⁷

The Association's work was continued partly by the Maratha Aikyecchu Sabha, which involved Lokhande in its leadership and which represented workers' grievances by taking part in the agitation for a twelve-hour day in 1905.²⁸ However, it was the Kamgar Hitawardhak Sabha, founded by S K Bole and others in 1909, which became the most prominent of the workers' welfare associations and lasted until developing radicalism among workers in the mid-1920s cut away its strength. The KHS defined its aims as aiding workers in times of difficulty, sponsoring lectures and handbills on useful subjects, opening schools for workers' children, and helping workers to "settle" struggles with factory owners.²⁹ By the 1920s it did indeed have three night schools and evening classes and sponsored sporting competitions and gymnasiums.³⁰ It represented workers' grievances during the 1918-19 textile workers' strike, and in 1919 it organised "the first conference of Bombay workmen" which supported a nine-hour day, urged medical care and workmen's compensation — and warned workers against falling victim to outside agitators.³¹ It also formed part of the deputation to the governor and Montague in 1917 which demanded communal representation for non-Brahmans.

The KHS organisation was based primarily on jobbers, and it developed the strongest organisation for its time,

with 200-300 members who were said to have influence over approximately 10,000 workers due to their role as jobbers in the early 1920s. Its centres were in Parel, Chinchpokli and Delisle Road, the central Bombay working class areas. It would appear that its upperclass lines of support were primarily non-Marathas, such as Bole and Manuji Rajaji Kalewar, a wealthy contractor whose meeting hall, "Manaji's wada", became its centre; at the lower organisation level however there is no evidence of caste differentiation.³²

The Social Service League, founded in 1909, was in seeming contrast to the KHS since it involved fulltime social workers but no jobbers in any obvious role.³³ Its most prominent leader was N M Joshi, the moderate Brahman labour leader of Bombay, who was appointed to many conferences as a labour representative and whose testimonials before enquiry committees were invariably the most thoroughly researched and effective. This gave the League less of a "backward class" character; yet it involved such persons as Govindrao Shinde,³⁴ and it is likely that through him and the group of jobbers he was connected with it had many of the same linkages as the KHS.

This was a particular style of labour organisation. Organisationally these associations brought together educated social workers, non-Brahman politicians and businessmen and jobbers and based themselves on the traditional social organisation of the mill areas. Ideologically they were conservative and reformist, seeking to represent the workers' grievances to the owners and the government, but consistently opposing strikes. It appears that this style was the basic model for the Bombay Textile Labour Union which arose in 1925 and grew to become the main competitor with the militant, communist-led Girni Kamgar Union in the last half of the decade. The BTLU brought together the main upper class labour-oriented politicians of Bombay — Bole, Joshi, Asavale, Jhabwala, Ginwala — and had an effective centralised bureaucracy. Newman contrasts it with the Girni Kamgar Mahamandal (the initial basis for the GKM; see below), arguing that it had only qualified jobber support and was not able to build on jobbers' gangs.³⁵ Yet it did apparently have jobber support through the more informal connections of the non-Brahman leaders (see also note 20). Rather, the difference was that the BTLU represented essentially the evolution of the traditional labour organisation into a

formalised union, whereas the GKM and the GKM built on something new: a developing wave of worker militancy that grew in opposition to such traditional authority of jobbers and educated "outsider" labour leaders.

IV

New Labour Movement: Communists and Non-Brahmans

The 1920s in fact produced radical new developments. Three phases of discontent — period of rising prices in 1918-20, a period of wage cuts from 1922-25, and a period of standardisation from 1927-29 — produced each two general strikes and an increasingly effective trade union.³⁶ Behind these were two coalescing trends of radicalisation. Both were militant in expressing some form of class struggle ideology as contrasted to the earlier mediationist approach; both were modern in representing a new form of worker's organisation fundamentally opposed to traditional jobber control. One was a movement for "workers' control" that developed in opposition to all forms of outside, upper-class, non-worker leadership: this was expressed in the Girni Kamgar Mahamandal and later in the GKM mill committees of 1928-30. The other was the Communist movement. Though seemingly opposed — the Communists, largely Brahmins, were in a sense "outsiders" of an extreme type — they nevertheless came together in the formation of the most impressive labour union in India of the time, the Girni Kamgar Union, known to the workers as the *Lal Batta* or "Red Flag" Union.³⁷

The Girni Kamgar Mahamandal came to the fore as a millworker's organisation during the 1923 strike. At this time it claimed a membership of 900 in 17 mills, but grew to a strength of 3,500-4,000 in 1926 and 1927.³⁸

Two non-manual workers were initially involved as leaders: Mayekar, a Bhandari clerk and storekeeper who had organised a rather nominal Girni Kamgar Sangh in 1919, and D A Bhatavdekar, a Brahman jobber. Most of its other members were actual labourers and mainly Marathas and allied castes. As it grew, the GKM encroached directly on the areas of strength of the KHS, with three clusters as its nucleus, one of which was at Delisle Road; as a result, the KHS disintegrated. This growth involved three correlated trends. The first was a movement towards a more aggressive and militant policy, particularly after

1926 and associated with relationships with emerging Communist leaders. The second was the inheritance of the anti-elitist attitudes of the non-Brahman movement; as Newman puts it, as the GKM took over the social basis of the KHS, "a section of the anti-Brahman movement was transplanted into the new union". And third, Mayekar and Bhatavdekar were excluded as they began to quarrel with more militant leaders, and their ouster "was accompanied by the rise of the ordinary millhands to positions of real responsibility in the union".³⁹

Most important of these militant worker leaders were A A Alve, a Vani, and G R Kasle, a Maratha fitter.⁴⁰ Both had been originally tenant farmers in the Konkan, and though driven by poverty to seek early work in the mills maintained their relations with the villages; Alve himself had made efforts to organise against the landlords. Both had come up from the ranks as workers but had previous political experience. Kasle had attended the first AITUC "on a delegates' ticket given him by a lawyer who was trying to promote himself as the leader of a labour organisation"⁴¹ and Alve had taken part in Congress campaigns during the non-cooperation movement but had become disillusioned. Because of their peasant as well as worker background, and probably because of experience of Brahman social exclusiveness,⁴² it was not unnatural for such men to see moneylender-landlord power, capitalist oppression, Brahman caste dominance and an elite-led Congress party as all of one piece.

This, for example, was reflected in Alve's criticisms of the Congress leadership, criticisms which reflected a more class-conscious version of the general non-Brahman opposition. Workers, he explained, had understood *swaraj* to mean that there would be a halt to moneylending, cheaper land, higher wages, and an end to capitalist oppression. But they had found Congress to be only a negotiating body making demands for factory owners, landlords and the educated intelligentsia: "It therefore became evident to me what Swaraj was and what would be the condition of us workers and peasants when it would come into the hands of such rich men."⁴³ Ideological themes underlying the GKM were those of workers' control: Its trend was to exclude middle-class patronage, to be an organisation purely of the working class. But it is important to note that its antagonism to educated elite outsiders was

directed not only against Brahmins, but also against upper class non-Brahmans. Not only did Alve express hostility to the "autocratic obstinacy" of N M Joshi,⁴⁴ he also opposed the KHS for similar reasons. As he described the 1923 strike negotiations,

Messrs Bole, Talcherkar and others of workers' institutions like the "Hitawardhak" put together something and placed it before the committee and these sensible and humanitarian persons represented as false the side of the workers placed by me before the committee, got it proclaimed through the English newspapers that they were the real leaders of the workers, that I knew nothing about the workers' condition and such other things. The committee also accepted as true their side, regarding them as sensible outsiders.⁴⁵

However, the militant workers did need to deal with outsiders and sometimes through outsiders, for all the reasons generally cited in studies of non-western unions: the importance of the economic regulations of a powerful government, the necessity of literacy (and literacy in a foreign language) in dealing with the millowners and government.⁴⁶ Thus GKM leaders maintained relationships with non-Brahman politicians such as A N Surve and R S Asavale. But it was not such leaders but rather the largely Brahman Communists of Bombay city who were to become the allies of the militant workers in the tumultuous events of the late 1920s, and it was men like Alve and Kasle who took the lead in bringing them in. Alve and others had early approached the Communists for help, particularly Joglekar, whom Alve had evidently known in Congress activity. From the time of the May Day rally in 1926, the Communists began to be leading speakers, and Mayekar's newspaper *Kamkari* began to be explicitly anti-capitalist and described communism as the goal of the workers. The GKM became the Communists' main channel to working class support, and when it was transformed into the GKM in 1928, it was Alve who played the crucial role of convincing reluctant workers to allow Communist "outsider" participation on the union official body.⁴⁷ By 1929 Alve was referring to himself as a Communist.⁴⁸

How was it that the Communists inherited the workers' militancy? If anything, the Communists' own class background and social-cultural outlook were barriers to the development of such relationships. Communism in Bombay city had emerged out of a radical faction of leftwing nationalists in the city Con-

gress Committee; they were men of similar high caste and middle or lower-middle class background whose political heroes were extremist Brahmans such as Tilak, Joglekar and Mirazkar were, it seems, the only two with some previous working class or union involvement.⁴⁹ The leader of the group was S A Dange, a Brahman whose 1920 pamphlet, "Gandhi and Lenin", had marked the beginnings of Marxist literature in India and had attracted the attention of M N Roy from abroad. With the patronage of a left-leaning flour mill owner he was able to build up a Marxist library and study groups that contributed to the growing influence of Marxism on the young Indian intellectuals. It appears it was the influence of scattered Comintern delegates who directed the attention of such left nationalist intellectuals to working class organisation.⁵⁰ Newman describes them as still "primarily a faction of frustrated Congressmen" in 1925 and N M Joshi argued in 1926 that they were "not real communists" (i.e., not leaders of the working class) but "nationalist before everything else".⁵¹

It is important to remember, then, the genuine lack of a functioning Communist party organisation during the 1920s, due to a very large degree to effective British repression⁵² which left Indian communists with very little chance to operate in comparison with, for instance, the Chinese or Indonesian parties. The willingness of these emerging Communist intellectuals to engage in militant working class organisation and to associate on a day-to-day level with the workers was no doubt important.⁵³ But the crucial factor in the attraction of Communism for militant workers was undoubtedly its ideology. Here the subtleties of "right" versus "left" trends within Comintern analysis were of little importance compared to the simple themes that filtered down to the workers. These were two. The first of course was the stress on the leading role of the working class and the eventual goal of socialism, whether conceived of in terms of a "proletarian dictatorship" or "the democratic dictatorship of the proletariat and peasantry". The concept of a "Workers' Raj", which was much discussed in the Meerut testimony, legitimised the already developing themes of workers' control as well as non-Brahman themes emphasising the role of the "masses". Second, the Marxist-Leninist attitude toward Third World national liberation movements, which stressed the validity of nationalism while condemning bourgeois national

leadership, corresponded almost perfectly with general militant non-Brahman attitudes. Thus the attraction of Communism was not simply a matter of efficient and dedicated support of working class "economic" demands but rather the matter of an ideology that fitted with the developing ideological radicalism of militant workers, a radicalism which itself transcended economism.

In this context sporadic but threatening Communist organising began. While M N Roy, the brilliant and sometimes arrogant Bengali, vied with representatives of the Communist Party of Great Britain for leadership over the Indian party, their policies and application of Bolshevik strategy seemed to have differed little. Communists were urged both to work with and form trade unions, and also to build up a nationalist, mass-based left wing organisation. M N Roy had early phrased this as a "peoples' party"; it later took the form of a Workers' and Peasants' Party which was conceived of as autonomous but operating as a "two-class pressure group" within the National Congress, a vehicle for both nationalism and labour organising.⁵⁴ Basing this on a Workers and Peasants Party already formed in Bengal, and gaining support for a Bombay Party among mill workers as a result of their union work (Alve, Kase and Desai, all GKM people, became WPP members), the Communists began to have impressive success.

With the GKM and its communist allies moving in an increasingly radical direction, isolated protests against rationalisation and wage reductions in 1928 coalesced into a six-month long general strike, the largest in India at the time: out of this arose the GKU. "The strike was not our creation, but we were the creation of the strike," said Dange.⁵⁵ Mayekar, expelled from the GKM, had registered a rump union under this name, and thus the workers of the old GKM joined with the Communists in a new union registered as the Gini Kamgar Union (the Red Flag or Lal Bacta Union), which now allowed outsiders (the Communists) to join with working class leaders in the central body. The relative success of the strike was followed by the tremendous expansion of the union to the numbers of 50,000-100,000 mentioned above (see footnote 37).

What is important here is the form which this expansion took. It was not simply that of affiliation of workers to a central body controlled by militant

workers and communist intellectuals: rather it was the expansion of the "workers' control" movement now taking the shape of mill committees (*gini samitiya*). The committees were made up of about 30-40 members elected as representatives from each department in the mills; by April 1929 there were 42 of such committees on record. The committees were informally organised, met on their own, and often did not keep in correspondence with the central union leadership; they had a distinct tendency to claim union authority for themselves or to "usurp it".⁵⁶ They took control of enrolment and subscriptions, watched petty officials, formulated grievances and bargained before the union central leaders came in; on occasion they initiated strikes. In fact they considered themselves the union, and their opponents began to see themselves as such. As H P Mody, chairman of the Millowners' Association, wrote, "the mill committees are in their own way the Union. There is no control over them on the part of the GKU".⁵⁷ Almost more than the communists themselves, it was the committees that frightened the establishment:

The mill committees did more than anything else to upset the established order in the mills. They caused unprecedented anxiety among the millowners, and overexcited the imagination of the government, the law, and many journalists and historians.⁵⁸

The most interesting aspect of this overturning of the established order was that in committees developed in opposition to the jobbers, the traditional focus of authority among the workers. Though some jobbers had initially assisted mill organising, conflicts quickly developed and the old discipline collapsed; jobbers were attacked and often beaten, their power coming to an end.

The Bombay mill committees thus represented a distinctly modern form of worker organisation, and have to be seen as a parallel to similar "factory councils" that have developed with almost equivalent spontaneity under revolutionary conditions throughout the world. During the Russian revolution, for example, the Bolsheviks actually gained much of their power base among the working class by supporting a similar factory-council based "workers' control" movement which was fighting a Menshevik-controlled trade union bureaucracy.⁵⁹ Although the Bolsheviks subsequently under the pressure of a revolutionary war substituted a nationalised bureaucracy for workers' collective management in the factories and over-

rode the independent power of the factory councils,⁶⁰ support of such committees or councils remained an important theme of Communist union organising. Similarly in Italy, while the right-wing Socialists controlled the union bureaucracy, the left wingers (especially the group in Turin under the leadership of Antonio Gramsci) who were later to become the nucleus of the Italian Communist Party, based themselves upon a similar factory council movement. In fact, it was Gramsci who became the primary Marxist theorist of such bodies. He argued that the factory councils, unions and the (Leninist) party were the three crucial working class institutions: of these the union as a form born of struggle within capitalist society tended to be limited consistently by capitalist legalities and to fall prey to bureaucratisation, while the councils in contrast were both incipient organs of a potential socialist state and a revolutionary force that constantly tended to override the limits of such legality: the party must base itself upon factory councils but continually insure that these were not treated mechanistically but remained democratic organs representing all tendencies within the working class.

We say the present period is revolutionary precisely because we can see that the working class, in all countries, is tending to generate from within itself, with the utmost vital energy... proletarian institutions of a new type: representative in basis and industrial in arena. We say that the present period is revolutionary because the working class tends with all its energy and all its will-power to found its own State. That is why we claim that the birth of the workers' Factory Councils represents a major historical event — the beginning of a new era in the history of humanity... The party and the trade union should not impose themselves as tutors or ready-made superstructures for the new institutions... They should become the conscious agents of its liberation from the restrictive forces concentrated in the bourgeois state.⁶¹

While the realisation of the actual historical importance of such forms as the mill committees was behind the Comintern stress on them as a form of union organisation, it is perhaps doubtful whether all Communists shared Gramsci's enthusiasm for them; it is certain that the Bombay Communists did not. Newman reveals a definite ambiguity in their attitude:

The mill committees were the most controversial part of the union's organisation... The Communists, in their recollections about the union's growth, emphasise the fact that the mill committees were a practical necessity.⁶²

In fact, the intellectual Communist leadership showed a clear distrust of the workers:

They feared that the transfer of power to the millhands might be divisive if local and communal loyalties had not first been subsumed in a wider class consciousness.⁶³ Underlying this distrust was the fact that the Communists, who were not thinking in terms of immediate revolutionary organising in any case, were constituting themselves as the union's bureaucratic leadership in a context of negotiating with the millowners; they began to be the channels through which the owners had the only hope of controlling the millhands, and were ready to make and abide by agreements even at the risk of unpopularity and to look toward the creation of an orderly workforce. But it was this orientation which brought them into conflict with the committees at many points as they tried to dampen disputes and control the volatile local branches of the union.⁶⁴ As Newman puts it, "The employers therefore had to deal with two unions, the union of the militant workers and the union of the leaders."⁶⁵ This was an emerging split, and what was happening was that instead of securing a thorough and organic basis among the working class, the Communist intellectuals were becoming a bureaucratised leadership over the workers.

In this context, the militant workers' distrust of "outside leadership" was bound to be reactivated. And it was precisely at this point that members of the more conservative Bombay non-Brahman elite began to undertake a conscious effort to reactivate it, and to transform antagonism to "outsiders" into anti-Brahmanism and by implication anti-Communism. The primary movers here were Bhaskarrao Jadhav, the leader of the non-Brahman political party, and Govindrao Shinde. Jadhav had in 1924 suggested to British officials the formation of a labour union along communal lines to counteract Congress organising;⁶⁶ he showed no hesitancy in advocating the same tactics *vis-a-vis* the Communists. As he noted later in his diary,

I told how the Non-Brahman party had decided to save our men the labourers from the evil influence of the Communists who had captured the labour unions. We worked upon Alve and Kase. Kase came over to us. But we advised him not to give up his Vice Presidency of the GKU but to work there in gaining more adherents who will oppose the Communists and ultimately will expel them.⁶⁷

The non-Brahman leaders were said to be getting money for propaganda

purposes from H P Mody and the Millowners Association, while their newspaper *Kaivari* was also financed by contributions from the Crawford market area merchant community.⁶⁸ They worked through this paper as well as through their personal contacts with many workers and jobbers in the Delisle Road area centred on Shinde's home. They invoked the tradition of Lokhande, declaring him to be a true worker and implying that almost any non-Brahman, as a member of the *bahujan samaj*, could be considered a representative of the workers, as contrasted with middle class Brahman leadership. Kase was indeed won over, and the entire Delisle Road area, earlier a centre of strength for the GKM-GKU, developed into an area of opposition.⁶⁹

Kaivari carried a wide range of non-Brahman news, but emphasised its labour orientation with extensive feature articles week after week accusing the "Communist *bhats*" of betraying the workers.⁷⁰ Edited at this time by Dinkarrao Javalkar, whose role will be discussed below, its line illustrated both Javalkar's own version of non-Brahman radicalism at that time and the significant degree to which Communist ideology itself had caught hold of the working class. Militantly expressed support for the union itself was combined with strong, crude and often witty accusations of betrayal and caste elitism by the Communist Brahman leaders. Brahmans, it argued, could never be either true nationalist or workers' leaders: "if anyone can be a true Communist, it is a non-Brahman!"⁷¹ The basic theme was a return to themes of "Workers' control":

The Red Flag Union must endure; the Red Flag Union Fund must grow, but the Union should be in the hands of the workers and there should be no room for *bhatis*.

Thus direct anti-Communism was itself never a basis of appeal but was rather fostered on the base of the workers' distrust of outsiders. Even so, the Communists might have learned to overcome these difficulties had they been given time. But the Government, fearful of a powerfully developing Communist movement, arrested 31 Communists and union leaders in the famous Meerut case, including both Alve and Kase. As a result, what has been described as a "young and inexperienced" communist leadership moved in to fill their places in the union. The result was disaster. A second precipitous strike of the GKU resulted in the practical destruction of the union and Com-

munist influence within it;⁷³ it declined to not more than 800 members by December 1929, and the rump was for a time captured by the Royists who now represented a separate faction.⁷⁴ Along with this the mill committees faded away as jobber influence reasserted itself with their role in recruiting new and strikebreaking workers: the old patterns were reasserting themselves at the expense of both forms of militancy. And this loss of the CKU was paralleled by the Communists' self-isolation from the nationalist struggle of 1930 and similar reckless strikes and splits with resulting losses of almost all their union base.⁷⁵

Most studies of this period argue that the disaster was the result of Communists following Comintern directives of a period of "ultraleftism" which emphasised opposition to and isolation from bourgeois nationalism and trade union reformism.⁷⁶ But in first Comintern directives on these issues appear to me, at least, to be highly ambiguous. In regard to participation in the nationalist movement, the most authoritative international directive, the "Theses on the Revolutionary Movements in the Colonies and Semi-Colonies" was an ambiguous document resulting from a somewhat unresolved discussion in the Sixth Comintern Congress debate of 1928. It emphasised disillusionment with the national bourgeoisie (reflecting the Chinese Party's disastrous experience with the Kuomintang) and urged Communists to develop an independent and illegal party and to demarcate themselves from all "petty bourgeois groups". But at the same time it advocated participation in nationalist struggles and "temporary agreements" with nationalist organisations, and was viewed by the Indonesian party at least as giving too many concessions to nationalism.⁷⁷

In this the Indian bourgeoisie was not included among those who had joined the "camp of counter-revolution" but was said to be vacillating between imperialism and revolution. Only after this, in resolutions of the Tenth ECCI Plenum and in the "Draft Platform of Action of the Communist Party of India" of 1930 was a more ultraleft line expressed, of treating the national bourgeoisie as counter-revolutionary. Thus, in 1929, Indian workers and peasants were urged to carry out a revolutionary struggle led by the proletariat against British imperialism, Indian feudal rulers and Indian national capital; in 1931 "proletarian leadership in the revolutionary liberation movement of the masses" was again urged.⁷⁸ Clearly this

was an ambiguous policy combining strongly expressed opposition to Gandhi and the national bourgeoisie with the familiar theme of participation in a liberation movement. What is important to note is that when the Meerut prisoners who opposed the ultraleft tendencies of the Communist leaders outside requested further international arbitration, there was an early result in an "Open Letter to the Indian Communists" in June 1932 which criticised their isolation from the national movement.⁷⁹ In sum, it appears that international directives were often ambiguous and as much responsive to Indian appeals as controlling Indian actions.

We are led back then to a focus on the new communist leadership within India and general Indian conditions for responsibility for the "ultraleft" and isolationist policies of 1929-32. The most important of these new leaders in Bombay were B K Ranadive and S V Deshpande. Ranadive, a brilliant economist, a party theoretician and a longtime opponent of Dange, has consistently represented "left" trends within the party. Deshpande was also primarily an intellectual, effective in study groups and in bringing middle class youth into the movement, but too preoccupied with these and with general party duties to have many contacts with the workers.⁸⁰

Both the ultraleftism and the factionalism characteristic of Indian communism are held by many leftwing critics of the CPI leadership to be a result of the "petty-bourgeois" origin of the leaders. Criticism of Party attitudes towards mass organisation such as unions and peasant leagues emphasises that the leaders had a "mechanistic" attitude toward these bodies, were unwilling to work with different trends within the mass movements, and treated them instead as organisations capable of being directed at will by the leaders. Thus M N Roy argued that:

trade unions under its control are not mass organisations, because the programme of the Party is imposed on them. As a matter of fact the CP does not seem to know the difference between the political party of the proletariat and the trade union.⁸¹

This was well illustrated by the Communist leaders' attitude toward the mill committees. Survivals of old, Brahman-based ideas of the leading role of the intellectuals and an unconscious distrust of the masses could very well constitute an intellectual elitism leading to a mechanistic attitude toward mass organisations; this in turn resulted in the vacillation of Indian communism, rather than a steadier policy more responsive

to lower-class moods, as one or another faction with its ideas of how to direct the struggle gained control. In the contest of mass self-assertiveness characteristic of the period in Maharashtra, this was bound to give some credence to those who claimed that Communism was only Brahmanism in disguise. The mere fact that a new middle-class Communist leadership could see itself as moving immediately into control of the organisations that were beginning to be established suggests the pervasiveness and disruptiveness of this fundamental underlying attitude; many workers evidently resisted this control and this itself was productive of splits.⁸² Dange's own criticism of the Ranadive faction itself illustrates the tendency: "Into the hands of the young and inexperienced leaders that were left behind fell an organised working class, pots of money in the Trade Unions and boundless enthusiasm."⁸³

This was a period in which radical tendencies in rural areas were being co-opted by a seeming responsive Congress leadership symbolised by Gandhi and activated by men like N V Gadgil. Though the Communists had no rural basis to counteract this, they had established an urban basis in alliance with similar militancy among the workers, but this was thrown away. And upperclass non-Brahman and Congress leadership was ready to move in. When Jawaharlal Nehru visited Bombay in 1930 after serving as president of the AITUC in Nagpur, Govindrao Shinde presided over the mass workers' meeting that honoured him. Mansingrao Jagtap, who also spoke at the meeting, recalls it as having been a "non-Brahman, anti-Communist effort".⁸⁴ Shinde was also leader of a group of jobbers and associated intermediary elites who around this time began to conceive of a "nationalist mill workers union" that would be opposed both to the Communists and the loyalist activities of leaders like Asavale, Bole, etc.⁸⁵ And when such a union, the Rashtriya Mill Mazdur Sangh, was formed in 1946, it was able to build up its support among the workers on the basis of the Communists' second period of isolation from the nationalist movement after 1941.⁸⁶ The RMMS appears in fact to represent the reincarnation of the old, traditionalist based, reformist style of unionism represented by the BTU in the 1920s, but continues to maintain its hold upon the millworkers in the face, of the CKU's continuing inability to base itself upon the revolutionary mill committees.⁸⁷

Thus the emergence of a genuinely

radical trend among millworkers failed to gain any hegemony in the face of British repression, Communist elitism, and an effective, conservative, co-opting response by non-Brahman leaders. But the genuine possibilities that did exist for a consolidation of Communist strength not only among the working class but also to some degree in the rural areas are illustrated by the influence of the workers' movement on Dinkarrao Javalkar; it is to Javalkar's role that we now turn.

(To be concluded)

Notes

- 1 The role of colonial working classes in national and social revolutionary movements is perhaps one of the most important issues in the analysis of colonialism, yet there is a dearth of studies analysing their social organisation and activities. In regard to India in particular we have a plethora of workers dealing with elites, village social systems, caste associations and regional and national political arenas, but very little on the working class as such. There is, for instance, nothing of the quality of Jean Chesneaux' study of the Chinese workers although Indian workers in the 1920s played as important, if not as dramatic, a role. Works on trade union organisation and Communist party history have dealt mostly with the upperlevel and formal organisation of such groups, without delving into the social organisation of the workers who formed their membership and without making use of vernacular sources. (See for instance V B Karnik, "Indian Trade Unions: A Survey", Bombay: Labour Education Service, 1960; Gene D Overstreet and Marshall Windmiller, "Communism in India", Princeton University Press, 1971 and Harold Crouch, "Trade Unions and Politics in India", Bombay: Manaktalas, 1966.) Bombay cotton millworkers — one of the most important sections of the working class throughout the late nineteenth and twentieth centuries — have been more studied than most, but none of the studies, including a very useful recent work by Richard Newman, use Marathi source materials. (Morris David Morris, "The Emergence of an Industrial Labour Force in India", University of California Press, 1965; R K Newman, "Labour Organisation in the Bombay Cotton Mills, 1918-1929" (Ph D Dissertation, University of Sussex, 1970); Ravinder Strike, mar, "The Bombay Textile Strike, 1919" in *Indian Economic and Social History Review*, March 1971, pp 1-30. Yet such Marathi material does exist, and while it is rarely produced by members of the working class themselves, it provides important insights into the position of workers in the overall

social structure of Bombay city and reveals the degree to which the working class was intimately involved with the social movements of the period in Maharashtra. Non-Brahman sources, for example, include labour-oriented newspapers and pamphlets edited by intellectuals and biographies of lower level elites who formed important links with the working class; these reveal the degree of interaction between village and city, the involvement of the major non-Brahman leaders in the state with working class politics, and the radicalising influence of working class activity upon the direction of Indian politics. These sources, together with the studies cited above, will form the basis for this paper.

- 2 The major languages of Bombay, in thousands, were as follows:

Marathi	553
Gujarati	242
Konkani	41
Western Hindi	197
Sindhi	27
Total population	1,161

 (from 1931 Census, Volume VIII: Part II, page 360 ff.)
- 3 1931 Census, VIII: I, Statement no 23, p 261.
- 4 1931 Census, VIII: II, Imperial Table X. Reports of the Inspector of Factories gave slightly different figures: of 381 factories in Bombay city employing 167,024 workers, 77 were cotton spinning, weaving and related factories employing 124,963 workers (Volume VIII: I, pp 2578).
- 5 From Morris David Morris, *op cit* pp 63-65.
- 6 Amiya Kumar Bagchi, "Entrepreneurship in India, 1900-1931" in Edmund Leach and S Mukherjee, (ed), "Elites in South Asia" (Cambridge University Press, 1970), pp 244-6. As a source of this difference, Bagchi cites early participation of Indians in trade, the special relationship of the British and Parsis, and the longer political independence of the Maratha hinterland.
- 7 *Ibid*, pp 248-50. A few "Kunbis" are listed as owners or managers of cotton factories but these are likely to have been the Gujarati-speaking group now known as Patidars, a caste similar in status to Marathas but one that had much earlier gained a commercial foothold and business orientation.
- 8 For a description of their early conflicts, see Christine Dobbin, "Competing Elites in Bombay City Politics" in "Elites in South Asia", pp 79-94.
- 9 New India, pp 295.
- 10 Census of India 1931, Volume VIII, Part I: Table VI, pp 374-5.
- 11 Thomas Peters, "Who's Who in Western India" and "Rao Bahadur Jannashatabdi Gaurav Granth" (Bole Memorial Book) (Bombay, 1969); interviews. Underlying Bole's membership in the Mahasabha were anti-Muslim feelings (his father

had been killed in a Hindu-Muslim riot), tension with Marathas who were joining the Congress *en masse* in the same period, and an attraction to Savarkar's radicalism on caste issues which made the Bombay chapters of the Mahasabha somewhat more socially radical than those in the rest of Maharashtra.

- 12 One indication of this is that in the Bole memorial books and others cited here there is relatively little participation in testimonials across caste lines.
- 13 Report to the seventh session of the Maratha Education Conference, 1913.
- 14 Report to fifth session of the Maratha Education Conference, 1911.
- 15 Interview, K V Bandal.
- 16 Dhananjay Keer, "Mahatma Jotirao Phoolay", p 235.
- 17 For example the Crawford Market Maratha Samaj and the Mandvi Koliwada Maratha Samaj were listed as affiliated organisations of the Maratha Education Conference (reports of 1913 and 1914); a Maratha Co-operative bank near the market was also started by fruit dealers and merchants.
- 18 Vishvanath Wable, "Shri Mansingrao Keshavrao Jagtap: Alp Parichay" (Bombay, 1952); interview B N Nalavde.
- 19 B B Palekar, "Shri Govindrao Yashwantrao Shinde: Jivanvritant" (Bombay, 1955), pp 2-9, 17-19.
- 20 "Jagtap Alp-Parichay", p 14; "Shinde Jivanvritant", p 107. Morris, *op cit*, pp 129-36; Newman, "Labour Organisation..." pp 34-38. According to Newman, 59.9 per cent of jobbers were Marathas and allied castes, 22.2 per cent were Kolis and backward castes, 9.1 per cent Muslims (p 34). As an example of a jobber risen from the ranks, the son of a spinning master at Kurla describes his father as having first been a labourer before he rose to a position where he was making Rs 600 a month at the time of his death; he became a member of the Kurla municipality in 1931 and co-operated with N M Joshi and Bakhle in the Bombay Textile Labour Union. His sons were educated; one began in politics in the late 1920s as secretary of the Maratha Social Club and the Young Men's non-Brahman Association, organised a "Chatrapati Mela" in Kurla under the inspiration of Jedhe, and later became a leader in Poona district politics (interview, K V Bandal).

- 22 *Ibid*, p 186, 196.
- 23 V B Karnik, "Indian Trade Unions", pp 3-4.
- 24 According to R G Rane, in Madhavrao Bagal, (ed), "Satyashodhak Samaj Harik Mahotsav Granth" (Kolhapur, 1933), chapter 10. See also Keer, "Mahatma Jotirao Phoolay", pp 154-6.
- 25 Karnik, "Indian Trade Unions", p 3.
- 26 Din Bandhu, April 14 and 21, 1895 reports meetings of "masters and

- mukaddams."
- 27 Morris, "Emergence...", p 181. Evidence here is very sketchy; while Morris feels it had no relation to Lokhande's organisation, S S Mirazkar reports that the tradition of Lokhande's work did exist among the millworkers.
- 28 Newman, "Labour Organisation...", p 130. The Maratha Aikyeche Sabha was thus an important link organisation, with leaders such as Lokhande and S K Bole over lapping with the earlier Millhands Association and the later KHS.
- 29 Bole Memorial Book, p 5.
- 30 Newman, "Labour Organisation...", pp 124-33.
- 31 *Bombay Chronicle*, December 16, 1919.
- 32 Newman states that its activities were "biased" towards backward classes and minorities, "especially Marathas and untouchables, and to a lesser extent, the Muslims" (p 124) — a rather strange phrasing, since these were the overwhelming majority of the working classes.
- 33 Newman, *ibid*.
- 34 He was chairman of the League for two years according to *Rashtravir*, December 14, 1926; see also "Jivan-krantant", p 30.
- 35 Newman, "Labor Organisation...", p 205.
- 36 *Ibid*, p 105.
- 37 Although the GKU's membership wildly fluctuated over the years, its peak of 54-100,000 in 1929-30 far outdid the BTLU's height of 9,800 or the 25,732 of the Ahmedabad (Gandhian) Textile Labour Association at that time (see Karnik, "Indian Trade Unions", p 100; Morris, "Emergence...", p 183-4). Morris cites the figure of 54,000 for the GKU; Newman gives 50,000 members by December 1929 and 65,000 by January 1930 from Labour Office Statistics but himself estimates the membership at over 100,000 in terms of income (dues) figures (p 300). In later years the RMMS (the Congress union in Bombay textile mills) reached a height of a claimed 84,000 in 1957 and the Ahmedabad union over 80,000 in 1956 (Karnik, p 100 and Crouch, p 272).
- 38 This account bases itself on Newman's work, (see pp 181-4, 222-4) though at crucial points I differ with Newman's analysis.
- 39 Newman, "Labour Organisation...", p 184, p 236.
- 40 Information is provided by their testimony in the Meerut Conspiracy Case, where they were convicted as pro-Communist leaders of the GKU, though Kasle by this time had renounced Communism and Alve had become disillusioned; see Testimony of Arjun Atmaram Alve, August 12-September 2, 1931 and of Govind Ramchandra Kasle, 8-15 September 1931, "Meerut Conspiracy Case" (Sessions Trial no 2 of 1930). There is also a biography of Alve in *Katvari*, January 12, 1929.
- 41 Newman, p 183; this was likely a non-Brahman, possibly Asavale.
- 42 According to the *Katvari* article, Alve had been discriminated against by a Brahman teacher as a child.
- 43 Meerut testimony, pp 943-6, 978-9.
- 44 *Ibid*, pp 950-53.
- 45 *Ibid*, p 947.
- 46 Still the antagonism to such leadership and the strong basis it developed is striking when considered next to such statements as this: "A further factor was the relative authoritarian and status-conscious organisation of Indian society which tended to prevent both managers and workers from conceiving of the possibility that both groups should meet as equals at the bargaining table... The working class had been conditioned to obey their superiors"; Crouch, "Trade Unions and Politics", p 29; this of course neglects the long tradition of revolt against authority.
- 47 Newman, "Labour Organisation...", pp 184-5, 222, 246.
- 48 Article in *Krantant*, 20 June 1929; cited Meerut Case, Vol II, p 419.
- 49 Newman, "Labour Organisation...", pp 211-216. K N Joglekar, a Brahman, was the son of a posthand and a brother of a millhand; S S Mirazkar, a Shimpi, was the brother of a postman; both had been effected by the postal workers' strikes in 1919-21 and had also witnessed early mill strikes. Mirazkar in addition had attended the first AITUC in 1920 as a representative of hotel workers (interview); as a non-Brahman he was also the only one who maintained relationships with non-Brahman activity around 1927.
- 50 Haithcox, "Communism and Nationalism...", p. 55 and Vasudev Rao, "History of the Formation of the Indian Communist Party" (Telegu Communist document translated by Krishna Kumarin) (1943) p 8.
- 51 Newman, "Labour Organisation...", pp 215-16.
- 52 Such moves as the Kanpur and Meerut Conspiracy Cases very effectively disrupted the formation of a continuing organisation; similarly every Comintern delegate (from M N Roy to the British representatives) had more or less to sneak into the country.
- 53 Thus when Alve urged that Communists be accepted, he stressed not simply the need for their literary and administrative skills but also testified that they were thought to have a "true fellow feeling" towards the workers. (Meerut testimony) Newman describes their daily accessibility in the mill areas.
- 54 Newman, "Labour Organisation...", p 218; Haithcox, "Nationalism and Communism", pp 35-37; Overstreet and Windmiller, "Communism in India", pp 59-81.
- 55 Quoted Newman, p 240.
- 56 *Ibid*, p 312. Newman's is perhaps the first study to stress the important role of the mill committees, though Karnik, "Strike in India", mentions them.
- 57 Quoted *ibid*, p 317.
- 58 *Ibid*, pp 315-16.
- 59 Jay B Sorenson, "The Life and Death of Soviet Trade Unionism", 1917-28, (N Y: Atherton Press, 1969) pp 10ff.
- 60 *Ibid*, pp 67-73. See also the pamphlet, "The Bolsheviks and Workers' Control, 1917-1921" for an attack on later Russian actions; the real question is the degree to which such overriding of workers' control was based on historical necessity; Sorenson for instance stresses the role of the resistance of the managerial groups to collective management.
- 61 Antonio Gramsci, "Soviets in Italy" (Institute for Workers' Control, Nottingham, 1971), pp 7-9. For comparative Comintern statements, the Ninth plenum of the ECCI and the Fourth Congress of the RILU urged Communists to "set up factory committees as the basis of revolutionary unions" and the ECCI Tenth Plenum (1929) stated "Factory councils can and must be the natural basis of class unity from below in the factories... The winning over of the factory councils is for the Communist Party and the revolutionary trade union movement one of the most important roads to the essential industrial districts". Jane DeGras, "Communist International: Documents", Vol III, pp 56, 59. See also Vol I, pp 148-9.
- 62 Newman, "Labour Organisation...", pp 305-6.
- 63 *Ibid*, p 295.
- 64 *Ibid*, pp 292-99, 312-18.
- 65 *Ibid*, p 318.
- 66 Letter from Sir M Hayward of 30-4-1924 in Home Department File 2937-1.
- 67 Diary, June 21, 1929.
- 68 Interview, K V Bandal.
- 69 Newman, "Labour Organisation...", p 323.
- 70 The circulation of *Katvari* in 1929 was 3,000, which at that time was higher than the 2,000 of *Krantant* (the Marathi-language Communist paper) (Native Newspaper Reports, 1929). *Bhat* was the common insulting term for Brahmans in Marathi, term for Brahmans in Marathi, somewhat akin to "honkies".
- 71 *Katvari*, February 2, 1929.
- 72 *Ibid*, January 26, 1929.
- 73 Newman, "Labour Organisation...", pp 332-41.
- 74 Haithcox, "Communism and Nationalism...", p 161, 181. One evidence that anti-Communism was not itself the issue (assuming that the Royists were basically promoting a Marxist-Leninist ideology at the time) was that the leader of the Royist millworkers, Kandalkar, who became later president of the GKU and a vicepresident of the AITUC, was along with Kasle and Alve one of the men that non-Brahman leaders had attempted to appeal to (interview, K V Bandal).
- 75 Karnik, "Indian Trade Unions", pp 51-53; Haithcox, "Nationalism and Communism", pp 159-63.
- 76 The weakness of most writing on Indian communism with its reliance on official and English-language documents and its neglect of a full sociologically sensitive study of the movement within its Indian context, is this overemphasis on the international context. Windmiller and Overstreet, and Karnik, a Royist, represent the clearest tendency here of treating all the shifts and deviations within Indian communism in terms of international directives. The more recent works of Haithcox and Newman are more balanced in this respect. In general, it would seem that more recent and thorough studies of Communist movements in third world countries would question the degree of attributing very much to the shifts in and the "periods" of Comintern policy. There are for instance, "right" or "left" wing shifts in Asian Communist parties that do not at all fit with the "united front" or "class against class" periods, e.g. the PKI rebellion in Indonesia in 1926 and 1927. Surely it is no coincidence, either, that the major "left" periods in Comintern and Cominform policies coincided with a worldwide depression (1929-35) and the period of radicalism following the end of World War II, the increased expectations brought with it, and the tremendous impact of a successful Communist revolution in China (1949-52).

- 79 Cited in Windmiller and Overstreet, "Communism in India", pp 150-52. Similarly in regard to "dual unionism", the policy is not at all clear. The most "ultraleft" document, the Draft Platform, did not urge union splitting but isolation of reformists and their expulsion (a trend that led to splitting only in the context of radicalisation, disorganisation and concurrent efforts of anti-Communists to expel the Communists) and advocated "the creation of a revolutionary trade union movement... based on factory committees with the leadership directly elected by the workers" (quoted in Karnik, "Indian Trade Unions" pp 41-3), something the Bombay communists had most clearly failed in doing. The Theses of the Tenth ECCI Plenum on Economic Struggle and the Tasks of Communist Parties (September 4, 1929; quoted in DeGras, pp 62-64) warned fairly clearly against the tendency of leaving reformist unions.
- 80 Ranadive gained control for the period of militancy of 1948 though he neglected peasant revolution (though one of the main inspirations for the militancy had been the Telengana insurrection) and evidently concentrated on the organisation of militant strikes and city struggles. - 86 Crouch feels that this explanation for the GKU decline is "dubious" since the dock workers union had grown under equally "collaborationist" leadership ("Trade Unions and Politics", pp 264-5). However, dockworkers were to a large degree non-Maharashtrian, whereas millworkers were coming in increasing numbers from the Deccan district — Satara, Poona, Kolhapur — that had seen the strongest national movement; these workers, with nationalist inclinations, and natural links with the Congress leaders, formed a social basis for RMMS organising (interview, Yashwant Chavan). Crouch cites the results of a survey (which he does not fully accept) which shows Satara as having contributed 13.6 per cent of the millworkers in 1940 as compared to 5.7 per cent in earlier years (p 229).
- 87 Not only does the RMMS see its primary job as that of maintaining worker discipline and has never called a strike since independence

Mohta Alloys and Steels

MOHTA ALLOYS AND STEELS is entering the capital market with an issue of 2,40,000 equity shares of Rs 10 each and 9,995 preference shares of Rs 100 each. The company is putting up a mini-steel plant at Dhandari Kalan near Ludhiana in Punjab. The installed capacity of the plant will be 28,700 tonnes per annum and the operating capacity about 23,000 tonnes per annum. The total cost of the project is estimated at Rs 143.91 lakhs and it is proposed to finance the project by raising share capital of Rs 50 lakhs, secured loans (Rs 42 lakhs), machinery to be acquired against deferred payment guarantees (Rs 20 lakhs), bank borrowings (Rs 27.63 lakhs) and land acquired on deferred payment terms (4.28 lakhs). According to M K Mohta, Chairman of the company, the capital cost of Rs 310 per tonne of annual production is perhaps the lowest in the industry. Mohta claims that, barring unforeseen circumstances, the company should earn enough profits to pay a minimum dividend of 10 per cent on the equity capital after the first year of operation. Two furnaces one of 10/12 tonnes capacity and the other of 5 tonnes capacity are to be installed. The first furnace of 10/

(*ibid*, p 122), but it seems to have taken over some of the style and functioning of jobbers. Thus workers accuse the union of demanding bribes of about Rs 2-300 to get a job and Rs 10-12 to get the pension due to the workers on leaving a job (interview, K B Patanker). In any event, the situation up to now has been a stalemate very reminiscent of the conflicts of the 1920s: the GKU exists and is able to lead workers during strikes but cannot gain membership figures for registration: the RMMS backs out of strikes but maintains its membership through skillful Congress manipulation. Finally, the mill committee movement continues to exist, calling for abolition of the RMMS, workers control (no non-workers in the union), and inclusion of workers of all political parties in the union (a very Gramscian position) but faces opposition both from the CPI-GKU and the Congress-RMMS leadership, through they have more recently gained the backing of another Communist force, the Lal Nishan Party. Unlike the old CPI, at least some of the leaders of the recent mill committee movement stress the importance of fighting caste as well as capitalism: (interview, Gaikwad, Patanker) the banner at a 1971 united meeting was half red (the "red flag" of communism) and half blue (the "blue flag" of the untouchables' Republican Party).

12 tonnes has arrived at site and production is expected to commence by July 1973.

Steel scrap is available in abundance in and around Ludhiana whereas steel ingots are in great demand by rolling mills in Ludhiana and the nearby Govindgarh areas, which have the largest concentration of rolling mills in the country. Mohta Alloys is thus assured of both raw material and market for its products. At present mini-steel plants at Ghaziabad, Faridabad, etc, are buying their scrap from Punjab and selling their ingots to Punjab. In the case of Mohta Alloys, the two-way freight would be saved. Electricity rates in Punjab are the lowest in northern India and this plant, being located at a 'focal point', will be exempted from electricity duty to the extent of 25 per cent and totally from sales and purchase taxes for a period of five years. The power position in Punjab should improve considerably with the commissioning of the Bhatinda thermal station and the completion of the Sutlej Beas Link.

The subscription list of the public issue will open on May 7, 1973.

Curbing Concentration of Economic Power

A Critique of the New Licensing Policy

A N Oza

The new industrial licensing policy announced in February this year gives the impression of retaining intact the basic features of the policy announced in 1970 with regard to curbing the concentration of economic power. Thus investment proposals of the large business houses are to continue to be subject to licensing regardless of their size and these houses are to be normally permitted to invest only in the core sector.

The rigour of application of both these restrictions has, however, been substantially diluted by, first, the change made in the definition of what constitutes a business house and, second, the revision of the list of core industries open to large houses.

If these vital features of the new industrial licensing policy are adequately taken into account, the conclusion is unavoidable that the objective of curbing the growth of large business houses and checking concentration of economic powers now occupies a lowly place in the government's scheme of priorities.

I

FOLLOWING the recommendations of the Industrial Licensing Policy Inquiry Committee (Dutt Committee), industrial licensing policy was very substantially revised in February 1970, primarily with a view to circumscribing the role of large business houses. However, in February this year licensing policy was again revised in such a manner as to materially dilute the effects of the policy introduced three years ago. That in a matter of three years the government should have developed cold feet about striking at the roots of the growth of big business shows how unsure and insincere it is about controlling the growth of big business houses so as to more widely distribute the opportunities for growth in the private sector.

The principal finding of the Dutt Committee was that the working of industrial licensing policy had been the basic cause of industrial growth in the private sector being concentrated in a few large houses. Approval of foreign collaboration agreements and the supply of institutional finance, being conditioned by the issue of industrial licences, had also favoured the growth of large houses. At the same time, the instrument of licensing had also failed to create industrial capacity according to Plan priorities but had brought about the rapid growth of a number of non-priority industries. The Dutt Committee's Report thus showed that the failure to curb economic concentration and the diversion of investment to non-priority industries had gone hand in hand. It was in view of this twofold failure that the Dutt Committee had suggested the incorporation of explicit

criteria in industrial licensing to discriminate against the large houses and in favour of other entrepreneurs.

In the decade preceding the publication of the Dutt Committee's Report, the average rate of industrial growth had been quite respectable — about 7 to 8 per cent per annum. During the same period, a number of inquiries (two by R K Hazari, one by the Mahalanobis Committee, and one by the Monopolies Inquiry Committee) had shown that the composition of this growth had been inconsistent with the Directive Principles of the Constitution. In the first phase of Indira Gandhi's reign in the late sixties, the government therefore used to be put on the mat in Parliament for its failure to check concentration of economic power and not so much for slow industrial growth. Also, since the Dutt Committee's Report became available about the time of the Congress split, the recommendations came in handy for Indira Gandhi in building up her radical image. It was, therefore, for reasons of political expediency, and not so much because it was convinced of the ideology underlying them, that, within a year of the Congress split, Indira Gandhi's government sought to implement some of the proposals of the Dutt Committee.

The government followed up the revision of its industrial licensing policy along the lines suggested by the Dutt Committee with the enactment of the Monopolies and Restrictive Trade Practices Act and the appointment of the MRTP Commission to administer the anti-concentration provisions of the MRTP Act. Further, the government also vested the public financial institutions with the power to convert loans given by them to private sector units

into equity. The Dutt Committee had strongly suggested the creation of joint sector enterprises in the 'core' industries with a view to socialising the management of the enterprises controlled by the large houses in the core industries. However, this was perhaps the only major recommendation of the Dutt Committee that was not accepted by the government in 1970.

The revision of industrial licensing policy in February 1970 had two major features. First, though the exemption limit for industrial licensing in terms of the size of investment was raised from Rs 25 lakhs to Rs 1 crore, the large houses were required to secure industrial licences regardless of the size of investment. Second, the large houses were to be permitted to invest only in specified, core sector industries and in heavy investment industries.

The new industrial licensing policy announced in February this year seeks to give the impression of retaining intact both these features of the 1970 policy. Investment proposals of the large houses are to continue to be subject to licensing regardless of their size, and these houses are to be permitted to invest only in core sector industries. However, the rigour of application of both these provisions has been substantially affected by, first, the change made in the definition of a large house and, second, the revision of the list of core industries open to large houses.

Government has claimed that the purpose of these revisions is to enhance the effectiveness of licensing policy in controlling concentration of economic power without sacrificing industrial growth. However, closer examination of the proposed changes indicates that the government's intentions are very

different. Whatever be their effect on growth, the changes made in industrial licensing policy considerably relax the restrictions on large houses.

II

Under the 1970 licensing policy, a business house was deemed to be a 'large' house if the total assets of the enterprises under its control added up to at least Rs 35 crores. This was the size-limit adopted by the Dutt Committee to identify the 20 'larger' industrial houses. After detailed investigations, the constituent units of those houses were listed in the Committee's Report. Under the new policy, the minimum size of assets for qualifying as a large house has been lowered from Rs 35 crores to Rs 20 crores. Henceforward a business house controlling undertakings with aggregate assets of at least Rs 20 crores will be considered a 'large' house. The lowering of the limit has been justified on the ground that the revised limit of Rs 20 crores is what has been adopted in the MRTP Act. The anti-concentration provisions of the MRTP Act, under which new units and substantial expansions require sanction under the Act, apply to enterprises which belong to a group of 'inter-connected' undertakings the sum of total of the assets of which is Rs 20 crores or more.

It might appear that the consequence of the lowering of the asset criterion for identification of a large business group would be that a larger number of business houses will henceforth qualify as large houses. Some estimates suggest that whereas out of the 70 business houses listed by the Dutt Committee, the earlier limit of Rs 35 crores covered only 20 business houses, the new lower limit of Rs 20 crores will rope in about two dozen more under the category of large houses. This optimistic expectation would indeed have had some justification had the Dutt Committee's definition of a business house been retained. Actually, the new licensing policy has given up the Dutt Committee's criteria for defining the constituent units of a large house in favour of the criteria of 'inter-connected' undertakings laid down in the MRTP Act. As we shall see later, the criteria for defining a business group prescribed in the MRTP Act are such that many large undertakings which the Dutt Committee had deemed to be part of one or the other large house may no longer be deemed to be so. It may now become possible for large

houses to divide themselves up on paper into single large units and/or small clusters of 'inter-connected' undertakings with the size of their assets well below the Rs 20 crores limit. Thus, while the revised Rs 20-crore limit will have the effect of enlarging the coverage of large houses, the new criteria for defining a business house will have the effect of reducing the number of business houses which are likely to be considered 'large' for licensing purposes. The net effect of these two opposite changes will on balance be favourable to the large houses.

DUTT COMMITTEE'S DEFINITION

We may compare the Dutt Committee's definition of large houses, which formed the basis of the 1970 licensing policy, with the criteria of 'inter-connection' set out in Section 2(g) of the MRTP Act which form the basis of the new policy. The Dutt Committee had not only defined what constituted a business house in clear terms but had also submitted for the use of the licensing authorities (i) the specific criteria the Committee had applied for identifying the undertakings under the common control of a business group; and (ii) a list of enterprises which the Committee's investigations had established as being controlled by the 20 large houses. The government had accepted these two submissions of the Committee without any modification for use as the data-base for decision-making. None of the large houses formally objected to the list of companies given in the Dutt Committee's Report. That is, each of the 20 large houses identified by the Committee tacitly accepted that the companies, listed by the Committee as being under its control, were in fact under its control.

Following R K Hazari, the Dutt Committee defined a business house (or group) as consisting of "those business concerns over which a common authority holds sway". Despite their separate legal entities and despite their day-to-day management being carried on by legally separate authorities, such concerns, according to the Committee, function in unison as parts of a common organisation under the overall guidance and direction and with the support of a closely knit group of persons. To determine which 'concerns' could be regarded as being under the "sway" of a "common authority", the Committee went by the substance of control and not by the legal definitions

of a "group" and of concerns "under the same management" laid down in Sections 372 and 370, respectively, of the Companies Act. The criteria adopted by the Committee were basically the same as those first used by R K Hazari. Briefly, these were:

- (1) Companies admitted by a particular business group (house) as being under its control in the replies sent by it to the Committee's questionnaires or in souvenirs or other house publications.
- (2) Concerns functioning as managing agents/secretaries and treasurers which were wholly or substantially owned by the controlling authority of a house (i.e. the nucleus family) along with their relatives.
- (3) Companies managed by concerns falling under (1) or (2).
- (5) Companies deemed to be "under the same management" in relation to companies falling within (1), (2) or (3) above within the meaning of Section 370 of the Companies Act.
- (5) Subsidiaries of companies falling under any one or more of (1) to (5).
- (6) Companies in which at least one-third of the "effective equity" (i.e. total equity minus the equity holdings of financial institutions, governments and non-residents) is clearly identifiable as the interest of the house — i.e. the holdings of companies under any one or more of (1) to (5) and/or of the members of the nucleus family and its relatives and senior executives of companies under any one or more of (1) to (5).
- (7) Concerns which, on the basis of other circumstantial evidence and special characteristics, can be identified as constituents of the house in question. Such circumstances and characteristics may consist of common addresses, common telephone and telex numbers, sole selling agency agreements, presence of house employees on the boards of directors, etc. (This criterion was used by the Committee only in unambiguous cases.)

The criteria adopted by the Dutt Committee to designate companies as belonging to a particular business group were thus based on the actual mechanics of corporate control. Some of these

criteria may not be amenable to tests of legal proof. Most important, the Dutt Committee was not concerned with establishing whether or not two or more companies, say, A and B, were 'inter-connected'. Its concern was with establishing whether A and B were under common control (i.e. under control of a common decision-making authority) regardless of whether or not they were inter-connected. For example, according to the Dutt Committee's methodology, groups of enterprises like Century, Orient Paper and Hindustan Motors or TELCO, TOMCO and TISCO or New Shorrock and NOCIL need not be groups of 'inter-connected' companies and yet the groups could, on the basis of the substance of their control, be considered as being controlled by Birlas, Tatas and Mahatlas, respectively.

The Dutt Committee's recommendations had considerably eased the licensing authorities' task of decision-making in relation to applications from large houses. The Committee had provided them with a set of specific criteria to establish whether or not a company belonged to a particular large house as well as a list of companies controlled by each of the large houses for ready reference. Given the clearly spelled out criteria and the lists of companies belonging to the large houses, the onus was on the applicant company to establish that it did not in fact belong to a large house.

Under the new industrial licensing policy, these advantages will not be available to the licensing authorities. The new policy adopts the criteria laid down in the MRTP Act for defining a large house and for identifying a company as belonging to a large house. The MRTP Act defines a business house in terms of a group of 'inter-connected' undertakings. To determine whether or not a company applying for an industrial licence belongs to a 'large' house, the licensing authorities will need to establish (i) its 'inter-connection' with other undertakings in terms of Section 2(g) of the MRTP Act, and (ii) whether or not the aggregate value of the assets of that company together with the total assets of its 'inter-connected' undertakings adds up to Rs 20 crores or more. Obviously, the second of the above two questions can be settled only after the first has been answered, i.e. only after the fact of inter-connection of an undertaking with other undertakings has been established. And for this purpose, the vague and loose criteria provided

in Section 2(g) of the MRTP Act are of very little use to decision-makers.

Although Section 2(g) of the MRTP Act lays down as many as seven criteria to determine inter-connection among two or more undertakings, not all of them are relevant to undertakings that are corporate bodies. And, from the point of view of industrial licensing, only the criteria for establishing inter-connection among corporate bodies are important. According to Section 2(g), undertakings owned by corporate bodies are deemed to be 'inter-connected' in the following circumstances: (i) if one manages the other; or (ii) if one is a subsidiary of the other; or (iii) if they are under the same management within the meaning of Section 370 of the Companies Act; or (iv) if one exercises control over the other in any other manner. Further under Section 2(g) (vii), if one undertaking in inter-connected with another by any of the above criteria, and the second with a third and so on, then all of them are deemed to be inter-connected; that is, if A is inter-connected with B, and B with C, and C with D, then all the four are deemed to be inter-connected with one another. Let us examine the implications of these criteria for evolving a legal definition of the phenomenon of business houses.

Of the above criteria, the first is now irrelevant with the abolition of the managing agency and its variants like secretaries and treasurers. It was only under the managing agency system that one company could manage one or more other companies. Similarly, the criteria by which companies are deemed to be inter-connected because of being "under the same management" within the meaning of Section 370 of the Companies Act is, again, of no significance for defining a business house. Of the five criteria laid down in Section 370 of the Companies Act for identifying companies under the same management, one refers to the managing agency system and is, therefore, of no relevance any more. The remaining four criteria are as follows: two companies are deemed to be under the same management if (i) a majority of the directors of one company constitute a majority of the directors of the other; or (ii) at least one-third of the total voting power (i.e. total equity capital) of the two companies is controlled by the same individual or by the same company; or (iii) the holding company of a subsidiary is under the same management, judged by any of the

above criteria, as another company; that is, if B is a subsidiary of A and A is under the same management as C then A, B and C are all under the same management; or (iv) one or more directors who, by themselves or with their relatives, hold a majority of shares in one company also hold a majority of shares in the other.

Anyone even slightly familiar with the *modus operandi* of business houses knows that the company law concept of a 'group' in terms of companies under the same management is too narrow and legalistic to even partially envelop the concept of a business house as it actually operates in India. For a business house to control a number of companies, it is not at all necessary to pack the boards of each of them with a majority of directors of its choice. Similarly, very few large enterprises are in fact controlled by any of the big business houses by virtue of the same individual or the same company holding more than one-third of the company's total equity. For control of a widely-held company, what matters is control of the largest block-vote, even if it be less than one-third or even 10 per cent of the total equity and even if it is held through several apparently independent nominees and/or companies who really work in cohesion, projecting the common interest of the business house. Further, since in most large companies a significant proportion of the equity is held by public financial institutions, what a business house needs to maintain control over a company is control of the largest block-holding of the 'effective' equity (as defined earlier) and not of total equity.

It is clear from the above that the provision of Section 2(g) of the MRTP Act seeking to define inter-connected undertakings on the basis of the company law concept of "companies under the same management" is too inadequate to rope in even one-tenth of the number of companies that each of the large houses in fact controls. According to the fourth criterion laid down in Section 2(g) of the MRTP Act, two undertakings are inter-connected if one controls the other in "any other manner". This is not a workable criterion for either legal or practical purposes since it begs the question. Except in the case of a subsidiary company, in what other circumstances can one company be regarded as controlling the other? This is a question of law as well as of fact. Since the MRTP Act throws

no light on what the law means by "controls...in any other manner", the implication is that the law intends to leave it to the MRTP Commission (or the Company Affairs Department, which administers the MRTP Act) to evolve, by building up case law, the criteria by which one company, which is not a holding company and does not fall within the "same management" definition, can be considered as controlling another company. If the MRTP Commission's investigative efforts — or, more accurately the efforts of one of the members of the Commission — to collect all available factual evidence for determining the inter-connections of such companies as TELCO or Century, as part of the Commission's examination of their expansion proposals, had not been interfered with, then perhaps by now some precedents might have been set to facilitate the interpretation of the nebulous criterion, "controls...in any other manner". However, this opportunity was missed, perhaps intentionally. There is now hardly any hope that the Licensing Committee will effectively use this sufficiently wide but vague criterion of Section 2(g) to identify companies under the control of large business houses.

These deficiencies in the MRTP Act's definition of inter-connected undertakings, particularly for the purpose of providing a set of legal criteria for defining a business house, had been anticipated in this journal at the time of the passing of the Act. (See A N Oza: 'Monopolies and Restrictive Trade Practices Act', February 28, 1970 and 'Putting Teeth into the Monopolies Act', Special Number, July 1971.) When the MRTP Commission was dealing with cases like Gwalior Rayon, Century, TELCO and other large house companies, it had become clear that because of the deficiencies of Section 2(g) certain large companies which in fact belong to certain large houses (and which had not objected to their inclusion in the lists of companies controlled by large houses compiled by the Dutt Committee), could successfully deny being part of any large house. The experience of the working of the MRTP Act has adequately proved that, for controlling concentration, the Dutt Committee criteria for defining a business house were definitely superior to those of Section 2(g) of the MRTP Act.

In addition to the weakness of Section 2(g) another major lacuna is that, under the MRTP Act, a number of undertakings are deemed to constitute a business house only if they form a

chain of inter-connected undertakings. That is, only those undertakings that can be established to be inter-connected can be considered as forming a business house. Companies which are not part of the chain of inter-connected undertakings are *ipso facto* considered independent, i.e. not controlled by any large business group. The result is that though earlier the Birlas, for example, had tacitly accepted the fact of 185 undertakings being under their control (as per the Dutt Committee's report to which they raised no objection), only 40 of these have been registered as inter-connected and/or dominant undertakings under Section 26 of the MRTP Act. Of these, excluding the non-interconnected dominant undertakings, the number of inter-connected undertakings is likely to be 35 at the most. The number of companies under the control of the other large houses must have been similarly 'pruned' by the MRTP Act's definition of a business house.

How this definitional 'reduction' in the size of large business houses occurs can be seen if one scans through the details of the applications referred to the MRTP Commission. Take the instance of India Linolium, a Birla company submitted as being inter-connected with only four other Birla enterprises, viz, Birla Jute, Bihar Alloy Steels, Assam Jute Supply and Express Dairy. On the other hand, another Birla company, Gwalior Rayon, claimed that it had no inter-connection with any enterprises (Birla or other). Thus under the MRTP Act's definition of a business group, the first five companies will constitute one group, independent of Gwalior Rayon, although in fact all the six companies constitute a part of the same group (or conglomerate of companies) under the control of Birlas. In other words, the result of the adoption of the MRTP Act's definition of a business house will be that the existing large houses will on paper, and legally, be sub-divided and fragmented into apparently independent clusters of 'inter-connected' enterprises though in fact these clusters operate as part of a group.

Not that the government, or the Company Affairs Department in particular, is unaware of these deficiencies of Section 2(g) of the MRTP Act. Yet the government does not want to amend the Act. The reason simply is that it does not want to lose its manoeuvrability and scope for discretionary action in dealing with applications from large houses for industrial licences. Instead

of a straightforward amendment of the MRTP Act's criteria for determining 'inter-connection' the government has thought of a roundabout way of overcoming the deficiencies of Section 2(g), that is, by amending the Companies Act definition of "companies under the same management" which is one of the criteria of 'inter-connected' undertakings laid down in Section 2(g) of the MRTP Act. Under the proposed amendment, which has been before Parliament for about a year now, the criteria for establishing that two companies are under the same management are to be as follows:

(i) If one exercises control over the other or both are under the control of the same group or any of the 'constituents' of the 'same group'; or

(ii) if the two companies have the same managing director or manager; or

(iii) if (a) one holds at least one-third of the shares (equity or preference) in the other; or (b) one controls at least one-third of the total membership of the board of directors of the other; or

(iv) if one or more directors (independently or together with relatives) of the company constitute one-third of the board of the other; or

(v) If the same individual or individuals belonging to a group while holding (by themselves or together with their relatives) at least one-third of the shares (equity or preference) in one company also hold at least one-third of the shares in the other;

(vi) If the same company or companies belonging to a group while holding at least one-third of the shares in one company, also hold at least one-third of the shares in the other; or

(vii) if at least one-third of the total voting power in respect of any matter relating to either of the two companies is exercised or controlled (a) by the same individual, whether independently or together with relatives; or (b) by the same company, whether independently or together with its subsidiaries; or (c) by individuals belonging to a group; or (d) by companies belonging to a group; or (e) jointly by such an individual or individuals and one or more of such companies;

(viii) if the directors of the company are accustomed to acting in accordance with the directions or instructions of one or more directors of the other, or if the directors of both the companies are accustomed to acting to the directions of any individual whether belonging to a group or not;

(ix) if a group exercises control over

a company then that company and every other constituent of the group shall be deemed to be under the same management.

The above definition of companies under the same management is no doubt considerably more extensive than the existing one. However, for the purpose of providing a legal definition of the amorphous concept of a business house and for specifying the criteria for identifying the companies under the control of a business house, even this revised definition of companies "under the same management" is not as specific and legally workable as it appears to be at first sight. In the above list, criteria (i), (vi), (vii) (c) and (d) and (ix) are the most important ones. But each of them is based on the presumption that either in company law or in some other statute the concepts of 'group', 'individuals belonging to a group' and 'constituent companies of a group' are clearly defined. This presumption is not valid. The proposed new definition of companies "under the same management" will, therefore, raise many questions of law as well as of fact before it can be applied.

The existing company law definition of a 'group' (Section 372), which is not proposed to be amended, is of no use whatever in this respect. For, under this definition, a company is deemed to belong to the same 'group' as another company which has invested in it if it is the managing agent of the investing company or if the two are deemed to be under the "same management" within the meaning of Section 370. Thus the new definition of companies "under the same management" involves circularity in the sense that its application is dependent on the definition of a 'group' which in turn is dependent on the definition of companies "under the same management". In other words, although the new definition of companies "under the same management" will, when enacted, strengthen and considerably extend the scope of the definition of inter-connected undertaking as laid down in Section 2(g) of the MRTP Act, it will not overcome the difficulties of applying Section 2(g) for bringing within its ambit all the companies which are in fact controlled by a large business house. The problem of bringing large enterprises like TELCO and TISCO of Tatas, Century, Gwalior, Hindustan Motors and Hindustan Aluminium of Birlas, and NOCIL of Mafatlals, for instance, within the meaning of groups of 'inter-

connected' undertakings will remain even after Section 370 of the Companies Act is amended. It can be solved only by adopting the approach of the Dutt Committee. That, under its new licensing policy, the government has instead preferred to discard the very useful tools provided for decision-makers by the Committee and to replace it with unworkable legal contraptions like Section 2(g) of the MRTP Act makes it clear that the government's real purpose is to abandon the objective of curbing the growth of big business, at least in the next Five-Year Plan period.

III

That the principal objective of the new industrial licensing policy is to remove the hurdles placed in the way of the growth of big business houses by the licensing policy of 1970 is also clear from the revised definition of 'core' sector industries. Like the 1970 policy, the new policy restricts the large houses to the 'core sector'. But the scope of the 'core sector' itself has been substantially enlarged under the new policy. On the basis of the Dutt Committee's recommendations, the core sector was defined in specific terms in the 1970 licensing policy. It included only the following industries: (1) agricultural inputs, fertilisers, pesticides, tractors and power tillers, rock phosphate and pyrites; (2) iron and steel; iron ore, pig iron and steel, alloy and special steels; (3) non-ferrous metals; (4) petroleum; oil exploration and production, refining, selected petrochemicals; (5) coking coal; (6) heavy industrial machinery (specified); (7) shipbuilding and building of dredgers; (8) newsprint; (9) electronics (selected components, testing and control equipment, wireless and microwave equipment).

By contrast, core industries are so broadly defined in the new policy announcement that the list includes practically every industry in which big business houses have been interested and are likely to be interested in future. It includes even low priority but highly profitable industries like man-made fibres and synthetic detergents. Not only is the number of categories of industries included in the 'core sector' larger but the scope of each category is broader than in the 1970 policy statement. And as if all this were not enough to soothe the feelings of the large business houses ruffled during the years 1970 to 1972, the Minister of Industrial Development has promised to

remove all post-licensing delays by offering a package of the required sanctions and permissions, like capital goods imports and term finance, simultaneously with the issue of the industrial licence.

IV

The reason for the unmistakable change in the government's attitude towards the large houses is to be seen in the slow industrial growth of the last few years as well as the strategy of the Fifth Plan. Though the Fifth Plan Approach document pays lip-service to the objective of reduction of poverty, in the Approach document scheme of things, this objective will at best be an appendix tagged on the basic investment strategy determined on the basis of other considerations. As in the Second Plan, the essence of the strategy is the emphasis placed on the core heavy investment industries. The annual growth targets for these industries are set at 10 to 17 per cent, compared to the prevailing rates of 3 to 5 per cent. Against this strategy and these ambitious growth targets for the core industries, the objective of curbing the growth of the large business house and checking concentration of economic power must necessarily take a lowly place in the scheme of priorities.

This conclusion is entirely supported by the general paragraph on the 'joint sector' incorporated in the new licensing policy statement — perhaps as a sop to the Minister for Industrial Development. The overall impression conveyed by the paragraph is that there is nothing new about the joint sector as a policy device; that it has existed all along since 1956 insofar as the government has, directly and through the public sector financial institutions, contributed to the equity of private sector enterprises; and that in future too the government will encourage the setting up of joint enterprises as a "promotional device". All this is far cry indeed from the Dutt Committee's view of the joint sector (See A N Oza: "Dissecting the Joint Sector", October 28, 1972.) As the Committee saw it, the joint sector was part of an integrated scheme — the other parts of which were discrimination against large business houses in industrial licensing, curbing of concentration of economic power, and break-up of large houses through anti-monopoly legislation and conversion of loans by public financial institutions into equity.

Admn. Office: Race Course Road, Bangalore-1.

Statement by the Chairman Shri Mulki Sunder Ram Shetty

at the 41st Annual General Meeting of the Shareholders
of the Bank held at Mangalore on April 12, 1973.

LADIES AND GENTLEMEN,

I have great pleasure in extending to you a hearty welcome to the 41st Annual General Meeting of our Bank. The Directors' report and Audited Accounts for the year ended 31st December, 1972 have been in your hands for some time now and with your permission I shall take them as read.

THE ECONOMIC SCENE 1972

For India, the year 1972, was a year of trials and tribulations. We have had to face many a new challenge. The new spirit of self-confidence which pervaded the country in the beginning of the year began to give way under the weight of economic problems that cropped up later. However, the Union Government and the State Governments did their best to re-instil the spirit of confidence. Now, we find a welcome change in the attitude of the people and the country seems prepared mentally to take all these problems in her stride.

However, the experiences of 1972 have brought into sharp focus two important facts which should warn us against self-complacency. Firstly, our achievements in various fields are not adequate to withstand the strains generated under unfavourable and adverse natural conditions. Secondly, without hard work and discipline the country cannot come by that capacity and endurance which will enable her to survive crises she may have to face.

On the international front, the pound sterling was left to float itself in June 1972 and many exchange controls were imposed by the UK Government "virtually putting an end to the sterling area". The prices of gold shot up sharply to reach unprecedented levels. The situation in the exchange markets remained highly fluid and uncertain.

The Indian economy was under considerable strain during 1972. This reflected, to a considerable extent, the rather unsatisfactory growth of agri-

cultural production in 1971-72. The kharif season of 1972-73 also suffered a set-back. Unfortunately, there was a significant increase in monetary outlays on account of refugee relief measures and increased defence expenditure during this period. Certain unforeseen events such as drought and natural calamities further aggravated the situation and raised the government expenditure. The resulting imbalance between the demand

Shri Mulki Sunder Ram Shetty

and supply, particularly with regard to foodgrains, vegetable oils and sugar, led to an enormous increase in the prices of basic necessities of life. The wholesale price index shot up by 13.7 per cent in the year 1972.

Many states had to face the serious problems of acute power shortage mainly due to the erratic behaviour of the monsoons.

Despite this, it is interesting to note that there was a sharp acceleration in the rate of growth of industrial production. The increase in industrial production is estimated at 7 per cent as com-

pared to an increase of 2.9 per cent in 1971.

It is heartening to note that our performance on the export front was found to be encouraging. The total export earnings during the eight months ended November, 1972 stood at Rs 1,239 crores, recording an increase of more than 23 per cent over the value of exports during the same period in 1971.

As regards the rate of domestic savings in 1972 it is believed that it may be slightly higher than in 1971. However, it must be remembered that the increase in rate of savings achieved in recent years is not much higher than the rate of savings realised in the early sixties.

All these facts strongly suggest that a higher standard of economic performance is required in all sectors of the economy if we are to achieve the goals of national development. I would like to assure you that our Bank will play its full role in achieving these goals.

THE BANKING SYSTEM

Though the performance of commercial banks in India in the year 1972, considering the difficult conditions that prevailed in the country, could be considered as satisfactory, the growth rates of deposits and advances as also the pace of branch expansion showed downward trends. It also proved to be a year of contrasts. There was excess liquidity in the banking system. An unusual situation developed when the banks had to bear the burden of a surfeit of funds without finding sufficient outlets for advances. Against a credit rise of Rs 599 crores in 1971 and Rs 861 crores in 1970, there was a rise of only Rs 345 crores in 1972. The rate of credit growth dropped sharply from 13.5 per cent in 1971 to 6.9 per cent in 1972. This painful burden of excess liquidity in the banking system made many of the major banks compete for advances and thus led them into an 'interest rate war' in the country.

As regards the deposits, the banks mobilised Rs 1,223 crores as fresh deposits during the year taking the total deposits of the country to Rs 8,145 crores as at the end of December, 1972, an increase of 17.4 per cent over the deposits of 1971. The increase during 1971 was 22 per cent. Inflationary pressures operating on the economy and the drought conditions prevailing in many parts of the country might have been responsible for the slower rate of deposit growth in 1972.

The total number of branches opened during 1972 stood at 1,763, slightly less than the total number of branches open-

ed in 1971. As at the end of December last, the total number of branches stood at 14,739, the average population served by a branch being 37,000.

CREDIT POLICY

As you all know, the money supply with the public has been increasing at an accelerated rate during the last few years. It has been observed that the major contributory factor in the growth of money supply was the net increase in bank credit to Government. The net increase in bank credit to Government was of the order of Rs 980 crores between March 1972 and January 12, 1973. The money supply stood at Rs 8,759 crores as on January 12, 1973, recording an increase of about 12.3 per cent in one year. But unfortunately, the rate of growth of real national output has been decreasing during the same period. The annual rate of growth which was 7.3 per cent in 1969-70 declined to 2 per cent in 1971-72. The rate of growth for 1972-73 is estimated to be about 2 per cent. As a result, the gap between the aggregate demand and the aggregate supply was widened and inflationary pressures were operating with great force on the economy of our country. Therefore, the Reserve Bank of India has been pursuing a fairly restrictive credit policy, keeping always in view the genuine credit needs of the productive sectors and the weaker sections of the community, during these years of increasing inflation.

In the slack season of 1972, there was no major change in the credit policy, excepting some modifications in the fields of selective credit controls. But the situations that developed later in the economy made the Reserve Bank of India come out with a credit policy of a more restrictive nature for the busy season of 1972-73. The mounting pressure on prices and the excess liquidity in the banking system were the two important problems faced by the economy. Therefore, the Reserve Bank did well by taking measures to syphon off the excess liquidity and to enable banks to assist in increasing the production, industrial as well as agricultural. The statutory liquidity requirement of banks was further raised to 30 per cent from 29 per cent and the minimum net liquidity ratio relevant for determining the rate of borrowings from the Reserve Bank of India was raised from 34 per cent to 36 per cent.

The banks utilised their surplus funds to repay their borrowings from the Reserve Bank and to step up their investment in Government securities.

The borrowings from the Reserve Bank which stood at Rs 171.15 crores as at the end of 1971 came down to Rs 8.55 crores at the end of 1972. The investment in Government securities in 1972 was of the order of Rs 507 crores whereas it was Rs 291 crores in 1971.

OUR BANK

I am indeed very happy to report to you that our Bank had another successful year in 1972. It maintained the all-round progress we achieved during the last few years, particularly during these four years since 1969, the year in which your Chairman was
